"Step after step the ladder is ascended."—George Herbert, *Jasula Prudentum*.
"Agriculture is the most healthful, most useful, and most noble employment of man."—WASHINGTON.

THE
TROPICAL AGRICULTURIST:

(ESTABLISHED 1881.)

A MONTHLY RECORD OF INFORMATION FOR PLANTERS

OF

TEA, CACAO, COFFEE, PALMS, RUBBER, CINCHONA, SUGAR,
RAMIE, COTTON, TOBACCO, SPICES, CAMPHOR, RICE,

AND OTHER PRODUCTS SUITED FOR CULTIVATION IN THE TROPICS:

Circulating in India, Ceylon, Burma, Straits, Java, Sumatra, Borneo, Northern Australia,
Queensland, Fiji, Mauritius, Natal, West Indies, South and Central America,
California, Southern States, and throughout Great Britain.

EDITED BY

J. FERGUSON,

of the "CEYLON OBSERVER," "CEYLON HANDBOOK AND DIRECTORY," &c.

"It is both the duty and interest of every owner and cultivator of the soil to study the best means of rendering that soil subservient to his own and the general wants of the community; and he, who introduces, beneficially, a new and useful *Seed, Plant or Shrub* into his district, is a blessing and an honour to his country."—SIR J. SINCLAIR.

VOL. XIX.

[Containing Numbers I. to XII.: July, 1899, to June, 1900.]

CEYLON: A. M. & J. FERGUSON, COLOMBO.

LONDON:

JOHN HADDON & Co.; KEGAN PAUL, TRENCH, TRUBNER & Co., LTD.; LUZAC & Co., &c.

BOMBAY: THACKER & Co., LTD. AUSTRALIAN COLONIES: GORDON & GOTCH.

WEST INDIES AND CENTRAL AMERICA: C. H. CALDERON, ST. THOMAS.

STRAITS SETTLEMENTS AND EASTERN ARCHIPELAGO: JOHN LITTLE & Co., SINGAPORE

HONGKONG AND YOKOHAMA: KELLY & Co. JAVA: MESSRS. JOHN PRYCE & Co.

BATAVIA: G. KOLFF & Co.

1900.

8 SEP 1900

TO OUR READERS.

In closing the Nineteenth Volume of the "**Tropical Agriculturist**," we would as usual direct attention to the large amount of useful information afforded and to the great variety of topics treated in the several numbers. From month to month, we have endeavoured to embody in these pages the latest results of practical experience and scientific teaching in all that concerns tropical agriculture; and our ambition has been to make this periodical not only indispensable to the planter, but of service to business men and capitalists, never forgetting that agriculture trenches upon every department of human knowledge, besides being the basis of personal and communal wealth.

While directing our attention chiefly to the products prominently mentioned on our title-page, we have always taken care to notice minor industries likely to fit in with sub-tropical conditions; and our readers have an ample guarantee in the index pages before them, that, in the future, no pains will be spared to bring together all available information both from the West and East, the same being examined in the light of the teachings of common sense as well as of prolonged tropical experience in this, the leading Crown and Planting Colony of the British Empire.

Special attention has, during the past year, been given to the introduction and extension of an industry in rubber-yielding trees (more especially in the planting of Para and Castilloa trees), and much literature on the subject will be found throughout our pages; also on cacao in Central America and the West Indies as well as in Ceylon; coffee and allied products in Brazil, Mexico, Costa Rica, East Java, Nyassaland, British Central Africa; Liberian coffee in Sumatra, Java, the Straits Settlements; and to other new developments in coconuts and tobacco planting, &c., in the Malayan Peninsula, Sumatra and North Borneo, as well as in this Island.

The Tea-planting Industry has sprung into so much importance in India (South as well as North) and Ceylon, as also in Java, that a considerable amount of space is naturally given to this great staple; and we think it will be admitted by impartial judges that the *Tropical Agriculturist* should be filed, for the convenience of planters, in every Tea Factory in this Island, in India and in Java.

A full and accurate Index affords the means of ready reference to every subject treated in this, the Nineteenth volume, which we now place in our subscribers' hands, in the full confidence that it will be received with an amount of approval, at least equal to that which has been so kindly extended to its predecessors.

To show how fully other Products besides Tea are treated in this volume, we may mention the number of entries under several headings as follows:—Coffee (including Liberian) 42; Cacao 24; Indiarubber 55; Coconuts and other Palms 18; and Miscellaneous Products nearly 1,000. In the 19 Volumes, the references to Rubber, Cacao and Coffee number many thousands, as also to Coconuts and other Palms.

We are convinced that no more suitable or useful addition can be made to a Planting Company's Library or gift to a tropical planter or agriculturist, whether he be about to enter on his career, or with many years of experience behind him, than the nineteen volumes of our periodical which we have now made available. They are full of information bearing on every department and relating to nearly every product within the scope of sub-tropical industries.

In conclusion, we have to tender our thanks to readers and contributors, and our wish that all friends may continue to write instructively and to read with approval; for then, indeed, must the "**Tropical Agriculturist**" continue to do well.

J. FERGUSON.

☛ All Planters of New Products or Pioneers in new lands should not fail to order this periodical as their best instructor.—Every Tea Factory, Coffee or Cacao Store ought to have a file of the TROPICAL AGRICULTURIST, which contains a vast amount of information about Tea, and a Record of the Tea and other Produce Sales.

The Portraits and Biographies of several OLD COLONISTS AND PLANTING PIONEERS are likely to appear in the next Volume.

ORDER FOR THE
"TROPICAL AGRICULTURIST."

.....

.....1900.

Sirs,

Please forward the above publication from the beginning of Vol. XX, 1st July, 1900.

Please send also (lettered as for.....Estate)
Vols. I, II, III, IV, V, VI, VII, VIII, IX, X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, ^{AND}/_{OR} XIX, for 1881-2, 1882-3; 1883-4, 1884-5, 1885-6, 1886-7, 1887-8, 1888-9, 1889-90, 1890-91, 1891-2, 1892-3, 1893-4, 1894-5, 1895-6, 1896-7, 1897-8, 1898-9, ^{AND}/_{OR} 1899-1900.

I am, Sirs,

Yours faithfully,

.....

To Messrs. A. M. & J. FERGUSON,
"CEYLON OBSERVER" OFFICE,
COLOMBO, CEYLON.

SUBSCRIBERS TO THE

✻ "TROPICAL" ✻ AGRICULTURIST ✻

as reminded that with the June Number, already received by them, and the Index and Title-page now issued, the NINETEENTH VOLUME (1899-1900) is closed.

SUBSCRIPTIONS are due payable in advance for 1900-1901, at the following rates:—

For Ceylon	} Yearly ... R12		For Europe, &c.	{ Yearly £1 6s.
and India				

N B.—Subscribers to the *Ceylon Observer* or *Oerland Ceylon Observer* R4 (6s.) LESS per annum.

Single copies, R1 ; back copies, R1½.

Per Bound Volume, R18 ; or £1 6s.

Those who have not settled for past subscriptions are requested to do so by return of Post, and to send Cheque, Post Office Order, or Bank Draft in favour of A. M. & J. FERGUSON, Colombo.

Covers for binding the Nineteenth Volume, July 1899 to June 1900 (870 pages) can be obtained for R1.50. Cost of binding and cover R2.50.

WHAT IS THOUGHT OF

THE "TROPICAL AGRICULTURIST."

A gentleman resident in the Central Province, who has as good opportunities of knowing what is of benefit to Planters as anyone we know, sent us the following explicit testimony to the value of the "T.A." :—

"Since its commencement, I have regularly seen and perused the *Tropical Agriculturist*. There can be but one opinion that its scope and object are highly important, and that it supplies a distinct desideratum, which it is to the interest of every estate proprietor, to have available in the bungalow for the use of his *locum tenens*, or superintendent. As a magazine it provides varied and instructive fresh literature at intervals; deprived, as most in Ceylon are, of easy access to libraries; and as years go by it will growingly become 'The Ceylon Encyclopædia' with reference to agricultural operations. Viewing estate property as practically a permanent investment to any proprietor, the trifling charge of R12 per annum—a rupee a month—is certainly of no account, provided the separate numbers are kept, and bound together yearly as a book of reference for the benefit of the manager and his successors. In that light, as the property of an estate to be handed over just as much as its office furniture, few proprietors would probably refuse to authorise its being taken and filed regularly (if the periodical was brought under their notice), more especially as on looking over the most recent volume one cannot fail to see how much valuable information on 'Tea' has been collated. In the belief that 'Tea' has restored prosperity to Ceylon, and that plantation property is a good investment for capitalists, such should not omit the office and connected equipment so advisable on all 'pucka' estates, a part of which should be the *Tropical Agriculturist*. I find I have gone on writing, but, as I am getting the numbers for the past year ready to be bound, the volume is before me."

THE VALUE OF THE "T.A." TO CEYLON ESTATE OWNERS.—A planting correspondent wrote some time ago:—"I think proprietors should supply every tea estate with the T.A. The information in it with regard to everything in connection with tea &c. is invaluable: it would pay its value over and over again. Owners of estates should not leave it to hard-up superintendents to take it in."

A Correspondent writes:—"I venture to say the volumes of the *Tropical Agriculturist* will be at a premium a few years hence: it is a book which is bound to rise in value as time rolls on, and subscribers will probably, if they so choose, be able to sell at a handsome profit, besides having had the benefit of using the information in the meantime."

From a Proprietor:—"I wonder how many planters know what they lose in not subscribing to your wonderful publication? The cost is absolutely nothing, compared to the convenience of having in a bound book all that is interesting and necessary in the literature of their calling. Information culled from a thousand sources, price lists of all produce sold locally, and home advertisements not seen elsewhere and a hundred other things necessary for them to see and to know: The T.A. is, in fact, a convenient file of useful information daily arising and permanently preserved."

Sir W. T. Thistleton Dyer, F.R.S., F.L.S., C.M.G., of Kew Gardens:—"Sir Joseph Hooker and myself always look out for the successive numbers of the T.A. with eagerness, and I keep a file in my office for reference. It is impossible to speak too highly of the utility of such a publication and of the way it is managed."

Sir George King, late of the Calcutta Government Museum:—"I know your *Tropical Agriculturist* well, having carefully secured every number since the beginning. You have succeeded in making it a wonderfully useful magazine of information for planters."

Surgeon-Major Bidie, F.L.S., of the Government Central Museum, Madras:—"I find the *Tropical Agriculturist* a most interesting and useful publication. It finds a place on the table of our Public Library and is much prized."

* The TROPICAL AGRICULTURIST *

◇ MONTHLY. ◇

Vol. XVIII.

COLOMBO, JULY 1ST, 1899.

No. 1.

TESTING CEYLON TIMBERS.

CEYLON timber logs have frequently been tested both practically and scientifically. Mr. Henry Byrne, when chief assistant to Major Skinner, we remember, published a series of tables with tests of a great variety of local timber trees in logs, scantlings, &c. But we suppose the most elaborate series of scientific tests is that which reaches us in the "Imperial Institute Journal" for May, being a report on the results of mechanical tests applied to a series of logs of timber received from the Ceylon Government (by Professor W. C. Unwin, F.R.S., Referee to the Scientific and Technical Department of

the Imperial Institute. We read:—"The whole of the samples (22 in number) were in a dry and well-seasoned condition, but some of them had serious drying cracks or shakes. No. 8 sample (Mandora), and No. 20 (Halmilla) have a good elastic range. No. 13 is an exceptionally light timber and—as would be expected—of relatively low strength. On the other hand, No. 22 (Nedun) is a very heavy timber of relatively great strength. No. 16 (Chomunti) is rather heavier than No. 22, but its strength is not so great. No. 14 (Walukina) is a rather light timber of good strength. The following tabular statements give:—(1) The heaviness of the timbers; (2) Their resistance to shearing along the fibres; (3) The crushing strength; (4) The transverse strength; (5) The deflections observed in the bending tests; and (6) The coefficient of elasticity from the bending tests." We give the tables below:—

REPORT ON THE RESULTS OF MECHANICAL TESTS APPLIED TO A SERIES OF LOGS OF TIMBER RECEIVED FROM THE CEYLON GOVERNMENT.

(By Professor W. C. UNWIN, F.R.S., Referee to the Scientific and Technical Department of the Imperial Institute.)

TIMBER SEASONING BY ELECTRICITY.

We extract the following from the *Engineer*:—

During the last few years considerable attention has been given to the invention of new processes for treating timber. The latest aspirant to fame is a process and apparatus which claims to give to timber properties which time alone has so far been able to produce. It is a French idea, and has, we are informed, met with considerable success in Paris, where works have been established to treat timber on a large scale. The Nodon-Bretonneau process involves the expulsion of the sap and its replacement by a solid matter, insoluble and aseptic. This is effected by placing the material to be treated in a vat containing a lukewarm solution made up of borax, 10 per cent.; resin 5 per cent.; and 75 per cent. of carbonate of soda. While in this bath, and electric current of about 100 volts pressure is caused to pass through the timber. The currents sets up what is termed lectro-capillary attraction, and drives out the p by

the introduction of the solution. This treatment lasts from six to eight hours generally, after which the wood is subjected to a further treatment of a few hours' duration in a warm bath to allow of thorough permeation of the entire section. It is then removed and dried under cover by air currents, a process which is said to take from fourteen days to a couple of months, according to the density and thickness of the material. The inventors claim that not only is a considerable saving in time and expense in the drying of timber effected by this process, but that certain classes of wood, such as maritime pine, which have not hitherto been readily saleable owing to the large amount of moisture they contain, can by its use be readily deprived of the sap. The expenditure of electric current is said to be 600 watts per cubic metre per hour for five hours. The Electric Timber Seasoning Company, Victoria-street, Westminster, is introducing the system into this country, and a model apparatus has been fitted up at the work of Messrs. Johnson and Phillips, Charlton Junction.

TEA PESTS AND BLIGHTS.

(BEING CHAPTER X. OF DR. GEO. WATTS' LARGE BOOK.*)

As a matter of convenience I have accepted the word "Pest" to denote Insect and other Animal Enemies, and the word "Blight" to refer to Fungal and other vegetable Parasites of the Tea Plant. While convenient the restrictions indicated for these words are of course open to criticism.

In the preceding chapters I have endeavoured to represent certain aspects of the cultivation of the plant that seem to me to call for more careful investigation, with a view to reforms. To my mind there exists sufficient presumptive evidence to justify the opinion that certain misapprehensions and defective methods of procedure have originated constitutional weaknesses that may be said to constantly predispose the plant to actual disease. In other words to render the depredations of its enemies and parasites more alarming than they might be otherwise. I have, therefore, advocated that such reforms as may be found desirable and practicable, should necessarily accompany more specific efforts to battle with the pests and blights.

In the foregoing remarks, at one or two places, I have already pointed out that the brief term of my explorations and the facilities of observation and investigation afforded, do not justify any attempt being made to deal with the pests and blights in a strictly scientific manner. It may be remarked that there are perhaps a dozen enemies of serious moment. The others, while occasionally doing considerable injury, are, nevertheless, of a local and accidental character. To solve the life histories of the dozen serious pests and blights, might take several years' patient study. To discover means of dealing with them would occupy much time and necessitate detailed and elaborate experiments.

SOURCES OF INFORMATION AND ASSISTANCE.

In presenting the observations which I now propose to offer, it may be as well to explain the chief sources of information and assistance which have been drawn upon in the study of the pests and blights of the tea plant:—

1st.—The Journals and Proceedings of the Agri-Horticultural Society of India, more especially from 1865 to 1885—the period of greatest interest by the Society in the subject of Tea Pests.

2nd.—Special publications on the India Tea Industry, including the annual Reports of the Indian Tea Association from 1882 to 1896.

3rd.—Newspaper correspondence from 1873 to present date, more especially the letters which appeared originally in the *Tea Gazette*, but which may now be conveniently consulted in the *T a Cyclopadia* and the *Tea Planter's Vade Mecum*. I have only incidentally referred to Ceylon newspapers for information, but the *Tropical Agriculturist* has been found of great value in confirming or correcting information regarding India.

4th.—The *Indian Museum Notes*, more especially Mr. E. C. COTES' Account (in Vol. III.) of the *Insects and Mites which attack the Tea Plant in India*.

5th.—The invaluable aid of Mr. W. T. THISELTON DYER, Director of Kew Gardens, London, and of Mr. GEORGE MASSEE, Cryptogamic Botanist to the Herbarium of Kew, for two reports on certain fungal blights collected by me. Through the kindness of the Director General, Medical Department, I have been favoured with a proof copy of Dr. D. D. CUNNINGHAM'S forthcoming paper "On Certain Diseases of Fungal and Algal origin affecting Economic Plants in India;" in that paper three of the diseases of the tea plant have been dealt with and consequently drawn upon very largely by me.

The liberal assistance of Sir GEORGE KING and of Dr. D. PRAIN of the Botanical Gardens, Calcutta, for helping me with the determination of the plants collected during my tour in Assam. This every now and again has been of value in connection with the

present report as, for example, in giving the names of the plants on which certain tea blights were found in the jungles.

The very great assistance, most generously afforded, by Mr. E. E. GREEN, the distinguished Entomologist of Ceylon, who has for many years identified himself with the study of the tea pests, and has in consequence discovered and investigated the life histories of a large number of very obscure species. Mr. GREEN has not only examined and reported on a complete series of the insect pests collected by me, but has in return presented a most valuable set of the pests collected by him in Ceylon. As types of the species he has named these have proved invaluable. Similarly I am much indebted to Dr. A. R. S. ANDERSON, Officiating Superintendent of the Indian Museum, for having examined the doubtful specimens referred by me to the Museum for determination, and to Mr. EDWARD BARLOW, the Assistant in charge of the Entomological Collections of the Indian Museum, for having very kindly worked with me during the time which I spent in comparing my specimens with the Museum sets.

6th.—But a debt of gratitude is more especially due to the large circle of planters whom it was my good fortune to meet during my tours, and from whom I obtained much valuable assistance. Added to all these sources of information I may mention the files of correspondence of the office of Reporter on Economic Products which have been freely drawn upon, and, lastly, the results of my own personal explorations.

The account to be given below, therefore of each species of pest or blight will be made, as far as possible, to embrace the entire available information. Stress will be laid on the effort to trace out the locality and date of first appearance, of each of the more important enemies of the tea plant, from the belief that particulars of that nature may very possibly be found of value in future investigations. I am fully conscious, however, that defects will be discovered, and can only hope that the present review of information may stimulate greater attention being given, more especially through the planters themselves once more, making the technical journals of the day the channels of recording their observations and opinions. The apathy that has existed, for the past score of years, in the matter of exchanging ideas, largely accounts, I am afraid, for the want of progress. Interest may be said to have been first prominently aroused in the subject of pests and blights by the late Mr. S. E. PEAL'S paper on "Mosquito," or, as he loved to call it, the "Tea Bug." Prior to the appearance of Mr. PEAL'S paper it had been vaguely designated "Blight," and was viewed as a mysterious visitation. Mr. PEAL'S showed that it was caused by an insect. Immediately there arose the enquiry as to methods of extermination. From that date one discovery after another followed quickly, until for twenty years or thereby the Journals of the *Agri-Horticultural Society* and the public newspapers of Calcutta teemed with letters and detailed reports on the pests and blights of the tea plant. Gradually, however, the subject seems to have lost interest, perhaps, through the discovery of new methods of cultivation and manufacture, that gave handsome returns in spite of the ravages of these enemies of the industry. Left thus to themselves they have multiplied and extended until attention has been forced once more to the question, which twenty years ago was discussed and pigeon-holed, by those most interested, *viz.*, the desirability of securing scientific assistance.*

In presenting this compilation of available information I may as well explain that I shall deal first with the Pests, and next with the Blights. Under Pests (Insects) I shall, as far as possible, follow the classification and the scientific determinations given in Mr. COTES' *Insects and Mites which attack the Tea*

* We republish this by request, because Dr. Watts' book is out of print.—ED. T.A.

* See Proposed Scheme, Journ. Agri-Hort. Soc. Ind., Vol. V. n. s. Proc., 24th Aug. 1876; 23rd Nov.; 21st Dec.; 19th April 1877; 23rd Aug.; Vol. VI, Proc., 18th Dec. 1879; Scheme Abandoned, 22nd July 1880.

Plant in India, It may, however, serve a useful purpose, if I attempt to indicate:—

- (a) The insects described in the Indian Museum Notes (including Mr. COTES' special paper) as actually found on the tea plant in India. (The pests of this section will for the most part be found dealt with in Mr. COTES' *Insects and Mites*, etc.)
- (b) The insects found on the tea plant in Ceylon, and which presumably may in the future be found in India.
- (c) The insects discovered by me in addition to (a) and including also those which prior to the date of my explorations have been treated under the position (b) above.

These particulars will be brought out by the letters (a), (b) or (c) being placed alongside of the serial given to the species dealt with. My object in so doing is to exemplify once more the very remarkable fact that the pests and blights of the tea plant are rapidly becoming diffused over the world's areas of tea cultivation. A large percentage of these insects have never been seen by entomologists, except on the cultivated tea plant, though many are common enemies to both tea and coffee. It need hardly be repeated that these very striking circumstances point unmistakably to cultivation having produced the conditions necessary for the appearance and distribution of these pests, the more so since the wild tea plant has been found to bear but a small percentage of these pests. (*Conf. with paras. 11 also 44 to 49*).

As a matter of convenience, I shall quote (at the end of the paragraph of references under each species) the registration numbers assigned to all pests collected by me and, when preserved in fluid, shall quote also the numbers engraved on the bottles or tubes in which they have been stored. These numbers, it will be understood, are given for Museum purposes only, and are of little interest to the general reader, except as indicating by their absence pest and blights of which specimens have not been procured and of which contributions would, therefore, be very acceptable.

COLEOPTERA.

THE BEETLES.

In this Order of insects both the grub and the perfect beetle may injure crops. The maggots or grubs are sometimes devoid of legs, but more frequently have three pairs of jointed legs—one pair on each of the three segments of the body near the head, and a pair of sucker-feet near the anal extremity. The chrysalis looks like a deformed beetle, curled up and motionless. The perfect insect or beetle has an upper pair of hard wing-cases, called the *elytra*, and below these a pair of large membranous wings that fold underneath the wing-cases.

There would seem to be five well-known species of beetles found on the tea, with perhaps three or four more that might be regarded as occasional enemies. The Cockchafer, or White Grub, in its larval stage eats the roots of the plant, and in its mature form would appear to devour the leaves as well. Then there are at least four species of leaf-feeders, that often do considerable damage to the crop when prevalent. Lastly, a wood-borer found in Ceylon, but not as yet in India. In Sibsagar district I came across a longicorn grub which is perhaps a by no means an uncommon tea-borer, though, so far as I can discover, it has not as yet been described.

HISTORY.—The first mention of this beetle, as an enemy to the tea plant, so far as I have been

able to discover, is contained in a letter by a Darjeeling Planter (1874) which will be found reprinted in the *Tea Cyclopaedia*. The author of *Notes on Tea in Darjeeling* (1858), gives it the vernacular name of *Kumla*. Mr. BAMBER says, "it occurs in all the tea districts," but does not tell us whether he had actually found it in Assam. Moreover, he makes the somewhat puzzling remark, "with the aid of lamps collecting the grubs at night when out to feed, would probably prove a satisfactory method for lessening their numbers." So far as I am aware the grubs of this beetle never under any circumstance come above ground and have no occasion to do so since their food consists of the young roots of the plant. Mr. COTES remarks that it appeared in vast numbers in Darjeeling in 1891 (*vide* letter from Messrs. DAVENPORT & Co., October 1891, *Ind. Mus. Notes*, III.) 3). "Its prevalence in other years," Mr. COTES adds, "is shown by the fact that in 1883 no less than 2,635,000 individuals were collected and destroyed in the public gardens, Darjeeling (*vide* *Ind. Mus. Notes*, Vol. I, 59). But Mr. COTES makes no mention of its being found in Assam. It was collected by me in a few gardens of the Sibsagar District, more especially at Khumtai and Ligri Pukri. Mr. CROLE (*Tea Text-Book*, pp. 84 and 222) incorrectly gives the scientific name of this beetle to the cricket.

DEPREDACTIONS.—Like most of the predatory Melolonthin beetles this species lives in its larval stage on roots. The eggs are laid in the ground. From these the white grubs escape and very possibly attack the roots of weeds in the first instance. Ultimately they penetrate to the depth at which they are able to discover the roots of the tea plant and these they devour. Mr. COTES suggests that the eggs are likely to be laid about the beginning of the rainy season in Northern India. "How long is spent by the grubs in the ground before they become full grown we do not know, but the fact that the European species *Melolontha vulgaris*, *Fabr.*, spends more than three years in this stage, while the American species, *Macrodactylus subspinosus*, *Fabr.*, spends the greater part of one year, leads to the supposition that an equally long period may be required in India." (*Cotes.*) A tea-planter, whose opinion will be found quoted below under the paragraph on "Remedy," thinks the Indian white grub may live in the ground for two or three years. At all events these grubs never come to the surface until after they have passed into the pupal stage, when in due course they emerge as the mature or copper-brown-coloured beetle.

At Khumtai on the 7th of April I witnessed this insect making its escape from the ground and found several of the mature beetles apparently eating the leaves of the plant. A large assortment of grubs in all stages of growth were sent me in December 1895 from another garden in the Sibsagar District. These were turned up while heavy hoeing, and the manager very properly thought that they had better be picked out. He accordingly sent me a selection and desired to be informed if they were insects reported hitherto to injure the tea. These larvæ I submitted to the Entomological Department of the Indian Museum, as there seemed to me to be at least two, if not three species. The reply obtained was to the effect that "the larger grubs are the larvæ of a Melolonthin beetle probably belonging to the genus *Lepidiota*, and the smaller are apparently the immature forms of *Lachnosterna impressa*. The mud ball sent is the pupal cell of a *Copris* beetle." Mud balls or nodules, of the size of a large hen's egg, are frequently thrown up from the ground, during the hoeing of tea gardens, when the soil consists of a fairly heavy clayey loam. They are commonly seen on the faces of road cuttings and may easily be mistaken for the mud cells of queen white-ants. On being broken open they will be found to contain a grub of a brown colour that may sometimes be 2 to 3 inches long. The nodules are stratified and closely compacted, the inner layer being sometimes of a darker colour than the outer layers.

APPEARANCE OF THE BUSK.—When beetles of this family attack tea, the plant at first is seen to

have lost its vigour. The buds often become *banjhi* and as the ravages of the beetle advance the leaves droop, turn brown and finally the bush appears as if killed, and it may actually be so. The appearance in fact is very similar to that when a wood-borer is at work (such as *Zeuzera coffeæ*), with this difference, that the whole bush appears to be suffering instead of one portion of it only, as is generally the case with borers. From what has already been said of this beetle, it will be understood there may be very little evidence of its ravages for months, while the grubs are steadily sapping the life of the plant and not one plant, for, as a rule, the beetle, if present, invades a considerable area, so that a whole plot of tea may be seen to be injured and clumps of bushes killed. When this occurs, the bushes if dug up will very often be found to have the roots invaded by fungi, and the inference is sometimes drawn, though incorrectly, that the fungus is the cause of the destruction. When bushes are seen to die in the manner indicated, it would be a good plan to have a healthy bush, near to those killed, dug up and carefully examined. It may then be seen that the fungus is only saprophytic, that is to say, a species that attacks dead, not living, plants, and that the real cause of the death of the bushes is the white grubs that may then be found feeding on the living roots.

REMEDY.—So far no cure has been discovered, except to dig up the grubs and kill them. But to check the multiplication of the pest it is necessary to catch and destroy the beetles. For this purpose children, armed with insect-collecting nets, would be found most valuable, when incited through the offer of a reward for the number captured. The planter whose letter first drew attention to this pest, tells us that he offered a reward to his coolies, when hoeing the land, of one pice for every 30 grubs collected. In consequence the coolies dug more than their day's task, so that the collection of the grub practically cost nothing. He informs us, however, that "to clear 15 acres cost in pice R108—giving two lakhs of grubs which filled two hogsheads. The eggs from which these grubs sprang must have been laid some two or three years before, and most likely they have quietly been doing great mischief. I am in the habit of buying the jungle—not all over the land, but in small holes, here and there, where convenient. This I found a great trap, for the grubs left the tea trees to attack this rotting vegetation and so were easily collected." The author of *Notes on Tea in Darjeeling* gives somewhat similar information, though he adds certain additional facts. The grub, he says, is "generally found in very rich soil, or where manure has been put down, or much jungle has been buried. This is fairly destructive to young cultivation and seed-beds, and eats off the roots of the young seedlings before they harden up, in some case killing off nearly every plant in young cultivation. Only remedy digging up. Plants attacked by *Kumlas* generally die slowly, first getting yellow at top and gradually dying down. Never fill in a vacancy thus caused without digging the insect up." Mr. Cores tells us that in Ceylon, on coffee estates "where Melolonthini larvæ at one time proved very troublesome, the only method of treatment that seemed to have been at all successful was digging out the grubs by hand." Speaking of the efforts made to extirpate an allied insect from the vines in Europe, bisulphide of carbon is said to have been used with success. Miss E. A. ORMEROD'S *Text-Book of Agricultural Entomology*, pp. 89-93, will be found to give many useful hints regarding Cockchafers. Mr. SAUNDERS ("Insects Injurious to Fruits") gives some valuable particulars regarding a species of *Lachnosterna* said to be injurious to the cherry, plum, and other such trees. During the day the beetle remains in repose, but at night becomes active, and, if numerous, rapidly defoliates the trees. They are best collected by placing a sheet below the bushes, during day time and then shaking when the beetles fall into the cloth, and may be collected in large numbers. He then adds that where the beetles are found abun-

dantly the grubs may be expected to remain for some years to come since the larvæ eat the roots during a protracted period of existence. The presence of this beetle even if it does not eat the tea leaves is a very dangerous prognostication of future injury, and it should, accordingly, be collected and destroyed as much as possible.

2 (A) DIAPROMORPHA MELANOPUS, Lacord.

THE ORANGE BEETLE, sometimes called PEAL'S BEETLE.

(Reg. No. 75, tube Nos. 62 and 272.)

HISTORY.—It would appear that Mr. E. L. EDGAR, of Cossipore Tea Estate, Cachar, was the first to draw attention to this beetle. He then wrote, that it had only appeared this year (1869) in any numbers. We next hear of it in 1872 from Moran in Sibsagar District, Assam. Both samples were sent through the Secretary, Agri-Horticultural Society of India, to Mr. F. MOORE, who identified them as being *Dia promorpha melanopus*. Mr. PEAL sent samples of it to Mr. WOOD MASON along with such notes and coloured drawings that Mr. WOOD MASON undertook to write for the Agri-Horticultural Society an account of the insect, which promises, apparently, he never fulfilled, as I have failed to trace a paper by him. Mr. PEAL himself, however, contributed some interesting particulars in the form of an article on Tea Pests that will be found in the *Tea Cyclopadia*. The subsequent historic facts are soon told. It was reported from Darjeeling by many writers, and Mr. Cores says, "The species is a common one in India."

DESCRIPTION.—A small orange-coloured beetle with the hard pitted wing-cases; head slightly darker coloured than the body; belly pale coloured. Size about $\frac{3}{8}$ th inch in length.

DEPREDACTIONS.—This very troublesome little beetle is one of those examples of an insect having left its own natural food and taken to the tea. Its life history does not appear to have been traced out, but Mr. Cores says, "From what is known of other species of the same family, it may be expected that the eggs are laid upon the leaves, that the larvæ are active little creatures which feed upon the foliage, eventually transforming, in some sheltered corner, into stationary pupæ from which the beetles ultimately emerge. These points, however," he adds, "require corroboration."

Mr. W. J. FLEET sent me, from Salonah, Nowgong, samples of this beetle on the 27th June 1897, which he collected on the 17th April, but had observed the beetle subsequently up to date of his letter. The winged insect was collected by me at Nigiriting on the 1st of May, and in the Sibsagar District some weeks earlier. I had a large supply sent me from Sonada, Darjeeling, in June 1897. The first two letters announcing the discovery of this pest make no mention of the date of appearance of the beetle, but these letters were published,—the one on the 17th November 1869, the other on the 19th September 1872.

It is curious that no writer makes mention definitely of the date of appearance and disappearance of this pest. The above facts have been mentioned to show all that is known on these points. It may, therefore, be presumed that its period of depredation extends, say, from the beginning of April to about the end of August. One point there seems to be no doubt about. The insect does not lay its eggs on the tea, nor do the larvæ feed

on tea. It is only the mature beetle so far that has been seen on tea. I questioned the late Mr. S. E. PEAL on this point carefully, and he assured me that it certainly did not breed on tea, but, in his opinion, lived its early life on *ulu* grass (*Imperata arundinacea*).

Regarding the manner of its depredations there can be no doubt. Mr. EDGAR, its original discoverer, says, "These insects scrape the green stem below the Pekoe or Pekoe-Souchong leaf, sometimes below the souchong leaf if the flush is quick grown, and the stem soft. They scrape or eat a place on it from half an inch to one and a quarter inch in length and from just touching it to three-fourths through. According to the depth they go, so soon do the two or three leaves above tumble over and wither. Should they multiply, they will be very destructive to new flushes." The Assistant Manager of Morau Company, Assam, in his letter even goes more fully into the subject. He says "So serious is it that I estimate a loss of at least a maund of tea from this flush alone, which I am now plucking, and the loss on the entire year must be very serious." "The insect eats or gnaws only a small portion of the stem of the young shoot, which, whenever the sun touches it withers, droops, and in about a day falls off and then the shoot looks just as if it had been plucked; so that to discover the entire depredations of this little pest, the bushes have to be examined once or twice every day." Mr. S. E. PEAL's original account of this pest is also worthy of being quoted, since it throws some additional light on the methods of procedure adopted by this insect. "Naturally," he says, "it is a grass, cater, and may be found in considerable numbers where larger grasses abound in the open. It has a habit of alighting on the tips and flies rather slowly, resting under the curved-over tips of the *ulu* grass. These insects are at times found in threes or fours, and rest there in the little shade afforded. In attacking tea, they generally eat away portions of the green stem of the shoot that is just fit to pluck; the shoot falls over, withers, dies, and turns black and dry. If this beetle is at all common, considerable damage is done, and a garden or patch of tea presents a brown, withered appearance. As the portion eaten out of each stem is not large, a single beetle may ruin half a dozen shoots as one morning's work."

The author of *Notes on Tea in Darjeeling* says, "This is a small reddish yellow insect, which always runs up if cow-dung has been put down, and sometimes on new extensions, probably from the same cause. This beetle seems to attack heavy pruning or young tea more than pieces. It bites the shoot low down, and the shoot then withers and rots away. If there is sun-grass near the tea, the beetle goes to the grass, instead of the tea."

Mr. BAMBER did not evidently give much attention to this pest as he devotes only some two lines to it and says, "at present the damage done has been small." Mr. COTES (*Insects and Mites, etc.*) gives no particulars as to its depredations, but refers to the *Indian Museum Notes, Vol. I, p. 106*, where it is stated that specimens had been received from Mr. S. E. PEAL in 1885. A Darjeeling correspondent in *The Planter* says, "Often when reading articles on tea blights I have been surprised never to have seen the 'Orange beetle' mentioned." "I have often seen a dozen or more of these beetles on one bush, and every bud lying over dry and making the bush look almost as though withering up at first sight. Another peculiarity about them is, that they only seem to go for the Assam *jats*, and are scarcely ever seen on a China bush, evidently preferring the more succulent shoot of the Assam bush to the less juicy one of the China."

The fact of this insect showing a decided preference for the Assam tea is a point of considerable interest. This I had recorded in my diary and found, when in Assam, that Mr. PEAL and others had made the same observation.

REMEDY.—In consequence of our ignorance of the early history of this insect, only the one cure is open for consideration, namely, to collect and destroy the beetle. This Mr. F. MOORE recommended over 20

years ago, and nothing further has been brought to light. Mr. PEAL was of opinion that far from *ulu* grass being a protection (as suggested by the author of *Notes on Tea in Darjeeling*) it is the chief cause of the mischief. While walking through one of the Moran Company's gardens Mr. PEAL stripped the long blades of *ulu* grass through his hand and demonstrated to me thereby the day habit of the insect. But while Mr. PEAL speaks of the insect accomplishing its ravages in the morning, I found the insect in the Golaghat Sub-Division most active late in the afternoon. It is thus probable that it feeds both in the morning and in the afternoon.

A planter whose letter originally appeared in the *Tea Gazette*, says, "I have had thousands of bushes damaged by this insect, and find it pays 'hand over fist' to give coolies so much for catching the little pests, say a pice for fifty. By so doing I have succeeded in destroying as many as 20,000 in the day." Mr. PEAL says, "eight or ten well-made butterfly nets, depth, say 18 inches, and diameter of mouth 1 foot, ring or hook of stout brass wire, bent, soldered and inserted in 4 feet high bamboo handles. These in the hands of as many smart boys will bring down the numbers very rapidly. If at all plentiful, a boy can easily 'bag' 300 beetles per hour, and where not much of a pest, I have taken several times myself at the rate of 250 per hour. A few days of this and the nuisance will abate very perceptibly."

LADYBIRDS BEETLE MISTAKEN FOR THE ORANGE BEETLE.—I desire in passing to warn those unfamiliar with the appearance of the Orange Beetle, not to be too hasty in coming to the conclusion that any small orange-coloured or red beetle, found on tea, is the pest here dealt with, or "at all events has no business" on the tea and had, therefore, better be removed. While visiting a garden in the Sibsagar District, the manager informed me that some ladybirds that I had caught and was examining were PEAL's Beetle. I assured him he was mistaken, and that the ladybird was one of the planter's best friends. It was no good my protesting that he was mistaken, for "some years ago they had caught that very insect by the thousands daily." Of course this was a case of mistaken identity. The insect to which he alluded, as having been collected, I found subsequently was the orange beetle right enough. The ladybird beetle is almost circular in outline and of a bright red colour with a few spots on its wing-cases. The orange beetle is a narrow elongated insect with a somewhat large and curiously truncated head, as if cut off abruptly. The wing-cases are of one uniform orange yellow colour throughout and seem as if some one had dabbed them all over with the point of a needle—the surface of the wing-case being pitted. The wing-cases of the ladybird are perfectly smooth and polished.

The larvæ and even the mature insect of the ladybird beetle are carnivorous and feed for the most part on the black aphid (*Ceylonia theaeicola*), and I believe also on the larvæ of the mosquito and green-fly. I have watched them repeatedly devouring the black aphid, and been surprised that colonies of these curious aphides were not alarmed by the appearance among them of so formidable an enemy. They seem undisturbed and await their turn of destruction perfectly unconcerned.

The ladybird does not injure the tea in any way and should most certainly be encouraged, on no account destroyed, through the mistaken notion of its being the orange beetle.

3. (A.) ASTYCUS CHRYS. CHLORUS, *Wied.*

THE GREEN BEETLE.

REFERENCES.—*Indian Museum Notes, Vol. III, 99, 126; Cotes, Ins. and Mites, etc., 8.*

HISTORY.—I have given this insect the name for Green Beetle as a simple and characteristic description Mr. Cotes tells us that it "was sent to the Indian Museum in April 1892 from a tea garden in Cachar, where it was supposed to have been the cause of some injury to the bushes. It was said to strip the young leaves off the tea shoots."

REMEDY.—Nothing further can be said than has already been mentioned in connection with the orange beetle. The insect should be collected and destroyed whenever seen. As with all others so with this species, it may be said, that the sooner the pest is attacked the better. It is, however, unfortunate that we have to confess ignorance of the actual life history of this beetle.

4. (C) *ASTYCUS LATERALIS*, Fabr.
(Reg. No. 102, tube No. 131.)

HISTORY.—Messrs. BALMER LAWRIE & Co., on the 3rd of June 1897, were good enough to forward to me a few beetles that had been sent to them from the manager of the Hukanpuri Division of the Jokai Company's estates. Mr. E. RAMSDEN in forwarding the specimens reported that they had been found on one-year-old plants. They had come during the night in thousands and simply stripped the bushes. Fortunately they were easy to catch. My reply identified the insect as a species of *Astycus*. Subsequently, however, on re-examining the specimens, I came to the conclusion that it might possibly be a species already identified by entomologists. I accordingly sent the samples to Dr. ANDERSON, of the Indian Museum, and he was good enough to inform me that the name of the insect was as above (*A. lateralis*). It is a much smaller beetle than *A. chrysochlorus* is of a dark brownish black ground colour, with a distinctly green metallic tinge. The chief difference to the non-professional eye may be said to be that *A. chrysochlorus* is about $\frac{3}{4}$ of an inch in length and is of a bright pale green colour, while *A. lateralis* is about half an inch long and of a dull metallic green.

REMEDY.—There is nothing further to remark on this point than has already been said regarding *A. chrysochlorus*.

5. (C) *ASTYCUS?* sp. nov.
(Reg. No. 101, tube No. 72.)

HISTORY.—A black beetle with a metallic green tint, is not uncommon in Assam as a tea pest. At first I took this to be *A. chrysochlorus*, but, on comparing at the Museum my specimens with the beetle from Cachar, I agreed with Mr. BARLOW that it must be regarded as a distinct and possibly an undescribed species. In point of size it is intermediate between *A. lateralis* and *A. chrysochlorus*, but in colour is more like the former than the latter.

I was shown specimens at Amguri, by Mr. BUCKINGHAM, which he had collected some time prior to the date of my visit. The insect had not appeared very severe but was known all over the Sibsagar District. It came one year, gave considerable cause for anxiety, and then disappeared for a number of years, perhaps to re-appear when least expected.

DEPREDACTIONS.—At Dirpai, North Lakhimpur, on the 8th July, I found a colony of this beetle doing much damage to some 10 to 12 bushes all near each other in one portion of the garden. The beetle commences on the margin of the leaf and eats downwards towards the midrib. When about half way down it commences on a new place, so that great ugly holes are cut out of the leaf.

REMEDY.—Same as for the other beetles dealt with under this genus.

6. (B) *XYLEBORUS FORNICATUS*, Eichhoff.
WOOD-BORING BEETLE.

REFERENCE.—*Indian Museum Notes*, Vol. IV., p. 57 Plate V., Fig. 2.

HISTORY.—This curious little beetle has been found in Ceylon to riddle the tea stems. Specimens were sent to the Indian Museum on the 20th January, 1897, by Mr. E. GREEN, and were forwarded to Mr. W. F. H. BLANDFORD, who identified the pest as the beetle above named.

DEPREDACTIONS.—Mr. G. ALSTON, Superintendent of Craighead, Nawalapitiya, who first drew Mr. GREEN'S attention to this new tea pest, wrote that it appears mostly in patches. "Most of the trees show no out-

ward sign of the pest, except when almost every branch is attacked, when they turn rather yellow and stop flushing. Young trees about two years old, before they are topped, often snap off at the spot where the borers have made holes for their entrance or exit. Strong vigorous trees in good soil seem to be very little affected by it, and threw out good red wood even from badly bored stems. On the other hand, poor plants on ridges or poor soil seem to naturally feel the effect of it quickly, though in no case have I seen a tree killed by it. Isolated branches die off, but new branches come out in their place. As a rule, you can only tell an attack tree (except in the case of young plants, when the stems snap off) on pruning it, when the holes in the wood are very apparent. It (the beetle) does not attack the cut surface after pruning, but makes its entrance through the back. In the case of young red wood it very generally goes straight down the pith; in older branches, I have often seen the wood riddled as if a charge of snipe-spot had been fired into it, with only one or two minute holes in the bark for exit or entrance. And yet in the case vigorous trees they seem to thrive notwithstanding. Since 1893 the pest has spread very much and become more general, though I cannot say that I see much difference in the fields that were attacked then." The plate quoted above is an excellent one but if the reader possess a copy of Miss ORMEROD'S useful little *Text-Book of Agricultural Entomology* he will find (p. 100) an illustration of the very closely allied species *X. despar* which shows the ravages of the European species on the plum.

REMEDY.—It would be dangerous to suppose that because strong, healthy, well-nourished bushes seem little affected by this pest that there is no occasion to take steps to secure its eradication. Should it appear in the Indian tea areas, every effort should be at once made to stamp it out. Improve the vigour of the plant by manuring, deep drainage and other means. Lop off and burn all affected parts. If found in a small compact area I personally should, however, prefer to fire the plot. In my experience this is by far the most effectual remedy with all diseases that occur over fixed and limited areas, more especially if the disease is recognised and the firing can be accomplished early in Spring. All over the plot dry straw should be placed within and through the bushes so as to secure rapid combustion. The embers should be at once cleared away from the bark of the main stem. After the fire has burned out, the bushes should then be pruned and all charred portions removed. The Spring shoots may be delayed a few weeks, but in exceptional cases only will the bushes be killed, unless the firing be done late in the season.

LII.—Other Beetles Reported as attacking the Tea

7. *CURCULIO TANYMECUS*.

In the Journal Agri-Horticultural Society of India Vol. VI. n. s. Proc., 24th July 1879, mention is made of a beetle sent to the Society by Messrs. WILLIAMSON, MAJOR & Co., "as doing much mischief to the tea bushes in the Munguldye Company's plantations." The specimens were forwarded to Mr. A. GROTE and ultimately submitted to Mr. F. MOORE. The reply appears in the Proc., of the 13th December, 1879. "The green beetle sent to you by the Munguldye Company is a *Curculio* allied, as Moore thinks, to *C. tanymecus*, but these beetles ordinarily bore into the stem and branches of plants and do not meddle with their leaves." I am unable to trace the name *C. tanymecus*. There is a genus of beetles known as *Tanymecus* but Gemminger and Harold make no mention under *Curculio* of a species *C. tanymecus*.

It is somewhat significant that the pest alluded to, in above correspondence, should apparently have disappeared while two species of *Astycus* (that are by no means remote from *Curculio*) should have taken its place as leaf-defoliators in Assam.

8. Two other as species of beetle have been sent to me by Mr. FLEET, injurious to tea, viz., *Crioceris impressa*

and *Odius bipunctata*. I have obtained no particulars regarding these beetles, and mention them purely in order to suggest further enquiry.

9 Grubs of *Lepidiota* and of *Copris* have been mentioned above (p. 184) as having been sent from a tea garden, but in addition I have before me now a third grub, viz., that of a Longicorn beetle (*Reg. No. 103*) which has been reported as doing much injury to the tea. The Longicorn (CERAMBYCID) beetles are mostly dangerous wood-borers.

A TREATISE ON TEA.*

A scientific dissertation on what tea-planters vulgarly call tea-bugs does not promise to be of absorbing interest. For a moment a flutter of hope is raised when the savant opens with an allusion to his *explorations* in the not un-mapped district of Kangra, and we congratulate ourselves he is about to invest it with some of the fascination that temporarily hangs over, say Klondyke. But from Kangra to Klondyke is a far cry, and the prospect of exciting adventure is quickly dispelled when the reader dips into the leaves of Mr. Watt's volume on *Tea Pests and Blights*, vainly seeking the cheerful powers of description that enlivened Fortunes books about China and its tea districts, and discovering only a tome full of peculiarly dry facts. The book will with difficulty interest tea-planters, a body of men who, as all the world knows, invariably fall asleep over their *Pioneer* after dinner, and are not to be appealed to by any form of literature excepting tea broker's disparaging reports and valuations on their samples, and, occasionally, perhaps a printed news letter from their own district that pokes fun at their daily life and habits.

And yet, notwithstanding, the entire absence of light and sweetness in its pages, Mr. Watt has written a book that deserves much commendation and will repay intelligent study. Tea holds the fifth place of precedence in the roll of Indian exports, and any work that helps the industry to understand itself better is deserving of cordial recognition. The literature of tea, both ephemeral and in volume form is sadly flaccid stuff. Since the *Indian Tea Gazette*—a periodical which did a vast deal of good, and diffused an immense amount of valuable practical information in its day—expired from lack of support from those it tried so hard to serve, the tea industry has not been adequately represented by any journal worthy of the name. As for Gold Medal Essays and fugitive works on tea planting, which our forefathers were guided by a quarter of a century ago, they have long and rightly been consigned to the limbo of the obsolete.

If we have a fault to hint at in Mr. Watt's book it is that it is too scientific for our taste, and that he is a little apt to cavalierly pooh-pooh practice when he is laying down theory. This mere especially in the first portion of the volume, which is devoted to the treatment and cultivation of the tea plant, and interests us far more than the too technical second part, with its staggering array of scientific Latin names in blocktype. Why cannot surgeons and scientists drop Latin? Fancy any sensible man calling a *janicar* an *Aspidiotus Cyanophylli* when he can damn it off hand, succinctly and suitably as a "scale-bug"? Conceive a tea planter whose one aim in life is to pull off a five maund per acre crop and get an eight anna average for it, seeking inspiration in three hundred dragging pages plentifully be sprinkled with scientific designations similar to the above. It is we presume for his exclusive benefit that the book is published by what he has recently apostrophised as "a kind and powerful Government." If so we hear it is not "popular" enough for its purpose. There is too

much of the economic study in it: it is too prolix to be perspicuous; and as a practical *vade mecum* it wants more one-syllable words.

On the other hand we willingly admit that Mr. Watt has written a learned and exhaustive treatise on *Tea Pests and Blights*, as he who runs may read. Those who suffer from these pests will do well to wrap a wet to towel round their heads (their own heads), and refer to Dr. Watt for information and advice. They shall learn in his book all about mosquito, green fly, red-spider, aphs (a single individual of which can, if unchecked, be the ancestor—Mr. Watt informs us—of 10,900,000,000,000,000 of its own species in three month's time, the unprincipled monster!) and several other protoplasmic organisms some of which might come, perhaps, as not an unmixed curse to planters behind-hand in their outturn, who, peradventure would on occasions welcome their occurrence with the enthusiasm they accord to the three benevolent hailstones, which timely constitute a storm and an excuse for reducing estimates by twenty thousand pounds. Certes there are some pests and blights described by Mr. Watt in very minute detail whose life history, however much it enthral's the pedant, can have but nominal interest for the planter, notwithstanding the portentous hints of possible calamity that Mr. Watt lets drop *ament* some of them in language solemn enough for the lubonic plague.

Take the caution to Kangra for instance. It is a district which "may be said to have two pests of any consequence. Neither should be viewed lightly, since it is possibly an accident, more than anything else, that they have not yet assumed gigantic proportions." These two pests are a scale-bug and a basket-worm, and we venture to assert that during the last forty years they have not lessened the Kangra aggregate tea crop of say, 60,000,000 by six thousand, we had almost written six hundred, pounds of tea. Forty years of consecutive "accident" should set Kangra planters fairly at their ease in regard to *Aspidiotus Theae* and *Amatissa Consorta*.

Apropos of Kangra tea pests we may mention an incident about the red spider and its occurrence in the Valley which may be new to Mr. Watt. Referring to the necessity of studying the habits of this pest more closely, he writes, "Experiments should be performed in every district. Why should we, for example, be unable to say where the red spider hibernates?" Taking this as a test it may be observed that about fourteen years ago the red spider was introduced into Kangra Valley by a planter who imported some high at tea seed from Assam. A few months after the seed arrived a ten acre plot of tea in his garden developed red spider in its acutest form, and absolutely stopped flushing in mid-season. That planter's feelings were quite too harrowing to describe. He believed he had not only ruined himself; but his innocent neighbours by introducing the veritable tea plague into the district. He saw himself handed down to the after ages as the villain who killed the Kangra tea industry. His courage failed him to confess his crime. He kept mum. Never a word said he. He lived in guilty but silent dread, hypocritically pretending to enjoy his pegs, awhile he hugged his horrible secret in his breast. The winter came. The red spider hibernated. Where? Presumably on the Better Land—the land from which there is no return, for it certainly never appeared again in his garden. To this honr no one but that planter knows that fourteen years ago ten acres of tea were for a single season red spider stricken in Kangra Valley, and that happily the pest failed to resurrect the following spring. Its exploration of Kangra involved it in the fate that awaits those who intend to explore Klondyke. And it is in the light of this illustration that we think Mr. Watt takes some of his pests and blights a little too seriously. Ignorance and idleness are far more dangerous foes to successful tea planting and the shareholders of tea companies than all the plant microbes Mr. Watt warns us against. With ignorance Mr. Watt seeks to battle in his first nine chapters, in which he discusses the treatment and cultivation of the tea bush. His very pertinent remarks on the selection and improvement of tea seed may be cordially commended to

* *The Pests and Blights of the Tea Plant, being a report of investigations conducted in Assam, and to some extent also in Kangra.* By George Watt, M.B., C.M., F.L.S., C.I.E., Reporter on Economic Products to the Government of India.

Calcutta agents and merchants, who sell the expensive article, in the hope that their consciences may be pricked. The chapters on pruning and picking tea bushes are full of theoretical wisdom, and will suggest practical experiments that may lead to valuable results. But it must always be born in mind that nature is over fond of sports and eccentricities. Every one who has daily and carefully made a study of the gradual development of a first flush on a pruned tea bush, will have been startled scores of times by seeing buds coming away from spots where theory and Mr. Watt's diagrams ignore them. Incidentally we may say that we totally disagree with Mr. Watt's dictum that a *bani* bush (*i.e.*, one whose tea shoots have prematurely opened out and ceased growing) should not be plucked. He attributes *bani* "to the want of energy in the entire plant," and prescribes rest. In our experience it is more often due to bad pruning, drought, wind, cold, and even excessive rainfall without compensating sunshine, than to want of stamina in the bush. In such cases it is of absolute and vital importance to pluck *bani* leaf; for it is an indisputable fact that an unplucked *bani* bush will be sulking in idleness, when its picked neighbour alongside is in the full fig of a new flush. Similarly we do not agree with Dr. Watt that continued cropping must necessarily exhaust and wear out a bush. We know of plantations forty years old and more, that are yielding larger and better crops to-day than ever they did before. This is due to improved cultivation, and better, though more frequent plucking. The older the bush the larger the root, and it is root power that gives leaf. If due provision is made to obtain a healthy leaf-bearing surface, and sufficient stimulant allowed in the shape of high cultivation, we would infinitely rather own a plantation of sixty year old bushes, than one of six year old bushes.

There are several other points we had marked for criticism from the practical point of view, but they are too technical to be treated with any chance of interesting. But we may briefly state that although Mr. Watt considers "the presence of old wood in the stem (of a tea bush) must be injurious to the planter's aims and object," the practical planter, who seeks to turn out a good liquoring tea, knows for a certainty that to do so *plenty*, of old wood in the body of the bush is essential. And finally, we cannot agree with Dr. Watt that the *sau* tree (*Allizzia Stipulata*) is always beneficial to tea. In Kangra at this moment there are many patches of bushes growing under *sau* trees which in this season of drought have actually not flushed at all, whilst outside the limit of the malign influence the surrounding plants have yielded their ordinary crop.

As a book of scientific research and theoretical teaching Mr. Watt's work is quite the best at the disposal of the tea industry. We should be sorry not to see a copy on every planter's book-shelf: but we should be more sorry if the planter had not some sound practical experience of his own, by the light of which to study it.

INDIAN TEA FOR PERSIA, ARABIA, TURKEY AND EGYPT,

INTERESTING CORRESPONDENCE.

Messrs. W. S. Cresswell & Co., the well-known Tea Brokers of 10, Hare Street, Calcutta, have sent us the following very interesting correspondence:—

Dear Sir,—In December last, we wrote to the British Consuls in Persia, Arabia, Turkey and Egypt, to enquire into the state of the tea trade there, thinking that the replies would be interesting to merchants and planters in this country. We enclose what replies we have received, which will show you that there is still room for furthering the consumption of Indian teas outside Europe, 42 per cent. of the teas sold in Calcutta, are taken for ports outside Great Britain. Only 6½ per cent. of the Indian teas sold in Mincing Lane are taken for outside markets. With another

200,000 chests sold in Calcutta, the outside markets would develop considerably more than hitherto, and instead of only 42 per cent. being taken, the consumption would be nearer 60 per cent. and the London market greatly eased by the supply being brought nearer the demand, unless something be done to regulate these supplies, we shall soon go back to the old fancy price of 4½d. for common kinds. The position at present is a very strong one, *why not make an effort to keep it so?*

BRITISH CONSULATE, BAGDAD, TURKEY; 23rd January 1899. No. 13.

To Messrs. W. S. CRESSWELL & Co., 10, Hare Street, Calcutta.

GENTLEMEN.—I have the honour to acknowledge receipt of your letter, dated the 5th December 1898, in which you make certain enquiries regarding the tea trade in this country. I enclose a memorandum, which contains the several questions in your letter under reply and the answers thereto.

With reference to the remark in your letter that all teas sold in the Calcutta market are absolutely free from any impurities, it seems probable that the native merchants who buy the tea in Calcutta or Bombay adulterate it before export so as to be able to lay it down in Bagdad at a low cost.—I have the honour to be, Gentlemen, Your most obedient servant (Sd.) P.J. Melvill, Major, Acting British Consul-General, Bagdad.

MEMORANDUM.

Question.—Is it possible to find out how much tea passes through Turkish Arabia, and to what destination and whether it be China or Indian or both?

Answer.—It is impossible to obtain entirely reliable figures, but it may be said that the average quantity passing annually through the Bagdad Custom House during the past three or four years has been nearly 5,000 cases of, say, 100 lb. each, say, 500,000 lb. Some 80 to 90 per cent. of this tea goes to supply the markets of North-West Persia. The great bulk of the tea imported is Indian and is known in the trade as "Calcutta" tea; only a small quantity (perhaps 5 per cent.) comes from Chiuva and Java.

Question.—Do the people of Turkish Arabia drink much tea, if any, and what do they have to pay per lb. for it?

Answer.—The people of Turkish Arabia generally are not tea drinkers. This is clearly shown by the fact that, of an annual import of some 5,000 cases, about 750 cases are sufficient to supply the wants of Turkish Arabia, of which Bagdad is the emporium. The present wholesale price of the description of "Calcutta" tea most freely sold in Bagdad is about Grand Seigneur Piastres 11½ per Constantinople oke (2·83lb.) equal at exchange of G. S. Piastres 115 per pound sterling on London to about 8½ per lb. *Question.*—Could you procure a sample of tea selling in your city, also letting me know how it is packed, size of boxes, etc.?

Answer.—A small sample of the "Calcutta" tea selling about G. S. Piastres 11½ is enclosed. The tea is usually packed in cases weighing 80lb. to 110lb. the net weight being marked on the case. The tea is enclosed in leaden wrappers in a wooden case with a covering of skins and gunny. It is sometimes also packed in a strong tin case with wooden boards at the ends, bound with two iron hoops. The tea in these cases is usually in bulk, but sometimes it is packed in 1lb. tin boxes bearing a label with an attractive design with usually the name of the native importer in Arabic or Persian.

Question.—Do you think there is room for further development in this particular trade? *Answer.*—The trade is at present worked very cheaply by native merchants having agents in India. It seems to be increasing, but there would appear to be no room for a sudden development in this particular trade. It is possible that, with the present low prices of Indian teas, there may be a gradual change in the habits of the people of Turkish Arabia, that is, they may, after a time, come to drink more tea and less coffee. At the same time lower prices nearly always mean larger consumption, and, and if the trade in Calcutta

can put a tea on the Bagdad market at a less price than that quoted, the trade will probably expand. The market here requires cheapness before quality.

Question.—Is there any import tax on tea? *Answer.*—On tea sold for consumption in Turkish Arabia the duty is 8 per cent *ad valorem*. If, however, it is sold for export direct into Persia, the duty is a transit one of 1 per cent. only. In the latter case, of course, the price paid here by merchants buying from the importers for the Persian market is proportionately less—*e. g.*, as against piastres 11½, quoted above the quotations, if selling for Persia, would be about piastres 10½ (Sd.) P. J. Malvill, Major, *Acting British Consul-General, Bagdad.*

BRITISH CONSULATE, SMYRNA, TURKEY; 14th January, 1899.

To MESSRS. W. S. CRESSWELL & Co. 10, HARE STREET, Calcutta.

SIRS,—In reply to the queries contained in your letter of the 6th ultimo, I have to state as follows:—

1. In 1897 about 168,500lb. of tea were imported at Smyrna, estimated value about £10,900, for local consumption. It was chiefly blended tea, *i. e.*, China and Indian teas mixed.

2. Natives of this country do not drink much tea, coffee being the beverage consumed instead. *The demand for tea is, however, increasing every year.* Price paid is from 2s. 6d. to 3s. (retail per lb.)

3. One solitary sample is not likely to prove of much use, but can be procured and sent if really desired and freight prepaid.

The article sold here is packed in chests tin foil of 56lb. or in tin boxes of kilo 1 kilo = 2.20lb., and its fractions ½, ¼ and ⅓. These last are imported by the French Colonial Company.

4. There is decidedly room for a further development in this trade.

5. The import duty on tea is 8 per cent. *ad valorem*.

6. I think it would be unadvisable to attempt too large a business at first as the country is not a rich one, and, as stated above, the national taste is on the side of coffee, which is consumed in great quantities.—I remain, Sir, Your obedient servant, (Sd.) H. A. CUMBERBATCH, *Consul.*

BRITISH CONSULATE, TRIPOLI, NORTH AFRICA; 15th January, 1899.

DEAR SIR,—In reply to your enquiry, dated the 6th ultimo, addressed to Tripoli, Arabia, I beg to inform you that the import of tea averages between £4,000 and £5,000 a year, the bulk of which is purchased here for export to the Soudan by the trade caravans proceeding south to Wadai, Kano, Sokoto, etc.

The qualities are as follows:—

Son Mec	... ½ chests	0 3 10 at France	210 per kilo.
Ditto	1 90 "
Young Hyson...	1 70 "
Ditto	2 0 "

Small quantity of Indian tea in chests of 10 4 at 1s. 4d. to 2s. per lb. (all sales at 4 months date.)

Packing.—Light wooden cases, lined with leadfoil, matting and canvas covering. The caravan trade being on the decline, I do not think there is room for further development. The local consumption is small; the import duty is 8 per cent. *ad valorem*.—Yours faithfully, (Sd.) T. S. JAGO, *Consul General.*

BRITISH CONSULATE, SALONICA, TURKEY; 16th January, 1899.

To MESSRS. W. S. CRESSWELL, & Co., Calcutta.

GENTLEMEN,—In reply to your letter of 5th December last relative to the importation of tea in this province, I am instructed by Her Majesty's Consul General to communicate to you the following information supplied to him by a firm of merchants here.

The importation of tea, mainly of Indian origin, amounts to 200 or 300 original cases in the season. The greater part of this is for consumption here and some for other parts of the province.

The use of tea is not general among the population, but appears to be extending with fair rapidity.

I send you separately four samples of the qualities known here.

Tea is always packed in the original cases.

The import duty is 8 per cent, as on all goods admitted into Turkey, and the price is from 2s. 3d. to 2s. 10d. per lb. according to quality.

Should you wish for any further information I should recommend you to apply to the merchants referred to above, Messrs. Jenny and Vock, a Swiss firm of Commission Agents occupying a good position here, who have expressed their willingness to enter into communication with you.—I am, Gentlemen, Your obedient servant, (Sd.) W. J. HEATHCOTE, *Consular Assistant.*

USCUB; TURKEY IN EUROPE; 22nd January, 1899. To W. T. CARTER, Esq.

DEAR SIR,—I received your letter of 7th December last (as also the one addressed to Monastir, I being in charge of both districts), and I have made some inquiries as to the consumption of tea here.

The annual consumption in this Vilayet (Kosova) is about 1,500 okes (an oke is 2 1-5b.)

Except for a small quantity of Russian tea, nearly all the tea consumed comes from Asia Minor. It arrives at Constantinople or Salonica in cases of 50 kilogrammes each. In those towns it is repacked in tins of 1 oke, ½ oke and ¼ oke sent to USCUB.

The price at Constantinople or Salonica of the tea in general consumption here is 30 piastres the oke (110 piastres = 1st. 1) and it sold here at 50 piastres the oke.

The Russian tea is sold in packets of 100 grammes at 5 piastres the packet.

I should say that probably the tea consumed here and said to be from Asia Minor is the same as you speak of as sold to Persian Gulf or Trebizonde merchants.

Hoping that this information may be of use to you.—I am, Sir, Yours faithfully, (Sd.) CHARLES S. SAMPSON. *H.M. Vice-Consul.*

H.B.M. VICE-CONSULATE, VAN, TURKEY-IN-ASIA; 22nd January, 1899.

SIR,—In reply to your letter of inquiry regarding the sale of tea in province, I beg to inform you that all tea imported here comes from Constantinople merchants.

It is said that these merchants import in large cases from India, but the tea is remixed and packed at Constantinople before forwarding into the interior.

It is packed in small fancy tin boxes containing from 25 dirhems to 3 okes each box. 400 (dirhems = 1 oke = 2½lb.)

One of the small boxes is forwarded as a sample. Inferior teas are in small canisters 4 to 6 inches high. Occasionally rectangular tin boxes 13 by 9 by 10 inches are used.

It must be remembered that all goods to this province must come by pack transport chiefly from Trebizonde, sometimes from Alexandria. It might be possible, however, to open a more direct trade with Van through Bagdad and Mosul; the caravan distance from Bagdad and Constantinople is about the same.

Since ten years ago people, both rich and poor have begun to drink more tea, and until three years ago the trade was increasing. The disturbances three years ago have much impoverished the country and there is no money to buy much besides bread and the absolute necessities of life. This year there are fears of a partial famine. The import last year to Van was 3,000 okes or 8,250 lb.

The present political situation is by no means clear, and there is no room at present for any further development of the trade.

The import duties are all paid in Constantinople. There are none here.

There are three kinds of tea imported here.—

(1) 80 piastres an oke	... 6 shillings a lb.
(2) 40 "	... 3 " "
(3) 20 "	... 1s. 6d. "

Samples of each are enclosed in the sample box.

As far as I can judge, all these have but a very remote connection with the actual tea plant.

Tea is not usually sold by the oke, but in the fancy boxes such as the one I send, which, filled with the second quality, is sold for 12 piastres or 2s. 6d.

A canister 2½ feet diameter and 3½ feet high full

of the worst quality is sold for 3½ piastres or 8½d.

A canister 4 feet high and diameter of second quality is sold for 5 piastres or 1s. ¾d.

If the condition of the country should improve I should think there would be a good demand for tea here.

The bagdad, Mosul-Van route would be the best, as the middlemen in Constantinople would be saved.

A central agency at Bagdad with sub-agents at Mosul, Bitlis-Van and Diarbekr ought to do a good trade in cheap tea of a good quality.

The people are not at all satisfied with the stuff represented in the present samples—I am, Yours, faithfully,
(Sd) F. R. MAUNSELL, Capt. R.A., H.B.M., Vice-Consul.

BEIRUT, TURKEY, 25th January, 1899.

SIR,—I am directed by H.B.M.'s Consul-General to reply to your questions regarding tea in your letter of the 7th ultimo.

6,000 okes—15,000 chests tea passes annually through Beirut. Destination—Beirut, Damascus, Jaffna, and Jerusalem receive an equal quantity.

Tea is not a national beverage, foreign residents consume the most. The quantity imported is drunk.

Indian teas, price 7d. to 9d per lb. China teas, 4 to 7 per 3lb. packets. China teas packed in 10 or 20lb. chests. Indian teas in 20 to 80lb. chests. The import duty is 8 per cent *ad valorem*.

There is little chance of developing the Trade—I remain, Yours very faithfully, (Sd.) J. E. Crow.
BRITISH CONSULATE, ANGORA, TURKEY, 27th January 1899.

DEAR SIR,—The following few particulars which in accordance with the request contained in your letter of the 5th ultimo, I have obtained respecting the consumption, etc., of tea in the town of Angora and immediate district are, I trust, what you require, I should, however, state by way of preliminary that as no official statistics whatever are procurable, the estimate given of the amount consumed must be regarded as at best approximate only.

The answers to your questions are as follows:—

1. No tea passes through the province of Angora, such as is imported being used in the district itself. The tea, I am informed, is of Chinese origin and comes through Russia to Constantinople, from which town it imported here by rail directly.

2. The annual consumption of tea in Angora and district is estimated to amount to 2,500 okes (the oke being taken at 3½lb.) of a value of some £500, which would give an average price of 4s. an oke or about 1s. 5d. per lb.

As you will see by the above figures, Angora can hardly be said to contain a tea-drinking population. Nevertheless I am told that during the last three or four years there have been signs that the article has been gradually gaining ground, and that the families who formerly drank nothing but coffee are now replacing it by tea. The same, though to a less degree, may be said of the Turkish peasants among whom the custom has been introduced by immigrant Circassians from the Caucasus.

3. I enclose four samples of the tea sold at Angora with price per oke of 2½lb. attached, and I would ask you to note that the sale of the quality marked No. 3 at 3s. 6d per oke, or about 1s. 3d. per lb., amounts to 90 per cent. of the total consumption.

As to the method of packing, etc., I am informed that the tea is forwarded to the export houses at Constantinople in wooden chests contain from thirty to thirty-five okes (82-95lb.) each. From Constantinople it is sent to the dealers here either in these same boxes or in tins containing from ½lb. to 6lb. each, according as the order may have been, wholesale or retail. I enclose mark on the chests which contain quality No. 3 at 3s. 6d. per oke. I may add that the wholesale buyers at Angora are allowed 91 days for payment by Constantinople firms, the Turkish lira, moreover, being accepted at 112 piastres, whereas it is taken in the market at only 108 piastres.

3. The import duty on goods entering the Ottoman Empire is 8 per cent, *ad valorem*. There is no octroi at Angora.

4. With regard to your question whether there is room for further development in this particular trade, I can only say that while, as already stated, there has been an increase during the past few years in the consumption of tea, this increase has only been very gradual and is likely to continue to be such for some time. In other words, British teas if introduced would have to compete with the Chinese article for a share of the rather modest annual consumption now existing, and what chances of success they might have I can of course offer no opinion, as it would depend on the taste of the consumer. In any case I am informed that the article introduced should be of the same quality or a little superior to the sample which I have numbered 3 and of a slightly lower price, say, 1s. 1d. per lb.

As regards method of doing business, I do not see how the present system, *viz.*, of obtaining the article through the large import houses of Constantinople, could be changed, for even if a dealer here were to attempt to enter into direct relations with, say, an Indian firm, he would have to employ a commission agent at Constantinople to clear the customs for him and forward the goods on. I can of course supply you with names of Angora grocers (there are no exclusive tea dealers) if desired, but it would appear to me that the better course under present conditions would be to apply to some old established firm English for preference, at Constantinople who would undertake to push the sale through agents here and who would be in a better position than I am to say what the chances of a sale might be.

I should add that the figures which I have given above only apply to Angora and immediate district. There are two other centres and the province, *viz.*, Caesarea and Yuzgat, at which the estimate annual consumption amounts to some £500, respectively.

The port through which Caesarea obtains its tea is, I am told, Mersina in the Mediterranean; that for Yuzgat Samsoun on the Black Sea. If desired I will endeavour to obtain samples of the teas used at these two places with prices and particulars attached as in samples endorsed in present letter.

I am, dear Sir, Yours very faithfully, (Sd.) H. S. SHIPLEY.

H.B.M. CONSULATE, DAMASCUS, TURKEY, 30th January, 1899.

GENTLEMEN,—With reference to your letter of the 7th ultimo asking me to give you information about the consumption of British-grown tea in this province I have to inform you that about 100 boxes of Indian tea are consumed yearly in Damascus and district, each box containing from 100lb. to 132lb. Of China tea the yearly consumption is so small that it is hardly worth mentioning, perhaps 2 or 3 boxes similar in size to those in which Indian tea is imported.

The habit of tea drinking is undoubtedly growing in this city and the few towns which are comprised within the limits of the province, but as the greater part of it (the province) is inhabited by Bedouins, Drnses, Circassians, and other wild and semi-civilized races to the great majority of whom tea is a novelty as well as a luxury, its consumption is necessarily very restricted.

I am forwarding to you by this post four different samples of tea, being the kinds for which there is most demand here, of which the prices (wholesale) range as you will see from 9d. to 1s. 1½d. per pound. The wholesale price of China tea, on the other hand, ranges from 1s. to 4s. the pound.

As regards packing, I am given to understand that the boxes, which, as stated above contain from 110 to 132lb., are tin lined.

The import duty on tea, as on all other articles imported into the Ottoman Empire, is 8 per cent, *ad valorem*.

The further development of the trade is not likely, considering the rough and uncivilized character of the majority of the inhabitants, to be either rapid or extensive. On the other hand, it is undeniable that such consumption of tea as exists has made very rapid strides in the towns of late years.

Moreover, thanks to British enterprise and capital, a Railway is now in the course of construction which will connect St. Jean d' Arc, Haifa and Damascus, and so tap a considerable tract of country which no railway has hitherto reached, so that the demand for luxuries, such as tea so considered in this country, will undoubtedly increase in the future. On the other hand, it should be remembered that coffee, though dearer than tea is the beverage of the country, while the latter is not. And even those who are most accustomed to the drinking of tea only indulge in the habit during the winter or cold months all through the summer and the autumn they drink coffee as being, so it is held less heating. Nevertheless the habit of tea drinking is certainly growing though chiefly confined at present to the towns. I am, gentlemen, Yours faithfully, (Sd.) W. S. RICHARD, H. M. Consul.

CAESAREA, TURKEY; 31st January, 1899.

MESSERS. W. S. CRESSWELL & Co., Calcutta.

DEAR SIR,—I do desire to make a work on tea now I will give information on this work.

In our province the merchants sell much tea by boxes or by pounds, but now usually by pounds. Our province people can pay for a pound, viz., four hundred drams, for a good one from fifteen to sixteen piastres.

In Turkey there is import tax on tea, the merchandise which come from foreign countries import tax is 8 per cent.

If you make trade with us I hope that other merchants cannot sell as us. I hope you give answer to my letter. There is nothing to read for this time. Yours truly, (Sd.) Y. ZAMBAKJIAN BROTHERS.

My address is this:

Y. ZAMBAKJIAN BROS., (CAESAREA), KASIRI,
TURKEY, ASIA.

JERUSALEM, TURKEY, 11th February, 1899.

W. CARTER, ESQ., CALCUTTA, India.

DEAR SIR,—In reply to your letter of the 5th ultimo I beg to state that the tea imported into Palestine is for the most part of an inferior quality, and is consumed by the Jewish population and Russian pilgrims.

The consumption, however, of tea in this country is on the increase, the natives buying of late years taken to tea drinking, but as a rule they are indifferent to the quality. The price generally paid for the ordinary, kind is at the rate of 1s. to 1s. 3d. per pound retail sold in ½ lb. packets and it is a blend of China and Indian tea (sample No. 1.)

The Europeans and better class of the inhabitant, consume generally Ceylon tea or Orange Pekoe which are retailed at 1s. 6d., to 2s. 6d. per pound and is sold in bulk and in 1 lb. packets (sample No. 2.) I forward samples by post.—I am, dear Sir, Yours faithfully, (Sd.) JOHN DICKSON. H.M. Consul.

KHARPUT, TURKEY, 17th February, 1899.

MESSERS. W. S. CRESSWELL & Co., Calcutta.

GENTLEMEN,—In reply to your note of the 7th December last asking for information respecting the tea trade in this province I beg to forward the following particulars:—

The amount of tea used in the province during the year is about two thousand okes (the oke being nearly equal to 2½ lb., distributed as follows:—

Kharput and the neighbourhood	...	700okes.
Malatia district	700 "
Arabhia	500 "
Egin	100 "

As regards the country of origin of tea imported into this province, I am informed that about 75 per cent. is Chinese tea, the remaining 25 per cent. being Indian of better quality than the China tea and higher in price.

The quality of the tea used is for the most part very inferior, only about 10 per cent. being fairly good.

The import is obtained entirely from Constantinople, there being no direct trade with China or India.

At that port tea, like other imports from foreign countries, is subject to a duty of 8 per cent. and in addition to this an interprovincial duty of one per cent. is levied on its introduction into this province.

Owing to the defective condition of the means of communication in this part of the Empire the cost of transport is very heavy and trade is thus greatly hampered.

Under these circumstances, and in view of the poverty-stricken condition of the province, there is but little hope of any great expansion of the trade taking place at an early date.

The tea as it comes from Constantinople is packed in comparatively small tins holding only a few pounds each.

Prices vary twenty-eight piastres (=4s. 8d.) the oke to fifty piastres (=8s. 4d.)—I am, Gentlemen, Your most obedient humble servant, (Sd.) I. FRANCIS JONES. HER MAJESTY'S LEGATION, TEHERAN, PERSIA; 18th February 1899.

MESSERS. W. S. CRESSWELL & Co., 10, HARE STREET.
Calcutta.

SIR,—I have received your letter of the 2nd December 1898 regarding the prospect of the tea trade in Persia.

I am making enquiries at the various trade centres, and will inform you of the results. Owing to the extreme slowness of communication in this country, I fear it will be some months before I can send you full information; but you shall have it as soon as possible. The import tax on tea is 5 per cent *ad valorem*.—I am, Sir, Your obedient servant. (Sd.) H. M. DURAND.

BRITISH VICE-CONSULATE, MOHAMMERAH, PERSIA; 24th February 1899.

SIR,—In reply to your letter of 2nd December regarding the tea trade in this province, I have the honour to inform you that the import of tea is increasing and is likely to increase.

The tea is Indian, Ceylon, China and Japan and is shipped by British steamer from Bombay.

The imports for the past three years were as follows:—

Year.	Landed at Reshipped		Transhipped	
	Mohammerah	to Karun	India to Karun	Ports.
1896	Cwt. 191½	Cwt. 65	Cwt. 301	
1897	191	133½	240	
1898	388½	82½	797½	

The second column should be deducted from first to show local consumption.

The following varieties are sold in Mohammerah Bazar at retail price given.

[Exchange, Krans 35=Rs. 10.]

1. Java tea, 200 tins of about a pound, at Krans 150.
2. Calcutta tea, Krans 10 per 6lb.
3. Ceylon tea, Krans 11 per 6lb.
4. White China Tea (Pekoe), Krans 5 per lb.
5. Khaldar (Java Pekoe), Krans 14 per 5lb. tin, or Krans 30 per 1lb. tin.

Indian and Ceylon is either loose or in packets packed in cases of 100lb and 200lb. Paper packets generally bear a label in Persian giving the name of some Persian trader either in India or here.

Samples are enclosed of above.

Import dues of tea if owned by Europeans 5 per cent *ad valorem* once and for all.

Tea imported by Persians pay no customs at Mohammerah, but an octroi of Krs. 0.025 per lb. package, with other charges including literature coming to about seven krans per case. If re-shipped it pays customs on shipment and at other places in the interior.

Through native cargo pays customs at Shnshter Krans 12.75 per mule load of 2 large or 4 small cases, it is liable to further dues at other places beyond Shuster.

The British India and the Bombay and the Persia Steam Navigation Companies issue through Bombay B L from Bombay to Nasri and Shuster on the Karun.

A mule road from Nasri (Ahuaz) to Ispahan is now being constructed and will probably lead to further trade with the interior by the Karun route.—I have the honour to be, Sir, Your most obedient servant (Sd.) W. McDONALL, H. B. M. Vice-Consul, Mohammerah.

BRITISH CONSULATE, ISPAHAN, PERSIA, 26th February 1899.

DEAR SIR,—Your letter of 2nd December to Her Majesty's Representative, Yezd, has been forwarded to me here, the Yezd district being in my charge, I, however, have no agent at Yezd, and am not in correspondence with anyone there to whom I can apply for the necessary information.

I do not believe that there is much chance of increasing the tea trade of the place, it is entirely in the hands Parsi merchants, who have there agencies in Bombay, who work it, you may be sure, for all that it is worth. I see by referring to my report of 1896 No. 1662, Circular report, that during the year 1895-96 the importation was 2,800,000lb. whereas in 1891-92 6,000,000 (six millions) was the figure. The closing of the Russian markets in the north was the cause of this great decrease.

With regard to this market in

1892-93	4,844	Boxes were imported.
1894-95	4,479	do
1896-97	3,117	do
1897-98	6,314	do

The major portion of this tea is Indian, about 1-10 may be taken as China, that is, the tea which finds most favour with the Ulama. Small consignment also come from Java from time to time. The supplies which come here are for the local market and the surrounding districts. I cannot find that any goes north. There is not very much tea drunk the people are poor and cannot afford to expend much on what to them is luxury.

Indian tea costs from Krans 32 to 40 per manshah, China tea do do 70 to 110 do Krans 3-50=one rupee, 52 krans=£1 and 12-60 lb.=manshah.

China tea is packed in big boxes, each containing 4 small boxes weighing about 28 lb.

Indian tea is packed in boxes lead foil, each containing about 100lb. I have seen it also in 1 lb. packages. This came from Kangra Valley. Also I have seen it in wood boxes, each box containing four tins of 20lb. of tea. These have come from Calcutta

There is an import tax of 5 per cent. on all tea brought in by Europeans.

I do not think that there is room for any development of the trade. European merchants here, who have connection with India, have tried the market and have not found it responsive.

If I can give you any further information I shall be glad to do what is in my power.

I am, dear Sir, Yours faithfully, (Sd.) J. R. PREECE. HER MAJESTY CONSULATE ERZEROU, TURKEY, 4th March 1899.

DEAR SIR,—Tea can be sold here for about £5,000 to 6,000 stag. per yard in Erzeroum only. But as there is ground to sell also tea for the north of Persia, for this year tea will be consumed for £10,000.

Either for our city or for Persia Indian teas are used; but a little quantity of China white tea.

The people of our province drink much tea, and from year to year the consumption is growing.

Per this mail I send you ten samples of tea in fine packages to show you the qualities which are sold in our country. No cheap teas are wanted, especially for Russian buyers, for Tabriz, too. Only small quantity of better qualities is wanted for Erzeroum and for Tabriz, this at 10-10½d. per lb. in Calcutta. Per the next mail I will send you samples of those nice teas, too.

Note that all the teas for this country must be flowery (fair appearance.) Black teas are never wanted here.

Tea is coming us per chest of 1001-10lb., but the qualities up to 6d. per half-chest of about 50lb., net. Chests must be strong and wrapped by strong

Hessian cloth, and all round chest iron rings. Boxes of 10lb., 20lb., 30lb. net flowery are selling also in large quantity.

By experience I know that there is room for further development in this particular trade.

As for all goods the tax on it is 8 per cent., which I pay at Trebizonde. But if transit for Persia no tax to pay in Turkey.

All the teas shipped from Calcutta to Trebizonde are 90 per cent. for Erzeroum trade. But the Persian FUTH ship also for Trebizonde about 10,000 to 12,000 chests, half-chests (from Calcutta) all for Tabriz (Persia, this year. Except FUTH the remainder are for our city. Trebizonde is not but a simple port for tea.

I tested always that the weights of London are exceeding in lbs. For instance a chest of tea sent us from London for 100lb. was weighing here 101-102 lb. net. But Calcutta weights besides are not exceeding in their weights have represented a deficit of 1-2lb. per each chest.

Sugar bags—28 x 48=2½lb. red or blue border—are selling in large quantity in this country.

As Indian teas are of British growth, I will try to sell teas hereafter on a large scale, having already developed business in the north of Persia because Persians like very much Indian teas with long but nice leaves and flowery.—I remain, dear Sir, Yours faithfully, (Sd.) P. H. H. MASSAY, Lieutenant-Colonel, P. S.—Herewith list showing the prices of samples.

I will point out to you that sometimes it happens that we receive from Calcutta a nice sample of 20½ chests shipped for us. When the goods arrive I find that 10-12 half-chests are the same as the sample but the remaining eight half-chests are of ordinary quality and not the same.

ERZEROUM *tc*, 4th February.
Calcutta price, Erzeroum selling prices.

F.P. No.	162-174	Chs.	d.	P.	per ocg.
c		3½	4¼		22½—13½
" "	199-205	7	4		9¼

E. P. C. Ceylon tea	7½	"	35 Cts.		12½-13½

An Ocg. is equal to 2½lb.

Trebizonde expedite has to receive one shilling of commission for each chest.

Tax 8 per cent. on the price fixed in Trebizonde Custom House.

Carriage from Trebizonde to Erzeroum about 2d. per ocg. per the back of horses or per oxen-carts. 18s. 2d. make 100 gold Piastres.

From Trebizonde to Tabriz tea is going per caravans of camels. They pay for carriage about 2½ piastres (about 5½d.) from Trebizonde to Tabriz for each ocg.

In Persia the tax on tea is about 5 per cent.

THE EUCALYPTUS IN BRITAIN.

It seems to me pertinent to enquire—is there any future for Eucalypti in England at all, and will they do good there? I have known persons who would emulate the credulity of the monks in the virtues which they attribute to these strange Australian trees. A broken Eucalyptus-bough or a few leaves were in their opinion sure to be a defence against influenza and other things—but all this for the most part beside the mark. In England, as elsewhere, they might be very serviceable for drainage purposes if only they would live, but that seems problematical in the highest degree, and for nothing else is it worth while to take much trouble about them. In your impression of December 3, I remem-

ber reading the following passage: "Eucalyptus Globulus.—I quite agree with 'J. H. D.' in his remarks as to the rarity or difficulty of growing this plant; here, we have plants 16 or 18 feet high that have withstood five winters without the slightest, protection, &c. In my opinion the principal cause of failure to grow is planting them too soon, &c." The writer, who is evidently alive to the difficulty that surrounds the whole matter, is full of hope that it may be somehow overcome. I am sure, I do not wish to daunt him in any degree, but with regard to E. Globulus I am persuaded that it has not a constitution which is sufficiently hardy for England. It is a great favourite wherever it gets on well because it makes a great show so quickly, and my friend the Trappist monk calls it A1, because it gives him no trouble at all; but that is a different thing from the way in which Cavaliere Palice speaks about the same matter. He does not say that Eucalyptus Globulus can be trusted in all places and positions, but he maintains exactly the reverse, and he puts E. resinifera at the head of the whole of them, because it is more reliable than the rest. And this, so far E. Globulus is concerned, I have seen over and over again in the Isle of Wight. It goes on well, say, for seven or eight years or more, and then a more than usually hard frost comes, and ever tree is destroyed.

I remember twenty (or twenty-five years ago receiving a letter from a friend who had a fine place at Westridge, near Ryde, and his asking me to go to him at once. He certainly was not addicted to botany or to the cultivation of trees and plants at all, but, somehow, E. Globulus had found its way into his garden, and had attained to a great size; he was very proud of his tree, but he could not make out the buds, and one spring very unexpectedly, and very suddenly, so far as the owner was concerned, it broke out into blossom, and was a pretty sight to see. I really do not know what this gentleman imagined had taken place. The knob-like buds he had esteemed to be seed-vessels, so far as he had thought about them at all, and the difficulty in his mind was, what then had succeeded them? and he was very slow to believe that his Eucalyptus was blossoming. But that tree gave rise to many false hopes in the Isle of Wight. If E. Globulus could behave like this, and grow so tall, and blossom so luxuriantly, what more could be required? It would certainly take to the Isle of Wight, and the Isle of Wight might have a new possession of great value about which no doubt need be entertained. But what really took place? E. Globulus was planted in fairly large quantity in and about Ryde, and everything went on swimmingly for a series of years. Near Trinity Church in Ryde there were some very large specimens indeed, there were one or two in St. John's Park, the same (I think) in the grounds of Isle of Wight College, certainly one or two in my own garden, and nobody dreamt of any ill coming to them; all boded so well. But the frost of 1881 made short work of the hole lot, and for sometime there was not a Eucalyptus in the place that was worth speaking of. Now they are coming up again in some plantations and gardens, and they look very promising, but the promise will only last till the mercury in the thermometer goes below a certain point, and the whole thing will be over. This sort of occurrence is by no means peculiar to the neighbourhood where I live. I asked a lady who is a visitor to Rome this winter, and who lives at Falmouth, how it fared with her about this matter, and her answer was, they get on well for five or six years, and then a hard forest come and every Eucalyptus is killed. I have even heard of a fine tree at Bournemouth, which stood the climate there for seventeen years, and at last was cut off. They may do permanently in other places about which I know nothing at all, but the Scilly Isles give the only exception I can think of to a universal rule. [Fota, Mr. Smith-Barry's place near Cork.—Ed.] I may, however, say, that I know nothing about the west coast of Scotland, and how they fare there.

The question, therefore, about them is this. Is any one species so much more hardy and so much more slow-growing than the others as to afford solid ground for hope?

I remember myself hearing some time ago of two names of Eucalypti. I think they were E. Gunni, E. coccifera and another, and these were said to promise quite well for the future in point of hardiness, but I do not know how the promise was fulfilled—it can do no harm if a third one be added to the list—it may prove a failure, like so many others; but E. resinifera has a very good character here, which should not be overlooked.

I would only just add, that I have brought a good supply of seed of E. resinifera from the Trappist Monastery, and I shall not myself want a tithe of it. I will readily send some of it to any one who applies for it to me on my return home to St. John's Ryde, which will be, so far as I can tell at present in the month of April next. H. Eobank (*Rev.*) *Rome, Christmas Eve, 1898.* [E. resinifera was figured in our columns, with a descriptive article from the late Dr. George Bennett. See *Gardeners' Chronicle*, August 3, 1872, p. 101. E. coccifera, at powderham Castle, Devon, has often been figured in our columns. See February 7, 1891. We should be pleased to hear the present height of that specimen. The tree a Kew which gets hurt by frost is E. Gunni. E. urnigera is the tree grown at Whittingham, East Lothian. See *Gardeners' Chronicle*, June 30, 1888. We may also refer to an article on February 7, 1891 as containing a summary of our knowledge of these plants, as grown in the open air in this country, Ed.]—*Gardeners' Chronicle.*

THE TEA CAMPAIGN.—The *Madras Mail* has some pungent remarks to make in criticism of a local paper thus:—India to act for herself. Now, if Ceylon has had less advantage than India out of co-operation up to the present time, why should she wish to continue a system that is unfavourable to herself; if more, then why should India take the bait that is put before her? As for the "futility" of South India acting independently, we can only say that, in our opinion, a scheme might easily be drawn up that would be within South India's means, and that would give a better return in proportion to the money laid out than the past efforts of either the Planters' Association of Ceylon or the Indian Tea Association have done. This is a bold assertion, perhaps, but, at least, the above efforts have done little for this part of India. The idea that Ceylon and Indian teas can be grouped together, and offered as if they constituted but one series of qualities, appears to us to be fallacious. There is as wide variety between some Ceylons and other Indians as between any Ceylon or Indian and any China teas. South Indian teas are, generally speaking, totally distinct from Assams or Darjeelings, at any rate from the higher grades. Such South Indian teas, as have been offered in the London market lately have been described as "useful sorts." That is what is wanted all the world over, and if South India makes it known in other markets than London that she has *useful sorts* to offer, she will reap the benefit of increased competition among buyers. Whatever our Colombo contemporary may say, we see no reason why India should make terms with Ceylon in respect to tea campaigns in America or elsewhere; and we specially deprecate the idea of South India placing herself in the position of the little streetboy, who steals a free ride at the back of a passing cab. She should push her on wares, not hang on to Ceylon or India's coat-tails.—As for the "Times of Ceylon" remark about "political feeling in Russia against India," our contemporary has so completely misunderstood our reference to political considerations as to try to put the boot on the wrong foot! If our contemporary will but consider that there is no Consular representative of Russia in India, and if he will try to ascertain or to guess the reason, he may possibly comprehend our statement that "political reasons obstruct progress" in regard to a direct line of steamers from Calcutta to Odessa, in rivalry with that which carries cargo from Colombo to Odessa,

FACILITIES FOR MAKING GOOD TEA:—VI.

It is perhaps, a good sign that even the new districts declare that better tea might be made with better soil; for although the declaration may be regarded as a confession of universal poverty of soil, we prefer to look on it as a recognition of the truth, too often forgotten, or ignored, that the soil requires to be liberally treated if it is to yield of its best. What if our soil as a whole is poor? It has yet shown its suitability for the profitable cultivation of tea; and it is far better to know its deficiencies and to supply them, by the aid of agricultural chemistry, than to live in a fool's paradise, or deliberately to conceal facts in a way to imperil a great industry, while injuring individual interests permanently. It is in that view we welcome the declaration from Maskeliya that the "want of richness in the soil" is the great drawback to making better tea. The up-to-date planters of a progressive district are not the men to make a declaration like that, and then to fold their hands and expect the soil to improve under contemplation. No; it will be their endeavour to give the soil what it lacks. With the jät of the bushes "fairly good," they will not be discouraged by the knowledge that the soil is "rather inferior, generally speaking"; and we are not surprised at the conclusion that manuring should be resorted to, to keep the bushes in heart, and enable them to bear the constant plucking to which they are subjected all the year round, though doubt is expressed if direct profits are realizable through manuring "with present prices." But that was written early in October; and since then prices have advanced; while there is reason to hope, with the growing demand, especially outside the United Kingdom, for Ceylon tea, that prices will not run down again to the lowest point reached last year. The factories are, as a rule, well-provided with withering room, machinery and motive power; and that must be a great help in the endeavour to produce good tea; while, with the labour force ample, and pruning practised with the wisdom which avoids severity on the one hand, and postpones the use of the knife too long on the other, nearly all the facilities for making good tea are present. The prices which Bunyan and Ovoca estates fetched only a few days ago in the open London market, proclaims the high position which Maskeliya enjoys as a tea district, and only confirms the correctness of the reply to our circular which claims that the soil, despite its deficiencies and its appearance, grows tea well, though large yields and high quality cannot be expected in combination, and that the climate and the rainfall further contribute to the popularity of the district for residential and agricultural purposes.

In Bogawantalawa, among the drawbacks to making better tea, are mentioned coarse plucking, want of care in plucking, and deficient withering space. The jät of tea varies on different estates, but on the whole it is fairly good. The soil, too, similarly varies—estates which had grown coffee being more or less worn, while the soil on others is good. The district, we are surprised to learn, is a stranger to manuring—the cost of transport, we fancy, proving an obstacle; but

confidence is expressed that the application of manures would be of advantage. Withering space is declared to be decidedly deficient on some estates, and so with machinery; but most estates have sufficient motive power, except during a severe drought when water-power fails. Like almost every other district, Bogawantalawa has had labour enough, and more than enough, during the past year; but matters, we suspect, are different now. Severe pruning is held accountable for reduced prices, though the yield has been increased by severity; but in some cases fields have been spared a taste of the knife too long; and in such cases it is claimed that flavour has been maintained. Is it not the case that pruning too long neglected must be generally followed by severe handling? And does not the bush suffer from such treatment? It is no uncertain claim that is preferred on behalf of Bogawantalawa—that it is well adapted for tea; and, given good factory accommodation and other aids to manufacture, its teas should be as flavoured as those of any other district of a like elevation. False economy in plucking and in manufacture is held responsible for disappointing prices on some places.

NOTES FROM OUR LONDON LETTER.

LONDON, May 5, 1899.

The

KLANANG PRODUCE CO., LD.,

of which I sent a forecast last mail, issues its prospectus this week. The share capital is £20,000, divided into 20,000 one pound shares, and the present issue is £13,500, of which 7,500 fully paid-up shares will be issued to the vendor in satisfaction of the purchase price, and 7,800 shares at par are now offered for subscription payable 2/6 on application, 2/6 on allotment and the balance as required. Mr. F. H. Wiggin, of Ceylon and Woolstone, Cheltenham, is Chairman, and the three gentlemen mentioned last week, viz., Messrs. Ed. Walker, Jas. M. Caine and David K. Michie, of Ceylon, are directors; bankers, the National Bank of India; solicitors, Messrs. Murray, Hutchins, Stirling and Murray, 11, Birchin Lane, E.C.; Secretary, Mr. A. M. Currie; offices, 17, Philpott Lane, E.C. The Company is formed to take over, carry on and develop the Klanang and Beaumont estates in the Federated Malay States of Selangor. Klanang is planted with 206 acres of coconuts and Liberian coffee, five acres of cacao, 14 months old; four of coconuts alone, half being in bearing; and 4½ acres are to be planted with tea, for tea seed; while from 1,705 to 1,924½ acres remain at present, jungle reserve. On Beaumont there are 90 acres of Liberian coffee, two years old; 148 cleared and drained, but not yet planted, and 156½ to 394½ still in jungle. Coconuts grow well and are extremely productive in the Klanang district, and it is intended to pay special attention to that product, but coffee, rubber, ramie, etc., will all probably be included in the cultivation and development of the Company's estates. The two estates have been valued by Mr. E. V. Carey, who put the Klanang estate at 47,615 dollars, and the Beaumont property 11,008.50 dollars.

CEYLON TEA IN AMERICA.

REPORT FROM MR. R. E. PINEO.

It was neither my purpose nor intention, in a previous communication, to point out, or even suggest, improvements on past methods. My object was to awaken and concentrate interest in the arduous undertaking of making our tea better and more widely known to the general public of the United States.

The "Thirty Committee" has announced its purpose to continue the campaign in America, and has voted six thousand pounds for 1900, to further exploit and endeavour to gain greater recognition for our staple in the United States of America. It should be the study and aim of the "Thirty Committee" to solve this one knotty question, *i.e. how can the consumer be most quickly and effectually reached, and, when captured, permanently retained?* This query covers the whole ground, and embraces every feature connected with the crusade.

It now remains for me to make known how, in my opinion, the consumer is to be secured, and, of equal moment, thereafter held! This can only be accomplished by working *through* and *with* the retailer, who should be assisted, in every reasonable way, by the Commissioner. Help the retailer by advertising in the local papers and by demonstrations. The retailer will then have an incentive to doing good work, as he is the only proper medium between the wholesale dealer and the consumer, whose aid should be invoked.

Once you have succeeded with, and gained the energetic assistance of, the retailer, the result is certain to be satisfactory; the consumer will be secured, and the wholesale dealer will be forced to keep and provide the retailer with everything he wants.

The representative in America of the "Thirty Committee" should be constantly on the move and work systematically. For example, let him visit Boston and every town having a population of 10,000 and upwards in the New England States; then take up the Central, Western, Pacific, and Southern States in the order named.

In each city or town let him seek out a few of the most prominent, progressive retailers, obtain their co-operation, assist them in locally advertising, and show them how best they can make attractive, and popular demonstrations.

SPECIAL, LOCAL ADVERTISING.—The representative should seek and act upon the advice of the retailer, and select such mediums as he—the retailer—may recommend. In some localities, more especially where the town may be the centre of a large agricultural district, the local weekly should be availed of, as every agriculturist uses tea, and reads everything—including advertisements—that appears in his weekly newspaper.

GENERAL ADVERTISING.—Monthly magazines that are read by the masses like "Munsey's" and the "Cosmopolitan," can be occasionally, used to great advantage, and there are also a few of the weekly papers that could be profitably utilised.

DEMONSTRATIONS.—One of the most successful and permanently profitable entertainments given by me was in connection with a bazaar held in aid of a large hospital, by the society ladies of Brooklyn, and what made it attractive and remembered, was the fact that about a dozen of the handsomest young women, daughters of society leaders, appeared in Tamil costume and served tea. The Bazaar was a huge financial success, and

the costumes and tea formed the subject of many a chat long after the whole thing was closed.

Now the representative should be furnished with at least a dozen washable, rich Tamil costumes, including a goodly show of native jewellery—and when making demonstrations in a shop, should engage a couple of handsome coloured women to appear in this costume and serve visitors with tea. This would prove a drawing card, and, in the smaller cities, a powerful attraction. Where it was found a Church festival or a bazaar was in progress, the feature that made the Brooklyn affair so telling, might be introduced. It may be thought that anything done, as herein mentioned, would be a slow, tedious operation, and take too long a time; but I maintain that it is the only method that will give lasting results at a minimum cost, seeing that the wholesale dealer cannot be relied upon to create a demand for an article that is not called for by the retailers, hence the latter's support must, in the first instance, be secured and his efforts assisted and fostered. The retailer is, therefore, the *one* person whose goodwill and aid should be sought, husbanded and promoted. Let the retailer work energetically, hopefully and successfully, and you have made a friend and coadjutor of the wholesale dealer or jobber. The method herein outlined may appear to some silly, childish and imperfect, and unworthy of consideration, but—frequently—simple, direct methods lead to the greatest successes.

Later on I may, perhaps, refer to Canada and Russia.

R. E. PINEO.

MINOR PRODUCT REPORT.

CRISTON SEEDS.—Offered 69 packages. Sold 0. All the offerings at the drug auctions today were bought in at from 50s to 70s.

CITRONELLE OIL.—Very quiet privately and quoted at the same figures. For today's auctions 2 drums were catalogued, but had been sold when reached.—*B. & C. Druggist*, April 28.

CINCHONA.—At the London auctions on Tuesday only odd lots of low percentage bark found buyers at a decline of about 25 per cent to 30 per cent on last sales' rate, the unit value being 1½d per lb, against 2½d at the previous sale.

CEYLON—Fiederiana, original stem chips. 8½d; poor red original chips 2½d and 3½d per lb for fair.

The bark sold to manufacturers on Tuesday represents 60,000 oz. or thereby of quinine sulphate. They were low quality barks. It will be noted that the firms who generally buy most largely were on this occasion small buyers, because they declined to pay the prices asked by the sellers for the higher quality barks. The sales scarcely form a criterion for the quinine speculator, and these matters must wait next week's auctions at Amsterdam. There the total quantity of quinine sulphate in the bark to be offered equals 19,450 kilos (680,750 cwt). The manufacturing bark contains an average yield of 5.52 per cent, against 5.26 per cent in March, and 5.21 per cent for the ten auctions of 1893. How the sales will go is a knotty problem. The Java shipments last week were nil (so it is said). Meanwhile the arrivals in Amsterdam are large, no fewer than 1,410 packages having arrived by one vessel this week.

LEMON OIL.—There has been a large amount of business done during the past ten days, and as large orders are available, holders are this week slightly easier at 3s to 3s 9d, c.i.f., according to quality and brand.

QUININE.—The course of this article has again been downward, and fruitless attempts were made by speculations to bolster up the market on Friday and Saturday last, but on Monday the improvement was lost, small sales being made for August delivery at 1s 4d, and there were buyers for May delivery

at 1s 3½d per oz. On Tuesday, in consequence of the disappointing bark sales, the market remained inactive, with sellers at 1s 4d and buyers at 1s 3d for August delivery. Wednesday brought a further decline; a sale of 8,000 oz. of Zimmer's brand at 1s 1½d per oz. actually took place, and the two leading German brands, which have been the subject of so much speculation, dropped to 1s 2½d spot and 1s 3d August, but we heard of no sales at these figures, and by the afternoon prices had recovered by ¼d there being no eager sellers. Today the market again is quiet.

SPICES have continued very dull all the week, and at the public sales on Wednesday there was little disposition to purchase. Zanzibar cloves steady, but quiet, at 3½d per lb for delivery. There were none offered at auction, but some good Ceylon, slightly mixed headless, sold at 5½d to 4d, and dark mixed at 3½d per lb. Cinnamon sold at 5½d per lb for hard fifths, at 5½d for dull quillings, at 6½d for broken, and at 2½d for common bark. All the Singapore and Penang Pepper in sale was bought in, but quotations remain the same as our last report. Long pepper partly sold at 38s per cwt, fine bold black Mangalore sold at 8½d per lb, and Ceylon white at 8d per lb.

ANNATTO SEED.—Good bright West Indian seed was limited at 2½d per lb, another lot sold at 1½d.

KOLA.—Boldish mouldy West Indian realised 2½d per lb, while fresh and good 6d was wanted. Small African quarters were bought in at 4d per lb. Privately retail sales of fresh West Indian have been made at 6d per lb.

CITRONELLA OIL.—Privately there have been retail sales in tins at 1s 0½d to 1s 0¼d per lb spot; drums are offered at 1s.

VANILLA.—At today's auctions only a moderate quantity offered, and chiefly sold at steady prices as follows:—Mauritius, good bold chocolate beans, 9 inch 3s; 8 to 8½ inch 2s 6d to 2s; 7½ to 8 inch 2s; 7 to 7½ inch, 2½s 6d to 2s; 6 to 6½ inch 2½s to 2s 6d; 5 to 6 inch 2s to 2s 6d per lb. Seychelles: 7½ to 8 inch 2½s 6d; 6 to 7 inch, 2½s; 6 to 6½ inch, 2s 6d; 5 to 6 inch, 19s. Tahiti were all bought in at 10s per lb.—*Chemist and Druggist*, April 29.

INDIAN TEA AND TEA SHARES.

Tea shares have been rather in the background during the week, says the Calcutta correspondent of the *Pioneer* writing on May 13, as there was considerable doubt of prices being maintained at the opening sale yesterday. There apparently was a want of pluck among buyers, resulting in a good many of the lots which were offered being withdrawn for shipment direct to London. I hear, too, that there was a tendency on buyers' part to divide the larger parcels, in this way preventing the competition which teas offered at auction are supposed to obtain. I am glad to hear that two firms at least among the brokers are determined to discourage amalgamation of this kind among the buyers. It is well known that this clubbing together to keep down prices exists to a great extent among the blenders and vendors of the ten-penny tea canisters in London; and, as Messrs. W. S. Cresswell & Co. remark in their tea report of yesterday, although "the position is an exceptionally strong one, unless tea is handled more judiciously than hitherto, we shall soon see prices collapse and fall back to their old level." Prices realised at yesterday's sales were in many cases 30 per cent higher than the opening sale of last season, but in spite of this there has been little movement in tea stocks today, and prices are lower all round than they were last Saturday.

OUVAH COFFEE COMPANY, LIMITED.

Report presented to the fourth ordinary general meeting of the Company held at No. 5, Dowgate Hill, London, on Tuesday, the 9th May, at noon.

The following accounts are now presented to shareholders, viz.:

Balance sheet made up to 31st July 1898.

Profit and loss account for crop 1897-98.

The receipts from the sale of produce were as under:—

Tea from the Company's own estates	708,500 lb.			
Tea made from bought leaf	106,247 ..			
		Total	814,747 ..	£ s d
				26,421 2 10
Coffee 375 cwt. 0 qr. 23 lb.				1,842 2 2
Cocoa 185 cwt. 0 qr. 19 lb.				611 6 1
Cinchona 17,963 lb.				200 15 8
Sundry sales in Ceylon				64 17 11

Total receipts £29,140 4 8

The total expenditure in Ceylon and London for the year amounted to £25,366 5s 1d, and deducting this from the value of the produce a profit is shown in the year's working of £3,773 19s 7d, to which has to be added the balance of £396 7s 10d, brought forward from last year. After deducting income tax the total at credit of profit and loss is £3,999 4s 9d.

An interim dividend of 1½ per cent was paid on the capital of the Company on 23rd November 1898, which absorbed £1,500 of the above sum, and the Directors now recommend that £2,000 be applied to the payment of a final dividend of two per cent, making 3½ per cent for the year, and that the balance of £499 4s 9d be carried forward.

Owing to drought experienced during the latter months of the financial year the estimated crop of tea was not secured, the yield from the 1,618 acres in full and partial bearing being 438 lb. per acre against 475 lb. per acre in the previous year. The market also ruled very low, and our tea realized 7-78d per lb. against 8-08d for the preceding season.

The small coffee and cocoa crops sold at an average of 98s 2d and 66s 1d against 91s 1d and 55s 1d respectively, and the cinchona realized an average of 2-68d per lb.

The cost of tea planting and upkeep of 523 acres of young tea not in bearing is included in the year's expenditure, and a sum of £2,037 6s 0d spent on factory extension has been held up in the balance sheet.

The tea crop for 1898-99 is estimated at 750,000 lb. So far the season has not been favourable, and pluckings have been small, but with a return of favourable weather our Estate Manager considers that the estimate can yet be secured. It is highly satisfactory, however, that prices influenced by short shipments from Ceylon and by an increased home and foreign demand, have hardened considerably since the commencement of the year, and it is generally considered that we are not likely to see a return to the very low values current last year.

Coffee prospects are better for the coming year. The crop is estimated at 3,000 bushels, against 1,882 bushels secured last year, and if this is realized it will materially swell the year's profits.

Only 23 acres are being planted with tea this season, a small area in comparison with the plantings of recent years. This will considerably relieve expenditure and release profits for dividend purposes.

The acreage of the Company's property is now as follows:—

Tea, over 5 years old	1,545 acres
„ planted November-December 1894	153 „
„ „ 1895	159 „
„ „ 1896	151 „
„ „ 1897	133 „
„ „ 1898	23 „
Area under tea	2,164 „
Area under coffee and cocoa	442 „
Area under fuel	367 „
Forest patna and waste	515 „
Total area	3,488 acres

The Directors regret to report the death of their esteemed colleague, Mr. Norman Stewart. They have filled up this vacancy on the Board by the appointment of Mr. J. G. Wardrop, who retires from office on this occasion, and, being eligible, offers himself for re-election.

PRODUCE AND PLANTING.

TEA AND COFFEE IN AMERICA.—The New York correspondent of the "Grocer," in calling attention to the consumption of coffee and tea in the United States, gives a table comparing the percapita consumption of the two products in beverage form in 1893 and 1898, which is as follows:—

	1893.	1898.
Coffee ..	14.00	19.46
Tea ..	8.00	5.46

From this it will be seen that the consumption of coffee has greatly increased, while that of tea does not grow. He says; "Probably the coffee returns are too high, as all deliveries from licensed warehouses are counted as consumption, whereas the quantity held in unlicensed warehouses is much larger than was customary in 1893, when the import cost was 7d, against 3½d in 1898. The tea figures are also misleading, as the withdrawals were unusually heavy in 1897 owing to heavy imports to escape the tax. Making allowance for these facts it appears, unmistakably, that the use of coffee has largely increased. The reason is not hard to find, as coffee is retailed at 5d per lb. up to 1s 6d. A pound of coffee at 5d makes two gallons of beverage, while one pound of tea paying 5d duty, and selling at 2s per lb. at retail, makes six gallons of beverage costing about 4d per gallon, or 1½d more than coffee. It is claimed that one pound of Ceylon and Indian tea will make sixteen gallons of beverage, which statement we will not dispute; but Americans will not learn to properly brew British-grown tea, insisting on using as large a quantity as they have been accustomed to of China or Japan sorts, and hence they do not take kindly to the heavier body and sweetish flavour of Ceylon and India. The preference is decidedly for a blend, and in this way there is a constantly enlarging demand for Ceylon and Indian tea. But the Americans are partially fond of coffee, and last year imported 851,691,084 lb., or nearly double the imports in 1880, '81, '82. The imports of tea average about 95,000,000 lb. for the last five years, while in 1880, '81, '82 they averaged over 75,000,000 lb.

GROUNDLESS ALARM.—Clearly there were some apprehensions on the subject of the Budget and the tea duty. Between the end of March and April 13th no less than 14,860,778 lb. were taken out of bond mainly as a precaution against any possible increase in the duty. This is 9,076,368 lb. more than was taken out during the same period in the previous year.—*H. & C. Mail*, May 5.

THE INDIAN TEA ASSOCIATION.

The opinion of the Assam Branch Association that it would be injudicious to discontinue our efforts in America, came too late to be of any use says *The Planter*. Mr. Buckingham's memo. expressing his opinion that the Assam Branch should strengthen the hands of the General Committee by protesting in the strongest terms against the discontinuance of the work in America, was confirmed by a subsequent letter, dated 20th April, recording that the Committee of the Assam Branch concurred in the opinions expressed in the memo andum. Unfortunately, Mr. Buckingham had to be informed that it was not open to the General Committee to take any further action in the matter, as it had been decided at a meeting of the London Committee held on 31st January, without reference to India, that operations in America should be discontinued. In his letter of 3rd February, Mr. Tye, the Secretary of the Association in London, had stated that the Committee were unanimously of opinion that the time had arrived for discontinuing the work, and had accordingly instructed Mr. Blechynden to bring his mission to a termination. Mr. Tye further stated that Mr. Mackenzie, the representative of Ceylon in the United States, had also informed his Committee that the work in America could well be brought to a speedy termination. So, for good or ill, the matter is settled, and those interested in tea can only sit and wait the result of the action of the London Association, which has practically been universally condemned in India and Ceylon.

We have some news at last of what is being done with reference to the Paris Exhibition. The London Committee has made arrangements with Mr. E. F. Langdale to sell Indian tea at the Paris Exhibition on the understanding that the Association should not be responsible for any outlay beyond the sum of £1,000 agreed to be paid to the Royal Commissioners for the space which had been allotted for the representation of Indian tea. Mr. Langdale was well known in connection with work of a similar description, as he had been associated with the Health Exhibition held in London in 1884 in a like capacity. It was understood that in the arrangements to be made Mr. Langdale would follow the lines observed by him at the latter Exhibition, which gave general satisfaction. Mr. Langdale would arrange for the service of Indian tea in the cup, and would make special efforts to render the Court in which it would be served attractive to visitors. So, apparently, beyond being responsible for £1,000 which is to be paid for space, the Tea Association washes its hands of the Exhibition, and leaves the interests of Indian tea entirely in the hands of a private individual, who, most naturally, has his own interests to think of first. However, these interests may possible coincide. The London Committee has had under consideration the question of the lines upon which a new Levy should be conducted for opening out new markets other than the American, for the sale of Indian tea. Favourable replies had been received from a few concerns in London to the circular issued by them on the 24th February, in which subscriptions were invited, but it was noted by the General Committee that it was not stated specifically upon what lines the new Levy was to be raised. The reply received to the former telegram sent not making the matter any clearer, it was decided to wire the London Committee again asking for full details of the new scheme for opening out new foreign markets,

as no satisfactory appeal for funds can be made without some knowledge of the programme proposed, and speedy action is essential to success. A remark to this effect was to be included in the telegram to be sent to the Committee of the Association in London.

Another letter from the London Committee in connection with the American Market, was dealt with. Mr. Mackenzie, the Ceylon Commissioner, had recommended the Ceylon Committee of Thirty to continue the work in America for two or three months only in 1,900. The decision of the Ceylon Committee had not, however, been so far received. The General Committee also understood that the balance remaining of the amount raised by the last levy, after the close of Mr. Blechynden's Mission, would be devoted to the continuance of the advertisement issued jointly by the representatives of India and Ceylon teas.

CROSSING OUR TEAS.

WHAT LONDON TEA MERCHANTS ARE CONCERNED ABOUT.

(Daily Mail Special.)

The statement made at the meeting of the Whitechapel guardians, and reported in our yesterday's issue, that there was an unexpected rise in the price of tea, was confirmed yesterday in the inquiries instituted by a *Daily Mail* representative.

What the London tea merchants are most concerned about, however, are the bold attempts of foreigners to foist cheap unwholesome teas on the London market.

"The Custom House authorities," said Messrs. Alfred Newby and Co., of Mincing-lane, to a *Daily Mail* representative yesterday, "ought to stop the importation of this foreign stuff at once. It is injurious to the public health, and should never be allowed to come into our market. Here is a sample of tea which we had sent to us from Belgium, the price quoted being 6½d per lb without duty. It is of too long growth, it has been infested with caterpillars, it has a most disagreeable odour, and it would be

A SOURCE OF DANGER

to the public health if it were consumed. It is Oolong tea, and is probably part of a consignment which was rejected by the Belgium people as worthless.

"And now attempts are being made with a view to putting it on the English markets. If something is not done to check its importation other countries besides Belgium will try to find a market here for the tea which is no good to them.

"This state of affairs arises from the fact that Indian, Ceylon, and China tea has been overbought by the blenders. There was a rumour about Christmas time that the supplies would be short, and since then prices have been gradually rising. Those blenders who foresaw the position bought as much tea as they could while the prices were normal, in order to carry themselves over the season, and, of course, they have made huge profits, one firm, we hear, having made as much as £20,000."

THE NUWARA ELIYA ESTATES COMPANY.

As Mr. A. F. Souter has appealed to us in connection with his criticism of this Company's affairs, we can bear testimony, from personal knowledge, to the adequacy of the explanation tendered in the Directors'

Report, of the falling-off of profit from Naseby estate during 1898. With the Factory under reconstruction and enlargement for the greater part of the year, we have been assured by the superintendent—Mr. Battinson—who has just gone on leave, that it was impossible for him to keep up the same careful preparation of the tea,—to secure adequate withering and to do justice in other ways. All that is now at an end, and the Factory, one of the roomiest and best equipped of its kind, in the hill-country, has been in full working order during the present year.

As regards the local management of the Company's affairs generally, we can assure Mr. Souter that, in our opinion, more hard-working, conscientious Manager and Superintendents—from all we have seen and heard—no Tea Company connected with Ceylon can show; while as to the Agents, it is superfluous to say one word. We have great confidence in the future of the Company and in its good management both in Ceylon and London.

CINCHONA IN CEYLON.

It was to be expected that the advance in the price of cinchona bark and the promise of a further rise in the future would set planters in India and Ceylon wondering whether it was worth while to go into the cultivation of cinchona trees again, or to extend their existing plantations. It appears that in Ceylon operations have actually been begun in this direction, and the *Tropical Agriculturist* prints an interesting letter which it has received as the result of advising the importation of fresh seed from India or Java for the purpose of trying cinchona again in the Ceylon hill district.—*British and Colonial Druggist*, May 5.

CINCHONA IN JAVA.

The unknown quantity to quinine speculators is the condition of the cinchona industry in Java, and whether it pays the planter or not to produce. "Why shouldn't it pay?" asked a sapient person in the Commercial Sale-rooms the other day. "Oak bark sells at £5 a ton, and pays." "Because it is a by-product," added a long-headed broker. "They cut down the oak trees for the sake of the wood." In Java they grow cinchona for the sake of the bark. We have before us a report regarding the plantations there, which gives the latest available information, and from this we learn that the Government has decided on principle to give up the cultivation of cinchona, and transform the plantations into experimental gardens. This will be done gradually, no seedlings being planted in place of the up-rooted trees. The Government plantations are eight in number and to the three of these plantation nurseries are attached for the propagation of seedlings and grafting. The number of trees in the plantations diminished in 1897 by eleven per cent, and, as the reduction will go on at about this rate yearly, it will be eight years at least before the Government ceases to be competing factor. They are eighty-three private plantations in Java, of which fifty-eight are situated in the Praenger province. These show no indication of reduction. The Bandoeng quinine-factory is now able to produce quinine to the extent of 3,500 oz per day, or 2,500,000 oz a year, and the Pandang Aroem works are gradually pulling up. So that there is no intention of stopping Java quinine. Thirty-four cases of the Bandoeng brand were landed at Amsterdam this week.—*Chemist and Druggist*, April 29.

PANAMA RUBBER.

In a report just issued by Mr. Willis, Director of the Royal Botanic Gardens, on Panama rubber (Castilloa) it is stated that the question of which rubber tree to plant with the most favourable prospects of a profitable return has been considerably altered by the discovery of a machine on the principle of the centrifugal cream separator, by which Mr. Biffen has succeeded in preparing almost pure caoutchouc from any which (*lutea*) which contains it. The question milk tree gives the greatest yield of caoutchouc has still to be answered; but, Mr. Willis says, there is great probability if not almost certainty that it must ultimately be answered in favour of Castilloa. Private planters, he thinks, will hardly find it worth while to establish plantations of Para rubber only. Probably the best thing to do would be to plant out the tree among the tea or other products at considerable distances apart. The trees would then grow to a large size in less time than if kept in plantations of rubber only, and their rubber would form a useful minor product. Those who intended to make plantations of rubber only would do better to use castilloa which yields much more fluid and easily collected milk, but even here no return can be got in much less than eight years. This tree may also be planted out as a bye-product on estates and will probably be found in the end the more favourable of the two. Ceylon seems an unfavourable country for yield though highly favourable for growth of rubber trees.

CEYLON TEA IN AMERICA.

Mr. MacCombie Murray sends us a chatty letter from Philadelphia about his early experiences in "tea"; and he adds correspondence which has appeared in the New York press and which reached us before; but which, now given consecutively, has a special interest, more especially with the addition of our correspondent's notes.

But the curious fact to us is that neither Mr. Martindale, Mr. Murray nor any of the other writers in this Tea discussion stumbled on the proper answer to the objection raised, that while Ceylon and Indian teas might do very well for the rainy, damp climate of England, they were unsuitable for the dry, electrical climate of the American States. The objection is that our teas have too much tannin for the latter condition. Now, apart from the fact that the proportion of tannin drawn off into cups of tea can be regulated by the time given to the infusion—what do Messrs. Martindale, Robertson, and others of our American cousins say to the case of Australia, with its far drier and more electrical climate than any to be found in the States? Here are the Australians—a nation of athletes, beating the English at their favourite game of cricket—drinking tea (mainly Ceylon and Indian) at the rate of 7 lb. per head per annum! Where are the bad effects? Does their experience not prove that tea is just the beverage for the people of the United States from New York to San Francisco, New Orleans to Chicago and Philadelphia to Denver? If our American cousins only took to tea, up to 2 lb. per head per annum, they would benefit themselves and tea growers everywhere!

PANAMA RUBBER (CASTILLOA).

(Royal Botanic Gardens Circular: issued by

Mr. Willis, Director,

In Circular No. 4 of this Series the cultivation of Para rubber was dealt with somewhat fully. It was pointed out that there is not very much suitable land in the Colony on which this cultivation was likely to prove really successful. The growth, cultivation, and yield of trees were considered, and a prospect of a moderately remunerative return in favourable places for the cultivation was shown to exist. Since the time of publication of these statements, however, the question of which rubber tree to plant with the most favourable prospects of profitable return has been considerably altered by the publication of the discovery of a machine for the preparation of rubber from the raw milk of the tree. By the aid of a machine on the principle of the centrifugal cream separator, Mr. Biffen has succeeded in preparing almost pure caoutchouc from any milk (*lutea*) which contains it. This is done in a few minutes at a very small cost, and the resulting product is almost free from impurity, and does not decay or smell like the ordinarily-prepared raw rubber. The best rubber hitherto sent into the market, contains at least 10 per cent. of impurity, and many kinds contain as much as 30 to 40 per cent. The importance of this discovery is manifest. The chief advantage of Para and Panama rubbers, as at present prepared, is their great freedom from impurity, due largely to the composition of the milks, and partly to the methods of preparation. Under the new conditions, however, this advantage is lost, for the machine will prepare from the poorest and most impure milk a rubber superior to the best Para now on the market. The first question therefore before the would-be grower of rubber trees is now no longer, "Which tree gives the best result as to quantity and quality combined?" but rather, "Which tree gives the greatest yield of caoutchouc?" The former question had been practically answered for Ceylon in favour of the Para rubber (*Hevea brasiliensis*). The latter has still to be answered, but there is great probability, if not almost certainly, that it must ultimately be answered in favour of Castilloa, and hence the publication of this Circular in which it is proposed to deal with the whole question so far as present existing data allow of conclusions. The tree has been so little cultivated in the East that reliable data in sufficient numbers are not to be had, and it is hoped that the publication of this paper will induce those who may have experimented with this tree to communicate the results of their work.

Another important bearing of the discovery above-mentioned must also be pointed out. At present the best natural rubbers obtain about 4s per lb. in the London market. When the machine-prepared article first comes upon the market it will doubtless obtain a higher price than this, but this will not long be the case. Inevitably the price of the best machine rubber will fall to about that of the best natural of today, while the latter will only fetch perhaps 3s per lb. and the poorer grades will also fall in price correspondingly. For profitable cultivation, that is, the machine methods must be used. Now, for this purpose it is necessary that the milk be collected in vessels and not allowed to dry on the tree. We have seen in dealing with Para rubber that in Ceylon, at any rate, the milk is very thick, almost like syrup. It quickly coagulates, and in all cases a lot of it dries on the tree. Before the recent discovery this mattered less, for this scrap rubber would sell for 1s 6d to 2s 6d per lb. Now, however, as we have just seen, this price is likely to fall by 1s or more. This will materially alter the figures of return given in the last paragraph of the circular referred to. Instead of the average price being 2s per lb it is more likely to be 1s 6d, and this will reduce the yield per acre to R112 say. This reduces the margin of R100 there given to R62, leaving considerable uncertainty as to whether the cultivation is likely to pay at all well enough to be worth attention from European planters, who would prob

ably find the trees yield much better in the Straits or America. *Castilloa* milk flows very much more freely and does not soon coagulate, so that the same objection does not apply to it. Practically the whole of the milk from a tree can be collected without any difficulty from coagulation beginning in it.

The practical corollary of these remarks, so far as Ceylon is concerned, is this. Para rubber will do fairly well at low elevations in certain districts, though probably at the best it will never do so well as in the Straits Settlements or America. Owing to the introduction of the machine methods it will in future be necessary to collect the milk in vessels. Now, the Para rubber tree when tapped at a girth of 2 feet, as recommended in the previous Circular, does not lend itself to this condition, much of the rubber dries on the tree. It will thus be necessary for planters either to content themselves with the old process, thus getting a lower average price for their product, or to wait till the trees get to a larger size, say in fifteen years on the average. It follows from this that private planters here will hardly find it worth while to establish plantations of Para rubber only. Probably the best thing to do will be to plant out the tree among tea or other products at considerable distances apart. The trees will then grow to a large size in less time than if kept in plantations of rubber only, and their rubber will form a useful minor product. The tree is a handsome tree when well grown apart from others, and might well be used as shade for roads or as an ornamental tree.

Those who intend to make plantations of rubber only would do better to use *Castilloa*, which yields much more fluid and easily collected milk, but even here no return can be got in much less than eight years. This tree may also be planted out as a bye product on estates, and will probably be found in the end the more profitable of the two. Ceylon seems an unfavourable country for yield, though highly favourable for growth, of rubber trees. Consequently, only the very best localities should be chosen for planting.

BOTANY.—*Castilloa* is a genus of the family *Moracee* (often included in *Urticaceae*), and belongs to that section of the family which includes the jak and breadfruit (*Artocarpus*), the upas (*Antiaris*), the milk tree (*Brosimum*), and the many plants of the genus *Ficus*, which include among others the Bo and the Assam rubber (*F. elastica*). The genus has two or three species. Of these the most important is *C. elastica*, Cervantes, the Ule of the Spaniards, which is found wild in Mexico from lat. 21° southwards, in Guatemala, Honduras, San Salvador, Costa Rica, and Nicaragua; it also appears to occur in north western South America. It grows to a large tree having been measured of 180 feet in height and 15 feet in girth. The growth is rapid. When young the tree grows rapidly upwards, and forms a number of short lateral branches, which after a time drop off, being detached from the trunk by a peculiar joint, whose surface resembles a piece of coral. The bark is rather soft and thick. The leaves are large and oblong. The flowers are borne when the tree has reached some considerable size and has begun to form permanent branches. They are monoecious, male and female on the same branch, enclosed or embedded in a top-like common receptacle, which is covered externally with small leaves. This subsequently forms a somewhat fleshy fruit, containing numerous small seeds about $\frac{1}{4}$ inch in diameter, with white papery seed-coats. Besides this species there is a second, the Caucho of the Spaniards, found near Darien (Panama) and elsewhere. This is the tree which we have in Ceylon, and it appears probable that it is a different species, *C. Markhamiana*, Markham (not Collins), but the point requires further study. In its native country this forms an important source of rubber. It appears to be a smaller tree than the true *C. elastica*. The details of the description of these species may be found in the paper by Hocker mentioned in the list of literature below.

HISTORY IN CEYLON.—The *Castilloa* rubber was introduced into the colony about the same time as the

Para, and through the same agency. A Wardian case of plants arrived in 1876 from the Royal Gardens, Kew, and the plants were put out at Henaratgoda and Peradeniya. They grew well at both places, but especially at Henaratgoda, and were increased by cuttings. They began to flower in 1881, and in the following year a few seeds were ripened. About 1886 the growth became less rapid, and since then has been very slight, the soil in the gardens being shallow, and at Henaratgoda not well drained at a little depth. A large number of young plants were sent to India and many were planted in Ceylon, but, compared with Ceara and Para rubbers, *Castilloa* is very rare in the Colony, and very few estates possess any appreciable number of trees. Samples of rubber prepared here have been sent home for valuation, and have received very favourable reports.

CLIMATE AND SOIL.—The tree ranges, as we have seen, over a large tract of country, but the conditions for its successful growth seem much the same everywhere. It inhabits a warm, steamy climate, like that of the lowcountry of south-west Ceylon, and is very rarely found above 1,500 feet. The most common situations are in alluvial soil at the sides of valleys or on low ridges. It needs deep soil, with plenty of water, but does not thrive where the soil is swampy, nor in places where there is not good drainage at the roots. It is probably partly for this reason that the growth at Henaratgoda so soon became slow, for the land there is flat and only twenty feet above the level of the sea. At Peradeniya it is on better drained land, but the soil is very shallow.

The tree prefers a steamy climate, but will do where this is interrupted by a dry season of two or three months, as in south-west Ceylon. It grows best where the temperature never falls below sixty degrees at any time.

The most promising localities for the cultivation of this tree would probably be found in the neighbourhood of Rambukkana, Kitulgala, Balangoda, and other districts in the foot hills of the south-west, and perhaps also in similar districts of the Bintenna country to the east of the mountain range, and in lower Madulsima, Passara, Monaragalla &c. It should be planted in sheltered places near streams, but with good drainage at the root. To plant above 2,000 feet is not advisable, and it would be better to plant below 1,000. The rainfall should not be below seventy inches, and should be well distributed. The tree affects drier localities on the whole than Para rubber, and so the two cultivations need not interfere with one another, as the Para tree will grow in the wetter places.

The tree grows best in a deep, warm, loamy soil. In its native country it is said to send its roots very deeply into the soil, and not to be a surface feeder. In the gardens at Henaratgoda, however, it sends out great roots at the base like the Assam rubber (*Ficus elastica*), growing out to considerable distances along the surface and projecting above it. One root was measured running along the surface for 30 yards, and where it finally became invisible it was three inches in thickness. This phenomenon at Henaratgoda may be largely due to the quality or lack of drainage of the lower soil, but it seems common in other places where the tree is grown in the Colony, and will limit its use as a shade tree, for which purpose it has often been recommended in other countries. If used as shade, it would perhaps do better with tea than with most of our other cultivated crops. In better soil and position than what has hitherto been tried, however, it may very likely strike deep roots, in which case other crops could be more easily cultivated between the rubber trees, e.g., plantains or even cacao.

CULTIVATION.—The seed should be sown as soon as obtained in a well-prepared nursery. They should be sown an inch deep, and about 8 inches apart, and lightly covered with a little vegetable mould. They must be kept lightly shaded, and watered when the surface of the ground is dry. In ten or twelve months the young plants will be 2 feet high and ready for planting out.

Cuttings may also be taken; those from lateral branches do not grow well, and have a tendency to

grow more or less horizontally, so that main shoots must be used. When cut back the main stem produces buds from the axils of the leaves, and these may in turn be used as cuttings, and so on. Cuttings should be at least 3 inches long, with a basal portion of old wood, and perhaps 12 inches is better, as described for the case of Para rubber.

The young plants should be planted out during rainy weather in prepared places. Holes should be dug and filled with well-prepared sandy, loamy soil. If the plantation is to consist of trees of *Castilloa* only, they may be put at about 12 feet apart, or perhaps better a little closer. If other products are to be cultivated between the rubber trees, the distance must be much greater. The young trees must be shaded for a time, and probably it would be best if they were lightly shaded for two or three years till they reached a height of 2) feet or so. This might be effected by planting them, for instance, on land already bearing such light shade trees as are used for cacao. On parts of estates where the canker has rendered it needful to cut out the cacao it might be well worth while to try the *Castilloa*. The ground should be kept clear of weeds and the trees watered in dry weather of long duration, until they reach sufficient size to take care of themselves.

RATE OF GROWTH.—The tree grows fairly rapidly at first, and soon reaches a height of 10 or more feet. From the annual Administration Reports of this Department the following extracts have been made with reference to this subject. In 1878 the original trees were two years old, from time of planting out as cuttings; some were 16 feet high, and 16 inches round the base of the trunk. In 1880 the largest tree at Henaratgoda was 17 inches in girth at a yard above the soil. In 1882 the largest tree there was 46 feet high, and 26 inches round at a yard above the soil. In 1884 its girth was 32½ inches; in 1886, 38 inches; and it began to show signs of less rapid growth, so that it only reached 40½ inches in 1888, 42½ in 1890, and 43½ in 1892. Up to about the tenth year, therefore, at any rate, the tree may apparently be counted upon to grow well; and even though the subsequent growth is slow, the yield of rubber seems to increase considerably. After reaching a girth of about 2 feet or 2 feet 6 inches the trees may probably be tapped for milk. Comparing the above measurements with those given in the circular on Para Rubber, it will be seen that *Castilloa* is distinctly slower in growth of the two and probably a plantation of Para rubber would reach the girth of 2 feet (average) in two years' less time than one of *Castilloa*.

TAPPING.—The tree should not be tapped till it reaches a girth of at least 2 feet. This should be attained in a period of perhaps nine years on the average, and it would be better to wait for two years more if possible till a girth of perhaps 2 ft 6 in is reached. After the eighth year there would probably be a fair number of trees in the plantation ready for tapping, and of course the number would increase every year till all were sufficiently large for the purpose.

The milk of this tree flows much more freely than that of *Hevea*, so that one cut seems to drain a much larger area of the stem of its milk. The native methods of tapping are mostly very wasteful, and also often cause the death of the trees. Sometimes the method described under Para rubber, by cutting V incisions at frequent intervals, is used, and so far this seems to have been the only one used in Ceylon. We have found that the milk here runs so freely that simple sloping cut is sufficient, and that there is no need to make the V. If this method is used the cuts need not be so close together as in *Hevea*; they may be 3 or 4 feet apart instead of 1. Sometimes the whole tree is cut down and incisions made in the bark as it lies on the ground. Other methods are to cut spiral groves round the tree for some distance up, or to make a main channel on one side of the stem with lateral cuts leading into it. These methods are almost sure to kill the tree, at any rate after a few years, and only the first-mentioned, the method of simple incisions, should be used with cultivated trees.

Further details of methods will be given in succeeding Circulars of this Series. The general principle recommended is to attach four or five tin cups at distances of a few feet apart on the tree. Single oblique incisions are made, one above each cup, and the milk is collected and washed into a vessel with a tap at the bottom. Probably the best machine would be a glass churn with tap at base, fixed so as to revolve about a horizontal axis. The milk is left to stand, when it separates into a cream containing all the rubber, and a beery, fluid below, which is run off by the tap. The cream is mixed with water, churned, left to stand, and the process repeated. The rubber is thus obtained almost pure in three washings, and the cream is poured out to dry on a porous surface, when a thin sheet of perfectly dry and almost pure caoutchouc is obtained in a short time.

YIELD.—Till further experience has been gained we do not know how much tapping is advisable in *Castilloa*, nor how much it will stand. The trees in the Island, so far as tested, yield very well, but it would be premature to draw any general conclusions. A few trees of about three feet girth gave an average of 5 ounces of rubber each from one day's tapping. Probably three or four tapings might be done every year without serious injury, but this remains to be investigated. The amount of rubber is not much larger than in Para trees of similar age, but it was collected from a quarter of the number of incisions, thus very much reducing the cost of its collection. It must also be remembered that this rubber was perfectly dry, whereas the driest rubber prepared by the old methods contained 10 per cent. or more of water.

The cost of opening plantations of rubber will be found in the preceding Circular. The probable return in the case of *Castilloa* is larger than in the case of Para, and its cost of collection is less, so that the cultivation of this plant as a bye product in favourable localities may be recommended to planters. Neither kind of rubber can be safely recommended as a principal product. Those who wish to plant it on a large scale would probably do better in countries further east.

LITERATURE.—The following books and papers, among others, relating to *Castilloa*, may be consulted in the Library at Peradeniya. The initials and figures indicate their place in the Library:—

JOHN C. WILLIS,
Director, Royal Botanic Gardens.

Peradeniya, April 7th, 1899.

THE PARA RUBBER TREES are described as doing splendidly in the Kalutara district and there ought to be a fine show all over the place in a few years.

COOLGARDIE EXHIBITION AND CEYLON TEA IN AUSTRALIA.

We publish elsewhere a chatty letter from M. Joubert, the General Manager of the Westralian Exhibition. The testimony he bears to the success of the Ceylon Tea Court will be gratifying to the "Thirty Committee" and to planters and merchants generally. We leave the further portion of the letter to speak for itself: we might have sent it on to the "Thirty Committee," but saw no hope of any practical result in that quarter, because M. Joubert must understand that a tea trade between Ceylon and the several Anstralian Colonies has already been established,—that from a beginning of a few thousand lb. in 1881—the year of the Melbourne Exhibition—we have now got to shipping 13 to 15 million lb. to Australasia. There is, of course, plenty of room for expansion still, seeing that Australasia is credited with requiring altogether 23½ million lb. (*vide* Estimates in our "Hand-book and Directory"); but the development of the Ceylon trade is now left entirely to our mercantile agencies, save in so far as the Tea Cess Fund (our tea planters' money) may help to establish a Tea Court at any local Exhibition, as has been done at Coolgardie.

Nevertheless, M. Joubert's wide family and business connection surely offers a tempting opportunity for establishing a successful Australian agency in Ceylon tea and we have, therefore, the more readily, given publicity to his letter on the chance of a Colombo tea exporting house without an Australian Agent, putting itself into communication with our correspondent. To forward the realization of his present wishes is to promote the interests of Ceylon tea; and we, therefore, trust that M. Joubert may be successful in hearing from a Colombo merchant, or proprietary planter, how a business may be established to cover the wide extent of colonies indicated in his letter.

FREIGHT AND COMMISSION CHARGES ON TEA PURCHASED IN CALCUTTA.

We (*The Indian Planters' Gazette*) enclose three *pro forma* documents:—viz.

- (1) Shipper's Invoice;
- (2) London account sale;
- (3) Relative account-current;

which purport to deal with parcels of 100 chests of tea purchased in Calcutta at 5½ annas per pound, shipped at freight £2-10s per ton, and covered at exchange 1s 4d; buying and selling commission at 1½ per cent. These, it will be noted, are the exact factors upon which our tables were based. The account sale shows the sale of this tea in London at 7¼d, the equivalent shown in our table against a cost of 5½ annas, and the account-current discloses a difference of £1-12s or about ¾ per cent. over the whole transaction—a point that is unappreciable when it is borne in mind 8,000 lb. of tea is dealt with. The charges shown in these examples are actuals.

PLANTERS' STORES & AGENCY CO., LTD,
Calcutta, 10th May, 1899.

SHIPPER'S INVOICE.

No.

TELEGRAPHIC CYPHER.

Invoice of 100 packages of tea marked and numbered as per margin, shipped by the Planters' Stores and Agency Co., Ltd., Calcutta, per steamer "City of Perth" for London for account and risk of the concerned and consigned to order. Freight at 50s.

Draft at 3 months sight through National Bank of India, Limited, for £203-13-1 at Ex. 1s 4d.

MINOR PRODUCTS REPORT.

LONDON, May 4.

CINCHONA BARK has dropped twenty-five per cent today in Amsterdam. Quinine, which has been the victim of the conflicting reports of Java bark shipments this week, has been, on the whole very quiet.

COCA LEAVES.—Quiet. Huanuco kind is neglected at 1s. For Truxillo there are inquiries, and business is likely to be done at 10d. The string of Ceylon leaves offered at the last auction have all been sold, 10d being obtained for all but the dark damaged leaves.

CINNAMON.—Quills are about half-pence better this week in anticipation of the small sale at the end of the month. Firsts are quoted 10d to 10½d; seconds, 9½d to 9¾d; thirds, 8¾d to 9d; and fourths, 8½d. In the spice sales yesterday 13 bales of Ceylon were sold without reserve at 6½d to 6¾d; while 25 bags of chips were bought in at 3½d. During the three months—January, February and March 1899—331,217 lb of quills and 563,345 lb of chips were exported from Ceylon.

CINCHONA BARK.—From details of the exports of this article from Ceylon which have been published it appears that of the 150,080 lb of bark exported, from January 1st to March 28th 121,250 lb went to the United Kingdom, 28,797 lb to America and 33 lb to France.

FIXED OILS.—Coconut: Ceylon, spot, £25 10s to £25 15s.—*British and Colonial Druggist*, May 6.

CINCHONA.—The Ceylon shipments from January 1st to April 11th were 168,770 lb, as compared with 201,273 for the corresponding period of 1898. Since the auctions last week sales of 400 to 500 hales are reported, at an advance of ¾d on the unit then paid. There have been nibbles for the soft Colombian bark, but no business has transpired. The exports of bark from Java for April were 996,000 Amst. lb against 850,000 last year, making a total for the four months of 3,021,800, against 3,225,000 Amst. lb last year. The shipments this year have been:—January 5098,00; February 539,000; and March 977,000 Amst. lb.

CARDAMOMS.—A fair amount of business is passing in Mysore privately at the rates paid in auction.—*Chemist and Druggist*, May 6.

INDIAN AND CEYLON TEA.

CIRCULAR TO ALL PRODUCERS AND IMPORTERS OF TEA.

The following circular has been issued by the Secretaries of the Indian Tea Association (London), and the Ceylon Association in London:—

We are instructed to forward to you the enclosed memorandum on the proposal to abolish the draft allowance on teas sold at public auction in London, and to invite your support. We are desired to point out that it is greatly to the interest of producers and importers that the proposal should be carried into effect, and to add that it has the unanimous approval of the Committees of the Indian Tea Association (London), and the Ceylon Association in London. If you see your way to support the proposal, we shall feel obliged by your returning to either of us as soon as possible the enclosed form duly filled up.—**ERNEST TVE**, Secretary, the Indian Tea Association, London. **WM. MAR JIN LEAKE**, Secretary, the Ceylon Association in

I/We, the undersigned grower or importer of Indian Ceylon, Java, or China teas, hereby agree that any teas I/we may put up for auction at public sale, in London, on and after a date to be hereafter determined by the Joint Committee of the Indian and Ceylon Association in London, but not before July 1 next, shall be sold on the express condition that no allowance for draft be made to the buyer.

This I/we agree to carry out, provided the Joint Committee of the two Associations receive in their opinion sufficient support to ensure the adoption of the proposal.

[Here follows name of firm, proprietor, or company and quantity represented of Indian, Ceylon, China and Java teas.]

MEMO. AS TO ALLOWANCE OF 1 LB. DRAFT ON TEA SALES.

1. The profit on tea cultivation having reached such a narrow margin it became imperative on the grower to curtail every item of expenditure in India and Ceylon to the very lowest limit, and in consequence many forms of allowances which were common in better times have of necessity been abolished.

2. It has now unfortunately become necessary for the grower to extend this pruning down to unnecessary charges and allowances on his teas in London, and the most obvious of these is the allowance of one pound draft per chest or half chest.

3. This allowance has long been looked upon by the grower as an unwarrantable tax upon his teas, and it is held that the time has come for it to be abolished.

4. During last year there were imported into London:

	Chests.	Half-chests
From India ..	1,286,998	285,664
„ Ceylon ..	831,406	316,090
	2,118,404	601,754

and the allowance on these from draft alone amounted to 27,20,000 lb.

5. And this is not all; for, by the present system of weighing by H.M. Customs, a turn of the scale is given in the buyer's favour on the gross weight and another on the tare weight. Each of these may give the buyer a maximum advantage of 15.7 oz., so that the two together average close on 1 lb. of tea per package, exclusive of draft.

6. Taking then the two forms of allowance (namely, draft and weighing) together, the buyers on these figures received 5,000,000 lb. of tea more than they paid for.

7. Without raising the question of an alteration in the system of weighing there is no reason why the draft allowance should not be abolished. It is a survival from times and conditions which no longer prevail, and it is not exacted in countries other than Great Britain, to which India and Ceylon supplied last year 560,000 chests.

8. In 1890 all draft allowance was abolished on cured provisions and cheese, the same has been done in the case of bark and other articles, and the same should be done now in the case of tea.—*H. and C. Mail*, May 5.

SIR A. MACKENZIE AND THE TEA PLANTERS.

Sir Alexander Mackenzie's thrice unfortunate aspersions on the tea-garden managers have aroused much indignation and no wonder. Although in giving evidence before the Currency Commission the ex-Lieutenant-Governor does not say in so many words that the manager are for the most part incompetent, he groups his answers in such a manner as to leave his hearers no alternative inference. Yet when we read on, we find that his grievance really is that "the conditions of profitable cultivation have changed." Surely that is not the manager's fault. Machinery has come in, says Sir Alexander, and with it the practice of amalgamating a number of

gardens under one management. The management that is called for under these conditions is expert and "it is hard to get." And yet one heard of large numbers of experienced tea planters who were to be met in Calcutta last cold weather looking for work in vain. That fact scarcely bears out Sir Alexander's petulant remark. Of course it is very annoying to be a shareholder in a company which does not pay a dividend upon the season because its manager has been dismissed, but, after all, surely that is a very small fact from which to argue the general laziness or stupidity of a large body of gentlemen. Sir A Maekenzie complains that the pampered tea planter picks up his experience "at the cost of the shareholders." There is a very general impression among those who know that he picks it up too often at his own,—*The Englishman*.

FACILITIES FOR MAKING GOOD TEA.— VII.

Dealing with two replies dating from Dikoya, one from Agrapatana, and one from Kotagala, we find the drawbacks to making better tea considered from different standpoints. One Dikoya planter, while holding the ignorance and carelessness of tea makers and coolies who try to hurry through their work, responsible for much, considers the teas now produced far superior in make to those turned out, say four years ago, and that it is only over-production and combination among buyers which has stood in the way of better prices. The other is unable to detect any special cause, though jât, soil where previously under coffee, rush of leaf, and neglect of pruning followed by severe cutting down, play their part in keeping down the quality. Agrapatana thinks the failure of buyers to give value is the great drawback to making better tea, as the district possesses great advantages; while Kotagala pleads unseasonable weather, want of accommodation and machinery in some places, and want of attention in others, as hindrances to improvement. On jât there is nothing new to record, as there is the usual variety, though as a whole all the districts have fair working bushes varying from good and medium to inferior in the first plantations. In soil, Dikoya is content to claim medium, but generally good for tea; while Agrapatana rejoices in decidedly good soil, and Kotagala regards its soil as not generally poor, though parts of most estates are worn. Mr. John Hughes' letter should draw special attention to the impoverishment of soil which immediately attends heavy and continuous showers, and the necessity of providing safeguards against avoidable loss, whether of soil or its more valuable constituents. While one Dikoya planter unequivocally declares in favour of manuring, the other insists that a dose of manure which shows good results exhausts itself in two years, after which the bushes suffer if the dose be not repeated; and with prices under 8d. per lb. there is very little profit in manuring. But may not the profits disappear altogether without manuring? From Agrapatana comes the warning that manuring, to do good, must be scientific, and in that description is not included "the usual castor-cake and bones," on which, however

those who have tried the combination generally report favourably. Kotagala adds its testimony in favour of manure, as both improving and profitable where the soil is not too much worn, and where neglect has not continued too long. Then it is a question of "Will it pay?"

In regard to factories, one Dikoya resident declares that most estates are deficient in withering space and that prices are seriously affected in consequence, through Visiting Agents, with no practical knowledge of the details of work, opposing extensions which the working Superintendent feels to be essential. The other Dikoya planter takes a different view, holding that most factories have ample room for nine months of the year, but the space is found insufficient generally during the rush in April and May. The question is, we suppose, whether additional expenditure will be justified by the saving of the loss that insufficient withering space leads to; but the latest invention will, perhaps, effect a revolution, and those who saved in buildings may yet rejoice! In Agrapatana there is no deficiency in withering space; and the sufficiency is specially mentioned as an explanation of the high average prices the District obtains; and Kotagala, too, finds that the want of space has been supplied in recent years. Dikoya is, generally, well supplied with machinery (save in respect of sifters and roll-breakers), and also with motive power, except during the dry season; and Agrapatana and Kotagala, too, are generally satisfied with the equipment of their factories. The labour force has been ample in all three districts—Kotagala experiencing that pleasure after five or six years. Dikoya holds two views of pruning—one that it is neglected too long, and then the knife is applied with too great severity, the other that poor jâts must be severely dealt with to yield paying flushes; but V.A.s are said to worry the bushes with too early plucking, to ultimate injury of the estate. While Agrapatana has not suffered from severe pruning, Kotagala complains of much too severe handling after prolonged neglect. From Dikoya and Agrapatana the unanimous verdict is that both soil and climate are most suitable for tea, the only drawback being that many of the earlier plantations had to be pushed on without reference to jât, and with undue regard to economy in consequence of the collapse of coffee. The results in such cases are sadly apparent now. This is a drawback from which Agrapatana evidently has not suffered; but Kotagala is burdened with land which had been for long years under coffee, and such cannot be expected to yield large returns.

COCONUT PALM CULTIVATION.—Cultivators of coconut palms in the Straits Settlements, who have been troubled by beetles and by "the effects of sugar estates on coconut plantations," will read with interest the letter of "W.J." elsewhere, as one of our most experienced Ceylon planters. In answer to his enquiries as to nature of soil, multiplicity of beetles, &c., we shall be glad to hear from any one having a knowledge of the conditions in Selangor and other divisions of the Straits Settlements.

CEYLON TEA IN AMERICA.

THE WORK OF PIONEERS.

(Reminiscences by an ex-Ceylon planter J. M. M.)
Philadelphia, April 1899.

I have taken a pioneer's interest in many things during my life, but no interest has cost me so much as Ceylon tea, and yet I turn with an apparently undying interest to Ceylon tea with every good wish for its success—I may say—indigenous to the 'make up' of my being. My position is that of the bird that flies with the wind (or, for a change, against it) *free*. I am not financially interested (in my work) and I am happy. I take a bird's eye view of the Tea Trade in the United States of America, and in doing so, quietly consider Why's and Wherefore's, look at things as I see them generally without bias. To take wing to Ceylon (I wish I could) I, in my dreams effect a mode of my own for quick transit. How much, do planters (so many of them my old friends, I see by the Directory) hear what resident planters have to say about America? How much from "late" planters now resident here in America as merchants? How very little do they hear from the retailers of Ceylon tea who sell your tea to the American people! I hope to do some good in this respect. I am known today, in Philadelphia, the moment I introduce myself—not only to tradesmen or tea men, but to Philadelphians generally as "the man who hung about 13th Market and Arch Street in four different stores, for five years—shouting out (metaphorically writing) about Ceylon Tea to an unresponsive public! Five out of six (to whom I may thus introduce myself) answer. "What? Were you under St. George's Hall?" "Yes, in the dreariest depths of basement." I can always answer! My signs were large, and demonstrative—being on a level with the eyes of the "passer by"—(please note "passer by") but they all seem to have passed by once at least—and remember my store. My saddest recollection in connection with this store is that of our dear old friend from Aberdeen—via 20 or 30 years in Ceylon,

JAMIE GARICCH.

He wrote me from Canada when he was stranded and I was in no position at that time to ask him to join me; but he turned up, and for about a year represented me in my store. Good, kind-hearted old soul, but dying on his feet. I suppose everyone who knew him, knows that he finally landed on his native heath, Aberdeen, and died at peace with the whole world among his friends. Little do those who have not cast their lot in a country like this realize what it is to "get left" in life, particularly in old age, after leaving Ceylon. Not until they have experienced such a position can they possibly imagine what lifeless and ambitionless existence means.

Another good old Ceylon man was represented there, viz.:

VERE MILLINGTON,

a good, cheery, kind and true-hearted man as ever lived. I have always looked upon him as the actual impersonation of "Mark Tapley"—and if any living being enjoyed and could repeat Dickens—Vere Millington was the man. He served me in the midst, and through the midst, of my troubles. I only learned to appreciate him after I thought he was torn bone from bone—dead and gone—annihilated by misfortune and mishaps. But after I had buried him, through false information from friends, he turned up serenely, not only able to walk, but through having to carry an overweight of *avoidupois* actually (what

shall I say?) unable to walk, or nearly so. The laugh was there and the happy temperament seemed to bear up all the weight he could gather from the flesh and all the sorrows he could glean from the d—l. There is a man who did me personally great service, never yet repaid, but was and is now more than appreciated. He was, in this country, a plucky fighter under the most trying circumstances, kept his head level, "kept a stiff upper lip," met misfortune with a merry laugh, and when at last dropped some 20 feet on to an asphalt floor from wheels revolving like lightning of heavy electric engines stripped of his clothes, half-a-dozen bones broken and in a generally mangled condition, unconscious, he wanted to know where they were taking him to, and why they didn't get him his clothes and let him go home to his wife as a decent although unfortunate man! I cannot, of course, remember exactly what he did remark, but what he said was to this effect! I saw him and his good wife on the last visit they made, and they were both looking great. I have lost their address in England, and can't write; but would be glad to know how. His property I heard (from himself) was doing him all that was necessary for a livelihood, and no one is happier to know it than the writer.

As I write, I have received letters from three prominent firms in Philadelphia, representing tea (retail). They speak for themselves. I expect others as time goes on, and will gradually afford you matter from which you may eventually be able to arrive at a consensus of retailers' opinion, representing finally an undebatable philo-ophy regarding Ceylon Tea in America.

CEYLON AND INDIA TEAS. CHINA TEAS.

November 9th, 1898.—Editor, "Journal of Commerce and Commercial Bulletin," New York.—Dear sir,—I note with interest a letter upon "China vs. Ceylon Teas" in your paper of even date. Only a very few years since I was a believer in the theory that Ceylon and Assam teas were too strong, too rich in tannin—"too rich for our blood"—in fact in this dry electrical climate of ours, but I could well understand the high favor which these teas met with in England because the wet damp climate with its raw benumbing cold, in the winter months (that characterizes the major portion of the weather in England, Ireland, Scotland and Wales) demands just such a nourishing, such a "grateful and comforting" drink as can alone be obtained from a cup of rich, full-bodied and fragrant Ceylon or Assam tea.

In fact in my various visits to the mother country I was so captivated with their "two shilling" teas, for instance, that I would bring some home with me for my own table, but I fancied that they did not taste nearly so well here as they did in England, which was probably due to the difference in climatic conditions; but the taste for them grew upon me and I finally began to experiment with them in our various blends which we sell so largely throughout the United States—at first gingerly and mincingly, fearful of making mistakes, but as popular approval in the shape of increased sales and enthusiastic commendations followed upon each increase of the proportions in which we used them in the "blends" we have finally reached a point that we never dreamed of, and that is to say that very nearly half of the stocks of black teas which we now carry in our warehouses is of Ceylon or Assam growth. Nor can this be called a matter of partiality either, because we find that their use now in our blends is imperative, we could not well discontinue them if we would.*

* This is precisely the principle that I advocated 12 or 13 years ago, and find endorsed by the retail trade of today—what follows is merely a repetition of my old arguments.—J. M. M.

If any dealer doubts the value of our experience in this respect, let him start say with an addition to any of his black or mixed teas, of 10 per cent. of good Ceylon or Assam tea, then let him bide result, and when popular approval does surely show itself, let him then gradually increase this proportion, until he has say a third of good Ceylon, a sixth of Congou and the balance of Foochow oolong, and let him note the pleased looks of his customers as they come back for more of "that very same tea" which they got before—"it was just splendid."

We candidly admit that the mixture of these teas in our "Caricol Blend" has more than trebled its sales and that not alone in territory (like the coal regions of Pennsylvania where a heavy-bodied tea is always in vogue) but in all parts of the country, in the far west where pan-fired and basket-fired Japans are the rage, and in the South where Chinese greens are used largely, as well as in New England where the people are partial to straight Formosa oolong, so that I am sure the time has come when the Chinese and Japanese tea growers may well look with apprehension upon their vanishing trade, not alone in England but in America as well—Yours truly,

THOMAS MARTINDALE.

[No statement of facts could be clearer or more truthful than the above—and I anticipate an answer to the similar effect from every grocer who favors me with a written expression of his opinion regarding the value of Ceylon tea as a staple article in America.—J. M. M.]

November 15, 1898.—Editor, "Journal of Commerce and Commercial Bulletin." New York. Dear Sir,—Replying to Mr. A. R. Robertson's criticism upon my letter of November 9th, which he good naturedly assures your readers "is not captious," permit me to say that in writing to His Excellency Li Hung Chang, as I did two years ago, it was not because my predilections were so strongly in favor of Chinese or Japanese teas; but it was in protest against a pictorial form of advertising then used by the Ceylon and Assam Planters' Association, which I believed was not only hurtful to the China and Japan tea trade but to the Ceylon and India teas as well, and which form of advertising I am rejoiced to see has been dispensed with.*

I have always maintained that it was questionable policy for a business rival to attack another, either in public or private, or for an advertiser to try to advertise his own business by ridiculing or humiliating his rival, and this from my point of view was what the representatives of "machine made" teas were doing, when under their direction a lot of scenes were published, showing almost nude Chinamen, reeking with perspiration, standing over the firing pans, firing tea; the scene showing likewise an occasional pig running in and around the firing room, by way of variety. Now granting that this picture was true to life, would it not breed in the imagination of nervous and refined men and women a feeling of repugnance to all teas, as it would surely raise in their minds an element of doubt as to the cleanliness of any teas, machine made or hand made?

Mr. Robertson wants to know if a cup of good congou Oolong or Formosa may not be as "grateful and comforting" to us in our dry climate as the Ceylon or India teas are to the tea drinkers in the cold wet climate of England. Unhesitatingly reply, "Yes." † In fact I think that Ceylons or Indians "straight," (that is by themselves) are too rich in tannin; too full

bodied for the lovers of tea in America, while they re "just the thing" over there. But my argument in their favour is as to their use in connection with other teas; that they will improve and "bring up" almost any teas that they are blended with. [Why didn't Mr. Martindale write this 12 years ago? Too late now—so far as I am concerned.—J. M. M.]

Mr. Robertson suggests that the marvellous success which we have met with in pushing our "Caricol" blend of tea, may be the result of the clever advertising it has received. This might be so as initial orders, else why spend money for publicity; but when the "repeat" * orders, begin to come in and keep on coming year after year, then it shows that it is the innate merit of the article itself that is doing the work.

I believe with Mr. Frank Munsey of magazine fame, that the man who tries to give the public the most and the best for its money will always win over the man who tries to make the most out of the public and give the least he can. The public day by day through the redundancy of newspaper, circular and poster publicity is becoming more enlightened and more critical; and while advertising may build up a trade, it can never hold it if absolute merit is lacking in the article advertised.

In this connection it strikes me as strange that members of the tea trade in this country do not advertise more than they do. † I venture the assertion that \$20.00 is spent in England in advertising and pushing teas to every single dollar that is spent here. Everywhere in the British Isles, you are confronted with tea publicity in some shape, form or other; even the theatre is not free from it, as witness this from one of Colley Gibbers characters—Lady Gentle: "Tea, tea! thou soft, thou sober, sage, and venerable liquor; thou innocent pretext for bringing the wicked of both sexes together in a morning; thou female tongue-running, smile-soothing, heart-opening, wink-tipping cordial, to whose glorious insipidity I owe the happiest moments of my life, let me fall prostrate and adore thee!"—Respectfully yours,

THOMAS MARTINDALE.

Philadelphia, Dec. 7th, 1898.

To the Editor, "Journal of Commerce and Commercial Bulletin", New York City.

Dear Sir,—As Mr. E A Willard states in his letter, published in your paper of December 3rd, that "he will not answer the parties seeking to advertise their particular brands through the medium of correspondence in your columns" and as I am the only man so far who has mentioned a particular brand in this correspondence, I must take it, that I am the one whom he will not answer: may it not be that the position I take in this controversy cannot be answered, or rather refuted? And that is, that the mixture of a certain portion of Ceylon or India teas with a blend of other teas, is invariably beneficial; in fact, Mr. Willard seems to admit this when he says, "That Ceylon and India teas have some merit and are desirable in blending, is true" therefore I may take it for granted that my position is unassailable, even if in order to clinch my point I was compelled to mention the "Caricol Blend."

Mr. Willard seems to object (with some show of temper too, by the way) to the fact that India and Ceylon teas are expensively and extensively advertised, "that hundreds of thousands of dollars are being annually spent" in advertising India, Ceylon and Japan

* Here again I agree. To picture *Tea* as subject to such methods of preparation in any country, is injurious to tea of all kinds. To build upon the wrongs of others as a means of raising ourselves is poor principle and to have recourse to illustrating the vilest methods of tea manufacture or preparation as an advertisement of the legitimate and actual treatment accorded to all countries where tea is known to be cultivated is surely open to criticism, and ought to be stopped by legal enactment.—J. M. M.

† What have I argued from first to last?—J. M. M.

* The repeat orders form the principle of successful issue.—By the gradual treatment of China and Japan tea drinkers to a taste for *body* in the liquor. Ceylon can eventually swamp the demand for the others and establish the demand for *itself* in its purity.—J. M. M.

† The tea houses in America do, as a rule, advertise, but what? Not the tea on its own merits, but what kind of present goes with the pound! That is what I see everywhere, and the people are fools in this respect. They do not dare criticise the quality of the tea even if they can, for they know the answer they would get "what can you expect, with such a present?"—J. M. M.

teas by "foreigners." Is it a crime or an offence against society that "foreigners" should spend their money in such a lavish manner to advertise teas which the gentleman himself admits "are desirable in blending?" Will it not rather strike the candid reader that may be in some manner the gentleman's interests or holdings of other teas may be jeopardized in their value? Not only by the successful advertising these "foreigners" indulge in but also by its results in increasing the consumption of a tea which he would have us believe (on the authority of two English doctors) will produce "intoxication." If this should be the underlying reason of the objections, the gentleman raises against Ceylon and Indian teas, the logical conclusion is, that he himself ought to start in and advertise "the purity and more delicate flavor of Chinese teas" with the same vigor and persistency that these "foreigners" show in their methods of "making publicity."

I entirely agree with Mr. Willard, however, in regard to some of the "extravagant statements" used by these "foreigners" in their advertisement, and I have always maintained that certain pictorial advertisements which they have used are calculated to discourage the drinking of teas of any kind, and as a case in point I note in Mr. Blechyndes reply to Mr. Willard in your paper of the 6th, the claim which he makes as to the use of night soil as a fertilizer by the "Mongolian tea planters" while the statement may be, and undoubtedly is possibly true, yet such a story in a public point is bound to breed disgust in the minds of tea-drinkers who may say "well how do I know but what such fertilizers are used upon all the tea plants. I'll be hauged if I'll drink any tea at all. I'll drink plain hot water first." And I also agree with Mr. Willard that the quality of China teas imported here, has improved very much during the past two years, and yet I must disagree again with him, when he states that Chinese teas are so much purer and of better flavor than Ceylon or India teas. If this were so, why don't the rejections by the tea inspectors show it to be so. There have been over a million pounds of China and Japan teas (mostly the former) rejected by the tea inspectors, since the new inspection law went into effect, and as far as my recollection goes, not a single chest of Ceylon or India tea has been rejected in all that time. What stronger proof of their purity and flavor can be asked for?—Respectfully yours,

THOMAS MARTINDALE.

February 10, 1899.

Editor, "Journal of Commerce", New York.

Sir,—It would seem from the various letters which appear from time to time in your Journal in connection either with the Tea Inspection Law or the war duty of 10 cents, that the Tea Trade as a whole is a marvel of inconsistency, (may we not rather say inconstancy).

The Inspection Law was championed and lobbied through congress by the leading members of the trade, and loud was the acclaim of these same men when it was put into operation.

The next thing that the tea men wanted was a duty and letters by the thousand were sent to Congressmen and Senators pleading with our legislators to place a duty upon tea. Whether this movement was undertaken to benefit the holders of large stocks of tea or for motives tending to benefit the public good will never be known, but the fact that the duty was advised and requested by some of these very men who now "kick" against the pricks, which are caused by the Inspection Law and the duty as well.*

It is unquestionably true that both causes combined have resulted in the nearly total disappearance through the channels of consumption of all the old teas

*The imposed duty of 10 cents per pound has done good, and further litigation as to protection against refuse is better. The U. S. A. is year by year presenting a more substantial field for the Ceylon planters to claim as their special interest. A word to the wise ought to suffice!—J. M. M.

with which the market has been burdened for so many, many years, and it is safe to say that probably in no country in the world can so little poor tea be found as at the present time in the United States. What a startling contrast this is to the condition of the Tea trade a short five years ago, when it was loaded down with mountains of trash without character and without any vivacity or actual worth save that of making bulk. The writer recollects vividly that in purchasing the general stock of a wholesale grocer who was declining business after a busy career of over a half century, that his stock of tea upon examination was found to be absolutely worthless. The tea lead which encased it had become oxidized and had separated into little globules of lead which was sprinkled through the tea. The owner stated that he had purchased it during the war at a cost of over two dollars a pound, and he sorrowfully said, that he really "hated to part with it. It had been with him so very, very long." It was sent to the auction-room and was bought by those who cared less for quality than they did for price, at seven cents per pound, but today if a man were hunting for that same sort of stuff in any fair sized quantity he would have difficulty in finding it, even at two dollars a pound, as the country is now practically clear of all such trash.

The duty and the inspection law having brought about this happy condition of affairs, the "inconstant leading tea men" now commence to make lamentations against the enforcement of the inspection law, and turn their tearful eyes to Congress for a repeal of the duty, else they say the poor people will stop drinking tea and will drink coffee only; that the price has already gone beyond the poor man's purse, etc., etc. Yet only this week in the city of Philadelphia, a blend of teas was offered at 33 cents in forty-three stores with the choice of a can of tomatoes, corn or peas thrown in as an inducement to buy the tea.

I went into a little grocery store on Wednesday of this week to wait for a street car, and while there, out of curiosity, purchased a quarter of a pound of their cheapest tea, for which I was charged eight cents.

The best known blend of tea now before the country (the "Caricol Blend") is being retailed at 34 cents per pound in the East and West and North and South, so that the poor man cannot yet have suffered very much from either the operation of the Inspection Law or the duty, and the chances are that the competition in trade will continue to give him a pound of good, pure, wholesome tea at from thirty-four to thirty-eight cents for years to come, which in actual merit will be worth two pounds of such stuff as but a short year ago he bought for the same price but with a glass, or a cup and saucer or a chromo thrown in. He does not surely lose the chromo and the glass dish and the piece of china, but he gets what he did not get before—good tea, which instead of driving him to drink coffee as a substitute, will make him a more liberal user of tea than ever, because it may be that he never knew before what a cup of good tea really was, and the "cup that cheers but not inebriates" will then become his daily solace, his comfort and his necessity.

THOMAS MARTINDALE.

INSPECTION OF THE PEARL BANKS.

The following report by Capt. Donnan, Master Attendant, has been placed at the disposal of the press:—

Master-Attendant's Office, Colombo, 14th April.
Sir,—I have the honour to report my return to Colombo on the 13th instant from an inspection of the Pearl Banks on west coast, lying off Arippe, Karaitivu, and Chilaw.

2. The banks examined off Arippe were the Cheval Paar, Southern portion of the Periya Paar, Moderagam Paar, Kerai, outer Vankalai Paar, Kallatidal Paar, Kondache Paar, and Jaggenboon Paar.

3. Large beds of young oysters from 3 to 6 months old were found on the Periya Paar and

on the outer Vankalai Paar, but no oysters whatever were found on any of the other banks. The few small patches of young oysters that were found on the east side of the Cheval Paar last year have entirely disappeared.

4. The banks examined off Karaitivu were the Dutch Moderagam, Kaaraitivu Paar, Alantua Paar, and Mutuvanatu Parr. No oysters were found on the Dutch Moderagam, Karaitivu Paar, and Alantua Paar. The Mutuvanatu Paar, which was so promising two years ago, I regret to report, failed completely. During the two days employed in going carefully over this bank only 120 oysters of $\frac{1}{2}$ to $3\frac{1}{2}$ years old were found, so that practically the 72 millions of young oysters estimated to be on this bank in March, 1897, have completely disappeared. I had to report last year of a very large reduction in the number of oysters on this bank, but I then hoped that the oysters left, being older and stronger to resist attacks of fish, would remain on the bank and come to maturity. The only evidence found of the cause of the disappearance of some of the oysters was that of a few of the empty shells sent up by the divers having a piece broken off them, large enough to have caused the death of the oysters, and it seemed to me that the pieces had been bitten off the shells by some fish. There were not, however, many of the empty shells damaged in that way. Out of a total of 55 picked up there were only 5 damaged, the remaining 50 were perfect, and showed no sign of the cause of the death of the oyster. The bulk of the oysters, however, must have been removed from the bank entirely otherwise, many more empty shells would have been found, and therefore, the cause of their removal remains a mystery. It is probable, however, that they might have been removed entirely by large fish such as skate, which would crush the shells in their mouth, and swallow the fragments of shells along with the oyster. I have found the stomachs of rock fish, of 10 to 15 lb. in weight, that have been caught on a bed of young oysters, full of fragments of the young oysters' shell and if such fish swallow the oyster shell, it is very probable that larger fish able to crush the shell of older oysters would do likewise.

5. The banks examined off Chilaw were the Udapanakane Paar, Muttundi Paar, Jakempiddi Paar, Kanukupany Paar, Chilaw Paar, Manatty Paar and Ungul Paar. No oysters, however, were found on any of these banks.—I remain, sir, your obedient servant,

(Signed), J. DONNAN, Master Attendant.
To the Hon. the Colonial Secretary.

CEYLON TEA COMPANIES: SCOTTISH CEYLON—PROPRIETARY —RAGALLA.

We publish reports of the annual general meetings of the above Companies, the latter of which alone declared no dividend.

In the case of the Scottish Ceylon a slight falling-off in results had been reported, and the rise in exchange had added £500 to the expenses of production. The average price, too, was $3\frac{1}{2}$ cents down from that of 1897; nevertheless the Company was able to pay a satisfactory final dividend of ten per cent. But for the inconsistency of the seasons, apart from other causes, it would doubtless have been appreciably higher.

In the Ceylon Proprietary Tea Estates Co, the rise in exchange was responsible

for a £900 increase in cost of production, while on the other hand the Company's prices had kept level with those of the previous year. The Chairman, however, stated his opinion that they were still below what they should be. With from 220 to 250 acres of young tea not yet in bearing, the declaration of four per cent dividend was creditable enough.

No dividend from the Ragalla Company was something of a surprise, when the news reached us by cable. Kelburne, the Chairman has now said, had been their disappointing property owing, first, to the rapid failure of the old coffee on the estate, and then to the shade from the coffee-trees hindering the growth of the young tea which was put in. Reference was made to Mr. W. L. Strachan and his report, which we have already published and which showed that in the Ragalla Group there was a fine possession which would rise superior to the handicapping incubus of Kelburne, more especially if the latter began to lose that character. Though no dividend was paid, it was satisfactory to learn that the capital account would in all probability be closed with the expenditure of £600 for the current year, unless a Pelton Wheel were installed, costing in all, £500. For this Company the dawn seems at hand.

CEYLON TEA IN CANADA.

STRONG MARKET REPORTED.

We publish a cutting from the "Montreal Daily Star," kindly sent us by a friend now visiting the Dominion, in which a remarkably strong market for tea is stated to have been the "feature of the grocery trade" during the last week in April. So much so that local dealers in Montreal had, at the date under notice, April 26th, shipped to London packages of tea at under 10d per lb. to the number of 1,600! Accordingly the local demand for low priced teas became for them very difficult to meet and prices had risen in consequence. It is further remarked that as China is not producing so much as hitherto, Ceylon and India blacks having driven out the Celestials' and as the former have been 11 millions lb. short of requirements, the deficiency cannot be remedied for some time; the Indian and China markets not opening till about the end of May, "while the small supply from Ceylon will hardly be noticed."

We are surprised at the later statement; but surely in view of such contingencies as that reported, it is, or rather it was, a mistaken policy for Ceylon producers to starve the London market, when there has been such a call for assistance that away West Canadian dealers have had to help in the supply and have been driven into a corner to meet local demands. Rises of 40 or 45 per cent are no doubt pleasing enough as results, but a little less of the starvation policy should increase sales immensely. We refer specially to the low-grade teas, concerning which we see that fears are entertained in the Dominion that the Indian and China may not reach them till September or October. Meanwhile Ceylon should be able to some extent to step into the breach with some brisk and substantial shipments,

THE WEATHER AND CROPS.

THE effects of the trying drought, which almost all parts of the Island experienced during the first quarter, have not quite disappeared yet, so far as the Export Tables are an index. We are now in the last week of the fifth month; and the Chamber of Commerce tables, made up to the 23rd May, which we published for our *Overland* edition and issued as a Supplement afford an interesting and instructive study. The form, in which we publish the Export Tables, enables our readers to see at a glance how the leading exports at the end of every week compare with the quantities sent away for the corresponding period of the three previous years. The tea shipped this year, so far, is 43,836,320 lb., and is for the first time, we believe, in 1899 ahead of the quantity shipped last year; and that only by about 220,000 lb., while it is still short of the exports to 23rd May in 1897, which reached 44,782,326! We know no reason for the falling-off, except the drought at the beginning of the year, coupled to a small extent with the frost in the highest districts. The last ground which has been already made up, gives promise of the realization of estimates for the year—though it is too early to prophesy confidently, or to revise the estimate. Coffee, curiously, has outstripped last year by nearly 1,000 cwt., albeit the quantity sent away is a miserable 6,344 cwt.; but the drought which told so disastrously on tea flushes was precisely what would bring out a blossom on coffee; and who knows but that the season may literally bear fruit next year, and help to swell the exports of the now despised berry? Cinchona, too, exhibits a leaf, with 336,700 lb. exported, which is about 50,000 lb. in excess of last year, and 3,000 lb. in excess of 1897. The rise is probably due, rather to the upward tendency of quinine early this year, and the slackness in tea plucking and manufacture which set labour free for barking, than to any increase in the acreage under cinchona, or any greater attention to cultivation. Cocoa, 20,555 cwt. exported, is 5,400 short of last year, but the fall may be explained by the rule of alternate big and small crops. This year is 5,000 cwt. ahead of 1896 and 1897. So that the chances are against disease having had been much to do with the outgoing crop. Cardamoms, which are not immediately affected by drought, are ahead by about 18,000 lb., of last year when 202,021 lb. were sent away, but only 8,300 lb. in advance of 1897.

It is on low-country products, however, that the drought has told with the greatest severity. Only 583,339 lb. of quilled cinnamon have been sent away, or nearly 200,000 lb. less than last year, 300,000 lb. less than in 1897, and 150,000 less than in 1896! The deficiency in manufactured bark—which is available only when the weather favours a free flow of sap, without which “peeling” is at a standstill—has, however, been more than covered by excess in chips—generally coarse bark which does not peel, and which can be harvested (scraped off the sticks) all the year round. The 942,777 lb. of chips exported represent an excess of 370,000 lb. over last

year, 400,000 over 1897, and 600,000 over 1896! Whether this immense quantity will tell on the prices of quilled bark is doubtful as fine bark is put to special uses for which chips are not suitable; and the deficiency in quills is really heavy. The prices now ruling confirm these doubts. The hand of the drought is to be seen in all the products of the coconut palm; for although oil shows a slight increase of 3,200 cwt., as compared with last year, previous weeks showed a deficiency, and the increase now recorded is scarcely proportionate to the growth of the palm industry, nor is it sufficient to compensate for the falling-off under other heads. Thus, in copra, which showed such splendid possibilities last year, there is a falling-off this year of 17,000 cwt. from the 114,435 of 1898. Desiccated coconut, in which there had been a steady progressive increase year by year, after the leaps and bounds of the earlier years of the new industry, exhibits a fall of 300,000 lb. as compared with 1898, and almost the same figures as 1897. In coconuts there is a fall of 200,000; and in poonac of 36,000 cwt. The two heaviest crops of nuts for the year have yet to be picked; but there is no reason to believe that these will be larger than the corresponding crops of the last two years. It is feared they will be smaller. If so, prices must go up, as the demand for copra is steady, and is generally stronger in the latter part of the year. The drought we have gone through will tell on the early crops of next year, too,—another reason why prices should be maintained, or even rise.

A product which shows a decided advance is one that is not grown, but dug up. We have sent away 210,280 cwt. of plumbago, against 161,255 cwt. last year, 123,398 in 1897, and 129,267 in 1896.

ASH OF CINNAMON BARK.—A fair amount of adulterated powdered cinnamon has been found in commerce in Germany, recently. Examination of a large number of samples of the pure drug have showed that the maximum quantity of ash should be five per cent, with not more than one per cent of silica.—From *B. and C. Druggist*, for May.

SALT AS A PLAGUE PREVENTIVE.—E. A. H. writing from Nice to the *Times of India*, expresses confidence in salt as a plague-preventive, and ascribes the immunity from sickness which he had enjoyed, during 35 years' residence in India, to a liberal consumption of salt with food. Even if the cheap and common condiment is not a direct preventive, there can be no doubt that an adequate use of salt goes a good way to sustain health; and it is the weakly ones who are susceptible, not alone to plague, but to all diseases. In this connection, it is interesting to learn that “further experiments are this summer to be made in the German Army with the object of ascertaining the exact value and sustaining power of sugar. Two companies of two regiments from different army corps are to make long marches, and the more intelligent men will be provided with pure sugar and with pastilles of sugar to which coffee or lemon will be added, and which will be dissolved in the water which will be carried in tins by the men. Comparisons will then be made and the results reported upon.”

NEW COMPANIES.

UKUWELA ESTATES CO., LD. (61,745).—Registered April 26th, with capital £17,000, in £25 shares (378 6 per cent. cumulative preference), to acquire the Ukuwela and Bowatte estates, in the Island of Ceylon, to adopt an agreement with F. G. Ambrose, and to grow, export, import, and deal in tea, coffee, cocoa, and other produce.

The number of directors is not to be less than 3 nor more than 5; the first are T. Gallie, T. Johnston, H. Neilson and C. Paterson; qualification £250; remuneration as fixed by the co. Registered office, 44 W. George St. Glasgow.

SEWU RUBBER CO., LD. (61,835).—Registered May 1st, with capital £1,000 in £1 shares, to adopt an agreement with F. Dawkins, and to acquire, own and work any rights relating to rubber and mahogany in Africa or elsewhere. The number of directors is not to be less than 3 nor more than 7; the subscribers are to appoint the first; qualification £100; remuneration as fixed by the co. Registered by Segar Bastard and Co. 56 Cannon St, E. C.—*Investors' Guardian*, May 6.

TEA IN CANADA.

REMARKABLE SCARCITY.

(From the MONTREAL *Daily Star*, April 26.)

MONTREAL SELLS LONDON A LARGE ORDER—A STRONG MARKET.

The strength of the tea market is undoubtedly the feature of the grocery trade this week. It appears that the Ceylon and India crops are about eleven million pounds short of the requirements and this shortage has had the effect of sending prices of grades under ninepence a pound up about 45 per cent. in the London market during the past few weeks.

Messrs. W D Stroud & Sons' say that Ceylon and India teas which were sold down at 5½d a pound two months ago cannot now be had at less than 8½d. Formerly, low grades sold to the trade here at 12½ and finest at 49c. while today the lowest cannot be had under 16½c. and the fine qualities bring 45c.

Reviewing the situation Mr. Stroud states that to show the excitement existing in the London trade, teas which blenders would not entertain at all two months ago sell quite freely today at 8d a pound.

In order to obtain sufficient for their requirements, London dealers have been sending even to Montreal for samples of all kinds of black under 20c a pound and local dealers have already shipped them some 1,600 packages.

Local dealers have now great difficulty in getting low price teas to meet the demand, and as a consequence of the scarcity, prices of some qualities have gone up 40 per cent. in the past three weeks. Green teas are also firmer.

One of the reasons given for the scarcity was that Ceylon and India teas have been gradually driving out the China blacks, and as China has not been producing the quantity heretofore produced, there are no stocks to take the place of the shortage in the other kinds. It also appears that the shortage cannot be relieved for some time as the China market does not open till about the end of May, and the India around the same time, while the small supply from Ceylon will hardly be noticed. As the best qualities are picked first it is not thought that the low grades will reach here before September or October.

PRODUCE AND PLANTING.

THE NEW SEASON FOR CHINA TEA.—The opening of the Hankow market, once an event of importance in Mincing Lane, has of late years chiefly concerned Russian and other foreign buyers. From time to time there are mysterious rumours to the effect that one of these days we shall see what we shall see in regard to China teas, but at present the indications of any remarkable increase of interest here in the doings at Hankow are few. Nevertheless, China tea has its uses in the London market, and the "Grocer," in commenting upon the opening of the new season in China, points out certain features of the demand, which are of general interest to the trade. It says: "Although operators here evince little interest in what is going on in Chinese teas, pretending that the dealers do not want them, and that the said teas are only asked for and drunk by epicures, connoisseurs, and old ladies of the aristocracy yet it must be owned that lately a more than average share of attention has been given by the blenders who have been sticklers for 'price' tea of common quality suitable for their special purpose, when there has been an unexpected and prolonged dearth of Indian and Ceylon descriptions of the lower class."

A "HUNGRY MARKET."—"This is a fact which should not be lost sight of when forecasting the probable future course of the tea market in general, for in times of scarcity all nice distinctions of quality and degrees of reference are silently dropped and fanciful pickings and choosings of favourite growths have to make room for rough-and-ready purchases of whatever ill-assorted teas may chance to be on offer. It is very well to say as we have often heard it said recently, that many of the dingy who'side men will not touch China tea while there is any Ceylon or India left to be had instead and even then it must always be had per pound under the lowest grades of British-grown teas. But circumstances, fresh in the recollection of the trade, have somewhat exploded this idea, and is proved by the revival of the demand that has been experienced for China tea at a certain figure, accompanied, as it has

been, by a considerable advance in value during the last few weeks, whilst the whole tendency of the London market is, if anything, still towards higher rates. The severely reduced stock in London, whittled down, to 71,129,450 lb. in contrast with 82,251,100 lb. on May 1, 1898, is sufficient proof of the poverty of the present situation in respect of not having at command an adequate and immediate supply of suitable teas for home consumption; and it can hardly be doubted that, when the new Monings arrive about the end of June, they will come upon what is significantly called a 'hungry market.'

THE TEA DUTY.—Last night in the House of Commons, during a discussion of the Budget Bill, Mr. Broadhurst boldly moved to reduce the tea duty by one half. The Chancellor of the Exchequer pleaded that that involved the loss of a sum of between a million and a half and two millions. He really could not face such a contingency. On a division the amendment was negatived by 246 votes against 125, so that there need not be any further discussion about the tea duty outside the House of Commons for a time at least.—*H. and C. Mail*, May 12.

FACILITIES FOR MAKING GOOD TEA—VIII.

One letter from Nuwara Eliya, and two from the adjoining little district of New Galway, may well be considered together. The two last are agreed that the chief drawback to the outturn of a better average tea, is the rush of leaf during March, April and May generally; while Nuwara Eliya complains of the lack of "detail factory supervision," by which is meant, we suppose, that higher intelligence than that of the ordinary tea-maker is wanted in the factory, if full advantage is to be taken of soil, climate and elevation—all of which favour the manufacture of high-class teas. While the jāt in New Galway is medium and the soil the same, Nuwara Eliya, being of more recent planting, undertaken when experience had taught the need of the utmost care in the choice of bushes, claims a decidedly good jāt, with a soil which, though not uniform, is generally above the average. There are no worn out estates in these districts; but patches in the steeper and more exposed parts are giving way; and for these grevillias are recommended, equally useful for firewood and for timber. From New Galway, we have one opinion absolutely in favour of manuring if prices kept up, and another favouring manure, if large yields are wanted, but prophesying a poor quality of tea. Why the tea which follows the application of manure should be poor, we are not told; but we thought that notion had been exploded by widespread experience. If not, it would be interesting to find out which manures are prejudicial to quality, and then to trace out the causes by the aid of scientific analysis. Nuwara Eliya, on the other hand, favours manures where transport is easy, but does not think the district requires refreshment just yet.

Nuwara Eliya commits itself to the declaration that all its estates are deficient in withering room, though factories on the whole are well supplied with machinery, and also with motive power, so far as water is concerned. New Galway, though in a more guarded manner, gives expression to the same complaint, one writer noting the

deficiency of withering space in wet weather, and the other declaring that more accommodation would be a decided advantage in the best flushing months and in wet weather. Some estates in this district are deficient in machinery, but the motive power, being water, is always available. From all three planters we have testimony of the abundance of labour, and one specially notes the advantage it offers in permitting of careful plucking even in the months of biggest flushes. While New Galway tells us that there has been but little of severe pruning so far, the general opinion favouring light pruning once in two or three years; Nuwara Eliya insists that severe pruning must be resorted to once in nine or ten years, after three or four light prunings. In neither district has pruning been too long neglected; but while the pruning at first, of bushes planted on virgin soil, was practised once in three years, every other year is the rule now. Nuwara Eliya claims to be the most suitable district for tea in the whole Island, and New Galway declares that there are thousands of acres of forest in the locality, equal to any in Ceylon; but these are not available at present. It looks forward to the time when, lowcountry estates having replaced their tea with some more suitable and more profitable product, the Government will see the wisdom of removing present restrictions, and offering alternate blocks of 500 acres to public competition, above the present elevation limit. Though we ourselves look forward with hope to that time, we cannot agree in the wholesale condemnation of the lowcountry. But for its teas, Chinas would be once more in the ascendant; and, while there is a certain demand for low-grown teas, their remunerativeness cannot be questioned. And has there been any offer to beat that which has been made for the property of a lowcountry Company, whose shares stand at a premium of 300 per cent, and which has been declaring dividends of 25 per cent with astonishing regularity? *Per contra*, one of the letters from New Galway, while claiming that soil and climate are exceptionally good, laments the failure of the bushes in the vigorous appearance which characterized them some years ago; and it desires the aid of experts to ascertain the cause of the decline. We trust the explanation will suggest the remedy, and that upcountry and lowcountry estates alike will continue to contribute to the general prosperity by their teas of distinctive flavor and body.

RUBBER PREPARATION.

India-rubber preparation or separation, with all the improvements which are "in the air," is likely to be an important question for many Ceylon planters for some time to come. Mr. Willis has been telling us a good deal that is new and he and Mr. Parkins are likely to give us a good deal more ere long. Meantime, we have an interesting communication today from Mr. Hart of Trinidad in criticism of a paper by Mr. Biffen, which we copied into our monthly periodical some months ago. Everything

bearing on the subject of rubber separation and coagulation is of interest to us at this stage of the industry in Ceylon, and we are obliged to Mr. Hart for writing so freely on the subject.

TEA ON SALE OR RETURN.

At the Southwark County Court before his Honour, Judge Addison, Q.C., on Monday, the British and Benington's Tea Trading Association, Limited, of Southwark-street, sued Mr. C W Burton, a grocer, carrying on business at Hemsby, Norfolk, to recover £2 13s 2d, for tea supplied. The Association was represented by Mr. Philcox, and the defendant by Mr. Foakes.—Mr. Alfred Scoopes, plaintiffs' traveller, said he took an order from the defendant for 45 lb. of tea, which was to be exchanged within two months for other tea if it could not be sold. The Association did not return any money. Defendant sold a portion of the tea and sent on the money, but said he could not get rid of the remainder. He was offered other tea in its place, but he refused to accept it and returned what he had in stock. It had not been accepted and was then in the possession of the railway company.—Mr. Foakes said that defendant had the tea on sale or return. He gave it a good trial but found it would not sell. He returned what he had left after four and a half months and sent on the money for the little he had sold. There was a distinct agreement between the defendant and his wife and the traveller that the tea should be had on sale or return. There was a certain inducement held out to purchasers which was that they would receive an article for domestic use in purchasing a quantity of the tea.—His Honour: I know; they give a present with half a pound of tea. That is very common.—Mr. Foakes: Yes, but it seems to throw some doubt on the quality of the firm's tea, because if they sold a good article they would not require to give presents with it.—His Honour: That is not so with the Association. They do it to oblige their customers—to enable your clients who sell tea, in a village to get rid of it. But the question here is as to sale or return. I have never heard of tea being sold in that way, although I have heard of Sir Walter Gilbey doing business on sale or return with regard to wines. That was how he made his large fortune by supplying wines on sale or return. But sale or return business is one ordinary firm will not touch; it is fatal to their interests. (To the traveller): Are there any large firms in the tea trade who deal with grocers on sale or return.—The Traveller: Yes, there are. I know of cases where it is done.—Mrs. Burton said she gave the order for 45 lb. of tea at £4 2s 6d to the traveller, and it was confirmed by her husband whom she consulted with at the time.—His Honour: What was the arrangement entered into?—The traveller said we could have the tea on sale or return. There was no time specified as to when the tea should be returned if it was not sold.—His Honour: Are you sure it was sent to you on sale or return?—Yes, sir, or I should not have had it.—His Honour: What sort of tea was it?—No better than I sell at 1s 4d a lb.—His Honour: Why didn't it sell better?—I don't know; we pushed it.—His Honour: It is no reflection on the tea to say that it would not sell. There is a great deal of fancy in regard to tea. At one time people made a great fuss about Ceylon, but now they have come back to China after trying Indian.—Witness said that some very nice presents were sent with the tea, but customers wanted certain articles which the first customers had chosen, and would not buy the tea unless they could get them. That was one reason why it did not sell well, but she could not order another parcel just to get certain presents.—His Honour: Did you give a present with each lb. of tea?—No, every ½ lb. at 6½d.—His Honour: What! a quarter of a lb. of tea and a nice present for 6½d. Have you ever bought from other people on sale or return?—Yes, the Ceylon Union Company, and I kept some of that tea seven months. I returned some I had had two years, and then I was allowed

5 per cent. discount.—Mr. Burton gave corroborative evidence.—His Honour said the defendant and his wife were more likely to remember the terms of the contract than the traveller who, in his zeal to do business, might have pushed the tea upon them on sale or return, and have forgotten he did so. He believed the defendant was supplied with the tea on sale or return, and therefore gave judgment for him with costs.—*Grocers Journal*, May 6.

INDIAN AND CEYLON TEAS.

The following letters appeared in the *New York Herald* of April 6th and 7th with reference to the lecture given by Dr. John Goodfellow, Ph.D., F.R.M.S. and published in that newspaper, on the 31st March, attacking Indian and Ceylon teas:—

Your article and correspondence on the subject of tea have amusing sides to teamen, as well as being liable to mislead your intelligent readers in this country.

Dr. Goodfellow's remarks undoubtedly applied to black tea, in the manner in which it is used in Great Britain, as in the lecture which formed the basis of your reporter's interview, he stated "that green teas contained more tannin than black teas." I would ask your attention to these facts:—There are 90,000,000 pounds of tea imported into America from China and Japan: less than ten per cent is China black, the balance is green and Oolong, with the exception of what comes from India and Ceylon, and which is known as "pure black" tea, no colouring matter being used in these countries.

In his remarks he emphasised the statement "that green teas contained more tannin than black teas, also more of the aromatic all," which he thinks "acts with a narcotic effect on the higher brain." It is quite apparent that between the teas available to American consumers, green and black, his recommendation would be for the pure black teas. The remarkable increase in their consumption all over the world is the best indication of their merits.

As regards the healthfulness of India and Ceylon teas, it is a matter of common knowledge that this was the solo beverage on which Lord Kitchener's army made its victorious campaign.

Concerning the healthfulness of tea, of which there seems to be some diversity of opinion, the following extract from a recent English paper is of interest:—Sir William Jenner, who died at the age of eighty-three years, had been Her Majesty's physician for upwards of thirty years. He retired from the Queen's service in 1893 owing to failing health. Throughout his busy career the physician's sole stimulant was tea. He drank it with his luncheon, he took it in his carriage while on his round of afternoon consultations, he drank it again at dinner, and tea was taken as a nightcap.

The great thing is to make tea properly, give it a short steep, and pour off the leaves, and it will not harm an infant, while it will stimulate strong men, doing the hardest of physical or mental work.

IMPARTIAL IMPORTER.

In your issue of March 31st you publish a very interesting article under the caption "Tea Drinking in all its Phases." The article in question, expressing as it does the views of Dr. John Goodfellow, Ph.D., F.R.M.S., naturally attracts more than passing attention.

In England practically nothing but black teas are used, and Ceylon and India tea has supplanted the China and Japan varieties. Now as to the effect of tea on the health of the public, Miss Florence Nightingale in her "Notes on Nursing" makes these comments:—"There is nothing yet discovered which is a substitute to the English patient for his cup of tea; he can take it when he can take nothing else, and he often cannot take anything else if he has it not. The only English patients I have ever known refuse tea have been typhus patients, and the first sign of their getting better was their craving again for tea."

India and Ceylon teas are black teas, and, as Dr. Goodfellow says, they are stronger than China teas. As a matter of fact, one pound of the former will make from two to four times as much liquid tea as the same quantity of China or Japan leaf. Assuming for argument sake that Ceylon and India tea contains more tannin than China black tea and as it takes from one-half to two-thirds less of the former than of China tea to make an equal quantity of liquid tea, is it not obvious that a cup of Ceylon-India must necessarily contain much less tannin than a cup of China tea?

Further, as Ceylon and India teas are unquestionably stronger and require a shorter steeping or infusion than China teas, and Dr. Goodfellow has laid down that the active desirable principles in tea are readily dissolved and the undesirable principle (tannin) dissolves more slowly, is it not also evident that tea which is prepared with short steeping is more hygienic than that which takes a long infusion to make a liquid sufficiently strong to satisfy the ordinary tea drinker?

TEA DRINKER.

THE DISTRIBUTION OF INDIAN AND CEYLON TEA.

In an interesting article in a recent number of the *Times of India*, dealing with "Some Facts about Indian Trade," we observe some suggestive facts on the exports of tea. During the past three years, the quantity exported from India has risen between 8 and 9 million lb.—from 148 millions to 157, to deal with round numbers. During the same period we have advanced from 11 to 12 million lb., that is from 108 millions to 119. Our big neighbour congratulates itself, as we do ourselves, on the growing quantities which find buyers outside the United Kingdom; and with good reason. Without a growing demand for our teas from all parts of the world, a fall in prices is inevitable—more correctly a further fall, as the downward tendency which producers have had to face during the past decade is primarily traceable to the supply having outrun the demand. The increased consumption in the United Kingdom cannot account for the whole of the growing output of British-grown teas. Other markets are essential; but it is curious that, while the Indian exports to Great Britain have steadily advanced during the past three years at the rate of about 2 million lb. annually, our own exports, after having leapt from 94 million lb. in 1896 to 99 millions in 1897, fell back to 96 million lb. last year. The decrease affords no ground for regret, as its explanation is, not any weakening of the popularity of our teas in the mother country, but a growth in direct shipments hence to countries which formerly drew almost all their supplies through London. A comparison of the figures in the table published by our Indian contemporary, with those in a table we have compiled, will show how much stronger has been our advance in other countries than that of India. The following is the table from the *Times of India*:-

	1896-97.	1897-98.	1898-99.
	lb.	lb.	lb.
To United Kingdom	135,456,884	137,655,857	139,245,995
" Russia ..	457,634	689,271	500,889
" United States ..	784,962	929,704	1,413,624
" Persia ..	1,993,823	1,464,394	3,456,791
" Turkey in Asia	1,981,197	1,336,970	2,598,281
" Australia ..	6,155,895	6,792,654	6,306,135
" Other Countries	2,078,066	2,582,967	3,948,957
Total ..	148,908,461	151,451,817	157,470,672

Our own compilation is as follows:-

	1896.	1897.	1898.
	lb.	lb.	lb.
To United Kingdom	93,936,361	98,930,059	96,133,893
" Russia ..	246,233	439,349	2,714,003
" United States ..	718,600	830,873	2,183,188
" Australia ..	11,062,832	13,258,456	15,126,891
" Other countries	2,177,386	2,595,880	3,614,766
Total ..	108,141,412	116,054,567	119,763,071

Persia and Turkey in Asia find no place in our Export tables, though Turkey (in Europe), from very small beginnings, took over 73,000 lb. last year; but India is a growing customer of ours with 924,000 lb., 986,000 lb. and 1,091,000 lb. the last three years. It will be seen at a glance how far ahead we are of India in Exports to Russia, the United States and Australia, and what strides we took last year in all three. On re-exports our Indian contemporary writes:-

Another branch of the tea trade seems to be in need of greater elucidation—that dealt with in the returns of re-exports of foreign merchandise. We received last year 3½ million pounds of tea from other countries, principally from Ceylon and China. Of this quantity 2½ million pounds was re-exported, almost entirely to Persia. Presumably the bulk of these re-exports found their way into Russia. But the re-export trade in tea is in a very different position from that which it occupied in 1896-97, when we received for re-exportation over six million pounds from China alone.

NINE YEARS OF TEA IMPORTS INTO CANADA.

CONSUMPTION 4 LBS. PER HEAD PER ANNUM.

Imports of tea into the Dominion during the fiscal year ending June 30th, 1898, were 19,954,565 lbs. valued at \$2,721,189.

In quantity, this is the smallest since 1893, when the figures were 18,034,897 lb.

The imports of tea into Canada during the nine years ending June 30th, 1898, were as follows:-

	Quantity in lb.	Value in \$.
1898 ..	19,954,565	2,721,189
1897 ..	24,317,104	3,310,348
1896 ..	22,667,535	3,252,133
1895 ..	20,610,733	3,115,025
1894 ..	20,459,530	3,039,928
1893 ..	18,034,897	2,975,452
1892 ..	22,593,619	3,650,940
1891 ..	18,042,043	2,981,415
1890 ..	18,451,373	3,073,643

The decline in the importation for 1898 cannot be ascribed to a falling off in the consumption of tea. It was undoubtedly due to the heavy purchases which were made during the previous year in expectation of a duty for revenue purposes being placed upon that commodity. Heavy stocks was the natural concomitant, which, in turn, caused a decline in importations. Consumptive requirements are limited, and, when one year the market is over-supplied, it is only to be expected that the next will be characterized by more cautious buying. Notwithstanding the decline, however, the average for the past two years exceeds that of the previous two, the average for 1897-98 being 22,135,834 lb., against 21,639,131 lb. for 1895-96.

The present fiscal year promises to witness another large importation of tea, the quantity brought in during the nine months ending March last being valued at \$2,965,068. The monthly returns from which the figures for the past nine months are gathered do not give the quantities. In value, it will be noticed, the figures exceed those for the 12 months of 1898. The monthly average for 12 months of 1898 was \$221,765, and for 1897 it was \$226,425. For the nine months of this year it is \$328,345

The fact that teas are costing more than in 1898 would in itself help to swell the value of the teas imported; but when the full returns have been issued, it will doubtless be seen that there is an increase in the quantity as well as in the value, particularly in view of the smallness of spot stocks in Canada in first and second hands.

It may, perhaps, not be uninteresting to note that the tea imported in 1877, 22 years ago, exceeded in value the imports of tea during any one of the past nine years given in the above table. In regard to quantity, however, the conditions were the very opposite, there only being 13,575,657 lb imported. Indirectly these figures show the difference in the price of the tea imported in 1877 and 1898 respectively, the cost being 25-90c. per lb in the former year and 13-63 in the latter, a decline of over 47 per cent.

Taking the population at 5,000,000 in 1890-91, and at 5,500,000 in 1897-98, the average consumption of tea in Canada per head during the former two-year period was about 3-64 lb and during the latter 4-02 lb.—*Canadian Grocer*, April 28th.

FACILITIES FOR MAKING GOOD TEA: BOGAWANTALAWA.

The information collated in our recent articles on this subject does not seem quite correct, to a correspondent whose letter is before us—more especially on the subject of MANURING. "The district, we are surprised to learn, is a stranger to manure," we are assured, is not correct. Seven estates could be named that have been manuring regularly for the last four years at all events—and six other estates that have either tried manure, and not gone on with it, or have just begun manuring and intend to go on with it. In regard to "Plucking" we are told that a good many planters have gone in for coarser leaf, because they find it has paid best, and is not so trying to the tea bushes: and "two or three estates which 'have been most careful about their leaf: 'and whose plucking has been the most 'costly, are now getting hardly any better 'prices than those that have gone in for 'coarser leaf, and cheaper working." Again, we are assured that though "Withering Space" may be deficient in a few cases, as a rule the Bogawantalawa factories are as well found in this respect, and in machinery, as in most districts. No doubt, in every district one could find some estates that, for various reasons, are not as "up to date," with manufacture, and factory accommodation, as they might be, and especially so on estates that are not all in bearing yet; and the same, of course, applies to some estates in Bogawantalawa; but only to a few. Altogether, the summary we gave does less than justice to this fine district, and so we give prominence to the above corrections.

COOLIES FOR ASSAM.

REVISION OF IMMIGRATION RULES.

A set of revised rules under the Immigration Act for regulating the importation of coolies into the tea districts of Assam have now been published by the Chief Commissioner of Assam to remedy the defects existing in the matter of sanitary conditions, transit, food and clothing of emigrants, which were brought to light by the investigations of Lieutenant-Colonel R. Neil Campbell, who, in consequence of a severe outbreak

of cholera on the river steamers which formerly were exclusively used for the transit of emigrants to the various districts of the province, was specially deputed to enquire into the matter. The new rules have been drawn up on the lines of those recently issued by the Government of Bengal, who took action after consultation with the Local Governments concerned, the Chamber of Commerce, and the Tea Associations. On the railway routes from the Recruiting Depots the adoption of a system of telegraphic advices will enable the authorities to prevent congestion of traffic, and a further improvement is the restriction of traffic to the two main routes, one *via* Naihati and Goalundo, and the other *via* Katihar and Jatra-pur.—*Pioneer*, May 28.

THE FLORIDA VELVET BEAN.

For the past year or two—says the Editor of the *New South Wales Agricultural Gazette*—a great deal has been written about this extraordinary plant. Mr. Geo. W. Hastings, an orange-grower in Florida State, thus sums up his experience of it in one of the leading American papers, and in view of the introduction of the bean to this Colony his words may be of interest:—

"The cultivation of the velvet bean up to the present time has established the following facts:—For the extreme south, it is the greatest forage and humus producer yet discovered. North of central Georgia, only in exceptionally long seasons will the seed mature. North of the Ohio River, it will make large growth of vine and leaves but will not come to bloom.

"It is a great fertiliser for orange groves, but its use is not advisable after the groves come into bearing, as the vines are a habitat of the pumpkin (stink) bug, and on the decay of the bean this pest goes to the orange, puncturing the fruit, and causing it to fall.

"As a rule, the velvet bean is not the equal of red clover or the cowpea, either for seed or forage, north of the Gulf States. For forage and fertiliser it has no equal in the barren sandy lands of the South, where the seasons are long enough for the crop to mature before the coming of frosts."

COFFEE NOTES FROM RIO.

The coffee crop of Nicaragua, which is now being gathered, is reported as yielding only about one-half the usual quantity of berries.

Our advices from one of the interior coffee districts of S. Paulo are to the effect that the growing crop is well grown and of better quality than last year.

A gentleman who was through the new coffee district as far as Ribeirão Preto last week, says the coffee plantations are in splendid condition and are loaded with fruit. The crop will be a very large one. Commenting on an estimate in the papers of two millions bags, one gentleman in that locality said it was more likely to be six millions. Ten years ago the country was quite new and few coffee trees were to be seen; now said our informant, the whole country is covered with splendid coffee orchards and trees are just reaching their best bearing age.—*Rio News*.

TEA IN AMERICA.

NEW YORK, April 26.

Invoice trading quiet and jobbing demand light—Low grades—in fact, all grades—rule steady, with greatest firmness in the lower qualities.

The English market is very firm, and all teas under 9d are in active demand, while better grades of Indian and Ceylon are irregular. The London deliveries in March were 13,149,228 pounds Indian, 7,310,692 pounds Ceylon, 352,170 pounds Java, and 2,558,122 pounds China—a total of 23,370,212 pounds, against 22,807,862 pounds in 1898. From June 1 to March 31 the deliveries were 224,008,936 pounds, against 218,197,969 pounds in 1897-98. Stock, April 1, 84,769,343 pounds, against 94,580,933 pounds at same date last year.—*American Grocer*.

DR. JOHNSON AND TEA DRINKING.

The following interesting note appears in a recent number of "Notes and Queries":—The use of tea being restricted by its costliness (generally from 3*l.* to 6*l.* a pound) to a limited number of persons, it became a very fashionable drink in the times of the later Stuarts,* and some of this feeling remained in the Doctor's time. Tea was then virtually a monopoly of the East India Company, and the tax upon it varied from 50 per cent. upwards. Hence the loss of our great American colony; hence too, from the exigencies of its price, the minute size of the Johnson teacups still to be seen at Lichfield. Neither was Johnson remarkable for his capacity in tea-drinking. Bishop Gilbert Burnet drank twenty-five cups in a morning, and the poet Cowper was also addicted to frequent libations of tea, in and one of his letters to Hill puts on record an adroit serving-man "raising the teapot to the ceiling with his right hand while in his left the teacup, descending almost to the ground, received a limpid stream, frothing and foaming on reaching its destination into a roaring syllabub."—evidently a waiter, who would have regarded with contempt a modern (air-valve) self-pouring or motionless teapot.—R. B. Upton.

CONDITION OF THE BALATA MARKET.

The output of Balata in Venezuela is on the increase, while that in the Guianas is declining. As an indication, the following comparison may be made of the total arrivals at Rotterdam for the past two years. Though the totals do not vary much for 1897 and 1898, but the percentage received from Venezuela in the latter year was more than double that of the former. The figures denote pounds:

	Surinam sheet.	Venezuela block.	Total.
Arrivals, 1897	337,370	160,600	497,970
Arrivals, 1898	168,960	349,360	518,320

The United States minister to Venezuela reports to his government that up to date Balata has been the main product from the lands of the Orinoco Co., Limited, an American corporation with \$30,000,000 capital, who have begun the development of Venezuela, having headquarters at Santa Catalina, on a tributary of the Orinoco.

The *Deutsche Gummi-Industrie* (Dresden) in its issue of March 20 printed this report from Rotterdam: "We would call your attention to the fact that the price of Balata, which has been

very low for the past two years, threatens to rise to a very high point. The production in Surinam during the past season was, as is well-known, materially lessened, and will be still more lessened during this season. Reliable reports inform us that the principal *cessionnaires* have engaged only one-half of their former employes for this season, and that the smaller producers have been compelled to stop altogether, owing to unprofitable prices. The arrivals of sheet Balata [Surinam], which showed a decrease already in the past year, do not promise any increase for this year. The production of block Balata, on account of the favorable weather conditions in Venezuela during the last season, was very good; how it will fare in the present season and how it will be affected by prices, can at present not even be conjectured. The consumption of Balata, like that of India-rubber and Gutta-percha, is continually increasing; its cheapness and easy working qualities have in a great measure led to the invention of new compounds likely to create additional fields for its usefulness. Stocks are at present very small. As regular imports cannot be expected until the middle of April or the beginning of May, it would be advisable to secure the needs for the present season without delay."

LIPTON, LIMITED.

THE FIRST REPORT TO THE SHAREHOLDERS.

The report of the directors of Lipton, Limited, for the period ended March 11 last states that the profit earned by the company since its incorporation amounts to £217,620, from which has to be deducted the following amounts already appropriated: Interest on debenture stock to March 11, £17,795; interim dividend on preference shares up to September 30, 1898, £22,063; interim dividend on ordinary shares for first half-year, at the rate of 10 per cent. per annum, paid October 15, 1898, £44,018; dividend on preference shares for half-year ended March 31, £25,000; total, £108,877; leaving a balance of £108,743. The directors recommend this balance should be dealt with as follows: To reserve fund, £45,000; in payment of a further dividend on the ordinary shares for the second half-year ended March 11, 1899, at the rate of 12 per cent. per annum (making, with the interim dividend, 11 per cent. for the year), £59,351 leaving a balance to be carried to next account of £4,391. The sum of £44,261, being profits, less interest to vendor, earned prior to the incorporation of the company, has been placed to capital reserve account. The trade done by the company during the past year has been very satisfactory and progressive. The shareholders will have observed that the sale of wines and spirits has been added to the business. This new department has involved very considerable expenditure, which has been charged to revenue. Many impediments and difficulties had to be overcome; but the directors are pleased to be able to report that the department is now in full working order, and they have every confidence it will become one of the largest and most important branches of the business. The directors have obtained 220 licenses in connection with the company's branches throughout the country. The extension of the cocoa factory has now been built, and is being fitted up with the requisite machinery. The additional factory connection with the preserve works is also nearing completion, and the directors anticipate it will

* Pepys first partook of it 25 Sept., 1660; see also an article on 'Tea-drinking' in *Temple Bar* of April, 1898.

be ready for occupation and in full working order for the new season's trade.—*H. and C. Mail*, May 12.

NO DIRECTORS RESIGN.

An official contradiction reached the *Daily Mail* on Saturday May 6, to the effect that there was no impending resignation from the board of Liptons, Limited. At the same time, it was admitted that considerable friction had taken place while discussing the dividend, and that one of the directors went so far as to threaten to resign if his views were not adopted. His opinion, we believe, was that a bigger dividend should have been paid. However, the ultimate declaration was the result of unanimous concord, so that we shall probably hear no more of the matter. It is hoped that the meeting will be held on Thursday, May 18th.

PRODUCE AND PLANTING.

THE POSITION OF THE TEA INDUSTRY.—After the doleful rumours about the tea industry current six months since, the majority of the recently-issued reports of companies are not so depressing after all. There have, of course, been disappointments, but things might have been much worse. On the whole, the season's working may be expected to show better results than was at first anticipated. Messrs. Gow, Wilson, and Stanton, who give a list of the dividends announced in their circular, point out that the average price of teas, notwithstanding some recent weakness, is well above what it was at this time last year. Here are some recent results: Alliance Tea Company: Final of 4 per cent, making 7 per cent for year; £300 depreciation; £500 forward. Assam Company: 12½ per cent for year. Borokai: Accounts show a debit of £223. British Assam: 8 per cent for year, and £128 forward. Cachar and Dooars: 3 per cent for year; £386 forward. Ceylon Tea Plantations: 15 per cent for year; £5,000 reserve; £5,000 depreciation; £3,908 forward. Ceylon Proprietary: 4 per cent for year; £121 forward. Carolina: An interim of 2 per cent. Darjeeling: 5 per cent; £884 from reserve. Darjeeling Consolidated: 5 per cent preference dividend to December, 1898. Doom Dooma: 12½ per cent for year; £4,986 forward. Eastern Assam: Five shillings per share; £2,098 forward. Galaha: 4 per cent for a period of eighteen months; £1,000 to reserve; £173 to ward. Highland: 5½ per cent; £125 written off new clearings; £70 forward. Imperial Ceylon: 4 per cent; £42 forward. Indian Tea of Cachar: 1½ per cent; £118 from reserve fund. Jhanzie: 5 per cent for the year on the ordinary shares, and the proportion payable on the contributory shares: leaving £301 to carry forward. Lebong: 10 per cent for year; £2,000 from reserve; £297 forward. Mazdehee: Reports show a deficit of £681. New Sylhet: Preference dividend paid, and £18 forward. Nuwara Eliya: 6 per cent; £300 sinking fund; £2,000 estates purchase account; £1,609 forward. Poonagalla: 4 per cent; £164 forward. Ragalla: Preference dividend paid; £64 forward. Scottish Ceylon: 10 per cent for year; £456 forward. Standard Tea Company: 15 per cent for year; £1,000 depreciation; £644 forward. South Wanarajah: 5 per cent on ordinary; £400 written off; £56 to reserve. Sunnygama: 3 per cent for year; £95 forward. Sylhet Company: Nil.

GIFTS WITH TEA.—The gift system in connection with the sale of tea has been carried to such lengths that there is no room left for astonishment as to the nature of the devices employed. But presumably these schemes pay or they would not be persisted in. "The Grocer" gives an extract from a circular issued on the subject, which runs:—"On behalf of my mother, the widow of the late—, I am pleased to inform you, in reply to your note, that she regularly receives her pension of 16s. weekly from

—as stated on the bills. My mother had been taking ½lb. of tea weekly when my father died last—, and immediately upon receiving evidence of the death and regular purchase of the tea the first cheque was sent, and since that time a cheque for 10s. has arrived every Saturday morning. My mother is over seventy years of age, and we can never be sufficiently thankful that her remaining years are thus rendered independent. The family would never have allowed her to want; but, still, this 10s. of her own gives her many little comforts, and she often says, 'Thank God for—and Co. l'—"*H. & C. Mail*, May 19.

THE OUTLOOK FOR COCOA BUTTER.

At the monthly auction sale of cocoa butter in London on Tuesday last the eighty-five tons of Cadbury's which were brought forward realized an average price of fourteen pence and one half-penny per pound, which is a slight advance over the price paid at the April sale. On the same day at the Amsterdam sale, some seventy tons of Van Houtens and a few tons of miscellaneous brands were secured by purchasers at figures that averaged the equivalent of about twenty-six cents in American money, a trifle less than was paid at April Amsterdam sale. What caused the advance in London is not yet known, the cables simply giving the prices paid.

For the first three months of this year bulk butter was in very strong shape, under the influence of a heavy consuming demand. Indeed, some holders confidently looked for a 40 cent market, and that their hopes were not realized was probably due to the large offerings at the monthly sales abroad. About the beginning of last month the demand eased off, and this, in connection with continued heavy offerings of butter at the auctions, has tended to weaken the market to the extent that the majority of holders would sell at least one cent lower than they were willing to do thirty days ago. The quotation for bulk in the local market today is thirty-one to thirty-three cents, according to the brand and holder. No advance in these quotations can be expected until Autumn, unless the price of cocoa beans should violently increase or an abnormal demand for butter set in during the Summer months, neither of which is likely. On the other hand, a tagging market until August or September next is not improbable, in view of the fact that the consumption of chocolate is at its lowest ebb during the hot water. Stocks of both domestic and foreign in this market are in strong hands, but are not small, and most confectioners seem to have already anticipated their limited wants for the next month or two. Cakes in twelve pound boxes, for druggists' use, are at present ruling firm at a slight advance over bulk, but may be expected to follow the latter in any price fluctuations which occur.—*Oil Paint and Drug Reporter*.

5 BOGAWANTALAWA AS A TEA DISTRICT.—

Referring to our editorial of recent date, a Bogawantalawa planter writes:—"As a matter of fact I fancy this district is very much up-to-date with manufacture and manuring. We nearly all have good cool fermenting rooms and get good flavour; but our teas are *thin* in the cup! We lack the body they get in the Agras, for instance. I fancy our soil is not so good, and when *thin* flavoury teas are not in demand, our prices all come down with a rush, as they have done just lately. And the finest have fallen far more lately than the medium, owing to the heavy fall in fine to finest broken orange pekoes."

PLANTING NOTES.

TEA CULTIVATION AND MARKET.—An experienced planter writes:—"I see your evening contemporary in one of his leaderettes writes that our old tea bushes are more sensitive to changes of weather than young. Well, that is quite opposed to the general opinion. When the bushes have their tap roots well down the trees are less sensitive to such changes than in the young state of growth. The Colombo market is very sensitive to adverse circumstances. Let the London market go down 3d, it will go down three cents. A scarcity of freight is also made an excuse of buyers slowing off. Except for Australia and direct shipments to Continent, the Colombo market is not to be relied on."

PRESERVATION OF RUBBER TREES IN THE CONGO FREE STATE.—The Government of the Congo Free State, with the object of preventing the threatened destruction of the india-rubber trees in that country has promulgated a decree by which it is provided that for every ton of rubber yielded annually, there shall be planted not less than 150 trees. A bureau of control of rubber forests is created, and is charged with the enforcement of the decree of 1892, which prohibits the gathering of rubber in any other mode than through incisions in the bark. Infractions of this new decree, which bears date of January 5th, 1899, are punishable by a fine up to 10,000 francs (£400) or imprisonment. Employers and directors of corporations are held personally responsible for the acts of their subordinates. Guide books for the cultivation of rubber are furnished by the District Commissioners on request, and agricultural inspectors will be placed temporarily at the service of private owners.—*Journal of the Society of Arts*, May 5.

RUBBER IN BRITISH NEW GUINEA.—In the discussion on Sir Wm. MacGregor's paper before the R. C. Institute, Mr. H. A. Wickham said:—

With regard to the resources of the Possession, I may mention that for thirty years I have had experience in tropical work, and I must state, even with so little time at my disposal, that, in my opinion, the most promising product likely to be of commercial value from New Guinea is india-rubber, particularly of the Para variety. In this I speak advisedly because so far back as the '70's, under the initiative of Sir Joseph Hooker, I introduced this variety for the Government of India with satisfactory results. In fact nearly all tropical products are capable of being grown in the Possession of British New Guinea. In no tropical country with which I am acquainted have I seen so many varieties of sugarcane, and so many indigenous varieties of banana. Tobacco of very fine quality is grown, and there is a native ginger superior to any grown even in the Western tropics. The cotton, also, is very fine, and there are some fibre plants of excellent quality. These things indicate the nature of the country and the climate and its more promising prospective sources of revenue. Especially would I most strongly urge those in administration to offer every possible facility and inducement for the introduction of the *Hevea* (or Para) india-rubber, which could now be readily brought down by short passage through uniformly warm latitudes. A short time since, passing through the Straits Settlements, I saw trees in the second and third generations from my originals from the valley of the Amazon, looking thoroughly well and at home, and loaded with ripe seed. The *Custia* tree of Mexico and Honduras, and the *Ceara* and the *Pineus* rubbers would find suitable localities, but why use other than the best as now to be obtained?

GENERAL TEA AND INVESTMENT COMPANY, LIMITED.—Registered on May 2, by R. Plews, 24, Rook-lane, E.C., with a capital of £10,000 in £1 shares (5,000 six percent. cumulative preference.) Object, to acquire, sell, and deal in the shares, stocks, and securities of tea and other companies, Table A mainly applies.—*Financial News*.

CINNAMON SALES IN LONDON.—The auction sale of cinnamon, which took place in London, resulted as follows:—

Quantity offered	800 bales.
Quantity sold	700 bales.

The tone for cinnamon is good and the demand is also good. Cinnamon of an ordinary quality is from 3d. to 1d. per lb. higher. Fine cinnamon and finest qualities are from 1d. to 2d. per lb. higher.

"TEA-MAKING WITHOUT WITHERING ROOM" comes, unfortunately, a little too late in the history of the Ceylon tea enterprise, when nearly every estate has its well-found factory. Pity Mr. Davidson's patent was not realized ten years ago! It is pointed out, however, that leaf bought at Kaluganawa at six cents a lb. might, during the recent hot weather, be well withered before it reached Colombo. We are shortly, however, to take advantage of Mr. Macguire's offer to inspect the machinery and the whole process of tea-making at the Sirocco Works.

SCARCITY OF RUBBER.—As may be imagined, the universal demand for cycles has caused a similar demand on rubber in its raw state with the result that the export of this material from the Gold Coast has become so valuable to the country that the Government is paying special attention to its growth and cultivation. Hitherto the natives, in their eagerness to collect as much rubber milk as possible, have been in the habit of cutting down the trees, instead of only gashing them, so in order to prevent this waste only those natives holding licences from the Government will in future be allowed to work—*Pastimes*.

TEA MANUFACTURE IN THE CAUCASUS.—The Russian *Official Messenger* gives some interesting details of the attempts that are to be made in the Caucasus to develop the local tea industry. A tea factory has been started by the authorities near Batoum, and machinery of the latest type, as used in India and Ceylon, has been ordered from London. The paper states that Russians prefer Chinese teas to those from India and Ceylon, and accordingly every effort is to be made to produce an article as much like the former as possible. With this view experts have been invited from Central China to assist and advise the local grower.

TEA?—OR MANURE?—A well-known Colombo buyer sends "A specimen of fine (!) tea plucking, which is certainly a credit to the estate concerned." "This choice lot," he remarks, "is to be offered in next sale and is certain to be bought by natives and eventually hawked in our harbour under some such description as 'specially selected pure Ceylon tea.' It certainly is tea, but it ought never to have left the bush, or, if plucked, it should have been buried as manure. Where is the Health Officer? The tea may fetch 5 to 10 cents per lb. It requires an expert (in manure) to value such stuff." For ourselves we may say we have never seen such coarse-plucked half-fired rubbish.

TO ALL PARTS OF ASIA, AFRICA, AMERICA AND OCEANIA.

Seeds & Plants of Commercial Products.

Hevea Brasiliensis (Para Rubber).—Orders being booked for the coming crop available in August and September. This is the only crop of seeds in the year. All orders should reach us before the end of July to avoid disappointment, as we have to make arrangements in time; guaranteed to arrive in good order at destination. We have already booked a large number of orders. A Sumatra Planter writes, dating 9th March, 1899:—"I consent to the price of £——per thousand. I herewith order 50,000 upon condition that you guarantee at least 93 % seeds germinating." Plants can be forwarded all the year round in Wardian cases. Price and particulars as per our Circular No. 30.

Ficus Elastica (Assam and Java Rubber).—Seeds supplied by the pound with instructions; price according to quantity. This tree grows equally well in high and low land, in forest and grass land, its cultivation being extended largely by the Indian Government.

Manihot Glaziovii (Ceara or Manicoba Rubber).—Fresh seeds available all the year round; price as per our Circular No. 31. It is superior to Mangiberia rubber and second to Para rubber.

Castilloa Elastica (Panama or Central American Rubber).—Seeds and Plants supplied; price and particulars as per our Circular No. 32.

Urceola Esculenta (Burma Rubber) and **Landolphia Kirkii** (Mozambique Rubber).—Seeds and plants, both are creepers.

Cinchona Seeds.—Different varieties.

Hybridised Maragogipe Coffee.—A larged-beaned superior variety of Coffee in demand; seeds.

Santalum Album (Sandlewood).—The cultivation and felling of the tree is entirely under Government monopoly in India, Sandlewoods to the value of over £100,000 being annually exported to various countries from India. The cultivation of this useful tree is now receiving increased attention in other countries; seeds and plants.

Eucalyptus Marginata (Jarra).—Large quantities of this most valuable timber are being annually exported from Australia to London and various parts of the world for street paving and other purposes. Price of seeds on application. 7,846 pieces of Jarra timber has already arrived for Ceylon use.

Seeds and Plants of Cinnamon, Nutmeg, Clove, Kolanut, Pepper, Cardamom, Vanilla, Arabian, Liberian and Maragogipe Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit Trees, Shade and Timber Trees, also Palms, Bulbs, Orchids, &c.

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for Foreign Countries for 1899-1900 are now being forwarded to applicants in different parts of the world.

"SOUTH AFRICA."—The great authority on South African affairs of 25th March, 1899, says:—"An interesting Catalogue reaches us from the East. It is issued by William Brothers, Tropical Seed Merchants, of Henaratgoda, Ceylon, and schedules all the useful and beautiful plants which will thrive in tropical and semi-tropical regions. We fancy Messrs. Williams should do good business, for now that the great Powers have grabbed all the waste places of the earth, they must turn to and prove that they were worth the grabbing. We recommend the great Powers and Concessionaries under them to go to William Brothers."

A leading Planter writes from *New Hebrides* under date 17th January, 1899:—"I shall like a few more of your Catalogues to distribute through these Islands, as I feel sure many would place themselves in communication with you, did they know where to write for Seeds and Plants."

Our New Descriptive Price List of Seeds and Plants of Fruit Trees now being prepared and will be ready shortly.

Agents in London:—MESSRS. P. W. WOOLLEY & Co., 33, Basinghall Street.

To the Editors.

RUBBER—ITS CULTURE AND PREPARATION IN TRINIDAD, &c.

Botanical Department, Trinidad, April 24.
To Editors "Tropical Agriculturist."

GENTLEMEN,—I note a reprint in *T.A.* which would probably have escaped notice, had I not been a reader of your periodical. As it was noted in your publication, it is due to you that I should send my reply to you also, and I trust therefore you will give the enclosed insertion, and Mr. Biffen is, I know, a friend of your Mr. Willis.—Yours faithfully,

J. H. HART.

RUBBER COAGULATION AND SEPARATION, &c., &c.

SIR,—In the *Tropical Agriculturist* for March 9th, I find an article by Mr. R. H. Biffen, copied from the "Journal of the Society of Arts," treating on the above subjects.

The writer exhibits a tendency to decry similar efforts as his own, and he uses extracts from the *Trinidad Bulletin* in a way to mislead those who have not that publication in hand; as he refrains from quoting the authorship of the articles. He should have told his readers that Dr. Ernst of Caracas was responsible for the statement he quotes as being "incorrect," and not the editor of the *T.B.* as he leaves it to be inferred for reasons of his own.

After discussing the value of rubber prepared in various ways, Mr. B. jumps to the conclusion that Dr. Ernst is wrong in stating that "smoked rubber is impregnated with impurity," and decides the fact by the prices realised by certain qualities on the larger markets for this class of produce. Now! I happen to have an estimate of rubber prepared without smoking (*Hevea*) given by respectable dealers on those same markets, who valued it as being quite equal to the best smoked rubber, so that a reliance upon this method of estimating quality is proved unsafe, and it may well be that, later on, when buyers have become accustomed to it, pure rubber will sell at higher prices than the smoked product.

Equally unsafe is Mr. Biffen's statement that the juice of the Moon-flower is "alkaline," for I have a qualified analyst's certificate that fresh juice sent by me was found "slightly acid." Equally fortunate is Mr. B.'s assertion that *Castilleja latex* will not coagulate by the addition of acid, as it has been found to coagulate by the addition of acetic acid (Biffen in *Ann. Bot.* pp. 165 et seq).

The point of Mr. Biffen's conclusions in his article in the *Annals of Botany* is "that the cause of coagulation must be looked for in the medium in which the rubber particles are suspended," but unfortunately for this theory it has been abundantly proved that not only can rubber be coagulated when the albumenoids are removed, but a better class of rubber produced.

An attempt follows to ridicule the statements as to the character of land suitable for various rubbers, and accuses us of "slight confusion" in the *Trinidad Bulletin*. As a matter of fact the statements are quite sound, and the confusion only exists in the writer's brain. *Hevea* will grow well in places never inundated, notwithstanding the fact that it is found in places regularly flooded, and this can be proved by trees growing in Trinidad, which have been found to stand drought with impunity, and have never been flooded.

I can well afford to pass without irritation the remark made on my supposed "re-discovery" of a method, for the method differs so much from that described by older writers, that it cannot be placed in the same category. It is a method of washing,

in it is true, but a very different method to any formerly described, in fact may well be compared to the washing of the steam laundry as contrasted with that of the peasant at the river side.

Notwithstanding what is said by "Le Caoutchouc" (p. 6) rubber prepared by this process is of the highest quality, as it is found possible to rash it quite free from *corps étrangers*.

Mr. Biffen claims that his machine separates the rubber particles by centrifugal action, but the real fact is, they are brought to the surface by *centripetal*, not centrifugal action.

The insertion of the word (*sic*) might also have been readily avoided by the writer, had he noted that the word "or" should have been substituted for the word "and."

I now come to a remarkable statement where Mr. Biffen says that research work should tend "to prepare rubber free from the other constituents of the latex." How this is to be reconciled with the previous *dictum* of the *Annals of Botany* is not quite clear. It there says "The action of centrifugal force effects the separation of the rubber, and from the failure of the processes usually employed, involving the use of chemical re-agents to bring about the clotting of the separated and washed rubber particles, we must infer that the cause of the coagulation must be looked for in the medium in which they are suspended." Again we are told that "the coagula in forming gather up the rubber particles" . . . "in the same way as the white-of-egg gathers up particles in suspension when clotted for the purpose of clearing jellies."

It must be concluded therefore that Mr. Biffen has abandoned the position he formerly took up, and is now devoted to the task of removing those very constituents he formerly stated were essential to coagulation, but which he at the same time proved could be dispensed with, for he told us that they could be "brought into a solid mass by pressure, by heating and by evaporation (*Ann. Bot.* p. 168). Why does he use the words "brought into a solid mass"? and not the word coagulation?

Mr. Biffen records his success in preparing rubber by a physical process. He started by requiring albumenoids for coagulation, but now he is recommending separation by a physical process; and has adopted what is actually the basis of the hydro process, which he facetiously accuses me of having re-discovered. I might with equal propriety ask him whether he re-discovered the Babcock machine. If I re-discovered! so has he. I separate by water, he by physical methods, but I dry by evaporation! so does he. His rubber is free from impurities! so is mine. His method requires a machine, so does mine. Again his rubber is free from smell, so is mine, and large quantities can be prepared in a day by simple apparatus, while it would take a powerful engine to drive the machine to get through a similar quantity by centrifugal action. The quality of my rubber is equal to that prepared by other physical processes, as a voucher for which I am quite prepared to submit samples for test and the "*merits or demerits of the system*," do not rest with me, but with those who can judge of its value by actual practice; Mr. Biffen states the contrary.

Mr. Biffen repudiates statements made in Trinidad, but no one has asked him to be sponsor for them. He must however allow me also to repudiate the points conveyed by his remark that "a copy of his machine was exhibited without his consent or knowledge." As a matter of fact the machine was no "copy," any more than his primary effort was a "copy" of the Babcock; but was of different construction, and a vast improvement upon his model, as he knows, for drawings of the improvements were placed in his hands. The "Babcock" machine was never patented, and there are consequently many modifications of it, among which are the forms under discussion which can hardly be called inventions, for such adaptations are being made daily all over the world, for the separation of materials of different densities.

I may be liable to a protest from Lefebvre for pirating his ancient washing method, I may perhaps expect a raid from Central American Indians for

having improved on their use of the juice of the Moon-flower; or I may be called to account for using a modified form of butcher knife for sticking a rubber tree; but I hardly thought I should be held responsible for having with others used the principle of the "Babcock" machine.

There is a point which I would commend to Mr. Biffen's attention, and this is the special character of the Rubber globules of *Castilloa*. Perhaps if he examines them he may find the cause of the rupture which is evidently the real cause of coagulation. This rupture can be caused in various ways, and he who succeeds in causing it in the simplest and most economical way will have solved the question of the preparation of *Castilloa* rubber, be it by a physical or non-physical process.

April 21st, 1899.

J. H. HART, F.L.S.

TIMBER TEA CHESTS COMPANY,
LIMITED.

(The Colindia.)

22 Fenchurch Street, London, May 5.

DEAR SIR,—I am directed to enclose for publication a report just received from the Colonial Tea Warehouses, bearing upon the condition of the Colindia chests arrived from Ceylon. Last mail we handed to your London correspondent copy of the brokers' report. We are now shipping the chest in large numbers as the orders are coming in most satisfactorily.—Yours faithfully,

THE TIMBER TEA CHESTS Co., Ltd.

T. W. Ricksby, Secretary.

Copy of letter from Colonial & Granite Wharves,
London E.

Re—93 chests tea marked "Belgravia" ex "Staffordshire" 2nd inst., packed in the new "Colindia" packages.

We have received and weighed 90 of the above and as requested a careful examination of the condition (external) has been made.

The packages are sound and intact, not a leakage showing anywhere, the nails and clamps being quite firm, there are a few splinters, showing signs of a heavy weight having been dropped on packages but in no case any damage occurred, and we feel quite justified in stating that this is the best package of its kind we have yet handled.

We find the gross weights are exactly even all the way through, not varying by a single pound and this with an even tare is of great importance as it will enable us to turn out the full net weight.

We understand that one chest not yet to hand has been roughly handled in ship which necessitates co-operation before we receive it, this package we will write to you about later.

Another consideration with these new packages is, that they need not to be opened for the Brokers' inspection but simply bored; which practically leaves the chest as it arrived.

"THE JUNGLE CROW."

Hagalla, May 7.

DEAR SIR,—It is a fact that the "Jungle Crow" nests and rears its young in the trees in this garden. Yesterday morning a young one was found at the foot of a large *Araucaria* tree. It had apparently got out of the nest before it could fly properly, and one of the coolies caught it.

I sent my son up the tree to find the nest, which he did in the thickest part near the top. The nest was rather untidy. The bottom part

was of twigs, something like a rook's nest, with lots of dirt like "wormcasts" among them. It was oval in shape, with a sort of hood on one side, and lined with leaves. The young one makes a noise like a young owl. It eats lizards and frogs, but rejects beef.

I think there were two young ones, as I several times heard the same sort of noise as the one we caught makes; but it was concealed in the tree, and I have not been able to catch sight of it. The old jungle crow was fidgetting about all day and seemed much troubled at the loss of her young one.—Yours truly,

W. N.

THE WESTRALIAN EXHIBITION AND
CEYLON TEA IN AUSTRALIA.

Coolgardie, Western Australia, May 8.

DEAR MR. EDITOR,—The Ceylon tea-room has, as I anticipated, done an immense deal of good. It has opened the eyes, not only of West Australians, but of many of our visitors, to the fact that these colonies, where tea is consumed in such enormous quantities, have been and are *poisoned*. It has been my hobby for many years—and your dear old senior and I had many talks about this opening up of the Australian trade. The time has come to do it. I have written by this mail to Mr. Lane and I want you to help me in carrying out the scheme.

I am tired of Exhibition work—this is my jubilee one; 50 Exhibitions! I have my youngest daughter married at Fremantle, a son in Perth, the others—seven—scattered over the eastern colonies—all doing well. I would pitch my camp in Perth, have a depôt here, and through my sons open up others in Melbourne, Adelaide, Sydney and Brisbane. The great thing is to have in Ceylon some expert to mix or blend the teas so as to ensure a constant supply of *one* sample of each grade—cheap, medium, good, and superior—being four prices—the first, of course, will command a huge sale.

The great and more important matter is to be able to rely on a supply: that the demand exists there is no doubt, and that we could soon increase the present trade I am confident, provided it be done systematically and well.

I would gladly undertake this and even forego the offer I have to go to the Paris Exhibition of 1900. As I said I am tired of Exhibitions. I need rest, but not idleness. This tea racket would suit me, and if the tea planters are willing I am "on the job." So satisfied am I of success, that I am willing to be paid by results, if they will guarantee *working expenses* as a first call or profits, of say £200 or £250 a year. Colombo is only a few days from here. I might, if need be, take a run across. But it is hardly worth while encountering even one day's *mal de mer* and I am an awful bad sailor.—Yours very truly,

JULES JOUBERT,

General Manager, West Australian
Exhibition.

ANALYSIS OF COPRA (KERNEL OF
COCONUT PALM).

City Analyst's Office, Colombo, May 17.

DEAR SIR,—In reply to your French correspondent at Reunion, who wished to have a fuller analysis of copra than he found in my Manual of Chemical Analyses, I have not had occasion to make any fuller analysis; but as coconut poonac is simply copra after the greater part of the oil has been expressed, the composition of the latter can be calculated from the analysis of the former. If we regard a good sample of copra as containing 67 per cent oil, and taking the moisture at about the average of 6 per cent, the composition of copra would be represented as follows:—

COMPOSITION OF COPRA.				
	Per cent		Per cent	
Moisture	...	6.00	Carbo-hydrates	...
Oil	...	67.00	Woody fibre	...
Albumenoids	...	6.69	Ash	...
				2.99

Total 100.00

The nutrient ratio, and the nutrient value, of copra such as above, calculated in the usual way, would be 127.3 and 189.4 respectively.—Yours truly,
M. COCHRAN.

"FACILITIES FOR MAKING GOOD TEA."

London, May 19.

SIR,—Your notes on the above subject are very interesting.

The ventilation of the subject of manufacture and the procedure in different districts will have the advantage of undoubtedly improving the quality in many places. The majority of planters in India and Ceylon have made up their minds, "let's hope" to sacrifice quantity to quality, and every effort should now be made to put a good class of tea on the market and not to be alarmed at the bogie of the cheap teas that are to be shipped from China.

With regard to withering accommodation, very few factories are in a position to keep their leaf properly thinly spread for more than a couple of days when there is a rush of leaf coming in—so that the leaf has to be made into tea ready or not—and the result is inferior tea. A neat and compact withering process is a great desideratum—and if not too expensive would pay for itself on a large factory in one season. One of the greatest deficiencies is in rolling power.* It is quite accepted as a necessity in India to roll the leaf thoroughly twice for 15 to 20 minutes each time according to the condition of the leaf. The last rolls take place after oxidation—and the leaf is taken straight from the roller to the driers—yet, how many factories are there that can carry this rolling out thoroughly on a heavy day? Tea-rolling machines are now made much cheaper than formerly and requires but little driving power, so that there is but little excuse for any factory not to be provided with ample rolling accommodation, which is such an important process in manufacture. A new system of drying tea by steam has many advantages, especially for final firing and packing. J. H. H. K.

* A rolling machine for every 100,000 lb. of tea made as stated by your correspondent, is an absolute necessity.

CEYLON TEA IN AMERICA.

Kandy, 23rd May.

DEAR SIR,—If Mr. Pineo is not on the "Thirty Committee," do not you think he should be asked to stand. His vast experience in America in pushing our staple, added to his well-known business capabilities, should prove of the utmost value to our local men.—Yours faithfully,

TEA

[We think Mr. Pineo is admirably qualified to serve, if he is willing.—ED. T.A.]

INDIAN "GREEN TEAS."

SIR,—One can scarcely take up a commercial paper without coming across complaints from Consular reports and elsewhere of the fatuous, and to themselves ruinous, stubbornness of home manufacturers in refusing to manufacture and pack their wares to the wants and requirements of foreign buyers. It almost seemed as if "this hidebound Toryism refusing to stretch an inch until it burst," was entirely confined to the home manufacturers; but judging from a letter of Commissioner Mr. Mackenzie, the Ceylon planter also considers himself the best judge of what his customers ought to take! On page 804 of the May issue of the T. A. occurs the following para:—

Greens.—In Mr. Blechynden's report to his Committee he says about *unfermented teas*:—"Some samples of these Oolong teas made in India were sent me early this year. They were found so suitable for the market, and firms were so ready to give immediate large orders that I have had to revise my opinion. I now believe that there are certain districts in India, where Oolong teas of a character to command a ready sale can be made, and if such teas are produced there is practically no limit to the business that could be done," etc. Those Indian greens, I mentioned in my letter of the 14th were picked up at once.

DIMBULA TEA PLANTER.

[Our correspondent should quote the rest, namely:—

Unfortunately there were only a few hundred cases, whereas thousands could be sold. These could be sold easily, whereas our blacks for *price* are unsaleable being too dear. An Importer bought some Ceylon greens lately. He has twice told me the people to whom he sold them could not get rid of them—as they were good and pretty, but different from the kinds used here. These people have now wired to him to reserve for them any other similar Ceylon greens he could get. Mr. Mackenzie's letter is dated March 29th last: have there been favourable sales of Ceylon Oologns in New York since then?—ED. T.A.]

MANURING COCONUTS.

DEAR SIR,—Mr. Beven's report on this subject in your paper of April 19, is both interesting and instructive. I beg Mr. Beven to give us the following information.

1. Of the trees experimented, how many are there to the acre?
2. Are there any vacancies?
3. Are there any young plants in those vacancies?
4. If so, how old are those plants?
5. How much does the manure cost to reach the estate?

6. How much does it cost to put it to the trees?
7. Do you plough or hoe down the manure?
8. In hoeing or ploughing how deep do you go?
9. How far from the root of the tree do you begin hoeing and ploughing, and to what breadth do you do it?

—Yours truly,

COCONUTS.

COCONUT PLANTING.

Franklands, Veyangoda, May 24.

DEAR SIR,—In answer to "Coconut"'s letter in last night's issue of the *Observer* I have pleasure in supplying the further particulars he asks for. I may mention that most of the information he wants was embodied in a previous report I sent to Messrs. Freudenberg & Co.

(1) 75 trees to the acre; (2), (3), (4), refer to my report, published in the *Observer* of the 19th ultimo, I now deal with the first and second plots of the five mentioned.

Plot No. 1:—In (A) 32 trees were manured. Besides these there are eight plants—from two to five years old—which were not manured. No vacancies. In (B) 33 trees were manured. Two three-year plants were not manured. One vacancy unfilled. In (C) 32 trees were manured. Two three-year old plants were not manured. In (D) 35 trees were manured. Two plants from two to five years old were not manured.

Plot No. 2:—In (a) of the 72 trees manured, six were not in bearing. Ten vacancies are occupied by plants ranging from two to four years old: these were not manured. In (b) 75 trees were manured, of which eleven trees were not in bearing. Besides these there are 15 plants from two to four years of age, which were not manured.

(5) The transport from the Veyangoda Railway Station to the estate costs 50 cents per cart, if outside carts, less if estate carts, are used. The usual load a cart carries on this road is 17 cwt.

(6) The average cost of digging in the manure round a tree is 1'4 cents per tree.

(7), (8), (9) My mode of application is:—The manure is spread evenly round the tree, three feet away from the trunk, then dug in—three manures in width—to a depth of from nine to twelve inches, after which the soil immediately round the trunk is loosened to a depth of two inches. Finally, the fallen branches are cut up and placed over the portion dug in: mulching.—Yours truly,

A. KARL BEVEN.

COCONUT PALM CULTIVATION IN THE STRAITS:

May 26.

DEAR SIR,—I have read with much interest, in the *Selangor Government Gazette* of 5th May, which you kindly sent me, the "Notes on the effects of Sugar Estates in Coconut plantations." As there are no sugar estates in Ceylon—the small areas of canes at Baddegama near Galle are, I believe, grown at intervals of several years, rotation of crops being the rule—it cannot be determined what effect growing sugar canes would have on coconut estates in the vicinity. So long as the megass is burnt, and the decaying nobs of the canes dug out and burnt, I cannot imagine what possible effect it can have one way or another. What strikes a Ceylon coconut planter at once is the enormous number of rhinoceros beetles there must be in Selangor and

other Straits Settlements, and the great havoc they commit, compared with the, comparatively speaking, small number in Ceylon and their practical harmlessness. What is the cause of their great numbers, and why are they so destructive in the Straits? Can the beetle be of a different species with different habits from the Ceylon one? The conditions for the breeding of the beetles—stable and cattle-shed refuse, and heaps of decaying vegetable matter—must be pretty much the same in both countries, so those alone cannot account for the larger numbers in the Straits. I am inclined to think that the land in the Straits is richer in humus and vegetable matter and thus affords more food for the grubs. I see that they are said to be worse in "bakan" land; what is "bakan"? I gather that whatever it is, it is very rich in vegetable mould, and in this, of course, the grubs thrive. Why the rhinoceros beetle should have acquired different habits and become more destructive in the Straits than it is in Ceylon I am not in a position to say; perhaps different local conditions, and variation, by natural selection, for its preservation? In Ceylon the rhinoceros beetle rarely attacks coconut plants before they are two to two-and-a-half years old, and then all the mischief it does is to work its way down to the tender portion of the centre leaf which it eats into till stopped by the hard midrib. When the leaf opens out it looks a little ragged and that is all: it never kills a plant. So little harm does it do to the coconut plant that for many years I have ceased to have them killed, deeming that the spearing does more harm to the plant than the beetle! It is possible that cases may arise, but I have never yet seen one, where a field of young plants may be badly infested with the beetles when, of course, it would be necessary to kill them with the barbed spear; but care should be taken when so doing to tamper as little as possible with the plants. Long may the rhinoceros beetle in Ceylon be as inoffensive as he is at present, and may he never develop the destructive propensities of his relative in the Straits Settlements. Our enemy is the dreaded red beetle, and against it we wage vigilant and constant war.

W. J.

ORCHIDS IN FLOWER AT THE ROYAL BOTANICAL GARDENS, PERADENIYA.

June 1.

DEAR SIR,—Local admirers of orchids may be interested to know that the following species may now be seen in flower in these Gardens:—

Renanthera coccinea ("Chinese air plant").—A climbing epiphytal species, native of Cochinchina, and said to be introduced to Peradeniya in 1884. A plant of this which was last year placed against a Cassia tree near the Orchid House has thriven well since, being now 7½ ft. high, and forms a striking object on account of its deep crimson inflorescence. The latter is a flattened form of panicle, nearly 3 ft. long, spreading horizontally, and bearing about 130 flowers. Flowers erect, about 3 inches in diam.; petals and dorsal sepal narrow and strap-shaped, orange-red spotted with crimson; lateral sepals large, oblong-spathulate, wavy, lobed at the base, dark-red ground, with blood-red blotches which appear velvety and raised; lip (labellum) small, 3-lobed pale yellow, red-tipped, inner side streaked with dark red, stem cylindrical, sending out numerous aerial roots which attach themselves firmly to the supporting tree. Leaves oblong, four to five inches, leathery and stiff. The flowers last for several weeks unless damaged by wind or rain.

Cattleya maxima var. *Peruviana*.—One of the several varieties of a species which represents a genus almost unrivalled, both for beauty and size of flowers. The genus is indigenous mostly to Central America and Brazil. Flowers very handsome, each 6 inches across; petals and sepals of a rich lilac colour; lip large, with crisped and sinuate margins edged with a paler line, the inner side variegated with violet-red veins, with a pale yellow band in the middle.

Dendrobium nobile.—One of the most beautiful of orchids when in flower, native of China. Flowers 3 inches in diam., in pairs, produced towards the ends of the stems, each pair being opposite to a leaf; thus the green flacid leaves are effectively intermingled with the flowers. Sepals and petals white at base, merging into rosy-pink at the tips; lip large, cup-like, white, tipped with rosy-pink, and blotched in the throat with purple-crimson. Pseudo bulbs $1\frac{1}{2}$ to 2ft. long.

Dendrobium atroviolaceum.—This is now in flower here for the first time, the plant being only introduced last year through Messrs. Sander & Co., of St. Albans, England. Though not strikingly showy, it is a distinctly handsome species. The petals and sepals are creamy white, tinged with yellow and dotted with purple; lip 3-lobed, the side lobes dark violet coloured on the inside; the front lobe being striped with the same colour on a green ground.

Miltonia Warszewiczii, var. *Weltoni*.—An epiphytic orchid from Peru. Inflorescence a panicle, issuing from base of pseudo-bulbs, about 2ft. long, rather slender and drooping. Flowers nearly 2 inches in diam., petals and sepals very similar, light brown with much crisped margins, white at the tips; lip large, flat, almost circular, undulated, maroon, fringed with pale grey, blotched with yellow at the base and with a shining spot of chocolate colour in the middle, the underside being marked by a semi-circular grey ring.

Eria armeniaca.—This is perhaps the most showy species of the genus, nearly all the others being considered more curious than beautiful. Growing in the forks of a shrub, it sends out several stalks of racemose inflorescence from the base of the short and flattened pseudo-bulbs, each stalk about 15 inches long. The large bright orange red bracts at the base of the flowers are the showy part, the flower itself being rather small and of dull greenish brown colour.

The following among others may also be seen in flower; *Dendrobium Jenkinsii*; *D. moschatum*; *D. cretaceum*; *D. sanguinolentum*; *D. fimbriatum*, var. *oculatum*; *Phalenopsis amabilis*; *P. Parishii*; *Epidendrum ciliare*; *Lycaste candida*, var. *Lawrenceana*; and species of *Oncidium*.—Yours faithfully,
H. F. MACMILLAN.

CEYLON "THIRTY COMMITTEE."

CEYLON TEA IN AMERICA.

Kandy, June 9.

SIR,—The enclosed letter from Mr. Mackenzie to Mr. Lane is forwarded for publication as of some general interest.—Yours faithfully,

A. PHILIP.

Secretary, Thirty Committee.

London, May 17.

DEAR LANE,—I have yours of 4th. I have already written to you, mentioning the very sum you suggest as what should be spent in America next year. It would be chiefly in subsidies and demonstrations, as we could not also keep up the advertising with that amount.

When writing to you about what I saw in Germany, I forgot to mention that the indefatigable Yankees have got hold of the banks of the Rhine. Sailing down, one sees huge wooden placards, on the most prominent points of the famous "Castled Crags" with "Eat Quaker Oats"

in very large white letters "Nothing is sacred from the sapper" may well be applied to the Yankee. I could not help wishing it were "Drink Ceylon Tea." An investigating Committee has been appointed in the States to enquire into Food Adulteration: some of the evidence is startling. Cheap as coffee is, it is manufactured in large quantities of flour paste, &c., pressed by machinery into the shape of coffee beans. I send two notices with our advertisement on the subject. I have arranged for a large advertisement to appear when tea is examined, provided ours are found pure. In one of the cuttings sent, you will see something about the green colouring matter used in some tea. I enclose one of Finlay, Muir's Seeta Ceylon advertisements. Also a letter addressed to the ladies of Canada by the Blue Ribbon Co. (Galt & Co.)—one of those firms specially induced to help us in Canada last year. I also send you in separate envelope a list of the papers in which they are advertising and copies of the advertisements which are striking. They have sent me a huge box of newspapers with the advertisement, for which I had to pay 10s cartage, &c. One likes to keep an eye on all our friends, and this was their crushing reply to a suggestion from me, that I would like to know what they were doing.

I send also a lot of our advertisements and those of others from recent Canadian Grocer papers, as you said lately in one of your letters that you took an interest in them.

Read the articles in *New York Herald* showing how politics come into every thing, and the lengths in robbery, &c., one may go provided he has a strong political friend.

There is an immense number of things one has to watch, follow and keep in touch with. This is more difficult now, that Blechynden is no longer on the spot and working with us. I may have to go over in June, but I won't unless actually necessary, as I do not wish to put the Committee to the expense. In July and August we will, as last year, practically stop, although correspondence is incessant. However, there will be neither salary nor travelling expenses.

I am giving our allies the hint, that "Ceylon" must now be the prominent feature, as "India" has ceased subsidising—although still assisting in advertising.—Yours truly,
(Signed) WM. MACKENZIE.

SIR,—In its Editorial of the 30th ultimo, in re "Our Staple and Foreign Markets," the "Times of Ceylon" suggests matter, both reasonable and comprehensive, for thoughtful, deliberate consideration, and all interested in our staple should give heed to it.

My object in now addressing you is for the purpose of again begging that greater concentration of effort be given to the markets of the United States where ground has been broken, but not yet thoroughly cultivated, and from which only a small harvest can, at this stage, reasonably be expected.

The Acting Secretary of the Indian Tea Association declares the operations in America "have admittedly been successful."

This satisfactory outcome is the result of work inaugurated and executed by Mr. Blechynden, who is deservedly entitled to great credit for satisfactory labour performed prior to, and during the opening of, and also subsequent to, the closing of the Chicago Exposition.

Mr. Blechynden was wise to study American methods, quick to accept ideas that gave promise of aiding him in accomplishing his designs; and the success he achieved was, in a measure, due to his power of assimilating what he felt would bring satisfactory results.

Ceylon is now to be congratulated on gaining the active aid and experience of Mr. Blechynden, as his services have been secured by the shrewd, progressive firm of Messrs. Whittall & Co., of Colombo, whose interests he will guide and advance in America.

The plan for the expenditure of the money voted for next year has not yet been disclosed to the public; but it will, doubtless, be largely on lines laid down and recommended by Messrs. Blechynden and Mackenzie, who, it is to be hoped, will not base their plans on a system of subsidies, which system can only be entered upon when guarded by conditions so stringent that no firm of high and honourable standing will care to accept. At best, this system is a poor make-shift affair, vicious in its bearings, and susceptible of great abuse, and ending—usually—in dissatisfaction, loss and calumny.

It may be accepted and recognised as a fact that both the American and Canadian consumer give the preference to Ceylon pure teas, and take to them more readily than to the teas of India, which are, however used in larger proportions than Ceylon's for blending with and fortifying inferior teas of other countries.

My contention is that Ceylon has done but little more than tickle the ground in the United States, and that more aggressive work is demanded; while no thought of decreasing our efforts should—for a moment—be entertained.

A population of 75,000,000 people, increasing steadily and rapidly, cannot be reached without a protracted and vigorous siege. The people who drink tea are not those who dwell in large cities, but they who live in the smaller towns, villages, and country, many of whom use it three times a day, while the majority of them never saw Ceylon tea! How is it proposed to get at this class? The retailer is the only medium that can be used, and he is the one to be helped. If, when granting a subsidy to a wholesale man, it can be arranged that a portion, at least, goes to the retailer,—the latter will have an incentive and will, probably, do good work; otherwise he will have nothing to gain, and much cannot be expected of him. A plan for reaching the real consuming class was submitted by me, but its very simplicity has, most likely, caused it to be received with disfavor, and yet the plan is a good one and can be elaborated and improved upon and made more workable.

Canada is not nearly conquered; but it is fast coming into line.

The lower or Maritime Provinces use nearly six pounds of tea per head per annum, whereas the upper Provinces only consume about three pounds.

The merchants of the Maritime Provinces have begun an aggressive campaign and our interests will be actively advanced by them, but, in the Upper Provinces, and in the Great North West, where large numbers of Russians are now settling, much remains to be done, and this work, we hope, will be conducted, with spirit and energy, by the merchants, who, however, should be assisted in every possible way, that may be considered advisable.

In Mr. Reuton's guiding hands we can confidently and safely leave our interests in France, Germany, Austria, Italy, and the lesser kingdoms of the Continent; but in Russia we have much to do, and our efforts should be largely directed to securing a reduction in the duties on tea, so as to bring our tea within the reach of the masses of the people. This must, of course, be done by the aid of the Imperial Government, and through the devious, delicate channels of diplomacy; but it is a matter of vast importance to Ceylon, and hence should be constantly kept in view.

In order to reach the acme of success Ceylon must continue to agitate, be aggressive and, in some form, advertise. Now the principal objects to be striven for in advertising are to attract, impress, convince and convey to the mind something that will long be remembered. Having these matters constantly before us, we must study just what kind of advertisement will be best suited to our purpose, and what mediums shall be used to reach the people we want to capture.

Nowhere is the act of advertising studied with greater fidelity and assiduity than in the United States, where men make it a vocation and give their undivided attention to it, and where they are a highly paid and absolutely necessary part of every establishment that seeks the purchasing public.

Advertising that brings results must be bright, alert, aggressive and constant, and its main object as before stated, should be to attract and so impress the reader's mind that he will remember it. No ordinary advertisement will do this, nor will a lack of persistent effort ever lead to success. Jumping or making a spurt and then easing off will not accomplish anything permanent, and this leads me to conclude my little say by imploring the "Thirty Committee" not to contract, but, on the contrary, to expand and increase its efforts in the United States, where a rich and satisfactory harvest may in time be secured, if cultivation of the ground be persistently conducted and uninterruptedly maintained.

Pears' soap has made a world-wide reputation and can be found in every first-class drug store in the World, and yet its owners go on increasing their advertising expenditure and effort every year, and that, too, in all parts of the globe. In the United States, the Royal Baking Powder Company—long established—spend something like a million dollars a year in advertising and making demonstrations, and yet no Grocery would think its stock complete without this article. Baker's cacao has been known for nearly a century, but the Company spends more and more money every year in advertising, and at the principal Food Exhibits in the country this cacao can be found in its attractive booths. The managers of these profitable concerns know that without constant, increasing advertising effort their business would decrease in volume and in amount. "Our own and only" Lipton's furnishes us with an object lesson, and where can a shrewder or more successful advertiser in modern, up-to-date business methods and management be found?

If we want to succeed we must advertise, and if we advertise it is our bounden duty to learn how, when and where to advertise. Circulars are mediums of waste land, no one in America heeds them. Advertising in the plethoric Sunday papers issued in the large cities of America is absolutely futile, and the same assertion is fairly applicable to the dailies—hence these mediums should all be rigorously excluded from any proposed plan.

As auxiliary to and part of my plan of demonstrations, which may be classed as one form of advertising, Cave's lecture on the buried cities of Ceylon, with its attendant paraphernalia, could be utilized and delivered before Lyceums, Lecture Rooms, and Church Vestries, where the tea drinking class do mostly congregate during the long evenings of winter; then Ceylon tea would become popularised and known far and wide. Many other forms of useful advertising might be enumerated, but enough for my present contention has already been said.

When we have succeeded in placing 25,000,000 lb. of our tea in the markets of America, then, and not till then, can we lay back and let the merchant, in place of the grower, advertise Ceylon tea.

If, Mr. Editor, you consider this little pipe of mine worthy of space in your valuable journal, please give it room—you will know what to do with it should it, in your opinion, be of doubtful interest to your readers—and if it will in a feeble way arouse the planters, for whom it is primarily intended, some good may emanate from its little wail.—Yours, &c.,
R. E. PINEO.

PROGRESS IN NORTH BORNEO.

Kandy, June 9.

DEAR SIR,—The following facts relative to progress in Borneo are interesting:—The increase in value of Imports 1898 over 1897 is over half a million of dollars; Cloth shows an increase of \$83,631; Treasure \$81,016; Machinery and Vessels \$69,430; Opium happily

shows only an increase of \$15,504; Spirits and Wines unhappily \$35,601. The above shows that British North Borneo or the New Ceylon is going forward.

As to Exports, if we exclude Tobacco, there has been an increase in the general trade of \$267,064 in 1898 over 1897. As regards tobacco, new ground is being taken up, and this discrepancy will probably rectify itself by next year.

Timber shows an increase of \$93,427; Cutch, a very progressive industry, \$35,706; Gutta and Rubber, \$61,700; "Seed" and Mother of Pearl, \$20,700; and Copra, quite a new feature, \$10,695.

To take the increase of Exports and Imports in the last decade, we find the following to show the "fornidness" of New Ceylon:—

1888—Imports...	\$1,798,620	Exports ...	\$701,433
1898— do, ...	\$2,419,087	Do. ...	\$2,881,851

Increase ...	\$620,467	\$2,180,418
--------------	-----------	-------------

To instance another feature in the prosperity of the Colony, one steamer alone, of 7th May, brought for the tobacco estates 182 free Chinese and 425 contract coolies.

I send you herewith a comparative statement of Foreign Exports and Imports during the years 1897 and 1898.—Yours truly,

W. D. GIBBON,

Ceylon Agent, British North Borneo Govt.

CASTILLOA RUBBER.

MAJOR GORDON REEVES' OPINION.

Ratnatenne, Madulkele, June 10.

SIR,—I have not been experimenting again with tapping Castilloa, as I do not wish to injure the seed crop;—though possibly, tapping would tend to increase this as in the case of mangoes, peaches, etc. The tapping which was done to obtain the samples I sent to Liverpool, was carried out in average showery weather. Some Para trees were tapped at the same time, and the superiority of the Castilloa as regards *yield* at once became apparent.

The quantity of dried rubber obtained, or rather the quantity which we took from three trees as a sample, was about 1½ lb.; doubtless, a good deal more could have been taken, but we did not want more. A tree seven years old may, I understand, be tapped five or six times a year. What we did prove was the fact that, under the same meteorological conditions, on that particular estate, Castilloa yielded *much* more readily than Para, and we at once acted on that discovery. I am sorry I cannot give more definite information as regards yield at the present moment, beyond the fact that Castilloa with us is by far the easier of the two trees to get a yield from; and, probably, therefore, the best yielder of rubber. But we intend to carry out exhaustive experiments later on; and you shall have a memorandum of these and of the results.—Yours, &c.,

E. GORDON REEVES.

CEYLON "THIRTY COMMITTEE."

CEYLON TEA IN RUSSIA.

SIR,—I herein enclose copy of letter received from Mr. Rogivue reporting on the progress made in the sale of Ceylon tea in Russia and also advertising to what is being done in Switzerland.—I am, sir, yours faithfully,

A. PHILIP,
Secretary to the "Thirty Committee."

A. Philip, Esq., Secretary to the "Thirty Committee," Kandy, (Ceylon).

Moscow, 1/13 May, 1899.

DEAR SIR,—I duly received your favor of the 27th February for which I thank you, also your Committee for their kind allowance of £40 towards the cost of my advertisement-cards, in the form of Ceylon views, which I have distributed over Russia. I now beg to inform you that I have this day taken the liberty to draw these forty pounds sterling upon your goodself at ten days' sight, to the order of Messrs. P. R. Buchanan & Co., London, which I shall thank you to kindly honour on presentation. As regards the progress of Ceylon tea in Russia, I am of opinion that the last Newspaper Advertisements directed by Mr. Christie, under my supervision, have done a great deal of good and the fact that more of Russian Firms' Tea buyers are establishing themselves in Colombo, and that the direct exports of tea from Colombo to Russia are increasing yearly in large proportions, also that the import of Ceylon tea in Russia, through London, and Germany is also increasing steadily,—is the best illustration one can get of the progress the article is making in this country. — is right enough when he says that Ceylon Tea is largely used for blending with Chinese Teas, but he is decidedly in error when he affirms that the Russians don't drink Pure Ceylon Tea. Almost all tea merchant in Russia is now selling Pure Ceylon Tea in packets, and I am not afraid of venturing to say that a few millions of pounds are now likewise (pure) sold and consumed yearly in Russia. The bulk of the trade, it is true, being however for blending purposes, because the Russians do not care any more for the weak and tasteless China Tea they are getting now. I was lately in Switzerland when I had the pleasure of meeting my old friend; Mr. Bremer of Messrs. George Steuart & Co., Colombo; he was greatly interested with the work I am doing there for the introduction of Ceylon Tea in Switzerland: where (at Morges on the Lake of Geneva) I have opened an Agency of Rogivue & Co., Limited, for the sale in chests and packages of pure Ceylon Tea, which is now gaining great favour in that country. Mr. Bremer will be able to inform your Committee about my exertions in pushing the article there, and he gave me to understand that the Thirty Committee would gladly support me and reimburse me a part of my expenditure for advertisement which I am doing on a pretty large scale by the way of Newspaper publications, fine placards with Ceylon views, Cards, Pamphlets, and samples of Pure Ceylon Tea distributed *gratis* all over the country.—I am, Dear sir, yours faithfully,

(Signed) M. ROGIVUE.

TEA PICKING.

[TO THE EDITOR OF THE "PLANTER."]

Coonor, May 29.

Sir,—I should like to know if the following record pick of tea leaf has been beaten on these Hills. The field is one planted in 1889 with plants from our own seed, off indigenous single plants. The plucking fairly fine, viz., two leaves and a bud. The field had its first low prune in July last only. The individual figures for fifteen pluckers are as follows:—58, 37, 50, 58, 60, 60, 60, 46, 55, 63, 64, 54, 48, 56, 59. The 68 was picked by a little Badaga girl, named Gunhee, who is about ten years old only. I do not pick by contract, but give small rewards now and again for merit. I have never, in my eighteen years on these Hills, had any better picks! The total into the factory for the day was 3,350 pounds, beating the previous highest record by 350 pounds. But for a heavy downpour of over an inch, lasting over an hour, the pick would have been far larger.

THOS. BROWN.

[Have any Ceylon planters larger figures to show?—ED. T.A.]

FACILITIES FOR MAKING GOOD TEA—IX.

From Uva, we have a letter from Passara and one from Madulsima, both of which indicate satisfaction with the quality of tea now produced—the former district recognising no existing drawbacks to good manufacture, and the latter holding that its teas are equal, and in many cases superior, to what used to be turned out when prices were at their highest—the estates themselves being in better condition than ever before. In both divisions, the jât is generally good with very little that is inferior; while the soil too answers to the same description, there being no worn-out estates, most of them having been newly planted, and evidently not needing manure, as the answer from Passara to the question whether manuring would improve the tea and be profitable, is a simple “no.” While Madulsima admits some deficiency in withering accommodation, Passara, where the factories are all new, considers the accommodation sufficient; and both divisions are blessed with factories well-equipped with machinery, and with abundance of motive power. In pruning, too, they have not suffered either from neglect or severity, regular and systematic use of the knife being the rule. Being blessed with well-distributed rainfall, Passara claims to have one of the best tea climates in Uva; but there is very little land left in the hands of Government for extension; while Madulsima, with its teas as good as ever they were, holds the London market alone responsible for low prices.

From the Southern low-country we have a letter from Neboda, which finds the weather the chief drawback to the manufacture of better tea, as the effect of successive wet days is to prevent successful withering, and a letter from Bentota which complains of insufficiency of withering accommodation which however, is being steadily remedied. From both districts we learn there is no inferior tea—the jât being very fair, middling to good. Though the soil may be generally poor, or appear so, it contains a lot of iron or other constituents which the tea bush affects; while where rocks abound the soil is rich. There are no exhausted estates, in the sense of those which will not repay cultivation; but both letters agree that manure would improve the tea and make it more profitable—one, with the qualification that much depends on the manure chosen and on the methods of application. Without deficiency of withering accommodation being specially noticeable, three or four wet days disclose insufficient space; but otherwise factories are generally well-equipped. In Bentota the motive power is ample, but Neboda cannot express itself satisfied in the absence of an alternative to provide for a breakdown. The labour was sufficient at the time when the replies to the Circular were written last October, but as a rule it was otherwise. In early days the pruning was both too severe and too frequent, but there has been a great improvement lately; and there has been no neglect of pruning which though it may affect returns, is believed to be helpful to the bush. As a low-country tea district, Bentota leaves little to be desired, but it is idle to expect up-country characteristics in

the tea produced. The same remark applies to Neboda, whose reflections on climate and altitude are worth reproducing:—

“The essentials in tea-making are good leaf and good withering. The districts which have the climate best adapted to provide these must make the best tea. The gradation from best to lowest quality depends on the degree to which districts possess the climate that will supply these essentials. It is difficult to suppose that anything can remedy the natural drawback of adverse climatic conditions. Thus it may be feared that chemistry must begin when the weather leaves off. Useful, though its labours may be (and we would hope that it may supply us with many hints to guide us towards better manufacture), it is clear that the tea districts are tied and bound to conditions which, in the main, settle once for all their degree of suitability for tea cultivation. Parts of Dimbula may be taken as supplying the best conditions. From that starting point you can go through the list, each supplying its weather-gauge for quality and quantity. Too dry, too wet, too irregular—each with its debit and credit of bad and good, all short of the standard: some from worn-out soil as an additional handicap, hopelessly so. This district, judging by their tests, is far from the bottom of the list, and should be ‘suitable’ for tea for a long time to come.”

TEA BLIGHT—CACAO—RUBBER.

(From the *Cryptogamist in England*.)

INTERESTING NOTES FROM MR. CARRUTHERS.

Writing to us on May 19th, Mr. Carruthers is good enough to send us the following interesting notes:—

“I noticed in all the Ceylon papers that that report of my inspection of a tea estate for the presence of fungi—printed ‘there is just one disease’, instead of ‘there is first one disease’ which made it read rather foolishly in my mind.

“I was sorry you considered the report unworthy,* but I was requested to go and report, and on a few hours’ inspection I couldn’t gain or impart more information than I did. I know Dr. Watt’s publications *re* tea and other blights—he only compiles these things. Masee of Kew works at them and the dry or pickled specimens don’t give the best material for work: consequently the ‘grey blight’ and many other fungi have never been investigated and only one stage of their lives described—their life history is unknown. I have here material which I collected, which I hope will enable me to give a more complete account of them, but have as yet had no time to look at it.

“I have heard no word as to the Commission on Agriculture. I suppose it has come to some conclusions. [Not yet: still sitting.—Ed. *T.A.*]

“Just now I am trying to get the *Nectria* from the Ceylon cacao to grow on apple trees here, as I want to prove it as a distinct physiological species from *N. ditissima*, the apple canker here. I have some experiments at Rothamsted and here.

“I have been approached with a view to my visiting Mexico to report on rubber es-

* We felt that Mr. Carruthers had not done justice to himself or to the blight he was called on to deal with: it is a matter that will require careful consideration on the part of experts.—Ed. *T.A.*

tates there, and if I go I shall make a détour to some of the West Indian Islands, if I can afford it, and see their cacao there, and may have some information for you.

"I was reading a pamphlet on Vanilla culture in the Seychelles, published recently by the U.S. Department of Agriculture,* and will write some notes and send them by next mail if I can: you may find them of interest to your constituents.

"It is a healthy sign to my mind that at home just now the two most important questions interesting the nation are the preservation of the 'day of rest'—one day in seven—and the battle against Romanising and ritualistic tendencies in the Church. The Sunday *Daily Mail* has given way before the weight of public opinion and stopped issue."

MALARIA: MAJOR RONALD ROSS ON.

The following is the text of the Report lately submitted by Major Ronald Ross, I.M.S., on his special investigations into malaria parasites:—

I have the honour to address you, on completion of my term of special duty for the investigation of malaria, on the subject of the practical results as regards the prevention of the disease which may be expected to arise from my researches: and I trust that this letter may be submitted to Government, if the Director-General thinks fit.

MOSQUITOES AND MALARIA.

It has been shewn in my reports to you that the parasites of malaria pass a stage of their existence in certain species of mosquitoes, by the bites of which they are inoculated into the blood of healthy men and birds. These observations have solved the problem—previously thought insoluble—of the mode of life of these parasites in external nature. My results have been accepted by Dr. Laveran, the discoverer of the parasites of malaria; by Dr. Manson, who elaborated the mosquito theory of malaria; by Dr. Nuttall of the Hygienic Institute of Berlin, who has made a special study of the relations between insects and disease; and, I understand, by M. Metchnikoff, Director of the Laboratory of the Pasteur Institute in Paris. Lately, moreover Dr. C. W. Daniels of the Malaria Commission, who has been sent to study with me in Calcutta, has confirmed my observations in a special report to the Royal Society; while, lastly, Professor Grassi and Drs. Bignami and Bastianelli of Rome have been able, after receiving specimens and copies of my reports from me, to repeat my experiments in detail, and to follow two of the parasites of human malaria through all their stages in a species of mosquito called the *Anopheles Claviger*. It may, therefore, be finally accepted as a fact that malaria is communicated by the bites of some species of mosquito; and to judge from the general laws governing the development of parasitic animals, such as the parasites of malaria, this is very probably the only way in which infection is acquired, in which opinion, several distinguished men of science concur with me.

In considering this statement, it is necessary to remember that it does not refer to the mere recurrences of fever to which people previously infected are often subject as the result of chill, fatigue and so on. When I say that malaria is communicated by the bites of mosquitoes, I allude only to the original infection. It is also necessary to guard against assertions to the effect that malaria is prevalent where mosquitoes and gnats do not exist. In my experience, when the facts come to be enquired into such assertions are found to be untrue. Scientific research has now yielded so absolute a proof of the mosquito theory of malaria that hearsay evidence opposed to it can no longer carry any weight.

* Quoted in *Tropical Agriculturist*.—ED. T. A.

PRACTICAL REMEDIES.

Hence it follows that, in order to eliminate malaria, wholly or partly from a given locality, it is necessary only to exterminate the various species of insect which carry the infection. This will certainly remove the malaria to a large extent and will almost certainly remove it altogether. It remains only to consider whether such a measure is practicable. Theoretically the extermination of mosquitoes is a very simple matter. These insects are always hatched from aquatic larvæ or grubs which can live only in small stagnant collections of water, such as pots and tubs of water, garden cisterns, wells, ditches and drains, small ponds, half-dried water-courses, and temporary pools of rain water. So far as I have yet observed, the larvæ are seldom to be found in larger bodies of water, such as tanks, rice fields, streams and rivers, and lakes, because in such places they are devoured by minnows and other small fish. Nor have I ever seen any evidence in favour of the popular view that they breed in damp grass, dead leaves, and so on. Hence in order to get rid of these insects from a locality, it will suffice to empty out or drain away or treat with certain chemicals the small collections of water in which their larvæ must pass their existence. But the practicability of this will depend on circumstances—especially, I think, on the species of mosquito with which we wish to deal. In my experience, different species select different habitations for their larvæ. Thus the common "brindled mosquitoes" breed almost entirely in pots and tubs of water; the common "grey mosquitoes" only in cisterns, ditches and drains; while the rarer "spotted-winged mosquitoes" seem to choose only shallow rain-water puddles and ponds too large to dry up under a week or more and too small or too foul and stagnant for minnows. Hence the larvæ of the first two varieties are found in large numbers round almost all human dwellings in India; and, because their breeding grounds—namely vessels of water, drains and wells—are so numerous and are so frequently contained in private tenements, it will be almost impossible to exterminate them on a large scale. On the other hand, spotted-winged mosquitoes are generally much more rare than the other two varieties. They do not appear to breed in wells, cisterns and vessels of water, and therefore have no special connection with human habitations. In fact, it is usually a matter of some difficulty to obtain their larvæ. Small pools of any permanence—such as they require—are not common in most parts of India, except during the rains, and then pools of this kind are generally full of minnows which make short work of any mosquito larvæ they may find. In other words, the breeding grounds of the spotted-winged varieties seem to be isolated and small that I think it may be possible to exterminate this species under certain circumstances. The importance of these observations will be apparent when I add that hitherto the parasites of human malaria have been found only in spotted-winged mosquitoes—namely in two species of them in India and in one species in Italy. As the result of very numerous experiments I think that the common brindled and grey mosquitoes are quite innocuous as regards human malaria—a fortunate circumstance for the human race in the tropics. And Professor Grassi seems to have come to the same conclusion as the result of his enquiries in Italy.

WORDS OF CAUTION.

But I wish to be understood as writing with all due caution on these points. Up to the present our knowledge, both as regards the habits of the various species of mosquito and as regards the capacity of each for carrying malaria is not complete. All I can now say is that if my anticipations be realised—if it be found that the malaria-bearing species of mosquito multiply in only small isolated collections of water which can easily be dissipated—we shall possess a simple mode of eliminating malaria from certain localities. I limit this statement to certain localities only, because it is obvious that where the breeding

pools are very numerous, as in water-logged country, or where the inhabitants are not sufficiently advanced to take the necessary precautions, we can scarcely expect the recent observations to be of much use—at least for some years to come. And this limitation must, I fear, exclude most of the rural areas in India. Where, however, the breeding pools are not very numerous and where there is anything approaching a competent sanitary establishment, we may, I think, hope to reap the benefit of these discoveries. And this should apply to the most crowded areas, such as those of cities, towns and cantonments, and also to tea, coffee, and indigo estates, and perhaps to military camps. For instance, malaria causes an enormous amount of sickness among the poor in most Indian cities. Here the common species of mosquitoes breed in the precincts of almost all the houses, and can therefore scarcely be exterminated; but pools suitable for the spotted-winged varieties are comparatively scarce, being found only on vacant areas, ill-kept gardens, or beside roads, in very exceptional positions where they can neither dry up quickly nor contain fish. Thus a single small puddle may supply the dangerous mosquitoes to several square miles containing a crowded population: if this be detected and drained off—which will generally cost only a very few rupees—we may expect malaria to vanish from that particular area. The same considerations will apply to military cantonments and estates under cultivation. In many such malaria cases the bulk of the sickness and may often, I think, originate from two or three small puddles of a few square yards in size. Thus in a malarious part of the cantonment of Secunderabad, I found the larvæ of spotted-winged mosquitoes only after a long search in a single little pool which could be filled up with a few cart-loads of town rubbish. In making these suggestions I do not wish to excite hopes which may ultimately prove to have been unfounded. We do not yet know all the dangerous species of mosquito, nor do we even possess an exhaustive knowledge of the haunts and habits of any one variety. I wish merely to indicate what, so far as I can see at present, may become a very simple means of eradicating malaria.

HOPE FOR THE FUTURE.

One thing may be said for certain. Where previously we have been unable to point out the exact origin of the malaria in a locality and have thought that it rises from the soil generally, we may now hope for much more precise knowledge regarding its source; and it will be contrary to experience if human ingenuity does not finally succeed in turning such information to practical account. More than this if the distinguishing characteristics of the malaria-bearing mosquitoes are sufficiently marked (if for instance, they all have spotted wings), people forced to live or travel in malarious districts will ultimately come to recognise them and to take precautions against being bitten by them. Before practical results can be reasonably looked for, however, we must find precisely—

(a) What species of Indian mosquitoes do and do not carry human malaria.

(b) What are the habits of the dangerous varieties, I hope, therefore, that I may be permitted to urge the desirability of carrying out this research. It will no longer present any scientific difficulties, as only the methods already successfully adopted will be required. The results obtained will be quite unequivocal and definite.

FURTHER INVESTIGATIONS.

But the inquiry should be exhaustive. It will not suffice to distinguish merely one or two malaria-bearing species of mosquito in one or two localities; we should learn to know all of them in all parts of the country. The investigation will be abbreviated if the dangerous species be found to belong only to one class of mosquito, as I think is likely; and the researches which are now being energetically entered upon in Germany, Italy, America and Africa will assist any which may be undertaken in

India, though there is reason for thinking that the malaria-bearing species differ in various countries. As each species is detected it will be possible to attempt measures at once for its extermination in given localities as an experiment. I regret that, owing to my work connected with *Lala azar*, I have not been able to advance this branch of knowledge as much during my term of special duty as I had hoped to do; but I think that the solution of the malaria problem which has been obtained during this period will ultimately yield results of practical importance. —*Madras Mail*, June 1.

THE INDIAN SUGAR INDUSTRY.

We have, from time to time, placed before our readers the substance of the grievances of the Indian sugar producers, and we have been able to sympathise with them in the unfair competition created by foreign bounties, and generally to approve the action of the Indian Government in proclaiming countervailing duties to counteract the effect of these bounties. Those who oppose the imposition of the new duties, have taken their stand partly on principle, alleging a violation of free trade, and partly on injustice to the consumer whose sugar has been rendered dearer to the extent of the duties imposed. The obvious answer to the first objection is that it is the bounties which are a violation of free trade, and that the sole object of the duties is to remove from the shoulders of the local producer the burden which is placed thereon by foreign bounties—and thus to promote free trade and equal competition. The consumer will probably be inconvenienced to some extent; but it is only the well-to-do consumer into whose diet refined sugar enters and who can afford to bear the small burden for the benefit of the poverty-stricken agriculturist, who is handicapped in the sale of his canes by the immense quantities of beet-root, bounty-fed sugar which is poured into India from Continental manufactories. A further objection has since been urged, that the duties are intended really for the benefit of Indian refiners who cannot turn out sugar of the quality of French and German sugar. An Indian contemporary publishes information which he has collected at some pains to combat this view, whose energetic exponent has been Mr. Harold Cox, who has declared that the best Indian sugar refineries have hitherto turned out only second-class sugar which cannot come near the article produced in Germany and Austria. The expert to whom the *Friend of India* referred the matter, has no hesitation in declaring the best Indian cane sugar, not only not inferior to the best imported sugar, but actually superior to it. The quantity produced, however, of this superior sugar is small; and the limitation is said to be solely due to the influence of unfair competition involved in foreign bounties. Capital fights shy of an industry which has to compete with unknown forces; and though India cannot just now produce all the first-class sugar for which there is a demand within its territories, it is quite able, with the encouragement offered by countervailing duties, to increase its output of sugar of the finest qualities so as to meet most of

the demand. Indeed, the work of extension had begun, when it was arrested by the enormous imports of bounty-fed sugar; and the Indian producer, more recently handicapped by the rise in exchange, has been further victimised by the proclamation of countervailing duties in America, whence large quantities of sugar were diverted into India! In the interests of the poorer classes of both producers and consumers, therefore, it is absolutely necessary that the cane and date sugar industries should not be allowed to be crushed out, while encouragement should be given to the higher class of refineries, so that they might compete on equal terms with foreign bounty-fed establishments. Whether India can really hold its own in competition with Europe can be ascertained only by the withdrawal of bounties by continental nations, following which the new duties must be withdrawn; but the alleged interests of consumers must not be allowed to inflict hardship on tens of thousands of agriculturists, whose industry, if it is once ruined, it may take years to revive.

RUBBER CULTIVATION IN CEYLON.

There can be no doubt of the practical value of the information which the Director of the Royal Botanic Gardens has put forth from time to time in respect of rubber-yielding trees and their cultivation in Ceylon. Planters who have studied the successive "Circulars," either at first hand or as reproduced in our *Tropical Agriculturist*, must have acquired a great deal of useful information respecting the different varieties of plants and their properties; but we fear they have not been at all prepared for the reversal of fortune which has overtaken the particular rubber-tree which has so long maintained the lead as chief favourite, namely the *Hevea Brasiliensis*, or Para-rubber tree. For various reasons detailed in Mr. Willis's latest Circular, Para may be said to be now dethroned, and Castilloa (the Mexican rival), belonging to the same group as our Bread-and-Jak-fruit trees, has been erected in its place. We fear a number of planters who went in largely for "Para," following the leading in the earlier Circulars, will be apt to become a little impatient with the expert advice and will be inclined to ask (however unjustly or inappropriately)—

'Tis true you dissembled your love,

But why did you kick us downstairs?

In other words, is it not possible that Para may be a little unduly depreciated, even in the light of the most recent discoveries and inventions, and that though it may be advisable now for all who wish to cultivate rubber to apply for "Castilloa," still that those who have planted out "Para" should "ca' canny" as they say in Scotland, and by no means view their investment as a mistake. In the first place, who can tell what another year,—another revolution of the wheel of discovery and invention,—may reveal. Again and again has the "whirligig of time brought in its revenges," and we may yet see that further scientific as well as inventive progress has

restored "Para" to its position of prestige, or at least brought it alongside of "Castilloa." So, while going in as freely as possible for the Mexican tree according to the latest deliverance, let not the clearings or boundaries of the Brazilian variety be neglected. Why even the despised "Ceara," if all reports be true, is likely to come once more to the front, under the new influence of invention and scientific enquiry; and we may have certain gentlemen who went in largely in the "eighties" for the quick growing variety, looking out their clearings, chena-grown as they may be, and once more doing justice to their plantings of ten to fifteen years ago. One such Ceara clearing if not rooted out for tea, should be found in the neighbourhood of Elkaduwa and another somewhere in the neighbourhood of Madawalatenna.

Meantime we have yet to read the details of Mr. Parkin's Report which the Director is said to be preparing for the Press; and even when we have perused and digested this supply of scientific information, it may well be asked, have we arrived at "finality" or even at "definite results?" Has Mr. Biffen, or the home inventors, no further steps to mark? He would be a bold man who would tender a negative to these questions. We must, of course, do the best by the light given to us for the present, and then wait in full expectation of learning more as time rolls on. No doubt, shrewd, observant men among our planters will begin to make experiments for themselves; and the results of these, when published, will provoke a healthy competition in the path marked out by scientific counsel, modified, it may be, by additional experience on the part of the cultivator.

Meantime, the present may be a favourable opportunity for taking stock of the progress actually made in the cultivation of the different kinds of Rubber by the planters of Ceylon, up to the present time; and in an early issue we hope to summarise information already placed at our disposal from a number of districts, bearing on this important practical side of the question.

TEA ON VIRGIN SOIL IN CEYLON.

ITS SUPERIORITY IN FLAVOUR AND STRENGTH.

In our last issue we quoted a Ceylon contemporary's remarks *re* the alleged superior quality which virgin soil gives to tea grown thereon. Statements such as these easily pass into current axioms and acquire the force of tradition if not rigidly examined at the outset. Without negating the assertion, we should like to examine it closely and discover, if possible, the data upon which it is based. We presume the idea arose in the writer's mind from the fact that Ceylon teas in the early years commanded higher price than they do now, proportionately, and in fact at that time stood above Indians, the reverse being now the case. Generations among Europeans in the East being covered by but a short span of years, it is easy to lose sight of the circumstances in the beginning of things. It is plain to see that the writer of the assertion is not perfectly *au fait* with early tea-planting in Ceylon. He has assumed that tea in that island was originally planted in virgin soil, which our information does not warrant. It was, in fact by no means the case universally.

Tea was originally put down in Ceylon as an experiment by owners of failing coffee plantations

upon old coffee land, by no means virgin land. The coffee was grubbed out to make room for it in some cases, and in other cases the tea was so much in the nature of a tentative effort that the plants were put down between the rows of coffee, and only when the experiment was found a decided success was the latter rooted out. From the very first Ceylon tea was a success on the market; and these teas, grown upon old, exhausted coffee land, in point of quality, were equal to the best. In combating the acceptance of a dogmatic conclusion of this kind without examination, we would not be hell to fall into the other extreme. The question requires very careful investigation all round, and valuable information is to be drawn therefrom. We consider, in view of the above considerations, that the absolute necessity of virgin soil for the production of the highest qualities of tea is not proved, if indeed the facts do not go to disprove it, since we see that in early Ceylon days tea equal to the best was grown on an old coffee land. We think, however, that an investigation of those early days will help Mr. Kelway-Bamber, who is reported to have devoted himself to the problem, towards the solution.

Ceylon estates used to be remarkable for high cultivation and heavy manuring. We remember particularly the original 100 acres on the Mazwatte tea estate (planted on old coffee land), which gave a phenomenal yield of 1,200 lb. to the acre of good class tea, used to be described as a perfect manure heap. This would seem to show that well cultivated old land is equal to virgin soil for the production of tea, a conclusion, by the way, which is borne out on other agricultural crops, and would tend to cast a doubt on the statement for which our Ceylon contemporary is responsible, that "More has to be studied than renovating and renewing the soil." In this connection it would be advisable, perhaps indispensable, to collate information as to whether reduced prices for tea and the consequent necessity of cutting down working-expenses have not forced the Ceylon men to lower their standard of cultivation, before drawing a hard-and-fast conclusion that Ceylon tea has fallen off in quality, merely because the tea lands are no longer "virgin." Our own planters would be able to throw more light on this question than we can hope from Ceylon, for the most ancient of the Island tea is very youthful in comparison to thousands of acres in Assam and Darjeeling.

We should be glad to receive opinions and information upon this subject from our own planters, whose experience, as we say above, must be far greater than that of the managers in the comparatively young tea colony of Ceylon. We think this is not a question to dogmatise upon without a vast deal more information being brought together, and that the matter may fairly be regarded as a very open one. At any rate, we think it is far too early for Ceylon to complain of exhausted soil as a cause for the fall in their tea prices as compared with India. If the argument should be erroneous, it would be distinctly harmful to Ceylon interests, as leading them away from the true causes to which they should seek to apply a remedy. If true, Indian planters may be excused for looking on Ceylon as resembling Gilbert's precocious infant, who died "a worn out debauchee of seven."—*Indian Planters' Gazette*.

"BRITAIN OF THE SOUTH."

(From a Ceylon Visitor's point of view.)

PONSONBY, NEW ZEALAND, May 11.

I have not forgotten the request you made me just as I was leaving Ceylon that I would drop you a few lines giving my impressions of this Colony, and the matter has been in abeyance only because of pressure of work and because I wanted to allow time for a distinct impression of the general bearing of things over here to be made on my own mind,

CLIMATE IN THIS NORTH ISLAND

is as near perfection as anything mundane can be. During February and March we had most superb weather and in April it was delightful too, though with occasional showers. Now in May (answering to November in Britain) it is cold at night and in the early morning, but warm in the daytime when fine. Very few people have started fires yet. Some fruits, such as pomegranates and persimons, are still on the trees, guavas having just been gathered in; of course, apples, pears, plums and peaches were earlier. The gardens are still ablaze with flowers, chiefly chrysanthemums, cosmos, and camellias, though geraniums, pelargoniums, Japanese anemones and fuschias are in evidence, too. A Ceylon visitor soon finds acquaintances among the plants and shrubs here. The ordinary red hibiscus is in almost every garden, rather dwarf plantain-trees are cultivated here and there though I have never seen them fruiting, palms of various species are seen occasionally, the large white trumpet flower (a double variety, though) grows on bushes as large as those in Ceylon.

THE SOIL

is volcanic. From the road near here, three distinct (but happily extinct) cones are to be seen, and from one point near Auckland, I believe, that fifteen are visible. There must have lively doings here in "the braw days of old."

THE ROADS

are simply execrable. They sadly want a P.W.D. here. Of course, they want good metal too, scoria large volcanic cinders the size of a gallon loaf, not lending itself at all kindly to road-making. Above all, they need the cool, accustomed to task-work and willing to work for as many pence a day as the labourer here asks shillings.

The scarcity and high-price of

LABOUR

is one of the serious drawbacks to this colony. A charwoman asks four and six pence a day working from 7-30 to 3-30 and getting dinner and tea; she also requires to have the kitchen copper fire lighted for her and the water boiling before she arrives and a pile of firewood sufficient for the day chopped up and heaped beside the copper. As for housemaids, most ladies here seem to think that it is far less trouble to do without them; and certainly in those cases where they cannot be dispensed with, they are very expensive necessities.

The habit of drudging for themselves into which most people seem to fall into here, though it has its pleasing side as fostering independence, is not without undesirable results as well.

READING

people are very few and far between, and I should say that the intellectual average of the middle class (there is no higher class here) is very far below that of the same class in England. Here and there you meet a man (generally a Scot from Glasgow) who keeps up his reading, but the majority of the people go no higher than an occasional novel hired for two-pence from trumpery "Circulating Libraries" kept by very small book-sellers. The fault is not so much with the people as with the kind of life this country forces upon them. Where men and women get only an hour or so of respite from manual labour of the roughest sort daily, there is little time and less energy for the cultivation of the mind; if books are sought at all in such circumstances, it

is as a relaxation, not as a means of culture. The results of this are beginning to appear. The range of conversation among middle class young men, young men in business in the colonies, is much narrower than that of the same class at home, for the simple reason that the mind runs in a narrower groove. Allusions in sermons and lectures and addresses to characters and situations in Standard Literature, to scientific or historical points, are seized by only the very few; a really good speech would be surer of being appreciated in Colombo or Kandy even, than here in British Auckland. One of the gravest perils threatening the Australasian colonies is this intellectual narrowing and dwarfing that is going on. While in Britain and many of the colonies there is intellectual elevation observable generation after generation, in these Australasian colonies alone there is deterioration; the old settler with just his memories of the old home life, and the remaining vestiges of his interest in the wider life he had at home, is generally intellectually (though often not educationally) the superior of his sons born in the colonies, his intellectual horizon being a wider one. How this will work out in another generation or two who can tell? Nobody who wants to see these colonies well to the fore in the competitions of the future (competitions in which intellect will ever give greater and greater advantage) can contemplate this feature of colonial life exactly with equanimity. Better subsidise Chinese and Indian coolies to come into the colonies and so secure for the average British there a little leisure for mental culture even though the working man's present preposterous wage is reduced a fraction or two, than by the present system pursued to train—for future competition with the home country and America and with other wiser colonies—a generation of well-fed animals with muscles well developed by labour, with power to read, write and count as the result of the really splendid educational system, but with a mind that has no interests beyond the work by which bread is earned. "Man shall not live by bread alone," *cannot*, without soon sinking below the ordained level of man.

If man could live by

BREAD ALONE,

using the word in its wider (Scripture) sense, this would be a Paradise, for butcher's meat is very cheap. Beef is about four pence a pound and mutton twopence. This is as near the lowest as it can well be, while still leaving to the public the flattering consciousness that they are paying for it. There are no poor people as far as I can see; I have never seen a hungry-looking face since I landed here; but I have seen sleek dogs passing contemptuously by bits of meat thrown to them from butchers' stalls, which would have been accepted by any of tens of thousands of human poor in England with loud blessings on the head of the donor.

It is a curious experiment commercially that is being tried here, namely, to develop a new country

WITHOUT CAPITALISTS.

I am not in a position to prophesy about the future, but at present everything seems to be languishing for a little more money than the authorities can spend on it. Auckland is a large and commercially flourishing city, but its buildings are poor; its streets, though wide are badly kept, some of the leading thoroughfares having strips of grass in huge tufts disfiguring them at intervals and being yellow with what looks like chaff, but which is the horse manure of months

pounded by the horses' feet and scattered by the winds; the footpaths are in many places half covered with asphalt and half left bare; at night you have to stumble about in the streets for the lamps are poor and far apart, and so unusual is anything more than the single-burner street lamp, that the erection of a triple-burner lamp in a suburb has led the "three lamps" at Ponsonby to be known as a laud mark all over the city. Auckland might have been a splendid city had there been finances to develop it on the lines on which it was originally laid out, but at present it wears the appearance of a splendid estate which has descended to an impecunious lord; and I am told (I know nothing by experience beyond Auckland) that this is the character of the colony lately. It is a pity that in avoiding the class-legislation of England, New Zealand should have adopted another form of the same thing. How difficult it is to be truly democratic! Democracy is Government by the people for the people, and the capitalist and the brain-worker are as much part of the Demos as is the 'orny'anded, and legislation that hampers the capitalist in favour of the working man is as contradictory to the true principles of democracy as legislation for the capitalist which disregards the interest of the working man.

CEYLON TEA

is advertised in every street and on every tram and omnibus in Auckland and was well to the fore in the recent Auckland Exhibition.

CABBAGE BANANA.

A NEW VEGETABLE FOR TABLE USE.

OUR attention has been drawn to the following extract in the *Florida Agriculturist*, referring to the "Abyssinian Banana" which has been introduced into Ceylon and is growing luxuriantly at Hakgala Gardens. The Superintendent of the National Botanic Gardens, United States, is responsible for stating that the ornamental value of this plant may be eclipsed by its usefulness as an esculent, and so he would call it the "cabbage banana." We are next treated to the following interesting extract from James Bruce's "Travels in Abyssinia to discover the source of the Nile," published in Edinburgh so far back as 1890. Mr. Bruce was a much-travelled writer; but all his statements have since been verified. He wrote:—

"It is said that the Galla, when transplanted into Abyssinia, brought for their particular use the coffee tree and the ensete (banana), the use of neither of which was before known. However, the general opinion is that both are naturally produced in Abyssinia, provided there is heat and moisture. It grows and comes to great perfection in Gondar, but it most abounds in that part of Maitsha and Goutto west of the Nile, where there are large plantations of it, and is there, almost exclusive of anything else, the food of the Galla inhabiting that province; Maitsha is nearly upon a dead level, and the rains have no slope to get off easily, but stagnate and prevent the sowing of grain. Vegetable food would, therefore, be very scarce in Maitsha were it not for this plant. As soon as the stalk of the ensete appears perfect and full of leaves, the body of the plant turns hard and fibrous, and is no longer eatable; before it is the best of all vegetables. When you make use of the ensete for eating you cut it immediately above the small detached roots, and perhaps a foot or two higher, as the plant

is of age. You strip the green from the upper part till it becomes white; when soft like a turnip well boiled, if eaten with milk or butter, it is the best of all foods, nourishing and easily digested."

The "proof of the pudding is the eating thereof"; and accordingly we have been favoured by Mr. Nock with the result of a trial made by him of part of the stem of an Abyssinian banana in the Gardens. He writes:—"We tried some last night and find it very fair, but a trifle bitter. I daresay with practice in cooking and choosing the right part of the stem, it would make a nice change as a vegetable. It is rather rare in Ceylon, but can be propagated to any extent by seeds. As an ornamental plant it is one of the handsomest known."

This banana is a larger and far showier plant or cluster of plants than our ordinary banana. In America seeds were selling at a penny a piece, and the plant is likely to be largely grown as a vegetable. Here it ought to do well in gardens throughout Upper Uva and the higher planting districts generally.

ENEMIES OF THE COFFEE TREE IN B.C. AFRICA.

(From an ex-Ceylon planter.)

BORER NO. 1

After a coffee clearing gets a year old, be on the outlook for the longicorn beetles, for they emerge from their cavity in the trees of the forest and begin to fly about from the middle of November to the middle of March (practically four months), during which time they are maturing and laying their eggs; and as sure as fate many will find their way into a coffee estate. When they find coffee, as they seemingly do, a palatable food, they live on the bark of the plants, and the female lays her eggs, usually from five to seven in number. From tree to tree she flies and lays only one egg, be it remembered, at the bottom of each tree in the ground (not as is usually supposed on the tree itself) about the size of a small canary seed, dirty-yellow in colour. The egg soon hatches and finds its way, as a very diminutive grub, to the root of the coffee and begins to nibble at the bark just at the collar of the plant. Working its way in it soon has a covering nest protecting it from birds and insects; ants even cannot get at it. In the course of a month or two, the forceps of the grub become strong enough to tackle the wood, which it burrows into and lives upon, till fully matured, boring up or down the tree, turning out saw-dust and keeping its hole open to prevent suffocation till fully matured, taking about six months before turning into the chrysalis stage; during this time he either kills the young tree outright, or damages it so much that it never recovers or makes a healthy tree afterwards. After the first rains in November and December the borer grub flies as a full-fledged beetle and having found a favourite feeding and breeding tree in our coffee estates, sticks to it and again begins egg-laying. Some of my planting friends may say, "Oh, I have found half a dozen borers in one tree." This may be so, but I challenge any planter to produce more than one borer in young coffee under two or three years old. It is when an estate becomes a nursery for the longicorn and several beetles lay eggs at the root of a tree, that a number are found, or the same beetle may lay more than one on the same ground, for it lays six to seven eggs; but this is not likely, for it flies about at night, seldom resting more than an hour or so, on one tree, although it sometimes feeds a whole day on the same tree; I judge from the amount of bark eaten. I feel almost certain eggs are only laid at night and not during the daytime when the beetle is at rest and feeding or basking half asleep on the sunny side of a coffee tree.

So much for borer No. 1. I shall now describe

BORER NO. 2

which comes from the larva of a yellowish white moth with steel hairs across its body, not so bright and visible as the Ceylon moth. This moth lays its eggs, usually only one, in a little web on the leaf of a coffee tree about the month of January usually, and the egg soon turns into a borer which finds its way into the coffee tree by means of a puncture it manages to make in tender green wood either in a branch or the stem of the tree and works its way into the pith along the primary and down the stem making air holes as it goes along (also pushing out saw-dust the same as the longicorn grub) till it reaches the root; only working in the pith, be it remembered, till it forms a chrysalis in four to six months' time. This borer is not very destructive, and is easily discovered as the branch or top of the tree it enters by usually dies. I have never found more than one in a tree. Both these borers I have seen in Ceylon—the first called the white borer, and the other the red borer; but the damage done was so trifling that they were hardly known to casual observers. I was always fond of "poochi" catching and have caught many of the same stag beetles and moths in Ceylon.

WHITE GRUB.

This is the most common of all grubs, and perhaps does more damage to young coffee than the borer. The beetle is chocolate coloured, and the grub is white, and curls up when exposed on the surface of the ground. This insect, unlike the borer, seems to propagate all the year round having no set time of year for laying eggs and lying in the chrysalis stage, for I have found grub of all sizes, and beetles, all in the same place, at the same time the farmer busy trimming the fibrous feeding roots of the coffee as fast as they are made.

BLACK GRUB.

This grub is very destructive, especially in vegetable gardens. It comes to the surface at night, cuts off coffee seedlings and rings larger plants at the collar and even goes the length of climbing for a leaf occasionally. In the case of its feeding operations being disturbed by the break of day, it pulls the leaf into its hole underground where it habitually descends to rest during the daytime. I do not think this insect eats the coffee roots like the white grub, but it does a tremendous amount of damage to nurseries and young plants in a new clearing—this I am certain of. The moth of this grub is black with a torpedo-shaped body, prominent eyes, and flies very fast; it appears just at dusk, darting about seeking food in flower gardens and elsewhere and laying its eggs, but how many I do not know, in November and December. The grub lives about six months and then turns into a repulsive looking, glossy chrysalis with a hard shell, sharp-pointed at one end and twists about the sharp end when touched. Black soil rich in vegetable humus is full of this grub and it is seldom found in poor land.

WIRE WORM.

This is the only other grub that attacks coffee to my knowledge: the beetle is small, about as big as an ordinary cleg-fly, and has a habit of pretending to be dead when caught. When turned on his back he lies still for a short time till he thinks all danger is over; then arching his body by drawing together both ends, springs in the air about a yard and lands on his feet and flies. I do not know how long the grub of this beetle remains alive; but in one case long enough, I have known one to kill out an "anona" (bullo. k's heart) tree three years old—I should imagine about six months. He is not very destructive to coffee (in fact not at all common), but does a lot of damage to fruit trees and vegetables.

STICK INSECT.

This caterpillar cuts off the primaries and tops of coffee plants, and arranges them round its body lengthways, binding them together with a strong, tough web. This house or shell it lives in, stretching itself in and out of it, according as required to enable it to walk about

with its house on its back. It does a lot of damage barking the coffee plants, sometimes ringing them right round, completely stopping the flow of sap; and it should be considered an enemy of our coffee and destroyed. This caterpillar lives from February to June in Nyassaland.

CRICKETS AND LOCUSTS

comprise a very large family indeed; but there are only a few that feed on and do damage to coffee and they are principally the green-backed, handsome fellows with yellow and blue rings round the body. They have stumpy wings and a hard, horny, sword-like beak. I don't think they fly, at least I have never seen them do so. These locusts do a lot of damage barking the coffee and may well be destroyed as an enemy of the coffee tree. Several others of the cricket locust family do some damage by cutting down small plants.

BLACK BUG

I have seen, but only on an individual tree or two; but it never spreads. It appears in February or March and disappears in May and June. This pest, I am of opinion, is kept in check by the lady-bird beetle, which is common in the country and is seen very lively on our coffee bushes at the time black bug appears, and it is well-known it preys upon the bug family.

COFFEE LICE

I have seen covering an individual coffee bush, but like the bug it never spreads, and is probably devoured by some tiger of the insect family.

THRIPS.

During a very dry season it appears about October and disappears with the first heavy thunderstorms towards the end of November or early in December—much damage done by the sun and heat during these two months, might be attributed to thrips. I don't think, however, that much harm can be done to our coffee by this insect, for the short time it is with us (and this only, to my knowledge, on two very dry years) that it can be considered very harmful or dangerous.

H. B.

LIVE STOCK AND THEIR IMPROVEMENT.

Few things are of greater importance with reference to the well-being of the natives in certain remote pastoral districts of the island than the improvement of their live stock. To secure this end, Sir Hercules Robinson established a Cattle Commission which had the late Mr. Wm. Smith, of Dinbula, as veterinary adviser, and the late Mr. John Capper as Secretary. Much information was collected and published and a great deal of "castration" was attended to, during the peregrinations of the Commission; but as in so many other efforts towards agricultural improvement, this proved a mere "flash in the pan" without any continuous result. The Cattle Commissioners' Report was pigeon-holed and forgotten, there being no one Department or officer responsible to see the recommendations carried out, or at any rate tested. It is well-known that both in the South (Hambantota), the South-east (the Park country), and in the North-Central and North-Eastern divisions, the natives feed large breeds of cattle; but give not the slightest attention to the quality of their stock. This is, of course, a matter which should be specially attended to by an Agricultural Director, Board, or Department by putting pressure from time to time on the provincial and district Agents. A gentleman, as well qualified as any in

Ceylon to write on the subject, favours us with the following results of his observation and experience:—

"One great difficulty about improvement of cattle arises from the natural existing conditions. Take the Vanni (N. C. P. and N. P.), the people rear great herds of cattle as they have so much jungle and pasture lands. The cattle increase naturally and go on increasing until murrain breaks out and sweeps off two-thirds of them. They sell *very few*, partly from religious scruples; partly, because a man likes to say "I have so many cattle." ("Pecunia," comes from "pecus"—cattle!) *These cattle are not herded or selected or interfered with in any way.* They cost the owner absolutely nothing. So whatever he sells is clear profit without trouble. He can get from R20 to R40 for bulls and considers that good enough. So he says "Why should I trouble to rear a better stock?" So he will not pay for the service of (say) a Scinde Bull. Again the breed deteriorates because the man who comes round to buy naturally selects the best bull and the foolish villager sells it. Young and weak bulls run with the breed and again the consequence is deterioration, except so far as nature gives the strongest bull the advantage. Here possibly the advent of a Railway may raise the price of cattle when they can readily be taken to market, just as the making of roads raised the price of paddy; (when there were no roads, paddy sold in Nuwara Kalaviya for two-pence a bushel.) But until the market price of beef rises from 15 cents, it would not pay to kill fed-beef and it is doubtful whether even if beef were well paid for, the cattle owners would supply any better animals. Where cattle are run wild on the pasture grounds, you get no good from introducing a *good* bull, as all the other bulls run with the herd.

TEA ON VIRGIN SOIL IN CEYLON.—We do not know if the *Indian Planters' Gazette* is aiming at us in its disquisition on this subject which we quote elsewhere. But we have no hesitation in saying that there is a large and reliable body of experience before us to shew that tea grown on virgin soil in Ceylon has produced a tea greatly superior in flavour, if not in strength, to tea grown on land previously occupied by coffee or other product; and that, as years rolled by, the tea even on virgin soil gave a leaf which did not maintain its original reputation. Perhaps the Ceylon planter who went into this matter most carefully, was Mr. T. C. Owen, of the Knuckles and Kelebobke district,—compiler for us of the "Tea Planters' Manual," but who has now retired and joined the London firm of Messrs. Rowe, White & Co. We recall very distinctly Mr. Owen's statement that, do what he would, he could never recall the delicate aroma which distinguished his teas grown on virgin soil during the first four of five years. His report and the experience generally of other planters in those early days (1883-1890) will be found given in successive volumes of our *Tropical Agriculturist*; and, although allowance may have to be made in some cases for "a virgin soil" a good deal weaker in one district than in others—for instance, in a Northern district as compared with the higher districts around Nuwara Eliya with their stronger and richer soils—yet to keep up tea to its pristine vigour (dare we say, "and delicate flavour") the soil must be supplied in some way with what it loses through successive, and perhaps heavy, crops of leaf,

TEA ENTERING U. STATES OF AMERICA :
STRINGENT CUSTOMS REGULATIONS.

The Treasury Department, New York, has just issued Circular No. 51 contained in No. 14, vol. 1, "Treasury Decisions," containing the act to prevent the importation of impure and unwholesome tea and the regulation and standards which take effect on May 1, 1899, excepting in the case of teas shipped from abroad prior to April 1, 1899, which will be governed by the old standards.

Section 2 provides that the examination of teas shall be made by means of samples to be drawn from packages designated by the collector and to be furnished by the importer, and of additional samples to be obtained by the examiner. The importer shall furnish a sworn statement that any samples submitted by him to the examiner are drawn from packages designated by the collector and covered by his entry (naming the vessel), and that they represent the true qualities of each and every part of the invoice (including the proportion of dust), and accord with the specifications therein contained. The importer shall submit with his entry a chop list or specification of the several lines included in the invoice, and the collector shall select for examination packages representing the different lines. The examination and report upon such samples shall be made in accordance with the provisions of section 7 of the tea act.

In comparing with standards, examiners are to test all the teas on these points, namely, for quality, for any foreign matter on the surface of the infusion, sometimes called scum, and for quality of leaf after infusion. Quality shall be ascertained by drawing according to the custom of the tea trade with the weight of a half dime to the cup. In Country Green teas, Imperial Hysons coarse leaf Gunpowders, and extra young Hysons are to be compared with Hyson standards, and all other young Hysons and small leaf Gunpowders with the young Hyson standard. The quality must be equal to standard, but the flavour may be that of a different district as long as it is equal in sweetness. As an illustration, a Teenkai may be equal to a Moyune, but a distinctly smoky or rank Pychow, or Wencho of sour character, must not be considered as equal to the two first mentioned.

In order to test for floating colouring matter or scum, and also for the quality of infused leaf, a second drawing should be made for any floating substance, and after pouring off the water the infused leaf should be taken out so as to exhibit the lower side which rested against the cup. Should the mass show a larger quantity of exhausted or decayed leaf, or foreign substance than the standard, it shall be considered inferior in quality, and the tea must be rejected. In greens and Japans particularly, the brightness of the leaf should be considered as an evidence of quality.

Should a tea prove, on examination, to be plainly inferior to the standard in any one of the requisites—viz., quality, scum, or quality of infused leaf, it shall be rejected, notwithstanding that it be superior to the standard in some qualifications. All consideration of the appearance or so-called style of the dry leaf shall be omitted.

In the case of Ceylon and India teas, the needle leaf and Pekoe tips shall be separated by passing them together with the dust through a No. 26 sieve or No. 30 brass wire after the tea has been first sifted through a No. 16 sieve. Dust and fannings in Japan teas must not exceed 4 per cent. when tested by a No. 30 sieve or No. 31 brass wire. Before condemning any tea for dust, examiners shall sieve at least two packages.

Examiners should preserve in tin, for one year, samples of all teas examined for future reference in case of complaints, and the Board of General Appraisers should also retain a portion of all samples sent them on appeal for the same object. To this end, examiners should always send the Board samples of at least half a pound, and never otherwise than in tin cans securely labeled.

Statistics showing the quantities of various kinds of less admitted and rejected should be kept at the custom houses for future reference.

In all cases of rejections by examiners, the importer should be notified of the reason for rejection—that is, whether it be on the ground of quality, character of infused leaf, dust, scum, or admixture with foreign substance.

Whenever Japan teas shall be imported hereafter, so made up as to imitate the green teas of China, examiners will compare such teas with the pan-fired standards for Japan teas. Should such teas be made up so as to imitate Congous, they will be compared with the North China standards for Congous.

In cases of importations of tea containing an excessive amount of dust, the dust can be exported after sifting and tea admitted to entry if found up to tea standards.—*The Planter*, May 27.

SUIT V. THE AMERICAN CUSTOMS.

The application recently made before Judge Lacombe for an injunction against the Collector of the Port, the Tea Examiner, and the Board of General Appraisers, to prevent the rejection of certain teas which, it is asserted, differ in certain respects from the established standards and yet are equal thereto in purity, wholesomeness, and fitness for consumption and quality within the true intent and meaning of the act, has been denied.

It is claimed that the regulations of the Treasury under which rejections are made are illegal; that the true intent and purpose of the act is to prevent the importation of pure and unwholesome tea; that it is ridiculous and unreasonable to suppose that Congress intended by this legislation to permit the Secretary of the Treasury to determine the grade of tea which the American people were permitted to drink; that Congress could not confer upon the Secretary of the Treasury the power to declare what teas should be imported into the United States; that a wrong meaning has been given to the word "quality."

"The purpose of a standard is that there may be a fixed and stable measure by which smaller articles can be tested, but if by the word 'quality' Congress meant to place it in the power of the Secretary, of the Treasury to fix and establish the teas admissible into the United States according to their taste and flavour, then not only is it possible that the widest fluctuations may exist from year to year in fixing of the standards, but the determination of whether teas offered for import are inferior in flavour and taste to the standards so established must necessarily fluctuate with the varying skill or delicacy of taste of tea experts. It needs no argument to show that to subject an extensive trade in a commodity of foreign production which must be purchased many months in advance of its arrival at our ports, subject to the variations of seasons, to entry under such a rule is to imperil all security of trade and to put the merchant under a hazard of loss for which there can be no compensation of gain to any other part of the community. For even if such a construction of the statute were not oppressive upon the importer, it would still be a harsh and unjust rule in its application to the consumer. It would exclude inferior grades of tea, although entirely genuine and wholesome, and would compel the poorer classes of citizens to purchase higher grades of tea presumably more costly and possibly less to their liking. To that extent it would interfere with the natural liberty of the citizens and the choice of commodities which it is the general policy of the law to extend rather than to restrict,

"If this be so the legislation is in the nature of a police regulation, and the word 'quality' is to be read as having regard to the tea as being fraudulent or deceptive or bad. The design of the statute, then, is to exclude 'impure,' 'trahy,' and 'unwholesome' tea.

"This in effect limits the word 'quality' by the purpose of the statute as we have claimed it, and by the words with which it is associated.

"The rejection of teas equal in purity, quality, and fitness for consumption because containing a greater mixture of similar teas broken up into fragments known as dust or fannings is unauthorized by the statute. The regulations provide that in certain standards the percentage of dust or fannings must be restricted to 10 per cent., and in others that the maximum of dust or fannings shall not exceed 4 per cent.

"It is entirely manifest that the inherent substance of the tea is not altered by its being broken into small fragments, nor is there any pretence that it is thereby rendered any less wholesome or fit for consumption. If these teas were properly rejected it must have been because the 'quality' refers not to the inherent substance of the tea, but to its size and packing. We submit that such a construction of the word 'quality' is inadmissible. It is strained and unnatural. It has no justification in the reason of the law or in the plain meaning of the words, and is merely a trade regulation absolutely unauthorised by the statute.

"The regulations require the rejection of teas not equal to the standard in flavor or cup quality, although equal to the standards in every other particular, and the defendants have applied and are applying that rule.

"The defendants having prevented the importation of teas which the plaintiff is entitled to import within the true intent and meaning of the act and threatening to continue to do so, should be enjoined from such unauthorized acts."—*American Grocer*, May 3.

REPORT ON THE DEPARTMENT OF LAND RECORDS AND AGRICULTURE, MADRAS.

The latest Report on this Department (1893-9) has reached our hands. The operations on the agricultural side of this Department are of interest to us just at this time when the question of establishing a Department of Agriculture in Ceylon is on the tapis. It will be remembered by some that the Ceylon School of Agriculture, as first established by Mr. H. W. Green, was to a great extent, modeled on the plan of the Madras College, while the contents of his "Primer of Agriculture for Ceylon Schools" was also compiled mainly from a work written by the Principal of that College. Whether the fact of the Colombo School having been established on the model of the Madras College explains an element of demerit or not we cannot say; but it has happened that not long ago the latter, like the former, was the subject of much adverse criticism. We note, however, in reading through the Report under review that a more liberal and up-to-date system of administration has superseded the old order of things in Madras, and we earnestly hope that the same change for the better will, before long, mark the progress of official, agricultural work in

this island. For one thing, we are glad to find under the head of "Scientific and National Enquiry under Imperial Control," that Geological Surveying is going on apace in the Presidency, and we read of the examination of such minerals as corundum, iron ore and mica, with a view to developing the mineral resources of the country. The rest of the work of the Department falls under the heads of Meteorology; Botany (the examination of various vegetable products—edible and otherwise—from an economic point of view); Entomology; Chemistry (chemical examination of soils, plants, manures, etc.); Statistics (Agriculture); Veterinary (Animal Diseases, Breeding); Cryptogamy (fungoid diseases); besides the Control of Agricultural Education (including dairy farming, Agricultural publications, the holding of Shows, etc. We expect that in all these matters, the proposed Department or Board of Agriculture in Ceylon will find ample scope for work, to be undertaken, it is hoped, in the same liberal spirit in which it appears to be carried on by the authorities in the Madras Presidency. We would draw attention to the following reference to the employment of men trained in Agriculture:—

It has long been held in this Presidency that it would be advantageous if the staff of the Revenue, Forest, Educational and other Departments were leavened by men who had received a thorough course of instruction in Agriculture, and of late years this has been specially recognized by placing men who have obtained the diploma in Agriculture on an equal footing with B.A. candidates for employment in the Revenue Department. The report of the Principal of the College of Agriculture, for 1897-98, shows the extent to which this leavening has been effected. The total number of former students of the College who were employed in the Revenue Department at the close of the year was 102, 41 of them being Revenue Inspectors. In the Forest Department under Government, and elsewhere, 43 were employed, and in the Educational Department as teachers of Agriculture, 16, whilst the number engaged in direct connection with agriculture and veterinary practice was 98.

The income of the Madras Agri-Horticultural Society is, we are told, chiefly derived from the Government grant (R1,000). Would that the local Government could see its way to follow this example!

MIDLAND (CEYLON) TEA PLANTATIONS COMPANY, LIMITED.

The following is from the report of the directors:—The directors beg to submit the accounts, duly audited, or the year ending December 31, 1898, which they much regret to say again show results far from satisfactory, owing chiefly to the low prices obtained for Ceylon teas last year. The receipts for the season are £9,074 7s 1d; less working expenses in Ceylon, £7,329; leaving gross profit, £1,745 7s 1d; from which has to be deducted:—Debenture interest—6 per cent. per annum on £15,000, £900; interest on loans, £269 7s 2d; fees to trustees, and auditors, and London agents' commission on teas sold, £234 2s 9d; general charges, &c., £75 12s 10d; and the following being also chargeable:—legal expenses in connection with the mortgages, £146 3s 7d; preliminary expenses, one-third written off, 1897, £133 5s 7d; ditto, 1898, £133 5s 7d; manure, cost written off, 1897, £193 5s 2d; rice, loss written off, 1897, £132 13s 9d, produce, over estimate written off, 1897, £34 15s 8d; auditors' fees, written off, 1897, £12 12s; the deficiency is as shown, £519 17s.

It will be seen there is no actual loss on the year's trading, but that the deficiency is caused by previous debits, and the legal expenses in connection with the mortgages to the trustees for the debenture-holders, and to the London agents. In consequence of the year's trading being so unfavourable, the directors have waived their fees, and the London agents, Messrs. M. P. Evans & Co., have made no charge for secretarial work and office rent. The tea sales for the season amounted to 381,940lb, the net average being 5'49d per lb. The rupee exchange was again higher, and averaged 1s 4'20d. The acreages under cultivation are: Over four years old, 938; under two years old, 49; total, 987 acres, and the crop for the current season is estimated at 380,000lb, of which there have been sold to date 29,880lb, at a net average of 7d per lb, a satisfactory advance on last year, and, as the prices now ruling in the London market for Ceylon teas are much higher than they have been for some time, the directors trust they may be able next season to present to the shareholders a statement of a more encouraging nature. It will be noticed that since the date of the last report the working capital of the company has been increased by £2,000 raised in preference shares. The company's visiting agent, Mr. W. R. Tatham, reports in a recent letter that the estates are in good order, and the bungalow and other buildings are in good repair. By his advice the directors have sanctioned a new clearing of thirty-one acres of land lying between Blackstone and Kenilworth, which are well adapted for the growth of tea. Mr. Tatham states that the work of clearing and draining is being carefully carried out by the superintendent, Mr. Campbell.—*H. & C. Mail*, May 26.

PRODUCE AND PLANTING.

THE DRAFT ON TEA.—This question is exercising the mind of the trade, and there is considerable opposition to the proposals for abolishing the draft allowance on tea at public auction in London. In the recent circular issued by the Indian Tea Association of London and the Ceylon Association of London, the signatures of growers and importers of Indian, Ceylon, Java, or China teas were invited to an agreement binding them to refuse the draft allowance to buyers in all tea sales after a fixed date. In an explanatory memorandum circulated with the form of agreement, one of the chief reasons advanced for making the proposed change is that the draft allowance "is a survival from times and conditions which no longer prevail." It is contended by the trade that the draft allowance is certainly a "survival" from old times, and this long-established custom ought not to be lightly set aside. The question raised, the "Grocer" points out, is one of considerable importance, affecting not only the Indian and Ceylon tea trade, but the tea trade in general. Retailers will naturally want to hear strong arguments before they endorse the Indo-Ceylonese proposal—stronger arguments, probably, than those advanced in the quoted memorandum. For example, it is said that what with draft and turn-of-scale allowance, buyers last year received "five-million pounds of tea more than they paid for." Surely that suggestion nullifies itself. People who buy do not usually receive more than they actually pay for, although they may receive more than they nominally pay for. We mean that if five million pounds of tea were handed over to buyers, that fact is large enough to show that their sellers did no more than they were properly expected to do; the prices paid were paid reckoning that fact in with them. Possibly the system of paying for the exact quantity bought may be a preferable one, but such a change as is proposed cannot justly be made unless all the parties concerned have their eyes open, so that the bearing of the change on future buying may be thoroughly understood. The real reason for the change is that set out in paragraph No. 1 in the memorandum namely, "the profit on tea cultivation having reached such a narrow margin." The growers in India and Ceylon have cut down there,

and are now wishful to cut down here. We should not have thought the Indian and Ceylon trade had been really so bad as all that, though we can quite understand why cutting down should be attempted if people find themselves, or think themselves, strong enough to do it. According to the "Produce Markets' Review," this draft was not allowed for loss of weight only, but was intended to cover all sorts of other contingencies arising from the nature of the trade, such as the occasional refusal of any allowance for damage, false package, &c., after delivery from the public warehouses. Of course, also buying at original landed weights, the trade accept a great risk when delivery is delayed, as it often is, and they must have some margin in return.

NOT SO BAD AS IT LOOKS.—It might be thought on looking at the figures representing the Imports of Indian and Ceylon tea to the United States and Canada for the first three months of the year that the demand was on the decline in North America. For the corresponding periods in 1897 and 1898 the amounts respectively were 4,460,943 lb. and 3,155,099 lb., while for the first three months of the current year the quantity taken was only 2,935,885lb. The explanation is that in 1897 the imports were unusually large owing to the fear which then existed of an alteration in the tea duty in the States, while the slight reduction in the first quarter of the present year is attributed to the recent high prices.

PLANTING IN BRITISH CENTRAL AFRICA.—The revenue of the British Central Africa Protectorate for the year ending March 31 last exceeded the estimate by several thousand pounds. The rainy season which has just come to a close has been a comparatively healthy one. Very few new planters settled in the Protectorate last year, but the area under coffee is constantly increasing, as also is the bearing capacity of the trees planted during recent years. There has been an increase in the export of rubber, but owing to the frequent bush fires British Central Africa is not an abundant rubber country, and is not likely to become a serious rival to Brazil or West Africa.—*H. and C. Mail*, May 26.

THE INDIAN TEA MARKET:

ANNUAL REPORT AND PROSPECTS.

THE annual report of Messrs. Carritt & Co. deals solely with Indian tea, and the greater portion has been forestalled so far as facts and figures are concerned in the earlier Broking reports. There are, however, a few passages which are worth taking over—for instance:—

The result of the past year's working has again been unsatisfactory to growers. The chief causes are to be found in the sameness of quality of a very large proportion of the crop, the unequal distribution of supply, the concentration of buying power in the London market and high exchange. The consistently low level of value, increased deliveries at home, together with the certainty of a crop practically the same weight as last year, and the uncertainty of a proportionately better price being obtainable, opposed the idea of curtailment outturn with a view to improving quality. The character of the crop, which has largely consisted of ordinary medium quality, has not tended to bring about any appreciable advance in sterling values, though, apart from other features of the trade, it should have been sufficiently good to maintain last year's level. Owing to improved facilities of transport, and also to accelerated services, the crop has reached the market quicker than usual; no adverse influences have temporarily impeded transit or have tended to check the rapid forwarding of supplies.

Next we have an altered condition of the trade dealt with and an evil of some magni-

tude affecting producers is certainly brought to light:—

The effect of a congested supply and the want of a more equable distribution of the crop on the home market has been more than ever emphasised this year. Improved means of carriage have been largely availed of (mainly on account of economy in finance), and tea has been rushed forward at headlong rate, regardless of the inevitable fate awaiting it in London. A more convincing proof of the need of a better regulation of supply cannot be wanted than this year's working affords; even the law of supply and demand has been suspended by the persistent pouring in of shipments, and any tendency to improved prices has been immediately stifled. The altered condition of the trade and the concentration of buying power in the hands of the comparatively few large London houses make it all the more necessary to feed the markets judiciously, and the absence of this precaution has never been brought home to the seller so acutely as in the past year. The continually depressed market at home and the difficulty in moving up sterling value, in spite of an exceptional position, are in a great measure directly attributable to this drawback, and so long as the annual flooding process supervenes no healthy recovery in values appears probable; they may slightly improve during the months of diminished supply but only to be forced down again when the weight of tea comes forward. That some effective scheme for ensuring a more uniform supply throughout the year than now exists would prove of enormous benefit to the industry is undoubted, but the difficulties to be overcome appear insurmountable; it would necessitate a strong combination of producing interests, and restricted dealings would probably be unacceptable to many. But prices have been forced down to such a low level, and the margin of profit to the grower, where it has not disappeared altogether, is so small and uncertain that any active measures with this object in view should receive every consideration.

Ceylon tea shipments, fairly distributed as they are over the year, do not give the same trouble as those from India—concentrated as the latter are—within a few months practically. But how to apply a remedy would puzzle even so great a capitalist and producer as Sir John Muir!

As regards "prospects," Messrs. Carritt & Co. write:—

Prospects for the ensuing season are brighter, and there are indications of a more prosperous year before the trade. That so large a portion of the crop should, under such abnormal conditions as existed during the past year, have been dealt with before any recovery in prices took place in London is instructive, and it is to be hoped that the measure of strength now acquired by producers will not be disturbed. The statistical position would seem to invite a freer supply, which in many cases would mean a coarser system of plucking and a consequent lowering of quality; under such conditions the outlook is not favourable. The past year's crop was by no means a full one, and with the increased yield during the current season from considerable extensions coming into bearing, there should, under normal conditions of weather be quite sufficient tea to meet home requirements, and also the increasing demands for outside markets. With a large and inferior quality crop, lower prices must be looked for, and any recovery in value (signs of which are now seen) cannot be maintained. As regards manufacture, the foregoing remarks may be some guide in deciding upon the best course to pursue. In the districts planters have been fully alive to the situation, and every effort on their part will doubtless be continued to attain the best results.

PLANTING NOTES.

COFFEE.—On the 6th of May one or two suggestions were offered in this journal towards the devising of some means of popularising coffee amidst the millions of possible consumers who will prefer tea for the plain reason that nothing is wanted for that save the boiling of the kettle. It is disappointing to find that not one local planter, hard hit though the industry be, has yet had one idea to rub on another as to this most practical question.—*S. F. Press*, May 23.

TEA IN NATAL.—The consumption of tea per head in England (notes the *Agricultural Journal*) is 6lb. per annum. The production for Natal is computed at 1,000,000lb. per annum says the *Mercury*. The white population of Natal is 50,000; at 6lb. per head the consumption in Natal is 300,000lb per annum, leaving 700,000lb for export. The average retail price for tea in Natal is 1s 5d per lb; hence £21,250 is spent annually in tea by a population of 50,000.

"COLONIA" for April is an interesting number. There are now some ten old students of the Colonial College (Suffolk) as tea planters in Ceylon. One of them notices the coincidence of three of them being connected with the one Company. We quote a paragraph:—

We had a visit during the Term from Mr. Youell Thorne who was back in the old country for a short time. He gave us pleasant accounts of life in Ceylon, and of the *Old Colonials* whom he had met there. Apropos of such meetings, the circumstance referred to by Mr. Beamish, in the Old Students' Column, of three College men coming together on the same estate is certainly noteworthy. Every one will wish the trio long life and prosperity, and a flourishing tea plantation of their own by and bye.

UNITED PLANTERS' ASSOCIATION OF THE FEDERATED MALAY STATES.—One interested in the Straits asks us if we have seen the Report of the latest meeting of this body "at which Mr. E. V. Carey has been elected Chairman by a large majority,—Ceylon again to the front." A copy of the Minutes or Report has been sent to us direct and it exhibits a good deal of enterprise on the part of the Straits planters. Mr. Carey succeeds another Ceylon man, Mr. T. H. Hill, as Chairman of the U.P.A. The Association is anxious to get an "Agricultural Department" established in the Straits for the general benefit of the inhabitants, and to this end it has been collecting information from the different Colonies with regard to botanical and agricultural departments, making, however, a big blunder in giving Ceylon credit for a general revenue of 19 million £ sterling in place of rupees,—a misprint, of course.—Mr. Coates was thanked for collecting information respecting the cultivation, transport, &c., of coffee in Brazil; but surely European (and ex-Ceylon) planters in the Straits have little to learn from South America in respect of coffee? The Straits planters are anxious to have a Bonded Store or Warehouse for their produce, in order that their coffee may have time to mature (!) and in the meantime that advances may be obtained,—rather dangerous business for a Government to meddle with. The "labour" question is always a lively one in the Straits, and in a variety of forms it is freely discussed in the present Report.

Ceylon Rainfall.

THE P. W. D. METEOROLOGICAL OBSERVATIONS FOR MAY 1899.—We append this Monthly Return of rain from which it will be seen that the highest fall was at Padupola in the Central Province, 32.46 inches, and the lowest at Elephant Pass in the Northern Province 0.14 inch.

* From 1st to 27th June 7.61 inches, that is up to 9.30 a.m., 28th June.—Ed. C.O

HOW TO CHOOSE ORANGES.—The sweetest oranges generally have rusty-looking coats. An English expert says:—"Pick out the dingiest in the box, and you will get the best." Another test is weight. The heaviest oranges have the thinnest rinds. Thick-skinned fruit is apt to be dry inside. A slight freezing on the tree causes this condition in otherwise fine fruit. The "kid-glove" oranges are the two varieties grown in Florida from stocks respectively brought from China and Tangier. The Glen Retreat orange of Queensland is a very fine-skinned heavy orange, and is amongst the best, if not the best of our mandarins.—*Queensland Agricultural Journal.*

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce.)

Colombo, June 27th, 1899.

EXCHANGE ON LONDON:—Closing Rates: Bank Selling Rates:—On demand 1/4 to 1-32; 4 months' sight 1/4 1-32 to 1-16; 6 months' sight 1/4 1-16 to 3-32.

Bank Buying Rates:—Credits 3 months' sight 1/4 5-32 to 3-16; 6 months' sight 1/4 1/2 to 9-32; Docts 3 months' sight 1/4 3-16 to 7-32; 6 months' sight 1/4 9-32 to 5-16.

THE
AGRICULTURAL MAGAZINE,
COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for July:—

Vol. XI.]

JULY, 1899.

[No. 1.

SEASON REPORTS FOR MAY, 1899.

THE ANNATTO DYE OF COMMERCE.

ESTERN Province.—Paddy. Sowing for Yala over. Rainfall heavy. Rinderpest in Rayigam Korale.

Central Province.—Paddy. Yala cultivation in early stages; rainfall sufficient, 6·46 in. registered

at Matale. Health of cattle fairly good.

Northern Province.—Paddy. Fields in preparation. Rainfall 2·36 in. at Jaffna, 5·63 in. at Mannar, 3·57 in. at Mullaittivu. Health of cattle good, except in Mullaittivu district, where there is murrain.

Southern Province.—Paddy. Yala crops in early stage promising well. Rainfall 18·35 in. at Galle. No reports of cattle disease.

Eastern Province.—Paddy. Fair prospects, though some damage by caterpillars in Batticaloa district. Rainfall nil at Batticaloa, 51 in. at Trincomalee.

North-Western Province.—Paddy. Yala crop still young. Prospects generally good. Rainfall fairly distributed, 2·33 in. at Puttalam. Cattle disease still lingers in some districts,

North-Central Province.—Paddy. Yala crops still young. Rainfall 3·94 in. at Anuradhapura. Health of cattle fair.

Province of Uva.—Paddy. Maha harvest nearly over, and preparations going on for Yala. Prospects middling. Weather dry. Health of cattle good.

Province of Sabaragamuwa.—Paddy. Yala cultivation in progress, prospects favourable. Rainfall at Ambanpitiya 10·5 in., at Ruanwella 29·8 in. Cattle murrain in both Ratnapura and Kegalle districts.

Dr. Nicholl's work from which extracts appeared in the May number of the *Agricultural Magazine* I suppose is a recent publication. It would therefore be interesting to know before entering into discussion, what older authorities had written on the subject. This is what P. L. Simmonds in his great work *Tropical Agriculture*, 1877 edition, p. 388, writes in reference to the annatto industries in Guadaloupe and Cayenne:—"The fruit is like a chestnut, a two-valved capsule covered with flexible bristles and contains a certain number of seeds smaller than peas. These seeds are covered with a soft, viscous, resinous pulp, of a beautiful vermilion colour, and unpleasant smell like red lead mixed with oil, and it is this substance which constitutes annatta, or arnotto. The mode in which it is obtained is by pouring hot water over the pulp and seeds, and leaving them to macerate, and then separating them by pounding with a wooden pestle. The seeds are removed by straining the mass through a sieve; and the pulp being allowed to settle, the water is gently poured off, and the pulp put into shallow vessels, in which it is gradually dried in the shade. After acquiring a proper consistence it is made into cylindrical rolls or balls, and placed in an airy place to dry, after which it is sent to market. It used to be most common in this form as small rolls, each 2 or 3 ozs. in weight, hard, dry and compact; brown without and red within. The other process of manufacture is that pursued in Cayenne. The pulp and seeds together are bruised in wooden vessels, and hotwater poured over

them; they are then left to soak for several days, and afterwards passed through a close sieve to separate the seeds. The matter is then left to ferment for about a week, when the water is gently poured off, and the solid part left to dry in the shade. When it has acquired the consistence of solid paste, it is formed into cakes of 3 or 4 lbs. weight, which are wrapped in the leaves of the banana, and known in commerce as flag arnotto. This variety is of a bright yellow colour, rather soft to the touch, and of considerable solidity. Labatstat informs us that the Indians instead of steeping and fermenting the seeds in water, rub them with the hands previously dipped in oil, till the pulp comes off and is reduced to a clear paste which is scraped off from the hands with a knife, and laid on a clean leaf in the shade to dry It owes its value to the colouring matter bixin and orellin, which constitute about 20 per cent of good dry annatto."

The following occurs in A. G. F. Eliot James' *Indian Industries*, 1880, p. 97:—"The *Bixa Orellana* belongs to the natural order Bixineae. The East Indian Bixa is found chiefly in Mysore, Travancore and Bengal. The capsules or pods are at first of a palish rose colour, but they change when ripe to a deep brown and burst open disclosing their bright-coloured contents. Directly the pods are quite ripe they are gathered, stripped of their husk and well bruised. The pulp surrounding the seeds is the portion of the pod containing the valuable annatto dye of commerce; it is extracted by bruising and macerating the pod (*sic*) in water, they are left in just enough water to cover them for some days, or until the fluid begins to ferment, it is then thrown off, and the pulp allowed to subside. Sometimes annatto goes through a beating process, similar to that employed in extracting indigo dye, before it is finally allowed to settle. The pulp which remains is then placed in shallow pans and left to dry in the shade. If it has been thoroughly well prepared it will be of a bright yellow colour, that is the American and West Indian annatto, the East Indian has a rose-coloured dye prepared from it, so says Colonel Dury in his account of the substance in *The Useful Plants of India*. . . . Formerly annatto was obtained by a much more tedious process than now prevails, which was first introduced by Leblond, and consisted in merely washing the seeds until all their colour was extracted, precipitating the colour with vinegar or lemon-juice, boiling it up to facilitate the removal of impurities with the scum, and then draining it in bags. M. Vanquelin made several experiments on the annatto pods, and quite confirmed the efficacy of these simple measures, which really enhanced the value of the dye, and made it even of more decided use to dyers. As annatto is not easily soluble in water, alkalies are generally employed to hasten its solution, potash being most generally used; they also improve the colour of the dye; it is perfectly soluble in alcohol. (p. 96.) Annatto before being used by dyers, varnishers and lacquer makers is always boiled with half its weight of American ash, in the least possible quantity of soft water; it is used in dyeing silks, straw, buff, and cream-colour; chamois, salmon-colour, orange, amber, and scarlet with cochineal, &c.; in dyeing cottons, orange and orange yellow; in varnish,

for gilt articles and for light wood work; in lacquer, for brass, pigments, such as orange lake, &c. In fact it is one of the most useful yellow dyes and one much in demand. It is to be hoped that the East Indian variety may become better known, and that it may also be made more valuable by being more carefully prepared."

This was written in 1880. In 1885 "The Pure Ceylon Annatto Dye Works" were started by the late Mr. A. G. K. Borron on his extensive property, Crystal Hill estate, whose assistant superintendent the writer—its present proprietor—was. Our main effort was to "more carefully" prepare the dye by adopting either one or the other processes described by these authorities. But our disappointment may be easily imagined when the contradictory accounts of the different writers is considered. These were confusing and put us into great expense by the necessity of experimenting on the different processes, before hitting upon one with success, and that one is this. To make PURE DYE the seed should not be bruised, but carefully washed, after it had been subjected to acetous fermentation which has to be regulated according to the weather. The acid used is sulphuric diluted with a certain percentage of water for the dry seed; but when fresh seed is used, a natural acid—acetic—is generated by the seed itself. If the fermentation is thorough the seed need be washed only in two waters, and the liquid strained and separated. To remove the acid is the next secret; this is done by boiling the liquid after it has been concentrated by applying alum and the superfluous water drained off by pumping it out from the top of the tub or cistern in use. The boiled mass contains the two principal colouring matter, one red and the other yellow. Here is the other secret; if it is dried hard the yellow goes off; but in the consistence of putty both colours are retained. The latter is now known as "Ceylon Paste" and considered to be superior to that produced in any other part of the globe. "Cake annatto" as well as "flag annatto" too were produced in my factory, but the trade does not take them. Here then is the solution for the various contradictory and conflicting statements found in Dr. Nichol's work as well as in others that I have seen with regard to the shape in which annatto is brought to the market. For, as in everything else, there are different varieties of *Bixa orellana* growing in different countries all known by the name annatto, annatto, anota, &c. In Ceylon we have two varieties—one with the pink or rose-coloured flower which give the red-coloured pod and scarlet seed; and the other with white flower, green-coloured pod and a deep orange-coloured seed. The red variety I find is the stronger dye, and is more valuable, but requires to be manufactured into paste only; dried hard it becomes worthless. The green variety gives yellow-colouring matter in place of the scarlet substance obtained from the red variety. It is of no consequence whether the yellow is made into paste or cake as it has nothing to lose by deterioration in one form or the other. Now the manufacturers of the dye in the West Indies where the green variety may be growing, adopt a certain process by which the cake is produced, and a writer whilst describing that process, falls into the error of applying the same process

to another country where the red variety may be growing, and only the paste is made and sent to the market. In the foregoing remarks I have not mentioned the method of drying the boiled mass which is done by a centrifugal machine, and also spread on linen and hung over a fire. This machine is the same about to be utilized for manufacturing indiarubber,

A. VAN STARREX.

OCCASIONAL NOTES

We should have mentioned in referring to Dr Dodge's book on "The Useful Fibre Plants of the World" that we are indebted to Mr. John Warr of Paterson, New Jersey, for his assistance in enabling us to procure us a copy of the valuable work, for which we tender him our best thanks.

In this issue we give the first part of a paper on the subject of Fibres with which Dr. Dodge prefaces his book. It is a short but comprehensive account dealing with the different aspects of the question, and is full of instruction to the student of Economic Botany.

We are glad to notify that we shall from time to time publish Veterinary Notes dealing with cases occurring in actual practice in Colombo, and which for that reason should prove of value to all horse and cattle owners. The contributor of the notes in the present issue is a qualified Veterinary Surgeon, who has started practising in the Metropolis under favourable auspices, and as a past student of the School of Agriculture, we are pleased that he should be once again connected with the institution through the Agricultural Magazine. Mr. Chinniah has set an admirable example to his brethren in his new departure from

the beaten tract of veterinary medicine, by making a trial of the preventive treatment for rinderpest, and we heartily congratulate him on the encouraging results of the trial.

We understand that the report of the Commission appointed by H.E. The Governor of Ceylon to consider the advisability of organising a department of Agriculture for the Island is due next month, and its contents are being eagerly looked forward to. It is to be hoped that the Commission will see its way to recommend some practical measures for the improvement of the agriculture of the Island, particularly the native side of agriculture, and that some properly organised controlling body will be appointed to overlook the agricultural interests of the Colony.

The approaching Agri-Horticultural Show to be held in Colombo bids fair to be a great success. The awards which, as a rule come a day after the fair, have been received betimes. They consist of 12 gold medals and 200 silver medals: the former worth £7 10s. the latter 15s. each. The Hon. Mr. F. R. Ellis, who is just now absent from Ceylon, evinced the greatest interest in the Show, and through his headmen disposed of no less than R3,000 worth of tickets in the villages, so that there should be a large attendance of the peasantry for whom the Show should have special attractions and valuable lessons to teach. The Hon. Mr. G. M. Fowler, who has succeeded Mr. Ellis as Government Agent of the Western Province, is no less keen in making the Show a success. It is to be hoped that Government will help the Society in making the Show an annual event.

FIBRES.

[A PAPER BY DR. CHAS. RICHARDS DODGE.]

Definition of Fibres.

The tissue of plants when viewed under the microscope is seen to be made up of cells which are compacted together as they are formed during the growth of the plant, thus slowly building up roots, stems, and leaves. The walls of these cells inclose the life germ, or protoplasm, and the substance of which they are composed is known as cellulose, which chemically is very similar to starch.

Regarding the size of the cells of which common plants are made up, Dr. Gray states that their ordinary diameter in vegetable tissue is between one three-hundredth and one five-hundredth of an inch. The smaller of these sizes would allow as many as 125,000,000 cells in the compass of a cubic inch. "All soft cellular tissue, as leaves, pith, and green bark, is called parenchyma, while fibres and woody parts are composed of prosenchyma, that is, of peculiarly formed strengthening cells." We are also told that those cells that lengthen and at the same time thicken their walls form the proper woody fibre or wood cells; those of larger size and thinner walls, which are thickened only in certain parts so as to have peculiar markings, and which often are seen to be made up of a row of cylindrical cells, with the partitions between absorbed or broken away, are called ducts, or

Sometimes vessels. There are all gradations between wood cells and ducts, and between both these and common cells. But in most plants the three kinds are fairly distinct. Wood cells or woody fibres consist of tubes, commonly between one and two thousandths of an inch in diameter. When highly-magnified one can see how button-wood, for instance, illustrates the manner wood cells are put together, their ends pointed and overlapping, thus strengthening the whole.

Wood cells also occur in the bark, though they are longer, finer, and tougher than those found in the wood. They form the principal part of fibrous bark, or the bast layer, and are called *bast-cells*. These give toughness and flexibility to the structure, and the extracted bundles of these cells form the filamentous product known economically as fibre, such as flax, hemp and jute derived from Dicotyledonous plants. "In monocotyledons the fibrous cells are found built up with vessels into a composite structure known as fibro-vascular bundle."—(Dr. MORRIS.) Such fibre occurs in the palms, and in the fleshy-leaved Agaves, like the century plant, the fibro-vascular bundles being found not in the outside covering of the trunk, as in bark, but throughout the stem, or leaf, forming what may be termed (in an Agave leaf, for example) the supporting structure, or that which gives rigidity and toughness to the leaf. These filaments or bundles of elongated, thickened cells, pressed firmly together, when extracted or separated from the soft cell mass by which they are surrounded, may be known as *structural fibre*, of which the fibre of sisal hemp is an example. The simple cells already described, when single or agglutinated and produced on the surface of the leaves, stems, and seeds of plants as hairs, form a fibrous material also valuable, to which the name *surface fibre* has been given. Such hairs are found enveloping the seeds of plants, and when they are produced in the bolls or capsules of species of *Gossypium* form the cotton of commerce.

The fibre bundles, therefore, whether occurring as bast fibre or structural fibre, or whether in the form of simple cells, as surface fibre, may be regarded as the spinning units, and a flax thread is but an aggregation of bundles of bast cells purified and cleansed of all extraneous matter and simply twisted together. In the perfecting of processes therefore for separating, cleansing, and purifying the bundles of cell structure known as fibre, a knowledge of their physical structure is absolutely essential. The rotting of a fibre is simply the breaking down of the cellular structure or complete separation of the individual cells, by which means the filament is resolved into its smallest parts, each part being measured by the length to which the original cell attains during the period of its growth.

(To be continued.)

RINDERPEST INOCULATION.

"Alston Lodge," Cinnamon Gardens,
Colombo, June 15.

DEAR SIR,—I herewith send you a report on the recent outbreak of rinderpest at Hatton, which afforded me an opportunity of trying Professor

Koch's and Dr. Edington's methods of preventive inoculation. As you will see from the report and Mr. Paterson's letter, the results have been very encouraging.

Being only a private practitioner who has but lately started practice, I have not yet fully equipped myself with all the necessary apparatus for inoculation, and I was much disappointed to find that I could not obtain such apparatus in Ceylon, while even the Government Veterinary Department was unable to supply me with a veterinary hypodermic syringe in working order. I intend carrying on inoculation, if the opportunity offers, and I am glad to say that another estate proprietor in Dikoya is willing to have his whole herd operated on.—I remain, dear sir, yours faithfully.

A. CHINNIAH.

I received an urgent call from Messrs. Aitken, Spence & Co., Hatton, on the 4th of May last, and on my arrival there I was told that within one week three of the best bullocks, out of a batch recently purchased in Colombo, had died within a day, after severe purging. There was another bullock which shewed similar symptoms, and to see which I was specially summoned. When I saw the animal he was only off feed, with no fever, and a stimulant mixture brought him round in a few days. When I was asked my opinion, I told the Manager that unless I held a *post mortem* examination I should not be able to say anything, for the symptoms might have been either those of poisoning or rinderpest. I advised him, however, to adopt the ordinary precautions against the spread of contagious diseases which he was very willing to do.

On the 7th May I received another telegraphic message intimating that three more animals had taken ill and that two of them were in a very bad way. I proceeded thither on the 8th of May and held a *post mortem* examination on two animals. With the bile obtained from them I inoculated four bullocks with 10 cc. of fresh bile. Of the four inoculated, one caught the contagion and died. This animal was a high-conditioned lazy beast, and I believe it was owing to this fact that he succumbed so readily (very possibly infected previous to the inoculation).

I may mention that one inoculated animal was intentionally exposed to contagion, but did not contract the disease.

I assured the Manager that inoculation was all that we could do, but I was unable to inoculate the whole herd at one time, owing to the fact that the working of the animals could not have been suspended. Under the circumstances I was able to inoculate only a few head of cattle at a time. Those that were not inoculated, readily caught the contagion and most of them died; while out of twenty-seven that had been inoculated by me only two contracted the disease, one of which died under the circumstances I have detailed above.

The following is a detailed account of my inoculation:—

9th May.—Inoculated four bullocks with 10 cc. of fresh bile.

16th May.—Inoculated two, one with 10 cc. the other 18 cc. of glycerinated bile.

18th May.—Four animals with 15, 18, 20, 20 cc. respectively.

19th May.—Two animals with 20 cc. each.

21st May.—Two animals with 12 cc. and 14 cc.

30th May.—One animal with 18 cc.

2nd June.—Twelve animals, one with 12½ cc., and the rest with 10 cc. each.

The following is the letter referred to :—

Hatton, June 13,

Dr. A. Chinniah, Veterinary Surgeon, Colombo.

Dear Sir,—In reply to yours of 10th, none of the bulls you inoculated when last here have taken the disease. Two previously inoculated took ill, one died, the other has recovered.

I cannot but think it was a pity so much time was wasted between your first pronouncement of the disease being rinderpest and the inoculation of all the stock.

The animals which recovered will be branded with an I as requested.

(Signed) W. B. PATERSON.

INSTRUCTION IN AGRICULTURE.

The following is a clause of a bill that has been introduced into the Ontario Legislature :—

The Council of every Municipality may, subject to the regulations of the Education Department, employ one or more persons holding the degrees of the Bachelor of Science of Agriculture or a certificate of qualification from the Ontario Agricultural College, to give instruction in agriculture in the separate public and high schools of the Municipality, and the Council shall have power to raise such sums of money as may be necessary to pay the salaries of such instructors, and all other expenses connected therewith. Such course of instruction shall include a knowledge of the chemistry of the soil, plant life, drainage, cultivation of fruit, the beautifying of the farm, and generally all matters which would tend to enhance the value of the product, of the farm, the dairy, and the garden.

Commenting upon which an Indian contemporary makes the following forcible remarks :—

The lines upon which the Ontario authorities are proceeding are deserving of careful consideration in this country. Agricultural education is rapidly coming to the forefront as one of the necessities of the times. Indeed, most thinking men now recognise that next to a thorough grounding in the three R's, young people attending State schools are most in need of a course of agricultural instruction sufficiently comprehensive to enable them in after life to carry on the business of farming in an intelligent and successful manner. But, instead of special attention being given to teaching of this kind, it has long been a source of complaint in this country, as well as in many other parts of the world, that the system of education provided for the young is calculated to engender a distaste for life on the farm. Boys spend a great deal of valuable time in learning things that are of no earthly use to them in after-life, while a grounding in the principles of agriculture is neglected, either because the teachers have no knowledge of the subject, or are disinclined from their point of view to waste time in teaching something that is not included in the list of subjects on which the pupils are ex-

amined by the inspectors. As the teachers gain nothing by imparting agricultural instruction, even if they possess the ability to do so, it is hardly to be wondered at that the subject practically receives no attention. Agricultural teaching, including matters relating to dairying, should constitute an important part of the education of State school children. Only a few of the large number who must depend for a living on farm work can take a course at the one agricultural college in the colony which has been successfully conducted. To make agricultural education general, the public schools must be utilised.

It is absolutely certain that if those engaged in rural industries are to hold their own in competition against the rest of the world, their education cannot begin at too early a period in their lives. Hitherto there has been a much too general desire on the part of young people whose parents can afford to give them a fair education to become members of the learned professions. The result of this is overcrowding, and the impossibility of the majority making a living, notwithstanding the time, money, and hard work spent in acquiring the right to use certain capital letters after their names. The case of boys who qualify themselves to pass the Matriculation examination and afterwards become clerks, etc. is worse, and as each batch comes forward, competition is keener, and it is more and more difficult to make a decent living. There has been far too much of this sort of thing and our system of education is in some measure responsible for it. Enormous sums of money are annually spent in educating our youth, and no effort worthy of the name is made to direct their attention towards the industries that afford them the best prospect of making a living, and the development of which is of the greatest value to the State. In almost every country in Europe elementary practical instruction in agriculture is given in primary schools, through the medium of travelling instructors, or professors who not only superintend the agricultural course in the schools, but also hold conferences, give lectures and advice, and keep themselves closely in touch with the actual cultivators of the soil. That some such system will have to be adopted in India if progress is to be maintained goes almost without saying. The farmers, horticulturists, or dairymen of the future must possess a thorough knowledge of their calling, and to insure this the teaching must begin in early youth.

VETERINARY NOTES.

I. THE USE OF A CANDLE LIGHT IN OPERATING FOR WORM IN THE EYE.

Filaria oculi does not commonly affect horses in temperate climes, and, indeed, it might be said to constitute a tropical disease. In India it is found to occur more frequently on the eastern coast and less so on the western side. *Filaria* may be said to be pretty common in Ceylon.

The parasite gains entry into the system of the horse through the medium of water, and when it enters the circulation it does not begin to develop till it finds itself in the aqueous humour of the eye. Other instances of parasites

reaching special organs before development are the fluke affecting the liver of the sheep, and the parasite occurring in the brain of the same animal and causing the disease known as sheep staggers, sturdy or gid. The tendency of filaria to reach the aqueous humour is attributed to its fondness for the light, and if it is not removed in time the irritation caused by its movements in the eye causes total blindness in the subject.

As a preventive against filaria, it is advisable that grass should be allowed to wilt or wither before being given to the animals, while care should be taken that only fresh pure water is used for drink, all sources of stagnant water being avoided.

On April 27th last I was summoned to operate on a mare belonging to Mr. Jacob de Mei for the removal of filaria oculi. As the parasite had been visible on the previous evening, I recommended that the operation should be put off for the following morning, as it is a habit of the worm to retreat from the light after exposing itself to its influence for a period, only to reappear again after a short interval; again recent movements have a tendency to cause a cloudiness which makes the detection of the parasite a matter of some difficulty.

On the day fixed for the operation I proceeded to cast and secure the mare, and after getting her head in an elevated position, I induced local anaesthesia by bathing the eye with a solution of cocaine. I, however, found it difficult to bring the parasite and keep it steady at the proposed seat of puncture (the upper and outer margin of the cornea). It occurred to me at this stage that the fact of the parasite affecting the light might be taken advantage of by placing and artificial light opposite the seat of operation, and the worm so attracted to and kept steady at the required point. To this end I ordered a lighted candle, by the use of which I was able to attain my object, viz., the removal of the worm with ease and certainty.

II. PROTRACTED LABOUR OF 12 HOURS IN A MARE.

On May 28th last I received a call to attend on a chestnut Delft pony mare at Messrs. Waller's yard in Colpetty. This mare had been brought over from Delft and landed by the Government Veterinary Surgeon, as far as I could ascertain, on the 9th of April. The pony which had been sold to, and is now in the possession of an officer of the H.L.I. Regiment did not show any symptoms of ill-health till May 27th, when labour pains began at about 10 p.m., and soon after the attendant in charge noticed the bursting of the water-bag. All through the night of the 27th the animal was in labour and continued to strain with no result. On my arrival the next morning (about 10 a.m.) I found that the animal in poor condition and unable to help the natural process of foaling by any effort on her part. I proceeded to administer a dose of ergot and sulphuric ether, and on examination found the knees of the foetus bent and the head and neck only protruding. Pushing back the head, I succeeded with some difficulty in securing both the forelegs one after the other, and with a steady pull managed to get the position of a normal presentation and delivered the foetus (which was larger than was to be expected) in a dead condition. As the foetus was fully formed I considered this a

case of premature birth and not of abortion. In the light of my knowledge of the history of the mare I would ascribe the cause of her premature labour to the effects of her recent sea-voyage, while protraction of labour is attributable to her low condition and consequent weak state of health.

The temperature of the mare, after delivery of the foetus, was 105° F., and the pulse frequent and small. I prescribed the following:—

Sod. hyposulph.	...	6 drs.
Mag. sulph.	...	10 oz.
Aq. camph.	...	1 pt.

½ part every 8 hours.

Later, on the temperature rising to 106° F., and the animal becoming very dull and refusing all nourishment, I gave

Tinc. aconit.	...	½ dr.
Tinc. digit.	...	20 m.m.
Water	...	1 pt.

½ part every 4 hours.

On the 30th the fever was reduced to 102° F., and the following mixture was prescribed:—

Quin. sulph.	...	2 drs.
Acid. sulph.	...	1½ drs.
Spt. Aeth. Nit.	...	2 oz.
Aq. menth. Ppt.	...	1 pt.

¼ part every 4 hours.

The womb was washed twice a day with Condy's fluid, and the mare is now quite recovered.

D. A. CHINNAH, *Veterinary Surgeon.*

SISAL HEMP.

The question of cultivating this plant which has proved a source of large profits to growers in the Bahamas and other parts (and in which our Secretary for the Colonies is said to be financially interested), has never been seriously thought of in Ceylon. Quite lately a good deal of interest was evinced in the Mauritius hemp traceable no doubt to the fact that a "new patent" was being "boomed" through local speculators. What has been the outcome of the mild excitement over Mauritius hemp as the *deus ex machina* which was to come to the rescue of the planter when low prices and other unavoidable circumstances placed him in jeopardy, we have never been able to find out. But one thing is certain, and that is that we are not likely to hear of further trials with new patent machines for treating Mauritius hemp in Ceylon.

We read in the *Indian Agriculturist* of no less an authority than Mr. Marshall Woodrow of the Indian Botanical Department pledging his faith in sisal hemp as an Indian fibre crop, and for the benefit of our readers who may see a possibility of growing sisal in Ceylon under similar conditions to those obtaining in India, we reproduce the remarks referred to above:—

Mr. Marshall Woodrow is so fully persuaded that sisal hemp is a good thing that he is determined to sacrifice Government service for it, and to start a limited liability company to grow and manufacture it. Mr. Woodrow, it will be remembered, introduced a few sisal hemp plants into the country seven years ago, and they grew remarkably well, giving 10,000 young plants. The fibre from the original plants proved of high

quality, and is valued £23 to £30 per ton in London. The cost of producing and exporting the fibre is estimated at R225 per ton, and if sold at £20 per ton, the profit would be 33½ per cent on the capital. Five years are required to produce the first crop of 3,000 lbs. of fibre per acre; thereafter 1,000 lbs. per acre yearly may be obtained. As the sisal plants increase in number in a rising ratio, it is calculated a very short time will be sufficient to obtain commercial quantities. Its principal use heretofore has been in the manufacture of ropes and carpets, but it is said that wider use for it have now been found. A sample of this fibre sent by Mr. Woodrow was tested by an expert. His report shows the sample to have plenty of tensile strength, but when put to a breaking strain, breaks "short," which is consistent with the general appearance and harshness of the fibre. If some means could be adopted to put the fibre through a process which would soften it, and at the same time not diminish its virtue, it would stand even a greater tensile strain, and also give a break more after the style of true hemp. He tested two specially made strands, and says the smaller one, which is below the Admiralty standard in size, stood the Admiralty test of 112 lbs., and broke at 120 lbs. This is very satisfactory except for the shortness of the break mentioned above. The second sample strand, which was made up to the Admiralty requirements, stood the same test (112 lbs.) and broke at a deadweight of 140 lbs., showing that nothing has to be feared as regards tensile strain. The expert, whose report we quote, says he is of opinion that this fibre when softened and worked into the larger kind of hawsers would meet with success, providing, of course, that the price is equal to or below that of hemp or coir. But for the smaller kinds of rope, unless the "shortness" of the break can be obviated, the fibre would not stand so well, more especially when taking short turns, around bits or bollards. Its success depends on the cost of production, and if rope made from this fibre can be put on the market at a less price than hemp or coir, the chances are that there will be a great demand for it, in spite of enormous quantities of wire rope of all descriptions which is used at the present time.

—♦— PANICUM COLONUM. —♦—

Mr. H. Jardine, manager of an Experimental Farm in Queensland, refers as follows to the above grass (indigenous to Ceylon) which is apparently unknown to stock owners:—

We often import at great expense and trouble foreign grasses and plants. This is right enough in its way. But I am inclined to think that often better results would be obtained by cultivating and improving some of our indigenous grasses which for æons past have adapted themselves to our soils, climate, and circumstances. When visiting farms in this newly-settled district (Biggenden and the surrounding neighbourhood), I was struck by the luxuriant appearance of a grass which was quite new to me. It is leafy and succulent, stooling well, growing very thick, and reaching 3 to 5 feet in height. It is mostly found on rich land, such as, for instance, old sheepyards and camping places, and in one instance at least I

saw it healthy and thriving well at the bottom of a hill where there was a soakage, rendering life impossible for corn and other plants, which were there stunted, yellow, and dying out. A local dairyman of great experience (Mr. Fowler) told me he considered the grass unsurpassed as a cow fodder.

As nobody in the district could tell me either the vernacular or the botanic name of the plant, I sent a handful of it to the Government Botanist (Mr. Bailey) who writes thus about it:—"The grass of which you forward a sample is *Panicum colonum* (Linn). It is indigenous in Queensland and most tropical and sub-tropical parts. In India it is considered one of the best for fodder, all kinds of stock being fond of it, and the abundant quantity of grains which it produces is considered to add greatly to its nutritive qualities."

Mr. Bailey adds that it is not so widely spread as a close ally, the *P. crus-galli*, but is probably better, and would be more easy to manage in cultivation, requiring, however, a good and *probably damp soil*.

From what I have seen so far of the grass, it seems to me to be a summer fodder, coming into seed in February and March. When depastured or mown down, it grows again very rapidly. I think it would stand a great amount of moisture being thus well adapted for dairymen to grow on the coast during the wet season.

At Mr. Bailey's request, I am now gathering some seeds of it for distribution to those desirous of giving it a trial on a small scale. One should be careful, though, to keep it well under control. Like all good fodder grasses, it is likely to become a nuisance amongst other crops. It does not extend by means of rhizome roots, like couch or Johnson grass; but its tiny seeds are very numerous and shed easily, so that it becomes difficult to eradicate it once it has got established.

—♦— AN INTERESTING LETTER ABOUT RHEA. —♦—

(To the Editor "Indian Agriculturist.")

SIR,—As you gave us a notice of our ramie experimental installation at Staines, you will perhaps not be indisposed to give your readers the news of our experiments having proved most successful. When we started, we were confronted with the following difficulties:—1st, supply; 2nd, decortication; 3rd, preparation; 4th, spinning; and lastly, demand or market. I will deal with these *seriatim* later. Ungumming, which had hitherto proved such a fruitful source of difficulty, had long been overcome by us; the gum question presented no terrors nor difficulties; by our method un gumming is simple and the durability of the fibre is unsurpassed, as is proved by the yarns which have been in use now three years. They are as strong now as when first prepared. I refer to those made at Staines. I have products prepared by our process which have been in use ten years and are as good now as ever. I will deal with the obstacles as they appeared at the initiation of our works at Staines.

Supply.—There is a vast supply in China, where the natives have cultivated it and all the best textiles are made from it. The wealthy Chinese

hold it in high esteem and it fetches high prices. Very small quantities compared with the vast crops grown, unfortunately, have yet found their way out of China. We have based our calculations on the price of raw material at £30 per ton, and at this price I can show a paying industry competing with flax, but I am promised contracts as low as £20 per ton; this will open up a vast field and enable us to compete with cotton. India produces vast quantities in a wild state; these will have to be brought under cultivation. Dr. Morris, of Kew, recommends ramie to the planters who cannot make sugar pay. It would be a boon to our West India Colonies. The Australian Colonies are growing ramie; Queensland and New South Wales have sent us splendid quality. The United States Government are recommending it to their farmers, and the Government has voted \$145,000 to the establishment of experimental plantations. Mexico, it appears from a Consular report, shows 145 per cent profit in ramie-growing. From South America I have splendid samples; as many as four crops in the year are cut, and I am promised regular supplies at a price which will put ramie on the market as a competitor to cotton. There is a vast field in Egypt and Soudau. The Government of Natal is recommending ramie-growing. Plantations are already started in Borneo, Ceylon, Straits Settlements, Formosa, Java, and the Malay Peninsula; Corea produces splendid ramie, and the Japanese are turning their attention to ramie-growing. In short, I hear from all quarters of the globe of the great advance in ramie-growing, and I have not the slightest doubt it will prove a strong rival to cotton. To our Colonies I would suggest ramie-growing, and, by the use of our decorticators, ribbons could be prepared whilst in a green state, for the ungumming process and flasse should be prepared on the plantation. It is a simple operation and the plant would not be expensive. The flasse so produced would be far superior to that produced from the dried ribbons, and in addition there would be a great saving in freight. The waste products, *viz.*, the leaves and lateral shoots, would produce an invaluable pulp for high-class paper making and command a high price.

Decortication.—In China this is accomplished by hand labour. The operator strips the ribbons from the stem and scrapes the fibre, removing the pellicle or brown bark and much of the pectose gummy matter whilst in a green state. The natives of India merely strip the plants and make no attempt to clean them. These rhea ribbons command a much lower price than the Chinese cleaned strips. Our decorticator cleans the ribbons similarly, but leaves them in a more perfect condition than those produced by Chinese hand labour, removing considerably more of the pectose in its fluid state.

Preparation.—The next difficulty is dressing the fibre ready for the spinner. Hitherto the expensive process of preparing on silk dressing machinery has stood in the way, and when we can turn out an article absolutely without waste beyond the shorts or noils which exist in the fibre, at a cost of one-halfpenny, which hitherto has cost 9d., we can claim success and considerable advance.

Spinning.—This is now a simple process. Our wet spinning frames produce an even yarn, gasing is no longer necessary, and the strength and lustre of the fibre is materially advanced by its abolishment.

Market.—On account of its great strength and lustre it is especially in demand for luce, duck, khaki, sail cloth, fishing-lines, braiding, tapestry, and all purposes where special strength or lustre is of advantage. It mixes with and fortifies weak wools. And as the price of the raw material is lessened, so in proportion will the demand increase. Our latest is milo-thread.

We shall be pleased to send you samples. For yacht-sails it has achieved a great success. The *Defender's* sails were ramie. The *Cona*, one of the most successful English yachts, carried ramie sails made by our process. As the fibre does not rot in water it is particularly applicable to fishing nets, sails, and rigging, and its great strength commends it further for these purposes.

D. EDWARDS-RADCLYFFE,
Hythe Eud Mill, Staines, Middlesex.

THE WHIP TREE.

This is the common local name of the tree botanically known as *Casuarina equisetifolia*—one of the Conifere or cone-bearing trees, so uncommon in the tropics, except in the higher elevations. In the Flora of Ceylon the wood is described as "very hard, fibrous, strong and brownish-red."

Mr. J. W. Fawcett, member of the English Arboricultural Society, in his description of the Timber Trees of Queensland, tells us that the generic name, *Casuarina*, was given by Linnæus on account of the pendent branchlets, resembling the feathers of the bird known as the cassowary. All the *Casuarinas*, he says, are splendid trees for planting. They are very rapid growers, and make good breakwinds, copses or shelter plantations, and the saplings are always useful for many other purposes besides the speedy supply of excellent fuel which they give. Mr. Fawcett thus makes special reference to the whip tree in his descriptive list:—

Botanical Description.—The Horsetail oak is a lofty tree of moderately large size, attaining a height of from 50 to as much as, 50 feet, with a diameter varying from 12 to 30 in.

Bark.—The bark is rough.

Branches.—The branches, which give it a very peculiar appearance, are long, slender, and wiry; the principal ones are spreading or ascending, the smaller ones generally pendulous or drooping. They are of a greyish-green colour, glabrous or tomentose when young, with very small scale-like sheaths instead of leaves.

Leaves.—The leaves are sheath-teeth, arranged in whorls, from 6 to 8, usually 7 in number, and are very short and acute.

Flowers.—The flowers are dioecious—that is they have neither calyx nor corolla, the stamens with the pistils being on separate flowers. The male flowers have only one stamen, and are in spikes about three-quarters of an inch in length, and terminate in a slender deciduous branchlet. The female flowers possess a one-celled ovary, and are arranged in dense heads.

Fruit.—The fruit consists of hardened bracts collected in a strobilus, or compact cone, about half-an-inch in diameter, of a globular shape, each enclosing a small shining or velvety winged nut.

VERNACULAR AND BOTANICAL NAMES.—The Horsetail Oak (so-called from the likeness of its long pendulous branchlets to the long hairs of a

horse's tail) is also called Forest Oak (from growing in small patches or forests); Coast Oak (from its growing generally on the coast); Swamp Oak (from its growing in swampy localities); Bull Oak (from its robust growth); and Ironwood (from the hardness of its timber). It is called Aitoa or Toa in the Society Islands, Filao in Madagascar, and Noko-noko in the Fiji Islands. The specific name, *equisetifolia*, was given to this species by the Forster brothers, writers on Australian botany, from the resemblance of the branches to an *Equisetum* or Horsetail.

DISTRIBUTION.—The Horsetail Oak loves a maritime situation, growing freely in sandy saline soils. It is found growing in great abundance near salt-water marshes and inlets on the coasts of tropical Queensland, North Australia, New Guinea, the Malayan Archipelago, the Indian Archipelago, on the eastern side of the Bay of Bengal as far north as Aracan, Eastern Africa, Madagascar, the South Sea Islands (Fiji, Society Islands, &c.), &c.

USES.—The Horsetail Oak produces a dark-coloured timber, coarse but closely grained, beautifully marked, hard, light, and tough. It is useful for shingles, staves, and for all purposes where lightness and toughness are required. Its timber makes splendid fuel, giving great heat and leaving very few ashes.

In the Society Islands, where it grows chiefly on the sides of the hills, its timber was formerly used for making clubs and other implements of war. Its hardness and durability led the earlier voyagers to the South Seas to distinguish it as Ironwood, although it is a very different tree from that bearing the same name in North America. This latter is botanically known as *Carpinus americana*, Mich.* Its dark hairlike pensile foliage gives it a mournful appearance, and in many of the islands of the Pacific it is consecrated to the dead, and, with crimson *Dracenas* and other shrubs and trees, is planted in or near burial-grounds. This tree has long been cultivated in gardens and nurseries, and has been introduced into France and India and other countries. It bears transplanting well, and will grow in sandy soil even to the edge of the sea. Captain Campbell Walker estimates the yield of firewood from this tree to be four times as great as the return from any tree of the forests of France. In India, where it grows on pure sand, it is greatly valued, as its timber bears a great strain, and is not readily injured by submersion in water, and it is also much used as fuel for railway locomotives. The cost of rearing *Casuarinas* in India has averaged, according to localities, from £4 to £10 per acre, and the return, after only eight years, averaged from £13 to £32. I would recommend this tree as a valuable one to plant on the coastal portions of our barren "walum" patches.

The branchlets of this, as of other *Casuarinas*, have a sub-acid flavour, and are readily eaten and relished by cattle, especially during the drougthy seasons in Queensland, and in many parts it is pollarded for fodder.

A variety of *Casuarina equisetifolia*, Forst., named *incana*, having horny or woolly young shoots and large cones nearly an inch in diameter, is found on the islands off the Queensland coast and also in New South Wales.

* The Ironwood of Ceylon is *Mesua ferrea*.

GENERAL ITEMS.

The *Queensland Agricultural Journal* in a paper on Pineapples makes the following reference to the manuring of pineapples as carried in in Fort Myers, Florida:—

A field was manured with a mixture of—

1,000 lb. cotton-seed meal,
500 „ kaint,
500 „ superphosphate
500 „ equal parts of bone-meal and dried blood,

2,000 „ cow manure,

of which 2,000 lb. were applied to the acre.

This mixture corresponds to a fertiliser containing 108 lb. nitrogen, 177 lb. phosphoric acid, and 78 lb. potash, the quantities of these ingredients applied to the acre being therefore as follows:—48 lb. nitrogen, 80 lb. phosphoric acid, and 35 lb. potash.

The field was planted at the beginning of June, 1892, after having been fertilised with 2 tons per acre of the mixture given above. Later the plants received a top-dressing of hen-manure; no record was kept of the quantities of this material applied.

The quality of the soil was light and sandy, corresponding to the typical Florida soil, which is considered of little value. The soil in question contained pretty large quantities of humus and sand at the surface, and had a hard-pan bottom at depth of from 1 to 2 feet. As far as the physical properties of the soil were concerned, it was well suited for pineapple culture. In June, 1893, 5,000 pineapples worth 5 cents (£10 18s. 4d.) a piece were harvested, and in June, 1894, the yield increased to 11,724 per acre, worth 10 cents a piece at the Fort Myers market (£97 14s.). The yield is allowed in the report to have been a complete success.

With reference to the discussion that has been going on among Indian planters on the subject of male coffee plants, Mr. F. M. Baily, the Botanist, says that no such thing as a male coffee plant has ever come under his notice, nor had it, to his knowledge, been mentioned by any other botanist. The coffee plant is neither *diœcious* nor *monœcious*; but is *hermaphrodite*, the flowers containing both male and female organs. As to a tree which bears peaberry being considered a male, the idea is absurd. If the tree were male it would not bear at all any more than a male date tree. It is possible for the flower to have the female organs and for the tree thus to be barren; but still this could not be considered a male tree unless such a condition were ever afterwards its characteristic.

A new industry is being opened up, says an Ex-changer to bring hardwood timber into prominence and value. It has been found that the wood of such trees as the beech, birch, maple, when cut into thin veneers and connected together three-ply, the thickness of the whole about $\frac{5}{16}$ inch, make very superior packing cases for carrying all kinds of heavy and light merchandise. To show that this is a very large field, it is stated that about 40 per cent. of the pine now cut finds its way into packing cases. This veneer box is waterproof for all practical purposes, it is less bulky, more durable, and much lighter than the 1-inch pine packing case now in use. By this reduction of weight, the saving in freight and express charges over long

distances, it is claimed, will give the shipper his packing case free of cost, which is a consideration in the expense account not to be overlooked. A veneer factory solely for this purpose, worked by an English company, has already made its appearance in Toronto. Another mill, by a different English company, is being built in the easterly section of New Brunswick, where hardwoods abound close to the seaboard, from where shipments to England, the great user of packing cases, can be economically made by water the year round. Here the veneer is manufactured, cut into sizes, and shipped to the London factory, where the cases are put together and distributed.

It is not generally known that the expressed juice of the garlic makes an excellent cement for broken glass and China. The juice must be applied as soon after breakage as possible, as the edges of the broken parts become worn away by friction. This makes an everlasting cement, and if the edges are joined no sign of fracture remains. The expressed juice of an onion also makes a very good adhesive fluid.

The sweetest oranges generally have rusty looking coats. An English expert says:—"Pick out the dingiest in the box and you will get the best." Another test is weight. The heaviest oranges have the thinnest rinds. Thick-skinned

fruit are apt to dry inside. The Glen Retreat oranges of Queensland are very fair-skinned heavy fruit and are amongst the best, if not the best of the mandarinus.

Two Government Veterinary Surgeons in Cape Colony recommend Cooper's dip (a well-known patent preparation) as the best remedy for ticks. One pound of the dip mixed with 20½ gallons of water and afterwards with 4 lbs. of soft soap should be used to wash the animals. Owing to the deposit of sulphur among the hair, fresh ticks are found unable to gain a lodgement for some period after the animal has been freed of the pest.

A writer to the *Queensland Agricultural Journal* highly recommends a simple remedy for stings from bees, warps, ants and stinging plants. It is called the "wet-earth" cure and consists of nothing more than applying moistened earth or mud to the affected parts.

Orange trees are very long-lived. In the orangery at Versailles is a tree, raised from seed, planted in 1421. There is another in the convent of St. Sabina, in Rome, said to have been planted by St. Dominic in 1200. In the neighbourhood of Finale is a tree which bears nearly 8000 oranges in a single year. In Holland are many trees which have been in the same family for from 200 to 300 years.

“PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

(Third Series.)

W. B. LAMONT:

COFFEE, COCONUT, CINNAMON, CACAO AND TEA PLANTER,
1841-1899.

THE subject of our notice was wont to be described by the late Mr. A. M. Ferguson as the “Hugh Miller” of Ceylon. And, when in his prime, there was a good deal of resemblance between Mr.

Lamont and his distinguished countryman—also a self-made man—but our portrait it must be remembered, is taken of the Ceylon Pioneer, as an old man well entered on his 83rd year. In another way there has been a resemblance between W. B. Lamont and Hugh Miller, namely, in the terse, vigorous style which the former gradually acquired and utilized so well in numerous contributions to the *Observer* in his younger and even later days—his sentences often reminding one of much in Miller’s “My Schools and Schoolmasters” and other well-known works. Few Ceylon pioneers have had such a diversified experience of planting in the Colony as W. B. Lamont, for he acquired, in due succession, a practical acquaintance with the cultivation of each of our leading products, and is now as much interested in Tea as ever he was in Coffee, Coconuts or Cinnamon. Landing in Ceylon on 17th February, 1841, he proceeded at once to the heart of the then inaccessible district of Ambagamuwa to help

to form the “Barcaple” coffee plantation; and after a terrible time of trial, from want of coolies and of nearly everything that has now come to be part and parcel of a planter’s life, Mr. Lamont in 1845 changed his employment, being engaged by Capt. Jolly to open Atherton, another unfortunate Ambagamuwa estate. Ten years were passed; and in the beginning of 1853, he was transferred by Capt. Jolly to the more prosperous Poengalla plantation in East Matale. He continued two years more in coffee—16 years in all—and then in the latter part of 1857, left the hill country and took charge of the Ratmalana Cinnamon and Coconut plantation, not far from Mount Lavinia, under the direction of Mr. Robert Dawson as Colombo agent. Mr. Dawson lost the agency in 1859 and Mr. Lamont left to take up “Coffee Store” work at Uplands, under Mr. David Wilson, head of the leading Colombo firm—Wilson, Ritchie & Co.—of that day. This, however, was not congenial work to the hardy Scot who had so long been trained to an out-of-door life and who, like his countrymen, the Douglasses, would any day prefer “to hear a lark sing than a mouse cheep”! So, in 1860, Mr. Lamont got charge from Messrs. Darley, Butler & Co. of the estates of Uluambalama and Kimbulpitya (Cinnamon and Coconuts) in the Negombo District. After eleven years of faithful service here, Mr. Lamont got twelve months’ leave

—his first and last furlough—and revisited his native Scotland. Returning in 1872, he found soon after, that the proprietor of the estates in his charge, having died, his plaeces had to be sold and a new Superintendent was selected. Mr. Lamont, however, had by this time a little Coconut venture of his own in the Maha-oya Valley—the opening up of which, for we suppose 30 by 10 miles, he has watched from the beginning—and of this he took charge. But another whirligig of change: in 1877 he sold out, and once again got charge of Ratmalana; but only for two years; and then he went to open a lowcountry property—Eilandhu—near Henaratgoda, for the late Mr. A. M. Ferguson, in Coconuts, some Cacao and Fruit, and Tea. Here Mr. Lamont remained seven years and then returned to the Maha-oya Valley where he had still some interests. In 1891 he disposed of these and in 1893 settled on a block of land near Ratnapura, which has been opened as a tea plantation (for himself and partners)—Kosgalla—137 acres out of 313 being planted with tea. This in a letter before us he pathetically calls his “last flitting,” the word applied in Scotland to a change of residence—one of the most touching of Border songs being “Luey’s Flitting,” written by William Laidlaw, so long the faithful, homely friend and amanuensis of Sir Walter Scott. The subject of our notice, however, belongs to one of the Western counties of the Borderland, to that part of Scotland where lies the scene of Crockett’s story of the “Raiders;” for, W. B. Lamont is a Galloway man, and we can recall the interested enquiry of a well-known Banker (in the O.B.C. days) as to what Galloway man could have written a clever story in one of our Christmas numbers, as he had thought he had been the only representative of Galloway in Ceylon! Our reply was that “W.B.L.” had left Galloway long before our Banking friend was born.—So much for a brief summary of this old Planting Pioneer’s career; but now we have his own autobiographical story written—be it remembered by a man well on in his 83rd year—and in the quaint, homely but eminently readable style which this self-made, honest, industrious and God-fearing Colonist long ago made his own. Let no one despise these simple annals of a cottager’s son trained to hard work from childhood and rising by slow degrees:—

“Honour and shame from no condition rise;
Act well your part, there all the honour lies:
Fortune in men has some small difference made—
One flaunts in rags, one flutters in brocade.”

AUTOBIOGRAPHIC.

On the 13th of February, 1818, I came to stay in the household of a labouring man—the seventh of ten such guests who arrived at intervals, during twenty years. The place where this event took place was a

cottage within five minutes’ walk of the mansion-house of Woodhall, a gentleman’s seat in the parish of Balmaghee and Stewartry of Kirkcudbright; and there I spent the first five years of my life and began to develop my individuality. My natal place is, in my memory, a lovely spot amid woods and pastures, with an extensive view over an undulating country, the villages of Lauriston in the foreground, and Bengairn in the distance. Unfortunately, an elder brother was accused of knocking down a hare that crossed his path; and the very suspicion of such a crime was sufficient to account for the warning to flit that speedily followed. My father was silently sorrowful, but my mother lamented her exile from the bonny Woodhall in verse. My father obtained a shelter for his family in the Clauchan of Tongland on the bank of the Dee, two miles above Kirkcudbright, which continued to be our home till the last of us took wing in search of a livelihood. My mother died when I was ten years old—the eldest of four, the youngest under one year. My elder brothers were then earning their living away from home and I had on the sad event to take up the rôle of cook and housekeeper. I had learned to read after a fashion in a dame’s school in Clauchan—an accomplishment I did not allow to rust. Before I was ten years I could have passed a creditable examination in Bible History. My father had some few volumes of devotional and controversial Divinity that were not much to my taste; but I read Buchanau’s History of Scotland and Knox’s of the Reformation with keen interest and every other story I could borrow from any of the neighbors. In my twelfth year I was sent to the parish school with more knowledge than most boys of my age, but a sad deficiency in my pronunciation of polysyllables. At first my reading and spelling took me to the bottom of my class, but the explanation carried me as regularly to the top and at the end of three months, I stayed there and was rapidly promoted till in little more than a year I had reached the highest taught in the institution. I had then finally to leave school and take up farm work for a time.

At that time the “Tally” business in England absorbed a good many young men of my class who found themselves superfluous commodities at home. Tally men are a sort of commercial travellers on a small scale: a man that had done well in the business got lads from Scotland and sometimes employed as many as five or six, each of whom had two-week rounds that brought them to the same place once a fortnight. They had to enquire into the means and characters of the dwellers within their sphere of action; select those whom they thought it safe to trust; and from such they must endeavour to obtain orders by forcing their way into houses, entertaining the inmates with small talk, displaying their samples, expatiting on the quality of the goods, and the advantage of paying in fortnightly instalments. To perform their duties efficiently they should have dauntless audacity, ready tact and unflinching fluency of speech. It was only by experience that I discovered my own deficiency of every one of those qualities; so I turned out a dead failure and returned home to farm work. My next move was to a nursery where I learned something of the propagation and culture of plants from the daisy to the oak, though not all that lies between them. My next move was into the service of a maiden lady—one of the Maitlands of Barcaple, an ancient family of landed gentry in Tongland—who was building a villa in the suburbs of Kirkcudbright. My work there was to lay out, plant and tend the garden and the four acres of land with fences and the et ceteras thereanent. After nearly two years in this post, the lady’s brother, the laird of Barcaple and a Mincing Lane broker offered to send me out to Ceylon to assist in forming coffee estates. I gladly accepted the offer as I had long desired to emigrate to Australia and was not then aware that life was very different in Ceylon. I was perfectly satisfied with his terms, viz. a free passage, board and lodging for three years, and a salary of £30, £40 and £50 for the same period.

Mr. Maitland kept me in London for two months by the way. I suppose for the purpose of studying my

character and capacity and to rub off some of my rusticity. He sent me on messages about the City and suburbs; he made me write to his dictation long letters to his Ceylon attorney and he directed me to write to his sister my impressions of the great City. He took advantage of my ignorance to send me on errands to make foolish enquiries and thereby took me in on several occasions that made me blush for my stupidity.

At last, I joined

THE BARK "IRIS" (CAPT. LINTON),

at Gravesend. My fellow-passengers were Dr. Kelson, Mr. and Mrs. Dawson, of the Baptist Mission, Miss Tweedy, Alexander Davidson, Matthew Lamb and Thomas Mottimer, a Jaffna Tamil, whom the C.M.S. had sent home as a specimen of their success in educating the natives. I alone am left of that set of fellow-creatures.

We reached Colombo on 17th February, 1841, five months minus six days out. A steady head wind kept us in the Channel three weeks and things were not much better in the Bay; in fact all the passengers were laid up with sea sickness till we were in sight of Madeira, where we had three days on shore, while wine was being taken in for the East India voyage. We were becalmed for nine days within 400 miles of Ceylon, which was ended by a squall that caused some havoc in the rigging and snapped the main yard.

I had to remain in Colombo for three days before I could get a seat in the coach. When I arrived in Kandy, the welcome of my P.D. seemed to me not quite so cordial as I thought I had a right to expect. Well, neither in dress nor manner did I reach his ideal of what his coadjutor should be: so he decided that I should go at once to the fittest place for such a rustic boor. After one day in Kandy we started for the spot where this estate was to be. We went to Gampola on horseback and then on foot by the little frequented native track across paddy fields up and down rocky ravines over tracts of low jungle. Our quarters for the night was a large ambalam about a mile beyond what is now

THE TOWN OF NAWALAPITIYA,

which then was a single hut inhabited by an old Moorman. On reaching our lodgings I was fairly done up and at once lay down on one of the mud-built bunks. Just off a long voyage and unsuitably dressed for a jungle journey, I was in bad form for such work in a blazing hot tropical day. I could eat nothing, but lay in there in pain and in the full belief that my first night in the jungle was to be my last. Towards the middle of the night, however, nature came to my relief and when daylight came I was fresh and empty—much fitter for the second day's journey than the first. Passing the Mahawille and the Masnawatte gangas by fords and climbing up a forest-clad hill, at the summit a view was obtained of the country destined to be the scene of my labours for fifteen years. Thousands of acres of patana lay before us sending spurs far up the forest-covered mountains: on the south lay the Galboda ridge, on the west Raxawa and Unulagala and on the east the Ritigala range with the Mastnawatte-ganga in the bottom of the vale. The top of the most distant patana to the left was pointed out as our destination; and, after a short rest, we started afresh to wade through some two miles of long grass and in descending to the bottom of the valleys we forded several streams that formed the main river lower down. From the last stream we had to climb a steep patana for a thousand feet. The settlement was not visible from below being situate in an inward dip of the land and not to be seen till within a few yards. I sat down on the grass and stared at the scene before me. There were three separate huts thatched with patana grass—two of them 10 x 20 feet and one 15 x 40—one of these smaller ones had the walls roughly finished and the other two had the wattle up, but were waiting for the daub. Writing home, I compared them to big bird cages. There were three inhabitants in this dreary settlement—a Tamil, a Sinhalese and an old Kaffir: the first was the servant, the second appeared to have no duty—he had

been engaged as timekeeper and store-man, but he had nothing to do in either capacity. As for the Kaffir he was past his working days. The Jaffna Tamil was the only one of the three that knew English. The furnishing was in harmony with the style of architecture—four posts stuck in the ground supported half-a-dozen small trees adzed square by way of table; on each side of this structure was a concern constructed of "warichchis" supported in the same way as the table, covered with dry grass with mats over it; these were seats by day and beds by night. These structures were put up at one end of the larger unfinished room. As the cooly had arrived with my carpet bag I was glad to get a wash and a change, after which I ate a hearty breakfast of better viands than I expected in such a desolate place. My P.D. stayed over the next day and showed me the coffee nursery the only other work that had been done, and gave me directions to select a site and build a set of cooly lines very soon as he expected to send me a supply of labour and with the parting advice to keep George, his Tamil servant, in good humour, as my comfort would entirely depend on him, I saw no more of him for six weeks and not a cooly arrived to do any work whatever. With the aid of the old Kaffir, I mudded up the walls of the smaller hut and made myself as comfortable as circumstances would admit. Towards the end of the second month of my solitary idle life, gangs of coolies began to arrive; but they did not stop long—a week to ten days being about the time they stayed. And fully six months elapsed before I had no intervals of enforced idleness from want of labour. Meantime Mr. Wise's visits were few, short and far between. He lived in Kandy in a house he rented in company with Wilson Ritchie's Visting Agent and he never spent a whole week on the estate all the four years I was on it, though on nearly every visit he announced that he had come to stay. That first year of planting life was the most miserable of my life, but I made no complaint and set myself to learn my new work with all my might and found out how to do things without a teacher or exemplar. Wise went a good deal about, as he said, to gain experience from seeing other people's work; but before a year had come and gone, I was aware that I knew much more of my business than he did.

It was only

IN THE SECOND YEAR

that I got about fifty acres ready for planting and the following year something over twice as much was ready for planting. About this time I had a bout of ill-health and had to ask for aid in the work. As I fell ill a second assistant had just arrived but he at first could be of little use. I had consulted Dr. Reed, and he advised a change. "Go to Kandy," he said, "eat beefsteak and drink porter: you are suffering from hard work and low living." By the by the low living was no choice of mine, but Wise having exempted his servant from my authority, he fed me on rice and "karawadu" and yet his master complained to me of the housekeeping which roused me to some self-assertion. I said that he charged the estate £4 a month, for my board and wheresoever the expense came in my food had never cost him one-fourth of his charge and that his servant and the clan he had gathered about him lived much better than I did. I was then entrusted with the supplies and within a month George and his clan were all off the place, but the evil to my health was already done. On my application for leave, Wise brought an old soldier with twelve months' experience to act during my absence. He did not invite me to take up my quarters in his house, but I had to go to an hotel. In three weeks I reported myself well enough to return to work. But to my no small surprise, I was directed to place myself under the orders of Mr. Freeman on my return. My first impulse was to decline to return at all; but then I considered that there was still six months of my original engagement to run and in good faith I must fulfil my contract, though as I then knew it was not legally binding and in the meantime I could look out for other employment; so I returned to find

that much of my system of working had been suspended and new rules established. The monthly weeding was stopped. The coolies were given a half-holiday on Saturdays on full pay and other things changed that with some trouble I had established. I never knew by what representations Wise endeavoured to justify this action to the proprietor, but by return mail it was found that they had not served their ends. The orders were:—"Discharge the new man; replace William in his former position. Let him build a suitable house for himself near his work and let his salary be for the present £10 a month"—a case of Haman and Mordecai.

Captain Dalrymple—Sir James Elphinstone—had visited Ceylon about the end of 1842. Though not a blood relation he was a family connection of Mr. Maitland and an intimate friend, and visiting the estate never doubted that he would not find the responsible manager in residence. He did not express his thoughts to me when he learned that the manager did not reside on the property and only visited it occasionally. He made it his business to enquire into Mr. Wise's character and it appeared that he had achieved a notable measure of notoriety. He further learned that Mr. Wise was a leader of the fastest set of young men that frequented the planting capital and all this he wrote to his friend and how much more I know not, only as I afterwards learned his remarks inferred that the person he found on the estate could not know much about planting, so that I had failed to make a favourable impression on the visitor. After this the rôle of keeping Mr. Maitland informed of the conduct of his employes was taken up by another correspondent; and just as Wise was adversely criticised, I was commended: hence the slap in the face the former received in his effort to get rid of me.

Still Mr. Maitland was reluctant to give up the young man that had been taken up at twelve years of age, educated at his cost and trained to business in his own office. He was the son of an attendant where Mr. Maitland kept his riding horse and the youngster was often trusted to bring him the animal when he wished to ride in the Park or elsewhere. Pleased with the intelligence and readiness of the boy, he took him as his own personal attendant, then sent to school where he made rapid progress and at sixteen he wrote a fine clerical hand and was a first-rate arithmetician. He was then taken into the office and at eighteen was principal book-keeper of the firm. At twenty he was sent to Bombay to study Indian commerce in the house of Ritchie, Stewart & Co. All this time he had behaved entirely to his patron's satisfaction. During his residence in Bombay the mercantile community of that city caught

THE COFFEE MANIA

and nothing was talked about but the fortunes to be made by coffee in Ceylon. Small blame to a young fellow in the lead of older and more experienced people, enthusiastically writing to his patron in favour of the opinions daily expressed by the leading members of the community in which he moved. Having read those letters in Mincing Lane fifty-nine years ago, I did not detect then the utter absence of established fact and the confidence with which the most extravagant estimates were advanced. I had to learn by experience the fallacy of such, and learned to distrust all speculative estimates of cost and profits. Those letters convinced Mr. Maitland, however, and he instructed Wise to go to Ceylon and secure a suitable tract of land.

He got the best available in Ceylon, which was of small value, where hardly one man knew any thing of soils, climates or how these affected the growth and cropping of the plant. He travelled to many districts and finally settled on Ambagamuwa, induced thereto by the fact that the high-class civil servants, the oldest European residents and consequently the best judges had selected that district as the locality as their own field of enterprise.

Finding a suitable tract between the properties of the Government Agent of the Western and Central Provinces, he applied for it and cleared the boundaries of 1,000 acres. He had really worked hard for the first six months and endured a good deal of hardship; but after getting the land surveyed, he set about indemnifying himself for his privations. He set himself down in Kandy and cultivated the acquaintance of a rather wild set of youths who paid frequent visits on the spree to Kandy; and up to the time of my arrival, no steps had been taken to begin work beyond what I have named. The habits he contracted at that period stuck to him; company was a ruin to his life and the monotony and solitude of the estate, as it was in those days, death: he had no resources within his reach, he read no books, he attached himself to no science, he studied no art and a practical planter he never could have become.

From the communications received about his attorney's mode of life, Mr. Maitland in all probability recognised the fact that he was not the stuff that planters should be made of. He therefore arranged to give him an employment somewhat akin to that to which he had brought him up. This idea was the management of a

GENERAL PLANTERS' STORE

in Kandy which was duly established and large consignments of goods and two assistants were sent out. At that time there was room for such an institution, but it did not thrive in Wise's hands and within a year it went into other hands at a heavy loss and was for many years carried on by James Affleck.

Wise, then a married man, came up with his wife and her mother, as he said to settle down for good on the estate. He stayed a fortnight.

The next news from home was that Mr. Maitland had decided on a visit to Ceylon and named the day he would leave England. It was, however, a month later when he started and he went first to Bombay, where he stayed for two months before coming down to Ceylon. I had been twelve months in a house of my own and managed the field work with hardly any interference. There was then two other assistants; they never did any field work. One being a house carpenter and the other a millwright, they found the small amount of work that satisfied them in the bungalow, and a shed by way of coffee store and a couple of rooms under the same roof for their own residence.

At length the day was named on which Mr. Maitland was to leave Bombay for Ceylon, but we had had two months to think over what would happen; and each had his own thoughts, but kept his own counsel. In my case it was the unexpected that came to pass. Wise came up with his family really to stay that time. Paterson was awaiting events in the hope that they would turn to his advantage and I was for good reasons easy in mind as to the course things might take.

The last day of September, 1845, came. That day I had gathered

THE FIRST COFFEE THE ESTATE YIELDED,

and taken it into the store where I found all my three fellow-employes. They had been erecting the store and preparing it for work. I suppose the sneer with which I enquired if they had never seen a pulper at work was visible, but I left them to find out for themselves what was wrong. The next morning being Sunday, after giving the coolies their chits, I went to the store to see how the pulping had got on. They had at once discovered that as they had placed the pulper, the pulp fell into the steeping tank instead of the chopp: so they had reversed its position, but the upper chop had being fixed too near the cylinder and much of the coffee was injured. Paterson did not accept my advice with a good grace, but he made use of it. On return to my bungalow, I met Wise's horsekeeper who handed a note which I at once opened and read. It was short and to the point. Thus it ran:—

"Having arranged to take the full management of the estate into my own hands from this date, be good

enough to send me the check-roll by bearer, and attend muster tomorrow morning when I will give you your orders for the day, and the charge of a gang. I have also to inform you that your services will not be required after the end of next month."

I promptly replied:—

"I send you the check-roll as ordered. I will leave the estate tomorrow."

Among other gentlemen that had visited the estate and been shown round it by me were two of the ablest and most respected members of the planting body in the persons of Captain Jolly and Mr. George Pride, from each of whom I had received a nearly identical communication, namely, to let them know if I found occasion to change my service. I at once wrote to Capt. Jolly that I was now at liberty to accept an engagement. He answered by requesting me to visit him at his residence in Katugastota. I walked to Kandy the next day and paid my visit the following morning. I found with him Mr. Fairey, one of his partners*, and they had already arranged to commence operations on land adjoining Barcaple and running high up on the Ritigala mountain and I was at once appointed to the operative part of the business on a salary R50 higher than I had in my former situation. Thus a second time the enmity of Wise had brought me advancement and no good to himself.

It was nearly two months after my dismissal that Mr. Maitland arrived. What passed between him and Wise was never revealed; but the latter departed bag and baggage within a week in company with a little rascal known as C—W—. He set up as a commission agent, but the firm did not prosper. Paterson was put in charge of the estate—a post he held for many years. Mr. Maitland made the estate his headquarters and lived on familiar terms with all classes in the district. At first I did not venture to call on him not being very sure of a welcome; but he came to see me and talked to me as if nothing had come between us since the old days in Mincing Lane, but for some time the name of Wise was not mentioned in our conversations. But at length he told me that he had received reports about both Wise and myself from several parties in the Island, and he thought they gave me more credit than was due to me. I replied that I could have no opinion as to what was written about either of us by outsiders; and though my position was never a pleasant one, but now that I was safely out of it, I would never say one word either in defence or accusation.

The superintendent of a neighbouring estate had built a grand bungalow and issued invitations to a great

HOUSE-WARMING FEAST

on Christmas Day. Mr. Maitland asked Paterson if he was going. He replied that he had not been asked and he believed that only resident proprietors or those who might become so were invited.

"Well, then", he said, "we will have a rival feast on the same day, and I doubt not ours will be the merriest of the two. Send invitations to all the Scottish superintendents and assistants in the neighbourhood."

Nine of us sat down to that dinner and a very pleasant night we had, as I well remember, and first-rate company our host proved himself. But the thing that amused us was a capital imitation of the voice and manner of host of the rival feast then going forward on the other side of the valley. He had only been in his company for half-an-hour, but he had caught the man's big boastful voice and loud self-glorification exactly and reproduced him in all his ignorance and vulgarity very much to the delight of his guests, to every one of whom he had given deep offence by his impudent self-assertion.

Mr. Maitland's health began to fail before he had been many months in the Island, but he held on till he became really very ill: so he left the estate one morning and rode to Gampola where he took the coach to Kandy. Mr. Albrecht of Ing-oya was his fellow passenger: he too was very ill and died at Kandy. The

* After whom of course "Faireyland" was called.—Ed.

same night Mr. Maitland took an extra coach to Colombo where he arrived at daylight next morning, only to die during the same evening.

He had parted finally with Wise, but had neglected to recall his power of attorney: so he returned and took possession of the estate. He too was doomed. Never of a robust constitution—some years of reckless dissipation had done its work. Paterson who had toadied him in the days of his power, now set him at naught having reached the position he had aimed at from the first and knew that the restored reign would be a short one. No one in Ceylon had suspected that Mr. Maitland's affairs were left in an unsatisfactory state; but there appeared to be such a state of things that only the Court of Chancery could disentangle. Mr. David Wilson was appointed local administrator and his first act was to dismiss Wise who then in an almost moribund state, got a second class passage for himself and his family. He died at sea and his mother-in-law died two days after. Mr. Maitland's hereditary estate was sold for the benefit of the creditors but it did not go out, of the family being purchased by an uncle who had made a fortune in New York and the coffee estate was ultimately bought by Sir James Elphinstone. Thus the coffee enterprise first ruined and then killed the two men that brought me into contact with it.

CAPTAIN JOLLY,

under whom I served for fourteen years, was a gentleman by birth and breeding. He entered the Mercantile Marine Service of the East India Company and was first Lieutenant to Captain Dalrymple, when the Company sold their fleet, after which he commanded one of the ships under the new owners in the same trade, which he gave up for coffee planting in connection with Macvicar, Burn & Co., of Bombay. He purchased land in various districts and opened four estates—one in Hantane, one in Matale, one in upper, and one in lower, Bulatgama. The two first were successes: the two latter failures from natural causes of which we had no previous knowledge and that were beyond our control. I did the best work that was in me. In two years

300 ACRES WERE PLANTED

and weeded monthly. Hopes ran high till the period of crop yielding arrived when they began to fall year by year till they reached zero. When it became certain that with the most economical expenditure the place would barely pay, its way, I had several reasons to desire a change. I had got no advance of salary for seven years, and had not the face to ask for it under the circumstances. I was confident that in a suitable climate my experience would bring better results for myself as well as my employers. I had married in 1851 a young girl belonging to an old Dutch family, who quickly lost her health in that cold rainy climate and had to go to the lowcountry always—after a few months on the estate. What with the cost of travelling in those days and our separate living on such occasions, I found my income hardly equal to my necessary expenses. I therefore applied to Captain Jolly then a partner in the firm of George Wall & Co., to give me an appointment in another district. The only one open was Yakkessa, but as it was then a shuck place and quite as rainy as Atherton, I declined it. In the middle of January 1855, however, I received an order to give over charge of Atherton to a young Eurasian in his employ and attend him in Kandy at once. My family was down in Kalutara at that time, so that I was without encumbrance and started next day. It appeared that the superintendent of Poengalla in Matale East had been drunk in a neighbour's bungalow for three weeks in the middle of crop and everything on the estate was in the utmost disorder. In the course of my 14 years of planting, I had seen neglected and mismanaged places, but

POENGALLA CROWNED ALL.

The soil was all that could be wished and the coffee was eleven years old on the oldest fields: not only had it made no return to the absent proprietor but he had advanced money to carry it on every year. The agents

Keir, Dundas & Co., finally offered to purchase it at about one fourth of what it had cost. He would not sell but he changed his agents. The first superintendent appointed by Captain Jolly began vigorously, but soon broke down and took to drink. I found the whole crop, 5,000 bushels of parchment, in the store; the weeds were in many places higher than the coffee; the older fields had been once pruned by the process of cutting the primaries within six inches from the stem and the primaries had become like broom besoms, the jungle had been allowed to encroach all round the borders and a field that had first given its maiden crop had suckers six feet high. Finally the cooly force was refractory and insubordinate.

My first report was a very gloomy one. I estimated that to get the place into anything like order £500 more than the previous average would have to be expended in the first year and then no great increase of crop could be expected in the current year. In answer I was authorised to spend whatever I thought necessary. Though I expected much from a thorough weeding and pruning, the result left my hopes far behind—masses of blossom came out on the leafless wood and so much young wood rushed out that there was very heavy work in handling and selecting the shoots that were to be left for the following year's crop. The crop of that first year was

ELEVEN CWT. PER ACRE

and a good deal was lost from insufficient labour and from heaviest plucking occurring in latest months of the year. I expected to get some personal advantage from the result of my first year's operations; but as it was not offered, I had to remind Captain Jolly that I had got no increment to my salary for eight years, while others many years my juniors in the service were higher paid than I was.

My request was conceded as I thought not with the best grace; and I found my resources hardly equal to the calls on them and began to think very seriously whether I should not seek lowcountry employment where my family could live at less than one half of what I was spending. I began therefore to make enquiries with that view and ultimately engaged with Mr. Robert Dawson to take charge of Ratmalane,

A CINNAMON AND COCONUT ESTATE,

eight miles from Colombo, at a very much lower salary than that I surrendered. I knew, of course, nothing about the productions of the place; but I trusted commonsense and earnest observation of facts would soon enable me to acquit myself creditably.

The first thing that I had to apply myself to was the study of the Kandapanuwa (coconut weevil) which threatened utter ruin to the coconut fields. By the end of a month I had arrived at a decided opinion and mode of treatment which put a full stop to that plague in the course of three months. The failure of Mr. Dawson in less than two years closed my connection with Ratmalana. I was introduced to Mr. E. J. Darley and highly recommended and he promised me the first opening that occurred under the agency of his firm and in the meantime I took service under Mr. David Wilson in Uplands Mills of which I was sufficiently tired when at the end of twelve months, Mr. Darley offered me charge of the two estates of

KIMBULAPITIYA AND ULUAMBALAMA, KADIRANA,

which I gladly accepted. After I had carefully studied the conditions, I sent in a report in which I recommended many changes and improvements. Mr. Darley did not as a rule approve of innovations and vetoed the most of my proposals. I however returned to the charge and gained several points. For instance I had proposed to sell off one half of the cattle on Uluambalama: he wrote "the more cattle the more mature." I ruthlessly attacked that position and so clearly proved him in the wrong, that he yielded the point and bade me do my will. Some other points I gained, but much was rejected, so that I was at first a good deal hampered but everything comes to the patient waiter. Being forbidden to increase the cost of the cinnamon cultivation, I went

in for improving the system of manning the coconuts where I was left with a freer hand.

The coconuts were about 20 years old when I took charge and ought to have been in full bearing, but the yield was poor on the light sandy soil: little more than 1,000 per acre and with only the manure I could make on the place, improvement was rather slow in the early years of my incumbency, but from the time I was allowed to add three tons of bonedust annually, the increments became larger. The first year I had 230,000 nnts; the twelfth 590,000 and would have had much more if I had been allowed more manure from outside the premises.

The health of my family continued to give me much anxiety: my wife died in 1863, having been unable to leave her room for two years.

In 1866 I entered into a second matrimonial arrangement which was very satisfactory while it continued, which was for less than three years. After my wife's death I fell into bad health and in 1891 had to take a change to save my life: so I got a twelvemonths' leave and went home. I had to return before the year was out, because I found that my *locum tenens* was very vigorously endeavouring to obtain the permanent appointment and on my return I found that he had succeeded in the case of one of the three properties left in his charge, the agency of which had been given up by Darley, Butler & Co. The other two, both belonging to the same person, were restored to me with *carte blanche* as to manuring coconuts and improving the cinnamon cultivation. In 1873, the proprietor died and by his will all his Ceylon properties were to be sold off at once which was quickly accomplished—in the case of Uluambalama much below its value. In those days there were few Europeans engaged in coconut planting and there was no employment for me in that line: so I retired to a small coconut property I had acquired in

THE MAHAOYA VALLEY

some years previous. As this place was very unhealthy and I suffered from fever all the time I was there, I accepted the offer of the proprietor of Ratmalana to again take charge of that estate and in 1878 I sold my Batakanda property and began to open a Liberian coffee and cacao concern on another land I owned in the Mahaoya valley. In 1879 I left Ratmalana and engaged with Mr. A. M. Ferguson to open Eilandhn in the Henaratgoda district where I remained for seven years. Liberian coffee and cacao failed there as elsewhere in the lowcountry, and the place was planted with tea. In my own case I dropped the greater part of my capital in my Liberian coffee and cacao experiments and in 1886 settled down on my own property to work it up in coconuts in which I fairly succeeded, but as I ran short of funds in 1891, I sold out all my belongings in the Mahaoya valley and remained at large for two years when my son who had been for seven years assistant on a tea estate, lost his employment and I thought of investing my funds in tea to give him work. I had lent out a part of my money on mortgage, but had the misfortunes to have seven thousand rupees in the new O.B.C. when it failed, so I hastened to invest anew what remained. The bargain I ultimately made was the worst of my many bad ones in the course of my life; but the salary allowed for management sufficed for economical living though no profits have accrued to the partners in the six years that have passed since I assumed charge. I have however enjoyed better health in the Ratnapura district than in any of my former localities; but old age is telling on both mental and bodily power.

Writing on 3rd February, 1899, Mr. Lamont reported:—"I am well in health, but old age has told in dull senses and unsteady step, &c. If I live for ten days more I will enter my 82nd year." The Ambagamuwa pioneer is therefore now well on in his 83rd year, and that his physical and more especially

his mental force has not abated, is shown by the above "autobiographic" notes written at our request only a few weeks ago to accompany his old-age portrait, photographed and etched by Messrs. W. L. H. Skeen & Co. in June last. To the veteran of Kosgalla, Ratnapura, we can only now wish a quiet time for undisturbed reflection and meditation as well as for the daily spell of work still required of him.

With W. B. Lamont it has eminently been a case of *laborare est orare*; and we may say:—

At eventide let there be light, and—peace.

FRUITS SUITABLE FOR THE LOW-COUNTRY AND FOR MODERATE ELEVATIONS IN CEYLON.

(From Circular Royal Botanic Gardens, Ceylon, Series 1.—No. 15, June 1899.)

The following pages contain a brief account of tropical fruits (mostly cultivated), with general directions for their treatment. They may be obtained (usually in bamboo-pots) in small quantities from the Royal Botanic Gardens, Peradeniya, on prepayment of cost; plants are delivered at the gardens or at Peradeniya railway station.

Seeds where mentioned can only be supplied when in season.

GENERAL DIRECTIONS.

Planting.—No arbitrary rules for planting can be laid down, as so much depends on climate, locality, and soil. Wet weather should however be always selected for the work; otherwise the late afternoon should be chosen in preference to the forenoon. The ground should be prepared and holes made before the plants are removed from their pots or nursery beds, so that no unnecessary delay may occur in planting them out. It is even preferable to have the holes opened some months previous to planting, as the soil thus exposed to the action of the air will be rendered more nutritive. For dimensions of hole to be dug and distances to plant apart, the character of the soil and the proportionate size of the plant when full, grown must be respectively considered, larger holes being necessary where the soil is poor and gravelly. For trees and shrubs generally, and in moderately good soil, holes about 2 ft. deep and 3 ft. in diameter may be recommended. Large trees, such as Durian, Sandoricum, Rambutan, &c., should be planted 10 to 50 ft. apart.

Soil and Manure.—Unless the soil is already of the desired condition, it will be improved by the addition of old manure, chopped decayed turf, marl, and old mortar rubbish, according to the need of the plants, a small proportion of sand being often necessary for giving porosity. Occasional surface dressings of a prepared compost and applications of liquid manure are most beneficial. Fresh manure of any kind should not be placed next the roots of a plant.

Shading and Watering.—These should have special attention, as the insufficiency or overabundance of either at first may cause irreparable damage to the plants. In the case of plants planted at considerable distances apart, shade by means of fast growing intercrops, such as Plantains, may be practicable; shelter from strong winds would also be thus afforded. All seed-pans, pots, boxes, or beds should be kept shaded, and only sufficiently moist to enable the seeds to germinate. After seedlings appear above ground less shade and more moisture will be required. If the weather be dry, daily watering of plants planted out will be necessary until they are well established.

Pruning.—Timely thinning out of superfluous, decayed, or weakly growths will greatly assist in the

perfect development and productiveness of a plant. Pruning back the ends of shoots will conduce to the formation of branches and to a spreading habit.

Weeding.—The ground should be kept free of weeds until at least the plants are sufficiently strong to supersede them. Frequent forking up for stirring of the surface soil is eminently conducive to the well-being of plants. The encroachment of roots from surrounding trees, which rapidly impoverish the soil, may be checked by cutting trenches at suitable distances round the plants.

Propagation.—The various forms of grafting, budding, and layering, as well as propagation by cuttings, suckers, roots, or leaves, are the surest means of raising plants true to their kinds, the newly-made plant being in each case merely a counterpart of the parent plant. Plants raised from seed, however, make more shapely, finer, and generally healthier trees, shrubs, &c.; but they are liable to variation from the parent stock according as the flowers of the latter are disposed to be affected by foreign pollen in their fertilization. Only the best seeds from mature and perfect fruits should be selected for sowing, and they should be sown of course before their germinative powers become impaired or lost. Seeds generally require to be sown in a light sandy soil, which should be kept only moderately moist, and as a rule they may have a covering of soil equal to their own thickness. Where practicable, it is advisable to have plants transplanted out into beds, or preferably into bamboo-pots, plant-baskets, or ordinary earthenware pots, and tended for some time previous to planting them out where intended to grow.

FRUIT PLANTS

FOR SALE AT THE ROYAL BOTANIC GARDENS, PERADENIYA.
Abbreviations: S. = Sinhalese; T. = Tamil; Prop. = Propagation.

Aberia Gardneri.—Ket-emibilla, S. and T.

A small shrubby tree of the Uguressa family endemic in Ceylon. The pale, purple, velvety edible fruit is of the size, form, and consistency of a gooseberry, with a pleasant acid taste. It makes excellent tarts and jam. Season, August to September. Thrives at medium altitudes, in light loamy soil. Prop. by seed. Sown in pots or boxes under cover.

Price: Small plants 25 cents each.

Achras Sapota.—Sapodilla-plum; Bully-tree; Naseberry; Rata-mi, S.; Shimai-eluppai, T.

A small symmetrical tree with dark green shining leaves, native of Tropical America. Fruit globular, about the size of a plant, with dark brown tender rind. When quite ripe it is considered of the most luscious of tropical fruits, the pulp being sweet and refreshing, and somewhat of the consistency of a pear. In India it is often sold under the name of Mangoes-teen. Season, November to February. The tree furnishes an elastic gum used in medicine, and the bark is considered to have febrifugal properties. Thrives in the low-country and up to 1,000 ft., in deep and well-drained soil. Prop. by seed and layering. Seeds similar to those of Sour-sop. Sow in nursery beds.

Price: Plants 25 cents each; seeds 25 cents per packet.

Egle Marmelos.—Bengal-quince; Bael-fruit; Baeli, S.; Vilvom, T.

A small spiny tree of the Orange family, considered a native of India. The fruit is comparable in form to a large orange, with a hard green shell, the interior containing a mass of doughy aromatic pulp, intermingled with which is a limpid glutinous substance, which some relish and consider of an agreeable flavour. It is renowned for its medicinal properties, being used especially in native medicine as a specific for dysentery and fever. Season, chiefly February to April. Low-country and medium altitudes. Prop. by seed. Sow in open beds.

Price: Plants 20 cents each; seeds 25 cents per packet.

Anacardium occidentale.—Cashewnut; Caju-gaha, S.; Mundiri-maram, T.

A bushy tree originally introduced from Tropical America; height about 30 ft. Its well-known fruit consists of two distinct parts, viz., (1) the swollen pear-shaped stalked (cashew-apple), which, being juicy and astringently acid, is used in preserves and made into a wine; and (2) the kidney-shaped brown nut at the extremity. The edible kernel (seed) of the latter is of an agreeable nutty taste, especially when roasted; it is in demand in Europe for confectionary and flavouring purposes. The crusted shell is acrid and poisonous. All parts of the fruit of various uses in medicines. Season, April and May. The tree yields a gum said to be obnoxious to insects, which is recommended for bookbinding. The juice obtained from incisions of the bark forms an indelible ink. Thrives best in the low-country up to 1,500 ft. Adapted for moderately dry districts. Prop. by seed, layering, and cuttings.

Price: Plants 20 cents each; seeds 35 cents per 100.
Ananas sativa.—Pineapple; Annasi, S.; Anasshi-pallam, T.

Generally supposed to be the most delicious fruit in the world. The leaves afford a fine and durable fibre of commercial importance. Will thrive from sea-level to medium altitudes in moist and dry districts. Rich loamy soil, leaf mould and well-rotted manure; well-drained and sunny situation. Plant about 2 ft. apart, in row 3 ft. from each other. Prop. by suckers and "crowns" (fruit shoots).

"Kew pine" (Smooth Cayenne).—The best variety for general cultivation, being a robust grower usually bearing in the low-country in six months from time of planting suckers. Fruit grows to a large size, sometimes weighing over 20 lb. (exceeding the record for other countries); is very juicy and of a delicious flavour. Leaves not spiny.

Price: Suckers Re. 1.50 per dozen.

"Mauritius".—Fruit moderately large, yellow, and well-flavoured. Leaves not spiny.

Price: Suckers Re. 1.20 per dozen.

"Gal-annasi".—Similar to the latter in appearance and flavour.

Price: Suckers Re. 1.20 per dozen.

Anona muricata.—Soursop. Katu-anoda, S.; Seetha, T.

A low fast-growing tree with fragrant laurel-like leaves, introduced from the West Indies. Fruit large (2 to 3½ lb.), green more or less oblong often kidney-shaped, covered with soft green pickles. It ranks among the best dessert fruits of the Tropics, the soft white luscious pulp being agreeable and refreshing, with a strawberry flavour. A grateful cooling drink is also made from it. Season, June to October. Low-country and up to 3,500 ft. Deep loamy soil. Prop. by seeds and layering. Sow seeds in prepared nursery beds.

Price: Plants 20 cents each; seeds 50 cents per 100.

Anona reticulata.—Bullock's heart; Anoda, S.; Ramsita, T.

A small bushy tree of Tropical America and West Indies. The name "bullock's heart" signifies the shape and size of the fruit, which is edible, the custard like granular pulp being of a rather agreeable flavour. Seasons, March to April and October to November. The leaves and young twigs are said to be used for tanning. Altitude and soil same as for latter species. Prop. by seeds sown in pots or open ground, or by cuttings planted in rainy weather.

Price: Seedling plants 25 cents each.

Averrhoa Bilimbi.—Cucumber tree; Blimbing; Biling, S.; Bilim-kai, T.

A fine-foliated dwarfish tree, long cultivated in the Eastern Tropics for fruits. Fruits about 3 in. long, resembling small cucumbers in form, produced in clusters on the trunk, are valued for making pickles, preserves, jam, tarts, and cooling drinks; they are also specially esteemed as an ingredient in curries. The flowers are sometimes made into preserves. Low and medium altitudes. Rich, friable, and well-drained soil decayed manure, leaf-mould, &c. Prop. by seeds

layering. Seeds small, sow in pots, pans, or boxes under cover.

Price: Plants 25 cents each.

Averrhoa Carambola.—Karambola-tree; Kamaranga, S.; Tamarata, T.

A tree similar to the latter, but more ornamented in habits, being also in cultivation in the East for a long period. Fruit oblong, 3 to 5 in. long, semi-transparent, amber-coloured, and produced on the branches its five peculiar wings or ridges give it a handsome appearance. The pulp is acid and very juicy, but, though used in some similar ways, is not so highly valued for culinary purpose as the fruit of its ally already described. The juice of the fruit removes stains from linen, and is good for burnishing brass, &c. It is also said to be used as a mordant in dyeing. Adapted for same elevations, soil, and method of propagation as the last described species.

Price: Plants 25 cents each; seeds 25 cents per packet.

Canarium commune.—Java almond; Rata-kekuna, S.

Myrrh family. A large handsome Malayan tree with generally a remarkable buttressed trunk, cultivated for the sake of its plum-like fruits produced in abundance from April to December. The hard three-cornered kernel contains an edible substance similar in flavour to sweet almonds; it yields by expression an oil used for burning in lamps and for cooking purposes. A desirable tree for planting in avenues, &c. Hot and moist districts up to about 1,500 ft. elevation. Deep and fairly well-drained soil. Plants are raised readily from seed. Sow seeds in nursery beds, and keep wet and shaded.

Price: Plants 20 cents each; seeds 50 cents per 100.

Carican Papaya.—Papaw; Tree-melon; Pepol, S.; Pappali, T.

Passion-fruit family. A familiar fast-growing, small, branchless tree, with a crown of large palmate leaves, indigenous to Central America and West Indies. Fruit greenish-yellow when ripe; globular or oblong, 10 to 15 in. long; centre hollow, flesh lemon to orange colour; seeds attached to walls of central cavity, plentiful, few, or none, according to variety. A most refreshing and wholesome dessert fruit. It may be made into jam and sauce; unripe, it may be pickled, or boiled and used as a vegetable. The milky juice of the unripe fruit curdles milk like rennet; it is in commercial demand for its peptic properties. The leaves are used for wrapping round fresh meat to render it tender. The tree is of short vitality, deteriorating at the age of five to six years, but bears fruit continuously from the time it is a few months old. Prop. by seeds, which germinate readily. Sow thinly in nursery beds. Low and medium elevations. Rich loose soil, decayed manure, vegetable mould, &c.

"Madagascar".—A large oblong fruit with many seeds.

"Pasba".—Fruit large, globular; seeds few, sometimes none.

"Lanka".—Fruit small, round, very milky.

Price: 20 cents per plant; seeds 25 cents per packet.

Chrysodalanus Icaco.—Coco-plum; Spanish nectarine. A small spreading shrubby tree of the Apple family, native of Tropical America. Its fruit is of the size and appearance of a rather round plum, with a purplish tender rind; it is eaten as dessert, the white pulp adhering to the kernel being of an agreeable taste; it is said to be also largely made into conserves in Cuba, where it thus forms an article of export. Will succeed in low-country and up to 2,000 ft. in light sandy loam. Prop. by seed or cuttings.

Price: Seedlings plants 30 cents each.

Chrysophyllum Cainito.—Star-apple; Rata-lawulu, S.; Seemaipala-pallam, T.

A fairly large West Indian tree with handsome foliage and habit of growth; leaves dark green above, copper-coloured underneath. The dark brown fruit is round in shape, about 5 in. in circumference, usually 2-seeded, very milky when unripe; the white inner portion of the pulp is edible, it being com-

pared by some with blanc-mange. Up to about 1,500 ft. Deep loamy soil. Prop. by seed. Sow in open and sheltered beds.

Price: Plants 25 cents each.

Chrysophyllum monopyrenum.—Date-plum; Kosetalwulu, S.; Seemaipala-pallam, T.

A graceful tree of more recent introduction from the West Indies than the preceding species, which it resembles in size and general appearance. As the vernacular names signify, the fruit is smaller in size and form to both a Date fruit and a Jak seed; it has a thin shining purplish black outer skin, and contains but one seed; the milky reddish pulp is edible. Principal season, February to April. Elevation and soil same as for preceding species. Prop. by seed. Sow in pots, &c., under cover or in sheltered beds.

Price: Plants 25 cents each.

Citrus Aurantium.—Sweet-orange; Peni-dhodan, S.; Narran-kai, T.

Except in the case of choice varieties, plants raised from seed of locally-grown fruit can only be recommended to be planted for local consumption. Imported fine kinds thrive best at medium and fairly high elevations, provided rainfall be not too great. Prop. is generally recommended by grafting and budding, the product of plants so raised being naturally less liable to variation in size and quality than that of seedlings. Experienced cultivators maintain, however, that no serious risk of deterioration arises from planting seedlings from carefully selected seed, provided that inferior varieties are not permitted to grow near the seed bearers. Soil, fairly deep and well-drained marly loam; decayed manure, mortar rubbish, &c.

Price: Seedlings from selected locally-grown seed 25 cents each.

Citrus Decumana.—Shaddock; Pumelo; Jambola, S.; Jamblica, or Bambalinas, T.

A tree of the Orange family, about 30 ft. high, cultivated for its large round fruits, as well as for the beauty of its foliage and flowers. Several varieties are met with, those with green pulp begin usually very sour; while others with reddish pulp have a pleasant sub-acid taste, and are valued for making jams, &c. Seedlings make good grafting stocks for the better kinds of oranges. Low-country up to fairly high elevations. Thrives in any middling good, deep, and well-drained soil. Prop. by seed or by layering.

Price: Seedlings 20 cents each.

Citrus Limetta.—Lime; Dehi, S.; Dbaisikei, T.

Of this also there are several varieties, some being superior to others as regards size and quality of the fruit. The latter is used for many different culinary and other purposes, especially for flavouring and in the making of cooling drinks, lime-juice of commerce being prepared from it; the rind yields citric acid. Low and medium altitudes. Rich and well-drained soil. Prop. by seed or by layering.

Price: Seedlings 25 cents each.

Citrus Limonum.—Lemon; Natran, S.; Kidanar-attankai, T.

This small-sized tree is extensively cultivated in Southern Europe and elsewhere, being a native of Northern India, and said to be now naturalized in the West Indies. Lemon fruits are very largely used for flavouring in confectionery, &c. The rind yields a valuable essential oil and citric acid; it is also made largely into candied lemon peel of commerce. Thrives best at medium at fairly high altitudes. Soil similar to that for oranges will answer. Plants are easily raised from seed (pips)

Price: Seedlings plants 25 cents each.

Citrus medica. Citron; Adam's apple; Sidran, S.; Nar-attam-palam, T.

A spinous, much-branched, small tree indigenous, like the Lemon, to Northern India, and also cultivated for its fruit. The thick rind forms the candied citron peel of commerce; it also affords citron oil and citric acid, used in medicine and perfumery. The white acid pulp of the fruit is made into conserves. Large quantities of special kinds of citrons

are said to be grown in parts of Southern Europe to be used solely at certain religious rites of the Jews. Medium and high altitudes. Fairly deep and well-drained soil. Prop. same as Lemon.

Price: Seedlings 25 cents each.

Citrus nobilis.—Mandarin-orange; Jamma-naran, S.; Konde-naran, T.

A thornless bushy tree, 20 to 25 ft. high with small pointed dark-green leaves. The fruit is of moderate size, and is distinct by its loose brittle rind, readily separating from the pulp, and by a curious button-like projection at the extremity; the rind remains green when ripe, but the pulp is deep orange-red and of delicious flavour. Affects moist localities at medium elevations. Rich and well-drained soil. Prop. by seeds, layering, &c.

Price: Seedling plants 25 cents each.

Clausena Wampi.—Wampee; Rata-karapincha, S.

An ornamental an odorous tree of the Orange family, 30 to 35 ft. high, native of China. Its pale yellow berries are edible, being of an aromatic acid taste; they are made into preserves, and used for flavouring meat curries, &c. The fragrant leaves also are a favourite leaves also are a favourite curry condiment. Humid districts at medium elevations. Fairly deep and porous soil. Prop. by seeds, layering, and cuttings. Sow seed in pots under cover.

Price: Seedling plants 25 cents each.

Cupania edulis.—Akee.

A moderate-sized tree of West Tropical Africa, where its fruit is eaten and relished. The edible portion is the firm fat-like substance (ari) in which the seeds are embedded. It is eaten either raw or cooked, and is considered delicious when fried with butter. The fruit is pear-shaped, about 3 in. long, bright red when ripe, produce in September and October. Seeds jet black, two to three in a fruit. From sea-level to about 1,000 ft. Deep sandy soil. Plants may be raised by layering, but are best from seed.

Price: Seedling plants 25 cents each.

Cynometra cauliflora.—Nam-nam; Leguminous family.

A large shrub of small and much-branched tree, native of India and Malaya. The fruit is a one-seeded and much-wrinkled pod, produced in quantity on the lowermost portions of the branches or trunk the thick fleshy shell is considered palatable and refreshing, and is used for pickling. The large flat seed yields an oil said to be used in medicine. Season, May and June. Low-country and up to about 1,500 ft. Fairly deep loamy soil. Prop. by seeds.

Price: Plants 25 cents each.

Dialium ovoides.—Velvet tamarind; Gal-siyambala, S.; Kalupnlium, T.

A tall leguminous tree peculiar to Ceylon. From near the ends of the branches hang the clustered dark brown velvety fruit, each of the size and form of a filbert. The thin brittle shell encloses a seed surrounded by a spongy-powdery pulp, which has a pleasant acid taste, and is considered a delicacy and a tonic by the natives; it is also made into a fine ohutney. The timber of the tree is dark red handsome and strong. Thrives best in the low-country with a rather dry climate. Light loamy and well-drained soil. Prop. by seeds.

Price: Plants 25 cents each.

Durio zibethinus.—Durian.

A very large and handsome pyramidal-shaped tree of the Malayan Archipelago, cultivated for the sake of its world-famed fruit, which, produced on the older branches, is oval-shaped, weighing 5 to 7 lb. and armed with thickly set formidable spiky prickles. This fruit is most highly prized by the Malays, and notwithstanding its offensive odour, Europeans, as well as Sinhalese and Tamils, frequently acquire a special taste and liking for it. The cream-coloured pulp wrapped round the seed is the edible portion. The large seed may be roasted and eaten like chestnuts. Pounded into flour, they are said to be made into vegetable ivory. Season, July and August. A desirable tree to plant for scenic effect. Hot and humid districts up to about 1,500 ft. Deep loamy and

well-drained soil. Prop. by seed. Seeds of short vitality; and germinate in seven to eight days.

Price: Plants 25 cents each.

Eleocharis edulis.—A small tree of the Veralu family, native of New Guinea. Its bright red fruit is 3 to 5 sharpangled, 1-seeded, is oval in shape, and nearly 2 in. long. The outer fleshy red portion is of a sweetish bitter taste, and may be made into a savoury jelly or used for pickling. A very ornamental tree both on account of its graceful foliage and handsome fruits. Thrives in shady places with loose rich soil, up to about 2,000 ft. Prop. by seed, layering, and cuttings.

Price: Seedling plants 30 cents each.

Eleocharis serratus.—Wild olive; Veralu, S.; Verali-pallam, T.

A handsome and rather small tree indigenous to Ceylon and said to be cultivated in parts of India for the sake of its olive-like fruit. The latter is edible, the fleshy portion surrounding the stone (seed) being sub-acid and palatable. It is excellent for pickling unripe like olives. Season, April and May. Moist districts up to about 2,000 ft. Prop. by seed. Sow in beds, and keep damp and shaded.

Price: Plants 20 cents each.

Engenia jambos.—Rose apple; Veli-Jambu, S.; Seenijambu, T.

A medium-size tree of India and Malaya, introduced early into Ceylon. Its symmetrical shape and fine foliage render it a handsome tree. Its fragrant rose-coloured fruit, about the size of a hen's egg, may be used for dessert or made into preserves. Season, chiefly May and June, Low-country and up to about 3,500 ft. Prop. by seeds and layering.

Price: Seedlings 20 cents each.

Eugenia javanica.—Wax jambu; Peni-jambu, S.; A Malayan tree, about 30 ft. high of an ornamental habit of growth. Its attractive, shining, white to rose-pink fruits are borne in small hanging clusters, each fruit being about the size of a big strawberry, with the base laterally compressed; the fragrant pulp is edible. Low and medium altitudes. Rich porous soil. Prop. by seeds.

Price:—Plants 20 cents each.

Eugenia malaccensis.—Malay apple; Jambu, S.; Peria-jambu, T.

A handsome tree of moderate size, combining beauty of foliage, flower and fruit, indigenous to the Malay islands. The pear-shaped white to bright-red fruits, produced abundantly in May and June, have an attractive appearance; the snowy-white pulp is of the consistency of a real apple, which it also simulates in flavour, though less juicy. Low and medium elevations. Fairly deep rich soil. Prop. by seeds. Sow in beds.

Price: Plants 20 cents each; seeds 25 cents per packet.

Eugenia Micheli.—Brazil cherry. Gorka-jambu, S.

A small shrubby tree of Brazil. Fruit round and ribbed, rather flattened at the ends, about 1 in. in diameter, polished and bright red, suggesting small tomatoes at a distance; pulp agreeably acid in taste, makes excellent jelly, tarts, and preserves. Medium altitudes to about 4,000 ft. Rich sandy and well-drained soil. Prop. by seeds or suckers.

Price: Seedlings 25 cents each.

Flacourtia inermis.—Lovi-lovi. Louvi, S.

Uguressa family. A handsome Malayan tree, growing to about 30 ft. high. The bright red, cherry-like fruit, produced almost all the year round, is sour in taste, but makes splendid jelly and tarts. Moist low-country and up to about 3,000 ft. Deep rich soil. Prop. by seeds seed small. Sow in boxes, &c., under cover.

Price: Plants 25 cents each; seeds 25 cents per packet.

Garcinia Mangostana.—Mangosteen; Mangos, S.; Mangos-kai, T.

A moderate-sized conical tree with large leathery leaves, indigenous to the Malay islands. Its globular purplish brown fruit, about the size of an apple, is as famed one of the most delicious fruit of the Tropics. The delicate white melting pulp is sometimes compared in flavour to a combination of

strawberries and pineapple. The firm thick rind is said to be used for dyeing, and to yield a valuable tan. The tree bears when seven to nine years old the fruiting season being June to September. Will thrive from sea-level to about 1,500 ft. in humid districts and sheltered localities. Rich loamy and well-drained soil. Prop. by seed, grafting, or layering. Seeds of short vitality. Sow in sandy soil and leaf-mould, in pots, &c., under cover.

Price: Seedling plants 50 cts each.

Garcinia Xanthochymus.—Co hin goraka; Rata-goraka, S.; Seemai-goraka, T.

A symmetrical cone-shaped, bushy tree, growing to 25 or 30 ft. high, with leathery linear-lanceolate leaves, 12 to 16 in. long; native of India and Malaya. The handsome yellow fruit, produced throughout the year, but more abundantly in December and January, is of the form and size of an orange, with a pointed projection at the end, the tender thin skin being smooth and polished; the pulp also is yellow and of an agreeable acid, refreshing taste, being good for making tarts, jam, jelly, &c. Low and medium altitudes. Will only thrive in fairly rich deep soil. Prop. by seeds and layering. Sow seeds in open beds.

Price: Seedling plants 25 cents each.

Hibiscus Sibirifolia.—Rozelle; Ratablincha. S.; Pulincha-kira, T.

A small annual shrub, cultivated in most warm countries—sometimes as an intercrop with other products—for the sake of its large red fleshy calyces (outer part of flower, which, remaining after the flowers fall away, become enlarged, enclosing the fruit-capsule; they are made into delicious puddings tarts, jam, and jelly, and a refreshing beverage is also prepared from them. The leaves are esteemed by the natives as a vegetable in curries, and the stems afford a quantity of strong fibre. The plants will begin to bear fruit in four to six weeks after planting. Medium and fairly high elevations. Light rich loose soil. Prop. by seed or cuttings. Sow seeds thinly in nursery beds.

Price: Plants Re. 1 per dozen; seeds 25 cents per packet.

Macadamia ternifolia.—Queensland nut.

An Australian tree of comparatively small size, with dense dark green foliage. It bears in May and June edible nuts of the size of marbles which are of an agreeable flavour, being similar to hazel nuts. Will thrive best at medium altitudes. Well-drained light sandy soil. Prop. by seeds (nuts).

Price: Plants 30 cents each.

Mammea americana.—Mammee apple; St. Domingo apricot.

A moderate-sized tree of the Mangosteen and Goraka family, native of Tropical America, where it is said to be much cultivated. The fruit is large and round, brown coloured; 1-seeded, $\frac{3}{4}$ to 5 in. in diameter, with usually a pointed nipple developed irregularly on any part of the surface. It has two rinds: the outer leathery, the inner tough, yellow, adhering to the pulp, which is firm and bright yellow; has a singular, though rather pleasant taste, and an aromatic smell. It may be made into jam and preserves, as well as used for dessert. An aromatic liqueur (*Eau de Creole*) and a scent are prepared from the flowers. Moist low-country up to about 1,500 ft. Deep loamy soil. Prop. by seeds.

Price: Re. 1 per plant.

Mangifera indica.—Mango; Amba, S.; Manga, T.

Generally the Mango thrives from sea-level to about 2,000 ft. in deep and properly drained soil, manuring not being of so much importance as attention to pruning, trenching and forking of the ground. Propagation is best by inarching, a form of grafting, but plants are easily raised from seed, and they generally come thus sufficiently true to kind, provided proper is exercised in their selection. A great many varieties of widely different merit are in cultivation, but the following are worth growing:—

"Bombay"; "Bombai, S.—A medium-sized yellow fruit, round and flattened in form flesh; cranged-coloured.

Price: Seedlings 25 cents each.

"Parrot-mango;" Gira-amba, S.; Kilimooku-manga, T. Fruit distinctly beaked, about 3½ in. long, flesh deep orange, aromatic, and of luscious flavour.

Price: Seedlings 25 cents each.

"Jafna;" Jap-pane, S.; Yalpanam-manga, T. Fruit large, oval-shaped, green when ripe, with delicious soft flesh.

Price: Seedlings 25 cents each.

"Mi-amba" (boney), S.; Thaina-manga, T. A small round fruit, juicy, and of a pleasant tart flavour.

Price: Seedlings 20 cents each.

"Nagpur."—Seedlings from a good variety grown in Nagpur.

Price: 25 cents each.

Monstera deliciosa.—Arnm family.

A noble epiphytic climber with large scalloped and perforated leaves, native of Mexico. The fruit, a sort of stalk (spadix), is edible and sweet-scented, having a flavour like pineapples, but is rather juiceless. Moist low-country up to about 1,500 ft. Soil a mixture of decayed coconut fibre, old bark, pieces of broken bricks, rotted turf, and chopped moss. Prop. by cuttings or seeds. Plant cuttings where intended to grow; as against large trees, decayed trunks, &c.

Price: Rs. 5 per cutting.

Nephelium lappaceum.—Rambntam; Runtum, S.

A Malayan fruit-tree of medium size and graceful spreading habit, its bright red fruits, suspended in clusters from the ends of the branches during June and July, rendering it especially attractive. The bur-like fruit, covered with long soft fleshy spines, is used for dessert, the acidulous white aril adhering to the seed and separating readily from the shell, being agreeably tasty and refreshing. Low-country up to about 2,000 ft. Deep loamy soil. Prop. by seeds.

Price: Plants Rs. 3 per dozen; seeds 75 cents per 100.

Passiflora laurifolia.—Water-lemon; "Jamaica Honey-suckle."

Passion-fruit family. A handsome West Indian climber with laurel-like foliage. Its egg-shaped fruit with soft, yellow rind, contains a quantity of an agreeably sweet watery pulp; it is considered the best dessert fruit of this family. A desirable plant for growing on arbours, &c., and as a screen to the sides of plant houses. It will thrive up to about 2,000 ft. Light humous and well-drained soil. Prop. by cuttings or seeds.

Price: Plants 20 cents each; cuttings 25 cents per dozen.

Passiflora quadrangularis.—Granadilla; Garandilla, or Rata-pubul, S.; Seemasorakal, T.

Passion-fruit family. This fast growing square-stemmed climber, introduced from Tropical America, is more robust in habit than the latter species. Its large oblong greenish-yellow fruit, resembling a vegetable-marrow, contains a mass of purple sweet acid pulp. In the unripe state it is boiled and used as a delicate vegetable. The root is usually swollen and fleshy, and is sometimes eaten like a yam. The flowers are generally fertilized by insects, in the absence of which artificial fertilization must be effected by hand. Low-country to about 3,000 ft. loose rich soil. Plant against trees, fences, &c. Prop. by cuttings or seeds.

Price: Plants 20 cents each; cuttings 25 cents per dozen.

Persea gratissima.—Avocado pear; Alligator; pear; Soldier's butter; Et-pera S.; Anakoya-pallam, T.

A small-sized tree of the Cinnamon family, native of Tropical America. The fruit, which remains green when ripe, is of the form of a large pear. When fit for eating, the round stone (seed) in the centre becomes loose from the pulp, which is ½ to ¾ in. thick, cream-coloured, of the consistency of firm butter, and may be eaten either plain or flavoured with pepper and salt, vinegar, wine, &c., according to taste. It is a grateful and wholesome fruit, being esteemed by some as a substitute for butter with bread; it is also prepared and relished in other ways. A useful oil is obtained from the pulp by expression. From sea-level to about 2,000 ft. Fairly deep and well-drained

soil. Prop. by seeds, which should be sown as soon as taken from the fruit; they germinate in a few days.

Price: Plants 25 cents each.

Photinia japonica.—Loquat; Japanese medlar.

Apple family. China and Japan. A tree of middling size and symmetrical habit, with large handsome leaves, which are woolly-white underneath; cultivated as a fruit tree in most warm countries. The small oval yellow fruit is not unlike a crab-apple both in appearance and taste, being rather acid in flavour. Medium and fairly high elevations. Plants are raised readily from seeds, but superior varieties should be propagated by grafting. Light rich soil with good drainage.

Price: Seedling plants 25 cents each.

Psidium Cattlejanum.—China guava Purple guava; Calcutta guava.

A small shrubby tree, native of Tropical America, said to be extensively cultivated in China and Japan especially. The spherical dark claret-coloured fruit is the best for dessert of the guava kind, its flavour being compared to that of strawberries. Thrives best at medium altitudes and up to about 4,000 ft. Light rich soil. Prop. by seeds or layering.

Price: Seedling plants 25 cents each.

Psidium Guyava.—Guava; Pera, S.; Koya-pallam, T. A low shrubby tree, often a shrub, long introduced from Tropical America, now naturalized in Ceylon, India and elsewhere in the east. Select varieties are cultivated in most warm countries for the sake of the fruit, which may be used either for dessert or made into pudding, jam, jelly, &c.; it is also largely made into preserves, in which form it is an article of export in some countries. Medium and moderately high altitudes. Loose loamy soil with good drainage. Prop. by seeds, suckers, cuttings, or grafting.

Price: Seedling plants 20 cents each.

Sandoricum indicum.—Santol.

A handsome lofty tree of Malaya, producing in June and July large clusters of yellow globular fruits, which resemble small oranges. Like the Rambutan, the soft white aril covering the seeds (5) is of an agreeably acid and refreshing taste; fermented and mixed with rice, an intoxicating drink is prepared from it. Will thrive in the moist low-country up to about 1,500 ft. Deep loamy soil. Prop. by seeds. Sow in well-prepared beds.

Price: Plants 25 cents each.

Sarcocephalus esculentus.—Negro-peach; Ratabakmi, S. A robust climbing or spreading shrub, allied to the Cinchona, and native of West Tropical Africa. The brown warty fruit, produced in almost all seasons of the year is about the size of an apple, the soft reddish edible pulp being rather juicy and of a sweetish taste. Low-country up to about 2,000 ft. Will thrive in any fairly deep and drained soil. Prop. by seeds and cuttings. Sow seeds in pots &c., under cover.

Price: Plants 25 cents each; cuttings 25 cents per dozen.

Tamarindus indica.—Tamarind; Siyambala, S.; Pullium, T.

This well-known large handsome leguminous tree is considered to be originally a native of Tropical Africa, though long naturalized in Ceylon, India, &c. It lives to a great age and affords a very valuable and beautiful timber. The acid pulp of its pods forms the Tamarinds of commerce, being preserved in syrup or with sugar. Tamarind wine and other cooling drinks are also prepared from the fruit. Season, December and February. Low-country up to 1,500 ft. Deep alluvial soil. Prop. by seed.

Price: Plants 20 cents each.

Vangueria edulis.—Voa-vanga.

A small much-branched shrubby and deciduous tree, native of Madagascar. The greenish-yellow, apple-like fruit is succulent and edible. The large shining light green leaves are of various uses in medicine in its native country. Moist low-country up to about 2,000 ft. Rich loamy soil. Prop. by seed and cuttings.

Price: Plants 25 cents each.

ALOE FIBRE.

A NEW INDUSTRY FOR CEYLON.
INTERVIEW WITH MR. ARTHUR
SILBURN.

[WITH NOTES BY AN EXPERT.]

Mr. Silburn is in Ceylon in connection with a Syndicate recently formed for working aloe fibre, which, it has been discovered, possesses the same valuable properties that Manila hemp has long been credited with, with the additional advantage of being superior in several respects.^a If it can be properly worked, concerning which Mr. Silburn is confident, visions open up of a new and profitable industry in which all can join, but more especially those who are at present thinking of abandoning the cultivation of tea on portions of their land.

Mr. Silburn is the inventor and sole patentee of the decorticating machine which purposes to do the trick, that is, extract the fibre from the aloe leaf and convert it into a valuable market commodity. Our readers must have had their attention attracted to an advertisement appearing lately above the name of Mr. W. Jenkins, inviting supplies of the leaves of the large green prickly aloe. Mr. Jenkins is a member of the Syndicate we have referred to, and is associated with other well-known gentlemen, whose general "caunyness" is amply sufficient to justify confidence in the potentialities of the new concern.

Mr. Silburn arrived in Ceylon from South Africa in August last for the purpose of extending the patentee rights of his decorticating machine, which he has at last secured and which covers a period of protection of fourteen years. On leaving

^a Inferior to Manila Hemp in strength—former would always command a higher price.—E.

Ceylon Mr. Silburn proceeded on a similar mission to India and has taken out patent rights in the adjoining continent. He has entrusted Messrs. Walker Sons & Co., with the manufacture of one of his machines, which he expects to have in readiness shortly. Mr. Stevenson has consented to have the machine set up at the Mattacooly Mills in order that experiments may be carried out, and if these prove satisfactory no time would be lost in establishing a manufactory to push on the work of the Syndicate on a more extensive scale. The machine has for years been in use in Natal, has carried off gold and silver medals at international exhibitions held in Mauritius, New Zealand, and Durban.^a Mr. Silburn, in fact, was awarded medals at both the 1895 and 1897 Exhibitions held in Durban. This gentleman informed our reporter that the chief preliminary trouble he anticipated was in getting sufficient of the raw material. There were various species of the aloe plant, but what the Syndicate wanted and had advertised for was for the leaves of *Agave Fourcroyæ* (sic) or green aloe, *b* not the *American Gigantica* (sic) *c* or blue aloe which was so frequently met with in the grounds of Government House and elsewhere.

"Have you seen any of the kind you want in the Island?"—"Oh! yes. We have received advices of quantities that are being sent down by planters. The plant is, in fact, indigenous to the Island.^d I have seen it growing wild about Kandy round by the Buddhist Temple. It grows in any soil, principally rock. However poor land may be for other purposes, green prickly aloe will grow there. It spreads with rapidity of woods, requires little or no attention, and no expenditure in the way of manuring. It is superior to ramie in one sense and is to be preferred on account of its high commercial value, and we expect it to take the place of Manila hemp and to be largely in requisition for the manufacture of ropes.^e Indeed, I have already large orders from India, if they could only be executed."

"Where are you going to establish yourself in India?"—"At Lucknow, where I have been able to secure a large grant of land, some 600 acres in extent, which are being planted out now from saplings supplied both myself and from public gardens in India. It takes two years to come to maturity."

"How do you purpose to plant it in Ceylon By seed?"—"By saplings ^f procured from the wild plants growing about the country. It will be a very large industry, employing a large number of people both in its cultivation and manufacture."

"What number would you say?"—"Oh! that depends upon the size of the mills and the business that would be created. In its manufacture alone a large number of natives would be required. In addition it would put work on the railway, especially on that portion of the line where the plants are thickest."

^a Have seen one silver medal for this machine only, and only Mr. Silburn's word for that—a Natal Medal. In Mauritius only the old "gratto" machine is used costing about R250 similar I think to the "Raspador" of Yacatan.—E.

^b *Fourcroya Gigantea* (not agave).—E.

^c American agave *Gigantica*.—E.

^d I doubt entirely its being indigenous, any more than lantana.—E.

^e Will not bear the same strain as Manila Hemp but probably comes in a good second.—E.

^f Sucklings.—E.

"Have you made any application to the authorities for assistance?"—"We intend to apply that for the purpose of our experiment the Railway authorities should grant a rebate of the dues. The experiment, as it is, will entail a great deal of expense. It is a new industry which should benefit the Colony a good deal. The machinery will be made in the Colony the plants are grown in the Colony; native labour will be employed, both skilled and otherwise; it will increase the revenue of the railway and the shipping agencies and the money realized by the sale of the fibre will be spent in the Colony. Large orders are constantly being received for the supply of the raw material and these are likely to increase especially as I see from today's papers that the Americans have captured Ilo Ilo, which was abandoned after the Filipinos had first fired the place."

"But the telegram said the Americans speedily extinguished the flames?"—"Yes, but there is no reason to doubt that the Filipinos destroyed the manufactories in the same way as they did the chief centre at Manila. From the latest advices Manila hemp has gone up from £40 to £50 a ton in consequence of the disturbed state of the country."

"I suppose the machine has been tested at Natal?"—"Oh! yes, and also in London and Glasgow, and from the latter place we have received orders to supply on an average 100 tons a month for weaving and rope purposes. The chief difficulty is to get a sufficient supply of the green stuff.^a

"Is that likely to be a serious difficulty in Ceylon?"—"No, I regard Ceylon as the natural *habitat* of the plant. It was a great difficulty in Natal. We had to plant out and experienced a lot of trouble through it. The cultivation of the aloe plant should specially commend itself to the tea planter. If he finds that his tea is likely to come to grief, that his land is bad and will not grow tea, or that he cannot afford to go in for manuring, constant pruning, and such like, he had better put in aloe, wait two years and then he would find he would get a valuable commodity which would last for seven years before it would require being renewed. That is what we do in Africa, where those engaged in the sugar industry chiefly suffer through the ravages of locusts, which sometimes threaten the grower with ruin altogether. In the Bahams there are 70,000 acres planted with sisal hemp which is not so good as the aloe fibre, and only obtains an inferior price in the market, rates being governed solely from the standpoint of the length of the strips. The machine which I have patented is the only fibre extractor in Africa.^b I hope to get a sufficient supply of green stuff to commence experiments in a fortnight's time I have had the machine protected in Ceylon, India, and Burma, and machinery is being constructed in Calcutta. It will deal with all leaves containing any fibre, independent of size, from a ten-foot aloe leaf to a foot pineapple leaf.^c It is a self-feeding machine capable of being adapted to any size. Of course, I have not had time to

^a Machine has never been tested except in Natal Mr. Stevenson's own machine, primitively made according to Silburn's drawings. Some fibre was sent to London and Glasgow and reported upon.—E.

^b There are a number of powerful machines in use in Bahamas, Yucatan, &c. with a very large fibre-extracting capacity.—E.

^c Would need special adjustment for a small leaf.—E.

go much about the country, but as I have said I believed the particular plants we want thrive largely in Ceylon."

The conversation ended here Mr. Silburn's attention being called off to attend to matters connected with the forthcoming work of the Syndicate.—Local "Independent."

[The commercial name of the fibre is *Mauritius Hemp* of which 800 to 1,000 bales are exported from the Colony monthly but it is claimed that the machine will produce the hemp longer, better, and unbroken and extract at least twice the weight of dry fibre from the same weight of green aloe leaf.—ED. T.A.]

CUPRESSUS MACROCARPA

In the villa gardens round about Torquay this Conifer is put to valuable use, and if proper attention be afforded, it admirably answers its purpose. Many of the villas are built on undulating land, and the roofs of some are almost in a line with the ground floors of those just above them on the hills. It follows that the garden of one is often open to those of its neighbour, and even to those placed on level ground, there is always a desire on the part of the occupants for a certain degree of privacy and seclusion, so essential to the enjoyment of a garden. The garden-walls are about 3 or 4 feet high, with soil on the inside borders almost level with the top of the wall. On this a number of *Cupressus macrocarpa* are planted, 2 or 3 feet apart, and being a quick grower, the lower portion soon thickens; and when the plants have grown some 6 or 8 feet high the leaders are cut away which encourage the thickening of the top. Ere, however, this finishing part is permitted, it is necessary that a strong iron railing be run the whole length of the intended hedge, and stout iron standard and stays well secured to the wall as well as the border inside with a couple of rails, one about 2 feet from the ground, and the other 5 feet. These of course, are firmly fixed to the upright so that when finished the whole is strong and able to resist the winds which will, by-and-by, try the hedge. The plants are secured to this iron railing, which is soon hidden and as they reach the height previously mentioned topped and clipped, a most compact and beautiful hedge is formed which entirely shields everything in the garden from the gaze of passers by or from neighbourly observation. The hedge may be permitted to measure 3 feet through at the base, gradually sloping in height till the top, perfectly level, is about a foot in thickness. Some run just 6 feet high, 2 feet at the base, sloping gradually to the top. The bright, pleasant green of the young shoots just at the present season makes such a hedge singularly attractive. Some of the owners, I notice, have made provision for the little gaps that occasionally occur in the lower part of the plants by planting a row of *Eunonymus* between the *Cupressus* and the walls; these are kept dense and compact by constant clipping. The variegated forms as well as the common *Eunonymus* are used, the whole making a very pretty and complete bank of vegetation, always green, and most attractive. The beauty of such a hedge is, of course, enhanced and preserved by regular clippings—twice a year they should be attended to by one who thoroughly understands his work. Of course, any one can use a pair of clipping shears; but where straight and curved lines and level top are to be maintained it is very desirable that one who is somewhat of an adept at his work should be always permitted to do it. In the hot summer seasons in the south of Devon, and on raised banks and borders, it is necessary that the hose-pipe be used, and abundant supplies of water constantly afforded, as only by such means can the health of the hedge-plants be maintained. W. S. Exmouth.—*Gardner's Chronicle*.

THE FERTILITY OF SOILS.

The factors upon which the fertility of the soil depend are many. The amount of plant-food and its degree of solubility, the mechanical texture or tilth, and the climate, which includes temperature, amount of rainfall, &c., are the chief of these.

Soils to be fertile must contain the elements of plant-food in such forms that they can be readily used for the nutrition of vegetation. At the same time, its condition must not be too loose, else a firm hold will not be afforded to the roots of plants, and there will be too much drainage and evaporation; nor must it be too heavy and plastic, for then air and water could not freely permeate it, nor the roots extend themselves beyond a very limited area. Generally speaking, light, loose soils are not as rich in plant-food as those in which clay predominates; yet, on account of their excellent condition of tilth, and the ease with which they are worked, they are specially adapted for most horticultural purposes, and having a sufficiency of manure, they often yield in favourable seasons heavier crops than the, stronger soils would do. Stiff heavy clays, though rich in inorganic food, potash, and phosphoric acid, are often poor in nitrogen, while their mechanical condition is such as to prevent through aération and the penetration of the roots. It is these soils especially that are benefited by drainage. By a system of drainage the water which saturates the surface-soil is carried off, air allowed to permeate, the whole is rendered more friable and easily worked, and much plant-food is converted into assimilable forms.

Where sand largely preponderates, the soil is not retentive of moisture and fertilising material, especially if the subsoil be light, and though easily worked it is not so desirable in very dry seasons as on a heavier soil. A proper proportion of sand and clay therefore, for many reasons, makes the best soil. With the clay and sand, varying amounts of peaty matter, or humus derived from the decomposition of vegetable matter, may be mixed. In horticulture leaf-mould is largely used. Calcareous matter, chalk, lime, and bone-meal, are usually associated, and a light proportion of these exerts a beneficial influence upon the tilth of the soil, as well as upon the solubility of the plant-food. By the slow decomposition of the clay, the vegetable matter, and the lime, valuable plant-nutrients, are liberated in a soluble form, and therefore the function of these soil constituents is, not only mechanical but chemical.

The most important inorganic constituents of a soil are potash and phosphoric acid. These, together with nitrogen, are known as the essential elements of plant-food.

To understand the question of soil-fertility, the gardener should become familiar with these matters, should know what these elements will do for crops and plants, and when and how to apply them.

Nitrogen.—This element, like potash, lime, and phosphoric acid, is an essential constituent of all plants. In its free state it is a permanent gas, and is one of the most widely distributed elements, comprising about four-fifths of the earth's atmosphere. This vast supply of nitrogen is, however, of no direct value to plants, since they are unable to use it, except when combined with the elements oxygen or hydrogen, forming nitric acid and ammonia, that may be taken up through the roots of plants. Leguminous plants, like Peas, Beans, Lupins, &c., and possibly Orchids, are indirectly able to build up their nitrogenous ingredients from the free nitrogen of the air, through the activities of microscopic plants (known as bacteria) intimately associated with them; other plants may, possibly, under favourable conditions to some extent have the same faculty.

Nitrogen is present in the soil in simple combinations as nitrates or ammonia salts, or as more complex organic compounds, forming the dark coloured humus especially abundant in peat, leaf-mould, and forest soils. The total quantity of nitrogen in ordinary soils varies between 0.1 and 0.2 per cent.; occasionally the nitrogen content will approach one per cent., as in the case of rich pasture soils. Peat soils will often contain over two per cent. of nitrogen; this is how-

ever; largely in a combination that will not directly sustain plant life, but has to undergo a weathering process before the plant can make use of it.

Nitrogenous manures help to strengthen plants in their earlier growth, favour leaf development, and give a deep green healthy colour to the foliage; applied in excessive quantities they induce rank growth at the expense of the development of the fruit.

Phosphoric acid is present in soils in combination with a number of other chemical substances, which exert a very beneficial influence on the growth of plants. Phosphoric acid is found in soils partly in a form that plants can readily dissolve and make use of in the building of their structure, partly in an insoluble form which under the influence of water carbonic acid and air, or the mineral components of the soil are gradually changed into available plant food. There is only a small quantity of phosphoric acid in ordinary soils, viz., less than 0.2 per cent., and often only 0.05 per cent.; but as the content is not decreased in any way except by the growing of crops, the soil will only become deficient in this constituent in case of continuous cropping without manuring.

Phosphoric acid is of special importance in the early life of plants; it stimulates the assimilation of mineral substances in the plant, and favours the development of its root-system. There is an intimate relation between the nitrogenous principles and the phosphoric acid in plants, and we find that, generally speaking, a high nitrogen content is accompanied by a high percentage of phosphoric acid. The phosphoric acid of plants is usually concentrated in their maturing organs, the flower and seed.

Potash is found in Nature in combination with acids like sulphuric, carbonic, and silicic acid.

Potash is generally distributed in small quantities in most soils, except light sandy soils, which are apt to be deficient in this fertilising element it is found in ordinary soils in somewhat larger quantities than phosphoric acid, namely, from one to three-tenths of one per cent., and occasionally as much as one per cent. in case of soils originating from granite, basaltic, and other rocks rich in potash. Like phosphoric acid, potash may be present in the soil in a non-available form, especially as double silicates, that are but slowly decomposed through the action of water, air, and other constituents of the soil.

Potash is found in the largest quantities in foliage plants, in leguminous plants, in Vines, and in Potatoes. It is of the greatest value to plants, in facilitating the flow of sap, and the diffusion of starch from cell to cell. It gives increased strength to the cell structure of plants and has in general a beneficial influence on the flavour and texture of fruits and Potatoes.

Lime is present in most fertile soils in sufficient quantities to allow of the production of large crops, but occasionally there will be too little of it to reach this end, in which case the addition of some lime compound to the soil, will produce very beneficial results. It is considered that a lime content of one-half of one per cent. an ample supply in light soils, while heavy soils may need 2 per cent. or more.

The good effects from the addition of lime to soils do not come only from the increase of an ingredient essential to plant growth, but the mechanical condition of the soil, its texture, water and heat-retaining capacity, are improved. This same is true in perhaps all cases when fertilisers are applied to soils, a fact which is generally overlooked by horticulturists.—*Gardener's Chronicle*.

THE RAMIE SYNDICATE.

The Ramie Syndicate, Hythe End Mill, Staines, sends us the following:—You will perhaps not be indisposed to give your readers the news of our experiments having proved most successful. When we started we were confronted with the following difficulties: 1st, supply; 2nd, decortication; 3rd, preparation; 4th, spinning, and lastly demand or market. I will deal with these seriatim later. Un-

gumming which had hitherto proved such a fruitful source of difficulty had long been overcome by us; the gum question presented no terrors nor difficulties to us; by our method ungumming is simple and the durability of the fibre is unsurpassed as is proved by the yarns which have been in use now three years, they are as strong now as when first prepared. I refer to those made at Staines. I have products prepared by our process which have been in use ten years and are as good now as ever. I will deal with the obstacles as they appeared at the initiation of our works at Staines:

1st. Supply.—There is a vast supply in China, where the natives have cultivated it and all the best textiles are made from it. The wealthy Chinese hold it in high esteem and it fetches high prices. Very small quantities compared with the vast crops grown, unfortunately, have yet found their way out of China. We have based our calculations on the price of raw material at £30 per ton, and at this price I can show a paying industry competing with flax, but I am promised contracts as low as £20 per ton; this will open up a vast field and enable us to compete with cotton. India produces vast quantities in a wild state, these will have to be brought under cultivation. Dr. Morris, of Kew, recommends Ramie to the planters who cannot make sugar pay. It would be a boon to our West India Colonies. The Australian Colonies are growing Ramie, Queensland and N. S. Wales have sent us splendid quality. The U. S. Government are recommending it to their farmers and the Government has voted a large sum \$145,000 to the establishment of experimental plantations. Mexico, it appears from a consular report, shows 145 per cent profit in ramie growing. From South America I have splendid samples, and as many as four crops in the year are cut; and I am promised regular supplies at a price which will put Ramie on the market a competitor to cotton. There is a vast field in Egypt and the Soudan. Thus Government of Natal is recommending Ramie growing. Plantations are already started in Borneo, Ceylon, Straits Settlements, Formosa, Java and Malay Peninsula. Corea produces splendid Ramie and the Japanese are turning their attention to Ramie growing. In short I hear from all quarters of the globe, of the great advance in Ramie growing, and I have not the slightest doubt it will prove a strong rival to cotton. To our colonies I would suggest Ramie growing, and by the use of our decorticators, ribbons could be prepared while a green state for the ungumming process, and flasse should be prepared on the plantations; it is a simple operation and the plant would not be expensive. The flasse so produced would be far superior to that produced from the dried ribbons, and in addition there would be a great saving in freight the waste products viz., the leaves and lateral shoots would produce an invaluable pulp for high class paper making and command a high price.

2nd. Decortication.—In China this is accomplished by hand labour. The operator strips the ribbons from the stem and scrapes the fibre, removing the pellicule or brown bark and much of the pectose gummy matter while in a green state. The natives of India merely strip the plant and make no attempt to clean them. These reha ribbons command a much lower price than the Chinese cleaned strips. Our decorticator cleans the ribbons similarly but in a more perfect condition to that produced by Chinese hand labour, removing considerably more of the pectose in its fluid state.

3rd. Preparation.—The next difficulty is dressing the fibre ready for the spinner; hitherto the expensive process of preparing on silk dressing machinery has stood in the way, and when we can turn out an article absolutely without waste beyond the shorts or noils which exist in the fibre at a cost of one-half penny, which hitherto has cost 9d. we can claim success and considerable advance.

4th. Spinning:—This is now a simple process, our wet spinning frames produce an even yarn, grasing

is no longer necessary and the strength and lustre of the fibre is materially advanced by its abolishment.

Lastly Market.—On account of its great strength and lustre it is specially in demand for lace, duck, khaki, sail cloth, fishing lines, braiding, tapestry, and all purposes where special strength or lustre is of advantage. It mixes with and fortifies weak wools. And as the price of raw material is lessened, so in proportion will the demand increase. Our latest is milo-thread. For yacht sails it has achieved a great success; "the Defenders" sails were Ramie. The Bona, one of the most successful English yachts, carried Ramie sails made by our process. As the fibre does not rot in water it is particularly applicable to fishing nets, rails and rigging, and its great strength commends it further for these purposes.—"Planter."

NEW PROCESS OF TEA MANUFACTURE IN COLOMBO.

A SERIES OF INVENTIONS.

THE NEW VENTILATING FAN

At Messrs. Davidson & Co.'s Sirocco works in Forbes Road, Maradana, Mr. F. G. McGuire has just finished erecting a complete plan for the manufacture of tea by "hot process," and has put through the first break from start to finish. He manufactures on Tuesdays and Fridays; but on other days visitors will be welcomed. The factory is fitted throughout with nothing but Davidson's patent machinery, and includes several novel features. First of all there is the new withering machine, which is the only one at present erected in the island, though previously a model one, with which experiments have been conducted, was set up on Polatagama estate in the Keli Valley, and which existed all last year. The machine is capable of keeping two rollers going, and is driven by a new and ingenious engine which has proved quite a success at home. It is a highspeed engine without any packing, except on the piston ring. The governor and the valve also are both situated inside the steam chest and this forms a special feature of the invention, for, as shown by Mr. McGuire, the governor regulates the working of the machine to a nicety unapproached by an outside governor. The main bearing and crank shaft, too, are submerged in oil, and an indicator is fixed to the outside of the oil bath, to constantly show the depth of oil.

Even when wet leaf is put into the witherer, in an hour's time it is ready for the roller, and in three hours the whole process from green leaf to black tea—but not the grading, &c.—is completed. With the roller, experiments are now being carried on to effect an increased degree of pressure by means of interchangeable cones in the centre rolling table. From the roller the tea passes into an evaporator, the object of which is to decrease the percentage of water to obtain a good twist on the leaf in the second rolling. This machine is fitted with one of the new patent fans, encased and driven by its own little engine. The down draft sirocco for firing is, of course, familiar to our readers; but at Maradana this also is fitted with a new fan, in place of a chimney, for the blast. Besides requiring a far less quantity of fuel the driver now consumes its own smoke, so that nothing but clear gas issues from the shaft. Then at the other end of the room, is one of Davidson's large sorting machines and a Davidson-McGuire Packing Machine, on which this morning twenty Acme chests were being placed in position to receive the first batch of tea, to be sent to Belfast to be sampled and sold. In course of time some of the breaks made, will be put on the local market; and experiments will be carried on for another month. The leaf from which the first break of tea has been made was bought from a native estate in Kaduganawa at 6 cents a lb., and Mr. McGuire claims that from this inferior material he has made good tea. The tea continues

hot from start to finish, and by this means it is asserted that, after a few additional experiments, it will be possible to make tea of a penny per lb. higher value than by the old process, which besides the saving of time and fuel, would naturally, amply repay and additional outlay in machinery. There is the further valuable consideration that instead of an expensive three-storey factory a simple shed of one floor will suffice to accommodate the machinery for the manufacture of any quantity of tea. Estates it is expected, will send down leaf to be experimented with as a practical way of testing what is claimed for the new method in improving prices. At the end of the office a laboratory has been fitted up in which chemical tests are carried on, and where with a powerful little microscope the leaf is examined in the various stages of manufacture.

THE "REVOLUTION" IN FANS.

Perhaps the most ingenious of all the new things to be seen at Messrs Davidson's Works, however is the fan. This was described in a letter in our paper of the 28th March, and the first shipment of 18 ventilating fans arrived by the last Bibby steamer. These had been preceded by two fans for smoke chimneys, one of which has been sent to Balangoda for Messrs. Finlay, Muir & Co., and the other is going to one of the Haputale estates of Lipton, Limited. The eighteen ventilating fans were all of 30 and 35 inches diameter; and last night the remaining eight were booked—two by one firm, and six by another the orders being for two fans in each factory. Another shipment is expected by the next Bibby steamer, when various sizes, from 15 inches to 35 inches, of the ventilating fans will come to hand. The new fans have not been advertised at home as yet, because, although the number turned out at Belfast is daily increasing, the existing demand can hardly be coped with. Before long, we are informed, 25 a day will be produced, and then the invention will be extensively advertised, and the production will be increased as quickly as possible to 100 per day. A contract has been obtained for the ventilation and cooling and heating, of the Law Courts in London, which have always been in an unsatisfactory atmospheric condition; and the fans are to be used in connection with the scheme, which involves a separate plant for each court with refrigerating and heating apparatus for winter and summer respectively. The air will also be filtered, so that fog and other impurities may not enter. In addition to this the ventilation of the House of Commons is to be similarly improved; and exhaustive experiments were to be made a week or two ago by the Admiralty to see whether the new instruments did what was claimed for them, in which case Sir William White, the Chief Director of Naval construction, had declared they would be adopted at once through out the new vessels of the Navy. Information of the result of these tests has not yet come to hand. The flax and linen industry of Russia, which had been considerably pushed in recent years, and which requires fans for the benefit of the work people, has also produced a wonderful demand for the new patent, which we are told has been ordered in such numbers that the Russian market alone constitute a very important element. It is in Ceylon, however that the fans have been first advertised and first erected in different factories.

To describe the fan, one of which, 30 inches in diameter, is already in position and working at the Maradana establishment, we may say that it involves an entirely new idea in practical engineering. The fan hitherto familiar to the public possessed blades extending from the circumference to the centre and it follows, as a fact, that the maximum amount of work done by each blade is at the circumference, the force being lessened gradually until the centre is reached, where there is very little speed at all. Thus with any opposing pressure the efficiency of the old fan is greatly reduced, and air may even pass the opposite way through the centre, while the blades are doing their work at the outer edge.

Davidson's patent may be described as shaped like a revolving squirrel cage, the blades being all of equal length round the circumference, and thus performing equal work throughout. By the same arrangement the space for the passage of air is as large as the fan itself, and the result is evident even to the lay mind, and is a marvellous advance on the old idea. An interesting feature is that the principle involved in the construction of the blades is in agreement with the contentions of professors, but contrasts with the experience of engineers in all other fans; and the new vindication of the scientific theory is to be shortly discussed at the Institute of Mechanical Engineers. The advantage of the machine is that, while the air emerges with greatly increased force it enters in a regular and even manner, producing no disturbance in the vicinity. The air in fact is drawn from all directions as powerfully as from immediately in front, and thus a much greater area of space is under its action. The regularity of the entrance of the air was also shown when a funnel was fixed to the bracket which holds the fan. The atmosphere rushed into this in a full and regular stream, indicating the fan's great capacity for disposing of an unusual volume of air in a given time. The speed was tested at various distances and from various directions by an anemometer, and established the inventor's contention. The fan was then running, driven by a belt, at 380 revolutions a minute, and 10,584 cubic feet of air per minute were being drawn through. This entered at the rate of 2,000 feet, but was ejected on the other side at the rate of 5,530 feet, when reversed the fan does nothing. It may also be mentioned that the bracket holding the fan has the shaft suspended like the axle of a bicycle, and the two bearings are in one piece, so that even if carelessly erected by an inexperienced person, they cannot be put up out of line. On the outside a solid disc prevents high wind, or even a cyclone, disturbing its efficiency; and the air is discharged with equal force on all sides. The force of this air can be utilised for an upper loft by the fan being enclosed and the air conducted to the storey above. The power used was only about $\frac{1}{4}$ h. p.

Close by the fan already in position preparations were going forward for the erection of a still larger fan, to be completed by this afternoon. Although no harm would result, it would be waste of energy to over-drive a small fan, and according to the amount of work to be accomplished, machines of certain diameters are recommended. Mr. McGuire further explained that the fans can be driven by electric motor and by water power, with new Pelton wheels recently patented by the inventor of the fan. A volume of photographs further shows the variety of uses to which the invention can be put; and other pictures represent some highly interesting tests, one of which in competition with one of the older style of fans of three times its area was fully decided in our issue of the 28th March.—Local "Times."

COFFEE.—The *Moniteur des Interêts Matériels* says the coffee crop of 1895 with 6,500,000 bags realised £25,000,000. The result induced increased production, but in 1897 the exportation of 9,500,000 bags only brought in £10,000,000, and the 10,000,000 bags in 1898 only realised £15,000,000.

THE MUNICIPALITY of Bariry, S Paulo, has about five millions of coffee trees planted of various ages. Its first crop will be gathered this year, which is estimated at 150,000 arrobas of coffee. A coffee plantation at Mocooca, Sao Paulo, was recently sold at judicial auction for the sum of 90,000\$ its valuation being 202,000\$. The plantation contained 112,000 coffee trees, 5,000 arrobas of picked coffee, coffee-cleaning machinery, buildings, saw-mill, etc., etc. It looks like a decided sacrifice.—*Rio News*.

RUBBER CULTIVATION IN CEYLON;
THE LATEST INFORMATION AS TO
CASTILLOA, PARA AND CEARA
KINDS;

ABOUT 1,500 ACRES NOW COVERED
WITH RUBBER TREES IN CEYLON;
THE APPROACHING REVOLUTION:—

NOT ONLY IN THE SYSTEM OF
SEPARATING CAOUTCHOUC FROM
MILK; BUT ALSO IN EXTRACT-
ING RUBBER FROM THE STEMS
OF YOUNG TREES.

We direct attention to a very important letter on local Rubber cultivation, above the well-known signature of "E.S.G." on page 94. The writer will be admitted to have had exceptional means of forming reliable opinions on the points he discusses, and where these differ from any in the official "Rubber" Circulars, we believe it will be safer to follow the lead of the practical planter. "E.S.G.", then, for good reasons given, rehabilitates Para rubber to a very great extent; and, indeed, we have never seen good reason for the rush from one extreme to the other in reference to the cultivation of this variety, nor could Mr. Willis mean that his latest views in favour of Castilloa should be construed to the depreciation of the continued cultivation of Para, where such had been established. We may even go farther and say that there is scope and fair encouragement for the continued planting of Para outside of the limited region between Kalutara and Ratnapura, which is considered most favourable for its growth; and in which, perhaps, the Castilloa tree would not prosper so well. Nevertheless, the latter, as "E.S.G." and Mr. Willis both show, has an extensive field for its production; and there is no reason why, as soon as seed is available, it (the Mexican tree) should not grow very freely both up and down country.

It will be observed that "E.S.G.," although in possession of the results of tapping experiments, does not give us estimates or figures, in the meantime, though he promises to do so at no distant date. On the other hand, there has been some instructive and even amusing correspondence in a local contemporary's columns on the subject. "J.M.," who was one of the first to plant "Castilloa," has shewn how, even in the face of a splendid valuation for the resulting rubber—which passed through our hands—he was officially discouraged from continuing the cultivation! "The whirligig of time" has indeed brought about "its revenge." Major Gordon Reeves, who now owns the Wiharegama estate and the trees planted by "J.M.," reports of the several old trees of Castilloa and his harvesting, as follows:—

There is no difficulty whatever in raising plants, and in a wet district I should imagine that any sized plants from seedlings of 3 inches to stumps of 2 feet will grow readily. In our climate, which is rather a dry one, I think there is no doubt that good sized stumps do best. The old trees on Wiharegama must have a girth of quite 30 inches at 3 feet, and are probably 30 feet

high and of spreading habit and rather resembling a teak tree: these are planted through the cacao, and do not seem to have any injurious effect on the latter, and we are now extending plantations of cacao, with *Castilloa* 20 feet apart, and *Erythrina* as a temporary shade. I had two of the old *Castilloa* experimentally tapped, taking only about 1½ lb. of rubber, though a great deal more could, of course, have been taken: the milk was simply run into butter tins without any cleansing, and dried chiefly in the sun, which is we now know an injurious process. The samples were forwarded to Messrs. W. Wright and Co., the principal India-rubber brokers in Liverpool, and are reported on as follows:—

- No. 1.—Good, clean, strong, dry rubber, value about 3s 6½d per lb.
- No. 2.—Good, clean, fairly strong rubber, but very wet, value about 2s 11d per lb.

A very satisfactory report, considering how little we then knew about curing. *Fine Para* rubber is only worth 4s 2d.

Next "J.M." recalls estimates for a Castilloa plantation in Nicaragua, which were given in the *Observer* and which can readily be found in full detail in the *Tropical Agriculturist* or still more conveniently in our Manual ("All about Rubber," a second edition of which is now passing through the press); but a few figures may be quoted if only to make the mouths water of some of our planting readers, in anticipation of a good time coming! Here is "J.M." quoting Mr. Cator:—

Cost of 500 acres of land at 5s per acre	£ 125	
„ survey and titles	„ „	100
„ clearing land	„ „	1,000
„ collecting seed, and planting...	„	500
„ 8 years' weeding at £200	„	1,600
„ tools, &c.	„ „	300
		<hr/> 3,625
Interest on £3,625 for 8 years at 5 per cent.	„ „	1,450
Superintendent's expenses, 8 years, at £200	„ „	1,600
Cost of gathering the 8th year's crop	1,500	<hr/> 4,550

		£8,175
He estimates a profit at the 8th year as follows, per acre: Dr.		Cr.
Cost of cultivation	£ s d	Government pre-
per acre	7 4 9	mium
Cost of tapping	3 0 0	Crop, 965 lbs.,
Balance of profit		at 2s
per acre	88 13 6	96 10 0
	<hr/> £98 18 3	<hr/> £98 18 3

Thus, 500 acres at £88 13s 6d = £44,337 10s profit on a capital of about £8,000; and, as if that was not sufficiently sanguine, take the 9th year by itself:—

Expenditure for weeding	£ 200	Value of crop in	£
„ harvesting	1,500	9th year	50,000
„ planting	500		
Interest	180		
Profit	47,620		
	<hr/> £50,000		<hr/> £50,000

Here, indeed, seems room for enterprize, even taken midway between the utterances of the sanguine "man on the spot" and the pessimistic reports from the Peradeniya Gardens Director. How this reminds us of the golden days of "Cinchona"!—when William Smith of Craigie Lea proved to a demonstration how foolish his partners, Colonel Byrde and Mr. John Davidson, were when they refused their consent to 150,000 cinchonas offered by Dr. Thwaites free from Hakgala ("a medicine

tree" as Col. Byrde rather contemptuously called it) being put out on Craigie Lea then being opened for coffee as the pioneer estate of Dimbula Felix in the early "sixties." Poor Smith—15 years afterwards when cinchona was booming and Nanuoya netted more than 10s a tree for some hundreds of mature trees cut down—used to say that his partners had thrown away £37,500, realizable by taking half of the 150,000 plants as coming to maturity at 10s a tree! No single proprietor in Ceylon, we fear, ever realized as much as a few thousands of pounds sterling from cinchona, although we got up to a shipment of 15 million lb. of bark in one year.

To return to Rubber: We may mention that we attempted some months ago to get an approximate idea of the extent to which the various kinds of rubber were cultivated on estates. First, we wished to see how far "Ceara" rubber, which was the earliest to be boomed, had been continued in cultivation; but our responses were but few; for, in most cases, the Ceara had been rooted out as inimical to cacao, or to give place to tea. We may quote a few illustrations: here, for instance, is a report from Crystal Hill estate, Matale:—

What kinds of Rubber are now growing? Three Ceara trees only remain out of several hundreds planted in 1878. A few hundreds of Castilloa were planted in October 1897 along with coconuts and are doing well.

Approximate age of oldest, Ceara 20 years.

Size of largest trees—circumference, height (actual or approximate), Ceara circumference 2 feet 4 inches, height about 30 feet.

Result of tapping, Nil.

Injuries or otherwise to plants underneath or near to the Cacao? Underneath the Ceara gave little or no crop. Wild pigs that had been attracted by the yam-like roots of the Ceara began to eat the Cacao pods, and the Cearas had therefore to be destroyed.

Going to the other end of the country in Madulsima, from an estate where there were 30 acres of rubber growing in 1886, the following was our latest report:—

What kinds of Rubber are now growing?—Ceara. Approximate age of oldest? About 18 years. Size of largest trees—circumference, height (actual or approximate.)? About 50 feet high, 4½ feet below lowest branch, 5 feet at the ground, branched out about 15 feet from ground.

There is only about one acre of rubber trees on estate now. Spread about. The rest have been cut out. I can't say what damage they would do to any other plants as they are near none. Next from a Hantane estate that had ten acres of Ceara in 1886, we are told it was all rooted out and there are no rubber trees growing now. Again, the well-known Kandenewera estate, Matale, had 6,000 Ceara trees a dozen years ago; but Mr. Gordon replied in answer to our circular some months ago:—

The Ceara rubber trees on this estate have all been cut out, some of the largest were tapped four years ago experimentally, but the yield of rubber was very poor and watery. Certainly no success commercially. As shade trees to either Cacao or Cardamoms they are harmful, and being greedy feeders are undesirable cultivations with mixed products.

Sanquhar estate, Gampola, has still 80 Ceara rubber trees growing alongside a road, but we have no particulars as to size. On Hurstpierpoint in the Galle district, of 5,000 Ceara trees in 1886, there are still

a few left about 17 years old, 30 to 40 feet high and 1½ to 2 feet in circumference.

Of reports on other Rubbers, we have a few to present. The Manager of Daisy Valley, Kurunegala, has put out a good deal of Para rubber from seed got in the Peradeniya Gardens. From Mr. P. D. Clark, Manager of Rasagalla, Balangoda we have a satisfactory report as to Para, showing, apparently, how much wider is the sphere for its successful growth, than Mr. Willis has conceived, when he confined it to the low-country between Kalutara and Ratnapura:—

What kind of Rubbers are now growing? Para rubber, Hevea Braziliensis, about 35,000 very promising trees. Cultivation to be extended. Approximate age of oldest, two years. Size of largest trees—circumference, height (actual or approximate,) 18 feet high, expected to tap from 8-10 year judging from present growth. Injuries or otherwise to plants underneath or near to? Apparently not injurious to tea.

Mr. Corrie was good enough, some months ago, to report from Gikiyanakanda in the Kalutara district as follows:—

What kinds of Rubber are now growing? Para and Castilloa. Approximate age of oldest, six years. Size of largest trees—circumference, height (actual or approximate,) 9 inches diameter, 3 feet from bottom, height say 30 feet. Injuries or otherwise to plants underneath or near to? All our Rubber but a new clearing just planted is growing through tea. No damage to tea at present.

There are a few Ceara trees growing about 15 years old, but we do not tap them, not considering it worth while as the yield at this variety is so small.

From Mr. J. A. Storey, on Igalkanda estate. Elpitiya, we learn of Para rubber trees, six years old, doing well, the size being given as follows:—

Largest measured 33½ inches circumference at one yard from ground, several others over 30 inches. Height (approximate,) 35 feet.

And then we have what Major Gordon Reeves wrote to us at the time of our circular in regard to Wiharegama, which, of course, must be modified by his more recent information:—

What kinds of Rubber are now growing? Ceara. Para, Castilloa, Approximate age of oldest, Ceara about 15 years, Para 5-6 years, Castilloa 8-10 years. Size of largest trees—circumference, height (actual or approximate.) Ceara, no measurement taken, Para circumference 2 feet to 2 feet 6 inches, height say 30 feet. Castilloa cir. 2 feet 6 inch to 3 feet, height say 25 feet. Result of tapping? In tapping experiments now being made (will report) with Para and Castilloa, but *not with Ceara*. Injuries or otherwise to plants underneath or near to Para rubber trees planted over nine acres of Cacao as shade. No injury apparent; on the contrary forms good shade at 20 to 25 feet apart. I proposed to plant as shade over a large extent of Cacao field.

So far three kinds of Rubber—Para, Castilloa and Ceara—have been mentioned. On a little estate in the Kelani Valley, there were, 12 years ago, some 500 specimens (creepers) of the East African rubber-yielding plant, Landolphia Kirkii, equal to four years' growth then, and kept as show stems and to see if they would seed. Unfortunately, these creepers no longer exist and this is the explanation offered by the proprietor, Mr. James Gibson:—

I regret that during my absence in India 1887 and 1888, that the man in charge cut out all the Landolphia Kirkii trees from Pleasure Ground

which is mine still and the few I also put in on Kennington were destroyed also. I do not know of any others on any estate; I was grieved at the destruction.

The above estate reports can, of course, be only taken as indicative of what is going on in many other estates in the planting districts. Twelve years ago we estimated 600 acres were covered with India-rubber trees, chiefly Ceara. Last year Mr. Willis estimated 750 acres of Para rubber alone; while our Directory returns in August last showed an aggregate of 1,071 acres, notwithstanding all that had been cleared out of Ceara. With all that has since been put out, of Para especially, we reckon that these figures may safely be increased to 1,500 acres. But we may be told that quantity or area does not matter so much as quality, and just as Ceara rubber—so rushed after at one time—was cast aside in Ceylon as well as Java in favour of the "Hevea" or Para, so is the latter about to be superseded by the Mexican or Castilloa tree. Now in all these conclusions, we think too much haste is manifested. We fear, indeed, that those who have abandoned even Ceara clearings, will live to regret their action. We can recall when samples of Ceara rubber from Ceylon realized 4s per lb., and now that we are on the eve of a revolution in the means of "harvesting" the crop, as well as of separating the caoutchouc, we say that every man who owns a rubber-yielding tree, whatever be the species, ought to carefully conserve it. In January, 1898, Mr. Willis told the world that the only important rubber for Ceylon was the "Para," and at the time he was, no doubt, acting up to the best light. But a good deal has been learned since; and in his Circular of April last, facts and figures are given to show that preference should be given to the Mexican or Panama *Castilloa* tree. Now we have not a word to say against this preference, nor do we fail to recognise the special importance of the invention of Messrs. Howard and Biffen in their "Caoutchouc Separator" as still further demonstrated, if not improved, by Mr. Hart of Trinidad. But while lately compiling from available literature for our "All About Rubber" Manual, we have been much struck with information reproduced in our own *Tropical Agriculturist* so far back as December last, which attracted too little attention at the time. From it we learn that, among other inventions or experimental applications on the *tupis*, is ONE FOR EXTRACTING CAOUTCHOUC PROFITABLY FROM THE YOUNG STEMS OF RUBBER-YIELDING TREES; AND WE VENTURE TO INFER THAT, ULTIMATELY, YOUNG TREES OF CEARA, PARA OR CASTILLOA MAY ALL BE FOUND AVAILABLE FOR THIS PURPOSE. Surely here we have the elements of a great revolution in Rubber cultivation? In case we may be supposed to write without chapter and verse, we refer to the article in the *Tropical Agriculturist* for December last entitled "Some Recent Developments in Rubber Cultivation," and we quote the writer as follows, premising that so far he gives the preference to young Castilloa trees:—

During a trip of several months through the old rubber-producing regions of Central America and the northern states of South America, I found a great interest in rubber cultivation, and preparations were being made to start very considerable

undertakings, particularly in the British West Indies, where the fact that rubber never has been indigenous to those islands is not considered in the enthusiasm of the people. On the island of Trinidad I found this enthusiasm increased to a substantial boom. Rubber seeds were selling at five cents each, and young trees were wanted at fifty cents, through owners were refusing to sell year-old trees about two feet high for less than a dollar a piece. It was reported that two English companies were about to begin operations in Trinidad and were proposing to invest a combined capital of \$5,000,000, while private enterprise would probably bring \$2,000,000 more to the island, making a total of \$7,000,000 prospective capital to be invested in that one locality. Other islands were becoming interested. In Grenada seeds were in demand with the prospect that a very considerable acreage will be set out.

The most interesting point under discussion in relation to rubber-planting in the British West Indies is a series of experiments now being carried on in London and Trinidad, by which it is proposed to secure rubber from year-old trees of the *Castilloa elastica*. It has been found that seeds sown broadcast over a prepared field will yield an abundant crop of young trees, which at about a year old can be cut and sent to a factory where, with ordinary machinery operating a simple process, 8 per cent. of fine rubber can be extracted from the young shoots. This can be done in the laboratory. It is claimed that the process is a simple one, that but little machinery is necessary, and that in future the world's rubber supply will be secured from an annual crop of young trees sown on cultivated estates, and not from remote forests at present. A series of experiments has shown that the young tree contains about 8 per cent. of rubber, which would at present prices return an estimated profit of \$200 to \$400 per acre. The extraction of rubber from young shoots has been accomplished chemically in the laboratory, but whether it can be applied to the economic production of rubber on a large scale remains to be seen.

And then the writer goes on to discuss the conditions under which "Castilloa" will grow. Every planter and merchant interested should read the paper in full, and decide whether we may not be on the eve of a boom in Rubber planting after the fashion of cinchona in the early "eighties"; but, we trust, with better results. Of course, the advice so far is to sow broadcast Castilloa seeds; but we cannot at all believe that the experiments dealing with year-old twigs of that variety, may not ultimately be extended to other varieties—not only to Para, but to the despised Ceara; and as we said above, we may shortly find branches or bark from every rubber-yielding tree or plant—even from many of our indigenous Ceylon species—in demand in connection with the very important experiments now being made in London and Trinidad—not only to separate the Caoutchouc from the milk, but to extract Rubber from the stems. True, this is only said to be realized so far from the stems of young Castilloa trees; but we cannot but anticipate a far wider application of the experiments ere long. Meantime, therefore, let all who can, plant Castilloa seed; and where that cannot be got, put in Para; and yet again, if such seed is not available, do not hesitate to multiply Ceara if the opportunity offer, rather than have no rubber trees at all; and very soon we shall see—what we shall see—possibly a demand for the stems of all three of these rubber-yielding trees,

RUBBER CULTIVATION IN CEYLON: PARA *versus* CASTILLOA;

CEYLON *versus* THE STRAITS.

DEAR SIR,—In reply to your enquiry as to the relative merits of Castilloa and Para Rubber cultivation in Ceylon, I think, and always have thought, that the former is adapted to a wider stretch of country than Para, and it will moreover grow and flourish at a much higher elevation; but the tree (in Ceylon at all events) is slow in developing, requires a good soil, and seed is very difficult to get: in fact unless a quantity can be imported into the country, it will be a long time before we have any appreciable acreage of this class of rubber growing here. I doubt, if there are more than 50 or 60 full-grown trees in the island at the present time, and it is only *some* of these that bear fruit. Those in the Peradeniya Gardens, for instance, though well matured, I am informed, give no seed. What Mr. Willis says about Para rubber growing in Ceylon may be briefly summarized thus:—

(1). That there is only a limited area available for its successful cultivation, probably about 10,000 acres in all; the land being situated between Kalutara and Ratnapura.

(2). If planted outside this zone, the trees, although they may grow well and develop a good girth, are not likely to yield a sufficient quantity of rubber to make the industry a remunerative one by itself.

(3). That the tree will do very much better in the Straits than in Ceylon, both as regards growth and productiveness.

As regards the area available for Para cultivation in Ceylon, I am inclined to agree with Mr. Willis that it is not very extensive if the *best* results are expected, and there is no doubt that well-grown trees in the locality he speaks of will produce very much better returns than in less favoured districts where the rainfall is deficient and the soil inferior. Experiments I have made fully bear this out: the yield from trees of varying ages in the Kalutara district being largely in excess of what would be expected in a drier climate. But when Mr. Willis implies that we must not look for a satisfactory yield *outside* this zone, I join issue with him at once and inquire how about Heneratgoda and the trees that have been tapped there?

Here we have a dry, hard, cabooky soil with a scanty rainfall,—conditions altogether unfavourable for such cultivation,—and yet the trees are well grown for their age and according to the published returns the tappings have been successful, both as regards the quantity and quality of the produce. The prospects of Para cultivation in Ceylon have been based exclusively on data supplied from Heneratgoda Gardens, and it says a good deal for the future of the enterprise that the returns should have been so satisfactory, seeing that according to Mr. Willis the trees are growing in a neighbourhood which may be described as wholly unsuited to their requirements. I have always myself thought it a great pity that the Heneratgoda Gardens were chosen as a home for the Para trees, for the reason that amidst such surroundings it seemed almost impossible that

results could be otherwise than unsatisfactory. The published records of the yield, however, shew to the surprise of everybody, a very good margin for profit, even if the price of rubber were to fall considerably below present quotations; and in more favoured localities, there is every reason to be well satisfied with the prospects of the enterprise.

I agree with Mr. Willis that the tree might be planted with advantage through fields of tea, and I am of opinion also that if placed at wide distances apart, the shade would be beneficial rather than otherwise to the tea underneath, but the trees would have to be kept well lopped up.

The statement made by Mr. Willis that Para rubber can be grown to better advantage in the Straits than in Ceylon applies to many other Products besides Rubber, and if we are to wait until we find something that will produce better results in Ceylon than anywhere else we shall have to wait for a very long time.

Take Rice, for instance. Is this cultivation to be discouraged because it grows better in India and Burma than it does here?

Are we to cease growing Cacao because the trees give better returns in the West Indies?

Is the cultivation of Tea to be discontinued because we cannot get the flavour of Darjeeling or the strength of Assam?

In Ceylon we have labour and transport facilities which counterbalance to a great extent the drawbacks associated with an inferior soil and, what we are chiefly concerned in knowing, is not whether tropical products can be cultivated to greater advantage in other countries, but whether there is a fair prospect of making them remunerative here.

In the case of Para rubber the only figures that have as yet been made public in Ceylon go to shew that satisfactory returns can be obtained from trees growing under all the disadvantages of soil and climate, and such being the case the presumption is that very much better results may be expected when the trees that have been planted in other parts of the country have reached full maturity.

I have figures at my disposal which point to excellent returns from this cultivation; but in view of the fact that more extensive tappings are now in progress it may be well to withhold these statistics in the meantime, though in due course the information may be imparted to those interested in the cultivation of Rubber in Ceylon.

The yield from Rubber trees in the Straits is considerably in excess of the best returns in Ceylon; but as a set-off against this, labour is twice as expensive there as it is here; and there are other disadvantages to contend with, though none that are very serious so far as I am aware.—Yours faithfully,

E. S. G.

—
AUSTRALIAN PRODUCE FOR THE RAND.—The *Leader* announces the arrival of a refrigerator car from Durban with the first consignment of Australian and Tasmanian apples. They arrived in first-class condition, as also a quantity of pasteurised Australian butter, rolled hams and rolled bacon, sugar cured, cheeses, cakes from Swallow and Ariel, and preserved rabbits from the Flemington works.

THE TEA AND PRODUCE COMMITTEE.

REPORT.

The Committee has held four meetings during the year.

The first subject brought under notice of the Committee was the proposal for the reduction or abolition of the duty on tea imported into the United Kingdom. A Joint Committee was appointed to consider the matter, consisting of three members of the Indian Tea Association (London) and three members of this Committee, Messrs. W. H. Anderson, H. Bois and H. K. Rutherford. But in view of the opinion, expressed by the Committee of the Planters' Association of Ceylon, that it was not desirable at the present time to press for the proposed relief it was decided to postpone any action.

A correspondence took place with the Postmaster-General as to the rates of postage and the limits of weight for samples of Tea posted between London and Ceylon, but no modification of the rules was obtained.

The Indian Tea Association (London) submitted to the Committee certain proposals for changing the conditions of Public Sales of Tea. The chief of these was the reduction of the biddings at Sales up to 6½d from 3d to 3d, but the proposed alteration did not meet with the approval of the Committee. A new scale for deposits, payable on the purchases of Tea at Public Sales, was approved by the Committee, but it has not yet been adopted in practice.

An attempt was made without success to obtain a reduction of the very high rates of freight ruling for Tea and other Produce between Colombo and the Australian ports.

In connection with the Indian Tea Association (London) a circular has been issued to all Producers and Importers of Tea, inviting assent to the proposed abolition of the allowance of 1 lb. draft on each package of Tea sold at Public Sales. A large number of assents has already been received, and it is hoped that there may be sufficient support to enable the reform to be shortly carried into effect.

The great improvement in the statistical position of tea during the year, as giving hope of a more prosperous time in the near future, is matter for congratulation to all concerned.

GREAT WESTERN TEA COMPANY OF CEYLON.

DIRECTORS' REPORT.

The report of the directors was submitted as follows:—

The Directors submit their Annual Report and Accounts for the Season ending 31st March, 1899.

The yield of Tea during the Season has been only 313,425 lb. (including a balance of 135 lb. from the previous Season) being a decrease of 145,728 lb. on last Season's crop.

This is due partly to the unfavourable Season which adversely affected the yield of all Ceylon Estates and partly to more careful plucking—the Tea averaging 48.15 cents per lb. against 49.27 cents in 1897-98—and partly to the necessity of nursing some of the fields which were suffering from previous overplucking.

The cost F. O. B. Colombo is 35.98 cents per lb. (including 3.56 cents for manuring) against 30.13 cents the previous Season, showing a profit on cultivation of 12.17 cents against 10.14 cents last Season.

The amount received under the Loss-of-Profit Policy effected over the Factory was R21,840.75 of which R13,184.46 (representing the additional cost of outside manufacture and transport caused by the destruction

of the Factory) has been deducted from the Expenditure of last Season and this, and the balance R8,656.29 (taken as a set-off against the loss entailed in the sale of the Factory) has been passed to credit of Profit and Loss Account.

The amount available for distribution is the sum of R45,376.88, out of which the Directors recommend the payment of a Dividend of 6½ per cent, absorbing R37,960.00, and in view of the present cost of and difficulty of obtaining firewood, and the need for the erection of other motive power, they recommend the carrying forward the balance R7,416.88.

The estimated crop for the current Season is 400,000 lbs. and the expenditure not including that on Capital Account R124,404.15 being at the rate of 31.10 cents per lb. tea inclusive of 3.06 cents per lb. for manuring.

In terms of the Articles of Association Mr. G. F. Walker retires by rotation, and being eligible offers himself for re-election.

PLANTING (TEA AND COFFEE) IN THE PHILIPPINES.

MR. T. H. STEPHENS, well-known here and who is practising his profession as dentist in Manila, sends us some planting information and in return we are glad to mention that Mr. Stephens says "he can get land cheap for anyone requiring it in the Philippines." He himself is introducing tea there; but he believes in coffee as well. From a local paper we quote the following account of what reads like a planting Eldorado:—

Mr. Donaldson-Sim finds that Benguet is a splendid place for plantations. He has over 8,000 coffee trees bearing excellently, besides some 30,000 tea seedlings and some 3,000 full-grown tea plants, bearing well and ready for picking. He has one of the best plantations in northern Luzon. He has practically no neighbors, that is to say, there is no other plantation anywhere near his, and the nearest village is about four or five miles away. His place is several hundred feet higher than the village, and is 4,600 feet above sea-level. He has done a good deal of experimental planting with other things with results so promising that the vexation of having the province overrun with armed lunatics, stopping all work, destroying all business, damaging all property and putting an end to every plan and scheme, is disheartening enough to drive a man mad. There is nothing to rebel about in Benguet, and the Benguet people themselves have no desire to rebel. They have nobody to rebel against and there would have been no disturbance at all if the Aguinaldists would only let people live and attend to their business in peace.

Benguet is believed to be the richest province in the Philippines for gold. There are native gold workings all over the province, the natives only working alluvial, but there is also quartz gold. The province is also rich in iron, copper and silver mines. It has some splendid mineral springs, especially at the village of Itogon and in Tublai in the north of the province. Benguet is partly wooded over with magnificent pine forests as good as Norway pine, and very fine quality of wood, and the remainder of the province, probably about a half at a rough guess, is open pasture land. It is difficult to estimate how much is wood and how much is open because it is all in patches here and there. The pasture land is excellent, and horses and cows thrive better there than in any other part of the island. Most of the hills are fairly gentle, undulating slopes, not precipitous to any great extent. Cattle and ponies, fine, large animals, are very cheap in Benguet.

What about labour we would ask, and its cost?—also rainfall? Mr. Stephens knows that the unsettlement caused by mining is not favourable to planters and their work.

COCONUT OIL AND COPRA.

The section devoted to Coconuts in the Kelani Valley Commissioner's Report contains without doubt some valuable information on the subject, but our attention has been drawn to certain averages which are apparently contradictory e.g., that 1,000 nuts is a safe average of the number required to produce one candy (560 lb. or 5 cwt.) of copra, and copra contains 2-3rd oil and $\frac{1}{2}$ poonac; while 36 nuts is a safe average to calculate for a gallon of oil. And further that according to the usual calculation 2 nuts=1 lb. copra. Now adopting these figures, as one correspondent points out, we arrive at curious results. On the basis that 1,000 nuts will give a candy of copra, we find that 3,000 nuts should give 15 cwt. copra, and that this ought to produce 10 cwt. oil and 5 cwt. poonac. But then 15 cwt. copra=1,680 lb., which at two nuts to the lb. would require 3,360 nuts for its production. Again, if 36 nuts are required for one gallon oil, the number required for 10 cwt. (125 gallons) would be 4,500 nuts. So that we thus have as a result of the calculation based on the above averages the unsatisfactory result that 10 cwt. of oil would require 3,000, or 3,360 or 4,500 nuts (as the case might be).

Another calculation gives an acre yielding 3,000 nuts as producing only 6 cwt. oil and 3 cwt. poonac, which is put down as equivalent to (not 9 cwt. but) $14\frac{1}{2}$ to 15 cwt. copra. But how is the difference accounted for? Putting aside these figures for the present, we should like to know what test is adopted in the trade for ascertaining the percentage of oil in purchased copra, or is it merely judged "by the eye?"

Turning to Mr. Cochran's Manual of Chemical Analysis, we find that the percentage of oil in copra may vary from 63 to 70 per cent, and the moisture from 2 to 7 per cent. If there is no means of judging of these variations in a practical way, and if copra is bought by weight, there is surely ample opportunity for finessing on the part of sellers.—*Agricultural Magazine.*

[We suppose the process is one of "give and take" as it is in so many departments of marketable produce—some men like Mr. George Hedges in the case of 'native coffee,' have an instinctive faculty or long-trained experience to aid them in discovering the true value of what is offered.—But what is the use of arguing over so variable a quantity as a coconut: 1,000 of one size will give 560 lb. of copra, while it may require 1,600 of smaller nuts to do the same.—Ed. T.A.]

THE FOOCHOW TEA TRADE.

Foochow, May 27.—Business in the new seasons tea commenced on the 23rd inst. (following some early shipments of Pakling Congou as usual and a few contract chops of Panyong) and buying has gone on steadily since. The settlements to date are reported at 40,000 half-chests Congou and 3,600 chests Flowery Pekoe. The "Glaucus" calling in today for brick tea will also take about 1,100 tons of the new leaf for London. The "Glenshiel" is advertised to clear on the 2nd prox., the "Ceylon" a week later, and the "Kintuck" about the 12th. There is a rumour that the "Java" is to call on the 29th inst., but she has not yet been circulated. The "Stoberg" is to take the berth for Havre and Hamburg.

We learn that on the opening of the port of San-tu-ao it was intended that the teas of the Panyong and Paklum districts should be brought to this market by steamers, but that the dissatisfaction and discontent of the small army of natives hitherto employed in carrying the tea to Foochow was so great that the new method of conveyance had to be abandoned for the time being at any rate. The tea could not be left there to lose its market while a settlement with these good people was being come to and so the teamen had to give in, but no doubt some arrangement will be made later on. The notice given to the carriers was probably too short and it was only natural that they kicked at being suddenly deprived of their livelihood.—*Echo.*

CEYLON TEA AT SYDNEY.

Messrs. Alfred Harvey and Co. offered a catalogue of 758 Ceylons on account of Dalgety and Co., Ltd., of which they sold 648. Price teas sold at fair current rates, demand being strong for lower grades. Low to fair broken Pekoes, although a shade easier in price, were really unaltered, taking quality into consideration. Finer grades were neglected, and passed in. Pekoe Souchongs realised from 7 $\frac{1}{2}$ d to 8d, Pekoes 8 $\frac{1}{2}$ d, and broken Pekoes 8 $\frac{1}{2}$ d to 10d.

Messrs. H. W. Carey and Co. offered an assorted catalogue of China, Ceylon, and Indian teas, under instructions from Messrs. Gibbs, Bright, and Co., and other importers, at the Exchange yesterday afternoon. For the bulk of the Ceylons, which consisted of high-grade Orange Pekoes, biddings were much below vendors' limits to be accepted; for the Chinas and Indians also vendors' limits could only be partially compassed, but, in the face of cabled advices from producing centres, holders were not prepared to sacrifice. 150 Ceylons changed hands under the hammer at 9d to 10 $\frac{1}{2}$ d per lb., and 150 China Congous at 6 $\frac{1}{2}$ d to 6 $\frac{3}{4}$ d per lb. in bond.—*Sydney Daily Telegraph*, May 27.

THE INDIAN TEA ASSOCIATION.

A meeting of the General Committee of the Indian Tea Association was held at the Royal Exchange Buildings, Calcutta, last week. There were present:—Messrs. H. S. Ashton, H. C. Begg, W. Brown, R. R. Magor, G. A. Ormiston, M. R. Quin, A. Tocher, R. R. Toynbee, and T. Traill. On the motion of Mr. Begg, Mr. Ashton was unanimously elected Chairman of the Association for the year 1899-1900. Mr. Ashton, having taken the chair, proposed that Mr. Begg be elected Vice-Chairman for the year. This was seconded by Mr. Tocher, and was carried unanimously.

OCEAN FREIGHTS.—The average rate obtained by the Conference during the last four years from Calcutta was 27s 6d per ton net, while the average rate from Colombo for about the same period was 23s 8 $\frac{1}{2}$, which, in the opinion of the Conference, showed that the figures of comparison as between the two ports, which had been adopted by the Association, were fallacious. It was also impossible, with any fairness to compare the rates of freight from Colombo with those from Calcutta on a mileage basis. Moreover, Colombo was one of the cheapest, and Calcutta one of the dearest, ports in the world, and rates of freight on tea from any part of the world must be assimilated to the current general rate in that particular locality. The Conference consequently declined to make any change in the existing rates. The General Committee discussed this letter to some length. It was decided to await further information as to what action the Committee of the Association in London proposed to take in the matter, and meanwhile, to circulate the papers to the members of the Committee for further consideration.

ONE POUND DRAFT ALLOWANCE OF TEA SALES.—With his letter of the 28th April, Mr. Tye forwarded copies of a joint circular issued in London by the Indian Tea Association and the Ceylon Association, asking support to a proposal to abolish the 1 lb. draft allowance on teas sold at public auction in London. This circular had been reprinted in Calcutta and issued to all members of the Association. The proposal was strongly supported by the General Committee, and a number of favourable replies had been received. These were to be forwarded to London in due course. It was understood that support had been received in London to the extent of 83,880,500 lb. of Indian, and 29,792,000 lb. of Ceylon, tea up to the time of writing.

THE PARIS EXHIBITION.—Considered (1) letter of 21st ultimo for the Hony. Secy. Nilgiri Planters' Association, asking whether a coffee room could be run in connection with the proposed Indian tea room at the Paris Exhibition, and the probable expense of so doing; (2) letter of the 26th ultimo from the Secretary, United Planters' Association of Southern

India, stating that that body had been informed by the Madras Government that the Government of India was prepared to allot space to the Indian Tea Association and to the United Planters' Association for an adequate exhibition of tea and coffee at the Paris Exhibition. The Government of India also suggested that should the two Associations desire to avail themselves of the offer, the arrangements might be most conveniently carried out by a Central Committee working in London. The Planters' Association wished to act as far as possible in concert with the Indian Tea Association, and it was asked in the letter if any definite plan of action had been formulated. They were also desirous that a coffee room should be opened in co-operation with the tea room. After some discussion, it was decided to forward copies of both the letters quoted to the Committee of the Association in London for their information in connection with the arrangements being made. It was also decided to write the United Planters' Association to the effect that the General Committee were not yet in a position to state definitely what arrangements would finally be made for the representation of Indian tea, or whether the Committee in London could work in conjunction with the representatives of the coffee industry if the latter desired to exhibit. It was also to be suggested to the United Planters' Association that they should put themselves in communication with the Indian Tea Association, London, stating the amount of money they were prepared to spend in connection with the Exhibition and the space desired for both tea and coffee. The Nilgiri Planters' Association were to be informed in reply to their letter, that the matter had been brought to the notice of the General Committee by the United Planters' Association to which body they were to be referred.—*Madras Mail*, June 13.

THE STOWAGE OF OIL.

The last subject was to present the report of the special committee appointed to consider the question of stowage of oil in steamers loading in Ceylon, which we published in our last issue.

APPROVED OF BY THE CEYLON CHAMBER OF COMMERCE FOR THE GUIDANCE OF CAPTAINS AND STEVEDORES OF STEAMERS LOADING IN CEYLON.

I. GENERAL RULES.—A solid level to be laid in ship's hold for the ground tier where coconut oil is shipped. The tier to be well bedded and quarter coigned, and a strict cantline to be observed.

Wings of bottom tier to be made up with dunnage wood. No small packages to be stowed in the wings, unless they can be protected from the weight of the next and following tiers above. This can be done by having uprights in wing, and strong cross-beds to rest on.

It is permissible to stow plumbago over oil, but not oil over plumbago.

Top tier in lower hold and top tier in 'tween decks must be well chocked and wedged off to prevent shifting. *This rule should have particular attention.* No packages to be stowed athwart-ship except in top tier.

Vessels without 'tween decks must lay one or a platform with 2" hardwood planks not more than 6" apart.

Copra, jaggery, dates, and other cargo throwing off heat must not be stowed in proximity to oil, as this is sure to lead to leakage by the heat shrinking the wood of the packages and expanding the hoops and oil. Termeric, ginger, pepper, &c., should be well dunnaged off, so as to prevent contact with oil packages.

II. COCONUT OIL PACKAGES to be well bedded and coigned, and a strict cantline and tier to be kept.

Casks must be well chocked off with dunnage wood and be stowed bung-up and bilge free. No more than 4 tiers of pipes to be allowed without an intervening platform as described above. No packages to be stowed athwart-ship except in top tier.

III. PLUMBAGO.—When commencing to stow plumbago on oil a perfect level should first be made

with dunnage so as to form a platform. The barrels to be stowed in square tiers full bilge and cantline, and to be well bedded in the first tier.

Particular care should be taken that the barrels are stowed in such a manner that the head staves are perpendicular.

Old sails and (or) mats to be put under the plumbago so as to enable the discharging Stevedore to readily collect sweepings from leakage and broken barrels. No more than three tiers with oil, and five tiers where no oil, to be allowed without an intervening deck, and no barrels to be stowed athwart-ship except in top tier, and then only to make a chock.

IV. ESSENTIAL OIL should be stowed away from any cargo liable to be affected by smell.

V. DUNNAGE WOOD to be used in sufficient quantity to properly bed, chock, and secure cargo so as to prevent any possibility of shifting.

VI. VENTILATION requires particular attention of Captains. If properly carried out by removing fore and aft hatch in cool and fine weather, it will chill the oil and prevent all leakage. Coconut oil will congeal at a temperature of 60° F.

VII. PACKAGES IN BAD ORDER and showing signs of leakage should not be stowed away until properly attended to by shipper's coopers. If the defect be serious and cannot be repaired on board, the package must be returned without delay.

Chamber of Commerce, Colombo, 1st June, 1889.

COPRA.

SAMOA.—During the last quarter of 1898 no invoices were issued at this consulate. Upon inquiry, I find that the contract of the German firm with the San Francisco merchant has terminated, and that a fair price for the commodity cannot be obtained in the United States. I am informed that only a trifle more than the cost of the copra at this place can be obtained at San Francisco. During the last year, Lever Brothers, of Sydney, had an agent here, and competition was sharp. By the last steamer the agent was notified that he was no longer needed, and that they had constituted the German firm their sole agents. This indicates that the entire product of the islands will from this time go to the colonies or to Europe. Rates between San Francisco and Samoa have been such that most American commodities consumed here are sent to Sydney, and thence 2,800 miles to Apia, and delivered here much cheaper than they could be obtained direct from San Francisco. The tariff direct from San Francisco is \$16 per marine ton, and from Vancouver to Sydney \$6 per ton. Possibly some arrangement could be made by which could be sent to Vancouver and thence to Fiji, and then here by the interisland boats, which to some extent would relieve this place from the excessive rates from San Francisco.—*United States Consul at Apia*.

SOUTH MYSORE PLANTERS' ASSOCIATION.

The annual general meeting was held at Munzerabal Club, Saklaspur, on the 30th ultimo; and from a speech of Mr. A.R. Park (President), we quote:—

"It is my pleasant duty to report that the somewhat gloomy forebodings expressed early in the year have not been realised, and that the season, on the whole, has been a moderately good one. The advices of sales of East India that have reached us indicate a depressed state of the market, which, owing to the increasing production in different parts of the world, seems likely to continue for some time. The cardamom crop was above average, but prices were lower, ruling from R50 to R60 per maund. Leaf disease has been less prevalent than for some years past. Crop prospects for the coming year are favorable, and the rain which fell in February has not on the whole been prejudicial."

AGRICULTURAL CHEMIST.—The out come of the various discussions that have taken place, as far as Mysore is concerned, is the appointment of Dr. Lehmann, the Dewan exhibiting in the matter his accustomed liberal-mindedness. All those who are interested in agriculture cannot fail to be gratified at the appointment of so highly qualified a Chemist, and I hope shortly we may learn what course the Durbar intend pursuing as regards his work. Meanwhile he has lost no time in showing a desire to become acquainted with the local circumstances, as is seen by his present visit to this district.

FORESTS.—I have written to the Chief Conservator of Forests to enquire if grants of land for cardamom cultivation have been made in the forests of Kubbenhully, Bisleh and Kempbhully, and await his reply.

Mr. Park was elected, President, and Mr. Playfair, Honorary Secretary.

MINOR PRODUCTS.

From Messrs. Schimmel & Co.'s "Semi-Annual Report," (April 1899) we take the following:—

CINNAMON OIL, CEYLON.—The Cinnamon market has settled down somewhat during recent months, but the prices still remain high. The transactions in cinnamon chips, the material used for the distillation of the oil, have surpassed any former ones. In 1898: 1,414,165 lb have been shipped, against 1,067,051 in 1897. The chips reached the highest price at 4d per lb, and since several months have brought 3½d to 3¼d per lb at Hamburg. The above figures show that Germany is now ranging at the head in the consumption of this commodity. Ceylon cinnamon oil is a speciality of our firm.

CITRONELLA OIL.—The transactions in this article have again considerably increased in 1898. The export from Colombo and Galle (Ceylon) reached the as yet greatest maximum figure, namely 1,365,917 lb. The distribution figures, however, do not exactly indicate the real consuming countries, for a considerable part of the oil destined for Germany and France only passes through England in transit. In our estimate Germany consumes at least 220,000 lb, or about one sixth of the entire production. A recent paper on the production of citronella oil, published in the October number (1898) of the *Tropical Agriculturist*, agrees in the principle points with the information given in our Reports of October 1898. Two kinds of citronella grass, *Maha pangiri* and *Lenabatu pangiri* are said to serve for distillation. The former is hardly cultivated any longer, while the latter was little known twenty-five years ago. *Maha pangiri* is said to be richer in oil but to perish after a cultivation for ten to fifteen years. The cultivation of citronella grass and the distillation of the oil are now sufficiently well known so that every one interested in them can readily obtain all desired information. The well known simple and reliable method testing the oil, elaborated by us and called "Schimmel's test," meets with approval and success. The proper rejoinder to some objections raised against it may be found on pages 16 and 17 of our October Report of 1898. Our test is in every respect as reliable as it is practical and deserving of full confidence and general application. A first shipment of citronella oil from a new plantation and distillery from Java, amounting to about 300 kilos, is on its way to us. Preliminary specimens which have reached us indicate an oil of superior quality of a very light colour and high percentage of geraniol. We must, however, defer our final estimate until the arrival of the gross lot. According to a recent statement in No. 986 of the *Chemist and Druggist* (London) a syndicate of Arabs has purchased a considerable area in Queensland for the purpose of raising citronella grass for distillation.

GERANIUM OIL.—The cultivation of geranium has been considerably extended in Algiers and as an additional explanation of the steady decline of values

it is claimed that a greater yield of oil is obtained in consequence of better methods of raising the plants and distilling the material. As far as we have been informed about the geranium production and the appointments for distillation, they by no means excel by perfection. The price of the oil is a low one in consequence of overproduction. Réunion oil, formerly much in favour, has become less in demand because it renders unsatisfactory results with transparent soaps. In view of the slight difference in price, African oil is preferred. The geranium cultivation on Réunion, moreover has experienced a considerable reduction, since the plantation of vanilla has proved more remunerative and surer of profitable disposal. Our supplies of East Indian oil of geranium (Palmarosa oil) have arrived and are of excellent quality. Upon several estimates they contain 92 per cent of geraniol. The price of the oil is normal and no reduction is to be expected. We also have a fresh supply of the exceedingly fine Spanish oil.—[Could not Geranium on estates up-country be utilised for oil?—Ed. C.O.]

LEMONGRASS OIL.—In this article normal values have finally returned. Quotations in China vary between 2½d to 2¾d per ounce, and transactions are said to be very dull, because large stocks are still laid up in London, checking any speculative tendency.

BUDDING MANGOES.

Mr. R. Bunnage, of Gracemere, Queensland, has successfully budded two mango-trees, and one of these has borne fruit for the past two seasons. The other, although the buds have united properly, has not yet begun to bear. The tree to be budded should be in full growth, and all the young wood should be taken off, but sufficient must be left to afford shade for the buds. The operation is best carried out in dull weather, and the buds should not be too far advanced. As soon as the tree is budded, all other growth must be taken off as it occurs, or the buds will not take.

On this subject Mr. A. H. Benson says:—"I note with interest that Mr. Bunnage has been successful in budding the mango, and agree with him that for the operation to be successful the tree to be budded must be in full growth. I should not, however, consider it advisable to cut back the tree that is to be budded before the union of the bud and stock has taken place, as there would be a danger of flooding the bud with too much sap, and consequently preventing a union. I have seen a mango-tree successfully budded in Mackay, and have succeeded in budding young seedling mango-trees myself. Unlike Mr. Bunnage, I would prefer the buds to be plump and fully developed; in fact, just ready to start into growth."—*Queensland Agricultural Journal*.

INTERNATIONAL SCIENTIFIC BUREAU.—Correspondence that has taken place between the Hon. Secretary of the Asiatic Society of Bengal and the Ceylon Government has been published regarding the subject of an international catalogue of scientific literature proposed by the Royal Society of London and the share Ceylon will take in the matter. Steps are being taken by the Ceylon Government to carry out the scheme and copies of the correspondence have been forwarded to the Secretary of the Ceylon Branch of the Royal Asiatic Society and the President of the Medical Association Ceylon. What Ceylon as well as India is requested to do is (a) to direct the heads of all Departments issuing publications, of which any of the contents come within the scope of the Royal Society's Catalogue, to supply to the Asiatic Society "index slips" prepared in accordance with the scheme finally adopted by the Royal Society; (b) to instruct all local Governments and Administrations—to supply to the Asiatic Society periodical lists of all Scientific and Literary Societies established within their jurisdiction, and periodical lists of all books published within their jurisdiction.

THE PROPOSED ABOLITION OF THE DRAFT POUND.

To the Editor of the Home and Colonial Mail.

SIR,—As the pound draft question is being debated now, I venture to suggest an alternative method of getting over the difficulty. The importers say "that the profits are so small that it is imperative to curtail every item of expenditure to the very lowest limits." And as there are various other items of expenditure on an average chest of Indian or Ceylon tea (worth, say, 8d per lb), it seems to me that, before reentering with an old trade custom, and raising another very serious controversy with the buyers of tea, it might be possible to apply the pruning knife first to such items as :

	Per chest.
	s. d.
Shipping charges and freight	4 0
Warehouse charges and insurance	3 8½
Calcutta agency commission	1 6
London agency commission	1 9
Brokerage and public sale charges	0 ½
	11

Now, the average saving to be effected by withholding the draft pound would only amount to 8d, and it seems to me that before levying all the tax on the retail tea dealer, it would be more productive to squeeze a little off the Calcutta and London agents, who seem to enjoy rather an undue share, in consideration of the amount of work they have to do.—I am, &c.,

A TEA DEALER.

IMPORTANT TO THE TEA TRADE.

We understand that a very determined effort will shortly be made to abolish the one pound draft allowed from time immemorial on chests and half chests of tea. In 1870 a similar attempt was made to carry out the same object, but, owing to the active efforts made by the leading wholesale and retail traders, the project was completely defeated, and the subject has not been raised for nearly thirty years. With similar energy on the part of the dealers there is no reason why they should not be equally successful in resisting the present attempt to deprive the trade of their legitimate rights.

It is well-known that teas are now weighed much closer than was the case a few years ago, and the experience of dealers is that, even allowing for the one pound draft, the net weight of tea contained in many packages is less than that actually paid for. Moreover, the trade has long suffered serious loss and inconvenience from the inefficient manner in which teas are bulked in London. Indeed, in many cases, it is well-known that importers instruct their warehouse keepers not to bulk their teas at all, trusting to luck that no complaint will be made by the buyer, and this, notwithstanding the fact that all catalogues state that "These teas have been weighed, inspected, and bulked" (in the country of production or London). In fairness to the better known companies it should, however, be stated that these latter remarks do not apply, as most of the teas from their estates are properly bulked at the place of growth. Still, the evil is an important, and, we fear, an increasing one, as far more complaints are now made with regard to the matter than was formerly the case. Meanwhile, we hope that immediate steps will be taken for opposing the proposal to abolish the one pound draft, and our columns, as on the previous occasion, are open for the free ventilation of this important subject.

On reading through the discussions which took place in 1870, nothing can be more clear than the fact that this draft was not allowed for loss of weight only, but was intended to cover all sorts of other contingencies arising from the nature of the trade, such as the occasional refusal of any allowance for damage, false package, &c., after delivery from the public warehouses. Of course, also buying at original landed weights, the trade accept a great risk when delivery is delayed, as it often is, and they must have some margin in return.—*Produce Market*, May 20.

INDIAN PATENT.

Applications for the under specified inventions have been made:—

No. 133.—Samuel Cleland Davidson, merchant, of Sirocco Engineering Works, Belfast, Ireland. Improvements in means of supporting the bearings of spindles or shafts in wall brackets or frames.

No. 134.—Samuel Cleland Davidson, merchant, of Sirocco Engineering Works, Belfast, Ireland. Improvements in centrifugal fans and pumps.

No. 165.—William Jackson, Engineer, of Thorn Grove, Mannofield, Aberdeen, North Britain. Improvements in apparatus for sifting, sorting and classifying tea or other products or materials.—*Indian and Eastern Engineer*.

CEYLON TEA IN AMERICA.—In our daily and *Tropical Agriculturist* will be found a good deal on this subject: Mr. Mackenzie reports progress and Mr. R. E. Pineo, at some length, discusses the need of extending as well as continuing the American campaign. "Advertising" is the burden of Mr. Pineo's advice and well pleased we are to follow him, until we come to the point where we learn that he would exclude advertising in the daily newspapers! "O lame and important conclusion," and yet it is true that the "dailies" are not regarded in the States as they are in British territory—and yet these papers must be read? If so, we believe it should pay well for the Ceylon Commissioner to make a contract in a few prominent dailies for a really conspicuous but concise intimation, such as "Drink Pure Ceylon Tea." It is all nonsense to say such would not eventually tell and if it is not the custom to advertise in dailies, the charge should be all the more moderate Mr. Pineo believes in "Demonstrations" and rightly so;—but to advocate an illustrated lecture on our "Buried Cities," in order to get the Americans to drink Ceylon tea, savours a little of the comical! And yet again, the "sensational" as well as the "amusing" must be freely used if popular attention is to be attracted across the Atlantic. Still, we should think that a lecturing campaign treating Ceylon on its productive merits—the island of cinnamon, cardamoms, citronella, coconuts, cacao, coffee, coolies and Cinghalese!—adding in its gems, pearls, plumbago, its grand variety of palms and all their wonders and winding up with its TEA, ought to tell. But there cannot be too much of a good thing and certainly the "Buried Cities," if backed by Mr. Cave's illustrations, would prove a capital subject; but would it be quite fair to tag on to it "a tea demonstration"? Mr. Mackenzie should be the best judge.

MATTE TEA.

Brazil.—Curitiba is the centre of the "matté" industry, which employs nineteen mills in the town and suburbs. The preparation, though simple, is all done by machinery. The raw material arrives in sacks of about 1 cwt. from the interior. At the mill the leaves and finer stems are separated and ground to dust of various fineness. The thicker stems serve as fuel. The Argentines prefer dust "matté," and as they suck it through a "bombilla" are not inconvenienced by the floating particles; but there is no reason why it should not be prepared in the leaf like tea. The decoction has a greenish colour. The taste is agreeable, but not so aromatic as tea. It is stated that "matté" is peculiarly sustaining; that it is a digestive nerve tonic and cure for sleeplessness. The "Gauchos" of Rio Grande, Uruguay, and Argentina are the chief consumers, and will do a hard day's work with no other nourishment. Mr. David Carneiro, whose mill we visited, employs about thirty men, and when in full work the daily output is between eighty and ninety barrels of about 250 lb. The dried leaves and twigs, as they arrive unprepared from the interior, cost on an average 13 milreis, or 8s. 8d. a cwt., and the price prepared at Curitiba averages 23 milreis, or about 15s. 6d. a cwt. The retail price at Buenos Ayres varies from 20s to 50s. a cwt. Mr. Carneiro is endeavouring to create a market for "matte" in Europe, and stated that duties, freight, &c., paid, it can be sold in France at 1 fr. a kilo. An agent has already been secured at Paris, and another in London. If "matte" drinking ever becomes popular in Europe, it will be more probably among the labouring classes, on account of its cheapness and sustaining qualities.—*British Legation Report from Rio de Janeiro.*

PRODUCE AND PLANTING.

THE DEMAND FOR CEYLON TEA IN RUSSIA.—The British Consul at Odessa, in his official report, had something very encouraging to say about Ceylon tea. He refers to the increasing consumption, and points out that it is only a few years since it was introduced into Russia, and last year nearly two and three-quarter million pounds of tea were shipped from Ceylon direct to Odessa, against less than half a million pounds in 1897. He points out that teas from China and Ceylon are imported in vessels of the Russian volunteer fleet, which, owing to the low freights charged by those vessels on the homeward voyages, have now practically a monopoly of the tea-carrying trade from the tea ports of China and from Colombo, more especially as now tea imported from the Far East in Russian bottoms has preferential railway rates between Odessa and Moscow. On the other hand, there is a growing purchase by Ceylon of Russian petroleum; in 1897 and 1898 Colombo took over one and a quarter million gallons each year. The Acting Consul-General suggests that Australian firms might avail themselves of the low rates of freight in order to introduce tin, tallow, copra, &c., into Russia. It is said that if these commodities were shipped by Singapore the local agency of the volunteer fleet would undertake their transhipment into Russian vessels on moderate terms.

DRAFT ON TEA SALES.—The following is a copy of a protest signed by practically all the leading wholesale tea firms and many country dealers against the proposals of the Indian and Ceylon Tea Associations in London. Clearly there is to be a strong stand against the abolition of the draft allowance.—"The Secretary, Indian Tea Association, London, May 23, 1899.—Dear Sir,—Out attention has been called to a circular and memorandum, issued by your Association, in conjunction with the Ceylon Association in London, to producers and importers of tea, containing a proposal to abolish the draft allowance on teas sold by public auction in London, and inviting support. In the Memorandum it is stated that it would be to the interest of producers and importers that the proposal should be carried into effect, and that it has the un-

animous approval of the committee of the two associations named. As this is a matter affecting, in a very serious way, the interests of the entire wholesale and retail tea trades, we feel that we cannot allow the circular to pass without entering a strong protest against the proposal which it contains. In opposition to the very trifling reasons advanced for the suggested alteration may be set a host of long-standing grievances under which those engaged in the tea trade in this country have been labouring for years, without being able to obtain the slightest satisfaction, mainly owing to the most unreasonable conditions of public sale. With regard to paragraph No. 8 in the memorandum, we submit that it is no argument to compare a duty-paid article like tea with bacon and cheese, as in the case of the former there is a very serious loss in the process of handling, sampling, and blending, and then again an additional waste in weighing in ordinary bulk form for general trade. This is accentuated when the retailer requires teas weighed out in small quantities, the total loss being much greater than the trifling and inadequate overdraft which it has hitherto been the custom from time immemorial to allow. Again, there is a regular loss through bad cooerage and broken, inferior lead, the latter resulting in the mixing of chips of wood with the tea, and the loss by percolation in transit. Another ever-present difficulty is that of extracting extraneous matter from teas, more especially nails, which results in considerable loss and inconvenience to dealers. What with cheesy teas, mouldy teas, badly bulked teas, and teas smelling strongly of indiarubber, apples, and other foreign substances, inferior returns in sample packages, and various other complaints with which the members of your association must be well acquainted, if the suggestion to remove the last crumb of comfort is carried it will be the duty of the undersigned to take steps to protect their interests in a way which will very much out-balance any benefit which might be gained by the merchants in the abolition of the pound draft, viz., by taking stringent measures to see that the conditions of sale are in every case followed to the letter especially as regards bulking, so as to ensure teas being in every way equal to sale sample. United action will also be taken in an effective way to deal with Clause 5 of the conditions of sale, which in its present form is an utter impossibility to buyers. We request that you will place this letter before your committee for their kind attention, and we remain, yours faithfully," (Here follow the signatures.)

TEA IN FRANCE.—Following the desire to be up to date as in London, the Parisians are taking rather slowly, it must be admitted, to tea, not as a decoction for invalids, but as a drink to be taken with food. Confectioners are inviting their customers to afternoon tea, and there is at length some prospect of tea becoming popular. Now is the time for developing the French taste for tea, and pushing the Ceylon and Indian product, for most of the tea sold at present in France is indescribably bad and very dear.

PUBLIC SALES OF COFFEE.—The "Grocer" calls attention to a congestion of public sales in coffee, which tends, it points out, to throw everything out of gear, and threatens to bring business in landed parcels of coffee to a deadlock. Complaints, though for the moment suppressed, are not the less urgent and strongly made against the defective arrangements, as they now exist, for disposing of coffee by auction; and the evils resulting from the prevailing system in occasioning delays, loss of time, and postponements of sales, have caused such widespread inconvenience to importers, exporters, and wholesale dealers, that it is admitted by all parties that "something should be done" to remedy the existing state of affairs as speedily as may be, or a complete break-down must occur in the whole commercial machinery for supplying the article to the public. Already this year public sales of coffee in Mincing Lane have been postponed more frequently than ever, entirely because of the excessive quantities put forward on certain

specified days, and it has always been uncertain when and at what hour such and such an auction in a long series would commence and finish. The same kind of chaos and confusion has been repeated during the present week, when, among the brokers's catalogues printed and issued for coffee to be sold under the hammer, were included eleven that contained particulars of parcels and descriptions which had been advertised for public sale on the 12th inst., being nearly a fortnight later than the date originally fixed. At this rate of progress the new season will be far advanced ere the superabundant imports of coffee from the British East Indies, Costa Rica, Guatemala, and other parts of Central America, will be worked off, and the nearer the trade get at the wind-up of the supplies for 1899, the fewer will their chances be of securing precisely the kind of coffee they require to carry their supply over till another year. A healthy competition has prevailed at the different auctions since the earlier part of the season, which fact goes to prove that both dealers and shippers were practically bare of stock at the outset; and as their wants have increased rather than otherwise, the extra buying necessary to replenish the exhausted stores of bonded or duty-paid coffee has lent additional support to the import market. Though the rates submitted to have been unquestionably low for the worst descriptions of coffee, they have been reasonably cheap, if at times uneven, for the middling and intermediate grades; whilst for bright colour, fancy, and attractive growths of plantation coffee, instead of a reduction a tangible advance has in many cases been seen.

A SUGGESTED REMEDY.—A few of the leading members of the coffee trade, with bolder spirits than their fellows, have hinted that Monday, which from ancient custom has been regarded as an "off" day, should in future be given up for the purpose of clearing away arrears remaining from public auctions held in the preceding week. Some such arrangement would no doubt materially help to bring the average daily supply of coffee within a manageable compass, and greatly facilitate the sale, preparation, and distribution of the article throughout the country; but from what we have heard in influential quarters, says the *Grocer*, so drastic a course of proceeding on the part of brokers and their merchants would be strongly opposed by the wholesale dealers, who would resist to the utmost any encroachment on their Mondays. *H and C Mail*, June 2nd.

CEYLON ASSOCIATION IN LONDON.

REPORT OF THE EXECUTIVE COMMITTEE

FOR 1898-1899.

LAI'D BEFORE THE ELEVENTH ANNUAL GENERAL MEETING, ON 12TH JUNE.

There has been again, as in every previous year, an increase in the numbers on the roll, the present number being 163 as against 159 in 1898.

As foreshadowed in the last report arrangements were made by the Committee for the full statement of the case for Ceylon before the Indian Currency Committee. Messrs. T. North Christie and H. Bois gave evidence in much detail as to the effect on Ceylon producing industries of the forced appreciation of the rupee, and have thereby earned the thanks of the Association. The Currency Committee has now finished its sittings for taking evidence, and its report is awaited with interest.

On 19th December last a General Meeting of the Association was held to consider the following resolutions:—1. "That this Association strongly disapproves of the proposed expenditure on the

Ceylon Northern Railway, as being opposed to the true economies of the Colony." 2. "That a deputation be appointed to wait on the Right Honourable J. Chamberlain, M.P., with the view of urging on the Government a re-consideration of the Ceylon Northern Railway scheme, and that Lord Stanmore be asked to introduce the deputation." The immediate result of the meeting was to disclose among Ceylon residents at home, many of them with very large interests in the Colony, a remarkable consensus of opinion adverse to the Government scheme, and the resolution of disapproval was passed *nem. con.* The deputation to the Secretary of State, it was decided, should be postponed till the views of the public bodies in Ceylon could be ascertained.

The position of this very important public question in Ceylon at the date of the Association meeting was, considering the novelty and gravity of the proposals, a singular one. It is true that early in the year both the Planters' Association and the Chamber of Commerce had passed resolutions approving of the then Government proposals; but those proposals embraced another Railway, and hence the value of the resolutions, as bearing on the Northern Railway, was rendered very uncertain.

Subsequently a change was made by the Government, both in respect of the gauge and of the provision of funds for the construction of the Northern line, a change on behalf of which no word of approval has been heard as yet from any quarter. The public bodies in Ceylon accepted the amended scheme without protest. Not so the local press; and in view of published statements as to the condition of opinion in Ceylon, statements which were left without contradiction, the Executive Officers of the Association felt it their duty to allow the question to be re-opened. Their action has been justified by the subsequent proceedings of the Ceylon public bodies.

It was most unfortunate that when for a second time the question came before the Planters' Association and Chamber of Commerce calm discussion on the merits of the Northern Railway should have been prejudiced by the introduction of personal and irrelevant matter, the more so as in the result the protest to the Secretary of State for the Colonies was thereby greatly weakened.

A deputation, representing the various interests of the Colony, waited on the Secretary of State on 16th March, and was informed that the Railway would be made, and made as a broad gauge line.

The Committee is unable to share the regret expressed by the Ceylon Chamber of Commerce and by the Chairman of the Planters' Association at the action of this Association; but, on the contrary, deems it a matter of congratulation that, at last, a formal protest has been lodged against the new Railway Policy of the Government.

The vote of thanks, accorded to Mr. J. Heniker Heaton, M.P. by the Association for his services in securing for Ceylon the benefit of Imperial Penny Postage, led to an invitation from that gentleman to representatives of the Association to attend a conference at the House of Commons to consider a scheme for the reduction of the cost of telegrams between the United Kingdom and the Colonies. The invitation was readily accepted, and it is hoped that the agitation thus initiated may prove successful.

The Committee regrets to report the death, during the year, of Mr. W. Bowden Smith, a gen-

tleman, who for forty years had been connected with the Ceylon planting industry, and during the years 1874-76 had represented that industry in the Legislative Council.

HOW IT STRUCK AN AMERICAN.

[EXTRACT FROM A LETTER RECEIVED FROM

GENERAL NAGLE BY MR. R. E. PINEO.]

"My Dear Sir,—I was quite delighted with your beautiful city, and with the evidences of prosperity which we saw on every hand.

"I have just read an article from your pen entitled 'Ceylon Tea in America.' Being an American, I was struck with the force of your suggestions concerning the most effective advertising of Ceylon tea in America.

"There is no question but that you people furnish a tea that is superior in quality and flavour to anything that comes to our shores, which, if properly advertised—its merits well demonstrated—would secure for it a very large sale indeed.

"Your Exhibit at the World's Fair in Chicago in '93 certainly must have augmented the demand for it very much, BUT A LIKE AMOUNT SPENT AS YOU SUGGEST WOULD BRING FAR GREATER RETURNS. The States are of very wide extent, filled with seventy millions of prosperous consumers. There is no way to make an impression on them in favour of Ceylon tea, but by hanging your banner on the outer wall and *keeping it there CONTINUALLY. The people who drink tea must see the banner—not the jobber alone—and it will be of infinitely more advantage if they can be induced to sample the tea. In almost every case this will result in securing a new customer, which will swell the demand for the tea, and will furnish an incentive to the retailer and wholesaler alike to push Ceylon tea. The advertisement in the local newspaper with the dealer's name attached will be worth far more than any general advertising you can do.*

"I have been a maker of American newspapers the greater part of my life, and feel that I know something of the subject in hand. I think I am safe in saying that, if Ceylon tea is properly put before the American people, you will have gained a permanent customer that will make the beautiful island of Ceylon, with its enterprising and interesting people, wealthy beyond expectation."

INDIA AND THE TEA CAMPAIGN.

At the annual general meeting of the Indian Tea Association, held on 29th May, Mr. Ashton drew attention to the fact that though Mr. Blechynden's engagement had terminated this by no means meant that the efforts to push our teas in America were to be abandoned. The new levy will be used for America, for Russia, and for the Paris Exhibition and India will work with Ceylon. Mr. Ashton points out—in view of the criticisms which have been made in the newspapers, and by some Association members since they heard of the termination of Mr. Blechynden's engagement—that the London Committee, who are the executive in all matters connected with Europe and America, are not in the happy position of our Ceylon friends. They do not know from year to year that they will get all the money they will require. They have to send out a levy, and they never know whether members of the Association even will respond fully to their request for funds. Mr. Ashton says: "Obviously this is very embarrassing when they have to make up a programme; and I think the details they have sent us are all we can expect at this stage of affairs.

I desire, therefore to appeal most strongly to proprietors if they accept the principle of joint advertising, to trust to the London executive, and not to cavil at details. The detail of a programme can never satisfy everybody, and I confess to being a little suspicious of people who tell you that they approve of a general idea, that they are the last people in the world who seek to benefit by other people's expenditure, but that they have not subscribed because so and so is done, or has not been done. I suggest to you to subscribe first." The sale of tea in India was next reviewed, and the distribution of pice-packets of quinine—through the agency of the Post Office—and the refusal of the Government to sanction tea being sold in the same way through postmasters noted. Mr. Ashton does not seem very much surprised that we have not been able to develop the local tea trade quicker. He says:—"I have often noticed in the criticisms people make on this matter, and the parallels they draw between what is done in India and in foreign markets, they leave out of sight the fact that foreign markets we compete against beer, coffee, spirits, wine and so on. These are all very much more expensive articles than tea, and the difficulty in those markets is not one of price but one of taste. We have to divert or create the taste of the people. In India it is quite different because here the natives are almost entirely water drinkers, and tea, although it is cheap, cannot compete with water on price. The consequence is that whereas the important matter in foreign markets is taste, the important matter in India is price. It seems to me that to induce people—and a very slow-moving people too—to spend more money on drink than they like is harder, if you take profits into account, than to divert taste, say from coffee to tea when you at the same time save people's pockets."—*Planter*, June 10.

CASUARINAS.—A correspondent elsewhere gives us some very interesting information about Casuarinas in Ceylon. We recall the fact that a Ceylon planter made "a little fortune" 30 years ago through a plantation of Casuarinas he had planted near the sea coast outside Madras city.

OVER-PLUCKING TEA.—A Ceylon planter writes to an Indian contemporary:—

"I have heard it said in more places than one and particularly from Indian tea planters who have now and again visited this district that in Ceylon we over-pluck, this, too, not so much from the older trees but from the younger ones particularly. Now as this has not come from one Indian tea planter, but from nearly all, surely their views should be received with attention, instead of our calmly ignoring the statement altogether. I have a friend who is in Assam and has been there for many years who writes me that he cannot believe that I am getting 500 lb. tea per acre off my estate, which is a young one. He tells me that he would never pluck it up to that but be content with 200 to 300 lb. and even off full-bearing tea he would not take more than 400 to 500 lb. at the most now. I would ask are we on the right tack? Are we doing the correct thing, and that which is likely to ultimately benefit the estate owners? That good tea estates in Ceylon will bear up to 700 lb. per acre is, I think, beyond doubt, but I want to know whether we are right in taking that quantity; will it not in all probability impoverish our trees in a few years?"

What does this Ceylon planter say to the 100 acres tea field on Mariawatte plucked at a rate averaging over 1,100 lb. per acre for 16 years and still vigorous!—or, higher up, the 30-year old field on Loolecondera giving between 400 and 500 lb. and looking remarkably well?

FACILITIES FOR MAKING GOOD TEA:—X.

KELLEBOKKA—RANGALA—UPPER

HEWAHETA:

MANURING AND PRICES.

Two letters from Madulkele, one from Rangala, and one from Hewaheta, may be conveniently treated together, though they illustrate diverse views. While one of the Madulkele letters (from the higher part of Kellebokka) holds "wind, mist and rain" as the drawbacks to making better tea, the other considers the character of the factories (one only being first-class in the district), the over-pruning and over-plucking of bushes whereby their health suffers and the flavour is affected, the chief obstacles to be overcome. And both planters are men of wide experience and keen observation. Our Rangala Correspondent again sees no drawbacks, as, with finer plucking on most estates, as good tea is turned out in the district as is possible; not so, the writer in Upper Hewaheta, who holds the weather in the North-East monsoon a drawback, and also the fact that half the crop of the district is plucked between 20th February and 7th June. But have not the months of pruning any effect on the chief months of plucking? On, perhaps, one estate only is all the tea regarded as good *jât*; on most estates there is, according to all four letters, a mixture represented on the whole by "fair"—the planting of over ten years being inferior. While one Kellebokka writer admits general poverty of soil, in which Rangala agrees, the other regards the general character of the soil as not poor. Our Hewaheta friend distinguishes between old coffee land, in which the soil is poor, and jungle land which is good. There is no difference in opinion that some of the Kellebokka estates are worn out, chiefly old coffee estates, whose surface soil has disappeared. In Rangala, as most of the tea is on old land, much of it has necessarily been worn; and what is not old, is wind-blown! So our friend cheerfully remarks that over-cropping is not the cause of the wearing out; while Hewaheta understands our question in an unusual sense, when he says that estates are worn out, only as far as good yields are concerned, and not as respects flavour and strength of liquor. Our question had reference to the character of the soil; and, perhaps, an answer is to be found in the fact that, though the yield of the land might be better, the flavour and strength of the tea remain what they were—which is not the general experience. Manuring, says one of our Madulkele friends, will improve the tea and prove profitable, on estates along the public cart road; the other admits improvement of the bushes as a sequel to manuring, which, however, is further followed by a fall in prices where manure has been extensively used. This last is an important statement; and we should like to see it thoroughly sifted. Is it merely a case of *post hoc, ergo propter hoc*, or, if an explanation is not to be found in the special character of the manures employed, can there have been climatic or other considerations to account for the fall in price. Rangala practically shares the opinion

first-mentioned, with the qualification that the profitableness of the operation is doubtful at present prices. Hewaheta is rather indefinite, in asserting that we have yet to learn the best form of manure to help to keep the tea bush in good heart.

The opinion of one of the Madulkelites on factories is to be found in his answer to the first question, which includes insufficient withering space among the drawbacks, and he is supported by his district neighbour, who further explains that the deficiency is chiefly due to the long spells of bad weather, which are at the bottom of most of the mischief in the Kellebokka and Knuckles districts. The two other districts suffer from the deficiency, though Rangala notes an improvement of late. In motive power little remains to be desired, except in dry weather; but as respects machinery, Kellebokka, in the opinion of one writer, is decidedly deficient in some places. Enough, or more than enough, is the general response to the question touching labour. On pruning, the opinion of one writer has already been expressed, as a drawback to making good tea, owing to its undue severity; but while he does not think the knife has been too long withheld, the other writer declares that the two extremes, of cutting down to within a few inches of the ground, and letting the bushes up to 2 feet or 2½ generally prevail. Rangala has no complaint against pruning; and he and Hewaheta are agreed on pruning at intervals of 18 months to two years. "General remarks" take the form of a growl against "Weather! Weather! Weather!" from one Madulkele source; while the other descants strongly against cruel pruning and close cropping as telling against the general health of the bushes. Rangala regards cheap manure as the only cure possible, where the old land is getting exhausted and the young is too exposed for heavy flushing; and Hewaheta rather contradicting itself as to loss of flavour, desires information as to the cause of the loss of some of the flavour for which tea from the district was noted some ten years ago. This, however, bears out the opinion of Mr. T. C. Owen which we quoted the other day as to a connection between virgin soil and delicate flavour; but, on the other hand, that veteran agriculturist, Mr. Joseph Holloway, on our sixth page today indicates how flavour as well as vigour may be maintained by judicious cultivation.

THE FLORIDA VELVET BEAN.

For the past year or two a great deal has been written about this extraordinary plant. Mr. Geo. W. Hastings, an orange grower in Florida State, thus sums up his experience of it in one of the leading American papers, and in view of the introduction of this bean to this colony may be of interest:—

"The cultivation of the velvet bean up to the present time has established the following facts:—For the extreme south, it is the greatest forage and humus producer yet discovered. North of central Georgia, only in exceptionally long seasons will the seed mature. North of the Ohio River, it will make large growth of vine and leaves, but will not come to bloom. It is a great fertiliser for orange groves, but its use is not advisable after the grooves come into bearing, as the vines are a habitat of

the pumpkin (stink) bug, and on the decay of the bean this pest goes to the orange, puncturing the fruit, and causing it to fall. As a rule, the velvet bean is not the equal of red clover or the cow-pea, either for seed or forage, north of the Gulf States. For forage and fertilizer it has no equal in the barren sandy lands of the south, where the seasons are long enough for the crop to mature before the coming of frosts."—*Agricultural Gazette*, of New South Wales.

CEYLON TEA IN RUSSIA.

The rapid increase in the consumption of Ceylon tea in Russia is noticed in the last British Consular report from Odessa. It is only a few years since it was introduced into Russia, and last year nearly two and three-quarter million pounds of tea were shipped from Ceylon direct to Odessa, against less than half a million pounds in 1897. Teas from China and Ceylon are imported in vessels of the Russian volunteer fleet, which, owing to the low freights charged by these vessels on the homeward voyages, have now practically a monopoly of the tea carrying trade from the tea ports of China and from Colombo, more especially as now tea imported from the Far East in Russian bottoms has preferential railway rates between Odessa and Moscow. On the other hand, there is a growing purchase by Ceylon of Russian petroleum; in 1897 and 1898 Colombo took over one and a quarter million gallons each year. The Acting Consul-General suggests that Australian firms might avail themselves of the low rates of freight in order to introduce tin, tallow, copra, &c., into Russia. It is said that if these commodities were shipped by Singapore the local agency of the volunteer fleet would undertake their transshipment into Russian vessels on moderate terms.—*London Times* May 31.

THE BRAZILIAN COFFEE CROP.

Messrs. W H Crossman and Brother, of New York, write as follows on the position and prospects of Brazilian coffee:—

"The receipts in Brazil up to date confirm the figures we have previously given on the current crop. In Santos the receipts already reached 5,000,000 bags, which make it probable that the total there will exceed 5,500,000 bags. In Rio, so far, the receipts are 2,700,000 bags, but in that port they again neglect to count the coffees sent down from the interior direct for export, the quantity received in this way being about 125,000 bags up to date. The total in Rio for the crop year, however, will be close to 3,500,000 bags, the aggregate for the two ports no doubt reaching 9,000,000 bags. Regarding the next crop, it is now well known that the Brazilians are averse to giving out figures, but they are practically unanimous in stating the next crop to be larger than the present one some claim 10 per cent. more and others as much as 20 per cent. more. But whatever the figure finally reaches, it is positively immaterial, since the fourth consecutive large crop in excess of the requirements of consumption will mean a continuation of very low prices.—*The Grocers' Journal*, May 27.

THE LONDON CINNAMON SALES.

WE are glad to find, from information received by a recent mail, that Cinnamon, like tea, has touched the bottom prices, and is now beginning to experience an upward tendency. When we wrote last, on the February sale, we had to chronicle a con-

tinued drop in prices, which had commenced with the Hispano-American war; and we were apprehensive that it might be some time yet before Spain recovered sufficiently from its expensive and humiliating defeat to resume her old commercial transactions. The apprehension, notwithstanding the loss of the greatest of her remaining colonies, has, we are glad to find, not been fully justified. Among the conditions which helped prices at the last quarterly auctions on the 29th May, was the receipt of Spanish orders. The effect of a demand for our great spice from Spain was naturally a rise in the price of the finer qualities of cinnamon. While the ordinary qualities advanced from $\frac{1}{2}$ d to 1 d per lb., the advance in the higher qualities was from 1 d to 2 d per lb. It is safe to anticipate, if not that the advance will be continued, that the present prices will be maintained, now that one of our oldest and best continental customers is again in the field.

The statistical position of the spice also favored the rise in prices. The quantity offered was only 781 bales, as against 959 in May last year; and 1,649 bales at the February sales. In February, out of the large quantity offered—and it was by no means the largest offering for the month—only about 650 had been sold at the auctions. The fair deduction from the smallness of the offerings and the rise in prices last month, is that the large quantity taken off in February found buyers privately in the interval between the two public sales. We pointed out that cinnamon, like most other products, showed a serious falling-off in exports, in consequence of the prolonged and severe drought during the past quarter. That, too, must have helped the disposal of the stocks in London, and sent up prices some extent. So far as quilled cinnamon goes, the deficiency has not been made up yet, and we are glad to think is not likely to be made good—at any rate during the present quarter. The exports of quilled cinnamon in bales, up to 02th Jun, stand as follows, compared with the three previous years:—

To 20th June 1899	...	660,985 lb.
Do do 1898	...	877,580 "
Do do 1897	...	903,749 "
Do do 1896	...	798,999 "

Against this falling-off in quilled bark must be set the phenomenal increase in chips, which is a natural consequence of weather which renders peeling impossible, or difficult, and compels the scraping of bark which has coarsened. Naturally, the immense increase in the quantity of chips sent away has led to a fall in prices. We find that chips were neglected at the last sales and that prices receded to 2d and 2½d. The outlook for quilled bark is thus very promising for the present, but rather doubtful for chips.

The following is the report of the leading London firm, from whom we generally quote:—

London, May 31, 1899.

CINNAMON.—At the periodical auctions held on the 29th inst., the small supply of 784 bales Ceylon was presented, compared with 1,649 bales offered in February and 959 bales at this period last year. There was a better attendance and with Spanish orders in the market, the sales went off

with spirit some 680 bales being cleared under the hammer. Ordinary to medium sorts "un-worked" (i.e., sold as shipped) mostly brought 1d to 1d per lb. advance on February prices, while the good and fine quill "worked"—all being sold—realised about 1d to 2d per lb. better than last sale's rates. Firsts, ordinary to fine, sold at 10d to 1s 6d. Seconds 9d to 1s 5d. Thirds, 9d to 1s 4d, and fourths 7½d to 11½d per lb. 33 bales Tellichery were brought in for want of offers.

CHIPS, &c., were in excessive supply and neglected. Of 2,638 bags offered, about 80 bags only were sold. Chips @ 2d to 2½d, clippings, &c., 7½d to 8½ per lb.

Present Stock of Ceylon 3,830.

1898.	1897.	1896.
-------	-------	-------

Bales against	3,854	3,408	3,473 Bales.
	1898.	1897.	1896.

Chips 7,383 bags 2,692 5,344 5,209 Bags.

The next auctions are fixed for 28th August.

LADY-BIRDS AND GREEN BUG.

The annual general meeting of the Lower Pulneys Planters' Association was held on the 3rd instant at the Dindigul Club.

The Hon. Secretary said:—In presenting my report for 1898-99, I regret I cannot record an altogether flourishing position of affairs. Crops, which in the early part of 1898 we were so sanguine would be large, proved disappointing. The average rainfall on the Lower Pulneys and Siroomullay Hills during June, July, and to the 20th August, 1898, did not exceed 55 cents, showing what a total failure the S.-W. monsoon was. This prolonged drought, accompanied with a bad attack of green bug, resulted in serious damage to our crops. For the present season crops again will not be satisfactory, and prices, I regret to say, have fallen very low.

LADY-BIRDS.—During the past year no action has been taken towards importing this useful insect (our only remedy for eradicating that awful pest—green bug). It has been suggested by the Nilgiri Association that Mr. Newport be asked to send periodical consignments of lady-birds by post from Australia. Unless we have an entomologist on this side to receive these insects, and subject them to a careful examination before setting them free, there would be the danger of introducing the parasite. We cannot be too careful, or the remedy may prove worse than the existing evil. As this question is to be discussed at this meeting, I shall say nothing further on this subject.

Discussing this subject later on, the Honorary Secretary, Mr. Gerrard, said:—"Mr. H O Newport was sent over to Australia to collect lady-birds. The experiment, as you all know, was an utter, and to us disastrous, failure: for we are somewhat in the same position now, as so vividly described by Mr. Newport in a speech before the U. P. A. S. I. two years ago (1897). He then said: 'Even if this bug spares our trees, it does not spare the crops, and if some thing is not done—and that quickly—we, on the Lower Pulneys, will have to abandon our estates, and leave the district.' Of course the picture was overdrawn. No estates have had to be abandoned on account of the attacks of green bug; but there is little doubt that the continued attacks of this pest have had a good deal to do with the short crops of the last few years, and it is for this reason that we would welcome the arrival of lady-birds to put an end to the bug; for it is very evident that, with present low prices, it is absolutely necessary for the trees to bear large crops, and any pest that prevents them from doing so, by destroying good bearing wood, becomes a very serious evil. So much money has been spent over the Newport failure that there is little left for further experiment, and how, now, to successfully introduce lady-birds from Australia will require very careful consideration at the next meeting of the U.P.A.S.I. I think you will

all agree with me that a skilled entomologist should receive the consignments as they arrive, for there is always the danger I believe, in unskilled hands, of introducing with the insect the parasite that feeds on it; and, with reference to this matter, I don't think that a botanist can be expected to carry out the work of an entomologist."

SANDY TEA FOR THE POOR.

Half the "dust teas" brought into England should be confiscated by the Customs according to Mr. Henry Sell's paper, *Commercial Intelligence*, which, by the way, has just been greatly enlarged and improved. In 1,000 pounds of "dust tea" there are often 200 pounds of sand and earthy matter. Sometimes there is as much as 35 per cent of mineral rubbish, although not more than 1 per cent of sand is "natural" to tea, in the opinion of Dr. Bell, of the Government laboratory. The official inspection, it is charged, is most superficial, for "not one sample out of 1,000 packages of 'dust teas' landed is submitted to analysis." Large importations of very inferior goods rejected by the Hamburg and New York Customs have been passed by the English Customs and sold in London. The breakfast table of the very poor suffers correspondingly.—*Home paper.*

TEA-GROWING IN RUSSIA.

The ten plantations in the neighbourhood of Batoum continue to occupy the serious attention of a few Russian tea planters, who appear to be more or less sanguine as to the ultimate results that are likely to be attained. Messrs. Popoff have erected a factory for manipulating tea on one of their estates near Batoum, and have gathered their first crop this year, but I regret to say that, owing to the mystery with which they attempt to surround their industry, and the secrecy which they maintain in respect to all matters concerning their plantations and the cultivation of tea on them, it is quite impossible to procure information of a reliable nature in regard to them. Although the tea crop from these gardens was all forwarded to Moscow and St. Petersburg, it does not, according to the St. Petersburg papers, appear to bear comparison with the imported article in general use in the Russian Empire. The Imperial Domain authorities expect to obtain a crop next season, and are making preparations for the erection of a factory on their estates, and I am given to understand that the order for the buildings and plant has been placed in the United Kingdom. It seems probable that the results of tea-growing on the last mentioned estates stand a better chance of success than those obtained on the other estates, thanks to the fact that they have not confined their sowings to one quality only, but have laid out plantations of several kinds of Indian teas as well as Chinese and Ceylon hybrids. By adopting this rational course they will be able to judge which quality is more especially adapted to the prevailing climate and other local conditions. Their acreage under tea has been largely increased during the present year.—*British Consul at Batoum.*

VANILLA.

MEXICO.—There are a few Americans already here in the business with plantations about ready to bear. Some have just started. Many others are coming, judging from the numerous inquiries. Heretofore, the French have mainly cultivated the vanilla, with now and then a Mexican, while the Indians hunt and gather the wild vanilla. Vanilla is principally exported to the United States—about \$2,000,000 worth per annum. I write this article to answer in a general way the many inquiries addressed to me concerning this industry. Now that our people are embarking in it, I look for improved methods that will increase the production and simplify the process of curing.—*United States Consul at Tuxpan.*

MINOR PRODUCTS REPORT.

CINCHONA.—The shipments from Ceylon for the week ending May 9th were 8,064 lb only. At Amsterdam, on June 8th, 4,956 bales and 530 cases will be offered. The total weight is 481,800 kilos (containing the equivalent of 829,920 ounce quinine sulphate), of which 73,382 kilos. is pharmaceutical bark, and 408,418 kilos. manufacturing bark. The manufacturing bark contains an average yield of 5.35 per cent quinine sulphate against 5.52 per cent in May, and 5.21 per cent for the ten auctions in 1898. There has been a fair amount of business done in druggists' barks lately, and in many instances lower prices have been accepted. The Java shipments in May amounted to 666,400 Amst. lb against 672,500 Amst. lb last May. The total for the five months is 170,000 Amst. lb under last year.

PLANTING NOTES.

A FINE POTATO PLANT.—A remarkably fine potato plant, says the *Australasian*, grown in the Apollo Bay district, has been shown to us by Messrs. Davis, Lancaster, and Co. It is from a crop grown by Mr. Jas. McPhee, at Heathfield Farm. The area of the paddock is five acres; but the yield is expected to reach 75 tons, or an average of 15 tons per acre. The soil is 20 feet deep, with a clay bottom, and the ground forms part of the river flats, of which there is a considerable quantity. The haulm of the plants exhibits unusual vigour of growth, the one shown to us, laid out on a board, reaching the length of nine feet. From its roots twelve large potatoes were taken. The variety is the New Zealand Blue Derwent. The Apollo Bay district also produces good crops of onions, yields of 30 tons per acre being common.

COFFEE AND CACAO IN MEXICO.—We have a letter from Mr. E. O. Darley—who will be remembered by some as a Knuckles coffee planter—stating that he had taken charge of about 100,000 acres of land belonging to a Company on which he has to plant a large acreage with coffee, cacao, rubber and sugarcane. He is to give us a report of the district and its capabilities when he has seen a little more of it. Meantime he writes:—"A very large quantity of very fine cacao is produced here and the native coffee bears very heavily and no leaf disease, and I do not believe it exists in Mexico at all. I have never seen or heard of it. Sugarcane also is most prolific, the local demand for sugar and rum making it a very profitable business."

ANNATTO: POOR PROSPECTS OF CROP AND AN ENEMY.—Mr. Van Starck, of Crystal Hill, Matale, who, we suppose, cultivates as much annatto as anybody in the country, writes:—"The annatto fly has been so bad in the Matale district this year that fears are entertained that the crop out-turn will not pay for upkeep, and there is a fear of the plant going consequently out of cultivation. At any rate, the poor crop with the low prices now given for the article, is likely to stop the manufacture of the dye on Crystal Hill for the present. Rather sad for those who have been earning something out of the seed sold to these manufacturing works from the smallest quantities up to several tons, every season." As soon as the Entomologist returns, he should see to the "fly" and its remedy. What is the cause of persistent low prices? Overproduction (where?) or chemical dyes?

RAMIE (Russia).—The cultivation of the ramie plant (Chinese nettle) has been so very successful, more especially in the district of Batoum, that the area under this plant is from year to year increasing. This year's crop has been very abundant, and it is stated that some Russian capitalists are on the point of building a factory in a suitable locality for the purpose of working up the fibre. The Imperial Domains at Chakva have already received machinery for handling this articles.—*British Consul at Batoum*, June 1.

HEATING CAPACITY OF WOOD.—The *River Plate Review* says that a writer in the *Staats-Zeitung* corrects a very common supposition in regard to the heating capacity of wood, the most notable fact in the case being that such a practicable and easy demonstrable error should so long have prevailed—namely, that the heating capacity of hardwood is greater than that of softwood. The fact, as ascertained by repeated determinations, is that the greatest heating power is possessed by one of the softest varieties of such material—viz., the linden. Taking its heating capacity by the unit, the second best heater is also a soft-wood:—Fir, with 0.99 heating power; next follow the elm and pine, with 0.98; willow, chestnut, larch, with 0.97; maple and spruce fir, with 0.96; black poplar, with 0.95; alder and white birch, with 0.94 only; then come the hard oak, with 0.92; the locust and the white beech, with 0.91; and the red beech, with 0.90. These examples leave no doubt of the general fact that hardwood heats the least.—*Queensland Agricultural Journal*.

INDIARUBBER CULTIVATION is attracting a great deal of attention in several of the French Dependencies. We have enquiries about our forthcoming Manual from Paris, Marseilles, West Africa and Madagascar; and an enterprising French Agriculturist reports that he has indentured for, and is daily expecting to receive, *one million* of Castilloa seeds and asks if such are of use in Ceylon. We have advised him to send 500,000, if in good condition, out here at once and that we may get the seed auctioned by Mr. Symons (with his consent) with perhaps as good a result as in the case of Para seed, if not better! In a recent French Review devoted to Colonial Agriculture we find several important, up-to-date papers on Rubber. One is devoted to West Africa where France has now very large tropical interests, and one authority shows how, to supplement the indigenous creeper rubber vines, they are introducing four exotic varieties:—Para, Castilloa, Ceara and a new and as yet little-known kind "Manicoba" rubber. It is evident that there is going to be a good deal done in "rubber" culture; but many parts of Ceylon have special advantages, especially where the rubber trees can be grown as a subsidiary to tea. As regards "preparation," we find the following in a letter addressed to the French Colonial Minister by M. Marcellin Pellet in the latest "Revue des Cultures Coloniales":—"M. Joaquín Asturias has found out a new system. He filters the milk, to get from it impurities of all sorts, and then lets it dry by natural evaporation, exposing it to the sun on mats, plantain leaves or skins. This process gives an absolutely pure product, equal or superior to the best Para rubber."

TO ALL PARTS OF ASIA, AFRICA, AMERICA AND OCEANIA.

Seeds & Plants of Commercial Products.

Hevea Brasiliensis (Para Rubber).—Orders being booked for the coming crop available in August and September. This is the only crop of seeds in the year. All orders should reach us before the end of July to avoid disappointment, as we have to make arrangements in time; guaranteed to arrive in good order at destination. We have already booked a large number of orders. A Sumatra Planter writes, dating 9th March, 1899:—"I consent to the price of £——per thousand. I herewith order 50,000 upon condition that you guarantee at least 33 % seeds germinating." Plants can be forwarded all the year round in Wardian cases. Price and particulars as per our Circular No. 30.

Ficus Elastica (Assam and Java Rubber).—Seeds supplied by the pound with instructions; price according to quantity. This tree grows equally well in high and low land, in forest and grass land, its cultivation being extended largely by the Indian Government.

Manihot Glaziovii (Ceara or Manicoba Rubber).—Fresh seeds available all the year round; price as per our Circular No. 31. It is superior to Mangabeira rubber and second to Para rubber.

Castilloa Elastica (Panama or Central American Rubber).—Seeds and Plants supplied; price and particulars as per our Circular No. 32.

Urceola Esculenta (Burma Rubber) and **Landolphia Kirkii** (Mozambique Rubber).—Seeds and plants, both are creepers.

Cinchona Seeds.—Different varieties.

Hybridised Maragopie Coffee.—A large-beaned superior variety of Coffee in demand; seeds.

Santalum Album (Sandlewood).—The cultivation and felling of the tree is entirely under Government monopoly in India, Sandlewoods to the value of over £100,000 being annually exported to various countries from India. The cultivation of this useful tree is now receiving increased attention in other countries; seeds and plants.

Eucalyptus Marginata (Jarra).—Large quantities of this most valuable timber are being annually exported from Australia to London and various parts of the world for street paving and other purposes. Price of seeds on application. 7,846 pieces of Jarra timber has already arrived for Ceylon use.

Seeds and Plants of Cinnamon, Nutmeg, Clove, Kolanut, Pepper, Cardamom, Vanilla, Arabian, Liberian and Maragopie Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit Trees, Shade and Timber Trees, also Palms, Bulbs, Orchids, &c.

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for Foreign Countries for 1899-1900 are now being forwarded to applicants in different parts of the world.

"SOUTH AFRICA."—The great authority on South African affairs of 25th March, 1899, says:—"An interesting Catalogue reaches us from the East. It is issued by William Brothers, Tropical Seed Merchants, of Henaratgoda, Ceylon, and schedules all the useful and beautiful plants which will thrive in tropical and semi-tropical regions. We fancy Messrs. Williams should do good business, for now that the great Powers have grabbed all the waste places of the earth, they must turn to and prove that they were worth the grabbing. We recommend the great Powers and Concessionaries under them to go to William Brothers."

A leading Planter writes from *New Hebrides* under date 17th January, 1899:—"I shall like a few more of your Catalogues to distribute through these Islands, as I feel sure many would place themselves in communication with you, did they know where to write for Seeds and Plants."

Our New Descriptive Price List of Seeds and Plants of Fruit Trees now being prepared and will be ready shortly.

Agents in London:—MESSRS. P. W. WOOLLEY & Co., 33, Basinghall Street.

Agent in Colombo, Ceylon:—E. B. CREASY, Esq.

RUBBER IN TRINIDAD.

The annual report of Mr. J H Hart, Superintendent of the Royal Botanic Gardens in Trinidad, for the year 1898, is as follows:—Rubber.—(*Castilloa elastica*, Cerv.) Rubber cultivation has been taken up with considerable energy during the year 1898. The principal kind used for planting was *Castilloa elastica*, Cerv. Auction sales of seeds and plants of this rubber were well attended and good prices were realised, as there was considerable competition.

At the experimental station a small area was planted in July. Among the *Castilloa* has been planted at wide intervals the larger and slower growing *Hevea brasiliensis* with the view to their becoming the permanent occupants of the ground; it being the intention to bleed the *Castilloa* trees very hard for certain experiments, under which many may succumb. Another area has been planted out under the shade of standing trees, in what is called the old cottage grounds. It has been found that where *Castilloa* is well shaded their growth is much more rapid and vigorous than in the open. To grow *Castilloa* without a certain amount of shade and shelter, would in my opinion be to invite a succession of slow and stunted growths. In its native countries it is always found in sheltered and protected lands and always become stunted in the open vega. Trees planted in Trinidad under standing shade have been found to thrive well, and soon become the picture of healthy growth. At the experimental station it was necessary to shade with Banana, Cassava, &c., and under these conditions the plants have also grown well. In the nurseries at St. Clair are several thousands of *Castilloa* plants in bamboo pots; a large proportion of which are already ordered for the next planting season. *Castilloa* under favourable conditions in Trinidad makes rapid growth, and is probably better suited to the climate than any other class of rubber, as it comes to maturity earlier and can be handled with a minimum of previous planting experience. Specimens of the rubber sent to England for valuation prove that our *Castilloa* trees are the best kind in cultivation. The large crops of seed now obtainable from *Castilloa* will make it possible at an early date to grow stems for the purpose of extracting rubber from them in their young state. Stems of a year old have been found to contain some 8 per cent. of their dry weight in rubber, and this amount has been extracted in the laboratory. Whether the same percentage can be extracted in actual practice, remains to be seen.

HEVEA BRASILIENSIS, "Para Rubber."—This tree produces rubber of the finest quality, for which the demand is very regular. As a tree it is of slower growth than *Castilloa*, but grown for a permanent crop it will probably exceed that tree in value. The tree proves itself to be hardy, it can be handled with ease, and grows freely; although it takes a number of years before the trunk becomes large enough to bleed regularly. Growing at the old Gardens, the tree is seen to make itself at home on the hard and barren soil which there obtains; showing that although it is a tree fond of water, and delighting in frequently-flooded valleys, it will also grow in other situations. Specimens of rubber made from these trees have been examined in London and valued at high rates.

I have noted that seeds of this kind of rubber are being offered in France at a rate of over £40 per thousand or 10s. each; and in Ceylon rates of £3 per thousand on the spot—packing cases, and freight extra—are being charged. The vitality of *Hevea* seed like that of *Castilloa*, is very fugitive, and great risk is run by planters in obtaining seeds from a distance. Our seed harvested in Nov. was of excellent quality and fully 99 per cent germinated.

A tree of *Hevea confusa*, Hemsly, formerly known as *Hevea Sprucei*, also bore fruit. The distinguishing characters of the seed are its large size, its angular form, and the softness of its outer covering, when compared with those of *Hevea brasiliensis*.

What is apparently another *Hevea* has been presented to the Experiment Station by his Excellency the Governor, who obtained it from Dr. Carl Bovalius, who was recently exploring the territory of the Amazon, S.A.

These, when handed over, were in bad condition, as I proved by cutting a sample lot before sowing. Out of 170 seeds only some five seeds germinated, and only two plants promise to survive. This *Hevea* has seed not more than half the size of those of *Hevea brasiliensis*, and of much darker colour.

Kicksia africana, or Ire Rubber is obtained from a newly introduced African tree. A small section was planted out in November, and, so far as we can judge in so short a time, promises to do well. This rubber has been seen in the African forest by Mr. Millen, my acting assistant, who states that our plants are quite true to name. Mr. Millen has shown me samples of material collected by himself from trees in the African interior which shows this rubber is little, if it all, inferior to the best "Para." A parcel of seed sent to us by Kew did not germinate so well as did the first lot received, and but few plants were obtained from it. Every endeavour will be made to extend the culture of this species, as it appears to be of great promise and well suited for growth in Trinidad.

A report reached us from German sources to the effect that *Kicksia africana* does not produce rubber at all. Mr. Millen's evidence, however, satisfies us upon this point. In addition, however, it may be recorded that we have trees sufficiently large to bleed on a small scale, and from these trees we have recently procured latex, from which a small piece of excellent rubber was produced, which proves the report to have been a mere trade rumour.

MANIHOT GLAZIOVII or **CEARA RUBBER**.—Some demand has set in for seeds of this rubber. These demands we have had to refer elsewhere, as we have no supply. There is one tree in the Garden which is said to be some 25 years old which bears a few seeds annually, but, although of this age, its stem is but barely six inches in diameter. Some of our correspondents, however, are quite sanguine as to its value for culture in Trinidad. Some few trees were planted a few years ago at the Chaguans Convict Depot, but their condition is far from convincing proof of its suitability for our climate. My own experience, the Ceylon records, and various other sources of information tend to convince that *Castilloa*, *Hevea*, and *Kicksia* are all preferable to *Ceara* for cultivation in this island. *Ceara*, when young, grows rapidly, and induce the cultivator in many cases to believe in a continuous run of growth, which often proves disappointing. It has been reported by some who have visited the *Ceara* districts that the trees never grow to a large size. It may possibly be grown with economy in some of our mountain lands, unsuited for other products, but as a rubber producer I cannot undertake to give it a higher recommendation. The rubber produce is, however, of good quality.

LANDOLPHIA and **CEROPEGIA**.—African and Ceylon rubbers. These are both under cultivation, but at present there does not appear to be sufficient inducement to plant them extensively.

TABORNAMONTANA CRASSE.—This tree is a reputed rubber producer, and was grown on trial in these gardens for the past few years. Having a tree which had attained a large size, it was bled freely, and the latex was treated in different ways with a view of producing coagulation, but without success. Eventually a substance was produced which resembled in appearance a lump of chalk, or compacted starch, quite brittle in character, and certainly not rubber.—*India-Rubber and Gutta-Percha Journal*

PARA RUBBER TREES.—We learn that the largest rubber tree on Culloden has a girth of about 8½ feet at 3 feet from the ground. This one is some 16 years old and others of the same or less age are, we are told, well over 7 feet.

TOBACCO.

The directors of the New London Borneo Tobacco Company recommend a dividend of 2½ per cent for 1898 and 5 per cent on account of 1899 on the paid-up capital of the 80,000 ordinary shares.

The United States Tobacco Trust announces its intention to proceed immediately with the construction and equipment of factories in Japan, where, however, tobacco is a Government monopoly.—*L and C Express*, June 2.

PRODUCE AND PLANTING.

TEA UNSUIT FOR CONSUMPTION.—Attention has been called in these columns, and by more than one of our contemporaries, to the rubbish called by courtesy tea which has of late found its way into the London market. From the complaints made it is clear that there has either been laxity on the part of those business it is to detect rubbish in tea or that the Customs department needs the addition of some expert knowledge and a general strengthening of its staff. The subject has been dealt with sensationally in more than one paper, and the result is that the Chancellor of the Exchequer was interrogated on the subject last night. Sir F. Flannery (Yorkshire, Shipley) asked the Chancellor of the Exchequer "if his attention had been called to a statement in the Press that a quarter of the caper teas and half of the dust teas now imported should be confiscated under the Food and Drugs Act of 1875 by reason of their containing 20 per cent. of earthy matter and sand; whether he would explain the nature of the precautions taken by the Customs department in London for the detection of such adulteration, and whether the number of samples analysed could be increased with advantage; and whether, having regard to the fact that the descriptions of tea above named were for the most part consumed by the humbler classes least able to protect themselves against adulteration, he would increase the staff of inspectors especially allocated to the duties of sampling and analysis of caper and dust teas." The Chancellor of the Exchequer, in reply, said: "My attention has been called to this matter. The Board of Customs have, in view of representations made to them by certain firms and of statements in the Press, ordered a full inquiry to be made. It is not easy, within the limits of an answer to a question, to explain the precautions taken by the Board for the detection of the adulteration of tea; but I shall be happy, if the hon. member wishes it, to supply him with particulars. The Board of Customs, as at present advised, do not consider that there is any need for altering the existing regulations, but if, as a result of the investigation now in progress, it should appear advisable to make such alterations or to increase the number of tea inspectors the necessary steps will be taken at once. Meantime a circular has been issued to the tea inspectors directing them to administer the existing regulations with special care." This full enquiry is needed, and it will be awaited with some interest.

THE DRAFT QUESTION.—It remains to be seen whether the strong opposition to the abolition of the draft on tea, as expressed at the meeting of the tea trade held on Wednesday, and reported in another column will cause the Tea Association to modify their views. That the trade is in earnest on the subject admits of no doubt, and the Associations will now have to consider the question of the wisdom of carrying their proposal into effect in the face of such strong feeling against it.

VERY COMMON TEA.—Apart from the adulteration question, it is noticeable of late that, owing to the competition in the tea trade, and the demand for low-priced tea, leaf of very inferior quality finds a sale. These teas are so very poor that they are really dearer than the better

qualities, and as a correspondent points out, the purchaser of low-priced canister teas contributes a much larger percentage to the revenue than he would if buying better and higher-priced teas.

THE INCREASING POPULARITY OF TEA.—With the ups and downs of the tea planting industry one fact is noticeable, and that is that tea drinking is on the increase. In spite of the open hostility of the medical profession, tea continues to grow in popularity in countries where tea drinking is a recognised institution, while it is gaining favour elsewhere. This is largely due to the enterprise of Indian and Ceylon planters. Tea has been "pushed" in recent years as it never was when China controlled the market, and the result is seen in the growing demand on the European Continent, in the United States, and in the British colonies. Referring to this we notice that the "Globe" pays tribute to the work of popularising tea. It says: "After a long and costly struggle, Indian and Ceylon teas are fast conquering the whole world of consumers by their now recognised superiority. Australasian prejudice was the first to succumb; then followed South Africa; the United States and Canada made a harder fight, but they too, have given way; while Russia, the greatest market of all, is largely and continuously increasing its importations." The *Globe* then refers to South America as a field for tea, and alludes to the consumption of maté. In some parts of South America Paraguay tea is popular, but there is plenty of scope for pioneer work in the introduction, or rather the pushing, of Indian and Ceylon tea in Brazil, the Argentines, Chili, Peru, and the other South American States, where up to now the opportunity for purchasing good tea has been very limited.

A NEW FORM OF ADVERTISING.—Apropos of "Tea and Travellers" the *Grocer* says: "In the law courts, Tuesday last a case was heard, which, though not relating tea to gave a few incidental references to curious procedure in connection with the tea trade. That branch of commerce, as we need hardly say, has greatly changed during recent years, both in its wholesale and retail aspects. There is no duty-paying article now sold at a closer margin of profit than tea; it is cheaper than ever, and people drink more of it, despite a fairly brisk demand for cocoa; and if a grocer is so ill-advised as to sell sugar without an adequate profit he cannot expect to recoup himself satisfactorily out of his tea sales. Competition has brought down prices to a point which seems to have reached the irreducible minimum; but some of our retail friends appear to believe that they have not yet touched bottom. We can only hope that their fears are unfounded. In the wholesale branch, moreover, the position of affairs is not eminently gratifying; things are, as the saying is, cut very fine. In the case referred to above, one of the litigants had been connected with a City tea company. He admitted, when questioned as to the business of that concern, that he had kept a set of books containing fictitious entries in order to get the travellers to believe they were doing a larger trade than they were, and to tell the customers so. 'That,' added this ingenious witness without periphrasis, 'was a form of advertising. He did not see anything discreditible in it, although it was certainly not a highly moral proceeding. Granting that such a method in regard to tea is exceptional, it indicates that there are in the City of London at the present time a certain class of speculative traders who are not particular what they do, and who, if they cannot sell tea in one way, are quick to try another, even if the latter does not happen to be 'highly moral.' So long as they are able to keep on the safe side of the law they do not trouble themselves with ethical problems. Their conscience only begins to prick them when there is little cash in the till, when business is falling off, and when they are not doing as well as expected. Then their efforts to improve their position—including 'fictitious entries' in books to produce an impression of great commercial

activity—are apt to stray near the border line where honesty ends and sharp practice (or worse) begins. It is a pity that the tea trade should be exploited by so many adventurers. They would have no chance, of course, if the public were not easily gullible, often being induced by peculiar 'forms of advertisement' to purchase inferior tea at a price far in excess of its value."

TEA IN HOLLAND.—The Dutch have not hitherto proved themselves large consumers of tea, but the popularity of the "cup that cheers" in other countries has given additional zest to it in Holland. As a result there is an increasing demand for Java tea in the Netherlands. In 1893 the imports of tea from Java amounted to 67,361 chests, while from China only 3,346 chests were received. According to Mr. Robinson, the British Consul at Amsterdam, the average price of the Java article in 1898 was 5 4-5d per lb. There were considerable fluctuations during the year—*H. and C. Mail*, June 9.

INDIA RUBBER IN FRENCH AFRICA.

(Translated for the "Ceylon Observer" and "Tropical Agriculturist" from the "Revue des Cultures Coloniales" for May 1899.)

There have been introduced into Africa, trees furnishing excellent caoutchouc. Those who introduced them thought they would compensate for the irrational destruction of the (lianes) creepers as carried on by natives. The following are the kinds introduced:—

Manihot Glaziovii (the Ceara rubber tree).
Manicoba (little known, but allied to Ceara.)
Castilloa elastica (from Colombia).
Hevea brasiliensis (gives the kind known as Para).

These trees grow well on the Western coast, but it is quite a question whether colonists should be advised to start plantations of these only, just at present. M. Chalot, Director of the Experimental Garden of Libreville has made a series of experiments with *Manihot* trees, aged six or seven years. The results, so far, are not conclusive, whether as to yield or method of collection; where they had expected one kilogramme of coagulated latex, they have only obtained 600 gr.; the value of the raw material being 3 fr. 60 c., in place of 6 francs as estimated, and the expense of harvesting had been much greater than was anticipated. Until now, they have been able to arrive at no conclusions as to the suitable soils, time for harvesting, &c. To get these, it will be necessary to collect information from private sources. Meanwhile it seems to us that a plantation of Caoutchouc would imply too tedious a sinking of capital, as there would probably be a waiting of 10 or 12 years involved. If an owner of plantations would put in belts of Indian rubber amongst coffee or cacao, perhaps as boundaries or as shade trees, the experiment could be carried on at small cost. So, also, if foresters holding a concession, would put in young rubber plants, in the cleared portions—getting these plants from the Experimental Gardens—and employing only bands of children for the work, they could at small cost help in useful experiments.

CULTIVATION OF RUBBER CREEPERS (*lianes*).

Would the cultivation of these be possible, it has been asked. In 1893 I asked that experiments in these might be made in the Garden at Libreville, but no information has been given. There are in the plantations of Aschuka a certain

number planted as a hedge, said to be in good condition. Better still, I heard, there is a M. Lacour, who has in the Kasai a plantation of 200,000 stumps of *Landolphia*. When was this plantation started? I have asked M. Merlin, General Secretary of the Congo, to answer several questions about this..... I have since learnt that the estate is only three years old.

If it is a question of creepers—these must be cultivated in a horizontal and not vertical direction, lest one should run against the other and cause great difficulty of harvesting—weather by incision or by cutting down trees. If by incision, one ought not to have to use ladders. Perhaps to solve the question of how to harvest, it would be well to follow the natives into the jungle for some days, noting carefully their methods and the quantity of vegetables used, the quantity of latex collected by one man, the distance covered and the means of transport used. The black man does not calculate his time or his food..... Should we not have to replace the plantain leaf in which the latex is collected by the native, by the earthenware vases provided with clamps that are used in the Gironde, for the collection of resin; and in place of the saucapan they use, should we not take a larger vessel and perhaps use acids, even if these are natural ones, made on the spot?

Finally we scarcely think our colonists could make a profitable industry out of rubber as things now stand. Perhaps it might be best to follow as near as may be the methods of collection of the natives if the trade is to be even profitable. But then the question of the destruction of the creepers and trees comes in and I would suggest that just as in some French departments a certain sum is annually set apart for re-foresting the hills and mountains, so here an agent for agriculture be employed to distribute plants and secure cultivation. He would not be content with simply collecting and despatching seed, but would see it well packed and planted; and once planted up, the lands would be regarded as communal forest and be hired or leased out at so much per tree, whether to Europeans or to natives. Another system has lately been put into practice in the Congo State. Inspectors of forests have been started, who are always moving about. Their work is not to forbid the cutting down of rubber creepers, but to oblige the chiefs, or village headmen to preserve a certain number of the fruits, which the natives used to eat, and to sow the seeds in the forest. Already many chiefs have come and announced their intention of so doing and the places have been marked where this was being done. The Belgians foresaw that their export would soon diminish, as has already been the case with Netherlands India. The native in Africa has further to be instructed in the preparation of the latex. They boil it, add some natural juices and earth, stones and woody fibres, and this product is of a lower value by 4 or 5 francs. The natives of the province of Para also coagulate by heat, but their process is in itself excellent. Into the vessels which contain the latex they plunge a wooden spatula which they afterwards expose over a hot fire of odorous planters. The spatula then goes and comes, from a hot fire to the vessel, and the latex coagulates in thin layers closed up and from which all humidity is driven away. This suppresses ulterior fermentations and prevents the disagreeable odour which comes from African stocks. In native Africa they use sometimes natural acids (native sorrel lemon juice). The process is excellent, but there is always the mixture of various juices and of foreign bodies. The native, then, must be taught that it is to his advantage to produce the best possible latex and that he must cause to coagulate rapidly the latex obtained from one single variety of creeper, the *Landolphia* is the best.

MOTHER-O'-PEARL AND RUBBER.

England supplied to France, in 1897, 1,308,331 kilos of mother-of-pearl, estimated at 3,794,159 francs, and Germany 24,594 kilos, estimated at 71,332 francs. The mother-of-pearl export from French Oceania, on the other hand, at the present time, ranges in value from 1¼ to 1½ million francs annually, and is monopolized by the Society Islands Group. Practically the whole of this export goes to London and Liverpool. As France, however, requires on an average 6½ million francs worth of mother-of-pearl annually for her industry, it would seem that the production of the French Oceanian Settlements is not likely, unless largely developed, to be sufficient. The shell fisheries of the Persian Gulf of Ceylon, of Cape Comorin, of British Australia, of the Straits Settlements, of the China Seas, of Japan, and of the United States of America, are not liable to French export duties, and will always remain for the supply of the British markets. It is interesting to note that, in 1897, the mother-of-pearl supply of France was drawn in the following proportion from the various countries: from England 55½ per cent., from India 27 per cent., from the United States of America 4 per cent., from Japan 2 per cent., from Germany 1½ per cent., from other foreign countries 9½ per cent., and direct from the French Colonies ¼ per cent. But mother-of-pearl is not the only article for which France is attempting to create a market in her ports by means of export duties. We hear upon good authority that a proposal is under consideration for the imposition of an export duty upon india-rubber, which, like the export duty upon mother-of-pearl, would be remitted upon the production of a certificate from the French Customs to the effect that the india-rubber has been sent direct to a French port and declared for consumption in France. The importance of this proposed step, which would cover Madagascar and the French Congo and French Guiana, need not be insisted upon.—*British Trade Journal*.

ADULTERATION OF TEA.

HOUSE OF COMMONS, THURSDAY, JUNE 8.

SIR F. FLANNERY (Yorkshire, Shipley) asked the Chancellor of the Exchequer if his attention had been called to a statement in the Press that a quarter of the caper teas and half of the dust teas now imported should be confiscated under the Food and Drugs Act of 1875 by reason of their containing 20 per cent of earthy matter and sand; whether he would explain the nature of the precautions taken by the Customs Department in London for the detection of such adulteration, and whether the number of samples analysed could be increased with advantage; and whether, having regard to the fact that the descriptions of tea above named were for the most part consumed by the humbler classes least able to protect themselves against adulteration, he would increase the staff of inspectors especially allocated to the duties of sampling and analysis of caper and dust teas.

THE CHANCELLOR OF THE EXCHEQUER.—My attention has been called to this matter. The Board of Customs have, in view of representations made to them by certain firms and of statements in the Press, ordered a full inquiry to be made. It is not easy, within the limits of an answer to a question, to explain the precautions taken by the Board for the detection of the adulteration of tea; but I shall be happy, if the hon. member wishes it, to supply him with particulars. The Board of Customs, as at present advised, do not consider that there is any need for altering the existing regulations but if, as a result of

the investigations now in progress, it should appear advisable to make such alterations or to increase the number of tea inspectors the necessary steps will be taken at once. Meantime a circular has been issued to the tea inspectors directing them to administer the existing regulations with special care.—*London Times*, June 9.

Shuttleworth, W. S. & Co.; Tetley, Jos., & Co., Travers, Jos., and Son, Limited; Tower Tea Co. This was seconded by Mr. T. Smith, formally put to the meeting, and carried unanimously. After further short addresses from gentlemen present, all to the same purpose, the meeting concluded with a vote of thanks to the chairman.—*H and C Mail*, June 9.

FACILITIES FOR MAKING GOOD TEA XI.

CONTRADICTIONARY VIEWS AS REGARDS MANURING.

IN respect of "Upper Hewaheta district," we misapprehended the local conditions in some of our remarks in our last article. For instance, as regards the time for "pruning," planters have to consider the effect of the South-west monsoon which sometimes plays havoc with tea bushes with less than a year's growth on them after pruning. As regards soil, the remarks made to us were meant to show that though the old coffee soils do not give as good yields as virgin soil; yet flavour is maintained in tea from the former, longer and more steadily than in tea from virgin soil, partly due, perhaps to the slower growth of the flush on old coffee land. No doubt there is a difference in flavour all round, if one makes comparisons with say ten years; but it is shown that fresh land yielding 500 lb. of tea per acre has lost flavour more than old land cropping 300 lb. per acre. In regard to "Manuring" it is felt that a better knowledge of chemistry would be a great help to a planter in going thoroughly into the question and making the practical experiments on his own land which can alone show what fertilisers are most suitable to apply.

The three letters which have been held over to the last, are dated from Hatton, Nawalapitiya and Dolosbage; but they are not the least important of those with which we have had to deal. The first holds the arranging and chopping the manufacture"—by which, we suppose, is meant interference by Proprietor or Visiting Agent, according to the supposed course of the market—as the drawback to the turning out of better tea. Nawalapitiya recognises no particular drawbacks, as the average rates obtained for its teas, are all that can fairly be expected from its elevation and soil. In Dolosbage, the great drawback has been, till very recently, insufficient labour, aggravated from March to May by a rush of leaf, which hinders proper withering and necessitates night work which seldom produces good tea. The jät on most estates in Hatton is said to be poor, and even inferior; whereas Nawalapitiya considers its jät generally fair; and Dolosbage generally good. On the other hand, the Hatton soil is fairly good, and, so far from being worn, the estates yield larger returns than they did some years ago; while Nawalapitiya, though its estates

are not worn, has generally poor soil, with exceptions, the tea having succeeded coffee or some other product which had left the land without rest for 30 to 40 years. Dolosbage does not regard its soil as particularly poor, and has no worn-out estates. Hatton returns a decided "No" to the question whether manuring would improve the tea, and make it more profitable; but gives us no reason in support of the strong opinion it holds. Nawalapitiya not only holds a diametrically opposite view; but also advances grounds in support of it which seem to us cogent, when it says that manure would improve the bushes and thus increase the quantity, on that the improved condition will enable the bushes to resist "the so-called rust, and other pests from which tea is by no means as free as some people imagine." These results would necessarily be profitable: Dolosbage reports the prosecution of manuring; and argues that, if it only pays the cost of the manure and its application, it should be continued, as affording work for coolies during the slack season!

In regard to Factories, Hatton does not complain of any deficiency of withering room or machinery; but thinks the motive power admits of improvement. Nawalapitiya is in a different case, lacking as it does withering room, but being well-off as regards machinery, while sharing the deficiency in motive power. Dolosbage gets on well with its withering space for nine months; but when April to May pours in thrice the average yield of leaf, there is necessarily pressure. Neither in respect of machinery nor motive power has it any grievance. All three districts enjoyed a sufficiency of labour during the past year; but Dolosbage during the rush has to resort generally to cash plucking, and even with that it is not possible to go round within ten days. Pruning is not too severe in Hatton, though it is neglected too long on most places; but Nawalapitiya is free from either neglect or undue severity, while Dolosbage laments the spare use of the knife which it thinks should be on the move once in 18 or 20 months, when flush practically stops, whereas the rule has been to keep the bushes on for two years. Hatton's general remarks embrace the counsel to prune frequently, and to adapt the manufacture to the district, without attempting to get high-grown tea from low-lying places. Dolosbage's forcing climate results in lack of flavour in its teas; but where quantity is not aimed at, fair prices are obtained. Nawalapitiya considers the district well-suited to tea, but does not hope for a larger output, as what little land may be added to the acreage will be enough only to make up the falling-off from older fields. Indeed, that is its view of the whole Island, save Balangoda where a big acreage has yet to show its yield; and there is some significance, coming as it does from an old hand, in the hint that the weather alone cannot explain the lack of growth in the output of the island's tea.

SATINWOOD IN CEYLON.—Mr. A. F. Broun has an interesting paper on this subject with a sketch map in the *Indian Forester* to hand. We shall take it over in full later on.

RUBBER ESTATES OF PARA. DIFFICULTIES WITH THE VENDOR'S OVER- COME—RUBBER ALREADY BEGINNING TO COME IN.

An extraordinary general meeting of the Rubber Estates of Para, Limited, was held yesterday, at Winchester House, Old Broad-street, E.C., the Hon. John Augustus de Grey in the chair. After the formal business.

Mr. Woodrow said: Will you tell us something about the business of the company now?

The CHAIRMAN: Our position, as I understand it, is now a very favourable one. But before going into that question, I feel that the board have to account to those gentlemen who originally subscribed for the shares of the company, for the fact that we have not yet been able to pay a dividend. I should remind those who hold preference shares that their dividend has not been passed over; it is simply postponed until the company is in funds sufficient to enable it to pay them. The reason why we have been obliged to defer payment of the dividend is a very simple one. When we were in treaty for taking over the company's property in Para, we ought to have concluded our contracts in April; but the company's issue was not responded to by the public sufficient to enable us to do so, and consequently we had to ask for an extension of time, and so it came about that we were not able to do so until September 10 of last year, when we did complete our contract by the purchase of the property. The result of that was this, that the vendor had us more or less in his power. We received an assurance through the vendor's agent on which we thought we could rely, that we should receive compensation for their crop which the vendor announced that he was going to deprive us of, and at that time we were obliged to pay £2,000 as compensation to the vendor for not having fulfilled the contract at the time it should have been fulfilled. Then we were informed that the vendor intended to appropriate the whole of last year's crop, but that we should be compensated. I should explain that the season for rubber collecting begins in July, but that the arrangements are made as early as about the February before. The vendor had made his arrangement for sending men to the estates and was in process of getting that crop when we completed our contract. We should not, if we had taken over the estate then, been in a position to interfere, but we expected that the crop would have been handed over to us. But we were disappointed in that respect, and in the result none of the promises which were made to us by the vendor were fulfilled. And, moreover, we were promised the rents of the rubber roads from the tenants, and we received £1,400. The whole of the money we received from the estates was in the past season. Those facts are what caused us to be unable at the present time to pay a dividend for our shares, because it was not until March 1 of this year that we obtained full possession of the estates, and were able to commence working on them. Some months ago, however, we sent out Mr. Milne, our manager, who has had his work supplemented by an accountant and several storekeepers from this country. You will have received the circular, dated April 14, which was the first information that we were able to give you of our prospects in the coming season. That circular is of an encouraging description, and as far as the expectations held out in it about the beginning of the season, they have been fully realised, because we have received altogether from the estates during the wet season, and up to the end of May, some 7½ tons; and we have now at Para about 1½ tons more awaiting shipment, which brings up the amount from the estate to a little more than we anticipated in that circular. We are, perhaps, the first people who have had any result at all from a rubber estate in the wet season; but we sent our men up early, and they consequently got this return, and we hope that the June returns will fully come up to what is foreshadowed in our circular. We have sent up about 650 men on our own account, and we are working the estates, as I told you that we should, on the direct system; that is to say, without the

intervention of a middle-man. We sent our men to work the roads under our own supervision. The system hitherto has been to let the rubber roads to tenants at a rent which the tenant pays; but if you send your men to the estates, you have, first of all, to keep them supplied with food and necessaries, and then they are debited with the amount of the stores which you provide, and they have to pay that back in rubber. All the rubber which they collect has to be sold to this company, and it is invoiced to you at a price between which and the price at Para there is a considerable difference; the exact amount of difference I will not now venture to state, but I will say that it is in your favour. Some of our roads are still let to tenants; but we reckon that we still have about 750 men working on that property, besides our manager and the accountant, and the five inspectors. We are in process of negotiation for a steam launch for our estate. I do not like to say too much about the profits which we are likely to make on the season, but I hope that something like the gross product foreshadowed in our circular may be realised. You must remember that this is a new business; it is a thing that has never been tried by anybody before, and with the actual number of trees in Para, what the number of trees per road may be, &c., is more or less an unknown quantity. Therefore, I will not commit myself to more than this—I will say that from the returns which we have had we may expect a profit at the end of the year. One important point which I am reminded of is that we believe we have now plenty of working capital to carry us to a successful issue in the operations of the company. (Applause.)

Mr. WOODROW moved a vote of thanks to the chairman, which was seconded by Mr. GILLINGHAM, and agreed to unanimously.

The CHAIRMAN having briefly acknowledged the vote, the proceedings terminated.—*Home paper.*

INDIAN AND CEYLON TEA. ANNUAL REVIEW.

38, MINING LANE, June 5th, 1899.

We take the opportunity offered by the publication of the figures covering the twelve months ending May 31st, to review the events of the season now concluded, and to print some statistics which may be of general interest.

The season has been memorable for the illustration it has afforded of the vicissitudes of fortune awaiting those who devote their energies and capital to the business of tea planting; and of the rapid transition from a state of discouragement to one of hope possible under the conditions which regulate trade in our times. It will also be remembered as the year in which the policy of striving to cultivate new markets, so long pursued with tenacity, at length met with an adequate reward.

Through a combination of circumstances, the position of Tea has, indeed, undergone since the autumn of 1898 a change so conspicuous as to claim very careful attention—placing in the background, for the time being, topics of minor importance.

As a preliminary to consideration of the question of deepest concern, "Is this change merely a temporary incident, or likely to be permanent in its effect?", it will be well to recall the position a year ago. We were then suffering from the loss to producers entailed by the rise in exchange and freight; from deterioration in the quality of the Indian crop; from a temporary check to the increase of consumption at home; and from disappointment at the slow development of trade with other countries.

At the opening of the season came estimates of a large supply from India—destined not to be realized, as has not infrequently been the case, but harmful through the fear of over-production which they created. Only for those estates capable of producing fine teas could the outlook be deemed hopeful; for it seemed that while values for these would be maintained, quotations for other sorts might fall even lower than before.

Eventually this proved to be the case, and towards the end of 1898 prices for all but the best qualities fell to a point which has rarely before been touched, to the serious disadvantage of sellers everywhere, but especially to those who had hurriedly sold in Calcutta.

In the meantime, movements resulting from the low value of produce were in progress. At home, consumption received a stimulus from the keen competition among Distributors, which led them to offer to the public cheaper tea than had ever before been sold; while trade in general received an impetus from the renewed industrial activity which followed the settlement of the labour troubles of 1897, thus augmenting the purchasing power of the wage-earners. Abroad, from nearly all quarters came, by degrees, the larger demand for which long and careful preparation had been made; mainly due, without doubt, to the low quotations at which the kinds wanted by foreign buyers could be secured, but partly in consequence of diminished exportation from China; and as regards the United States, it is said, owing to stringent measures taken there to prohibit the admission of certain common kinds of Chinese tea.

As the months passed it began to be evident that the supply from India would be curtailed by the drought in Sylhet and Cachar; that the heavy yield once obtained from certain parts of Ceylon and India might not be kept up; and that a good deal of unprofitable and immature acreage was here and there being quietly abandoned. Everywhere the work of extension was so far suspended as to make seed practically unsaleable; while if the limit of Ceylon's producing power had not yet been reached, it was evident that we should probably receive from that quarter less than hitherto instead of more.

All these points were duly noted here, and their hearing upon the future was pointed out. But the Trade, long accustomed to abundant supplies and low quotations, were slow to believe that a change was impending, and being quite unprepared for it were eventually compelled to operate at advancing prices. They had, indeed, no option, for the modern system of business had left the country bare of the reserve stocks upon which in former times retailers could fall back, and so resist a rise in price. It had long been foreseen that whenever the position should justify a rise on its merits, and apart from the action of speculators (from which we have been fortunately free) the small stocks on which the Trade had accustomed themselves to work would make an upward movement sudden and pronounced:—and it must not be forgotten that when something occurs to *weaken* the position, re-action on the same lines may follow.

But whether that be so or not, we have now to deal with the fact that the unprecedented increase in the use of Indian Tea at home and the larger demand for both Indian and Ceylon Teas abroad have raised prices for the lower qualities to a point which has enabled those who had not the misfortune of a short crop to reap a better result of the year's work than at one time seemed possible, while opening to all who make them a brighter prospect for the coming year. For producers of the finer qualities, however, the effect has not been quite so beneficial—advance in the value of the cheaper sorts being generally prejudicial to the value of fine—but as a large portion of the fine crops were sold in the autumn at high prices, those who made them would have shown as good results as usual, if it had not been for the abnormally high freights and an exchange of 1s 4d or 1s 4½d for the rupee.

We have now to consider how the near future will be affected by what has occurred. It is only reasonable to assume that many growers, tempted by the prospect of a good profit on a large crop laid down at a low cost, will make all the tea they can:—and because such a policy has not usually proved successful in the past, it does not follow that it may not be the best course for some to take now. The short Deliveries in May show that the need of the moment is a plentiful supply of low-priced Indian and Ceylon tea quickly brought to market, in order

that the wants of consumers may be at once met and the danger of a check to consumption averted. Failing such a full and free supply, traders will turn elsewhere; for opposed to the frequent assertion that when once British-grown tea has been used it will never be given up, stands the fact that the public have to take what retailers sell them; and some retailers have a way of using for a time anything that can be called tea sooner than raise the price to their customers or forego their accustomed profit. The door has already been opened here through which foreign rubbish enters, and it should be closed as soon as possible.

But there must be limits to this policy. The production of large crops of low-priced tea should be left to those who can attempt it with the least hazard. It would be most imprudent for those in Assam, Darjeeling, or the highlands of Ceylon, whose estates can yield tea of fine quality to risk their pre-eminence. We have behind us the evidence of many years that demand for fine tea is an assured and constant feature of the home market, and although, for the time being, those who produce it may not be getting their due proportion of profit, this will be adjusted when liberal supplies once more come forward and the normal range of value between fine and common tea is re-established.

An ideal crop would be one containing the widest possible variety of character and value, with enough of the best to meet the home demand and to maintain the reputation of British-grown tea all over the world, and with a sufficiency of such as growers could afford to sell at low rates, in order to increase our trade abroad by supplanting the produce of other countries. New markets can neither be opened nor kept open with short supplies and high prices.

Recognizing how much of encouragement there is in the present position, we feel there are too many uncertain factors of the problem to justify the very sanguine forecasts in which some have indulged;—the quantity that may possibly be drawn from China by the prices now ruling is unknown; Ceylon as well as India, is liable to suffer, and has suffered from drought and blight; in India the difficulty of getting coelies increases; and though freights may be lower, an exchange at 1s. 4d. has still to be reckoned with. On the other hand, the Home Trade is in a strong position, abundantly supplied with capital; the advance in quotations was a genuine movement, entirely due to the fact that supply had fallen short of demand and not to any artificial manipulation of the market; stocks are lower than they have been since 1886, when the annual turnover was 50 million lb. less than it is now and the price of tea 50 per cent. higher;—and although an increase in the importation from India may be expected, very little more will come from Ceylon; there is consequently not much reason to expect to total supply from these sources will be larger than we require here, provided that a free consumption at home and abroad is not hindered by very high prices at the outset.

It is no longer necessary to enlarge upon the importance of gaining for our tea a better share of foreign trade, for the result of taking a few million lb. from the London market has been seen. It is sufficient to state that 92 per cent of the home trade, and 75 per cent of the Australian trade have already been secured, in order to show that we more than ever need the help of other outlets, if there is to be further development of the tea-growing industries of India and Ceylon.

As regards home requirements for the coming season, it should be safe to take the year 1898 as a criterion. The Board of Trade returns show that in that year we used at home or sent abroad 141 million lb. of Indian, 94 million lb. of Ceylon and 36 million lb. of China and Java tea:—total 271 million lb. We should, therefore, be able to handle here without much difficulty during the season ending the 31st May, 1900, about 145 millions from India, 95 millions from Ceylon, and 35 millions from elsewhere—say a total of 275 million lb.

We refrain from details relating to manufacture, assortment and so on, respecting which managers must already be in possession of the information they

need: but inasmuch as it is desirable that the requirements of Continental and American buyers should be studied by those who can produce the sort of teas they take, it may be useful to mention that the desiderata for those markets are—an even leaf, not broken or dusty; flavour rather than strength; aroma on the dry leaf; large breaks and sound packages made of the best material.

And whereas the stability of the home market is undoubtedly endangered for more by the excessive number of separate invoices and breaks than by the actual weight of tea brought to sale when it is necessary to hold large Auctions, we would once more urge those who pack many different kinds or send forward small invoices at short intervals, in their own interest to do what they can (short of sending unsorted tea) to lessen the difficulty experienced by the Trade in handling the large quantities which must of necessity be brought to market during the busy months of the season.

WM. JAS. & HY. THOMPSON.

Showing the progress of the Ceylon Tea Trade in London:—

Season ending 31st May, 1897. Imported 92 million lb. Total of Auctions, 1,140,000 packages. Average price 8d per lb.

Season ending 31st May, 1898. Imported 93½ million lb. Total of auctions, 1,160,000 packages. Average price 7½d per lb.

Season ending 31st May, 1899. Imported 93 million lb. Total of auctions, 1,105,000 packages. Average 8½d per lb.

London Warehouse Returns, including all kinds of tea, for the past three seasons, ending 31st May. (Estimated Weights):—

TEA IN WESTERN ASIA AND EUROPEAN TURKEY.

Looking over the several replies received by Messrs. Cresswell, we find that in Turkish Arabia the bulk of the tea imported is Indian, and only about 5 per cent. from China and Java. The people are not tea drinkers, coffee being their beverage, but the Consul-General thinks it possible a change may take place in the habits of the people. In Smyrna, the Consul says the demand for tea is increasing, and there is room for further development of the trade; the tea used being a blend of India and China. In Salonica the use of tea is not general among the population, but appears to be extending rapidly. The Vice-Consul at Uscub (European Turkey) says tea is not largely consumed there; what there is, comes from Asia Minor. From Van (Asiatic Turkey) comes the intimation that there would be a good demand for tea there. All the tea comes from Constantinople, where it is mixed, but the people are not at all satisfied with the stuff as sold there. At Beyrout (Turkey) tea is not a national beverage, but about 15,000 chests pass through annually. There is little chance of developing the trade there. At Angora (also in Turkey) the tea-drinking population is increasing, tea being said to be taking the place of coffee. The British Consul at Damascus says the tea consumed there is Indian; that the habit of tea drinking is undoubtedly growing in the city, and the demand for tea will certainly increase in the future, though coffee is the beverage of the country. In Jerusalem the consumption of tea is on the increase, though the people are indifferent to the quality. The Europeans and the better class of inhabitants consume Ceylon tea. Her Majesty's Minister at Teheran (Sir M. Durand) says he is making enquiries as to the prospects of the tea trade in Persia, and will send the information as soon as possible. At Mohammerah (Persia) the British Vice-Consul says the imports of tea are increasing, and are likely to increase. Indian, Ceylon, China and Japan supply the demand, the tea being shipped by British steamer at Bombay. The British Consul at Ispahan (Persia) does not think there is much chance of increasing the tea trade of the place; but the tea imported is Indian, and the trade is entirely in the hands of Parsee Merchants, who have their agencies at Bombay. The Consul at Erzeroum says only Indian teas are imported, and that the people are great tea drinkers, while the habit is increasing from year to year. We notice that the tax or duty on teas in all of the cities referred to in the correspondence is low, ranging from 5 to 8 per cent. *ad valorem*.

THE PLUMBAGO TRADE IN CEYLON.

(From Capital.)

Plumbago prospecting in Ceylon, about which so much had been heard of late, can scarcely be said to be a profitable undertaking—at any rate as far as the generality of those engaged in the industry are concerned. And it seems to be understood that hardly one out of every ten embarked in this business makes any appreciable profit.

This statement might seem strange at first sight, for the plumbago trade has every appearance of prosperity. The prices prevailing are high, and during the last year or two they have stood higher than they ever have been. Moreover, the supply of plumbago is abundant, and plumbago mining is conducted in several parts of Ceylon, for the mineral has been found in localities where only a few years ago its presence was not even suspected. About two years ago the number of plumbago mines in the Colony was officially stated to be 299, and the aggregate annual yield of these mines was declared to be over 23,000 tons, while the value of this produce was estimated at slightly over 3½ millions of rupees.

There are various causes, however, which contribute towards rendering plumbago prospecting in Ceylon a

non-profitable concern—at any rate not a generally profitable one. First and foremost, it would appear that there are considerable difficulties connected with the transport of plumbago from the mines to centres where markets can be found for it. The plumbago obtained from mines in the interior of the island is, with no little trouble, carried by means of rivers or canals to the closest Railway station, and is then trained to Colombo whence it is exported. As railways are not abundant in the interior of the island, the inconvenience and expense of such transport can easily be imagined.

Moreover, there are difficulties about the particular sort of timber which is required for the casks in which plumbago is exported. It appears that *hora* wood is the only kind of timber which answers this purpose, and it is stated that oaks made of any other sort of timber are ill-adapted for exportation of this mineral. Unfortunately this *hora* timber is becoming scarce in Ceylon, and high prices are being accordingly demanded for it, and thus the cost of transporting plumbago to a place of exportation is enhanced by the expenses due to the purchase of *hora* timber. Roughly speaking, the supply of *hora* is practically exhausted in the Western parts of the island of Ceylon, and it is now procured in the Southern regions. The price of 1,000 feet *hora* is at present about R70, whereas scarcely ten years ago the same quantity could have been purchased for R30. The *hora*, which is obtained in the Southern Province of the Colony, is conveyed at much cost to the railway line along the Southern Coast, and is then transported (by railway) to Colombo, the port of shipment. The cost of transport to Colombo amounts to about R15 or 20; and this item helps considerably towards maintaining the high prices of *hora*. If the railway authorities could be prevailed upon to reduce their rates, the trade in *hora* timber would probably increase a great deal, and if the freight could only be reduced to something like R5 per 1,000 feet, the plumbago trade might be run at a profit. Moreover, the local timber trade could receive a great impetus; and the crown lands in the south of the colony would doubtless then be taken up for the purpose of exploiting *hora* timber; but, as matters stand at present, these Crown lands are taken up merely for purposes of cultivation, for the timber trade is not sufficiently paying under the circumstances now prevailing.

While plumbago prospecting has not proved remunerative to the majority of those engaged in it, a happy minority contrive to make it profitable; and among these fortunate people should be mentioned certain persons who are known as District Mudaliyars, and who are the lawful guardians of Crown lands. A thorough knowledge of local conditions is necessary to understand how profit is made in these cases; but it is believed that the Government of Ceylon would be well advised to thoroughly investigate the matter.

PLUMBAGO IN UVA.—We learn that the plumbago work on Dambattenne, although so far not very remunerative, is encouraging. Others think of trying their luck, and “Capt. Boyd”—so says a correspondent—has a commission from the Poonagalla Valley Company to report and advise. Let us hope that the expert's visit will result in finding a rich paying vein.

OIL ENGINE.—We heard the other day of two of “Campbell's Oil Engines” doing most satisfactory work on a Kelani Valley estate and that, although fuel was abundant, they were preferred to steam, the cost of oil not exceeding half cent per lb. of tea. This should be encouraging news where fuel is not abundant, as in the central portion of Dimbula, for instance.

THE PROPOSED ABOLITION OF THE
DRAFT POUND.
MEETING IN LONDON.

A meeting of the members of the wholesale and retail tea trade was held at the Commercial Sale Rooms, Mincing Lane, on Wednesday last, to oppose the proposed abolition of the draft pound by the Ceylon and Indian Tea Associations. The Right Honourable the LORD MAYOR, who was called to the chair, explained the purpose for which the meeting had been called. He said that he had great pleasure in presiding over that numerous and influential meeting, because he felt that it was a matter of great importance to every wholesale and retail dealer throughout the United Kingdom. From time immemorial the pound draft had been a concession to the trade, sanctioned by the importers to cover all the various losses of the retailers occasioned by leakage, samples, &c., and now the Ceylon and Indian Tea Associations had made the astounding proposal that this one pound draft should be abolished. He would give the two chief reasons for their seeking to introduce so serious a change. First, it had the unanimous approval of committee of the two associations named. This seemed a very inadequate reason, for those represented by the associations would benefit by the change. Second, the profits on tea had been greatly reduced of late, but those present had only to take the dividends paid by the leading tea companies to see that this was greatly exaggerated. He had looked up the matter and found that the four leading companies interested paid dividends averaging from 15 per cent to 12½ per cent, and those were profits that could hardly be complained of. Personally, he (the Chairman) had given the subject very great attention, and in his judgment the proposed abolition of the one pound draft was most unfair and unreasonable, and further, the assigned reasons were wholly inadequate. He then called upon Mr. Thomas Lough, M.P., to propose the first resolution, viz: "That this meeting expresses its great surprise and regret at the ill-considered and drastic proposal emanating from the Ceylon and Indian Tea Associations to abolish the draft allowance on teas sold under sale conditions in London, which would inflict a very serious loss upon the tea trade in this country; and this representative gathering of the entire wholesale and retail tea trades protests against this one-sided and unreasonable change in the sale conditions."

Mr. LOUGH, in proposing this, complained strongly of the secrecy of the proceedings to which they had been subject, saying that he had heard nothing of the proposal till a fortnight since, although he heard now that as long ago as last March circulars had been sent out to India and Ceylon and distributed among all the tea-growers and their consent obtained to the proposal. He said there was only one party who would benefit by this proposed change, and that was the sellers. Another thing he had to complain of was that they had to pay 40 per cent. of the price of tea before they got the order of delivery. He said that those in the tea trade had a number of grievances that they did not complain of, but which would never be tolerated in any other trade, and that this pound draft, which was now their sole refuge, was not a concession because in the majority of cases it barely covered the losses arising from leakage, samples, &c. When, therefore, this was abolished it would leave the trade exposed to the full misery of the situation,

and the real reason was the private profit of those represented by the association. The associations had in their circular stated what a large number of pound packages they had given away through this one pound draft, but this amount was only 1 per cent. on the whole sale of tea in this country. He trusted that they would un-animously accept the resolution, and that, with the consent of buyers and sellers, no change would be made.

Mr. HUDSON KEARLEY, M.P., seconded the resolution. He also said that it was a matter of history repeating itself, for in 1870 when Chinese tea had the monopoly, a similar proposal had been made and had been rejected unanimously, as he was confident this one would be. Such an alteration would seriously disturb the tea trade, and he thought that the fact of its being an old established custom ought to be sufficient to prevent the abolition of this one pound draft. He begged to make a single suggestion, and that was that if there was not already an organisation strong enough to represent the interests of the tea trade that they should form one out of that meeting and fight the importers' association.

SIR WILLIAM PINK, Mr. J Lecky, Mr. Heath Clarke, and Mr. J J Meakins, amongst others supported the resolution, and reiterated the opinions expressed by the previous speakers. The resolution was then formally put to the meeting and carried unanimously. Various gentlemen representing large firms in the provinces then warmly opposed the proposed abolition, giving as their experience that the one pound draft in the majority of cases barely covered the losses arising from leakage, samples, &c., and in some cases actually it did not cover them.

The CHAIRMAN then said that he had received a large number of letters and telegrams from firms in most of the large towns. The names of the towns and firms were then read. The Chairman called upon Mr. J. Innes Roger to propose the second resolution, viz:—"That representatives of the following firms be appointed a General Committee, with power to add to their number, and to form an Executive Committee to deal, in conjunction with the Committee of the Wholesale Tea Dealers' Association, with any questions that may arise from time to time in connection with the subject now before this meeting." Budgett, Samuel, & Co., Limited; Burbidge, Pritchard, and Bartlett; Brooke, Bond, & Co., Limited; Co-operative Wholesale, Limited; Edwards & Sons; Hanson, S. Son and Barter; Harrisons and Crosfield; Home and Colonial Stores, Limited; Kearley and Tonge, Limited; Lipton, Limited; Lloyd, David, Pigott & Co.; Mazawatte Tea Co., Limited; Payne, Geo., & Co., Limited; Rowley and Davies Shuttleworth, W. S. & Co.; Tetley, Jos., & Co.' Travers, Jos. and Son, Limited; Tower Tea Co.

This was seconded by Mr. T. Smith, formally put to the meeting, and carried unanimously. After further short addresses from gentlemen present, all to the same purpose, the meeting concluded with a vote of thanks to the chairman.—*H and C Mail*, June 9.

THE PROPOSED ABOLITION OF THE
DRAFT POUND.

To the Editor of the *Home and Colonial Mail*.

SIR,—As a regular reader of your valuable paper, I have noticed a letter in your issue of the 2nd inst., signed "A Tea Dealer," in which he argues that it would be more productive to squeeze a little off the Calcutta and London agents than to abolish the draft pound. In sup-

port of his contention "A Tea Dealer" states that the average saving to be effected by withholding the draft pound would only amount to 8d per average chest, whilst, according to his estimate, Calcutta Agency Commission amounts to 1s 6d, and London Agency Commission to 1s 9d per average chest.

I do not know how "A Tea Dealer" has arrived at these comparative figures, but I am in a position to supply some actual figures, extracted from the 1898 accounts of a company in which I am interested.

The company in question made in 1898 a total crop of 1,956,825 lb. of tea. The number of packages was 22,930, and the average gross sale price was 11 23-32d per lb. The 1 lb. per package draft was therefore 11 23-32d per lb. on 22,930 lb. or, say, £1,119 12s 7d. The Calcutta Agency Commission for the year was £474 13s 1d. The comparison in the case of the company in question is therefore not 1s 6d for Calcutta Agency against 8d for the pound draft, but 4 31-32d for the Calcutta Agency against 11 23-32d for the pound draft.

The company in question does not pay any London Agency Commission, but the accounts, show an item of £60 for rent of London office a moderate sum for office salaries, and auditors' fees, and certain other charges, which, as it appears to me it would be difficult to reduce.

On the whole I am not convinced by the argument that it would be more productive to squeeze a little off the Calcutta and London agents than to tackle the question of the 1lb per package draft.—Yours faithfully,

E. G. ROCK,

1, Great Winchester Street, London, E.C., June 6, 1899.

MINOR PRODUCTS REPORT.

CINCHONA.—There was a good demand for the small supply offered in auction on Wednesday, and the bulk sold at full rates to a slight advance, the average unit working out at 1½d to 1¾d per lb, and 2d for cinchonidine. A parcel of 99 bales East India was withdrawn upon instructions from India. The catalogues offered by the six brokers consisted of:—

	Packages offered.		
East Indian cinchona ..	290	of which 165 were sold.	
Ceylon cinchona ..	245	do	245 do
South American cinchona ..	120	do	47 do
	655		457

The following are the approximate quantities purchased by the principal buyers:—

American and Italian factories ..	41,314
Amsterdam and Mannheim factories ..	26,663
Messrs. Howards & Sons ..	12,156
Brunswick factory ..	9,344
Paris factory ..	3,220
Druggists, &c. ..	6,060

Total quantities sold ..	98,757
Bought in or withdrawn ..	40,041

Total quantity offered .. 138,978

CEYLON.—Succirubra, good rich chips, quilly, 7½d to 5½d for fair; medium, 4½d to 4¾d; and fair root chips 3¾d. Officialis, chips and shavings 5¾d to 6¾d; renewed ditto 4¾d to 6¾d per lb.

QUININE has again shown more activity, at rising prices, and when the market opened on Tuesday small transactions were put through, mostly for August delivery, at 1s 4½d to 1s 4¾d, an advance of 1d on Friday's prices; October delivery also

changed hands at 1s 5d per ounce, Wednesday saw an advance to 1s 5d for August, and 1s 5½d for October, with a fair business. Today it has been in good demand, and as high as 1s 5d spot has been paid; June 1s 4½d, and August 1s 5d to 1s 5½d.

VANILLA.—The exports from Bordeaux in 1898 were 741 cwt, as compared with 473 cwt in 1897; of this quantity 187 cwt. went to the United Kingdom, against 27 cwt in 1897. The stock of vanilla at the close of 1898 was 4,255 kilos., against 4,560 kilos in 1897, that in first hands being nil.—*Chemist and Druggist*, May 27.

THE TEA TRADE.

After a long and costly struggle, Indian and Ceylon teas are fast conquering the whole world of consumers by their now recognised superiority. Australasian prejudice was the first to succumb; then followed South Africa; the United States and Canada made a harder fight, but they, too, have given way; while Russia, the greatest market of all, is largely and continuously increasing its importations. South America, however, still remains faithful to mate or Paraguayan tea, as it is sometimes called. The decoction of this herb is altogether inferior to the genuine brew, but it has the advantage of being very much cheaper. That merit is more than counterbalanced, however, by its containing a higher percentage of theine, a drug which produces violent nervous excitement unless consumed in very small quantities, and the smaller the better. Possibly, the revolutions, which have been so common in South America had their origin, to some extent, in mate. The people themselves are sufficiently excitable without any adventitious aid to inflame their passions. Even from a purely political point of view, therefore, some benefit might come from the substitution of Indian and Ceylon teas for the indigenous herb. At all events, if that could be managed, great gain would result to our planters from securing a footing in an enormous stretch of country where, as in Russia, a liking for "the cup that cheers but not inebriates" is already firmly rooted. After South America is won over there will remain no more worlds for Anglo-Indian enterprise to conquer by tea.—*Globe*, June 5.

NEW AREAS OF CULTIVATION IN THE NORTHERN PROVINCE IN 1898.

As stated in my Administration Report for 1896, there is hardly any scope for extending the cultivation in the Jaffna peninsula. The following figures show the extent of the new area brought under cultivation as estimated by the headmen, and the extent sold during the year:—

	Private Land	Extent sold	
	estimated	at the	
	by Headmen.	Kacheri.	
	Acres.	Acres.	
Jaffna.			
Fit for coconut ..	—	..	73
Fit for paddy ..	9	..	72
Fit for garden ...	—	..	30
Mullaittivu.			
Fit for paddy ..	136	..	367

The Assistant Government Agent of Mannar states that no new land has been opened in his district during 1898, and that there is no likelihood of any attempts being made to extend the cultivated area until after the restoration of the Giant's tank. There is a great opening for coconut cultivation in the Mullaittivu district, where the soil and climate are favourable. I refer to the remarks of my Assistant regarding this.—*Mr. Levers's Report*.

SATINWOOD.

CHLOROXYLON SWIETENIA D.C.

Brandis in his "Flora of North-West and Central India" thus speaks of this tree:—"A common tree in the Satpura Range, the Dekkan, the Konkan, and the drier parts of the peninsula and Ceylon. A small tree in Central India, in South India attaining 30-40 ft.; trunk straight, symmetrical. Bark yellow, soft, corky, $\frac{1}{2}$ in. thick or more. Heartwood, with a beautiful satin lustre, fragrant, when seasoned, greenish white with a yellow tinge, or yellow, mottled, and feathered, close grained. Heavy the cub. ft. weighs 51-66 lb. when seasoned and 70-75 lb. when green. The value of P. has been found to fluctuate between 600 and 1059, and the average may be taken at 800. Has been compared to box, not found suited for engraving, but is excellent for turning. Employed for agricultural implements, cart-building, makes beautiful furniture and picture-frames. Imported into England, used for cabinet work and the backs of brushes."

My experience of Satinwood in India being most limited, my remarks apply mainly to this tree in Ceylon, where it attains its best dimensions.

DISTRIBUTION.—The annexed sketch map shows, roughly, the distribution of this tree over the island. It will be seen that it is only absent from the South-Western portion, *i. e.*, from the portions affected by the South-Western monsoon, and from the higher mountain ranges. I have seen some trees at an elevation of about 1,500 feet in the Province of Uva, and a few trees in the intermediate rainfall zone near Kurunegala, but, as a rule, it can be said that it is not found above an elevation of 800 feet, and in localities with a rainfall of over 65 inches. The finest forests are in the Northern portions of the Batticaloa district, and in the Puttalam district. In the Northern portion of the island, the trees, although abundant, do not attain very large dimensions.

SOIL.—Satinwood requires a light sandy soil with good subsoil drainage. It is also found on well-drained rocky hills, if there is not too much clay in the soil.

SYLVICULTURAL REQUIREMENTS.—This tree is essentially a shade-avoiding tree, except perhaps in its infancy when, like other trees, belonging to the natural order of the Meliaceae, it prefers side-shelter or low cover. It springs up readily in clearings, but is also found along the sides of forest roads and lines or growing in the midst of bushes in old clearings abandoned by the chena cultivator. In this respect it is a valuable re-forestation agent; for, after the chena cultivator has cut and burnt off the jungle and cultivated it for two or three years, a rank growth of spiny and prickly bushes springs up, which the Satinwood helps in again becoming valuable forest. In high forest, especially if the leaf canopy is not dense, or if it is not high, Satinwood seedlings germinate readily enough, but they require the aid of man to develop into trees. It is for this reason that in Ceylon forests of a certain age, although large and medium-sized trees are not uncommon, there is a remarkable absence of saplings and poles. This has led Mr. Vincent, in his valuable Report on the Ceylon forests, to state that the natural reproduction was poor. The contrary is, however, the case; but up to recently the Government did not do anything to replace the trees taken away by helping the young seedlings, and no cleanings or seed-fellings have been carried out. It appears to me that the correct treatment for Satinwood is to girdle trees for some distance to leeward of the seed-bearers, in sufficient numbers to give light to the soil without encouraging the growth of rank grass and weeds, and far enough to let the light seed, which is carried to some distance by the wind, have a chance of developing into seedlings. As the seed ripens before the North East monsoon, the girdling should be done early in the year, and at the same time all large climbers which invade the crowns of the trees should be cut. After the seed has germinated and the

seedling established itself, it requires direct overhead light, and this should be provided, but caution must be exercised in not girdling too many of the dominant trees, for this might lead to an invasion of insects which would be liable to attack the seedlings as well as the girdled trees.

DIMENSIONS AND RATE OF GROWTH.—Satinwood grows to a large tree, except in wind-swept localities near the sea, where it attains only small dimensions. The crown is large, as can be expected with its light, feathery foliage; the bole, although it attains a girth of 8 or 9 feet is usually comparatively short, *i. e.*, rarely over 30 feet in height. This is due to the requirements of light by the tree which early forms branches in order to develop a large crown. As regards the rate of growth of the tree, the data which we have at present are unfortunately not very reliable on account of the small number of trees in each sample plot and in consequence of the habit of mixing up trees of different girth-classes, and of calculating the average girth for all. This method of measurement has now been given up and the trees are measured by girth-class, and it is hoped that in a few years reliable data will be obtained. I have gone carefully into the figures available and the following appear to me to give a fairly correct idea of the rate of growth of an average Satinwood tree.

Age of tree 18 inches in girth	..	20 years
do do 3 feet do	..	45 do
do do 4ft 6in do	..	75 do
do do 6 feet do	..	125 do

If this estimate of the rate of growth proves to be correct, it takes 50 years for a tree 4ft. 6in. in girth to reach a circumference of 6 feet. If, therefore, the exploitable size is taken at 6ft. as it is now in Ceylon, it would be proper under the selection method of treatment to go over the forest in 50 years, taking all the trees 6ft. and over which can be spared from a silvicultural point of view. In all forests, it would be better still to go each year, on an average, over one twenty-fifth of the area, taking only one-half of the exploitable stock or confining operation to trees whose removal is most urgent.

We have not yet sufficient experience to know, in the event of the Regular Method being adopted, how many years before the final fellings the seed-fellings should be made. Observations made in our forests since 1891, show that the Satinwood flowers abundantly every year and it is probable that seed-fellings made some 7 to 10 years before the final fellings, would give a good crop of seedlings.

ENEMIES.—This tree, like others belonging to the same natural order, is liable to attacks from insects which bore into the pith of the young shoots. A large number of trees die from the attacks of the larva of a beetle, probably a longicorn, which makes galleries between bark and wood, that not unfrequently girdle the tree. The young saplings are very liable to injury by stags, since these prefer them to any other trees for rubbing off the velvet from their horns. This preference is probably due partly to the corky nature of the bark and partly to the gum, which exudes from wounds and soothes the irritation which the animals feel. In some parts of the island the trees are liable to the attacks of a fungus, which rots the centre of the tree and causes a clean hole, sometimes throughout the length of the bole. This is the case particularly in the South-Western portion of the island. Satinwood does not resist fires well.

THE TIMBER.—The weight of 12 well-seasoned pieces taken by me from different parts of the island, varied from 55.2 lb to 65.4 lb per cub. ft., and the average was 59.92 lb or cub. ft. This is a somewhat average than that of the specimens higher tested by Mr. Smythies in 1878, which averaged 57lb. Seasoned wood can, therefore, be said to be lighter than water. The wood is hard and strong, takes a beautiful polish, and is extremely durable. The most valuable wood is that which is known in Ceylon as "flowered," and in the home market as "figury" wood, especially if it is light coloured and can be used together with West Indian satinwood. The price of

flowered satinwood in Colombo ranges from R4 to R7 per cubic foot in the log. It has not yet been ascertained what the figure in the wood, which is merely curly fibre, is due to, and whether it is hereditary. It was found in some abundance in one of the forests of the Puttalam district, which was exposed to the full blast of the monsoons and wind may have something to do with it, but I think that it must be due also partly to the soil. There is streaky and curly flower, and it is the latter which gives the prettiest effects of satin-like lustre and which fetches the best prices in the market. Unflowered satinwood fetches prices up to R2.50 per cubic foot according to colour and size of the logs. Light-coloured logs are preferred although the darker ones are better for patching up old cabinet work. Logs of a dull, muddy colour are not appreciated. The best logs as regards colour and size are now obtained from the forests in the East of the island. Fine logs used to be obtained from Puttalam, but these forests have been more or less exhausted by timber traders in the old days. The finest logs I have seen were eight to nine ft. in girth.

The logs for the home market are sent to the Central Timber Depot in Colombo, where they are tested for "flower," and the flowered logs set aside. Hitherto they have been sold according to market rates; but, in future, on account of the great demand for flowered logs, the latter will be sold by auction. The proportion of flowered logs is not much above 5 per cent. Satinwood is also sold at the Forest Depots or, when possible, standing in the forests. This has been the case in the Eastern provinces, where first-class logs have been stamped over one-sixtieth of the area, but the sale of the *coupes* was effected after the picked logs had been felled and sent to Colombo.

The strength of the wood has not yet been tested with pieces of a proper size, the largest specimens tested having, according to Gamble, a cross-section 2 in. square. I have not much faith in tests made on pieces of timber which may be taken from any part of a log, and should like to see the example of the University of Sidney followed, where Professor W H Warren tests pieces of timber of the dimensions ordinarily employed for construction. According to Gamble the value of P. varies from 504 to 1,059, but I think, that, on an average, it will be nearer 1,000 than 500.

The uses to which this timber is put in Ceylon are the following:—

Cabinet work and furniture. Satinwood furniture is however, heavy; and is really suitable only when finely made, as in the case of Chippendale patterns. In cart-building it is used for the naves and spokes of heavy carts. It has been much used for house and bridge building, and the bridge at Peradeniya, near Kandy, consisting of a single arch 205 ft. wide, is built entirely of this wood. Ball-room floors made of Satinwood are considered good, but to my mind they are too hard, wanting in elasticity and much too hard, too slippery for dancing. Sleepers made of this timber have lasted over 20 years on the Ceylon Government Railway, and experiments are now being carried out in the new Colombo Harbour-works to test its resistance to the *teredo*. The pieces have only been put in position a year ago, but so far they are intact. In the North of the island the wood is used for oil mills; and in the Eastern province, hollow logs are in great demand for wells. Ploughs are usually made of this wood.

MINOR PRODUCTS.—According to the Dictionary of Economic Products, this tree yields a yellow dye and a wood-oil. I have, however, never heard of these products being employed in Ceylon. The bark, like that of other Meliaceæ, has medicinal properties, and a gum exudes from it which might prove to be a good substitute for gum arabic. A. R. BROWN in *Indian Forester*.

Colombo, 28th March, 1899.

THE PLANTING SEASON AT ZANZIBAR.

The spell of dry which we have experienced for two years has at last terminated and the country from end to end will now be busy planting. 7.13 inches of rain fell at Dunga on April 2nd 6.07 inches; being recorded between 5 p.m., and 3 a.m., and 10.18 in the great rain of the 23rd. Sweet potatoes, mulhogo, Indian corn, mtama, ground nuts, rice will all have been put in. We have called attention elsewhere to the expediency of planting cloves and the same urgency may be pleaded in favour of coconuts. Arabs don't plant now-a-days; a few hundred coconuts here and there perhaps, but nothing more. What will be the state of this country in another decade or two if the yearly waste among the cloves and coconut plantation is not repaired? The rearing of a coconut plantation is a long but not a laborious or expensive process, and money put into a coconut plantation is like money put into the bank, and at good interest too. We can understand the reluctance of Arabs to embark upon new ventures like cocoa, coffee or vanilla, until something definite has been ascertained as to their suitability to this country but every planter on the island knows the value of the coconut industry.—The *Shamba*, March, April and May.

COFFEE CULTIVATION IN CEYLON AND THE STRAITS.

WE are indebted to Mr. E. V. Carey for an interesting letter addressed to us on his experience of Liberian coffee and hybrids from Coorg plants in the Straits. It is too soon to draw conclusions as to the success of the latter, but so far all is promising; and it is certainly of interest to learn that the hybrids are free from the leaf fungus pest. Long may they continue so!

Meantime we learn from a very experienced Ceylon planter that coffee in Udapussellawa at 5,500 feet elevation and more or less under dense shade, is cropping well this year. There is hardly any "bug" to be seen on this coffee and *none at all* where the shade is very dense, although the crop is just as heavy as in the open—indeed heavier. This, our informant remarks, "conveys a lesson; but it comes too late." But then, we would remind him how shade did not save the well-known Hopewell coffee in Hantane, rising up to 4,000 feet; and we have a clear recollection of a delightful coffee clearing on Nilambe estate in the middle "seventies," which, we believe, was opened very carefully under shade; but where is it now? Nevertheless, we sincerely trust that the experiment in Udapussellawa at a much higher elevation, and on splendid virgin soil, may continue to be very successful.

CATTLE FOR NORTH CEYLON.

Nearly a thousand head of bulls and calves were landed last week at Kayts, being brought from Puliur in South India by some Moors. We also learn that some of the Maniagars, during their recent trip to the metropolis, purchased and brought with them some very fine cows from the Government Dairy.—*Cor.*

NEW COMPANY.

ANTI-TANNIC TEA INFUSER, SYND LD. (62,257).—Registered May 24th, with capital £8,000, in £1 shares, to acquire the business carried on at 180 West Regent St. Glasgow, to adopt an agreement with John Marshall, to carry on the business of manufacturers of and dealers in china, hardware, and household utensils, and to cultivate and deal in tea, coffee, cinchona, and other produce. The number of directors is not to be less than 3 nor more than 7; the subscribers are to appoint the first; qualification £100; remuneration £75 each per annum (£150 for the chairman Registered by King and Co. 77 Gresham St., E.C.—*Investors' Guardian*, June 3.

HOW TO MAKE GOOD TEA.

At the suggestion of a well-known planter interested in the reputation of Ceylon tea, we printed off 500 cards and sent them on board the ss. "Olympia," in the hope that each recipient of Sir Thomas Lipton's generous gift of a 5lb.-box of tea will take care to follow the directions:—

[With the compliments and good wishes of the Editor "*Ceylon Observer*."]]

HOW TO MAKE A GOOD CUP

FROM

PURE CEYLON TEA.

First fill your kettle with FRESH water; then see that it really BOILS. Next warm your TEAPOT, and put one small teaspoonful of tea for each cup required; then pour on the required quantity of boiling water, infuse for FIVE minutes, then pour off the tea into another teapot or cups ready for use. [Milk and sugar added according to taste.] Thus treated, CEYLON TEA will give a liquor, pure, delicious and fragrant.

On no account should a second brew be obtained from the same leaves.

THE INDIAN TEA CAMPAIGN.

The "Times of Ceylon" has dragged us into the arena of its little sparing match with the *Madras Mail*, not "to see fair play," but as a supposed ally. We must disclaim the honour. Our contemporary introduces us in these terms:—"Meanwhile there is a little paper, known as *Planting Opinion*, which is produced much nearer to the planting districts of Southern India than the *Madras Mail*; and it does not back up the separation idea at all. It reproduces the first editorials on the subject; and is delighted that Travancore Associations are subscribing to the central fund." We need not go into the geographical question, as our greater proximity to the planting districts is a mere matter of yards, if not of inches. We would only say, that when, some little time ago, we urged South Indian planters to push onwards, and to combine for the purpose, we were mostly in favour of *South Indian* combination. That we approved of Travancore subscriptions to the I.T.A. is true. Better half a loaf than no bread at all. Our Colombo contemporary accuses our Madras neighbour of affecting a lack of perception after the former's statement that Ceylon wants the co-operative system revised because the present one is unfavourable to herself. But the *Mail's* question was to the point:—"If Ceylon has had less advantage than India out of co-operation up to the present time, why should she wish to continue a system that is unfavourable to herself?" It is, we think, absurd to suggest that India has reaped a greater advantage than Ceylon out of the joint efforts of their Commissioners. It is perfectly clear that Ceylon would not wish to continue co-operation, unless she saw something to be gained by it. As for South India, she is too small to help her big brethren materially, and, consequently, if she co-operates, can

only expect to reap very small benefits, unless she attempts to get an unfair share on the sly. This would be a course unworthy of her. Of course, it is impossible for her to conduct a campaign on broad lines such as those of the Ceylon Planters' Association and the Indian Tea Association, but that she can quietly and at small cost bring her teas under the notice of buyers in various markets is beyond question. Hers cannot be a series of massed operations, where numerical count for nought so long as the battle is won. On the contrary it must be the advance of a small but resolute body of men, bent upon making every shot tell, knowing that the "shot in the locker" is not over-plentiful.—*Planting Opinion*.

TEA COMPANIES' ACCOUNTS.

There is a proverb to the effect that "Speech is intended to conceal one's thoughts," and there is another common saying that "Figures can be made to prove anything." Whatever truth there may be in the former, there need be absolutely none in the latter; for accounts properly kept, can only show, and show plainly, *facts*—alas! too often, hard, logical, stern facts. But what can be, and often is, done, is to unwisely mix up the different branches or heads of account; with a result following, that no clear perception of facts, as they really are, is practicable. It has long been a matter of complaint, both in England and in India, that the accounts of some public companies are far from being as perspicuous as they might be, and ought to be. This is the more to be regretted in India, because so many shareholders are almost permanently absent from Calcutta. A man may be, and in regard to tea often is, a shareholder in several companies. He takes up the accounts he has received, and finds probably a different system and classification adopted in each. He tries to make some comparison, but finds it impossible.

It may, therefore, not be out of place to suggest greater uniformity and more particularity of detail. If it be answered that those concerned have it in their power to obtain information at any time, on any point, from agents, we would remark, in the interests of agents themselves, that it would be found to add greatly to their labour and inconvenience if such references were at all frequently to be made. It may be said, if the experience of agents is that such references are not as a rule made, we would reply that when a shareholder finds his investments unprofitable, he will probably be inclined to take a little more interest in his affairs than he is now found to do. Or if, again, it be argued by the executive that it will be time enough to change when shareholders think it worth while to demand it, we would say, rather anticipate any objections that may possibly be made, and show that you are desirous to prove that you have nothing to conceal, but that, on the other hand, you invite the fullest examination of every part of the company's expenditure. We know very well that directors and agents are blamed sometimes unjustly, and held responsible for inevitable results, which they have earnestly striven to mitigate the effects of, in the interests of their shareholders. The more clearly explanations are put before those concerned, the better for all parties.

Speaking generally, we think that a statement of expenditure should be absolutely separated into garden and Calcutta outlay. By Calcutta outlay we mean that really *appertaining* to Calcutta, and not including, as is often the case, garden stores purchased, or garden payments made, in Calcutta.

Regarding the item of "stores' outlay" only such portion as is actually consumed during the season should be entered to debit of the year's account, and this figure should be derived from the garden at the end of the year, supported by detailed lists of stock on hand. For all stores purchased, the agents would keep "Suspense Account" with the garden, writing off "deficiencies" only, annually, and carrying forward "balances" as an asset. There is little trouble or risk attending this plan, which, indeed, some have adopted. The mere fact of the purchase of a certain amount of stores during the year, does not necessarily entitle that amount to be altogether debited in that year's account, but we believe it often is so done. Thus matters are made to look worse than they really are, besides which, if the manager is paid partly by commission, he may stand, thus, to be much prejudiced in any one year, and the next he may die or leave.

The expenditure on the garden during the season is, (except in respect to bonuses, new machinery and buildings), of course, all fairly debitable to that season; but it may be quite otherwise in respect to certain items of payment through agents in Calcutta. We would, as we say, have only so much of that expenditure as really belongs to the season, entered in the statement of the year's expenditure. Supposing, for instance, an original batch of three years' agreement coolies to be forwarded, 50 per cent. only (say) of engagement and importation cost should be debited to the first year—the remainder being recoverable during the next two years. The same may be said, also, of coolie bonuses, only in this case, as the people have become, then, acclimatised, the cost might fairly be distributed equally over the whole period of re-engagement. This is sometimes done, it should be always done; and so, also, as to the matter of stores proper, before adverted to.

We would greatly multiply the headings at present in use. There is no difficulty, trouble, or expense in so doing. Vouchers being made out for every item of expenditure, and submitted for passing to the competent authority, it would only need to endorse, on the face of each voucher, when passing it, the account to which it was to go. These vouchers being properly posted, shareholders would thus be able to see, at a glance, what was the amount of each main item of expenditure; and assuming that a uniform system was thus the adopted, a comparison of the cost of working, the several companies could readily be made taking into account, of course, their relative acreage, and any special circumstances prevailing.

At present tea companies' reports can scarcely be said to afford sufficient information to shareholders, nor are the accounts detailed in a manner sufficient to permit of that examination and comparison which it is the duty of the shareholders to make, and which, we submit, it would be desirable that agents should render easy and practicable, even in their own interests.—*The Planter*, June 17.

PLANTING NOTES.

CEYLON TEA IN AMERICA.—We direct attention to the communication by Mr. Pineo published in another column in which it is shown that the way in which to secure and 'hold' the consumer is by working through the retailer who should be assisted in every reasonable way by the Commissioner in advertising and through demonstrations.

FERTILIZERS should not be allowed to come in direct contact with the seed of any crop. This caution is constantly urged in fertilizing pamphlets and otherwise, but most of us fail to properly heed it. Careful and scientific tests have shown that "ammouia nitrate of soda, chlorate and sulphate of potash and ammoniated superphosphates exert an injurious effect upon the germination of seed in general." But this can be wholly avoided by mixing the fertilizer with the soil.—*Hawaiian Planter's Monthly*.

JARRAH-WOOD PAVING IN LONDON.—Australian wood as a paving material is ousting the softer woods previously in use in London. In the report to the Vestry of the Chairman of the St. Pancras Department of Works it is stated that the hard Australian wood lasts longer and decreases splashing. The western section of Euston Road was paved seven years ago in section of Swedish, Jarrah, and Karri blocks. The Swedish timber broke up so rapidly that a vote of urgency had to be obtained for replacing it with the Jarrah blocks.—*Home paper*.

THE OPIUM TRADE OF BENGAL: IMMENSE INCREASE.—It is notified that during the calendar year 1,900 not more than 44,400 chests of Bengal opium will be offered for sale, and not more than 3,700 chests in each month; also that not more than 2,000 chests each month will be Benares opium, and not more than 1,700 Patna opium. No reduction in these quantities will be made without three months' notice. The figures show in a striking manner how production must have increased in the North-West Provinces and Oudh, Ghazipur and Patna having changed places in respect of the quantity of opium manufactured.—*Pioneer*, June 25.

A LIVING ADVERTISEMENT FOR CEYLON-INDIAN TEA.—Thus the *American Grocer*:—A. Nicholson, of New York, resident representative of the Ceylon and India tea growers, was a welcome visitor among the "trade" here last week. Mr. Nicholson is a worthy specimen of our English consins, and if he has thus developed by the stimulating effects of Ceylon-India tea, he presents in his physical and social qualities a "big card" to encourage its more general use. Mr. Nicholson states that the sales of the above tea in Philadelphia are in the proportion of 500 chests as against 5 chests five years ago. Coupling the above facts, we shall certainly look for a generation of Quaker giants when our growing tea-drinkers shall mature.

COFFEE IN MEXICO.—The "North American Review" has a paper on "Mexican Haciendas—the peon system"—that is the labour supply. The writer makes out that of the three divisions of Mexico, "cold," "temperate" and "hot," haciendas (plantations) in the last pay best, and up to a few years ago were calculated to yield a yearly interest of 14 to 15 per cent. and to repay outlay in half-a-dozen years. From "coffee" even now, we are told, a yearly income of 20 per cent. on the value of plantations in 1892 can be got; while a majority of the coffee investments established five or six years ago now yield from 40 to 150 per cent. on the sum of their cost. This is too highly coloured to be accepted; because we cannot believe that the hard-headed Ceylon planters, who exploited Mexico in 1897, would have declined to invest, had there been such profits available.

COFFEE-GROWERS should not be discouraged by the present low prices, says the *Hawaii Planters' Monthly*. This is sound advice, and is based on conditions that are a repetition of the history of the coffee trade. Higher prices will again return, as they have in the past. In 1886 there was an era of low cost, and the industry being unprofitable, the planters neglected their plantations and no new areas were cultivated. The supply was out of relation to the world's requirements, and an era of high prices followed, and this stimulated coffee-planting in Mexico, Central and South America, and in time has brought out an excess of supply and present low prices. There is no excess of fine coffee, and the result is the wide range in quotations—from seven cents for low grade up to 33 cents for the finest raw Java and Kona.

INOCULATION AGAINST RINDERPEST IN INDIA.

—In the last issue of the *Pioneer* to hand we learn that successful experiments in inoculating cattle had been made in the N. W. Province of India, at the instance of Capt. Rogers Imperial Bacteriologist. Care was taken not to prejudice the natives against the measure, a Tabsildar or Deputy collector being sent to the village where our outbreak was announced; he assembled the chief landlords and *raiyats*, explained the use of inoculation and asked them for their consent without which no operations were performed. The Lieut.-Governor of the Province expresses the hope that general inoculation of cattle would follow upon the successful first experiments at Bareilly. In Ceylon there has not been evidence of so much prejudice as in India and the importance of preventive measures to check rinderpest in the island is equally great.

INDIARUBBER IN FRENCH AFRICA.—We direct attention to an interesting Report (see page 110) on Rubber operations—in hand, intended or advised—in French West Africa. Besides the indigenous *Landolphia*, the four best-known American kinds (Para, Castilloa, Ceara and (or) Maniçoba) have been introduced; and although it is too soon to get results, yet there is a good deal of interesting information afforded, especially from an official point of view and we see that both the French and Belgian (Congo) authorities are most fully alive to the necessity of replanting in order to make up for the present ruthless waste of rubber-yielding trees and creepers by the natives in their harvesting. How this is proposed to be done, we must leave our translation on page 110 to say.

AGRICULTURAL CONGRESS AT THE PARIS EXHIBITION.—A programme has reached us by a recent mail of the coming Sixth International Congress of Agriculture to be held during the Paris Exhibition next year from July 1st-8th. With it comes a printed letter from M. Jules Méline, President of the Commission, in which he states that the Commission appeals to agriculturists and farmers of every land, asking them "to lend their aid in increasing the importance and the *éclat* of this great reunion which should draw together the bonds that already exist between the agriculturists in all countries." Sir Ernest Clarke, Hon. Cecil T. Parker, and Mr. R. W. Granville-Smith are to represent Great Britain on the Commission. But as far as we can see, the subjects to be discussed concern Agriculture in Europe alone.

USEFUL TIMBER TREES.—The Queensland "Agricultural Journal" gives particulars of several timber trees which seem easily grown and very useful: first, there is "The Swamp Oak," *Casuarina glauca*, growing 30 to 90 feet with a diameter of 9 inches to 3 feet, according to soil and locality, and of which we are told:—

The timber of the Swamp Oak is of a reddish colour, beautifully marked and very close-grained. It is also hard and durable, strong and tough, and is valuable, and much used for shingles and staves. It is also useful as a cabinet wood. The straight saplings make splendid rafters for bush buildings, and old trees, with plenty of heartwood, make good posts, lasting well in the ground. All the *Casuarinas* are splendid trees for planting. They are all of very rapid growth, and make good breakwinds, copees, or shelter plantations. The saplings are always useful for many other things besides the speedy supply of excellent firewood which they give. These trees form one of the most striking features of the Australian landscape. Their leafless branches and black, gloomy, sombre appearance always make a sad impression on the traveller, and whenever there is a slight breeze there comes from them a dull, depressing sigh. They are remarkable as belonging to a class of trees which abounded in the forests of other countries in long-past geological ages, as is evidenced by the fossil remains frequently found in the coal measures. The Swamp Oak, besides being a quick grower, is a very beautiful tree if planted apart, its tall, straight-stemmed trunk and pendulous leafless branches showing well.

Next the "Horse-tail Oak," *Casuarina equisetifolia*, 50 to 150 feet high and 12 to 30 inches in diameter:—

The Horsetail Oak produces a dark-coloured timber, coarse but closely grained, beautifully marked, hard, light, and tough. It is useful for shingles, staves, and veneers, and for all purposes where lightness and toughness are required. Its timber makes splendid fuel, giving great heat and leaving very few ashes.

The "Erect She-Oak," *Casuarina suberosa*, 30 to 50 feet by 12 to 24 inches in diameter:—

The timber of the Erect She-Oak is of a dark-brown, very prettily marked, coarse in the grain, but hard and tough. It is a handsome timber, strong and durable, and is very valuable. It is used for bullock-yokes and hurdles, shingles, staves for buckets, kegs and tubs, mauls, &c. It is also useful in cabinet work and for veneers.

The "Forest Oak," *Casuarina torulosa*, 30 to 80 feet by 9 to 24 inches in diameter:—

The timber of the Forest Oak is of a reddish colour, and very nicely marked. It is a handsome wood, sometimes remarkably heavy, and of great strength, hard, tough, and close in the grain. It is in much demand for durable shingles and furniture-work, and is also much used for yokes for bullock drays and wagons, and for staves. It is also valuable for cabinet work, and gives a handsome veneer. It furnishes one of the best timbers for fuel, and is thus greatly in favour both for domestic use and for heating bakers' ovens. It burns with a clear white ash, and leaves no cinders. It is a tree which is worthy of cultivation, for when growing on good soils it makes a handsome tree.

The editor adds on the *Casuarina* generally:—

All the *Casuarinas* ought to be planted more frequently than they are. They are all fast-growing trees, growing as much as 3 and 4 feet in one year in height, and are all useful. There is no waste, for the timber of all species makes excellent firewood. Besides this, they make excellent breakwinds or shelter plantations. For general beauty and use (in so many ways) they are hard to beat, and farmers and settlers might do worse than plant some of them.

Perhaps Mr. Nock may be able to tell us how some of the above have grown at Hakgala, or are there any at Peradeniya and in Colombo?

AN ENTERPRISING PLANTING COMPANY.

Southern India, having shown the way in the introduction of electric tramways, is now showing the way in the introduction of electric ropeways for ghaut work. One of the links in the communications between the sea-board and the Kanan Devan Hills in North Travancore, where the big planting concern started by Sir John Muir is now spending huge sums in developing tea and other cultivation, will be a ropeway for the ghaut section between the hills and the Madura plains which will be quite unique in several respects: (1) it is being built locally in the Planting Company's own workshops; (2) it is to be driven by electricity; (3) it is one of the biggest undertakings of the kind in existence; (4) it rises over 4,000 feet in 2½ miles. The light railway from Ammayanayakanur, on the South Indian Railway, for which a concession has lately been granted to Messrs. Wilson & Co., and which is about to be put on the market in London, will run right to the foot of the ropeway. Then, on the top of the ghaut, from the upper end of the ropeway, a light single-rail tramway, on Ewing's system and worked probably by electric motor cars, will run for 22 miles through the tract of country that is now being opened up for cultivation. Some idea of the amount of work that is being done on these Hills and the amount of capital that is being spent, may be gathered from the fact that there are some 75 Europeans employed there at present. A correspondent now up there writes to us:—"I is a beautiful country, but inaccessible at present. However, when the ropeway is completed (a few months hence, it is hoped) one will be able to go up the ghaut in half an hour and pass from the red-hot climate of Kotagoodee at 2,800 ft. to the beautiful climate of Kundale at 6,000 ft. It is opposed to start a hill-station here before long. It will be laid out in such a way that the drainage will be perfect and typhoid fever unknown. Arrangements will be made for constructing one or two lakes of very considerable size, into which trout and other fish will be introduced. The whole of this new planting district is now connected up with telephones, so that every one is practically in communication with the whole world from his bungalow. And last, but not least, the climate is very fine." The moving spirit in the enterprise is Mr. Davidson, formerly of Ceylon, who has been working from dawn to dark every day for the last 18 months initiating, guiding and controlling the numerous important works that are connected with the Company's big programme of operations. Seldom, if ever, we should say, has a tract of hill country been opened up so quickly and, comparatively speaking, so thoroughly. It is a wonderful example of what energy and enterprise can do when backed by sufficient capital.—*Madras Mail.*

TO SUPPLANT TEA.

SOUTH AMERICAN HOLLY, MAKING THE ATTEMPT.

Our cup of tea is threatened with a rival in our affections, and one no less formidable than "mate," the tea substitute of Buenos Ayres, Paraguay, and other South American territories. The shrub from which it is made is the *ilex paraguayensis*, and looks like an English holly tree, which, in fact, is one of its cousins. Not only the leaves are used, but the whole plant—stalks, bark, and all—after being dried, is chopped up rather finely, and is ready for use. The mate cups are made of gourds, the stalk part forming a short of handle at the side, and a little opening is cut in the top. The tea, stalks, dust, &c., are put into the cup, and boiling water is poured over it. You take your mate through a tube—instead of a straw—with a strainer at the end. Milk and sugar can be added, and the mate poured into everyday cups, but that is not the really professional way of taking it. The beverage is paler and more

bitter than our own tea, but those who have learnt to like it drink it far more lavishly than we drink tea. In fact, English residents in South America say that mate is the one thing continually in evidence there. Entering a bank to do business the usual thing is to have a smoke and a cup of mate before mentioning the object of the visit, and at every house the visitor learns that it is a breach of etiquette not to accept a cup. At a party or circle of friends a larger mate cup is passed round, and everyone takes a suck at the same tube.

Old stagers who have lived out in South America for a score or so of years cannot do without their mate, and have it sent over here to them; but you may break yourself off the habit if it is not too inveterate. The British Acting-Consul in Paraguay is bringing the mate under notice; but it is doubtful whether it will ever seriously challenge our own tea.—*Morning Leader.*

MINOR PRODUCTS REPORT.

COCOA BUTTER.—In auction at Amsterdam, on June 6th, 70 tons Van Houten sold at 73½c to 77c, 3½ tons Helm at 74½c to 75½c, 3 tons Hamer at 75½c, and 10 tons Suchard at 75c per half kilo. In London, on the same day, 65 tons Cadbury's brand sold at 1s 2½d to 1s 2¾d (average 1s 2¾d, against 1s 2½d in March).

QUININE is quiet, and in consequence, easier. Spot transaction include B. & S. or Brunswick at 1s 4½d to 1s 5d. August delivery 1s 4¾d to 1s 5d; June delivery at 1s 4¾d per ounce; and spot 1s 4¾d with buyers at 1s 4d. French can be had at 1s 4d. In auction two cases Zimmer, containing ten tins each of 100 oz, were bought in at 1s 4½d per oz.

ARCA NUTS.—Fine Ceylon partly sold 25s per cwt.

CARDAMOMS sold with fair competition at slightly dearer rates. The following was the range of prices:—Ceylon-Mysore, fine medium to bold pale pods, 3s 1½d to 4s; good bold steady 3s 10d; medium to bold pale 3s 5d to 3s 6d; dull small to medium ditto 3s to 3s 3d; bold dull long pale 3s 2d; medium lean pale 2s 6d; pale medium long 2s 10d to 2s 1½d; small pale long 2s to 2s 4d; long dull bleached 2s 9d; very small lean 1s 9d; medium dull long 2s 2½; good splits 2s 3d; long, lean and split 1s 6d to 1s 9d; brown splits and pickings 1s 8d. Ceylon-Malabar fair to medium lean palish 1s 1½d, and small brown lean 1s 8d; fair wild Ceylon 2s 6d per lb. Seeds, good brown 2s 4d; mixed seeds 2s 2d. Shipments from Ceylon from January 1st to May 16th were 216,087 lb.

CINCHONA.—In auction the demand was for crown and grey bark only, which sold as follows:—Good bold pale Crown Loxa 7½d per lb; 1 c.c. damages 5½d to 6½d; second class 3¾d to 4¾d; and fourth class 2d. Dusty grey Huanoco, broken was bought in at 5d, and Bolivian cultivated calisaya, thin was limited at 10d per lb, and Cartagina, flat at 4½d per lb. Four bales of flat calisaya brought 4d per lb, subject to approval. The shipments from Ceylon from January 1st to May 16th were 284,371 lb. The stocks in first hands at Amsterdam on May 31st consisted of 2,403 packages Government and 9,996 packages private bark. The arrivals last week in Amsterdam were 2,553 packages. The "Netherlandsche-Veem" reports the cinchona bark shipments from Java during May at

	1899	1898	1897	1896	1895
Amst. lb	943,000	672,000	600,000	768,000	402,700
Jan.-May	3,964,800	3,884,000	2,510,000	3,260,000	2,879,700

while the "Vriesseveem" received a telegram from Java announcing the shipments from May 2nd to June 5th at 1,156,000 Amst lb, and from January 1st to June 5th at 3,848,403 Amst lb.

CITRONELLA OIL.—Dull of sale, at 1s to 1s ¾d per lb in drums on the spot, and for August shipment there are sellers at 10¾d per lb c.i.f. in drums. A parcel of 5 packages catalogued as guaranteed to pass "Schimmel's test," sold without reserve at 1½d per lb; other parcels of good odour were limited at 1s 1d per lb. The Ceylon

shipments for the week ending May 9th were 19,788 lb, and from January 1st to May 9th they have been:—

Lb ...	1899	1898	1897	1896
	393,275	432,356	443,775	359,494

VANILLA.—Moderate supplies were catalogued today, and mostly sold at 1s higher as follows:—Madagascar, 8 to 8½ inch 15s 6d; 7 to 7½ inch 14s; 6 to 6½ inch 13s 6d; 5 to 5½ inch 12s to 12 6d; Seychelles, good chocolate 5 to 6 inch 17s to 18s; 4½ to 5 inch, 16s. Bourbon fine bold, 8 inch 26s 6d; 7 to 8 inch 26s; 6 to 6½ inch 28s; 6 to 7 inch 20s; 5 to 5½ inch 23s; 3½ to 4½ inch 22s 6d; mixed sizes 10s 6d to 13s 6d per lb.—*B & C Druggist, June 10.*

FROM THE NILGIRIS:—CINCHONAS.

Mr. T. C. Anderson and Mr. A. E. Scovell returned recently from their trip to the Nilgiris, highly pleased with the visit and all they saw. The little Railway up to Coonoor is working well now and is a great convenience:—three bogie carriages with an engine behind make an up-train. The line is now being carried on to Ooty itself and may be prolonged down one of the Western Ghats. Mr. Anderson met Mr. Standen, Superintendent of the Government Cinchona Gardens, who had been on a three months' trip to Java (where he saw succirubra trees two feet in diameter), to Darjiling, &c. He thinks very highly of Glen Morgan hybrid trees of which there are 40,000 of a mature age. These Mr. Anderson thinks of coppicing this year: his bark has analysed over 6 per cent. The seed is very carefully collected only when fully ripe and from mature trees.—Tea is also doing well on Glen Morgan.

KANAN DEVAN PLANTERS' ASSOCIATION.

ANNUAL REPORT OF COMMITTEE.

In presenting the Annual Report, the Committee congratulate you on the absence of cholera from the District, largely due, they believe, to the steps taken by His Excellency the Governor Madras to improve the sanitary condition of Bodinayakanur. The success of last year's planting in the District, coupled with improved prices both for tea and cinchona, make the outlook for the future satisfactory. Coffee prices are unfortunately low, but crops all round have been exceptionally good this year. The absence of the Chairman on a well deserved holiday, and the departure of the Secretary, Mr. Sharp, to another District, leave blanks in the Association, which are felt by all. The improvements in Post and Telegraph services are greatly appreciated, and it is to be hoped that the improved postal facilities between these hills and Madras may very shortly be extended to Ceylon. The Committee regret that the inadequate medical grant of the past was entirely withdrawn last year, but trust and believe that this District will be put on an equal footing with the other Districts in His Highness' territory in the near future. The Committee regret that, while all other South Indian planting Districts have had or are having cart-roads cut to them, the prospects of a cart-road to this District are no nearer than they were a year ago. Your Committee are thankful that plague has practically disappeared from Southern India. Your Committee are also thankful to see that the Government of India have under consideration a labour ordinance, which will meet the requirements of planters and also give some security for advances in the future. There has been an

abundance of labour in your District during the past year, and now, with better facilities for procuring food-stuffs, there seems every likelihood that this satisfactory state of affairs will continue. Another marked feature with regard to the labour-supply is the increased number of old Ceylon trained coolies now coming in from their villages to work on these hills for small advances of under £10 per head. These coolies, to a young District with a large acreage of tea coming into bearing necessitating trained factory hands, will be very acceptable. This result has undoubtedly been partly brought about by recent gratuitous commitments in Ceylon papers, for which the Committee desire to thank those who are responsible.—*M. Mail, July 3.*

TEA COMPANY REPORT.

EMPIRE OF INDIA AND CEYLON TEA.

The directors, in their report for year 1898, regret that the results for 1898 were unsatisfactory and disappointing. The year began well; but as it progressed, several causes contributed to a poor result. The weather was, on the whole, unfavourable. Exchange advanced from 1s 30-32 d. to 1s 4-32th d, which reduced profits by £1,000. Higher ocean freights also increased the cost of bringing the tea to market. The tea market was depressed until near the close of the season. No one was responsible for this conjunction of misfortunes, and it should not be forgotten that the year was one of crisis and difficulty for all tea gardens. But the directors regret to have to add that on some of the company's gardens there was a mismanagement and a neglect on the part of the members of the staff, which undoubtedly contributed to the failure of the year's results. Mr. George Moore, a director of the company, who has had a long and successful experience in tea planting, went out to India in last November, and has spent nearly six months on the company's Assam gardens, investigating the system of working, and carrying out reforms. While bearing testimony to excellent work on some of the properties, Mr. Moore felt constrained to replace the managers of three of the company's gardens by more efficient men. Having regard to the general position of the tea industry, and to the improvements which have been effected in the local organisation at the gardens, the board hope, with some confidence, that the year 1899 will result favourably. Including the amount brought forward from last year of £143 3s 9d., the available profit is £20,084. The board recommend the payment of the preference dividend of £10,950, and a dividend on the ordinary shares of 4½ per cent. per annum, which will absorb £8,988, leaving a balance of £145 to be carried forward.—*H. & C. Mail, June 16.*

CEYLON TEA IN CANADA.—From a leading wholesale merchant in Montreal we have received a communication in which he says:—“Ceylon Tea is selling well here and becoming more popular every day; prices are also up several cents lately: incidentally I may say I have had a good season and feel bright.”

TEA “FLUFF” FOR DYEING PURPOSES.—A correspondent writes:—“Re the statements about shipments of bad tea from Colombo, can the London Customs people be making a mistake, in supposing that local shipments of tea ‘fluff’ for dyeing purposes are meant to be used for tea infusion. This ‘fluff’ has been several times exported recently.” We scarcely think a mistake could be made about tea “fluff”; but ought not the cases containing it to be marked as for dyeing purposes, to prevent any misapprehension?

Correspondence.

—————
To the Editor.

TEA ON VIRGIN SOIL: AND HOW
FLAVOUR IS KEPT UP BY
PROPER CULTIVATION.

June 15.

DEAR SIR,—I see in one of your leaders you quote Mr. T. C. Owen as saying—“Do what he could, he could not keep up the quality of tea to what he got the first few years from tea in virgin forest land.”

I am well aware it is easy to sweat lands by allowing plants to grow up and spread out to their own sweet will and to allow them to bear fruit or leaf to such an extent that the trees will soon become sickly, will not be able to bear even part of the crops they did before and even the crop they do bear is of inferior quality—why is this? Well, the pump of the tree has been used to the utmost of its capacity and the roots became contracted, so sap could not be taken in sufficient quantity to nourish the fruit and leaves,—leaves drop off and fruit does not get ripe or get the same flavour as fruit did on same tree before it was allowed to overbear.

On the other hand, an experienced Agriculturist is able to grow fine trees on land where not even a blade of grass did grow before he took in hand this barren land. Your own *Tropical Agriculturist* books of the past, bear evidence how, I, on Maria, tended one Arabian coffee tree grown up as native coffee and picked one year, one bushel and one measure parchment from that tree. 2.—How I planted one tea seed in another part which became a tree 25 feet high. 3.—When I had one cacao tree which gave three varieties of cacao from three branches, and another from the stem 20 feet high. 4.—How I planted out tea plants on Raxawa estate after my Agents advised me to sell the plants, as that soil would never grow tea, got some bushes to spread seven and eight feet, and tea now giving over 600 lb. made tea per acre and tea of good quality. 5.—How on Frankland estate, where at first cacao would not come on by judicious manuring, I have many trees over 20 feet high and had excellent crops—from the same estate. I sent you the largest cacao leaf grown in Ceylon, and sent also the largest pods.

You will remember how I have repeatedly written advising the use of green manure (weed and foliage from trees), cattle manure. The latter is purchased from villagers by some planters because it costs on the spot from 3d to 6d a cart-load. They, however, forget that it is not pure cattle manure but a mixture of cattle-dung and earth, besides village cattle eat all kinds of foliage even lantana, so you get a lot of seed in your manure, and in addition you take to your estates, beetles and their eggs, which require to be picked out. Then also you require one basket full to each tree, whereas I warrant $\frac{1}{4}$

basket of poonac and straw-fed cattle manure collected on roadside cattle shed, carefully heaped up on a stone floor will be twice as good as one basket village rubbish; but green manure is the most essential to keep trees up to the original standard, and in Ceylon we are blessed with a large variety of plants and trees which I have discovered and I will undertake to increase yield and improve flavour in tea, with this green manure, wood ash, lime and in some cases bones added in any part of the island.—Yours faithfully,

JOSEPH HOLLOWAY.

—————
USEFUL TIMBER TREES (CASU-
ARINA.)

DEAR SIR,—With reference to your notes on the above in the *Observer* of the 16th inst. (see page 122) *Casuarina equisetifolia*, as well as some other species of the family, finds in Ceylon a congenial home, growing rapidly and producing seed in abundance both in the low-country and up to about 4,500 feet elevation. A tree of this in Peradeniya Gardens which was killed by lightning in 1896, was found to measure 150 feet in length, with a girth of over 11 feet at the base (which was buttressed), the diameter being over 40 inches, thus exceeding by 10 inches, the maximum diameter recorded for it in its native country, Australia. In India the same species has been rather extensively planted, especially in unreclaimed areas, for the purpose of supplying fuel to the railway, as the wood makes good fuel and leaves but little ashes. The heart-wood is hard, heavy, and fairly durable, though in the latter quality it does not equal some of the Ceylon woods, e.g. Palu, Satinwood, Keta-kala, &c. The Sinhalese call it “Kassa-gaha,” meaning whip-tree, on account of the slender cord-like leafless branches; while in Australia it is known under the names of She-oak, Forest oak, Beef-wood (on account of the colour of the wood), Horse-tail oak, &c. The latter as well as the specific names signify the Horse-tail herb of temperate climes. This is one of the handsomest species of *Casuarina*, and is highly esteemed as an ornamental pot-plant in Europe.—Yours faithfully, X.

—————
BAMBARA “BEE.”

SIR,—Is there any other man in Ceylon who tamed the Bambara Bee. I kept them in an open bee box in my verandah, till their young were ready to fly, when one day in my absence they left the box and had settled on three different trees, but my cooly was afraid to catch them in boxes I had prepared, and when I came back I could not trace them.

J. H.

[We rather think the late Mudaliyar Jayatileke of Kurunegala—a great bee-keeper—succeeded well with the two indigenous bees of Ceylon. Does “J.H.” recall the experiences of Mr. Benton, the American Apianian, when here? —ED. T.A.]

THE PRICE OF ANNATTO.

DEAR SIR,—In answer to your enquiry, the present low price of annatto is said to be due to a falling-off in the use of the dye for colouring cheese in Germany to which country the seed was chiefly imported from Africa. It remains to be seen whether this seed has gone to other countries and sold at the lowest prices. This gives rise to the suspicion that chemical or aniline dyes are more in use now for purposes for which annatto was used before. The fall of prices in 1890-91 was due to over-production in Ceylon. But the following year the price of cacao rose, which led to annatto lands being cleared and cacao planted. From what was still left, care was taken not to export the dye in seed. The manufacturing works at Crystal Hill started purchasing all the raw material produced in the island.

This had the tendency of gradually raising the price again; and the trade preferred buying the made dye rather than the raw seed, as it came to be known that while the latter does not keep long but deteriorates, if kept unused for more than five or six months, the former can be kept for any length of time—in fact it develops and improves in strength the longer it was kept. Of course, the present low prices have affected the Ceylon-made dye too, and except in Holland there has been no demand for it anywhere else in Europe for the last eighteen months or so. Under the circumstance the present insect pest so destructive, both to the crop and the plant, seems to be providential.—Yours truly, PLANTER.

HYBRID COFFEE IN THE STRAITS :
FREEDOM OF COORG COFFEE TREES
FROM LEAF-DISEASE.

Klang, Selangor, Straits Settlements,

June 15.

DEAR SIR,—In the year 1893, I got some Coorg Arabian seed over here and planted eight acres, in two patches of five and three acres each, on hills in the middle of large Liberian clearings.

From an economic point of view, this result was not a success, though at first the trees came on splendidly; but grown at sea level in this latitude, a satisfactory result could hardly have been expected: blossoms mostly brushed, owing perhaps to insufficient shade, and the trees have never at any time up to the present yielded more than 50 to 60 berries each. But the experiment has not been altogether without interest, inasmuch as plants raised from the seed of these trees are showing distinct hybrid characteristics, taking more after the Arabian parent, but being fuller in the leaf and with their primaries further apart. At present the few hundred plants I have growing are only about six months old from seed, so it is impossible to say how they will turn out; but in view of Mr. Cameron's extremely interesting report upon coffee in Coorg, I need hardly say they will be watched most carefully.

Perhaps the strangest feature of this small experiment has been the fact that I have never seen a spot of leaf-disease on one of the Arabian trees yet, although the two small clearings are surrounded with Liberian,

scarcely a tree of which is free from it. When the surplus plants were very thick in the nurseries, two or three, certainly not more than half a dozen, were attacked with a spot or two, and I then rooted up and destroyed the nursery, but though I have often examined the two clearings very closely, being struck by the strange phenomenon, not a sign of *Hemileia* have I ever detected.—I am, dear sir, yours faithfully,

E. V. CAREY.

RUBBISH IN TEA.

Upcountry, June 26.

DEAR SIR,—I fancy the stuff your London correspondent describes as taken out of 14 chests of tea must have been the results of tampering with chests after they left the factory and tea was in transit. Such tampering has been known, but it is not always found out.—Truly yours,

FACTORY BULKED.

RUBBER-PREPARING MACHINE.

June 26, Upcountry.

DEAR SIR,—Can you tell me if Mr. Thomas Christy's Rubber Machine has arrived in the island, and who are his Agents in Ceylon?—Truly yours,

RUBBER-FARMER.

[We cannot answer: possibly this publication may bring the required information.—ED. T.A.]

HOW TO INFUSE CEYLON TEA.

DEAR SIR,—May I call attention to a small omission in Mr. Kelway-Bamber's handy and useful *brochure* on the Dietetic Value of Tea? He says (4) "put the required quantity of tea into the hot tea-pot," etc.—but nowhere specifies "the required quantity!" Now, of course, the great advantage of Ceylon over China tea for Australia, America and the Continent is that you need not use so much: the old rule was a good tea-spoonful for each person, and one for the pot. With Ceylon tea, the one for the pot and some more may be dispensed with.—Yours truly,

HOUSEKEEPER.

[We obtained through the courtesy of a friend, a copy of the above, and agree with our correspondent that the "little omission" requires to be supplied in what is otherwise a most excellent and instructive little guide. In our own little pamphlets, cards and hand-slips we have said:—"Put one small tea-spoonful of tea for each cup required."—ED. T.A.]

IMPRESSIONS OF KALUTARA TEA
DISTRICT.

Ambagamuwa, July 3.

DEAR SIR,—If my impressions of what I saw of the Kalutara tea district can be of any interest to your readers, the following is at your disposal. In company with yet another K.T.B. I proceeded last week to Kalutara, taking ad.

vantage of this truly slack season to spend a few days with an old friend whom I had not met for years, he having severed his connection from Ceylon quite ten years ago and only recently returned to once more toil in our midst. Of the journey to and back from Kalutara to Polgahakanda I will say as little as possible. Suffice it to think I have arrived there with my framework quite entire. We took the shortest route out, viz., via Dodangoda: the last three miles or so of this road would take a lot of beating, -road! save the mark, it was more like a newly-ploughed puddy-field; my only experience of such another beauty in the highly-favoured Central Province is the $3\frac{1}{2}$ miles from Katugastota bridge to the sixth milepost on the Galagedara road, where I have a small totum.

Plumbago mining is much in evidence all along the Dodangoda route. Our driver pointed out a hillside planted in tea and coconuts, with large embankments thrown up of clayey-looking soil heaped along the lower edges of this hillside. On inquiring as to what it all meant, we were told it was "Hector Mahatmaya's" plumbago pit, and that half the men employed were at that present moment working *under our Perambulator*. Pleasant sensation!

One does not begin to realise that tea would grow as it does in Kalutara until you are well within the hill-country of this district. Once passed the Dodangoda toll bar, the formidable range of forest-clad hills burst into view; it will not be too much to say that the forests of Kalutara are second to none I have yet seen in Ceylon; the soil too is very friable, save in some parts where cabook is seen to advantage; but yet I have seen as good tea growing in cabooky soil as would well compare with the tea growing on Kalutara's best alluvial deposits.

Heatherley, Pantiarf, Clontarf, and Polgahakanda estates, which I have seen, would be hard to beat. On the first-named totum an all-round yield of 550 lb. per acre was almost secured for the year ending 30th June, so said the young Superintendent! On Polgahakanda 500 lb. per acre is expected for 1899, 31st December, and with good reason. This estate is looking in fine heart under the able management of my good old friend. Nothing less was to be expected.

We had a very pleasant time of it, the proverbial hospitality of the planters not being one shade behind in Kalutara to that of the general run. In fact, my genial host and hostess will take the places anywhere. Polgahakanda has a factory quite suited to its wants a brand new (8 or 10 H P.) horizontal engine supplying the power. Up to date rollers and desiccators were in full swing, taking the leaf—heaps of withering accommodation. The wind and rain was much in evidence; yet the flush was there in appreciable quantities. Would I could say the same of the country where Noah launched his cruiser.

Clontarf has a new factory in course of construction. Taking this district as a whole, my own impression is that the tea estates in the "Richmond of Ceylon" will take a lot of beating. C. T.

OIL ENGINES.

Hatton, July 6.

DEAR SIR,—I see in your paper of 5th that one of your correspondents that stick to facts or your P.D. has made a mistake. I allude to paragraph "Oil Engine"—you there-

in state oil engines doing most satisfactory work in Kelani Valley, &c., &c. The cost of "oil not exceeding half-cent per lb. tea." Now, Mr. Editor, I take that statement with a pinch of salt. Up this side I am told 2 cents per lb tea is about the cost, and I have heard of one man somewhere in Matale East, who says he can do it for one and half-cent. Could you give me the address of your half-cent friend so that we may be able to do likewise?—Yours faithfully,

PLANTER.

[Our Kelani Valley friend will, we have no doubt, allow "Planter" to inspect his oil engines and see how cheaply they work.—Ed. T.A.]

AERATED WATERS AND TEA.—It was not so very long ago that the sickness on board of a favourite passenger ship of a favourite line calling here was traced to bad ice taken on board at Port Said. Our own leading Ice and Aerated Companies enjoy a high reputation; but it would be well that it should be generally known that neither freezing nor aerating renders impure water pure. An Indian contemporary contains the following useful warning:—

There is a general impression among residents in India that aerating water destroys any bacteria that it contains, but it has remained for an Italian physician to dispel this cherished delusion. This investigator found that bacteria grew and flourished when subjected to a pressure of carbonic acid gas equal to fifty five atmospheres, and that the liveliness of the typhoid bacillus was in no way affected by being exposed to an uninterrupted current of the gas. The dirty or otherwise of a mineral water is, therefore, dependent entirely on the care exercised by the manufacturer in boiling and sterilizing the original medium. The extent to which this is carried out may be gathered from the fact it was ascertained during a cholera epidemic last year, that not one of the European manufacturers of aerated waters in one of our largest stations either boiled or filtered the water from which their mineral waters were manufactured.

PATENT TEA MACHINERY.—We have received from W. J. McDonnell, of the Ceylon P.W.D., some particulars of his patent tea-leaf cooler and oxidiser which had a successful trial in Ceylon last year. The apparatus consists of a blower connected by means of a pipe with the receptacle of a tea rolling machine. The receptacle is made with a lid or air-tight cover, to which the pipe leading from the blower is attached, and, on the air supplier being put into motion, a mid-current of air, of the temperature of the surrounding atmosphere, is made to permeate, with a downward action, the mass of leaf being rolled, keeping it cool and aiding oxidation. The covered in top or lid, together with the downward motion of the air, tends to retain the flavour in the leaf, which in the ordinary receptacle rises with the warm air through the open or partly open top and escapes by reason of its specific gravity, into the cooler atmosphere above the receptacle. An obvious advantage is claimed for this system, as the loss of flavour, due to the heating of the leaf during the process of rolling, cannot afterwards be remedied, no matter what treatment the leaf undergoes later on, nor how cool it may be kept. The apparatus has been successfully used it is stated, with results varying from $\frac{1}{3}$ to 1d per lb. over prices obtained for teas made alongside in the ordinary manner. It is recommended that the blower be placed outside the factory, in order that the leaf may be treated with air of a lower temperature than that of the rolling room.—*Indian and Eastern Engineer*, May.

RUBBER-YIELDING TREES IN THE FRENCH SOUDAN.

IN the *Revue des Cultures Coloniales* of June 5, 1899, we find an article on "The Exploitation of Caoutchouc in the French Soudan" which gives very recent news and shows how the French are now setting to work to make a wise use of their colonies. We give a special translation of the summary referred to:—

"We have received from Kayes the following interesting particulars:—The Governor of Soudan some time ago empowered a technical Commission to investigate in S. Soudan the Caoutchouc bearing zone, particularly as to the density of the growth of the rubber-bearing plants, the quality of the latex and the native methods of extraction. The sittings have now ended, and M. Hamet, the head of the Commission, has just given in information, from which it is evident that any undertakings for exploiting rubber in the Soudan are bound to be very profitable and that there is room in the Soudan for many such undertakings.

The rubbers were originally collected there under the auspices and under the control of the French military who gathered it partly as a tax and tried by this means on the one hand to prove to the natives the value of the exploitation and on the other hand to cause this Soudan product to be known in the European market. The rubber has gained a standing in the European market and often ranks after the rubber imported from Central America or even compares favourably with it. It was bought on the European markets at fr. 6.50 or fr. 7 or fr. 7.50 and the purchasers would still have freights, &c., to meet; and the price has risen of late. No trouble has been spared to secure the increase in value of the article. Schools of Agriculture have been started at Kouroussa to which natives from different rubber-growing districts come to learn the right methods for coagulation, &c.

M. Hamet also says "the Soudan rubbers compare favorably with those of the Belgian Congo, having all their purity, resistance and nerve and they also have greater resistance to heat."

M. Hamet and his co-workers have been studying the different kinds of milk-bearing plants native to Soudan: *artocarpia*, genus *ficus*, *euphorbiacæ*, *apocynacæ*, &c.

It is one of these latter, a *Landolphia* (*hendolitic senegalensis*) called, commonly *liane goi* or *gohive*, that gave the results referred to above. This creeper is one of the shrubs most abundant in the south of the Soudan. In places visited by the mission, its density attained to 100 to 150 plants to the *hectare* (about $2\frac{1}{2}$ acres) 40 of the plants being very stout—rather thicker than a man's arm. These (8 or 10 years old) may give 8 to 10 gallons of latex a year. When the latex from this plant (the *gohive* creeper) is examined, says M. Hamet, one can see from the coagulation that it consists of two parts:—(1st) the liquid containing the rubber proper with albuminoid matter and a vegetable wax; (2nd) the serum which contains the constituent water, mineral matters and azotized matters which the rapid fermentation of the latex carries off before any coagulation takes place. On the other hand, these matters imprisoned in the bitter waters tend to deteriorate the rubber. It is these fermentable agents that it is absolutely necessary to destroy either before or during the coagulation.

These two operations are effected by the one stroke by using fluoride of sodium,—antiseptic and very strong in the proportion of 2% of the weight of the latex.

Other antiseptics, such as *formol*, *gáicól*, *salol* *acid thymic* and ammoniacal acid do not coagulate,

M. Hamet has tried coagulation of this plant by the different processes in use in the country: First mechanical; second by heat; third by smoking; fourth by chemical agents; fifth by decoctions of native plants. The yield of rubber has been independent of the process employed; practically, it has varied from 23 to 32 per cent. All the methods tried have given excellent results, specially the two last. Amongst the chemical agents employed must be signalized chlorhydric, sulphuric, oxalic and citric acid, marine salt, chloride of aluminium and finally ammoniacal and chlorhydric acid together. Finally, the native plants that have given equally good results are: the *guama*, the *do*, the wild sorrel, *somo*, lemons or limes and the tamarind. They have been used in decoctions which have been left to lie for a night and been filtered through a cloth the next day, then warmed up to boiling point before being used. The experiments have been made on *aseptized* latex and have brought about the coagulation of a rubber of very first quality.

But we must remark that, even treated by natives and without first being *aseptized* and with decoctions of plants of the country, the latex of the *gohiva* has given a rubber that fetches four to five fr. at Kouroussa.

M. Hamet sums up and concludes by affirming that the rubber furnished by the Soudan, especially the South, is of excellent quality, that the methods of collecting prevalent should be continued; that they are simple and easy even for children who go into the brushwood to collect it and that experiments are being made in the agronomic stations for the multiplication of plants.

THE COORG PLANTERS' ASSOCIATION.

The following are from Proceedings of the Annual General Meeting of the Coorg Planters' Association, held at the North Coorg Club, on the 1st ultimo:—

CROP.—The coffee crop just gathered was one of the best the country has given for some years; but, unfortunately, the poor quality of the coffee, owing to the season, and the great drop in prices, owing to the large Central American and Brazil productions, has deprived us, to a great extent, of the benefit of the good crop. The price of native coffee was also extremely low, and large areas have been abandoned by the natives and have gone out of cultivation. The official returns of the coffee crop for 1897-98 were 2,500 tons against 2,030 tons for 1896-97, and this year, in spite of the decrease of native coffee should show a substantial increase. Next year the prospects are almost universally poor, and a great deal of damage is reported to have been done by abnormally heavy rain in April. However, we can only hope for better quality and better prices. Mr. Cameron, whose services were so kindly lent by the Mysore Durbar, made tour of these coffee districts during November, and delivered two very interesting and instructive lectures at Mercara and Pollibetta, a report of which has been printed and circulated, and has also been sent to the U. P. A. S. I., and will doubtless form a subject for discussion at the next Meeting. Our best thanks are due to Mr. Cameron for the trouble he took, and for his very able and instructive lectures, and to the Mysore Durbar for lending his services.

TEA.—About 50 acres have been planted by Mr. Parsons during the year, but, owing to small plants being put out, the clearing was not so successful as it might have been. This industry is being watched with great interest.

CINCHONA.—Owing to the rise in the price of this product, increased interest has been given to the hitherto-neglected Cinchona trees, and several lots of bark have been sent Home for sale.—*M. Mail.*

PROGRESS IN THE FEDERATED MALAY STATES.

We envy the Malay States for the thoroughly just and scientific basis on which their system of revenue collection is based. Beginning *de novo* these Administrators were able to profit by experience gained in Ceylon as well as at Singapore. We have before us Mr. H. Conway Belfield's report on Lands, Mines and Surveys, Federated Malay States, for the year 1898, and from it we learn that the combined Land Offices of the Federated Malay States have once again succeeded in amassing a revenue which exceeds former records and stands at the satisfactory figure of \$637,699. The increase is progressive year by year. The credit for this advance is due, says Mr. Belfield, to the excellent progress made by the States of the Negri Sembilan and Pahang, the older States of Perak and Selangor having been both unsuccessful in attaining the totals achieved in the previous year. There is one principal reason, however, why the returns of the two latter States were no higher than as recorded, which so completely eliminates any suggestion of deterioration of revenue that it is well that it should be mentioned at once: "It is found in the determination of the Government of Perak and Selangor to restrict in some measure the alienation of mining land, so as to reduce the number of speculative purchases, and prevent as far as possible the locking up of lands for lengthy periods. The difference in the amounts of purchase money thus realised is far greater than the actual decrease of the revenues in each State, and is more than sufficient of itself to account for the whole of the falling off. The revenue derived from the recurrent and, therefore, more important items, such as Rents on Agricultural and Mining Lands, shew solid improvements." The following particulars of the quantity and value of tin exported are of interest. They are furnished by the Warden of Mints:—

Year.	Tons.	Pikuls.	Price.	Value.
			\$	\$
1894 ...	23,552 ...	395,631 ...	39 ...	15,047,748
1895 ...	23,866 ...	400,956 ...	35 ...	14,853,507
1896 ...	22,811 ...	383,227 ...	32 ...	12,339,909
1897 ...	20,949 ...	351,945 ...	36 ...	12,701,695
1898 ...	19,703 ...	331,007 ...	43 ...	14,177,101

We read that "the Survey branch, Lower Perak, measured up 36 town lots and one agricultural estate of 262 acres, and ran 74 miles of traverse. The district branch of the Survey Office sustained a severe loss in the unfortunate accidental death of the District Surveyor, Mr. Draycott, who was drowned in the Perak river on the 11th October, in consequence of a collision between the steam launch in which he was travelling and the ss. 'Canton.' I had inspected Mr. Draycott's office shortly before that date and had had pleasure in expressing to the Resident my high opinion of the value of his work. His death has deprived the Government of the services of an experienced and hardworking officer."

With regard to Ula Langat, we read :—

As a considerable portion of the agricultural land of this district has been devoted by the natives to the cultivation of coffee it is satisfactory to observe that the precarious condition of this

industry has not caused diminution in the amount of Land Rents collected, which, though they did not reach the estimates, were nevertheless better than in the previous year. The total credited was \$7,028'50. As in many other places, receipts on account of Forest Products also shew increases, attributed by the District Officer to improved supervision, which has been possible since the Forest Rangers were relieved of the demarcation work.

For Kuala Selangor, we read :—

There is little to report in connection with the European owned estates; upon two of them the planting of coffee is being continued, and planters have generally acted similarly to those in other districts in turning their attention to experiments in other forms of cultivation. The Selangor Coconut Oil Mill Company's factory is now in working order, and oil has been produced. It will be necessary to largely supplement the supply of locally grown nuts by purchases elsewhere.

In respect of Registration of Titles, Mining and even Land Enactments, Ceylon is, we suspect, behind the Malay States. This is how Mr. Belfield winds up his very voluminous and able Report:—

The Land Enactment came into operation at the commencement of the year in all the States, and has, upon the whole, worked satisfactorily. Since its provisions have been submitted to the test of practice certain minor points have come to light in which it will be possible to effect improvement, but it has, I think wisely, been decided to defer amendment until the law as it now stands has remained in operation for a longer period. Land Officers would have found it much more easy to work the Enactment had it been possible to publish the Land Rules during the year.

The Registration of Titles Enactment was brought into force in Perak and slightly amended in Selangor during the year, and has worked smoothly. It was considered that the time had not yet arrived to enforce its provisions in the other two States.

The new Mining Enactment, which is much wanted, was discussed in detail at a conference of Residents presided over by the Resident-General at Kuala Lumpur, and formed the subject of prolonged correspondence. At the time of writing it has not yet come into force.

In preceding paragraphs of this report I have spoken of Settlement Officers and their work, and have attempted to emphasize the importance of their employment in all districts in which demarcation work is in progress.

A great deal is now being done every day throughout the States in the way of measuring up native holdings, but that is only one stage of this important work, and I am anxious that it should be more generally recognised than it now is that that work only becomes of value when it is accompanied and attested by the examination of the Settlement Officer. I trust that more general recognition will be accorded to this matter in the immediate future.

I may perhaps be permitted to close this report with an expression of the genuine satisfaction which is felt by the Land Officers of the Malay States and myself at the really remarkable progress in the collection of Land Revenue which has been a feature of the administration of these States from the commencement of Federation to the present time. The improvement has been effected concurrently with the institution of radical changes of system, and the introduction of laws and regulations novel to the officers who were called upon to enforce them; that results such as those recorded have been attained not only speaks volumes in favour of the changes made, but testifies to the assiduous manner in which officers have studied the new procedure, and to hearty and well sustained efforts on their part to do their best for the Department by earnest application and constant personal industry.

PLANTING NOTES.

PINEAPPLES—writes Datu Meldrum from Johore—are a drug 80 (dollar) cents per 100, some have been sold as low as 60 cents per 100. Is nothing ever to be done with the fibre, or a temperance drink be made out of the pine, a fortune may be in it; but “brains” are wanted.

THE EMPIRE OF INDIA AND CEYLON TEA'S COMPANY.—The dividend on the ordinary share of the Empire of India and Ceylon Tea Company for 1898 is only 4½ per cent., compared with 9 per cent. in 1897. Other causes than the rise in exchange contributed (says the *Home and Colonial Mail*) to this disappointing result. Bad weather reduced the outturn on the Assam and Ceylon properties, and although there was a large increase in the crops of the Dooars gardens, the price of Dooars tea was lower. In addition, the directors state that there was mismanagement on some of the company's gardens, which undoubtedly assisted in causing the poor results. An investigation has since taken place; the management has been reformed, and with the firm appearance of the tea market better things are hoped for in the current year.

RUBBER PLANTING RESULTS IN MEXICO.—Writing in *Modern Mexico* from San Juan Bautista, the capital of the Mexican state of Tabasco, under recent date Clarence W Gano says:—“During the past few years many planters have turned their attention to the cultivation of rubber, and they are generally of the opinion that it is the most profitable crop that can be grown. One planter, Don Federico Calcaño, a few weeks ago sold the rubber from 2000 seven-year-old trees in San Juan for a net profit of \$3000—an excellent return from ten acres of ground. The rubber tree increases its yield from the seventh to the fifteenth year, after which, if it receives proper attention, it will bring a steady income for two score years or longer. The method of planting is simple and inexpensive, and after the third year there is practically no care bestowed on the plantation beyond seeing that the trees are properly tapped.”—The *India Rubber World*, June 1st.

SOCOTRA'S PEOPLE AND PLANTS.—A preliminary report upon the results of the scientific expedition to the island of Socotra has been issued by Mr. Henry O Forbes, Director of Museums to the Liverpool Corporation, who, under the auspices of the Royal and Royal Geographical Societies of London and of the British Association, and in conjunction with Mr. W R Ogilvie-Grant, representing the British Museum, undertook the investigation of the natural history of the island. The expedition occupied about six months, and the party discovered many species of animals, birds, insects and plants new to science. According to the report the Socotrians are only poorly civilised Mohammedans, living in caves or rude huts, and possessing few utensils implements, or ornaments, and no weapons. Still the explorers took back specimens of pottery of primitive quern-like mills of basket work, and of weaving apparatus. The plants, of which living specimens or ripe seeds, over 200 in number, have been taken to England, Mr. Bayley Balfour, Professor of Botany in Edinburgh University, describes as of highest scientific interest and of great commercial value being, unique out of Socotra.—*Pioneer*, June 30.

COFFEE IN BRAZIL.—A coffee plantation near Campinas, São Paulo, said to have been valued at 130,000\$, was sold at auction the other day for 13,000\$! That is a better illustration of the situation—says the *Rio News*, May 30,—than any we can find in the official reports.

THE RISE OF THE PORTUGUESE IN INDIA.—Upon the recent review of this work which appeared in our columns the author writes us an appreciative letter saying that the review was the first he had seen written by any one with a competent knowledge of the subject. He admits some errors and a share in their responsibility but on some points he would join issue with our reviewer. He writes:—

It is Barros who says (I allow the others differ) that D. Lourenço was ordered to search for Ceylon as well as the Maldives. It is Castanheda (ii. c. 23) who says that the pillar (which he describes) was erected at Gabaliquama “now called porto de Gale,” the date 1506 is from Correa. I admit there are difficulties in the chronology. As to the loss of ships from the attacks of the English and Dutch there was more talk than damage. Falcão in his (p. 195) abstracts the loss as four vessels taken and three burned, total seven. From his detailed list of ships, however, I should say the totals should be five vessels captured, three burned and one run on shore, total nine—a number which did not seem to me to appreciably affect the percentage. At the same time I might have noted this cause.

CEYLON IN THE “LONDON TIMES.”—In *The Times* of June 12th, received by the German mail, the following appears:—

CEYLON.—Our Colombo Correspondent writes on May 17:—The check which the interference of the Indian Government with the currency gave to productive enterprise is proving a blessing in disguise to tea planters at least, for there can be no doubt that if a rupee of 1s 2d or less value had continued, the planting and production of tea would have far outstripped the demand, to the injury of the general body of planters. The sixteenpenny rupee stopped extensions and not only so, but has led to a contraction of cultivation by the abandonment of poor fields in some instances, so that, both from Ceylon and India, there is no immediate prospect of an increase of crops—while the United Kingdom is getting an almost less supply of our staple. The direct trade in tea with the Continent of Europe—notably Russia and Germany—with America and Australasia—is being carefully fostered, and must steadily increase. Meantime an improvement of prices in London has cheered our tea planters. Their restricted enterprise, however, has begun to tell on the general revenue, the quarterly return ending March 31 showing a comparative decrease—a warning to our authorities and the Colonial Office not to press unremunerative public works too much. “What single product can be (profitably) grown over 80 miles of our North Central territory?” was a question seriously propounded in an official quarter lately, and no answer could be given. An agricultural commission is now sitting to try and devise means to improve local agriculture, if not to establish an agricultural department. A commission to inquire into the incidence of taxation, as promised by Governor Ridgeway, is now eagerly looked for by the public. The defenceless state of Trincomalee and the need of railway communication with Colombo has recently attracted attention. The Colombo harbour works and graving dock have made good progress of late; the working season afloat for the former will now close with the advent of the south-west monsoon. Ceylon is to be well represented at the Paris Exhibition, especially in respect of our tea and general planting industries and in gems. The total export of tea up to May 16, 1899, to the United Kingdom is 33,457,229 lb., against same period, 1898, 34,288,943 lb., and to all other countries in 1899, 8,078,783 lb. against 7,723,624 lb. in 1898.

NORTH TRAVANCORE NOTES.

July 2.

TEA FACTORIES

are not so busy just at present, although there is a considerable quantity of leaf coming in. On the whole I do not think this monsoon quite so bad as it was last year; the rain measured up to date is much about the same but the wind probably not so strong.

I had the pleasure of taking a short trip down to some

COFFEE

estates in the Valley, a few miles away one day last week. Although but a short couple of days I enjoyed it very much. I was eager once more to behold old king coffee, and must say that the bushes laden with green berries, and in good heart was a pleasure to look upon—no sign of disease of any kind, the trees crowded with fine healthy wood, and now being all nicely "handled" out. The elevation of these estates is about 4,000 to 5,000 feet and certainly seems to suit the coffee tree. During my morning walk down through the heavy jungle my friend and self passed through a wealth of vegetation, enormous timber trees standing out here and there, and lesser ones loaded with creepers, a great number of which were in bloom, the colours of these being many and varied, but all beautiful. The lower down we descended they changed considerably, and being more numerous, until we reached the coffee regions, where the hand of man has stepped in to try and improve upon the wealth of flowers adding climbing roses, and many other kinds introduced there, from the gardens of civilization. There are some 200 acres of new clearings now being opened up, but for tea and not coffee. Soil is good, but a good deal of rock about; it looked to be grand, lay, and soil for cinchona, too many rocks for tea, and I should say the cinchona trees in such land would grow to be giants. I was rather unlucky in my visit finding most of the Valley men away attending

I have been on the out-look for some time back for any news regarding what we call our

TRAMWAY

from the flat country west of Bodinayakanur. This tram is being erected from the bottom of the Ghaut up to Yellapatti, this latter being the top of the hill, or rather gap in these hills. It is on the principle of some tramways which I have seen in Ceylon, but only much stronger, I had some little news of it the other day, and from what I could learn it ought to be in working order, before this year ends. Loads of 5 cwt. will be carried up and down; loads will be fixed on rope every 500 feet, to be worked in middle by an engine. Should this work all right, which I see no reason to doubt, it will make an immense difference to transport of both goods and passengers (for the latter are to be carried). Engineers go first trip, of course, to show that they have every confidence in their tramway. Then from Yellapatti the road tramway will bring goods, etc., all the way on to Munaar and later on still nearer. The opening of this interesting and much-needed tramway ought to be quite a red-letter day for these parts. I may be lucky enough to be at this function and, if so, you shall have notes on the day's doings. With this tram going and a railway from the station called Ammayanayakanur via Perri Kolam and Bodi to foot of the ghaut, we will be wonderfully much better off for transport of goods, etc.

KLONDYKE.

CULTIVATION OF SEEDLESS PLANTS.

Discussing some recent experiments of the Agricultural Department, the New York *Sun* says: "Under modern methods of cultivation the seeds of our best varieties of fruits can easily be dispensed with, as they are of little practical value. Seedling stock, raised from the wild or common varieties, answer the purpose as well as the rare or choice trees, and their usual combination of hardiness and virility influences the budded scions for good. Nature had already anticipated horticulturists in dispensing with the seeds and depending upon other methods of propagation. The banana, for instance, is a seedless fruit which nature has apparently changed through some peculiar process. Rudimentary seeds are to be found in the fruit today. By slitting the banana down lengthwise rows of the rudimentary seeds will be exposed to view. Undoubtedly at one time, in its primitive wild state, the banana propagated itself by means of seeds, but the use of suckers for this purpose gradually made the seeds of less and less value. Following out the law of nature, the seeds, becoming useless organs, degenerated. Occasionally a banana is found that does propagate itself by means of its seeds, or at least perfect seeds are produced in the fruit which can germinate. If for any reason the suckers of this plant should fail to do the work entrusted to them, it is not unlikely that nature would reinstate the seed organs and develop them gradually to their early responsible position.

"The pineapple and cauliflower are two other common illustrations of how nature occasionally dispenses with seeds. The pineapple is almost seedless, and, like the banana, its propagation is entirely by suckers. The seeds are in a low, rudimentary condition, but at one time they must have had their function to perform in life, and they are capable, under stress of circumstances to renew their vitality. The type would not be exterminated if the suckers should fail to perpetuate the plants. All the resources of the plants would go to the assistance of the seeds to develop and vitalize them once more. This has been found possible by experiment. By selecting the pineapple with the most promising seeds, and propagating them by the usual process, the seed organs have gradually been developed until they are able to reproduce their kind.

"The eggplant is more interesting than either the banana or pineapple. Here we have a fruit which is only occasionally seedless. That the seeds are really immaterial to the welfare of the plant is evidenced by the fact that perfect fruits are often developed whether the blossoms are fertilized or not. If the hands of the horticulturists it would be an easy matter to produce eggplants that would have only the slightest trace of rudimentary seed organs, or vice versa. It would be possible to develop a class of fruits that would be supplied with an abundance of large, full-grown seeds.

"Nature's hints, thus supplied in a few isolated cases, have been the opportunities of man to raise a class of seedless fruits. Sometimes it is merely a freak of nature that happens only once or twice in a generation, and if the opportunity is missed the loss is great. To this origin we owe our fine California navel orange, which is generally a seedless fruit, although occasionally a few small seeds are to be found in it. The navel orange was an effort of nature to produce twins, but one of the twins aborted, merely surviving as a protuberance in the blossom end of the orange, a little kernel enveloped in the skin, which closely resembles the human navel in appearance. In the effort to produce a monstrosity the seeds were apparently neglected. By taking the scions of this fruit tree and grafting them on seedling stock we have practically established a seedless orange. It is, further more, remarkable because of its excellent quality and size. Usually the freaks of nature produce fruits that are not very good. Thus quite a number of apple trees have been produced, the fruit of which is nearly or quite seedless. Their origin has been largely the same as that of the navel orange,

They are generally abnormalities, and they are often called 'bloomless,' because the blossoms have no petals and sometimes lack stamens. Their appearance and quality are not such as to recommend them to the general consumer. The core is small and insignificant, but the shape is peculiar and the flavor poor.

"But seedless apples and pears of good quality may yet be propagated, and gardeners are working towards this end. Recent new varieties show great improvements over those first produced, and in the course of time careful culture and selection may bring about the desired results. How much the culture, selection and environment have to do with the proper development of the fruit is apparent in the case of the seedless currants of Corinth or the Sultana grapes of south Europe. These were supposed to have been as full of seeds as any other fruits far back in history, but successive years of culture and selection eliminated the seeds and improved the quality of the fruits. How the culturists first got their hint of seedless fruits is not known, but it is reasonable to believe that they took advantage of a freak of nature which produced a vine with fruits that had very few or no seeds.

"Experiments are now being made in California with the famous Muscat grape of Alexandria. This famous raisin grape would be greatly enhanced in value if the seeds could all be eliminated. Considerable progress has been made in this direction by selecting cuttings from vines which produce grapes with less than the normal number of seeds. Several smaller varieties of seedless grapes have been in existence for many years, but most of them are inferior in some way to the best raisin grapes raised for market. Seedless fruits will be a success only when, in addition to maturing without seeds, the size and quality of the fruits will be equal or superior to the best varieties in the country. That is the essential reason why the navel orange is the greatest success of modern horticultural."—*Bradstreet's*, June 10.

UKUWELA ESTATE COMPANY, LIMITED.

Registered on April 26th, by Harwood and Stephenson, 31, Lombard-street, E.C., with a capital of £17,000 in £50 shares (378 six per cent. cumulative preference.) Object, to acquire the Ukuwela and Bowatte estates in Ceylon, to adopt an agreement with F G Ambrose, and carry on the business of tea, coffee, and cacao planters, importers, exporters, and merchants. The first directors—to number not less than two nor more than five—are F G Ambrose (chairman and managing director with £250 per annum), H L Anley, W B Anley, and J P B Anley. Qualification, £250. Remuneration, £50 each per annum. Registered office: 165, Fenchurch-street, E.C.—*Financial News*, May 3.

CINCHONA IN INDIA.

The planters in India are watching suspiciously the new energy of the Government in the direction of cinchona culture, an example of this, which we instanced the other day, being the sending of Mr. Standen to Java to see how things were done there. The Government of Madras purpose extending their cinchona plantations in the Nilgiri Hills to a very large extent, and have already acquired two estates for the purpose. A vote for the extension of cinchona culture was included in the last estimates. Some of the planting papers are indignant at what they regard as an attempt to acquire a Government monopoly of cinchona planting in the Nilgiris.—*British and Colonial Druggist*, June 23.

AMSTERDAM BARK MARKET.

June 15.

The detailed particulars of the Amsterdam bark auction of last week are as follows:—About 20 tons (20,623 kilos) of *Manufacturers'* bark were actually sold in the auction, and about 1½ ton (1,748 kilos) of *Druggists'* bark. There were brought in about 1½ ton of the former, and about 1 cwt. of the latter. So that nearly the whole amount offered was sold. The tone of the auction was quiet: the unit selling price worked out at 8·25 cents per half kilo. (1½ per lb.), against 8·5 cents at the last auction, a decline of over three per cent. Of the bark put up, 73,382 kilos, were succirubra, 369,720 were Ledgeriana, 38,698 were Hybrid and other kinds, and of all these 49,956 kilos were root bark.—*British and Colonial Druggist*, June 19.

MINOR PRODUCTS REPORT.

ARECA NUTS.—Offered 25 bags. Sold 0. Good quality was bought in at 3/0s.

CITRONELLA OIL.—Steady and quiet at last week's price, the spot value of drums being 11½d, and that of tins 1s to 1s 0½d. For 3 casks of fair quality put up at today's auctions without reserve, no bid was obtained.

KOLA NUTS.—Offered 36 packages. Sold one. A bag of fair dried nuts was sold at 2½d, all the rest being bought in.

LEMON OIL.—Slightly better this week. One brand, indeed has been advanced 6d in price, 3s 8d c.i.f. being asked when 3s 2d would have been taken yesterday.—*B. & C. Druggist*, June 23.

ANNATTO SEEDS.—Business was done in ordinary vermilion colour at 1d to 1½d per lb. The Jamaica crop has been over for some time, and the demand there is poor.—*Chemist and Druggist*, June 24.

DIRT IN TEA.

COMMERCIAL INTELLIGENCE.

Our special correspondent's revelations concerning the adulteration of tea and the rules for its examination by the Custom House have provoked the greatest interest, not only in the trade, but throughout the country. Last week, in the House, Sir F. Flannery asked the Chancellor of the Exchequer if his attention had been called to a statement in the Press that a quarter of the caper teas and half of the dust teas now imported should be confiscated under the Food and Drugs Act of 1875, by reason of their containing 20 per cent of earthy matter and sand; whether we would explain the nature of the precautions taken by the Customs Department in London for the detection of such adulteration, and whether the number of samples analysed could be increased with advantage; and whether, having regard to the fact that the descriptions of tea above named were for the most part consumed by the humbler classes least able to protect themselves against adulteration, he would increase the staff of inspectors especially allocated to the duties of sampling and analysis of caper and dust teas.

The Chancellor of the Exchequer: My attention has been called to the matter. The Board of Customs have, in view of representations made to them by certain firms and of statements in the Press, ordered a full inquiry to be made. It is not easy, within the limits of an answer to a question, to explain the precautions taken by the Board for the detection of the adulteration of tea; but I shall be happy, if the hon. member wishes it, to supply him with particulars. The Board of Customs, as at present advised, do not consider that there is any need for altering the existing regulations, but if, as a result of the investigation now

in progress, it should appear advisable to make such alterations or to increase the number of tea inspectors, the necessary steps will be taken at once.

On the following evening, Mr. Carew returned to the attack. He asked the Financial Secretary to the Treasury whether he was aware that large importations of tea rejected by the Hamburg and New York Customs had recently been passed by the English Customs and sold in London, though containing up to 20 per cent. of clay and sand, and was unfit for human consumption; and whether, in view of the fact that the price of common teas had advanced 50 per cent., of which the poor were the largest consumers, the Government would insist on a more rigid inspection of all future importations to prevent a repetition of the fraud.

Mr. Hanbury replied that the "Board of Customs have no means of testing the accuracy of the statement in the first paragraph. A full inquiry is being made and if it should appear advisable to alter the existing regulations, or to increase the number of tea inspectors, the necessary steps will be taken at once. Meantime, a circular has been issued to the tea inspectors, directing them to administer the existing regulations with special care."

We are glad that our revelations have had such immediate and far-reaching results, and as inquiry can only reveal the truth of every word of our indictment, we shall look to it that the Government is held to its pledge of reform.—*Public Opinion*, June 23.

PRODUCE AND PLANTING.

NO CHANGE.—The latest report of the Commissioner of Customs for Shanghai does not confirm the reports circulated freely some time back that the Chinese were about to reform their methods of tea manufacture. The hopes expressed that the mandarins were at last awakening to the advantage of preparing tea by machinery, we are told, have been disappointed. There has been no improvement, says the report for 1898, in the treatment of tea, "nor is there likely to be as long as Russia takes nearly all the crop of black as it is."

THE SORROWS OF THE TEA RETAILER.—The "Grocer" reproves those who foster the demand for cheap tea. It says "Consumers of tea are willing to pay a fair price for a good article, and it may be hoped those retailers who are fostering the demand for 'the shilling canister,' and who are by so doing throwing away another chance of making a legitimate living profit, will curb their zeal and philanthropy. Generally speaking, profit on sugar is almost an unknown quantity; at any rate, retailers do not get a fair return for the labour and capital involved in its distribution. It will be a great misfortune if the tea trade is allowed to drift in a similar direction, and an effort to check the diminution in the margin of profit ought to be made before it is too late. Would the retail distributor's determination to secure a fair return on all his tea sales limit the demand? We think not." Touching lightly upon the sorrows of the retailer, the "Grocer" adds: "The tea trade has been the subject of a great deal of attention during the last few weeks. In several of the general newspapers statements have recently appeared to the effect that a quantity of tea containing an appreciable percentage of 'dirt' has found its way to Mincing Lane, and sensation-mongers have been urging consumers 'to be on their guard against retailers who desire to charge them for tea and to foist upon them an inferior article containing substances not grown upon the tea plant.' It is a pity that such writers do not make inquiries of the Commissioners of Customs before perpetrating such libels on a trade which is generally conducted on as pure a basis as any that could be mentioned. Following upon this damaging statement came the assertion in the prosecution of Lipton, Limited, last week that it is 'the universal custom of the trade to weigh tea

with the paper in which it is wrapped.' We publish this week another batch of protests against the assertion, but it is to be feared that among the readers of some of the daily newspapers which did not give sufficient prominence to the contradictions of the statement quoted above, distrust of retail tea-dealers will be created."

TEA AND COFFEE IN AMERICA.—They are trying tea as a rival to beer in New York. Tea saloons have been opened where it is sold for a penny a pint, and the buyer may have it hot or cold. Colonel Hadley, the inaugurator of the movement, is going to try and convince the poorer class of consumers that: "Tea builds up; alcohol burns up. Tea quenches thirst; beer starts a thirst." The plan also includes a scheme to induce the beer-drinker to substitute tea and place the daily saving in a bank. To encourage this the society start the account with a gift of 1s, with the understanding that the money formerly spent for beer less that spent for tea, shall be deposited daily. The would mean a saving, where a pint of tea is taken instead of a pint of beer, of £17 12, to which the society will add the balance to bring the year's saving up to £20. Coffee finds a more ready sale than tea in some quarters, because the former can be purchased at 4½d to 5d per pound, with a coupon for a gift in each package. This makes one gallon of coffee cost 2½d, while one gallon of tea of a poor sort costs 4d.

A NEW USE FOR TEA.—A correspondent who writes to a contemporary on the subject of fortune-telling "in the name of common-sense of society, and of religion," states that fees are now being extorted for the revelation of future events by the medium of tea leaves. He tells us that a professional lady attends at private houses, bringing her own tea pot, and dares "to predict the future by the position of the tea-leaves when poured with due solemnity into a cup." These fortune-tellers have no preference for Indian and Ceylon tea unfortunately, and can perform their cabalistic mysteries with either high or low grade teas.

RUBBER IN TOGOLAND.—In Togoland, (a German colony in West Africa between the British gold coast possessions and Dahomey) regulations have been issued to prevent the wanton destruction of india rubber trees, and the dealers receive licenses from the Government. Only natives are allowed to collect this product, strangers being forbidden to ply the trade without a special license, which costs £50 a year.—*H. and C. Mail*, June 30.

PLANTING NOTES.

DURIAN PLANTS.—Three plants were raised from seed received from Peradeniya Garden. They are now about eight inches high and are making a promising growth and will be planted out on the first favourable opportunity. These may succeed where the imported plants have hitherto failed.—*Madras Agri-Horticultural Society's Proceedings*.

ANOTHER MARKET FOR OUR TEAS.—A correspondent writes:—We note that a large exodus of Moormen from Holy Utah is taking place, the much married saints leaving for Manitoba and north-west Canada generally. Here we have another market for our teas, if travellers were sent to tap it via Vancouver. With half-a-dozen dames of one "harem" sitting in solemn conclave to pick to pieces the characters of their dearest friends, the spouses of a neighbouring elder, the consumption of the cup that cheers, which is inseparable from the proverbial scandal on such occasions, ought to be considerable.—*The Planter*.

A RUBBER COAGULATING MACHINE.—It is learned from Messrs. Thomas Christy & Co. (25, Lime street, London, E.C.), that they have sold "a rubber coagulating machine which has given every satisfaction, and turns out a very fine class of rubber, quite free from dirt and foreign matter. One of its great advantages is that the rubber can be coagulated without the admixture of chemicals, except in certain circumstances, and can be got ready for export free from water and moisture, saving a great deal in freight and labor." It is understood that a circular describing this machine will be printed soon, and that it is not built on the Biffen centrifugal system.—*India Rubber World*.

COFFEE SHADE.—Read the following letter from Mr. J. W. Minchin, Honorary Secretary, Nilgiri Agri-Horticultural Society, Ootacamund, dated 7th February, 1899:—"Mr. Rhodes James, of Coonoor, writes me that he wishes to obtain more seed of the *Pithecolobium polyccephalum*, which, he says, promises to be a very valuable shade tree for coffee. He reports that one tree from the seed, received through me from your Society in 1897, has grown well and is apparently a faster grower than even the *Albizia moluccana*. Can you assist Mr. Rhodes James of this Society in getting any more of this seed". The seed asked for will be procured and supplied.—*Madras Agri-Horticultural Society's Proceedings*.

CAMPHOR PLANTS.—Of the twenty-four plants^s received from the Royal Botanic Gardens, Calcutta, twenty-two plants have been distributed to members and others. Those planted out in our gardens two years ago are now two to three feet high. Mr. Winterbotham, of Meppadi, Wynaad, reports that the two plants we sent him in October 1896 are doing remarkably well; 4 feet high Mr. S. M. Pritchard, of Yercaud, in his letter of the 18th March, says that the one plant sent to him in August, 1898, made little progress till a month ago, when it began to make a vigorous growth. The elevation of Yercaud is not quite 4,000 feet; soil a virgin black, and the temperature never goes above 89° in the hot and the rainfall averages fifty inches.—*Madras Agri-Horticultural Society's Proceedings*.

BLACK PEPPER: A PROFITABLE CROP.—The cultivation of black pepper in Wynaad is being largely increased, the crops harvested last season being the heaviest ever known in this taluq, while the price realised touched R600 per ton, the local quotations having been R180 per candy of 680 lb. This year the vines appear to be yielding even more largely, and 18 inch long cuttings of the best variety known as "Barlancottan" for transplanting purposes are selling at R5 per mile. Pepper in Wynaad is not usually grown from seed; cuttings being almost exclusively used; these are planted in pits about 15 inches in depth at the base of the tree or standard up which they are to be trained. Where natural standards are not available, stakes of the *Erythrina Indica*, or thorny *Indica*, are laid down, as this variety of indigenous tree appears to be most in favour for this particular purpose, as it strikes root readily, and, being deciduous for several months in the year, it gives a light shade, too much of which is inimical to the vines bearing well. At existing quotations, pepper is undoubtedly the most profitable staple to cultivate in Malabar, as after being well started, the gardens require but little labour for cultivation, and "locals" suffice for the purpose.—*Ibid*,

CHINESE COMPETITION IN TEA.—It will interest exporters of tea in Calcutta to know that, owing to the competition on the Pacific, the new season's China teas are being carried from Yokohama at less than a cent a pound.—*Pioneer*.

A MADAGASCAR RUBBER TREE.—M. Henry Jumelle contributes to the *Comptes Rendus* for May 29th, a paper on the Guidroa, a rubber-tree of Madagascar. The writer mentions that the plant has hitherto been known only under its native name, but that now, thanks to specimens sent from Suberbieville (!) by M. Périer de la Bathié, it has been possible to ascertain whether it is a new species, or can be identified with any that is already known. The conclusion arrived at is, that the Guidroa, though clearly belonging to the *Mascarenhasia* genus, does not exactly resemble either of the fifteen or sixteen known species, but may be held to be a new species, and may be named *Mascarenhasia velutina*, in allusion to the very characteristic velvety substance of the leaves. M. Jumelle describes the manner in which the rubber is gathered from the trees by the Sakalaves. During the dry season, when the milky juice is very thick, they make, he says, numerous incisions in the trunks. The milky juice coagulates almost immediately below the wound, forming small bands of gum which the workers remove after an hour, and which they agglomerate into balls. In this way one man can easily gather a kilogram of the gum in one day. The caoutchouc thus obtained is of good quality, and even, it appears, superior to that gained by ebullition. Thus it seems likely that the *Mascarenhasia* genus, only found on the east side of Africa and in Madagascar (especially in the north and east), will play a more important part in furnishing caoutchouc plants than has previously been thought likely.—*Gardeners' Chronicle*, June 17th.

CASTILLOA RUBBER TREES on Wiharegama, Matale, have done even better than Major Gordon Reeves recently reported. We now learn on undoubted authority, in a note from Matale, that the trees from which seed is now being gathered and which must be almost nine to ten years old, vary in girth from 40 to 46 inches at three feet from the ground. Of this size there are about 25 trees. Of trees about seven years of age there are some 25 also, average girth 20 to 22 inches; four years old trees about 45, approximate girth 12 inches. Of trees two to three years about 90 trees of varying girth, eight to twelve inches, besides, of course, a large number of younger sapling plants. Most of these larger trees have been planted along with or under cacao and Liberian coffee; and the manager sees no reason whatever to abandon the system. In regard to planting *Castilloa* rubber as shade for cacao, we find on reference to the *T. A.* of 2nd July, 1894, (Columbia) reports on cultivation of cacao, banana and indiarubber, in districts surrounding Sierra Nevada, and Mr. Munton followed the practice there established. The planting of Ceara rubber in cacao is certainly not desirable; the tree absorbs too much moisture and drops its foliage where the cacao has most need for shade. Dr. Morris, when Assistant Director Kew Gardens, we see by a footnote to this report, stated that the yield of *Castilloa* trees of ten years should be from four to seven lb. of rubber per annum!

Ceylon Rainfall.

THE P. W. D. METEOROLOGICAL OBSERVATIONS FOR JUNE 1899.—We append this Monthly Return of rain from which it will be seen that the highest fall was at Padupola in the Central Province, 46.42 inches, and the lowest at Naulla in the Eastern Province 0.10 inch.

CHINA TEA PROSPECTS.

THE Hongkong Daily Press of 4th July has the following interesting deliverance:—

Experts in tea are agreed that the *desiderata* to retrieve the fortunes of the China tea trade are improved cultivation and manipulation, and a reduction in the cost of production. "So long, however," says Mr. Hughes in his Kiukiang Customs report, "as the present heavy taxation exists in China all along the route from the place of origin to the point of shipment—a taxation amounting to about 25 per cent. of the cost, whilst the tea of other countries (India, Ceylon, etc.) are free of duty, neither the improvement of the leaf nor the reduction of the original cost can be reckoned as prime factors in the question. The wonder is that an article so heavily handicapped as China tea is, in the matter of duty and taxes, should still hold a respectable place in the world's markets and still retain such a large share of foreign patronage. It would almost seem as if, even without any other alteration in the present state of affairs, China tea, with a wise removal of, say, half its fiscal burdens, could hold its own with its modern rivals, to the immense benefit of the Chinese Government and people." The 25 per cent. mentioned by Mr. Hughes as the amount of taxation to which Kiukiang tea is subjected is somewhat less than the amount given by competent authorities at other ports. Mr. Brennan, in the Canton Consular report for 1897, placed the figure at 35 per cent., while Mr. Cass, of Amoy, in a review of the tea trade supplied by him to the Consul and incorporated in the 1896 reported, said the reason for the decline was not far to seek: the entire crop realised \$136,000, while the lekin paid amounted to \$20,000 and the export duty to \$35,000, or a total of \$55,000, considerably more than one-third of the value of the tea. The result is that at Amoy the tea trade has practically ceased to exist.

The latest market report in the same paper is of interest:—

SHANGHAI, 3rd July.—(From Messrs. Welch Lewis & Co.'s Circular.)—Our last "printed" tea market advices were under date 16th instant. From Hankow we hear of an active demand from Russian houses for second crop Black Teas from the Liang Hu districts at prices which make early purchases of first crop Teas look cheap.

GREEN TEA.—It is perhaps a matter for congratulation to find that the fear of rejection by the United States Customs Inspectors is no longer oppressing the dealings in good sound common Teas, and it is hardly to be wondered at that the craving for common Teas, in most of the consuming centres should cause inflated prices here. Fine Teas are comparatively neglected, but lines which were going a begging last year at Tls. 12/14 are now eagerly taken at Tls. 20/21, and the lowest quotation for "skin" is Taels 14 a picul. We must not forget to say that there is no suspicion of adulteration about these Teas, and they are all sweet drawing. At the same time if these prices continue the supply of common Tea will be largely increased.

From the table of exports we see that the comparison in the case of shipments to the United Kingdom is as follows:—

		Black.	Green.
		lb.	lb.
Total to date, 1899	...	8,380,059	7,064
Do. 1898	...	5,914,936	10,068
Do. 1897	...	7,533,126	20,049

To North America, on the other hand, there is a slight falling-off this season so far, as also in the direct shipments to Russia.

COFFEE IN BRAZIL.—It is stated that near Cravinhos, S Paulo, a plantation with 50,000 coffee trees, formerly valued at 181,000\$ has been bought by Dr. Alfredo Pujol for 22,000\$. The journal from which we take this item estimates the growing crop at 30,90 arrobas; but this is evidently a mistake, for, although there is no lack of individual instances in which trees bear even more than 20 lb of coffee each, we have never before heard of a whole plantation's averaging a third of that yield per tree.—Rio News.

COLOMBO PRICE CURRENT.

[No. 2.

THE ANNATTO DYE OF COMMERCE.

(Continued.)

THE use of annatto for colouring cheese and other food articles seems to have originated from the belief that it possessed certain antiseptic and peptic properties, but the country of its origin is not known. The West Indians were known to be using it as a medicine in the treatment for dysentery, while in East India, Mysore, the natives use it as a condiment in their curries. The Spanish mix the prepared dye in their chocolates—evidently not for the sake of the colouring but for its virtue as a digestive. The superiority of cheese made in Holland is no doubt due to a judicious use of the dye which it seems the Dutch keep as a secret. Manufacturers in Germany in attempting to imitate the Dutch product, overdid it so much so, that it was found necessary for the German government to enact special laws last year prohibiting the use of annatto in that country. In an extract from the *Journal of the Society of Arts* which appeared in the *Ceylon Observer* of 12th instant, it will be seen that annatto which is therein named "bixa orellana" formed one of the principal products of Togoland in German West Africa. After the new laws came into operation in the fatherland, the produce of those colonies evidently found its way to other countries, carrying with it the tendency of lowering prices and demoralizing the market. But this state of things should not continue long, for as soon as it is known that the variety of the annatto

growing in Africa is different from those found in East India and Ceylon, preference will be given once more to the latter as has actually been the case once before when the West Indian product reigned supreme. In this connection it will be interesting to look back to the discussion which a sample of West African annatto seed sent to England had elicited. The following letter which appeared in the *Kew Bulletin* for July, 1890, speaks for itself:—

ROYAL GARDENS, KEW, TO COLONIAL OFFICE.

Royal Gardens, Kew, 29th March, 1890.

Sir,—I am desired by Mr. Thiselton Dyer to acknowledge the receipt of your letter of 22nd January last, forwarding a copy of a despatch from the Officer Administrating the Government of Lagos on the subject of an experimental consignment of annatto seeds forwarded to this country for valuation and report.

2. These seeds were duly received at Kew early last month, and samples were forwarded to several firms of annatto dealers and manufacturers inviting their opinion upon them for the information of the Government of Lagos.

3. Copies of the replies received are herewith enclosed. It appears that Lagos annatto seeds are not so good as those exported from Jamaica; they are smaller, less bright in appearance, and not so rich in colour. This may be owing to the fact that the Lagos seeds were gathered before they were fully ripe. In any case the market value is very low, and it is doubtful whether West African seeds can be shipped to this country at a profit.

4. The subject of annatto has already been very fully treated in the *Kew Bulletin* (July and September, 1887). It is a matter for consideration, if the export of the seeds will not prove remunerative on the West Coast, whether it would be possible to prepare the flag or roll annatto. There is a regular and steady demand for annatto in this form, and the charges for freight are con-

siderably reduced. The methods adopted in the preparation of flag or roll annatto are fully given in the *Kew Bulletin* for July 1887.

I, am &c.,

(Signed) D. MORRIS.

The Hon. R. H. Meade, C.B.

The supposition in that early period of the history of this new product in attributing the inferiority of the seed to premature gathering is quite natural; but since it has been pointed out in the June number of the *Agricultural Magazine* that there are more than two varieties of annatto growing in different countries, one inferior to the other as regards the quality of the colouring matter each contained, it may be safely inferred that the variety growing in Lagos is not the same as what we have in Ceylon. And if the seed now selling in the English market at 1d. per lb. is the same as the sample referred to in the above correspondence, I fear it won't pay the growers to send any more there!

In my next I hope to give some more interesting notes.

A. VAN STARREX.

Mean rainfall for the month .68 in.

Recorded by Mr. J. A. G. RODRIGO.

OCCASIONAL NOTES.

The Colombo Agri-Horticultural Society's Exhibition was held on July 21st and 22nd and proved to be a great success. The attendance was large, being estimated on the first day to have exceeded 3,000. The exhibits of fruits and vegetables though not large in number were of a good quality. Special accommodation was provided for arts and manufactures and cattle, and both sections were well represented. His Excellency the Lieut.-Governor attended the first day and distributed the gold medals. On the second day Mrs. S. M. Fowler, wife of the Hon'ble the Govt. Agent, Western Province, distributed the silver medals.

Only nine gold medals (of exceptionally high value and finish) were awarded to the following:—

Mr. P. D. Siebel (collection of flowers and pot plants).

Mr. A. J. R. de Soysa (Cinnamon).

Mr. A. W. D. Jayasuriya (Paddy).

Lady de Soysa (Tea).

Mr. George C. Warr (Coconut Oil).

Mr. J. W. C. de Soysa (Native Bull).

Mr. T. Sanmugam (Poultry).

Mr. Weerakody (Collection of native fruits).

Mr. C. C. Barber (Cacao).

Mr. S. M. Burrows, the new Director of Public Instruction, will arrive before the end of the year and resume duties probably in November. While welcoming him we cannot but feel sorry to lose Mr. Harward, the Acting D.P.I., who has proved an ideal Director and won the esteem of all.

The report of the Agricultural Commission is now due and will no doubt be forwarded to Government within the month. It is being eagerly looked forward to, as the deliberations of the Commissioners have so far been of a private nature. We trust the best decision has been arrived at for the good of the agriculture of the Island.

The operations of the Paris Exhibition Committee are taking practical form, and Exhibits under the various sections are being now made up, and indeed are beginning to come in. The Hon. Mr. C. P. Layard has succeeded the Hon. Mr. Ellis as Chairman.

Foot and mouth disease broke out in the Government Dairy despite all the precautionary measures that are in force against the incursions of epizootics. There is no doubt that the dairy herd was infected at the Havelock Racecourse where the animals are daily sent to pasture. These grounds are, as a rule, over-run by stray cattle during the night, and the virus of the disease was most probably deposited on the pasture grass by these stray animals. The dairy is once again quite free from disease, though the occurrence of the outbreak has caused a serious diminution in the output of milk.

FIBRES.

It has already been noted as an interesting fact, though in no wise a remarkable one, that the most valuable commercial fibres of today were the prominent fibres of ancient times, illustrating, in a word, the survival of the fittest. Flax, cotton, hemp, the liliaceous fibres, many of the palms, reeds, and grasses were known and valued in past ages on both hemispheres, being employed in connection with the common animal fibres, as wool, hair and silk. When or how vegetable fibres first came to be used will never be known, but it is possible that they were first employed in aiding man to secure his food, as the natives of every country from the burning tropics to the frigid north have drawn largely upon the resources of the vegetable kingdom for their fish

lines and nets. And it might further be conjectured that the rude knotting of the twisted filaments of fibre in the form of nets may have first suggested weaving and the substitution of vegetable clothing for the skins of animals.

Flax has a greater antiquity than any of the fibres of which we have knowledge, for its cultivation goes back to the Stone Age in Europe. It is known to have been manufactured by the Swiss Lake Dwellers, a people contemporaneous with the long-extinct mammoth and other great mammals of the Quaternary Epoch, as specimens of the straw, fibre, fabrics, etc., prepared by them are preserved in the Museums. It is supposed that the species cultivated at that remote period of the world's history, concerning which no written records remain, was *Linum angustifolium*, which at a later period, though still remote by four or five thousand years, the Egyptians cultivated the species known today as commercial flax (*Linum usitatissimum*).

Before the books of Genesis and Exodus were written Egyptians were skilled in spinning and weaving flax, for both the culture and the manufacture of this textile are pictorially carved upon the bas-reliefs and upon the walls of palaces, temples, and tombs. Egyptian fabrics of linen 4,500 years old and preserved in the museums and among the mummy cloths, fabrics from the most delicate tissues to linen, like sailcloth, have been found, and as many as 350 yards were sometimes used to enwrap one body. The linens were both white and dyed in colors: yellow, red, and purple, and they were handsomely embroidered. Spinning and weaving in Bible times were household industries, as we are assured by many references to women and flax. The Phœnicians did much to extend the culture of flax and the art of weaving linen, as their ships plowed the Atlantic more than three thousand years ago, even journeying to Britain, for they were a nation of traders, and there is every reason to believe that the Chaldeans excelled in spinning and weaving flax, while the Babylonians, centuries before Christ, were noted for their luxury and the high state of development of their textile art, flax, cotton, and wool being manufactured by them.

Wool was more grown in ancient Greece than flax, though the latter textile was produced in certain favourable districts and imported in large quantities for manufacture. There was a distinct linen industry, slaves being the operatives, as well as a household industry, for whether in the cottage or the palace, if possible, a special room was set apart for the occupation of weaving. In Homeric times not only were maids and ladies of high degree familiar with weaving, but with spinning and embroidery, and the distaff and spindle were often made of ivory or of gold. As in Greece, so in Rome, there were regular linen establishments, and at the same time a domestic manufacture practiced by maids and matrons. Woollen was earlier used for clothing by the Romans; then linen was employed, first for domestic uses, then as a dress material, the women adopting it before the men.

Regarding the early use of linen in our own country, the time when American history began to be made is so recent that the word ancient does not apply. It has been stated that both flax

and hemp were known to the ancient Mexicans or Aztecs, though I can refer to no records which relate to their use.

While it has been shown that cotton was the ancient national textile of India, its cultivation and use were by no means confined to that country. Flax was the aristocratic textile of Egypt and was generally cultivated, but cotton was grown in the southern part of the country. Cotton and linen were sometimes woven together (flax warp and cotton woof), just as mixed "tow linen" is made in the mountains of Virginia and North Carolina today. These Egyptian mixed fabrics, as well as pure cotton cloths, were largely used in upholstery as the coverings of chairs and couches, and probably also as drapery hangings. The cottons of India were famous and Hindoo muslins were formerly produced that were so fine that when laid upon the grass and wet with dew they became invisible. The marvelous fabrics of Cos and Tarentum, by some said to have been made from cotton, were more likely silk, as they are described as floating like mist around the female form, disclosing the contour like gauze veil. There is also the record of a muslin turban 30 English yards in length, contained in a coconut set with jewels, which was also exquisitely fine that it could scarcely be felt by the touch. It is impossible to say how far back into the ages cotton was first used in India, and though it is referred to 800 B.C., we may be sure that the industry was old at that time. Cotton was a late introduction into Greece, though it was known 200 B.C., and even linen was an introduced textile, which came slowly into favor at a time when wool was almost universally used.

VELVET BEANS AS HUMAN FOOD.

The shelled beans have been used as food for cattle, hogs and chickens and even as a table vegetable. The writer has up to this time made no experiments to determine the suitability of the beans for feeding to different classes of live stock.

Inasmuch as there is on record one well authenticated case of injury following the use of green immature shelled velvet beans as a table vegetable, caution is advised in using the beans for human food. This case of apparent poisoning or acute indigestion following the eating of green velvet beans, boiled, was carefully investigated by Mr. V. K. Chestnut, of the U.S. Department of Agriculture. He has kindly permitted the writer to examine his correspondence with Mr. J. S. Sergeant of Florida, who reported the only case on record, where velvet beans proved decidedly harmful. With him green boiled velvet beans proved injurious, not only to men, but also to the poultry. Mr. Sergeant writes as follows concerning velvet beans as a substitute for beans:—"We have since used them as coffee two and three times a day for three or four months continually without observing any deleterious effect. If properly ground they make a very pleasant drink. The least bit of burning makes the beverage too bitter, and on the other hand too little browning, leaves them with an unpleasant taste and odor." Four Floridians who have

had extensive experience with velvet beans were consulted on the suitability of velvet beans for food of man and beast. All hold the opinion that they contain no poisonous principles, but three of these four correspondents agree that the velvet bean is not a desirable table vegetable. The fourth, Mr. F. J. Johnson, Leesbruy, Fla., writes thus:—For human food they are by all odds the richest and best vegetable I have ever tasted. If eaten in large quantities they will nauseate the stomach, not from poison, but from richness. They should be soaked in water over night. This separates the inside hull from the bean. They should then be parboiled in at least two waters. Then cook them as you do any other beans.

The air-dry shelled beans analysed by Prof. H. H. Persons, (Fla. Bul. No. 35), contained 6.29 per cent. of fat, 53.5 per cent. of nitrogen-free extract (starch, etc.), and the very large amount of 18.81 per cent. of protein or muscle forming material. This indicates that the beans are even richer in food materials than the cowpea, which ranks especially high as a food-stuff.

OBSERVATIONS ON THE AGRICULTURAL EDUCATION OF THE ISLAND OF CEYLON.

The necessity for the appointment of the present Agricultural Commission, if I am not mistaken, has arisen from the fact that a cry has been raised that the Colombo School of Agriculture is not doing what was expected of it, or in other words, that it has proved to be a failure. The re-organization of the School, therefore, with a view to devising a more liberal system of agricultural education among the native population of the island seems to me to be one of the most important duties that the Commission has to perform. Before proceeding further, it will therefore be useful at this stage to inquire,

1st. What was expected of the Agricultural School to do when it was first started.

2nd. What it has done so far, and

3rd. Why it has apparently been a failure.

It is of course impossible to show by statistics how much good an institution of this nature may do to a country, nor is it necessary here to enumerate instances in which this particular Institution has been of service to the island. From an educational point of view nobody can be blind to the fact that the School has done an immense deal of good. In this respect I may make bold to say that it has done more good to the native population of this island than either the Royal Botanic Gardens or the Colombo Museum, both of which Institutions absorb a much larger share of the revenue than the School of Agriculture. The School is purely a scientific and a technical one, and anybody who is not conversant with the sciences that go to help an agriculturist, nor anyone who has not studied the methods of cultivation as practised by our village goiyas is really unable to see what good an Agricultural School is likely to do to the people. The Hon'ble Mr. Mitchell once observed: "With regard to the good the school was doing nobody could be blind

to that. Lads came from the country and studied Agriculture there and went back to their villages, and no one can be blind to the fact that very important results must follow from that in the course of time." A knowledge of Agriculture with its allied sciences such as Botany, Chemistry, Veterinary Science, &c., will at least enable a lad to go about with his eyes open, while the influence that he could exercise on the people among whom he moves is from an educational point of view incalculable.

Mr. H. W. Green, the founder of this Institution, was always a keen observer of the various methods of cultivation as practised by our village goiyas, and he exactly knew in what directions improvements should be carried out. I am speaking with some authority, as I have had the opportunity of personally discussing these matters with Mr. Green on several occasions during my connection with the Agricultural School from its very commencement in 1884 and until 1890 as a teacher of Botany, Chemistry, &c., there. His Primer of Agriculture which is at present taught in every village Government School from the Vth Standard upwards is highly appreciated by the villagers.

The Agricultural School has at least succeeded in teaching our educated youths the dignity of labour. In the words of Mr. Elliott, the late Government Agent, "the young men who have passed through it are a credit to the school in which they were trained. They are capable Agriculturists and intelligent workmen who understand their work, and know how and when to plough, to sow, to water and to reap."

The iron plough which Mr. Green tried to introduce was undoubtedly a failure, and some people are under the impression that this was all that the School tried to do; and when the plough failed the school was also put down as a failure. The plough must be left out of account altogether in considering the results of the school. All that Mr. Green tried to do was to find out an implement by which the soil may be properly turned up and properly tilled and with the least expense to the goiya. That the soil must be properly tilled before anything can be made to grow on it successfully is an admitted fact; the point was to get a suitable implement.

It was expected that the youths who studied at the school would go back to their own lands and take up Agriculture as their profession; but even the big landed proprietors who have passed through it, with one or two exceptions, have not done so. The reason for this is not far to seek. Anybody who is acquainted with native character will be able to supply an explanation. It is however a mistake to suppose that simply because these young men did not take to Agriculture the School was a failure, and the money spent in teaching them was spent in vain.

Again, a promise was I believe held out by Government at the time that the school was started, that preference would be given to young men who had studied Agriculture in filling up vacancies as Korale Mudaliyars, Mubandirams &c. There is no instance on record in which any of the young men who passed through the school

ever attained to this distinction. This is not very encouraging.

Now I come to an important point. When Mr. Green started the school, he was anxious to have it as part and parcel of the old Normal School, the only training Institution for Government teachers. He succeeded in this, and it was placed in charge of the Principal and Science Master of the Normal School who was a European. Unfortunately, soon after the school was started Mr. Green, who was then the Director of Public Instruction fell ill and had to leave the island on furlough. The Vernacular Normal students who were trained to be village teachers were then taught Botany, Chemistry and Agriculture in addition to the ordinary school subject. Mr. Green's idea was to give these teachers a training in practical Agriculture also, so as to enable them to teach Agriculture to the villagers through the school boys. This was a capital idea. The influence that a good village teacher can exercise among the people with whom he mixes is great. The boys who pass through the village school will be the future men of the district, and what an opportunity a teacher who understands his duty has in forming the character and habits of the people and reforming existing methods of cultivation; while very little can be done by directly going to the older people. Agricultural reform must be made to pass from boy to man, and this can only be done through educational agencies. Mr. Green had recognised this fact before he started the school, but unfortunately during his absence in England the Government decided to abolish the old Normal School and to open village Training schools instead. A large saving was thus effected, but from then the Agricultural School had to stand alone. Mr. Green on his return to the island was apparently much vexed at this, and we read in his Administration Report that he never ceased to regret the closing of the old Normal School. He was, however, equal to the occasion, and decided to make teachers of the Agricultural students and the sanction of Government was obtained to appoint a number of students as Agricultural Instructors. So long as Mr. Green was at the helm things went on very smoothly. Passed students were sent out expressly with the view of showing improved methods of paddy cultivation to the villagers. The experiments conducted by these young men from all we gather from records proved successful in most cases, and the villagers in some instances learnt much from them. But in a country like this where the people are so conservative it is impossible to create a lasting impression upon them by experiments conducted in a haphazard manner here and there. A series of experiments for a great length of time at each place and under proper guidance should have been systematically carried out. Unfortunately this was not done. Young Instructors were in most cases placed under the guidance of the native chiefs of the district. These chiefs had not received any training in Agriculture, and they themselves were as ignorant as the ordinary villager. The Instructors were further much handicapped in their work, and were rather expected like the Hebrew of old to make bricks

without straw. They had no money, no seed paddy, no implements given them, but were generally attached to an ordinary village school and expected to cultivate paddy in an improved style. Progress, under such circumstances, was of course impossible. Mr. Green's primary object in starting the school was to help small agriculturist and not the big one; small owners of little tracts of land who suffered distress from want of food. That want of food he had seen, and he was satisfied that it was caused by the people not knowing what to do with what they had. They threw away 3 bushels of paddy in sowing when 10 seers would be enough, and this saving of seed paddy would keep a family in comparative comfort for a month or six weeks: and that in a time of famine and distress was a great thing. In some of the Kandyan districts of the island the preparation of the land for paddy is apparently most carefully done, and weeding and transplanting are carried out. These methods are, however, confined to only a very small area of the island, and the people even here have as yet to learn a great deal as regards the most improved methods of preparing the land and various other details, such as the selection of seed paddy, &c.

The Agricultural Instructors are no more, and the step that the Government took in discontinuing their services is, I think, a mistake. These young men should have been properly guided. Their work should have been constantly supervised and reported upon by somebody who was competent to do so. In my opinion there were a few among them who were incompetent for the work, and they should have been dismissed; while there were others who were really capable men, and they could have done a deal of good if they had received sufficient encouragement to do so. I have, I think, so far partly explained the primary object in starting the Agricultural School, and have also to a certain extent pointed out what it tried to do and has done. I shall next attempt to show why it is that it has apparently been a failure in the eyes of the public.

(To be continued.)

INFECTIVE DISEASES OF ANIMALS.

The above is the title of the 1st vol. of a work on Veterinary Pathology, recently written by the German Veterinary Surgeon Friedberger and Fröhner, and translated and edited by Veterinary Surgeon Hayes. Among the commoner diseases treated of in this work are Septicæmia and Pyæmia, Strangles, Distemper, Ezoötic Abortion, Dysentery, Anthrax, Foot and Mouth Disease and Rinderpest.

It is an up-to-date book containing the latest information on the diseases treated of, and is considered one of the best authorities on the subject. The term '*infective diseases*' is used to include both contagious and infectious diseases, a distinction which the translator calls in the appendix as mainly one of degree, as the difference in their mode of transference is often more apparent than real.

The following passage occurs under the head of rinderpest;—"During the year 1897, Koch and

Edington have more or less successfully carried out extensive protective inoculation experiments against rinderpest with infected bile. The most hopeful results, however, appear to be obtainable from the method of Danysz, Bordet and Theiler, a translation of whose report may be seen in the Veterinary Record of the 26th February, 1898.

"These observers at first confer comparative immunity by the injection of immune blood on experimental cattle, to which they then transmit rinderpest by natural infection, with the result that these partially protected cattle take the disease in a mild form, and, on recovery become immune for the remainder of their lives. In this, these pathologists act on the knowledge that the injection of blood serum obtained from cattle which have recovered from rinderpest, renders the experimental cattle capable, for a short time, of withstanding the effects of the disease more easily than they would otherwise do, although it does not prevent them from taking the infection. In this method, defibrinated blood is used in preference to blood serum, as it is more economical in practice, and is at least equally effective."

A more detailed account of this method of treatment can also be found on reference to the last October number of the *Agricultural Magazine*.

The distinctions drawn between rinderpest and other diseases will be found useful. It is thus differentiated from dysentery. "In *dysentery* the diarrhoea appears earlier and contains more blood. The intestine only is implicated and the affections of the mucous membranes (mostly eyes, nasal cavities &c.) are absent. The *post mortem* appearances are also different." Again, differentiating it from the gastric form of anthrax the authors say that the latter disease runs a much more stormy course and is not directly infectious. *Post mortem* and bacteriological examinations also materially help in diagnosing these diseases correctly.

The description given under the head of "Deer and Cattle Disease" is interesting, especially because it tends to throw light on a disease called *kandamalai* in Ceylon. It has hitherto been thought that this is a form of anthrax and was called gloss-anthrax. Of "deer and cattle disease" we read:—"It was usually mistaken for anthrax with the lingual form of which it possesses in some cases great similarity. The question whether the majority of cases described as "anthrax of the tongue" or "gloss-anthrax" were not those of this disease is almost self-suggestive."

The following are the symptoms of the disease as it occurs in cattle:—Loss of appetite, diminution of milk, temperature very high; the soft parts of the head, especially of the face, intermaxillary space, dewlap and neck are swollen often to an enormous size. The swellings are tense, hard, hot, painful and unyielding. Symptoms of stomatitis and pharyngitis appear at the same time. There is salivation with difficulty of swallowing; the tongue hangs out and is swollen. Difficulty of breathing and even actual suffocation may occur on account of the great swelling about the throat. The visible mucous membranes are of a brown-red colour and infiltrated with hæmorrhages. Excessive dyspnoea and colic come on at the last stage,

This disease is distinguished from anthrax by the absence of the anthrax bacillus in the blood, absence of enlargement of the spleen and of the characteristic tarry condition of the blood, which are always present in anthrax. Deer and cattle disease can, unlike anthrax, be easily transmitted to pigs, scarcely to sheep and never to man. Death generally takes place within 24 hours.

Free incisions into the swellings with subsequent application of strong disinfectants is recommended by way of treatment.

Injections of a 5 per cent solution of creolin and the internal administration of creolin are also recommended.

One interesting and important feature of the volume under review is that, amongst others, it directs attention to diseases that can be communicated to man by milk, meat, infection, inoculation, &c., and is therefore useful to doctors as well as to veterinary surgeons. Among diseases of this description are apthæpizootica, anthrax, tuberculosis, influenza, actinomycosis, diphtheria, tetanus, glanders and rabies.

The second volume, which has not yet been published, will more particularly concern the veterinary surgeon, as it will deal with the diseases of animals purely.

E. T. HOOLE.

ABOUT THE KOLA NUT.

Most people are acquainted with the Kola nut tonic, so universally sold, but few know much of the great esteem in which the nut is held in the Soudan. As an article of commerce in Central Africa, it far and away exceeds in importance every other article of commerce throughout the whole of the Western and Central Soudan. Mr. C. H. Robinson, in an article on the Kola nut, in his book "Hausaland," says:—

Though not found originally in any part of the Hausa States, there is nevertheless no village or hamlet, however small or remote, in which it is not constantly used. The Kola nut is the product of a tree called *Sterculia acuminata*, which is found in the greatest perfection in the country to the back of the Gold Coast Colony. It is also found as far east as the River Gambia, and, with more or less frequency, in all the intervening country.

The fruit resembles a large-sized chestnut, and is encased in long pods, each containing 4 or 6 nuts. It grows like chestnuts, in bunches of 3 or 4 on the tree. Round the Kola nut there is usually a black line, sometimes two, at which it can be divided or subdivided. The colour is generally brick-red, though in some countries, especially in the Far West, there are all sorts of intermediate shades between red and white. In the country of the Bambara tribe the Kola nuts play an important part in private and public life. The colour in this case has a special significance: a white kola is always a sign of friendship and hospitality, whilst proposals of marriage, acceptances or refusals, defiances, declarations of war, &c., are conveyed by the sending of a number of kolas of the prescribed colour.

The Kola from Gandja, which is of a uniformly red colour, is the one most frequently brought to Kavo (the capital of Central Soudan), as it keeps better than any other. The most minute care and attention on the part of the merchant are necessary in order that the Kolas may reach the market in good saleable condition. They are carried for the most part in Kavo-made baskets, each of which contains 3,000 or 4,000 Kolas, whilst two of them form a donkey-load. If treated with the utmost care the nuts may be preserved fresh for 2 or even 3 years, but in order to secure this they must be kept constantly damp. If exposed to the air and allowed to dry the Kola opens along the black line mentioned above, wrinkles, and becomes as hard as wood. In this condition it has lost 90 per cent of its value. During the march the nuts are packed in baskets and covered with fresh green leaves. Every 4 or 5 days they ought to be repacked, in order that the leaves may be renewed and that the nuts which are touched with mildew may be removed.

The large profits obtainable on the sale of those which reach the various markets in good condition compensate for the risk and trouble of their carriage. At Gandja the average nut costs 5 cowries; at Say, on the Middle Niger, 70 to 80 cowries; at Sokoto, 100; at Kavo, 140 to 250; at Kuka, on Lake Tchad, 250 to 300.

What, then, one may naturally ask, are the peculiar virtues of this fruit, which forms by far the most important article of commerce in the Central Soudan? The fact that for generations past it has been eagerly sought after by rich and poor alike, and that men will constantly spend the last cowries they possess in buying one to chew, seems clearly to show that it is something more than a mere luxury. The scientific analysis of the nut shows the existence of a large quantity of tannin and of an alkaloid analogous to theine and caffeine. The natives believe that it keeps off the pangs of hunger and enables them to work for long periods without food. As a stimulant, it takes the place which tea and coffee with us, both of these being practically unknown. Owing to its extremely bitter and unpleasant taste, we were prevented from giving the sustaining power of Kola a fair trial. On the occasions, when, through lack of food we would gladly have made the experiment, we were unable to obtain the nut. Whatever its real virtues may be, it is certain that the commercial value of Kavo is to a very large extent dependent upon the millions of Kolas which its market contains.

On one occasion I met a caravan consisting of about 1,000 men, together with a large number of donkeys carrying Kola nuts up towards Kano. The value of the nuts in the caravan, which was only one out of several that annually came to Kavo for the same purpose, was little less than £100,000 sterling. The whole of this immense trade is at present in the hands of natives, as the course of the Niger is not such as to allow of the Kolas being carried by water any part of the way.

[The name of Mr. J. P. Williams, the well-known Seedsman of Henaratgodu, is always associated with Kola nut in this colony. Mr. Williams sent some excellent specimens of dry Kola nut to the Colombo Agri-Horticultural Society Show held last month.—Ed. A.M.]

A NEW SYSTEM OF SOIL CULTURE.

This is the title of an article in the *Rural Californian*, in which a great deal is written in praise of Mr. H. W. Campbell, the originator of the so-called new system of soil-culture. We would quote the following which is given as part of a report of the Northern Pacific Railroad Company, to give some idea of the new system referred to:—

"The Campbell method consists in a complete re-arrangement and pulverising of the top seven or eight inches of soil, and turning it as nearly bottom upward as possible. The plant food in the soil is found at the end of each season very largely concentrated in the top four inches. This plant food must be ploughed down into the bottom of a furrow seven or eight inches. From this depth it will be placed by the action of moisture, just where the little feeders of the plant roots want it. Immediately after ploughing, the lower four inches of the furrow-slice must be packed as firm as possible, for four important reasons:

"1. To completely obliterate all cavities. Where the furrow lies loose, the air circulates under the plants and the ground dries out. It must not be permitted to do this. It is ruinous to the crop.

"To cause moisture to gather from six to eight inches from the surface. Why? Because the stubble and manure, and other vegetable matter, is there, and water is necessary to rot it and fit it for the food of the crops. Unless this is done, the plants are robbed of their most valuable food.

"3. To get the right conditions for rapid root-growth in the early part of the season. For this a fine, firm, moist soil must be had. The lower part of the furrow-slice is the root-bed, and must be kept in just the right condition if we are to get a rapid and vigorous root-growth.

"4. By firming the root-bed we hold more moisture. More than this: The pores in the ground are made so small, that the water creeps through the soil readily by the force called capillary attraction. By increased capillary attraction moisture is drawn more rapidly and from a greater distance. This gives the plant food and drink at critical times, when the weather is hot; when the hot winds blow, and when the evaporation from the leaves is greatest. Your crop never suffers at such times if there is plenty of water for the roots. But a shortage of water at that point may ruin your whole crop in a day."

Large increases in crops are reported as the result of actual experiments carried out on the lines of this system. We shall refer to this subject in a future issue.

ORIGIN AND FORMATION OF ORGANIC MATTER IN PLANTS.

By the ordinary method of sand culture, in which the plant is grown in sand free from organic matter, it may be demonstrated that the plant accumulates considerable quantities of carbon and nitrogen during its growth. This carbon and nitrogen with the elements of water form the organic constituents of the plants, which with a small quantity of mineral ingredients make up the

roots, stem and leaves, and give the seed its valuable nutritive qualities. Since the soil did not contain either carbon or nitrogen, the plant must have drawn these two elements from the air. It is the purpose of this article to explain the nature of this fixation of the carbon and nitrogen of the air.

The classic experiments of Priestly, in 1771, established the fact that plants exhale oxygen. Later researches made by Ingenhous and by Tenneber explained the decomposition of the carbon dioxide of the air and the evolution of oxygen by the leaves under the influence of light.

The earth's atmosphere contains only three parts of carbon dioxide in 10,000 of air. It is evident, therefore, that in order that plants may obtain the carbon which they require from a medium so poorly supplied with it, rapidity of absorption by the tissues must compensate for the scarcity of the element in the air.

In the first place the absorption of carbon dioxide is favoured by the form of the leaves, which is such that they offer, as compared with their weight, an enormous absorbing surface. In a tree the leaves are at the extremities of infinitely ramified, flexible branches, which are agitated by the slightest breeze, thus facilitating contact of the leaves with the constantly renewed layers of air about them. That the absorption of carbon dioxide is very rapid may be shown by placing a leaf from which the air has been exhausted by means of an air-pump in an atmosphere of carbon dioxide in an apparatus which measures the change of the volume. It will be observed that absorption begins instantly, but that it is largely dependent upon the quantity of the water present in the leaf. Thus, the co-efficient of absorption of the carbon dioxide in old leaves of Japanese *Euonymus*, containing 66.3 per cent. of water was found to be 0.70 at 15°, while in young leaves of the same tree containing 75.4 per cent. of water the co-efficient was 0.83. A comparison, at different temperatures, of the co-efficient of absorption of carbon dioxide in the leaves with that in pure water shows the absorption in the leaves to be somewhat greater than in pure water. This indicates that the carbon dioxide is not simply dissolved in the water in leaves, but that it combines with the water to form a hydrate. It will be shown later that this fact is of great importance.

The carbon dioxide which is absorbed by the leaves is decomposed, and the products of this decomposition are utilised in the formation of the simplest primary organic compounds, from which the more complex constituents of plants are derived. To accomplish this the principal condition is that the leaf be perfectly healthy.

If it does not contain its normal proportion of water, *i.e.*, if the roots do not draw from the soil as much water as is given off through the leaves the decomposition of carbon dioxide is checked. Assimilation has ceased when, as at the end of a summer day, the leaves of the tobacco plant, for instance, are hanging down the stem, or those of the beet lie flat on the soil. In fact it has been found that the decomposition of carbon dioxide begins to decline even before the leaves have lost their turgescence.

Light is absolutely essential to the assimilation of carbon by the leaves of plants. The principal source of this energy is, of course, the sun, but attempts have been made to utilise artificial light, especially electric light, for foreign plants. Siemens in England, Bailely in America, and the author in France have made experiments of this character. Since there is no doubt that, with the increasing use of water power for the production of electricity, a large supply of electric light can be economically obtained, it is highly interesting to learn what its action is on plants. All observers have found that rays from an arc lamp without a globe exert an injurious influence, blackening the epidermis of the leaves. During the author's experiments in 1881 the epidermis exposed to the direct rays became black, while the parts protected by the upper leaves preserved their beautiful green colour. The line of demarcation was as sharp as in a photographic plate. The injurious influence ceased as soon as the lamp was surrounded by a white glass globe through which the ultra-violet rays passed with difficulty. To understand the influence which the heat rays situated at the other extremity of the spectrum exert on vegetation, we must recall to mind that in respiration leaves, like all other plant organs, absorb oxygen and exhale carbon dioxide, a process which is precisely the opposite of that which occurs in assimilation.

It must also be remembered that the activity of respiration increases with elevation of temperature, while rise in temperature has only a very slight effect on assimilation. Maquenne and the author some years ago made a careful study of the action of both light and heat rays on leaves. In this research two source of light were used, the Drummond light, which is obtained by rendering a piece of quicklime incandescent by means of the oxhydrogen blowpipe, and the Bourbonze lamp, which is composed of a cylinder of platinum wire gauze, which becomes incandescent when heated with illuminating gas, the combustion of which is promoted by a strong current of air. The leaves were introduced into tubes containing an atmosphere of known composition, and were placed very near the lights, but were protected by screens containing transparent liquids of varying diathermanous properties. In some cases water was used, which allowed the light rays to pass but retained the heat rays. In other cases the screens were filled with benzene or with chloroform, which are also transparent but much more diathermanous than water. Exposing the leaves to the action of the Drummond light, which is poor in heat rays, and surrounding them with a screen filled with water, promoted reduction, the proportion of carbon dioxide in the tube diminishing, while the oxygen increased. When the screens were filled with chloroform, however, and the Bourbonze lamp was used, which is rich in heat rays, the opposite effect was obtained, *i.e.*, the carbon dioxide increased and the oxygen diminished. In this case the phenomena of respiration took the place of those of assimilation.

Passing from the study of the chemical and heat rays to that of the light rays in the central part of the spectrum, we find that the latter produce very different effects from the former,

Draper demonstrated long ago that the orange rays are the most active in decomposing carbonic acid in the leaves. This conclusion was fully confirmed by the researches of Sachs, Cailletet, and the author, made nearly 30 years ago. The reason for this special action of the rays of this part of the spectrum were not investigated until the Russian physiologist, Timiriacheff, took up the subject. He found that the rays which are most active in decomposing carbon dioxide are the orange and yellow, which are absorbed by chlorophyll when the latter is examined with the spectroscope. The same fact has been beautifully demonstrated by Engelmann. He received a ray of light upon a prism so placed under the objective of a microscope, that on looking through the instrument the different rays of the spectrum could be seen. He then put a drop of water on a slide and added a filament of green alga and some putrefactive bacteria, which were aerobic. It was observed that the bacteria congregated in great numbers on that part of the alga lighted by the yellow and orange rays. In the green region only a few were observed, and these finally collected in the blue portion. In other words, the bacteria collected in the different rays in numbers approximately proportionate to their activity in assisting the decomposition of the carbon dioxide by chlorophyll.

Evidently the rays which pass freely through the chlorophyll exert no action. So it happens, as shown above, that the extreme red or the green rays are without effect on the decomposition of carbon dioxide. On the other hand, the orange and blue rays are retained and absorbed by the chlorophyll, and thus made available for the work of decomposing carbon dioxide. The fact that orange rays are much more effective than the blue is easily explained. The decomposition of the carbon dioxide, with the evolution of oxygen, requires an expenditure of energy equal to that involved in the burning of carbon in oxygen. In order, therefore, that the rays may be effective for reducing carbon dioxide, they must be not only readily absorbed but sufficiently warm. The orange rays, which are situated at the side of the spectrum where the heat rays are concentrated, are far more energetic than the blue, because, in addition to being readily absorbed, they are warmer than the latter.

The decomposition of carbon dioxide can only be brought about by the aid of outside energy. This energy is supplied by the sun's rays. Since decomposition of carbon dioxide in the chlorophyll cells is the source of the organic constituents of plants, and since these substances are essential to the life of animals, we see that all living beings on the earth's surface owe their activity primarily to the sun.

RINDERPEST.

D. HUTCHEON, COLONIAL VETERINARY SURGEON,
CAPE COLONY.

As Rinderpest has re-appeared in the Transvaal and Bechuanaland several months after it was believed to have died out in all the states and colonies south of the Zambesi, it is of importance that the farmers should consider what is the most satisfactory method of inoculation to adopt, should the disease again invade their herds. When

writing my annual report for 1897-98, and reviewing the character of the work done up to that date, and the various methods of inoculation which were adopted for the purpose of arresting the spread of the plague, and saving as many as possible of the cattle exposed to its ravages, I remarked, with reference to inoculation, that if we had to commence the work over again, I had very little doubt that, profiting by the information which we had gained by painful experience, we could improve upon the results which we had previously obtained by the adoption of any one of the methods which had been tried. For example, in carrying out Koch's method of bile inoculation, if the biles were extracted and selected from affected animals in the last stages of collapse, or immediately after death, (a system which was carried out in Basutoland with such satisfactory results), a stronger and more uniform immunity would have been given than was frequently obtained. Again, our experience clearly indicated that if a larger dose than 10 c.c. had been given, or a second inoculation of bile injected, the immunity conferred by the bile would have been very much strengthened and the period of protection considerably extended. Further, it is very probable that if all suitable biles could have been kept in an ice chest for some days before being used, infection would not have been conveyed to clean herds by bile inoculation, as was undoubtedly done in the majority of instances where fresh bile was used; and we would not now follow Koch's bile inoculation by an injection of virulent blood. As this is still advocated I will refer to it again. I, however, expressed myself as being still in favour of using an injection of virulent blood after inoculation with glycerinated bile; beginning with very small doses, and repeating the injection at short intervals and in increasing doses until a decided reaction was obtained, but I do not even advocate that now, for reasons which will appear later on.

With respect to the serum method of inoculation, it is a very interesting fact that although all the cattle in a herd are given the disease in a more or less modified form by this method of inoculation, it is comparatively rare that infection is carried from such a herd if ordinary precautions are taken, and quarantine regulations enforced. In the Cape Peninsula, serum inoculation was not generally adopted, nor carried out in a systematic manner in any locality. Individual herds were inoculated at different centres all over the district, yet the disease was not spread by that means. On the contrary, by the aid of serum inoculation, the disease practically disappeared from the Cape, Malmesbury and Tulbagh districts. I expressed the hope, therefore, that by the adoption of serum inoculation, systematically applied, the disease could be eradicated from the country.

Since the above was written, however, the disease has practically died out within the boundaries of the Colony, and until these outbreaks, which were reported from the Transvaal the other day occurred, we had no information of any cases of Rinderpest south of the Zambesi, a condition which the most sanguine optimist amongst us would hardly have ventured to predict. Such is our fortunate position, however, and the circumstances being entirely different to what we anticipated at such an early date, our opinion with

regard to the course which should be followed under the altered circumstances has undergone a corresponding change. For some considerable time, I have frequently been asked the question,—“If Rinderpest should appear either amongst my own cattle, or in my immediate neighbourhood, what method of inoculation would you recommend me to adopt?” In replying to this question I have readily and frankly given the individual querist the advice which I considered the best under the particular circumstances in which he was placed with regard to his cattle. Hitherto, however, I have been reluctant to publish advice to the public generally which would in any particular contradict the directions for inoculation which were drawn up by the Rinderpest experts at their last conference in Cape Town, and published for general information, until I felt convinced that the altered conditions necessitated some departure from the course then recommended. And in publishing these slightly altered recommendations to the public at the present time, it is due to my colleagues as well as to the public to explain that my opinion with respect to the efficacy of the preventive and curative treatment of Rinderpest thus recommended has not undergone any change. It is merely the altered circumstances which I consider require that a slightly different course should be pursued.

With respect to the serum method of inoculation, all the experts are agreed that, if Rinderpest should appear in a herd of cattle which have not been previously inoculated with bile, they should be immediately inoculated with strong immunising serum if it can be obtained. Every animal which indicates, by the thermometer, the presence of fever should receive a very large dose, while the healthy ones should receive the usual modifying dose. If serum cannot be procured, then blood freshly drawn from a salted animal and defibrinated should be injected in proportionate doses. And if neither of these can be obtained, then glycerinated bile should be used, as it has been shown to possess strongly curative as well as immunising properties similar to serum, when used in large doses, more especially when injected direct into the jugular vein.

(To be continued.)

GENERAL ITEMS.

Dillenia indica or *speciosa* (the Sinhalese Honda-para) is not known in Ceylon to produce an edible fruit. Dr. Trimen in his Flora merely refers to the fact that the fruit makes a lather with water and is used as soap. Dr. Watt, however, mentions that it is eaten by natives either raw or cooked—chiefly cooked in curries; adding that it is also made into a pleasant jelly, while the acid juice sweetened with sugar forms a cooling drink. Mr. Lewis Bernays, writing about the tree in the *Queensland Agricultural Journal*, says that the fleshy leaves of the calyx, when the fruit is fully matured, have an agreeable acid taste, and are eaten raw, cooked in curries, or made into sherbet; inside are numerous reniform seeds, surrounded by a pellucid glutinous matter, and used for making a palatable jelly, for a cough mixture, or a cooling drink in fevers, and otherwise. The bark and leaves are both astringent, and are used medicinally.

A Zanzibar paper says: Throw a bit of alum about the size of a marble, into a bowl of water and wet the hands and face and any exposed parts lightly with it. Not a mosquito will approach you. They hum about a little, and disappear.

The United States Government at the experiment stations has succeeded in grafting the tomato top on to the potato root, and strange as it may seem the growing of a crop of tomatoes does not seem to interfere with the growth of the potato, and we have no doubt that it will become common some time by this means to grow the finest tomatoes and potatoes both from the same plant.—*Exchange*

Mr. D. F. Turnbull, Martintown, Cairns district, writes to say that he has discovered a “wrinkle” worth knowing to keep cattle free from ticks. As it is important that every light should be thrown on the subject of cattle ticks, we print Mr. Turnbull’s letter. He says:—“Of a few cows I have, one in particular seemed such a favourite of the ticks that I got tired of trying to keep her clean. She was down to skin and bone, when a neighbour, happening to see her, said she could not live above three days. Shortly after this, I thought of saltpetre and its effect on dead beef. I decided to try it on the cow. I ground a bit the size of two peas, with a little salt, and gave her this amount daily for three days, when half of the ticks disappeared. I then reduced the amount to one-half for the next three days, when I could count on my fingers the remaining ticks. After this, I gave her a bit—and still do so—the size of a pea twice a week, which keeps her in a thoroughly clean condition. Of course the cow put on flesh quickly, and was nearly fat in six weeks after the treatment began.” This remedy, says the *Australian Exchange*, is not new. A Frenchman was travelling the colonies some time ago, who affirmed that he could cure ticks by the use of saltpetre. Mr. P. R. Gordon says that the matter was gone into by Sir Horace Tozer, and quantities of saltpetre were tried on cattle without the slightest effect. The presumption is that the cow above mentioned was just about getting clear of the ticks when the remedy was tried with such a satisfactory result. Mr. J. Irving, M.R.C.V.S., concurs in Mr. Gordon’s opinion.

Veterinary Major F. Smith, M.R.C.V.S., says:—The mean ratio of carrying power to body weight is 1 : 5·757, that is to say, it takes, speaking roughly, 5¾ lb. of body weight to carry 1 lb. on the back during severe exertion (racing excepted). The rule therefore for ascertaining the carrying power of a horse is to divide his body weight by 5·757, and, if intended for only moderate work, add to the product 28 lb. It has to be noted that the observations were made upon military horses, and it is doubtful if it would work out so accurately if applied to all horses used for the saddle.

The fruit of *Aberia Caffra*, known as the kei apple, is used for making a most palatable jelly mixed with the ash pumpkin pulp. Unripe, the kei apple is used for pickling. The plants form excellent hedges. In Ceylon we have *Aberia Gardneri* (Sinhalese kei-ambilla,) but we are not aware that any use is made of the fruit.

No. 3

GRAPHITE :

ITS FORMATION AND MANUFACTURE.*

By E. G. ACHESON, Member of the Franklin Institute.

Early History and Recognition.

In the year 1779, Karl Wilhelm Scheele, a young apothecary in the town of Koping, Sweden, a remarkable genius as an investigator, and then in the 37th year of his age, discovered that graphite had an individuality quite apart from molybdenum

sulphide, with which it had been until then confounded. He discovered that when it was treated with nitric acid, carbon dioxide was produced, whereas molybdenum sulphide when oxidised produced a white earth, and he drew the conclusion that it must be some kind of carbon, likely of the general natural of coal.

Previous to this discovery by Scheele, a group of minerals including graphite and certain ores of lead, molybdenum, antimony, and manganese (lead sulphide, molybdenum sulphide, antimony sulphide, manganese dioxide) were believed to be one and the same substance, or, at least, members of the same family. This opinion was due to their outward resemblance, and the fact that they produced marks on paper. This confusion naturally led to the application of the same name or names to each of the members of the group, and as graphite had not been recognised by any peculiarity distinctively its own, it received the names *molibdæna*, *plumbago*, *graphite*, and *black-lead*, which were used in an indiscriminate manner for each of the several substances. The name *molybdæna* was dropped at any early date, probably immediately following the discovery by Scheele, and there is no known reason why *plumbago* and *black-lead* should not have followed its lead, for graphite is the only one of the series not misleading and entirely appropriate, meaning as it does "I write," from the Greek word *graphos*.

Graphite does not seem to have received any particular attention from chemists from the time of the discovery by Scheele until the year 1800. During the last quarter of the eighteenth century, the diamond was the subject of much interest, in a chemical sense, and in the hands of the French chemists it was shown to produce carbon dioxide when ignited in air. In 1796 Smithson Tennant showed that equal weights of charcoal and diamond yielded equal weights of carbon dioxide on burning and they were thereafter associated together as carbon. In 1800 Mackenzie added graphite to the carbon group, by showing that it also, in equal weight, produced the same weight of carbon dioxide (Roscoe). Thus, in the opening year of the present century, graphite was proven to be an elementary substance. Charcoal, diamond, graphite were then recognised as three distinct allotropic form of the element carbon.

Distribution.

Graphite, in a more or less pure state, is quite freely distributed over the earth, but only in a few places is it found under conditions of purity, quantity, ease of mining, refining, and transportation to market that permit of a profitable business being made of it. Statistics for the six years 1890 to 1895, inclusive, give the world's production as 73,751, 57,220, 54,280, 55,810, 46,951 and 53,955 short tons. This is an average yearly production of 56,994 tons—over 156 tons every day of the year—of a material known to the majority of men as black-lead or plumbago, useful only for writing on paper and polishing stoves.

The production during the years mentioned was contributed to by Austria, Ceylon, Germany, Italy, United States, Canada, Japan, India, Russia, Great Britain, and Spain, the proportionate quantities furnished by these countries being in the order given (*Mineral Industry*, 1898). It will be observed that Great Britain is, with but one exception, the smallest producer; indeed 45 tons cover the total amount reported, and this mined in 1895. For several centuries Great Britain was one of, or the largest producer; in fact, in the earliest days of the industry, it was probably the only one. The graphite from the Borrowdale mines in Cumberland was famous as the best for making pencils. In the sixteenth and seventeenth centuries these mines were so productive as to yield an annual revenue £40,000, although they were only worked a few weeks in the year for fear of exhausting them (Roscoe).

Great indifferences exist in the structure and purity of the graphites furnished from the various mines. Mother Nature was seemingly not content with making carbon appear in three forms, charcoal: diamond, and graphite, but extended her labours on graphite; and, to the further confusion of the metallurgist and the chemist, made it a family of two members, crystalline and amorphous, two distinct allotropic forms of the allotropic substance, graphite. The pro-

* From Advance Sheets of the *Journal of the Franklin Institute*, June, 1899.

duct of the Ceylon mines is crystalline, of great purity, analysing in some instances over 99 per cent. carbon, while that of the Borrowdale mines is amorphous and also very pure.

The chief impurity in graphites iron; indeed, its constant presence and frequent large quantity led to the belief, in the early days, that graphite was a carbon-iron compound, and it was even sometimes called carburet of iron.

Uses.

It is quite probable that the first use made of graphite was an instrument for writing. The first account we have of its employment for this purpose is contained in the writings of Conrad Gessner on "Cossils," published in 1565. A picture of a pencil is shown, and, referring to it, he says:—"The pencil represented below is made for writing, of a certain kind of lead (which I am told is an artificial substance termed by some, English antimony), sharpened to a point and inserted in a wooden handle" (Roscoe). This pencil was probably made of graphite from the Borrowdale mines, which, we are told, were in operation in the sixteenth century. Its uses for other purposes than pencils are of much more recent date, probably all of them falling within the present century, and nearly all within the last few years.

The present uses of graphite include the manufacture of pencils crucibles, stove polish foundry facing, paint, mortar and dynamo bushes, anti-friction compounds, electrodes for electro-metallurgical work, conducting surfaces in electro-typing, and covering the surface of powder grains. For most of these purposes it is used in the natural impure state, while for others it is necessary to render it quite pure and free from grit. Its purification is accomplished by a method worked out by Brodie, which consists in first grinding, or otherwise reducing the graphite to a state of fine subdivision, washing out the heavier impurities, mixing 14 parts with 1 part of potassium chlorate and 2 parts of concentrated sulphuric acid, heating on a water-bath for some hours, washing thoroughly and afterwards roasting at a red heat. If silica is present a treatment with hydrofluoric acid is added to the process.

The mining and manufacture of graphite into articles for which it has been found useful give employment to thousands of people. The mines of Ceylon alone, when working to their capacity, employ about 24,000 men, women, and children; the work, however, is done entirely by hand, and in a very crude manner (Watts' "Dict. of Chem.," 1890). In the city of Nuremberg, Germany, the home of the famous Faber pencil, are twenty-six factories, employing about 5,500 people in the making of pencils ("Encl. Brit.").

Manufacture.

The rapid increase in the use of graphite, and consequent decrease in Nature's stocks, make the problem of manufacturing it to order a subject of much importance.

When we consider the hundreds of thousands of chemical changes men are constantly putting the elementary bodies through, and the very prominent part taken by carbon in these re-actions, it would be rather remarkable if at some point, Nature's method for producing graphite was not discovered. That it is not a very difficult act is evident from the fact that it has been accomplished, in a small way, in several instances.

Mr. Muir, in Watt's "Dictionary of Chemistry," edition of 1890, mentions six recognised methods.

(1) By heating charcoal with molten iron, and dissolving out the iron with hydrochloric and nitric acids.

(2) By the slow decomposition of hydrocyanic acid, and boiling the product with nitric acid.

(3) By evaporating the mother-liquors obtained in making soda: these contain cyanogen compounds which are decomposed at a certain concentration of the liquid with formation of ammonia and graphite.

(4) By leading carbon monoxide over ferric oxide at 300° to 400°.

(5) By the decomposition of carbon disulphide at high temperature, in contact with metallic iron.

(6) By leading carbon tetrachloride over molten pig iron.

Whether or not any of these methods could be developed to a state providing a commercial process, I am not prepared to say, but am inclined to think not. They have always been considered accidents or chemical feats of the laboratory, and in some instances their formation was very objectionable.

The Cowles Bros., of Cleveland, O., are reported to have found that graphite sometimes occurred in or about the charge of an electric furnace. This formation is referred to in one of their patents, and a feature of the patent is a provision to get rid of the material, as it was very objectionable on account of its high electric conductivity. Its formation was not reduced to a method, the causes for, or the exact conditions under which it was made, not having been investigated. It was like some of those in the list of Muir, an accident, and a great nuisance.

Still another way of making graphite was described by G. Rose, in 1872. He exposed a cut diamond, bedded in charcoal, to a temperature equal to molten cast iron, whereupon the surface became coated with graphite. It is safe to say this process will never attain commercial success nor popularity.

Finally, in the "Encyclopædia Britannica" (1890) we are told that "by heating to the high temperature afforded by a powerful galvanic battery, both the diamond and amorphous carbon are converted into graphite." This statement I will refer to later on.

In a paper which I had the honour of presenting to the institute at its stated meeting of June 21, 1893 ("Carborundum: its History, Manufacture, and Uses"), reference was made to the formation of a black material consisting of a mixture of carborundum and free carbon during the operation of the carborundum furnaces. This was again referred to, and at much greater length, by Mr. Francis A. Fitzgerald, chemist to the Carborundum Company, in a lecture delivered before the Institute on December 11th, 1896 ("The manufacture and Development of Carborundum at Niagara Falls"), after it had been the subject of much thought and study, and when I had about concluded the formation of a theory covering the transformation of amorphous into graphitic carbon.

Very early in my experiments on the manufacture of carborundum, I noticed that graphite occasionally formed in the portion of the furnace charging next to the cylinder of granular amorphous carbon which passed through the centre of the furnace and which became heated to an extremely high temperature, by the passage of a heavy electric current, and around which the charge was placed to receive the heat necessary for the formation of carborundum. Also that when ordinary bituminous coal coke was used to form the core, quite a large amount of it was converted into graphite, whereas, when petroleum coke was used, very little of it was made graphite.

By a careful study of these formations, it was found that the graphite formed outside of an surrounding the core was produced by the decomposition of the carborundum, which is chemically, a carbide of silicon, and by induction from a number of known facts, that that form within the core was also produced from a similar decomposition of carbides, which were created by the chemical union of the carbon of the core with its contained impurities. The facts from which I have drawn this conclusion are:—

1. Comparatively pure petroleum coke produces practically no graphite.

2. Impure bituminous coal coke produces large quantities.

3. The larger the known percentage of impurities in the bituminous coal coke, the greater the amount produced.

4. That only a part of the carbon of the core is converted into graphite. This not being increased, even by repeated use of the same grains, in successive carborundum furnaces.

The graphite found by the destruction of carborundum is remarkable in that it retains the form of the crystal of carborundum, from which it is, derived. It has, however, less than one-third the weight of car-

borundum, and possess the characteristic metallic-grey colour of natural graphite; but in size and form it so closely resembles the original crystal as to be, in fact its skeleton pseudomorph in graphite. The graphite formed in the core is usually not so well defined, or distinct, as in that from carborundum, most of being disseminated through the body of the individual grains in which it is found, the amount contained in any one grain varying with the percentage of impurity originally present. In some instances the entire mass of the grain is converted into beautiful, graphitic this occurring, I think, in cases where the grain is largely composed of slate, and it sometimes happens that one-half of the grain is completely converted, while the remainder is changed but little.

These two seemingly distinct methods of producing graphite from carborundum and from coke, are in fact identically the same; the first step in each is the formation of a carbide, the second its destruction. In making carborundum, silica and coke are mixed in the correct proportions to produce a true carbide, when heated in the electric furnace, without an excess of either constituent. In making this mixture, account is taken of the impurities contained in the coke, and the silica reduced proportionately. In the case of the core there is a natural mixture that produces a carbide from a portion of the carbon. The carbides formed under both of these conditions decompose when heated to a certain temperature above that at which they were formed.

This method of manufacturing graphite I would define as consisting in heating carbon in association with one or more oxides, to a temperature sufficiently high to cause a chemical re-action between the constituents, and then continuing the heating until the combined carbon separates in the free state. It is not, however, limited to the use of oxides, as pure metals; their sulphides and other salts may be used, but for various reasons the oxides are to be preferred.

Theory of Formation

All of the methods of manufacture, thus far known; contain the same underlying fundamental principle. Each of the six methods described by Muir, as well as my own method, contain as a part of the process the expulsion or liberation of the carbon from a chemical association with one or more elements, and this occurs under conditions unfavourable to, or absolutely prohibitive of its re-association with the same or other elements. It is cast out free to take until itself such physical or other properties as, we must assume, properly belong to it in the free state, when formed under normal conditions. It has been shown by Moissan, that, when subjected to great pressure, at the moment of separation from cast-iron carbon has those distinctive characteristics that cause it to be called diamond; while Scheele shown in 1778, that the same carbon, separating from the iron without pressure, takes the graphitic form. Amorphous carbon, the third allotropic form, never occurs pure, and is invariably produced from carborundum in chemical association with other elements, under conditions favourable to free chemical action between it and other elements.

The production of graphite by Rose's method—heating a diamond bedded in charcoal to the melting point of cast iron—is a beautiful illustration of the return of a body under strain to the form it takes under normal conditions. It will be noted that the diamond was heated to the temperature at which it is known to form, as shown by Moissan's experiments; also that it was fairly well protected from chemical action.

The statement in the "Encyclopædia Britannica" that both diamond and amorphous carbon are converted into graphite, when heated by a powerful electric current, is very commonly held—indeed I might say universally,—although Berthelot concluded from his investigations, that heat alone is without influence on carbon; that is to say, graphite is not changed to amorphous carbon, nor the amorphous to graphite, when heated to witness in an atmosphere of hydrogen or chlorine. That diamond will change to graphite, when protected from chemical influences, under the

influences of high temperature is undoubtedly true, and, indeed, is what might be expected from other known facts; but that *pure* amorphous carbon will change to graphite as the simple result of heating, is not proven, and certainly it does not occur at, below, the temperature necessary for the transformation of the carbon in a carbide to graphite.

From the facts in hand I have deduced the following theory:—

1. Graphite is the form carbon assumes, when freed from chemical associations, under conditions of low pressure and protection from chemical influence.

2. Diamond is the form carbon assumes, when freed from chemical associations, under conditions of high pressure and protection from chemical influence. And, by inference,

3. Amorphous carbon is the form carbon assumes, when freed from chemical associations, under conditions of low or high pressure and exposure to chemical influence.

This theory does not, however, account for all of the observed facts, and must be supplemented by the hypothesis that catalysis occurs, under certain conditions, during the transformation of amorphous into graphitic carbon. The amount of graphite produced in the core of a carborundum furnace, and also in graphite articles I have made, is much too great to be accounted for by the theory that it is formed by the dissolution of the fixed carbides, formed by the contained impurities and carbon sufficient to satisfy the chemical formula. The most probable and satisfactory explanation is that a catalytic action occurs—a progressive formation and dissolution of carbides. The temperature being much above the point of volatilisation of silica, and all other possible impurities, a rapid dissipation of the active agents takes place, and is completed, in this case, before the conversion of all of the amorphous carbon can occur.

Commercial Manufacture.

As the result of my investigations and deductions, I think the only commercial way to make graphite is by breaking up a carbide by the action of heat. The carbon should be freed from chemical combination by what might be termed the evaporation of its associated elementary substances. I have secured patents covering this method, and these have been made the basis for the organisation of an incorporated company bearing the name "Acheson Graphite Company." The company has now under way the erection of works at Niagara Falls where necessary electric current will be obtained from the Niagara Falls Power Company.

Several distinct forms of the product will be produced. One consists of forms or articles, made out of amorphous carbon, with the desired amount of impurity added thereto, which will afterwards be heated in an electric furnace, and converted, more or less, into graphite. I have been carrying on this line of manufacture for a year or more, using the furnaces of the Carborundum Company to produce the graphitisation, the articles having first been made by the arc-light carbon manufacturers. Over 200,000 carbon electrodes, measuring 15 inches in length, with about 1 inch cross-sectional area, were made for use in the Castner alkali process, nearly one-half of them having been shipped to Europe, to be used for this work in England and Germany. The life or efficiency of these graphitised electrodes is many times that of the same electrodes ungraphitised. I have also graphitised some tons of carbon plates, to be used in making dynamo and motor brushes, and a large variety of odd forms and sizes for divers purposes.

Another product—the one which will probably be of greatest importance—is an intimate mixture of pure amorphous carbon and graphite in fine powder. This will be put on the market for paint and foundry facing, and, as it has been formed at an extremely high temperature, it is quite pure, and possesses all of the qualities desirable for the purposes for which it is intended.

It is not the present intention of the company to enter into the manufacture of their product into finished form for the general market, but rather to encourage those who are now engaged in making up

the natural graphite into articles of commerce to become buyers of their material, substituting it for that now used.

The company's plans, now being carried out, provide for the erection of a brick-and iron building, 100 x 50 feet, on a plot of ground in Block No. 8 of the Niagara Falls Power Company's lands (adjoining the works of the Carborundum Company). Therein they will erect machinery for reducing coke to grains of the desired size, an electric furnace through which the prepared grains will pass in a continuous stream, a pulveriser for reducing the grains as received from the furnace, and a scalping sieve through which the product from the pulveriser will pass, that particles exceeding the 1/200th of an inch diameter may be removed. The final flour or powder will contain an amount of pure graphite proportionate to the percentage of impurities in the original coke. It is quite possible that, instead of using high-grade marketable coke, the fine refuse from the coke ovens—which is at present a waste material—will be utilised in the manufacture of this product.

In this connection I would call attention to the need of a specific name for the new product. *Artificial*, as applied to a product, chemically and physically identical with that made by Nature, is not pleasing; it conveys the impression that, failing to produce the real thing, a cheap imitation, a sham, is being palmed off as the genuine article. Not even the Century Dictionary's definition of artificial, as "made or contrived by art, or by human skill and labour; opposed to Nature," is sufficient to banish this feeling; for, after all, in the particular case in hand, being ignorant of the exact methods pursued by Nature, we may be simply forcing her to reveal her methods, to the final results of which we neither add nor subtract one jot or tittle. The same objections may be made to the expression *Artificial Manufacture of Graphite*, for we may not be sure that the process forced upon her is not identical with that of her own selection. *Manufacture Graphite* would be quite appropriate, were it not for the fact that it is popularly applied to articles made of graphite.

It may not detract from the general interest in this subject to call attention, in closing, to the fact that graphite first shown to be an elementary body, an allotropic form of carbon, in the first year of the nineteenth century, is in this, the last year, made to order in great quantities, and that it will, before the close of the century, become an article of ordinary commerce in its new form. Perhaps it will take its place as the primitive form of carbon—the one it assumes under normal conditions.

THE EUCALYPTUS.

THE SOIL AND THE GRAFT.

The information which has been recently published in these columns on the subject of the Eucalyptus, shows that the tree may be cultivated in this country even as far north as the country of Inverness. It is indisputable, however, that the risk is always great, except perhaps in certain favourable situations, not only on account of the climate, but also for other reasons, to which reference will presently be made. The Eucalyptus at Meadfoot Rock, Torquay, which is reported to be twenty years old, must, for instance be growing under exceptionally favourable conditions, since it resisted the winter of 1894-95, when the genus was practically exterminated from the Island of Jersey. Many of the trees, moreover, had attained to a very large size, and seemed to be thoroughly acclimatised in the Island, where the average temperature is considerably higher, and the extremes of heat and cold considerably less, than in England. The question of temperature is, indeed, not the only one to be considered in the successful cultivation of the Eucalyptus and it is probably on this account that the limit of cold endurance of the tree is found in Western Europe to vary within comparatively wide limits as will be mentioned at the end of this article.

Some species are undoubtedly better adapted than others to certain soils and situations, and it should not

be forgotten that in the Australian continent, which is the home of the Eucalyptus, different species thrive best under very different conditions. For instance, the spotted-gum of New South Wales, *E. maculata*, is generally found on stony ridges; the White-gum *E. viminalis*, attains to a great size in rich soil in mountain forests, but it thrives only moderately in poor soil; and the bloodwood, *E. corymbosa*, flourishes better in the mountains than on the coast. Some varieties, again, are best adapted to the northern and warmer parts of Australia, and whilst some prefer swampy ground, others thrive best in sandy or calcareous soils.

So important, indeed, is the question of soil, that in the commercial cultivation of the Eucalyptus it is well recognised, as Professor Warren states in his work entitled *Australian Timbers*, that the strength and durability of the timber opened to a great extent upon the locality in which the trees are grown. Timber for example, of the same name, and presenting the same general characteristics, differs widely in quality when it is grown under different conditions of temperature, geological formation of soil, and amount and distribution of rainfall; or when it is grown on mountain ridges, or in swampy, low-lying ground. The Blue-gum, for instance, from a particular district of Victoria (Corner-Inlet), gives excellent results compared with the timber of the same species grown in other localities under less favourable conditions. Again the timber grown in swampy, low-lying districts is found to possess less tenacity of fibre than the product of the same tree grown at higher elevations, and in more favourable geological formations; and the granite soils of Australia, it may be added, do not appear to produce any kind of good timber.

The Eucalyptus, moreover, is subject to a defect called gum-vein, which is caused by the extravasation of gum-resin in particular parts among the woody tissue, and where an apparent injury has been sustained; or in the concentric circles between successive layers of wood. If therefore, the Eucalyptus is so affected by local conditions in its native habitat, how much should they not be considered when the tree is grown in regions where frost is an additional, and its greatest, danger. It may be mentioned in this connection, as Senor Sempere has stated in his Monograph on the Eucalyptus, that the cultivation of the tree has been very successful in Spain, because it finds there three climatic conditions which it requires, viz., "the proper temperature, the necessary humidity, and the suitable quality of the ambient air."

The opinion of M. Felix Sahut is also of great value in this connection, inasmuch as he is one of the best authorities as regards the acclimatisation of the tree in Europe. He states that while the minimum winter temperate must first be considered, the relative atmospheric humidity and other local circumstances must not be overlooked as is indeed proved by the following circumstance. Fifty-three species of Eucalyptus were growing near Montellier in the winter of 1864, when the temperature fell to 10.40 F., which completely destroyed twenty-eight species nine others being more or less injured, whilst sixteen completely resisted the cold. Moreover, other experiments made under different local conditions, showed that some of these species, in certain cases, withstood lower temperatures while under other conditions they suffered more when the cold was not so severe. It has also been found that several of the species which most successfully resist the winters in the south of France are unable to exist in the soil of Provence. M. Sahut gives a very remarkable account of an Eucalyptus which, planted at Lattes in 1864, resisted 32° F. of frost during the memorable winter of 1870-71 nor did the tree suffer in any way, and even its leaves remained intact. It had been raised from a seedling among seed of *E. Risdoni*, and its identity was never traced. It grew to a height of nearly 40 feet during its comparatively short life, for at the age of twenty years it gradually began to show signs of weakness and ultimately it died. This tree which had been provisionally named *E. lattensis* by M. Naudin, indicated a species possessing cold-resisting qualities but as it never blossomed, M. Sahut's foresight led

him to draft it on an allied species with a view to its cultivation as an ornamental tree in more northern parts of France. Two methods were employed: one the cleft graft with moderate results only; and the graft by approach, or in arching, with much greater success. The stock being more susceptible to cold than the scion, the operation was purposely made as near as possible to the root. The union of the plants was practically perfect, and five or six dozen plants developed vigorously and with great promise. Some of them grew to a height of 6 feet during the first year, but during the next season they all began to fail, and at the end of the third year not one was alive.

The operation of budding was not tried by M. Sahut in these experiments, because he did not think it would succeed, and it is interesting to note that this method has been adopted with good results elsewhere. The *Revue Horticole* published in 1893 an account of work of this character conducted in Palestine by M. Justin Dugourd, who budded *E. Globulus* on *E. resinifera*. The former variety is one with spreading roots, and is less resistant to the influence of the wind, &c., than the latter, which was used as the stock, because it grows into a strong tree. It appears to be necessary for the complete success of this operation to support the scion in some suitable manner, so that the sap may the more readily reach it. As the stock increases in growth, it is also desirable to remove any shoots which it may produce, unless the operation is unsuccessful, when the subject may then be allowed to grow. It should be mentioned that M. Sahut is of opinion that the *E. Resinifera* in question is the popular but incorrect name given by many French gardeners to a variety of *E. rostrata*, which is very generally found in the south of France, where it thrives best in the calcareous soils, and is more resistant to drought than many other kinds.

Considered in the light of past results in connection with other plants, M. Sahut is of opinion that the graft may be the means of greatly extending the cultivation of the *Eucalyptus* in Europe. He himself has proved that certain rare species of *Pinus* will not grow in a particular limestone district, except when grafted on *P. halepensis*, or *P. nigra*, or *P. pinea*. To quote M. Sahut verbally from his paper on the subject, in the *Annales de la Societe d'Horticulture de l'Herault*, the problem is as follows: "Given one or several species of *Eucalyptus* which develop vigorously in a certain soil, it is required to employ them as stocks whereon to graft species which will not themselves thrive therein." And he illustrates his proposition by the following evidence: Of the 150 species of *Eucalyptus* experimentally grown at Lattes the larger proportion were killed by the cold, others succumbed to the heat, while yet others, after languishing for several years ultimately perished not on account of the cold but because the nature of the soil was unsuitable and different from the mountain regions of Australia whence the trees originally came.

As regards the limit of cold endurance of the *Eucalyptus* it may be added that, with a view to the cultivation of the tree in America, the United States Government made an inquiry on the Subject through its consular service in the year 1894, and the reports received from various parts of the world are of very great interest. The officer at Marseilles reported that, generally speaking, some species which have been thoroughly acclimatised in southern Europe are capable of resisting a temperature as low as 8° F., but successful cultivation of desirable sorts cannot be hoped for in localities where the winter maximum of cold exceeds 21° to 17° F.

The report from Rome stated that *Eucalyptus* is killed by the cold in Italy when the thermometer marks 12° F. below Freezing. The consul at Madrid, writing in March, 1894, stated that *E. Globulus* and other allied species had resisted the climate of Barcelona and Madrid, where the temperature is frequently as low as 6° or 7° C. (20.7° or 45° F.), without any diminution in vigour or vitality.

The consul at Zanzibar reported that an attempt had been made to cultivate the tree in his district but

without success, owing to want of care or to the unsuitability of the soil.

Further evidence could be given to show that the experimental cultivation of Gum-trees must be regulated by a consideration of various factors other than the temperature of the district. It may be added for instance, that in the Punjab, planting in groves gives a better chance of success than when the tree is planted singly along the roadsides, and that its general failure in that district is mainly attributable to three causes, viz, failure of the rains; injury to the young stems by sunburn; but principally to the white ants, which destroy the roots.

It may be interesting in conclusion, to give the following information from a comparatively recent Spanish work on horticulture.* *E. Globulus* is the favourite variety in Spain, where it thrives in humid soil, but not in humid air; *E. resinifera* is found to resist the wind remarkably well, and to accommodate itself to every soil; *E. urnigera* is suited to the mountainous districts and to low temperatures; *E. Gunnii* and *E. coriacea* are indifferent to cold; *E. marginata* is rather sensitive; *E. amygdalina* grows best in sandy soil, *E. fissilis* prospers in poor soil, *E. odora* thrives in dry soil.

In Bois' *Dictionnaire d'Horticulture*, the following species are mentioned as extensively grown in Provence, and to be as rustic as *E. Globulus*:—*E. calophylla*, *E. cornuta*, *E. Gomphocephala*, *E. robusta*; and *E. Gunnii*, *E. polyanthema*, and *E. viminalis*, which are also specially named as among the most hardy of the species.

A large number of species have been experimentally planted in the Landes of the southwest of France with unsuccessful results; and in the region of Paris the tree is taken to the temperate-house as early as the month of November. Hence, M. Bouquet de la Grye defines the northern limit of the *Eucalyptus* in Europe to be the same as that of the Orange—a statement with which many growers do not agree, and which is not unlikely to be disproved by cultivation of the tree under the selective conditions to which allusion has here been made. *Scion*.

EARLY ATTEMPTS TO CULTIVATE TEA IN ENGLAND.

I send you the following extracts from a book on the History of Tea, in Old English, by John Coakby Lettsom, M.D., London, printed by J. Nichols for Charles Dilly. First edition 1772; New edition, 1779.

It is a very interesting book with nice illustrations. It seems some attempts were made to cultivate the tea plant in gardens in England and in some colonies. The work also contains very valuable and curious information about the natural history of tea, and the rise and progress of tea consumption not only in England, but throughout the continent of Europe, in the seventeenth and eighteenth centuries. Here are a few of the extracts:—

"Within these three or four years we have been successful enough to introduce into this kingdom a few genuine tea plants. There was formerly, I am told a very large one in England, the property of an East Indian Captain, who kept it some years, and refused to part with either cuttings or layers. This died and there was not another left in the kingdom. A large plant was not long since in the possession of the great Linnaeus, but, I am informed, it is now dead. I know several gentlemen who have spared neither pains nor expense to procure this evergreen from China; but their best endeavours have, in general, proved unsuccessful, for, though many strong and good plants were shipped at Canton, and all possible care taken of them during the voyage, yet they soon grew sickly, and but one, till of late, survived the passage to England."

"The largest tea plant in this kingdom is, I believe, at Kew; it was presented to that royal luminary by

* *Novissima Guia del Hortelano Jardinero y Arbolista*,

John Ellis, Esq., who raised it from the seed. But the plant at Lion House, belonging to the Duke of Northumberland, is the first that ever flowered in Europe, and an elegant drawing has been taken from it in that state, with its botanical description. The engraver has done justice to his original drawing, which is now in the possession of that great promoter of natural history, Dr. Fothergill, to whom I have been indebted for many dried specimens and flowers of the tea tree from China. * * *

"Among several hundred specimens of dried tea flowers that I have examined, scarcely one in twenty was perfect. Some had three petals only, some nine, and others the several intermediate numbers. The greatest number consisted of six large petals, and externally three lesser ones of the same form. But the flowers which blossomed on the tea plant belonging to the Duke of Northumberland, from which this description is taken, consisted in general of six petals. One of the flowers indeed appeared to have eight petals; however, the numbers in the flowers in most plants vary considerably, which may account for the mistake of Dr. Hill and Professor Linnaeus (who described this plant on Dr. Hill's authority), who make the green and bohea tea two distinct species, giving nine petals to the former and six to the latter. * * *

"The best tea grows in a mild temperate climate; the country about Nankin producing better tea than either Pekin or Canton, between which places it is situated. It has been asserted that no tea plants have yet died in England through excess of cold, but the contrary, I know, has happened. The plant in the Princess Dowager's garden at Kew flourished under glass windows with the natural heat of the sun, as now do those at Mile-end, in the possession of the intelligent botanist, J. Gordon. The tea plant belonging to Dr. Fothergill thrives in his garden at Upton, exposed to the open air, and the plant introduced into the Botanic garden at Chelsea had one leaf which measured five inches and a quarter in length. * * *

"The bohea tea trees, now introduced into many botanic gardens near London; exhibit very obvious varieties. The leaves are of a deeper green colour, and so deeply serrated, the stalk is usually of a darker colour, and the whole shrub appears less luxuriant than that represented in the annexed plate of the bohea tea; but the botanical characters are the same. * * *

"Father Labot next thought he had discovered the real tea plant in Martinico, agreeing, he says, in all respects with the China sort. He pretends also to have procured tea seeds from the East Indies and to have raised the plant in America; but, from his own account, this supposed tea appears to be only a species of *Lysimachia*, or what is called West India tea. Many other pretended discoveries of the Oriental Tea tree have been related, all of which have proved erroneous when properly enquired into. The genus of plant, called by Kaempfer *Tfinbakki*, has the nearest resemblance to it. The leaves of several European herbs have been used at different times as substitutes for tea, either from some similarity in the shape of the leaves or in the taste and flavour; among these, two or three species of *Veronica* are particularly recommended, besides the leaves of sage, myrtle, betony, sloe, agrimony, wild rose, and many others. Whether any of these are really more salutary or not, is undetermined; and we now find that from the place to the cottage every other substitute has yielded to the genuine Asiatic tea. * * *

"Many attempts to introduce the tea tree into Europe have proved unsuccessful, owing to the bad state of the seeds when first procured, or to a want of judgement in preserving them long enough in a state capable of vegetation. If this complaint arise from the first cause, future precautions about such seeds will be in vain. It is therefore necessary to procure fresh, sound, ripe seeds, white, plump, and moist internally. Two methods of preserving the

seeds have put us in possession of a few young plants of the true tea tree of China: one is by enclosing the seeds in bees' wax, after they have been well dried in the sun; and the other, by putting them, included in their pods or capsules, into very close canisters of tin and tutenague."

"See directions for bringing over seeds and plants from the East Indies, by J. Ellis, F.R.S., etc., in which particular directions are given, both to choose the proper seeds and to preserve them in the best manner for vegetation. See also the Naturalists' and Travellers' Companion, containing instructions for discovering and preserving objects of Natural History, Section III. We may observe here that the best method of bringing over the parts of flowers entire is to put them in bottles of spirits of wine, good rum, first runnings, or brandy."

"Most of the plants now in England were procured by these means; and though many of the seedlings will die, yet by this kind of management we may probably succeed in bringing over the curious vegetable productions of China, of which they have an amazing treasure, both in respect to use, show, and variety. If young plants could be procured in China, they might be sent over in a growing state in some of these boxes. * * *

"The young tea plants in the gardens about London thrive very well in the green-houses in winter, and some bear the open air in summer. The leaves of many of them are from one to three inches long, not without a fine deep verdure; and the young shoots are succulent. It is therefore probable that in a few years many layers may be procured from them, and the number of plants considerably increased thereby. * * *

"It may not be improper to observe here that many exotic vegetables, like human constitutions, require a certain period before they become naturalized to a change of climate. Many plants, which on their first introduction, would not bear our winters without shelter, now endure our harder frosts. The beautiful *Magnolia*, among several others, is a proof of this observation, and we have already taken notice (Section V) that the degree of cold at Pekin sometimes exceeds ours. We have hence reason to expect that the tea tree may in a few years be capable of bearing our climate, or at least that of our colonies; at length thrive as if indigenous to the soil; and, were labour cheaper, become an article of export, like the common potato, for which we are indebted to America or Spain. It is, however, better suited, for the climates of the Southern parts of Europe and America; but hitherto it has not been cultivated in an extensive manner in either of these quarters of the world, nor is it likely ever to be, whilst it can be procured from Asia at the present reduced price. It was introduced into Georgia about the year 1770. Hence the ingenious author of *Onabi* (Mrs. Morton) in her recent poem of *Beave-hill*, in describing the products of this province, introduces the exotic of China:—

Yet round these shores prolific plenty twines,
Stores the thick field, and swells the clustering vines,
A thousand groves their glossy leaves unfold,
Where the rich orange rolls its ruddy gold,
China's green shrub, divine *Magnolia's* bloom,
With mingling odours fling their high perfume.

"It is indeed probable that the North American summers, in the same latitude with Pekin, would suit this tree better than ours, for, in China and some parts of North America, the heat in summer is such that vegetables make quicker and more early shoots, whereby they have time to acquire sufficient strength and firmness before the winter commences; but, in England, the tender shoots are pushed forth late, and winter soon after succeeding, they often perish in a degree of cold much less severe than at Pekin, or in colder latitudes of North America."—*Indian Planter*.

AMERICAN FIBRE PLANTS.

Mr. G. E. Walsh, writing in the *Scientific American*, says:—Commercially there are 30 or 40 species of fibre plants found throughout the world, but botanically there are over 1,000 species the fibre of which can be made more or less useful in the arts and industries.

In view of the territorial changes produced by the war, the fibre industry is of peculiar interest to the farming and manufacturing world. The Islands affected by the war are all noted for the fibre plants raised on them; and taken together—that is, Porto Rico, Cuba, and the Philippines—they produce a large bulk of the best plants, except cotton, used in a commercial and manufacturing way for their fibre. Manila hemp has long been familiar wherever cultivation exists; sisal hemp comes from Cuba, in times of peace, as largely as from Yucatan or the Bahamas; Cuba has been essential to the millinery trade of the world; and Sunu hemp and cebu hemp are but trade varieties that come from the same islands.

The Philippines, in particular, are rich in fibre plants, with possibilities for development and expansion scarcely conceivable. Throughout the archipelago, it is estimated, all the fibre used in the manufacturing world could be produced at a cost that would annihilate similar industries anywhere else in the East. This is not entirely true, however, for neither cotton nor flax could ever find a foothold in the Philippines to compete with the United States. Our cotton is already seeking Eastern markets in ever increasing proportions and great prospects are anticipated for this trade. But in turn we must secure our hemp and jute, and other fibre-material, from the lands where they best grow.

There are over thirty species of fibre plants that can be raised in this country, but most of them are unimportant in the commercial world, and most of the others thrive only very indifferently in the United States. Should we, however, extend our colonial possessions, so that in time they included Cuba and the Philippine Islands, as well as Porto Rico, we would be the greatest fibre producing country on the globe.

At present the leading vegetable fibre that is imported into the United States, according to statistics of 1897, is sisal grass. Most of this sisal grass comes to us from Cuba, Yucatan, and the Bahamas. Attempts have been made to introduce its culture in Florida, and with some success; but its superior growth in its native islands, and their close proximity to the United States, will for ever preclude it from becoming an important industry here.

Next to sisal grass comes Manila hemp in commercial importance. The imports of this amount to nearly \$4,000,000 annually. This hemp has also been experimented with in this country, and in other lands, but the world's trade will always look for its main supply to the islands of the East, where it flourishes as naturally as cotton does in our Southern States. It can be produced and shipped to this country cheaper than our farmers can raise it at home. Cebu hemp comes from the Philippine Islands also, and is merely a trade variety that has its useful purpose in the manufactures.

Jute and "jute butts" stand third on the list of imported fibre plants. Jute comes from a variety of countries. Originally India controlled the trade in jute, but the West Indies and Cuba have entered the market in competition with her, and they are lusty rivals that cannot be ignored. The possibilities of Cuba in this line are only partly appreciated, for rebellions and wars have so long agitated the island, that little experiment has been made in anything outside of sugar and tobacco-growing.

Since 1890 the Department of Agriculture has been engaged in making experiments with fibre plants in various parts of the country, and farmers have been encouraged to grow certain fibre plants for manufacturing purpose. Nearly all the commercial fibre plants have been tested by the Department experts, and some of them have been recommended for general

culture. This movement, started seven or eight years ago, has not exactly proved all that the inaugurators of it anticipated. Ramie has been raised to some extent in Florida; sisal hemp from Yucatan has been established in a limited way in parts of the same State, and a little impetus has been given to the rejuvenation of flax culture—one of the oldest agricultural products in this country. Great efforts have also been made to utilise some of the plants that grow naturally here for fibre manufacturing. Thus the palmetto fibre and vegetable hair of the Spanish moss growing on the trees of the Southern States have found some use that makes the product of fair value. Several of the leading varieties of palms in Florida have been cultivated for the fibre in their stalks and leaves, and the palmettoes have been utilised for making brushes and brooms. Jute culture has been extended, so that we produce annually a fair crop. Yet this weed is natural to this country, and some varieties are the finest and best grown in the world.

It is possible to double the annual production of fibre plants in the United States, and thus increase the manufactures; but the history of many of our agricultural products hardly warrants one in predicting that we can raise successfully most of the fibre plants needed in this land. The flax industry was at one time an important industry in New England; but it has steadily declined for half a century now, because farmers could put their land to more profitable use in raising other crops. No amount of push and energy has ever been able to renew this industry, although spasmodic efforts have frequently been attempted. There was plenty of land in the world where flax thrived better than in the United States, and it could be cultivated cheaper there than in this country.

Likewise the hemp industry in the South has been declining ever since 1870. It flourished and expanded in the early sixties, and just prior to the rebellion it was an important industry, promising in time to rank second only to cotton. But sisal and Manila hemp appeared in the market, and the Southern hemp could not compete with them. Our hemp lost its position in the manufacturing world, and sisal and manila were soon used in its place. No amount of study and experiment could rejuvenate the decadent industry.

While there are undoubtedly many native fibre plants growing in this country that will be found useful in many industries, it will be impossible to make them compete with the low-priced fibres that come from many of the tropical and semi-tropical islands. Nor shall we ever be able to introduce these foreign plants into this country, so that their culture will prove successful enough to supply us with the raw material for all of our manufactures. The world will still look to the Philippines, the West Indies, Cuba, Central America, and China and India for the fibre plants that supply material for cheap clothing, bagging, rope, and similar products.

In the islands that have been acquired from Spain however, we have the soil and climate to produce all the fibre plants that are lacking in this country. Their resources in this respect are so great that they could soon supply the world with all the raw material used for cheap textile goods, cordage, nets, and kindred necessities. In Porto Rico alone we could raise successfully a dozen of the leading fibre plants, while in Cuba and the Philippines there are many peculiar only to those islands.—*Journal of the Society of Arts.*

THE EUCALYPTUS GLOBULUS.

As a good deal has recently been written on this tree, perhaps I may be permitted to record my little experience regarding the same. When at Lucknow, I used to receive seeds of various kinds of Eucalyptus from the late Baron von Mueller. Of course, the *E. Globulus* was among them. I raised several plants of the latter, and planted a row of them. They made rapid progress, and in a few years gained the

height of between 20 and 30 feet, with a thick stem in proportion.

I began to be proud of having introduced this wonderful tree, which then had the reputation of draining marshes. Well, one monsoon came with torrential rains, and every one of my beautiful *E. Globulus* died from too much water at the roots, and an atmosphere saturated with moisture. I began then to be sceptical about the supposed properties of this fast-growing tree of draining marshy land.

The only variety which I succeeded in growing was the *E. citriodora*, which, when it sheds its bark, leaves the stem as white as snow. It flowered and seeded; but I do not know what the result was after I left.

On another occasion I landed at Naples from Bombay in January. It was snowing, and the pools round the fountains were hard frozen—a very unusual occurrence in that latitude. On my way from Naples to Rome I saw a number of large Eucalyptus-trees—presumably *E. Globulus*—killed by frost.

The only place in India where I saw the Eucalyptus *Globulus* thrive was on the Nilgherry Hills at Ootacamund. The frost there is very slight, and occurs only on the highest ridges; and the drainage on the hill slopes is very good. It was a beautiful sight to see a hill-side covered with the young blue trees. The only use they make of the tree there is for firewood. As to the Eucalyptus-oil, a lady in London told me that when she caught a cold, she rubbed a little of this oil round her mouth and nose, and the cold was scared away. I thought I would try this wonderful oil the first time I caught a cold. I had not long to wait; and one night I rubbed some as directed, and got into bed. In a very short time my face felt as if it were on fire. I had to jump out of bed and put my face in a basin of cold water, when I got some peace!

A friend of scientific culture assures me that in the City there is an insurance company who employ a large number of clerks. During an epidemic of influenza, the porter was instructed to go round and drop Eucalyptus-oil on the blotting-pad of each clerk, and my friend asserts that not one of those clerks got influenza. They were all the time inhaling an atmosphere containing the essential oil of Eucalyptus. Such a thing, it would seem, might easily be verified. I am not aware, however, that any scientific investigation has ever been made of the properties of this oil. When a new drug is introduced, the sellers of it exaggerate its curative properties to such an extent that it soon falls into discredit and neglect. There are few things in Nature that have not some use.

The history of the metal "thorium" is a lesson. It was very rare, and was thought to be very useless. Now, however, as Thoria, it is used everywhere for incandescent lights. The demand for this metal caused geologists and chemists to search for it, and it was found that, after all, it was not so very rare. When a thing is pronounced useless, it means that no use for it has yet been discovered.

In an article in the *Gardeners' Chronicle* on "Rome," it was stated that the Trappists near Rome can now live where, before they planted Eucalypti, they could not live. In the *National Review* for February, 1899, in an article on the "Rule of the Chartered Company," by H. C. Thomson, p. 901, this is stated:—"Look at Tasmania . . . with a glorious climate, in which it is difficult to feel ill, with Eucalyptus forests in which fever cannot exist," &c. Now is all this true, or is it mere hearsay? If Tasmania has such a glorious climate, why should the non-existence of fever be attributed to Eucalyptus forests.

Then in the *Standard* of February 14, 1899, it is stated that "Influenza has made its appearance again . . . and alike in church and on 'Change the odour of Eucalyptus is significantly perceptible."

Rightly or wrongly, many people evidently believe in the property of Eucalyptus oil of staving off influenza. Investigators of the future will have to find out what is true and what is not true, not only

in this, but in many other things. In a butcher's shop I saw a miserable-looking plant of *E. Globulus* in a pot. I asked why he kept it there? He said, "It keeps away flies." I thought I would try the experiment in my room, where flies abound in summer. I cut some branches off a blue Gum-tree I have, and placed them in a jug of water on the mantelpiece. Lo and behold, that very same evening there was a fly on the wall a few inches above the Eucalyptus leaves, and I have been told that flies have been seen to actually settle on its leaves! *E. Bonavia, M. D.*

OIL ENGINES AND TEA MANUFACTURE.

SIR,—In reply to Mr. Turbervill's query re oil engines and the cost per lb. made tea, "Petrol" only has vouchsafed an answer, but I do not wholly agree with him. I contend the cost per lb. made tea would (relatively speaking) rather depend upon the consumption of oil by the engine per H.P. per hour, viz. of an engine consuming one pint of oil per H.P. per hour and that using only half pint per H.P. per hour—than the outturn of made tea per hour (as per "Petrol") as this could be obviated by having two smaller sized engines of, say, 12 and 8 H.P. instead of one 20 H.P. engine, excess of power in one engine being economy on the wrong side wastage of power meaning the same in oil—hence an enhanced cost. Taking a six months' working, I find that oil has cost me '96 cents per lb. of made tea.

This includes transport of oil, &c., &c., and minus the rebate at 25 cents per gallon. (This is what Mr. Turbervill wants to get at.) The engine in use being a 17 H.P. Campbell's, and using one pint per H.P. per hour, and the consumption of oil being about 1.38 gallon per hour, my contention may be easily seen. Using an engine consuming only half pint per H.P. per hour, I should imagine 70 cents per lb. would be a safe figure for and estimate of cost.—Yours, &c.

W. R. SHELTON AGAR.

Mount Temple, Gampola, July 12th.

II.

SIR,—Re oil and oil engines and the information asked for by your correspondent, the cost per pound of tea must depend a good deal on the yield daily. But, taking a busy month, in my small factory, with an 8 H.P. Tangye engine working a Davidson large sirocco down-draft, a large roller, and two small rollers, and sifter and roll-breaker, my made tea was over 18,000 lb., and the oil consumed, "Russian"—which is much inferior to American—was 46 tins, or 23 cases, which cost me on the estate R5 per case. So we get R 115—say 11,500 cents for 1800 lb. of tea. I could have made more for the same money. Of course, when the yield is small, the cost is comparatively greater—for instance, to make 103,000 lb. of tea has cost me R1,124. Your correspondent will find oil a cheap motor-power provided the cost of the oil is not excessive.—Yours, &c.,

H. DRUMMOND DEANE.

Stagbrook, Peermaad, Travancore, July 10th.

—"Local Times."

VANILLA CULTURE IN TAHITI.—The increase of Vanilla culture in Tahiti is said to be spreading rapidly; the natives, with few exceptions, are giving their whole attention to the growth of the plant, and curing of the pods. Its export, which in 1893 was 29,858 lb., valued at £3,938, reached during 1898 to 92,137 lb., but owing to a serious decline in its market value, that quantity realised only £20,468, as against £35,862 for 75,740 lb. in 1897.—*Planting Opinion.*

INDIARUBBER OR CAOUTCHOUC.

ITS ORIGIN, COLLECTION AND PREPARATION FOR THE MARKET. THE LATEST PERADENIYA "CIRCULAR" WITH MR. PARKIN'S REPORT.

Such is the subject of a Circular just issued from the Government Printing Press, and received by us from Peradeniya, giving the results of the investigations of Mr. J. Parkin, M.A., of Trinity College, Cambridge, as carried on at the Peradeniya Gardens, with General Remarks by Mr. Willis, Director of the Gardens. "Prodigious" was our first exclamation on seeing this "Circular," and yet it by no means contains the complete results of Mr. Parkin's work which will be published at home. Still it certainly includes more than enough to satisfy the most exigent of Ceylon rubber planters, and the report reaches us just in time to be included in our "INDIARUBBER PLANTERS' MANUAL" due from the press at an early date. There is, of course, in the 60 pages before us, a great deal that is of scientific, rather than practical, interest; and we cannot help suspecting that the recent discoveries in Central America and Trinidad by Mr. Biffen, Mr. Hart and others may have interfered to some extent with the practical value of Mr. Parkin's patient and truly scientific investigation. At the same time the fullest justice is done to Mr. Biffen in prominently referring to his valuable work; while the paper in the *Tropical Agriculturist* of December last (taken from the "India-rubber World") to which we made pointed reference some weeks back, is also specially referred to and quoted (on page 118) as showing that the Castilloas growing in Trinidad seem to possess proper caoutchouc in their young stems, and this would, apparently, mark them out as a different species from the Castilloas of Ceylon. But clearly, further investigation and experiment are required to settle this very important point, and we have also to continue to watch very closely the outcome of Mr. Biffen's discovery in Central America, and of Mr. Hart's continuous experiments in Trinidad.

Meantime to revert to the Circular before us: it opens after a few lines of introduction with an explanation of the measurements and contractions used; and then Mr. Parkin's paper comes under the following heads:—

A.—Botanical.

B.—The Extraction of Latex. I.—Incision

(1) Kind of Incision; (2) Instrument to Use; II.—Collection of Latex from Incisions; III.—Area of Trunk to be Tapped; IV.—Effect of Wounding on Flow of Latex.

C.—The Preparation of Commercial Rubber from the Latex. (1) Hevea; (2) Castilloa; (3) Manihot.

D.—Yield.

E.—Notes on other Caoutchouc-yielding Plants. The "botanical" chapter covers some eight pages and notices, among other things, the possible successful manufacture of "artificial caoutchouc" though no one has, as yet, got beyond the stage of laboratory experiments. The great inducement to plant rubber-yielding trees at a time when raw rubber of good quality is selling at 4s a lb.,

is noticed, as also Mr. Biffen's special investigations in tropical America resulting in preparations from the milk with a loss in manufacture of less than one per cent. The problems which Mr. Parkin put before himself are thus given:—

We want to know the trees which promise best for cultivation, both as regards quality and yield of rubber. We have to consider the best times and means of tapping them, and then of preparing the rubber from the collected milk.

We find special reference made more than once to *Alstonia scholaris* as "possessing copious latex (milky juice) in its trunk." This is not an uncommon tree in our low-country, and it ought at once, we think, to be exploited. One of the finest specimens in Colombo is near the Turret Road gate of Canella Villa, its trunk being covered with the "Colombo Agent" and other well-known creepers. In closing his botanical chapter, Mr. Parkin makes the following significant remark:

Personally I am not inclined to look upon latex as playing an important part in nutrition, and should imagine that if it were possible to extract all the latex from such a tree as *Hevea brasiliensis* without greatly injuring the other tissues, it would not be seriously harmed. I am inclined to regard the laticiferous system more as channels for holding water in reserve to be called upon during times of drought or during the dry season.

We come next to the "extraction of the latex," and here we have a large number of rubber-yielding trees specified, with the different modes of extracting the caoutchouc, and special mention of certain new African kinds with thick underground stems full of latex, which Dr. Morris suggests might, if cultivated, give early returns. These are *Carpodinus lanceolatus* and *Clitandra henriquesiana*. Then comes an important statement:—

The only other parts of the plant besides the trunk and main branches of such trees as Castilloa or Hevea, which might be used for the extraction of rubber, are the young shoots. If these could be used profitably, then a return on the capital could be obtained in a year, either by growing crops of seedlings or by coppicing permanent plants. Our attention has been applied to this with, however, no encouraging results.

Hevea brasiliensis will not answer at all, as far as our experience goes.

Now, here is where notice is taken of the different results obtained from young stems of Castilloa in Trinidad as fully related in our *T.A.* for December and March last and subsequent numbers. Finally, Mr. Parkin says:—

In our opinion it seems hardly likely, at any rate as far as Ceylon is concerned, that rubber can be extracted profitably from the leaves, twigs, &c., so we must return to the consideration of the main stem and consider the best means of extracting the latex from this.

But we suspect this is arriving at a premature conclusion, and we cannot see why eventually Ceylon should not do as well in this way as Trinidad. Mr. Parkin next proceeds to consider, in great detail, the best kind of incision, the best instrument, the collection of the latex from the incisions, the area of the trunk to be tapped and the results of experiments made at Henaratgoda in March last. All through here he is deal-

ing with the Hevea or Para, and we may quote the concluding statement:—

The reason why the base of the trunk should yield so much more latex has, I think, something to do with the thicker and softer bark at this region. This peculiarity has not been only observed in Ceylon. In Colonel W. J. Seaton's report on the Para rubber trees of Tenasserim, Burmah, dated January 28, 1889, he remarks: "It was observed that the exudation of milk was greatest near the ground, where the bark was thickest, while at a height of six or seven feet it was almost *nil*."

MR. PARKIN next, takes up the Castilloa tree as grown in Ceylon, and gives the results of his experiments as to the outflow of the latex. Further on, we have "the effect of wounding on the flow of the latex," with a further series of experiments in tapping, extending up to June 6th last. We do not give the details and results, because as we reproduce the Circular in full in our monthly periodical as well as Manual, planters specially interested can carefully study it there. Suffice to say that the result seems satisfactory, although in conclusion we are told:—

Probably it will be found that under some conditions it is best to tap daily, while under others it is best to tap at intervals of two, three, four, seven, or even ten or twelve days. A large number of experiments on different methods of tapping have been made and are still being made in the Botanic Gardens, and their results will be published later. Those planters who are beginning to tap their trees might well repeat some of the experiments described above on a larger scale. The success or failure of the cultivation depends chiefly on the yield of milk, and it has been clearly shown that this is extraordinarily different in different trees of the same size and age, and that it may be enormously affected by different methods of treatment. Each man must find out for himself the method absolutely best suited to his trees, in the light of the above observations and of his own and those of other workers.

We now come to "the preparation of Commercial Rubber from the extracted latex," and we read:—

The two chief points with respect to the preparation of commercial rubber are to have it free from moisture and putrefaction. The first can be effected by drying the rubber particles in thin sheets; the second by either removing the proteid matter or by the addition of some antiseptic substance which prevents the growth of bacteria and mould.

And again:—

Considering that the caoutchouc in latex exists in the form of minute globules suspended in a fluid, and that they are lighter than water, it is rather surprising that no one till now has thought of the idea of separating the caoutchouc and so preparing rubber by centrifugal force, such as is used for separating the butter fat of milk. The credit of applying the idea is due to Mr. Biffen of Cambridge University, who, in connection with Mr. Erme Howard, recently undertook an expedition through the rubber-producing districts of America. With a modified centrifugal milk-tester they tested the possibility of extracting the caoutchouc from several latices with great success. Then experiments made by Mr. Drieberg at the Agricultural School with a cream-separator are referred to; but sufficient speed could not be got to operate successfully. Next:—

In connection with Mr. Biffen's discovery a company has been formed and a large tract of land laid down in Mexico in Castilloa, with the

purpose of producing commercial rubber by centrifugalisation. A patent has been taken out on the machine, and consequently it remains to be seen at what price it will be put on the market. It may be somewhat prohibitive. In the meantime, let us consider what other means there are for preparing good rubber from the latex of Hevea and Castilloa.

Accordingly we are told of "Coagulation by acetic acid," "Extraction of Caoutchouc by means of Mercuric Chloride (corrosive sublimate)". Next we have the effect in dealing with "Castilloa," and again we are reminded that our Ceylon species "Markhamiana" probably differs from "C. elastica" in the properties of its latex; but on the whole greater success was attained than in the case of Para. Nor is the Ceara to be despised, since we read:—

Manihot Glaziovii (Ceara Rubber Tree).—This latex has been shown by Biffen to be also capable of yielding its rubber by centrifugalisation, as well as by churning.

Finally, we come to the "yield," and we are told "there is a great individual difference in the trees in the yield per incision. Out of the 32 trees of "Para" at Peradeniya, two flow much better than any of the rest without any apparent reason. Six times the largest quantity of latex got from a Hevea in a single incision, has been got from a Castilloa rubber tree. (It is extraordinary how a prejudice could have been formed some years ago against the cultivation of Castilloa trees in Ceylon!) On the other hand, however, the Castilloa latex, as a rule, contains only about half the percentage of caoutchouc that than of Hevea does. And the results of experiments are summed up as follows after giving details of tapping of Castilloa trees at Henaratgoda at the beginning of March:—

What time should elapse before the trees flowed as well again, has not yet been ascertained. Perhaps the trees would not be worth tapping more than twice a year. In that case the yield of rubber per tree per year from a trunk 3 ft. in girth and 12 ft. in length would come to about 300 grams or 10½ oz., a small amount compared to the results stated for its native country. In fact, the weight of rubber, would not be much greater than from Heveas of corresponding size tapped ten to twelve times in the year, but the expense of extraction would be very much less. Further experiments in tappings—both in Government Gardens and on private plantations—are clearly necessary. We are promised a note of results from the Kalutara district.

In his last chapter Mr. Parkin gives us some notes on other rubber-yielding trees growing at Peradeniya and Heneratgoda, none of which, except the African *Landolphia*s seem to be worth much. At the end Mr. Willis gives us some "general remarks" on Mr. Parkin's Report, the cream of which we extract in the following, although Mr. Willis has a good deal more to say:—

The ideal rubber-yielding tree would be one in which there were many laticiferous vessels, all communicating freely with one another, and containing only caoutchouc in an emulsion with water. The trees cultivated in Ceylon do not reach this standard, but depart from it in different ways. Hevea contains very pure latex, but its laticiferous vessels do not seem to communicate freely, so that a large number of incisions are needed to get all the milk; Castilloa has much freer communication, but a more impure latex, and less percentage of caoutchouc therein;

Manihot has poor communication and very impure latex, containing a small percentage of rubber. The objects to be aimed at in practice are principally:—

(1) To get a good quickly growing tree, which will yield a large quantity of rubber after as few years as possible.

(2) To obtain the latex with as little labour as possible, and with the greatest possible cleanliness, as all impurity lessens its value.

(3) To obtain from this latex as pure caoutchouc as possible, with the least practicable labour and cost.

(4) To get the caoutchouc as dry and antiseptic as possible. With regard to the first point, we have at present three trees which do well in Ceylon: Hevea Castilloa, and Manihot. The second desideratum is best supplied by Castilloa, which yields latex very freely from a small number of incisions, and also gives a very fluid latex. Hevea is second best in this respect, and Manihot worst.

Here we must take leave of this very full, instructive and suggestive series of papers. The conclusions arrived at are by no means final; but there is a great deal of light thrown on problems of much practical importance to Rubber planters who all ought to feel, as we do, specially indebted to Mr. Parkin and Mr. Willis.

BOGAWANTALAWA DISTRICT TEA COMPANY, LIMITED.

ANNUAL REPORT.

Report presented at the Second Ordinary Annual General Meeting of the Company, held at the Office of the Company of Wednesday, 28th June.

The Directors have the pleasure to submit the balance sheet and accounts of the Company for the year ending 31st March, 1899, duly audited.

Notwithstanding a deficiency of some 25 inches in the rainfall, the aggregate yield of tea exceeded the estimate, and the gross price obtained in London was 8.71 per lb. against 8.20 per lb. in the previous season.

The working expenditure compares favourably with the estimates, and in spite of a higher average rate of exchange the cost of production was lower, being 25½ cents against 26½ cents per lb. last season.

Since October last the Bridwell leaf has been manufactured at the Bogawana factory, and the sum of £954 18s 11d expended thereon to complete the extensions, has been charged to capital account. On the other hand, a sum of about £650 expended on renewals and improvements to existing factories, and in opening 75 acres new land to be planted with tea, has been charged to revenue account.

The total yield was 1,031,782 lb tea plucked off 2,081 acres, of which 86 acres are only in partial bearing, being at the rate of 495 lb. per acre all round, costing free on board Colombo 25½ cents or 4.12d per lb. The gross average price of the 1,024,646 lb. sold in London was 8.71d per lb., as stated above.

The crops for the current season are estimated at 1,020,200 lb. tea.

The gross average at which drafts were negotiated was 1/4 5-32 per rupee, against 1/3 9-16 per rupee the previous season.

The Directors desire to place on record their appreciation of the services of their manager and his staff in Ceylon.

The Profit for the year, inclusive of Interest and after providing for General Expenses amounts to ..	£	s.	d.
To which has to be added the Balance from last year of ..	15,033	15	11
And Interest	958	14	4
	54	5	8

	1,013	0	0
Less Income Tax (season 1897-98) ..	435	1	4
	577	18	8
	15,611	14	7

Interest on the Mortgage Debentures has been paid, less Income Tax 406 0 0

Dividends on the 6 per cent. Preference Shares for the 12 months were paid on the 12th October, 1898, and 1st April, 1899, less Tax 5,394 0 0

An Interim Dividend of 2½ per cent on the Ordinary Shares was paid, less Tax, on the 11th Jan. 1899 ... 2,416 13 4

It is proposed:—

To pay a final Dividend of 5 per cent. on the Ordinary Shares, making 7½ per cent. for the year, which will require, less Tax .. 4,833 6 8

To transfer to Reserve Account .. 1,500 0 0

And to carry forward to next year the balance (out of which Income Tax has to be paid) of .. 1,061 14 7

£15,611 14 7

In view of the expenditure on buildings and clearings charged to revenue account, and of the fact that all buildings and machinery are in a high state of efficiency, the Directors do not consider it necessary to write off a specific sum for depreciation.

The Director who retires on this occasion is Mr. John Geoffrey Fort, who, being eligible, offers himself for re-election.

Mr. John Smith the Auditor also retires, and offers himself for re-election.

THE DIMBULA VALLEY (CEYLON) TEA COMPANY, LIMITED.

ANNUAL REPORT.

Directors' Report submitted to the shareholders at the Third Annual Ordinary General Meeting, to be held at the Cannon Street Hotel, on Monday, the 3rd day of July, at 12 o'clock noon. The Directors beg to submit the General Balance Sheet and Profit and Loss Account for the year ending 31st March last.

After bringing forward £226 16s 9d from last account, and providing for general expenses, for

* About 75 acres felled and prepared for planting with tea.

London office expenses, and £500 for depreciation, the net amount at credit of Profit and Loss is £15,709 4s 9d.

Dividends aggregating 6 per cent., less Income Tax, have been paid for the 12 months on the Preference Shares, amounting to .. £3,440 2 0

An Interim dividend of 4 per cent., less Income Tax, on the Ordinary Shares, has been paid, and amounted to £4,586 12

It is proposed to pay a final dividend of 6 per cent. on the Ordinary Shares, making 10 per cent. for the year, and which will amount to £6,879 18 0

Thus leaving to be carried forward to next year a balance of £802 12 9

£15,709 4 9

The past season in Ceylon has probably been the worst ever recorded as regards the yield of tea. The crop from the Company's estates, owing entirely to untoward weather, has turned out some 70,000 lb. under the estimate, so preventing the full profit which your Directors were justified in looking for. The result, however, cannot but be said to be very satisfactory, and your Directors consider that great credit is due to those responsible for the management of the Company, both in Ceylon and London.

The total crop for the past season amounted to 930,281 lb. which sold for £39,127 13s 4d, or an average of 10·09d per lb., as against the previous year's crop, 833,874 lb., which realised £30,923 7s 4d or 8·90d per lb.

The Estates are in a high state of cultivation, a liberal expenditure, as will be seen by the summary below, having been allowed. The tea cost f.o.b. about 29 cents. of a rupee per lb., distributed as follows:—

General	·039 cents.
Cultivation	·072 ..
Plucking and Manufacture	·171 ..
Buildings (upkeep)	·005 ..

Capital Account on Buildings
Machinery, and Tea Clearings £2,056 6 7

The freight, warehousing, and selling in London, cost ·93 of a penny.

Exchange averaged at the rate of 1/4·29, as against last year at 1/3½, and 1/2 9-10 the previous year.

The outlay on capital account exceeded our intention of a year ago, but as practically the whole of this was laid out on factory extensions at Tallicoultry and Belgravia, the better prices realised have fully justified the outlay.

Mr. McDonell retires by rotation, but, being eligible, offers himself for re-election.

Messrs. Singleton, Fabian & Co., the Auditors to the Company, retire, and, being eligible, offer themselves for re-election.

GAME AND THE PARK COUNTRY IN CEYLON.

(From Mr. D. Blair's Report, Survey Department, 1898.)

PARK COUNTRY.—The park country is situated in scattered areas among the forests. One of the largest is the Hingurawatdamana situated between the Kandulla and Minneriya-oayas, covering not less than 10,000 acres. Another great park extent lies between the bund of the "Prakrama Sea" and the Amban-ganga, and even between the Amban-ganga and Mahaweli-ganga along the road from Kotawela to Dastota.

East and north of Polonnaruwa, too, there are thousands of acres of park country extending in a broken series to Knmadi village. The park country varies in openness. When very open it is possible to see for a mile through the trees dotted over the plain, while at other times they are so close as to be of the nature of an open forest. The trees are seldom of great size, and among them are many lovely blossoming varieties such as satin, ehela mee, damba, &c., and when many of these are in flower before the grass land is scorched it is the most lovely country in the Island to travel through.

GAME.—The chief big game in Tamankaduwa are elephant, buffalo, bear, leopard, sambur, cheetah, spotted deer, red deer, and pig. In the rainy season, when water is to be found in every "dola," the elephants are scattered over the whole country and seem to travel about considerably, but as water becomes scarce they retreat towards the Mahaweli-ganga and the vicinity of the great "villus." The steep banks of the river are worn into steps and stairs by these animals constantly descending to drink, and the marshy ramba grass land along its banks is pitted with their footprints. Buffalo are not plentiful and their destruction by sportsmen is discouraged by Government. They usually frequent the marshy pools near the park country far from human habitations, but they have often been known to attach themselves to a herd of tame ones. Leopards are found wherever their quarry is, be that where it may.

Bears are most common in the park country when the fruits and flowers they feed upon are ripe, but the search for honey takes them everywhere, and the marks of their claws made in climbing trees are met frequently. Their favourite haunts are in the vicinity of bare rock hills and boulders and caves as in the country south of Kotawela. They are the most dreaded of all the denizens of the forest by the inhabitants, and the number of the horribly disfigured and scarred bear victims among them show good reason for the dread.

Sambur are met with all over the district, but they are oftenest found in the hills or feeding in the park country. They rarely go in large flocks; a buck and two or three does with a fawn or so being the usual numbers met with, though occasionally the stag alone is met, and he is then most easily approached. Their breeding season is during the rains, and the young fawns are oftenest seen in the early months of the year.

Spotted deer are more numerous in Tamankaduwa than the other varieties, and in the dry season they are met with in herds of a score or so in the park country—the does being by far the most numerous. Their breeding season does not seem to be so well defined as that of sambur. In January and February many young fawns have been met, but again fawns are not uncommonly found in September at the end of the dry season.

Red deer are probably least common of all deer in Tamankaduwa, but they shun the open country and frequent the forests in pairs or often singly. No direct evidence of their breeding season was noticed.

Wild pig frequent the vicinity of paddy fields and abandoned but not quite empty tanks, in which they wallow. Among the Moor villages and in the low-lying "ramba-damanas" along the Mahaweli-ganga they roam in great droves of twenty or thirty, tearing up the ground as they go in their search for roots.

CHINA TEA—OR POISON?—An analyst records that there are over sixty substances used by the Chinese in colouring and weighting much of the tea that finds its way to this country. These substances include subacetate of copper, indigo, and tumeric mixed together to make a bright vegetable green; sulphate of lime or gypsum, to give the tea a greyish, smooth, glossy appearance; glucose of gum arabic water, to make the gypsum adhere to the tea; Prussian blue, Dutch pink, soapstone, graphite, rice, and starch.—*Daily Mail*.

NILGIRI TEAS.

PRICES AND AVERAGES: POOR JATS: WYNAAD SHIPMENTS.

In common with the rest of India, the Nilgiris have shared in the benefits of the remarkable recovery in the London market during the last few months. It is gratifying to note, besides, a marked improvement all round in manufacturing methods in the district—an improvement which, though inaugurated some half-a-dozen years ago, has not till lately attained its full development. That there is still room for very considerable improvement in methods of manufacture, pruning, and cultivation cannot of course be denied by any one conversant with the latest modes obtaining in Assam and Darjeeling. But the spirit of progress is in the air, and on all sides we hear of up-to-date machinery being imported, and a general inclination to drop for good and all the backward methods and appliances that in past years did such serious damage to the tea industry in the district.

Last week's sale report included shipments from six Nilgiri estates, the average price obtained being 7.72d per pound, less than a half-penny below the average for all India, and only one-fifth of a penny under the Ceylon average. The best prices were realized by New Hope, which has made such very gratifying progress in the last two or three years—with the very good all-round rate of 8.7d per pound. The shipment too was a large one, consisting of 340 packages, and on the whole, was fairly representative, the only grades not included being Pekoe Souchong and Dust. Kodanaad stands next with an average of 8.4d, with Pykara Falls 7.7d, Seaforth 7.3d, Genmorgan 7.1d, and Hocorra 7d, following in the order named.

The Wynaad shipment was, however, still better the average being 8.16d, while even Travancore ranked higher than the Nilgiris with a rate of 7.81d per pound. The Wynaad, of course, though handicapped to a certain extent by the climate, has the advantage of all new tea districts in being planted up with the best possible variety of tea, a point in which the Nilgiris are so lamentably behind the times. It seems strange that even now, when the great advantages of the Assam *jat* have been proved up to the hilt, that extensions should still be made with hybrid varieties.—*Indian Planters' Gazette*.

SILVER GOLD AND PRICES.

The extraordinary fall in the prices of commodities during the past twenty-five years is put down by bimetallists to the depreciation in the value of silver; by monometalists to improved methods of production and transport. We are not going, in a few lines, to attempt to discuss such an intricate subject, but we subjoin some striking figures, taken (with the exception of the value of the silver produced, which is our own estimate) from a recent publication of the Gold Standard Defence Association. Judging from all previous experience, the enormous increase in the production of gold must, sooner or later, have a marked effect in raising the prices of other produce. There have been strong evidences already of a tendency in this direction, which may become more marked in the course of a year or two. Broadly speaking, if there are two sovereigns where there used to be one, the two will not, in the long run, buy much more than the one did. The tendency of prices to rise has been masked by the greater demand for gold from countries which had not a gold currency previously, or which wished to build up a war chest.

PLANTING NOTES.

PEANUTS.—This nut, so common in the United States, is very rarely eaten roasted in France and nearly all that enter the port of Bordeaux are imported from Spain, Italy and Africa. The variety is small and uninviting-looking and exorbitantly high, the price, being about three times that asked in America. The taste for these nuts as a food is growing; it is practically certain that if the American varieties were put upon this market at a reasonable price, they would find a ready sale. Many tons of peanuts are imported from the west coast of Africa, India and Malayan Archipelago and are sold in Marseilles and other European countries; these are principally for the oil, which is extracted from them. Peanut oil is used for cooking purposes and as an adulterant and substitute for olive oil.—*United States Consular Reports*, Dec. 1898, p. 539.

SPANISH PEANUTS: A NEW VARIETY OF GROUND NUTS.—(*Arachis hypogaea*).—This is a special variety of peanuts, grown largely in North Louisiana for forage purposes. Its growth is erect and, at maturity, the pods adhere very tenaciously to the stalk when the latter is uprooted. In sandy, or light, loamy soils, this operation of uprooting can easily be accomplished without hardly the loss of a pod. By gathering them in this way while the leaves are still green and curing the entire plant with adherent pods into hay, a large quantity of excellent forage of high feeding value can be obtained. This plant, as can be seen later on, has an enormous power of gathering nitrogen. It stores much of it in the fruit. It matures easily, and two crops upon the same soil have been made in one year at Audubon Park. This crop is frequently planted, and hog permitted to gather it is maturity. Its feeding value is very great, and this is abundantly corroborated by numerous experiments in feeding by practical farmers. The value to the land of this crop is very great, and the yield of nuts is sufficient, if grown in large areas, to justify a considerable commerce with profit to the farmer at present prices—three cents per pound in Norfolk Virginia.—*The Louisiana Planter and Sugar Manufacturer*, 11th March, 1899, p. 146.

PRODUCE AND PLANTING.

WEIGHING PAPER WITH TEA.—The Lipton case, the first stage of which was decided last week, is sub-judice, as it will shortly come before a higher court. It is pointed out on behalf of Messrs. Lipton that a mistake had crept into some of the reports of the proceedings, in which it is represented that the deficiency in a 1lb packet amounts to as much as 2oz. While the company make no secret of the fact that their 1lb packets include the weight of the paper, it is of course, quite wrong to imagine that the paper weighs anything like 2oz. The explanation is that drachms have been mistaken for ounces in the reports in question. It was stated during the hearing of the case before the magistrate that including the weight of the wrapper in the weight of the tea was a custom of the tea trade "from time immemorial." This has hurt the feelings of a number of firms who do not follow this custom. So many packet tea trading firms have denied this soft impeachment that it is necessary to remove the impression that it is a general custom to include the weight of the paper with the tea. It is stated on behalf of Messrs. Lipton that the £17,000 mentioned as profit on this method of selling tea during a year's operation is greatly exaggerated, and that the sum of £2,000 would be nearer the mark. It is also argued in defence of those who sell the paper with the tea that if a buyer goes into a grocer's shop and buys a pound of sugar, in the ordinary way, the grocer places a piece of paper on the scale, puts the sugar on it, and when the scale is turned, does the packet up and sells it. No doubt if the buyer wanted it he would give the sugar without the paper, and the buyer would get a little more. It is the same in regard to packet teas and all other articles sold in packets. This is ingenious, but not conclusive.

INTERESTING FIGURES.—Apropos of the Lipton case, a correspondent writes that the turnover of Lipton's business is estimated at 3,000 chests per week. It follows that if, as was proved when the company was convicted for selling at short weights, the gain is 3 per cent, there would be three pounds of tea in every chest which would virtually cost nothing. This, on the turnover of 3,000 chests, would equal ninety chests gained per week. Taking the value of the quantity gained at 1s per pound duty paid, the money value would be £150 per week, or £23,400 per annum.

NATAL TEA.—Indian and Ceylon tea planters have not taken tea growing operations in Natal seriously, at present looking upon tea cultivation in that colony more as an interesting experiment than in the light of competition. Doubtless the supply of Natal tea in Mincing Lane will be on a small scale for some time to come, but it cannot be denied that tea planting in Natal can be profitably conducted. A correspondent of the "Grocer," who is very enthusiastic about them informs the tea trade that "Natal tea will soon be definitely on the market," and that the analysis of these teas is "really first-rate." He says: "There is a due amount of caffeine present which should make them mild, yet sufficiently strong in the invigorating properties. The low per-centage of tannin should make these teas welcome to the dyspeptic, and indeed to everyone who thinks much about his digestion. In each case the percentage of tannin appears to be much lower than that which is found in samples of Indian tea. The other items in the analysis are quite normal; but when we come to the ash we find a rather unusual ingredient, for it contains a notable per-centage of manganese. This is undoubtedly derived from the soil, in which manganese is fairly widely distributed. I am not aware that there is any soluble salt of manganese in the tea which could be dissolved out by the water, and if there is I do not know what the precise effect upon the system would be to anyone drinking it. So far as can be gathered, the amount which would be taken in a cup of tea if it really does dissolve, is so insignificant as to be practically without any importance whatever, and

so it may be disregarded. On the other hand, if the manganese only exists in the tea leaves and is not dissolved out, then of course it has no significance whatever to the tea-drinker."

BRAZIL COFFEE.—The British Consul at Rio de Janeiro, in his report received on Brazilian affairs, speaks in hopeful terms of the coffee planting industry, and expresses surprise that, although some hundred millions sterling of British capital are employed in public funds and enterprises in Brazil, so little has been invested in the profitable pursuit of coffee planting. It may be due, he thinks, to a feeling of insecurity as to the protection afforded to the property of foreigners in the interior of the country; but he notes with satisfaction that the President of the Republic has made a powerful appeal to the State Government to extend full protection to all immigrants and foreigners.

COCOA.—The consumption of cocoa is increasing rapidly. In some countries this is very noticeable. Germany has doubled her consumption of cocoa since 1882, and England has considerably more than doubled hers. In France the consumption was in 1868 about 15,000,000 lb, which figure has now been more than doubled. The annual consumption in the various countries was, according to some recent statistics: France, 30,500,000 lb; United States, 26,400,000; England, 22,100,000; Germany, 19,900,000; Holland, 17,000,000; Spain, 12,800,000; Switzerland, 4,800,000; Belgium, 3,600,000; Austria-Hungary, 2,200,000; Russia, 1,900,000; Denmark, 1,400,000; Italy, 1,100,000; Sweden, 800,000; Norway, 300,000; Portugal, 200,000. Reduced to annual consumption per individual Holland heads the list with three and a half pounds per head, Switzerland comes next with one and three-fifths pounds, and France third with four-fifths of a pound.—*H. & C. Mail*, June 23.

MINOR PRODUCTS REPORT.

LONDON, June 15.

CARDAMOMS.—A fair "jobbing" trade has been done this week at well maintained prices, the demand being especially for seeds.

COCA LEAVES.—There are numerous enquiries to be met with but little or no actual business. Truxillo leaves are offered at 10d and Huancoco at 1s 3d.

OIL OF CITRONELE.—A fair business has been doing this week the tone is slightly better. Drums are offered on the spot at 11½d and tins at 1s to 1s 0½d.

OIL OF LEMONGRASS.—Still quiet, and purchasable at 2½d spot.—*British and Colonial Druggist* June 16.

London, June 23.

CANELLA BARK.—Fair bark can be bought at 35s per cwt.

CINCHONA.—The auctions on Tuesday were not animated in the sense that the tea sales next door were, for tea buyers have a style of their own which is a hybrid between a bear garden and the Chicago Wheat Exchange. The offerings at the cinchona sales were limited to five catalogues, and much of the stuff had been seen before. It was also notable that the usual large buyers on this occasion stood down, not caring to go to the extreme rates which the ultimate purchasers paid. The cinchona bark auctions to be held in Amsterdam on July 13th will consist of 5,611 packages of Ledger and hybrid, of 577 cases and 677 bales of succirubra. The stock in first hand at Amsterdam consisted on June 20th, of 2,044 packages Government bark, and 8,259 packages private bark, including the quantity to be offered in the next auction.

LEMON OIL.—Dearer by 3d to 6d per lb, according to holders. Super is quoted 3s spot, and extra super 3s 8½ f.o.h. Messina; these are the lowest prices in the classes mentioned.

KOLA NUTS.—Firmer, West Indian having sold at 2½d, and more was wanted for African.

VANILLA.—Tahitis were offered today, apparently as a matter of form, for only 1 tin sold at 6s 6d per lb, 4 inch to 6 inch beans.—*Chemist and Druggist*, June 24.

FACILITIES FOR MAKING TEA IN
CEYLON:

IN CONCLUSION.

DIVERSE OPINIONS ON THE VALUE
OF MANURING; PRUNING AND JÄTS.

We find three returns from well-known planters have escaped attention in our series of summaries on this subject. One of these writers who has had much experience in the systematic manuring of coffee as well as tea, in answer to our enquiry, "Would manuring improve the tea and be profitable in your opinion?" says:—"Yes, manuring is profitable. I can't say it improves the tea: but it makes you pretty independent of the weather, for manured tea flushes, when the other through climatic causes has got shut up"; while a second, also a practical observant Manager replies:—"Yes, both in quality and yield, and systematically carried out, manuring is profitable, with decent prices." The third answer comes from a Visiting Agent with a wide area of observation, who remarks:—"Manuring improves quantity of yield, but it is disputed as to its improving quality. It is only profitable where estates yielded a profit previously." Here then we have perhaps the last word upon "Manuring" until the scientists and especially Mr. Kelway-Bamber demonstrate how both quality and quantity may be secured by carefully adopted manuring and appropriate cultivation. By the way, there is a rumour that in regard to the kind of application suited to Ceylon tea estates, there is a good deal of difference of opinion among Analytical Chemists, each of whom have testimonials from different districts as to the good effect of diverse manures. All will, no doubt, be made public in due season, and perhaps the old saying may come true that in "a multitude of counsellors, there is safety."

As regards other elements towards successful cultivation, it is noteworthy that while our "V.A." critic considers that machinery as a rule is now sufficient to the needs of factories—some, of course, being better provided, especially in regard to withering room, so getting a higher average,—he adds that there are really very few factories in the island that have a sufficient reserve of withering accommodation to cope with "the rush of leaf" which is experienced in most districts during one or other month of the year. In the same gentleman's opinion there should be no complaint of want of sufficient "motive power" now-a-days, in view of the great improvement in oil engines and the grant of a Customs rebate on machinery oil. About "pruning" the same authority does not think that planters use the knife before there is the necessity nor that they prune severely where lighter pruning should suffice. In other words we have arrived at the stage in Ceylon where the superintendents of tea plantations have—through instruction, example, observation and experience combined—acquired that practical acquaintance with their work in all its details, which in years gone by, placed them or their predecessors in the very forefront of the world's cultivators of coffee. Of course there are exceptions; but we take it this is what our correspondents generally mean

to imply. As regards "jät" we are shrewdly reminded that "a good jät tea as a rule gives more strength; but medium jät's give a better appearance and sometimes better flavour"—to which may be added the fact that "indigenous" and so-called high class jät tea, has undoubtedly been found in Ceylon more subject to "blight" than the hardier Assam-hybrid. In judging of the older planting districts, we must always remember how most of the estates were made out of old coffee or scrub land, and yet a good authority declares that estates within a ten mile radius of Kandy can hold their own as regards "quantity," though the average price for their tea can never be a high one. Tea of a good fair medium strength (says a planter within the radius) can be made; but there are too many competitors in the same grade, to benefit much thereby. On the other hand, he adds:—"we have the advantage of cheap transport which is not enjoyed by some other medium districts." The influence of "fine plucking" as regards quality and of particular seasons as respects both quantity and quality, must not be overlooked; while no doubt from "Dan to Beersheba" the cry of "the poor but honest and industrious planter" will find an echo, when he says:—"We can all grow tea, but it is a hard struggle to grow it so as to leave a margin of profit with low prices and high exchange." Nevertheless, let us hope that an increased demand for Ceylon tea in North America, Russia and the Continent generally may make the "margin" a real and constant factor; for as the old song has it:—

"We've lippen'd aye to Providence,

An' sae will we yet.

Only the tea planters of Ceylon know well, and act on the knowledge, that Providence generally helps those who help themselves—so, let the "Tea Cess" continue to be wisely administered and may our Indian planting neighbours do their best to get a similar Cess collected on their tea, so as to secure the means for driving out 'China's and 'Japan's' from North America and the Continent of Europe, at the earliest possible date.

MANURING FRUIT-TREES IN HOLSTEIN.—A method of fertilising fruit-trees in vogue in Holstein is suggestive, and not unworthy of a trial. The trees, it is said, receive no cultivation, and the fruit is large, sound, and produced in abundance. Every two years a few holes are dug in the ground about 4 or 5 feet from the trunk of the tree, and about 1 foot deep, closer and shallower in the case of young trees. These holes are filled with liquid-manure about four times during the winter months, and for young trees this is diluted with water. If there is more liquid-manure than is wanted, it is distributed over the surface of the orchard, using an old street sprinkling-waggon for the purpose. There is no reason why manure water should not be used once or twice after it is seen what the crop is likely to be; of course, not affording any at that season to trees not bearing a crop, or which are carrying only a few fruits, as to dose them would be to encourage, probably, an unnecessary growth of shoots. But in this matter, the cultivator must be guided by the condition of the trees, and of the soil.

ALLEGED CEYLON TEA CONFISCATED IN LONDON.

There is more in this matter than we understood at first and we hereby call on the Chamber of Commerce or "Thirty Committee" to investigate the same. It seems from all we have been able to learn that the tea actually confiscated and destroyed in England, *was landed there in bags* and is alleged to have been discharged by one of the "Maru" boats. Now, we understand that no such shipment was made by any steamer from Ceylon: and Ceylon tea is never shipped in bags. Either "an enemy hath done this"—some one from Japan sending the stuff on and labelling it as from Ceylon—or the London Customs has made a mistake as regards the port from which the bags came. Could not the Agents of the "Maru" boats be asked to make inquiry in London and ascertain on what documents the Customs officials fixed "Ceylon" as the country from which the stuff came? We do not think the matter should be passed over, as it ought to be easy to trace where (if not by whom) the shipment was made.

JAVA QUININE.

Mr. C. W. van Heeckeren, Director of the Bandoeng factory, has written a very long letter to a Java paper to protest against certain serious insinuations made in that journal, in which it was alleged that the Bandoeng works had carried on a private speculation in quinine made by them for Java planters. It was said that the factory had led the planters to believe that this quinine was held in stock for the planters' account, whereupon in reality it had been privately sold by the factory. Prices subsequently rose, and when the planters gave orders for their quinine to be sold, it transpired that it had already been disposed of months ago, whereof the planters decided to break off relations with the Bandoeng works, and to consign their barks to Amsterdam as before. The statement was made that the German quinine-makers, out of their enmity to the Bandoeng works, had purposely engineered a rise in the market as soon as they got wind of the aforesaid speculation, so as to bring about a breach between the planters and the Bandoeng works. Mr. Van Heeckeren denies all these allegations. He says that the factory is debarred by its articles of association from trading in quinine, all that the works make being sold through to Messrs McNeill & Co., of Samarang. The accounts between the works and the planters are settled in March of each year, when Messrs McNeill are in possession of the account sales for the whole of the preceding year. No one could have foreseen the sudden rise of quinine to 1s 9³/₄ last March, and Messrs McNeill before that rise had sold at from 12¹/₂ to 14d per oz on delivery. On January 1st about 5,000 kilos of quinine had been made by the factory, for which the owners had not yet received an account sale. Of this only 120 kilos were at the works, 1,000 kilos were at Batavia, and 3,600 were on the way to various ports. During January and March about 3,200 kilos made at Bandoeng were sold. Mr. Van Heeckeren complains that the Bandoeng factory is badly supported by the Java planters. Some of them habitually belittle it, and carp at its working. The total production of the Bandoeng factory between January 1st and March 13th was 320,000 oz, of which Messrs McNeill had sold in the same time 253,580 oz, at an average equivalent of 7c per unit gross. In commenting upon Mr. Van Heeckeren's letter the Java paper maintains its allegations, although it acknowledges that the speculation was not undertaken for motives of

illegal personal gain, but was merely an ill-considered speculation in the interest of the planters, who, unfortunately, have turned out losers over the affair.—*Chemist and Druggist*, June 24.

AGRICULTURAL PRODUCTS OF TOGO. LAND.

The principal products of Togoland (a German colony in West Africa, between the British gold coast possessions and Dahomey) are oil palms, coco palms, india rubber and coffee. The most important from the European point of view is the kola nut, to the cultivation of which great attention is being paid. Regulations have been issued to prevent the wanton destruction of india-rubber trees, and the dealers receive licenses from the Government. Only natives are allowed to collect this product, strangers being forbidden to ply the trade without a special license, which costs £50 a year. It is not allowed to give natives an advance on the year's yield. According to a recent report by the Second Secretaries of H.M. Embassy in Berlin, the cultivation of the oil palm has not yet been undertaken by Europeans, and remains in the hands of the natives. Good building wood is supplied by the following trees:—*Chlorophora excelsa*, *borussus flabelliformis* and *eryodendron anfractuosum*. There are six coffee plantations, the number of trees varying from 30 to 3,000. The yield is given as 4,300 kilogrammes (9,479 lb.) Coconuts last year were grown in five plantations, varying from from 33 to 1,000 in each, and the yield was 10,000 nuts. New undertakings are in view. In the mountains, five days journey from the coast, the natives are growing coffee with success, and plantation on large scale with European capital will shortly be commenced. The india-rubber tree (*manihot glaziovii*) is grown in the coffee and coconut plantations. It does fairly well, but suffers from a blight (*Loronthocox*) which does much damage. Cassava (tapioca), yams, maize, and earth nuts are also cultivated with success. An experimental plantation is carried on at Sebbe. It has been found that the trees which do best are mangoes, eucalyptus, banana, bixa orellana, oranges, and coffee. Mulberry trees do well in the rainy season, but three-quarters of them die in the dry season. A new garden is being started at Lome, where native gardens are being trained. Coffee, manihot, *kikxia africana*, *inophyllum*, &c., are being raised from seed. The following annuals are being grown:—*Lycinus*, *sesamum indicum*, oil plants, maize, *andropogon* and *corchorus capsularis*.—*Journal of the Society of Arts*.

COFFEE AND TEA IN THE NILGIRI: OOTY, June 3rd.—A doleful year this is likely to be, my masters, for planters of coffee, for prices are falling, falling every day, and there seems no end to the depths into which they are plunging. And to make matters worse, if worse they could be, the rain on the open blossom has done immense harm to crops. Kotagiri way they are still hopeful, but there hope is getting thin. Coonoor,—well there is an end of hope for them, and the damage to the coming crop is put down at one-third to two-thirds of the whole. On the western slopes, in the Ouchterlony Valley and Nallacottah, things are a great deal better, one enthusiast declaring his 1899-1900 crop will be one of the best on record. Tea, of course, is sharing in the general improvement in prices, and the season is, moreover, and exceptionally favourable one. New Hope, one of the Valley estates, is attaining quite a respectable position in the home market, and for very good all-round breaks too. Another estate, long known for its excellent prices, Non-such to wit, on the Coonoor side, is also coming forward again after a year's slump.—*The Indian Planter's Gazette*, June 10.

PENRHOS ESTATES COMPANY OF CEYLON, LIMITED.

REPORT.

The report of the directors for the past year which is as follows was taken as read:—
The Directors have pleasure in laying before the Shareholders their Report and Accounts for the year ended 30th June, 1899.

The amount of Tea secured was 201,020 lb.—158,106 lb. on Estate account, as against an estimate of 165,000 lb. and 42,914 lb. manufactured from bought leaf.

In view of the severe drought during the latter half of the Season, the crop may be considered satisfactory.

The following figures, shewing the results of the past three Seasons, will be found interesting.

	Crops in lbs.	Cost laid down in Colombo in cents.	Or with-out Manure.	Nett Average Price.
1896-97	155,025	27.52	26.31	36.42
1897-98	145,250	26.23	25.65	39.12
1898-99	158,106	25.41	24.05	41.03

These figures refer to the Estate tea only.
As regards the Season under review, the total crop secured has cost, laid in Colombo, cts., 25.43, and has realized a nett average price of cts 40.27.

Included in the proceeds of tea is a sum of R506.80, being balance proceeds of tea unsold at 30th of June last year and estimated for.

After payment of the Interest on Debentures, namely, R 3,030.00, the amount at credit of Profit and Loss Account is R23,237.52, which is equal to 15½ per cent on the Capital of the Company, as against 9 per cent last Season, and 5½ per cent the year before; this may be considered very satisfactory.

The Directors recommend that this sum be apportioned as follows:—

By the payment of a dividend of 10 per cent for the year	R 15,000.00
By the payment of a bonus to the Superintendent	1,000.00
By placing to Reserve fund	700.00
By carrying forward to the next Account	237.52
	R 23,237.52

The Directors desire to place on record their appreciation of Mr. J. E. Martin's management of the Estates during the Season under review.

It is proposed to open a further 10 acres in Tea during the coming Season, and another 20 acres in 1900-1901, there being sufficient Capital in hand to do this.

The Acreage of the Company's Estates is as follows:—

Old Tea	508 Acres
Tea under four years	25 "
Tea not in bearing	24 "
Forest	51 "
Waste and Patna Land	212 "
	Total 820 acres

In terms of the Articles of Association, Mr. W. B. Kingsbury retires from the Board of Directors, but, being eligible, offers himself for re-election.

THE FUTURE OF COFFEE,

(By a Planter in India.)

The whole of my argument turns on the supposed increase in consumption, the check on production, and the probability of a rise in the rate of Brazilian exchange. As regards the first condition, I rely mainly on the analogy of 1881-86, but there is plenty of direct

evidence that consumption is increasing. It is true that

THE CONSUMPTION OF COFFEE

in the United Kingdom has not increased with the population, but the *Westminster Gazette* reports an enormous increase in the year ending March last in the number of cups of coffee sold in refreshment rooms. One firm alone used 134 tons of coffee in 1898-99 for this purpose, against 48 tons in 1897-98. Still, it is to the great coffee consuming countries of the Continent and America that we must mainly look to dispose of the increased production. The average annual consumption in ounces per head of population of late has been as follows:—Holland, 370; Denmark, 247; Belgium, 176; United States, 155; Switzerland, 112; Germany, 78; France, 53; Austria, 52; Italy, 17; Great Britain, 11; Spain, 9; Russia, 3. The British Consul at Hamburg, which is the great importing centre for Germany and its immediate neighbours, reports that, as a natural consequence of the low price of coffee in 1898 (about 9d. a lb. in spite of high import duties), there is a largely increased consumption in Germany and other countries. The following figures for deliveries in the United States are from the *American Grocer*:—

1896-7	1897-8	1898-9
Avg. monthly deliveries.	424,049	503,026
	497,435	bags.

In 1897-98 the deliveries were the highest on record and unduly stimulated by the fear of a duty, but those of 1898-99 show little fall-off. Yet with these heavy deliveries, the *American Grocer* says, there was no gain in stocks, showing that the coffee actually went into consumption. This consumption was per head of population:—In 1896, 8.7lbs; in 1897, 10.9lb.; in 1898, 10.7lb. The New York correspondent of the *Grocer* gives the following consumption of made coffee per head of population:—In 1893, 14 gallons; in 1898, 19.46 gallons. He attributes the increase to the great roasting firms selling coffee at 5d. a lb., and estimates that nearly four times as much coffee is drunk as there is tea, because coffee is the cheaper beverage. The English retail price of coffee has remained at about 1s. 8d. a lb. for the last 25 years, whether the wholesale price was high or low. If cheap coffee was pushed in England as in America, we might see a great increase in the consumption of the United Kingdom.

Turning next to the

CHECK ON PRODUCTION,

the following facts will show I considerably understated my case. From Mexico, Ceylon planters who have tried coffee cultivation there are returning and reporting in the *Ceylon Observer* that cultivation is unremunerative at present prices. A local (Mexican) paper says:—"The present price of coffee offers no margin to planters worth talking about. It is plain therefore that plantations will be abandoned and the crops reduced until prices rise again. It will be remembered that about 15 years ago, under very similar circumstances an extensive area went out of cultivation." From Ecuador and Venezuela it is reported coffee is being abandoned for new industries. Probably the same is true of the other Central American countries, as we know they all complain of the scarcity of money hampering trade; and a disease has appeared in Guatemala and Nicaragua "which has made many plantations valueless." The British Consul at Rio reports the same movement toward new industries, and says:—"On more than one occasion the current price of coffee did not cover the carriage from the interior, so that it is fully expected by those interested that, owing to neglect in clearing the trees and the abandonment of new plantations every year will show a gradual diminution of production." In spite of the optimistic views of the President of San Paulo, the Brazilian papers do not hesitate to say, that "the coffee industry is no longer a paying one," and that even estates like the San Paulo Coffee Estates, bought at comparatively low prices and worked by cheap European capital, are not remunera-

tive. The Santor correspondent of the *Brazilian Review* reports that planters are trying to combine to reduce wages, but that the Italian labourers are leaving the estates and are settling in the towns. We all know by experience that an attempt to reduce wages when labour can go elsewhere is a policy of desperation!

Nearer home it is reported by Mr. Elliot and the Coorg Planters' Association that

A LARGE ACREAGE OF NATIVE COFFEE

has been abandoned in Mysore and Coorg. From the Straits, the *Malay Mail* and Sir Graeme Elphinstone, a Ceylon planter settled in Perak, report that planters are being driven by low prices to abandon coffee for coconut cultivation. The British Consul in Java reports that some plantations are being disposed of and more are likely to be abandoned if no improvement in prices takes place. In fact, not only is there a decided check on the increase of production all over the world, but a prospect of an actual diminution of production. And East Indian planters have this advantage on the present occasion. Fifteen years ago East India prices fell *pari passu* with those of Brazil; but the prices of all rough coffee began to fall heavily in 1897, whereas East India prices were not seriously affected till this year. So that, taking into account only the effect of the natural increase of consumption and check on production caused by low prices, it should, on the analogy of 1881-86, take only two years more for prices to rise again. This is the actual time named by the *American Grocer* as that during which grocers can reckon on low prices.

This calculation, however, leaves out the factor of

A RISE IN BRAZILIAN EXCHANGE

which is almost certain to occur. The following figures will show that the value of the millereis depends almost entirely on the amount of paper money in circulation:—

	Paper money in circula- tion.	Rate of Ex- change	Population (including Indians.)
In 1887-9	about 200,000 contos	22 <i>l.</i> 27 <i>d.</i>	14,000,000
In 1892	" 556,000 "	12 <i>d.</i>	15,000,000
In 1898	" 790,000 "	8 <i>d.</i>	17,000,000

For an increase of population under 25 per cent. the paper money was nearly quadrupled, and Exchange fell in 1897 to under the quarter of the par value which obtained in 1889. The quadrupling of the paper money made no difference in the gold value of the circulation per head of population, which was almost exactly the same in 1898 as in 1889. This fatal over-issue of paper money was due to false ideas of the value of money, to the weakness of constantly changing Governments, to reckless extravagance in the cost of administration, and to gross laxity in the collection of revenue. In December, 1896, an attempt was made to raise the value of the millereis, and a law passed assigning certain funds to the redemption of paper money; but practically very few of these funds were applied to this purpose up to 1898. In that year the President-Elect paid a visit to Europe and arranged with Rothschilds the following scheme, which came into force on the first July, 1898:—£10,000,000 is to be advanced by Rothschilds on the security of the Customs revenues, and the interest on the Government debts, amounting to nearly £3,000,000 a year, is to be funded for three years. As funding bonds are issued, Government undertakes to deposit an equivalent amount in paper money at the exchange of 1*sd* per millereis with certain Banks. This paper money is to be destroyed, or used to purchase Bills in London when Exchange is favourable, that is, at or over 1*sd* per millereis. By this means it is proposed to reduce the excessive paper money by 133,400 contos (thousands of millereis) when it is expected the millereis will rise to 1*sd.*, "the rate agreed on." Strict economy is also to be practised by the Government, and the revenue is to be duly collected, when it is expected to yield much more than it has hitherto done. Up to March last, or for nine months since the scheme came into force, Government has burnt 9,000 contos of paper money; has paid off 31,000 contos of debt

instead of as usual incurring fresh debts, and had a credit balance of 2,600 contos with the Banks in place of the usual debit balance. Up to the end of 1899 the benefits of the scheme will be retarded by the debts contracted in 1897, but from 1900 onwards the full benefits of the scheme will be realised.

Although since the new President came into office the Government has faithfully fulfilled its obligations, it is obvious that this scheme cannot be judged by its effect on Exchange in the first nine months of its existence. As a matter of fact, Exchange was raised at once from about 6*d* to 8*½d*, and though it receded a little below 8*d*. for a time it now stands at 8*3*/*32d*. But the Government of India's scheme for fixing Exchange failed to be of any beneficial effect to Indian Exchange for the first two years of its existence, and yet succeeded in the next two years in raising the value of the rupee to the desired level. So probably every year the Brazilian scheme is kept at work its influence will increase in geometrical progression. We may fairly hope that the Brazilian Government, having begun so well, will carry out the scheme without wavering—more especially, if it does not raise the millereis to 1*sd*. in three years time, it will be face to face with bankruptcy.

There is another reason which has not yet been touched on why coffee prices cannot long remain at a low level, and that is

THE INCREASED COST OF PRODUCTION

all over the world. Twenty-five years ago coffee was grown in India chiefly without manure. Now manuring is almost universally necessary, and this has increased expenses quite 50 per cent while the yield has not increased. In Brazil, the substitution of Italian for slave labour, the exhaustion of land near the sea board, and the opening up of districts in the interior seems to have increased the cost of production about 75 per cent in the last 15 years, for Brazil coffee is now worth in millereis quite that much more than in 1885 and yet does not pay any more than it did then. Thus:—

	Gold price.	Exchange	Millereis price.
1885-6	.. 48 francs	19 <i>d.</i>	24
1798-9	.. 34 <i>½</i>	8 <i>d.</i>	41

Similarly the cost of growing in Central America must have about doubled, as the rate of Exchange in nearly all Central American States is about half what it was 25 years ago, and yet present prices are unremunerative.—*Madras Mail*, July 17.

THE "STATIST" ON TEA PROSPECTS.—The following are the material parts of the article we referred to on Saturday:—

We think, that the prospect before the tea-growing industry of India and Ceylon is a favourable one at the present time, and that the moment is opportune for considering investments in the shares of sound companies. In this industry, as in others, there is no lack of "wild-cat" enterprises; but there are also good and sound ventures which may be brought to give a comparatively high yield, and at the same time afford a reasonable measure of security. We give below some notes on companies which have recently issued their reports, which will assist readers in making a selection. As the fall in last year's profit is due in the main to temporary causes, there seems a prospect of larger distributions in the future, and some may be inclined to invest in the shares as a somewhat speculative lock-up. *Ceylon Tea Plantations*.—This is one of the older companies, which has the recommendation of having maintained a dividend of 15 per cent. on its Ordinary shares for many years. Profits for 1898 were £41,351, as compared with £42,199 in 1897, the slight decline being due to the crop being rather below that of 1897 and to a rise in exchange. The issued capital of the Company is as follows:—

£	Shares.	Nom. value.	Price.	Yield
		£		per cent.
167,330	Ordinary	10	26 <i>½</i>	5 <i>½</i>
81,030	7 per cent. Pref.	10	18	4

The reserve fund now amounts to £95,000. At present prices, both the Ordinary and the Preference merit attention.

Correspondence.

To the Editor.

AN ANSWER TO "QUERIES FOR
TEA MAKERS":

MR. THORNTON PETT'S ANSWER.

Elpitiya, July 11.

SIR,—I have just come across a letter in your last weekly edition, signed "Enquirer" asking "what errors in the manipulation of tea leaf could cause the *dry* leaf to have a reddish brown appearance." Here are a few suggestions, at his service, towards an answer:—

Under-withered leaf kept rather long in wet weather, gives, as you say in your note, a large percentage of red leaf.

Over-withered coarse leaf also gives a very large percentage of red and reddish leaf.

One seldom gets a good colour on tea made from fields in which the bushes have run a long time from pruning. Leaf carelessly treated in the withering lofts, left in heaps, and trodden on by coolies also turns out a reddish tea; so does leaf that has got heated in bags or baskets whilst in transit to factory. The remedy for these is obvious.

I believe it is the almost universal experience in Ceylon, and I know it is a fact in several districts at medium elevations, that leaf plucked during a prolonged drought, and especially if there is any wind at the time, gives tea with a very pronounced reddish tinge, however fine the plucking may have been and though there may be no actual red leaf in it. This tea, though wanting in black appearance, generally sells well as the flavour is decidedly augmented: this is notably the case in Uva, witness the sale prices of teas made on estates there in July and August, the dry months of that side of the country.

Reyour correspondent's second query: "Does the handling of the leaf in the drawers of drier cause greyness of the dry leaf?" If he fills his drawers or trays properly, there should be but little handling required, and the *necessary* amount of such handling will not perceptibly "grey" the tea. A mistake some tea makers are apt to make, under the false impression, that they are saving time, is allowing the firing coolies to lump on to the drawer or trays as much rolled leaf as they possibly can, when a good deal of turning over is, of course, required to get all the leaf fired equally. Trays should always be spread thinly, and pushed or worked through quickly. It is well to bear in mind the rule that was in force when we used chulas, *i.e.*, that it should be possible to see the fire through the leaf on the loaded tray. Leaf saturated with water just before being put into the drier will, however, come out rather grey if much handled by the firing coolies, and a sort of black "soot" or bloom will be found adhering to the coolies' hands and the mesh of the tray. I have ascertained this from actual experiment. This bloom is, of course, sap from the leaf cells broken up in the rolling, and which has got diffused over the surface of the leaves. It follows from this, I think, that leaf which has been care-

lessly fermented, and allowed to get dry during the process should be only slightly moistened with water before firing and not saturated as I have seen it done by some tea makers.—I am, &c.,

GEO. THORNTON PETT.

TEA: AN INDIAN AND CEYLON
DISTRIBUTING AGENCY.

Madulkele, July 19.

DEAR SIR,—Could not the present moment, whilst the Indian and Ceylon trade in tea is at a standstill, be seized as an opportunity for starting an Indian and Ceylon Distributing Agency, and break down effectually the combination against us? The Agency's duty should be to buy tea as required in the London market (no draft allowance) and supply outside dealers, grocers, and even take private orders of not less than a chest or box. Advertise in every paper supplies direct from importers at wholesale rates, expenses of starting to be guaranteed by Indian and Ceylon Planters' Association—latter out of Thirty Committee funds. Surely with such good men on the spot as Rutherford, Henry Bois, Leake, Campbell for Ceylon and others for India, the thing could be done. The Agency started and properly organised at once, and a Company of Indian and Ceylon men would doubtless come forward afterwards to take over the going concern.

I think the attempt to do away with the 1-lb allowance has been a mistake, and has been undertaken without sufficient forethought or preparation and at an unfortunate time. I don't believe that the new arrangement, if carried, will benefit growers one bit. It is not wise to interfere with the channels through which trade passes; but now that the channel is blocked why not make a new one?—Yours truly,

CUSTOS.

LOCAL ALLOWANCES ON TEA.

July 19.

DEAR SIR,—Here is a resolution that has been omitted at the Tea Traders' Association meeting to be held today:—

"That before we take any active steps *re* 1-lb. draft in London, we must wash our hands clear of the allowance we have imposed on sellers in our local market."

PLANTER.

[Will "Planter" tell us plainly what he means? Does he want his tea sold without any samples being given out?—if so there will be little or no chance of bids. Does he grudge 3 lb. for samples out of 1,500, or 1,000, or 500 lb.? If not, to make all his breaks up to that weight is the only remedy we can see. A merchant, who is himself a proprietary planter, declared in our office yesterday, that 3 lb. is now-a-days scarcely enough for sampling: so many buyers have to be attended to, in Colombo. "I wanted the other day" he said, "to see a little more of a certain tea than the wee sample I had got so I went round to the Brokers, and found they had less left than in the days when only 2 lb. were taken for samples."—"But is it

not hard," we remarked, "that 3 lb. should have to be taken out of 100 lb.?" "Well, whose fault is that, save the planter's, who is idiotic enough to send so small a break for sale?"—The remedy therefore is solely with the planter so far as we can judge, unless he cares to instruct his Brokers to give out no samples.—Ed. T.A.]

RUBBER IN MEXICO: CASTILLOA ELASTICA.

Henaratgoda, 21st July 1899.

DEAR SIR,—I beg to enclose particulars on Castilloa Elastica cultivation supplied by a leading Rubber planter in Mexico at my request, who has several plantations of his own. I trust that the particulars will be useful to the readers of the *Observer* and *Tropical Agriculturist*. He writes:—"A good many plantations of this tree are being started all over the Southern part of this country now, but owing to their being still young, seeds have still to be gathered principally in the forests."—Yours faithfully,

J. P. WILLIAM.

"CASTILLOA ELASTICA."

(To Messrs. J. P. William & Co., Ceylon.)

Mexico, June 1.

The fresh seeds are sown with or without the surrounding pulp in the nursery bed at one foot's distance, giving them some shade, and keeping the ground well drained. The best soil is considered to be alluvial sandy loam, but I have seen very large rubber trees growing on clayey soil, and in many localities the trees seem to grow with preference on the hilly ground and not down in the bottom of the canyons.

When one year old the young plants are transplanted in the rainy season to holes dug previously in the ground, and if the tap-root is very long, as is apt to be the case if the plants, as done in some places, are left in nursery till two years old, it is simply cut, leaving it only ten or twelve inches long and letting it bleed profusely before planting it, as it is said that the clogged milk impedes its taking root quickly. Transplanting without cutting the root is however preferable, as is also transplanting "en-pilon" that is with the lump of earth surrounding the roots; but this is not always practicable when transplanting to a long distance. Cuttings are very seldom planted, and seem not to give good results.

As for planting in the sun or in the shade, there are different opinions as to the proper course. Some claim that they ought to be planted in the forest in the shade of other trees, and that the sun hurts its milk-production, makes its rind thicker and prevents its growing old and strong. The other side claims that the young trees planted in the sun grow much more vigorously than in the shade, and that not only the greater facility and convenience in looking after the plantation, but also the actual increased growth favors planting in the sun. It is rather difficult to decide which is true in the absence of large old plantations formed on both plans, but I for my part am of the opinion that it depends greatly on the climate of the locality where the plantation is made, for whereas on the Pacific Coast and part of the Atlantic coast there is a long dry season, sometimes fully six months during which the sun may inflict some damages on the trees and where consequently shade would be preferable, in other places as for instance on my own plantation there are rains in ten months or more in the year, and the moist atmosphere consequently prevents the sun from damaging the vitality of the trees, and especially if the altitude is from 200 to 500 meters over sea-level, as on my place, where a heavy shade would not be beneficial to the trees, since they would not get the necessary heat, and this is borne out by the fact observed by myself, that the young trees

planted in the sun grow much quicker and stronger there than those left in the shade. Several planters in the State of Chiapas, however, claim just the opposite result, their plantations being situated almost at sea-level and farther south than mine. On the other hand I have seen a plantation of young trees grow nicely at a height of over 700 meters altitude, but these I am inclined to think that the absence of the necessary heat may have an adverse influence on the latex of the grown tree. I have found that lime and green manure seem to help the growth of the trees very much.

The distance between the trees varies much. Some give them as much as 20 feet, but the average seems to be 15 feet. Some few give only 12 feet but without planting anything else between the trees, and a few are trying the Trinidad system of planting at 8 to 10 feet only, intending to uproot and thoroughly bleed one half later. Of course, in selecting the distance, the quality and configuration of the soil and the climatic conditions have all to be taken into consideration. Where the ground is very wet and inclined to form pools, it seems advisable to follow the system of forming a hill around the foot of each tree, as, contrary to the "Hevea" excessive moisture and swampy land seem to hurt it.

I do not think the Castilloa Elastica ought to be tapped till in its eighth year to avoid injuring the tree, nor do I think that planters ought to effect such fabulous yields as five or more pounds a year, as some enthusiasts promise. Here we generally make the safe estimate of one to two pounds of rubber per year, and rather the former than the latter.

PLUMBAGO.—We have received copy of a valuable paper on "Graphite: its formation and manufacture" by a competent scientist, which will be given in full in our *Tropical Agriculturist*. It is curious to read that the only difference between the diamond and graphite—both being carbon—is one of pressure, the former being the result of high, and the latter of low, pressure. A formula we have already published runs:—(1) Diamond, (2) Plumbago or Graphite, (3) Amber, (4) Coal, (5) Peat, (6) Petroleum.

THE CAMPHOR MONOPOLY IN FORMOSA.—A Taipei correspondent writing to a Hongkong paper on 29th June says:—

Preparations for the operation of the camphor monopoly law, which will come into force on the 5th August next, are now in progress, and it has been announced that six camphor offices will be established, namely at Taipei, Tekcham, Miori, Taichu, Rinkeho, and Giran. It is the intention of the Government to improve the present method of packing by making the chests of pine instead of camphor-wood as hitherto and lining them with zinc, so that the contents can be kept for a long time without loss by evaporation. If all the stills now in use are well managed they have a capacity of turning out some 150,000 piculs a year, while the world's consumption is roughly estimated at forty or fifty thousand piculs only. The Government therefore intends to greatly decrease the present number of stills so as to keep a fair proportion between demand and supply and to ensure a fair price for the drug. As regards the manner in which the Government will sell its camphor nothing definite has been decided, but according to a competent authority the Government will not sell the drug at all for the present but will allow an interval of six months or a year to elapse, when it is anticipated the article will fetch three times the price paid for it to the producers. Owing to the importance of increasing the general revenue to make it balance the expenditure the Government, it is stated, desire to get a million yen out of the monopoly.

A VISIT TO THE RAJAKADALUWA COCONUT PLANTING DISTRICT.

THE YEARS' EXPERIENCE OF COCONUTS.

CHILAW RESTHOUSE is placed in an exceptionally healthy situation, on a rising bank facing the sea, and it is neatly and substantially built; but with an entire disregard of ventilation in respect of the bedrooms. Either window or door must be left open at the risk of thieves, or closed with a lack of fresh air. The Malay resthouse-keeper, who has had eight years' experience, is one of the best managers in the country, second only, perhaps, to the veteran at Negombo who has had 23 years' service, but is still the active, bright, intelligent Sinhalese he has always been from Sir Charles Layard's day onwards and yet only an Arachchi when he ought long ago to have been made a Muhandiram! Mr. Ellis, however, cannot overlook so faithful a servant—since he has known him since he (Mr. Ellis) was a young Police Magistrate at Negombo.

On the long creeper-covered, sandy, back-water bank in front of the gaol, resthouse and other buildings at Chilaw, an interesting experiment is being made in growing coconuts, shelter being provided. This shelter is indispensable in the South-West monsoon, as the difference between trees in front and behind the resthouse will show; but I am surprised the experiment does not extend to palmyras which would probably suit the soil and climate better, judging by the splendid clump of mature trees in one corner. Has any European planter in Ceylon ever gone in for

A CLEARING OF PALMYRAS?

I suppose not; the greater number of years than in coconuts, required to arrive at maturity, being a deterrent. But certainly the experiment ought to be made around and North of Chilaw. Mr. Martin, the leading Proctor (and son of honest John Martin, who with Carry and Lamont was long the best known of Negombo and Chilaw planters), has a good opportunity of making a fine avenue of palmyras on his plantation property stretching from the town to the Deduruoya.

Very delightful is the early morning—between 5-30 and 7-30—for a drive along a good road in this comparatively dry coast region of the island with the South-West breeze blowing. In 1895 I found Mr. Ingles, of the Survey Department, busy with his celebrated triangulation tower in front of Chilaw, and it was a coincidence that we should meet here again, Mr. Ingles meditating the erection of another tower after a permanent form to serve for observations, the top of the lofty and widely-known Chilaw R.C. Church (which Capt. Donnan and other mariners utilise) being now rendered unfit for triangulation purposes. Mr. Ingles was always one of the most active, and he has now become one of the more experienced, officers of his Department; and it was a pleasure to note his enthusiasm over the work going on in the triangulation, as well as in cadastral and topographical departments. His colleague, Mr. T. Hampton—son of an old friend, the late Mr. J. L. Hampton, so long proprietor

of Penrhos and Hentleys estates—is busy with "boundaries and applications," the distracting work for which the Surveyor-General thinks a separate staff ought to be provided, so as to have his trained men free to go on uninterruptedly with the responsible undertakings now entrusted to them. Early as was our start northwards to Rajakadalawa, it was not too early for industrious Tamils to be out attending to herds of cattle dotted over their

TOBACCO GROUNDS

for manuring purposes. All is fallow or in the rough at present; but to the extent to which manure can be got, this tobacco is cultivated freely, and is one of the most paying of industries. Why does not an artificial manure maker try an experiment on a Chilaw tobacco field—an acre would not involve much risk, and the object lesson that would show an artificial mixture to give better results than cattle manure, would attract universal attention. Nor would an experimentalist require to go so far afield as Chilaw; there is quite a large number of tobacco fields cultivated by Sinhalese North of the Mahaoya near Nya-madenai.

The road to the

DEDURUOYA

and beyond, is in much better order than in days of old. Mr. Simmonds, who built the bridge in 1894-5, is, I understand, still in charge of the district—left here, I am told, because he is supposed to be fever-proof! Be that as it may, he has made many improvements in the numerous small bridges or culverts and in general attention to his roads. His big river bridge is ready for a 2½-foot gauge light railway, and we had full evidence in a succession of crowded passenger coaches starting thus early for Puttalam, of plenty of traffic being available. The Deduruoya is a strange river; you never know where to find it! It has shifted its course greatly in the four years and so concentrated its full force against one end of the bridge that a series of wooden breakwaters had to be formed with piles to check the rush of floodwater in washing out the bank and perhaps the foundation! Between Chilaw and Rajakadalawa, over six miles, there is far more evidence of life and cultivation than we can recall on our first visit ten years ago. There is an almost continuous line of gardens or plantations, frequent boutiques or bazaars, where all was loneliness in the "eighties," and where a cheetah quietly crossing the road in front of one's bullock cart was an ordinary afternoon's experience a decade back.

Plantain and coconuts are the favourite products, and I am told the whole roadside via Battuluoya to Puttalam is now fairly well occupied.

But I have to do with

RAJAKADALUWA

district and its 25 coconut plantations and gardens covering some 3,500 to 5,000 acres of planted land from the new clearing to fields 14 to 15 years old—from Amalgamated Tea Estates Co.'s (Messrs. Finlay, Muir & Co., Agents) Nellunkuliya of 400 to 500 acres with regular work for 200 labourers down to the

garden of 30 or 40 acres. There is, moreover, quite a group of Sinhalese villages with thousands of population scattered throughout the neighbourhood, who have benefited greatly by the money spent in planting coconuts; although more than half the permanent workers—perhaps two-thirds—are immigrant Tamils.

The pioneer of Rajakadaluwa was the late Mr. G. D. Miller, who originally came to Ceylon under the auspices of the Eastern Produce and Estates, or rather of the then Ceylon Co., Ltd., and had experience as a coffee planter in Matale, before (while visiting Horrekelly) he became interested in the country North of the Deduruoya for coconuts. He got his land on the roadside at upset price and made a good start, though he was inclined, perhaps, to take too much out of the soil in plantains, and though he made a big mistake by planting his first clearing too close, the palms being four to six feet too near each other. What a difference this makes (the common practice in nearly all native gardens) was never better illustrated than in neighbouring fields—close and wide planted—on Mr. Miller's place: the trees are well grown on both, but the bearing qualities of the palms are vastly different. We first heard of Mr. Miller's pioneering work in 1887; and looking out at the time for a Coconut investment for relatives in England, we allowed him to purchase two lots, aggregating 166 acres, adjoining his own Rajakadaluwa which, with fees, &c., cost R2,125. This was called by one of the lady proprietors

TOYNBEE

(after the well-known philanthropist who gave the name to Toynbee Hall, in Whitechapel) and for its size and age (after a good many vicissitudes) it is now one of the show coconut places in the district. Mr. Miller did good work in opening and planting Toynbee—though taking too much out in plantains for our taste—for two or three years; then he lost his health—a great deal of fever prevailing at times, especially while the soil was being turned and opened for planting—and during the last period of illness and our absence on furlough in England, the Toynbee fields got terribly neglected; and after poor Miller's sudden death from fever in Colombo hospital, there had to be a large expenditure to meet, in order to retrieve the mischief done, while the plantain contractor had bolted, leaving some R1,500 unpaid for fruit harvested by him! The first operation was to clear out all the plantains, make trenches and bury the stems, which, no doubt, both as an act of cultivation and means of nutrition, did much to benefit the young palms; but the number of supplies required was disheartening; and not till 1895 was there much pleasure in looking at Toynbee. Unfortunately "iluk" grass had been allowed to get in at one or two corners; and poor Miller's place became so neglected after his death, that some parts became a breeding-ground for beetles which swarmed over to adjacent plantations. Weeding, clearing stumps and logs and burning, and beetle hunting were, however, vigorously pursued, as well as careful supplying and the change wrought during 1895 and succeeding years under the careful

direction of an experienced Negombo planter, who put conductors on the place and supervised them by periodical visits, was wonderful to see. Better or more economical work no property has ever had done for it. One thing for which credit may well be taken was the number of trees, supposed to be fatally injured by beetles which were saved by the complete cauterizing and scooping out of the part attacked, and then tarring the inside—so that now there are palms to be found with a full crop of nuts, whose hearts, for two or three feet, are all gone—whose sides in fact look as if someone had, for pleasure, cut out the figure of a canoe, leaving but a shell in half the stem. Nevertheless, this shell is found sufficient to sustain a vigorous growth and mature a good crop of nuts, and now there is not a beetle (or beetle's work) to be seen, unless a stray one should come over the high fence from where there may still be neglect and decay. Less success has attended the eradication of the "iluk": it is a most persistent, detestable weed and has cost from first to last an extraordinary outlay; but there is good hope that 1899—after a seven years' campaign—will see the last of it.

Mr. Jardine visited Toynbee during the first year and again two years after: his report was all that could be desired as regarded the immediate prospects and he made it clear that the place had a wonderful preservative against drought, in the brackish damp subsoil, which seemed to indicate that this region is the old site of a backwater, the land rising between it and the sea. This has been proved to be correct by experience; for the palms never droop even in the most prolonged drought. But Mr. Jardine—we may now mention—in 1888 and 1890—doubted

THE "STAYING" QUALITY

of the soil,—in other words, if it had substance enough to carry the palms to a healthy full maturity and give crops for many years. So far as it went, in its mixture of humus and brackish sand, it was perfection for young coconuts; but "How long would its sustaining powers continue?" was his question. Undoubtedly cultivation and the digging in of an extensive area of plantains, must have improved and strengthened the soil; for another "coconut" veteran, Mr. W. H. Wright in visiting and reporting at the end of 1895, though by no means prejudiced in favour of the district, after a very careful inspection and examination of the soil in the different fields of Toynbee, gave a most hopeful report on the prospects of the trees and plantation, if only justice were done in careful cultivation and, by-and-by, in judicious manuring—which, of course, was also Mr. Jardine's panacea for the deficiency he feared.

No product—as old W. B. Lamont has well said, laying down the law 30 years ago,—no product in Ceylon responds to, or repays, so well for

MANURING, AS THE COCONUT PALM;

but few proprietors, we should say, will care to incur a cent of outlay in manure, artificial or otherwise, so long as there is no crop of nuts. Let something first be harvested, in the shape of crop, and surely then it is

time enough to call out for a little outlay on manure. For nine weary years, it was all expenditure on Toynbee without a cent of return. We are not at liberty at present to quote figures of outlay; but we may shew how the

CROPS OF NUTS

have increased since the trees began to bear. The seasons count from July to June and in 1895-96 came the first pluckings worthy of notice aggregating a crop of 33,788 nuts (22 nuts were gathered in June 1894, and 1,541 between that month and May 1895). The oldest trees were under 7½ years at the end of season 1895-6. The rise then may be given as follows:—

Season.	Age.	Crop nuts.
1895-6	... 7 years	... 33,788
1896-7	... 8 "	... 108,372
1897-8	... 9 "	... 200,125
1898-9	... 10 "	... 296,000

It is reckoned that little more than 6,000 trees on an average contributed to the last crop giving a return of say 49 nuts per tree; while, altogether, Toynbee should have 10,000 trees and plants of all ages growing, so that a large proportion has yet to come into bearing. But what about the "staying" character of the soil, it may be asked? Well, there is nothing in the appearance of the heaviest-bearing trees (and from some as many as 70 to 80 nuts have been got, in this last May-June plucking alone) to indicate any failure, or approach to failure, in regard to means of sustenance. The palms are all green and vigorous, although with few exceptions—to be noted hereafter—they have had little or no manure. One evidence of the neglect and suffering of 1891-2-3 is very evident throughout one or two fields in the irregular stems of the palms—the shrinking and less circumference noticeable at mid-height, no doubt indicating the check and loss of proper feeding which they sustained during the years when the plantains were allowed their own sweet will, as well as the weeds and beetles. Nevertheless, Toynbee, as a whole, is a most encouraging picture of a ten to eleven year old

LOWCOUNTRY COCONUT PLANTATION,

covering, we may say, 166 acres, all planted. It is by no means such a model of neat, almost perfect cultivation, as is Mr. W. H. Wright's far-famed Mirigama estate; but in crops, we suppose, it will, so far, compare with any plantation, we, at least, have ever heard of, with authentic crop returns in Ceylon. Still, let no one suppose that anything like big *net* returns are even now being got by the proprietors. The accounts have not yet been closed; but even with a crop of 300,000 nuts from, say, the equivalent of 100 acres, the outlay on the whole 166 will not leave

A PROFIT

exceeding R25 per acre probably, which would be laughed to scorn by certain of our "tea" friends with their R100 or even £10 sterling per acre of profit.

But there should be a future before Toynbee, more especially now that the era for

MANURING

has arrived. This was begun in November 1898 on certain selected plots of about four acres each, in different fields—two plots to each kind of manure and six plots in all. First, we have an artificial manure—"Baur's special fertiliser"—6lb. per tree being applied in two marked plots (situated in two different parts of the estate); Second, another but even stronger (in nitrogen) artificial preparation from Mr. Baur (who owns the adjoining fine Palugaswewa coconut property), of 4½ lb. per tree and this was applied on two plots under similar conditions; while, Thirdly, 3lb. bone-meal and 6lb. castor-cake per tree were applied over exactly similar plots. No examination of results or proper comparison can be made, it is thought, much under two years from the time of application. Some useful data ought then, however, to be available, as the crop for each plot (number of trees and yield) is being carefully recorded.

The only other manuring attempted was over a few acres by village cattle, two or three years ago; and in 1896 ten ewes and a ram were secured as the beginning of an experiment in

SHEEP

manuring. These bred up to 50 (besides sales of several rams at about R9 each*) when an epidemic broke out and reduced the stock to 35. The great advantage is that sheep do not touch young coconut plants, while they keep down grass, cost nothing; but the herding, and, of course, their manure was of service. Now, however, that nearly all the supplies are out of danger, it is intended to begin a stock of Sinhalese or cross-bred

CATTLE

getting up to 60 or 70 head from a nucleus of a dozen, as there is really good pasture between the rows of palms and a couple of cattle can be reckoned to manure effectively an acre quite in a year. It will be instructive to watch the result over 20 or 30 acres, and compare it with the plots artificially treated.

One curious feature in Toynbee is the exceptionally numerous bunches of nuts on the young trees which require

TO BE SUPPORTED BY FORKED STICKS

with the other end pointed and fixed against the stem of the tree. Quite a constant work this has become for two or three Sinhalese men, and blame is cast on Mr. Miller for not leaving one or two acres of jungle from which such sticks could be cut, in place now of having to buy the same—a warning to other young planters! As the trees get older, it is expected they will be able to bear their heaviest bunches unsupported. Everything points to estates in the Rajakadalawa district being in their prime between their 15th and 18th years. Unfortunately the oldest (Mr. Miller's place) which

* Mr. Wright of Mirigama presented Toynbee with one of his young cross-bred rams which, developing a tremendous pair of horns, has become rather a nuisance through his love of constant butting, none of the others being, of course, able to stand against him!

is about the former age, cannot be taken as a fair test, through a large part being too closely planted and most of it being neglected; at any rate there has been an absence of proper cultivation for the past eight or nine years. Still, it is wonderful how, in spite of little being done for the palms, they go on cropping on this place and the story of their dying out, except it be when young from beetles, is not correct.

We do not say that crops on Toynbee are to go on increasing after the rate of recent years per tree; but if present appearances continue, there is no reason, we suppose, why the proprietors should not count on a crop of 550,000 nuts by 1904, and perhaps of 750,000 nuts when every one of the 10,000 palms is in full bearing. How long should such crops continue? That will depend on careful cultivation and judicious manuring. Meantime, the little place along with its neighbours has been

A BLESSING TO THE PEOPLE

of the district and of many immigrant coolies. The money spent during the past fifteen and especially the past six, years has enabled the Sinhalese to live far more comfortably than ever before. The

MESSRS. DE MEL

have three fine, young and extensive coconut plantations—one on each side of Toynbee—and all promising exceedingly well. On a young place, Karukkuliya (Mr. Manuel de Mel's) which we inspected, the planting has been most carefully attended to, and the plantain cultivation confined to a square in the centre space where it could not possibly injure the young palms. Wilpotha plantation (belonging to Mr. Jacob de Mel and his son-in-law, Mr. Barrister Pieris) under the skilful management of Mr. Edward MacCarthy, is older than Karukkuliya (two or three years younger than Toynbee) and promises exceedingly well, having 300 acres planted with 100 more to go in this year. It is a very valuable property. Mr. Baur has some 400 to 500 acres planted at

PALUGASWEWA,

the oldest field a year younger than Toynbee and which must prove a very valuable property. Still further inland, Messrs. Finlay, Muir & Co. are covering some 600 acres with the palm on Nellunkulia, under the experienced direction of Mr. Jardine as Inspector and Visiting Agent. Then there are the properties of Messrs. Mason and Manchip (being much improved under the latter's care), of Mr. H. J. Pieris, of Mr. Mutiah, of Mr. de Soya, of Dr. Hallock, etc. Altogether there are 25 estates, employing 1,200 coolies and covering 5,000 acres, perhaps, and the district altogether promises well. The feverish time of the year in the older properties is confined to November-December when the malaria-laden land-wind makes it very trying for coolies and Superintendents. The proprietors have been anxious this year to get the Government to open a Dispensary; but Dr. Perry thinks Battuluoya—half-way between Chilaw and Puttalam—the proper site. Rajakadalawa, however, should have a

DISPENSARY

of its own to serve 1,200 to 1,500 of a cooly population and some 3,000 villagers. A few of the leading proprietors could readily erect a residence and dispensary and guarantee a salary, provided the supply of medicines was got free; but then comes the question whether coconut plantations so far north—even when employing immigrant coolies—come under the privileges granted in the tea and cacao planting districts? This must

be inquired into. Here is an estimate done up by a resident planter:—

The undermentioned are the estates which would be directly benefited by a Dispensary at Rajakadalawa:—

	Coolies.		Coolies.
Toynbee	50	Adv. Chitty's	10
Jacob De Mel's (Wilpotha)	70	Samarakoon Mudaliyar's	25
Miller's	40	Jacob De Mel's (Panadikulam)	40
Manuel De Mel's (Karukkuliya)	15	C. P. Silva's (Johanna-watte)	20
A. Baur's (Palugaswewa)	150	Messrs. Finlay, Muir & Co.'s (Nellunkulia)	200
Muttiah's	50	Messrs. Mason and Manchip (Sitamadama)	30
U. D. S. Gunasekara's	30	Dr. Hallock's	50
H. J. Pieris's	100	Seena Moona Shagoo Varusay's	50
S. G. Perera's	25	Ana Kana Modelali's	25
P. Fernando's	25	Varusay Modelali's	15
J. J. Lorange's	5	Goonoo Saiboo's	10
C. De Soya's	40	Don Juan Appu Rendarala's	30
Manuel De Mel's	50		

The time, too, has come when there ought to be an extension of Tamil Cooly and Sinhalese Itinerating Missions to the district and schools opened for the children. There is one Sinhalese grant-in-aid school at Karukkuliya, close to Rajakadalawa, but no Tamil school yet.

Turning back to Toynbee, we should give a word to the convenient

COPRA DRYING HOUSE AND BARBECUE

—capable of holding the copra of 25,000 nuts, or 24 candies—a model erection for the rest of the district—the fuel being coconut shells (heat without smoke); copra store and drying ground. When the last is extended, the hope is that all the drying of copra can be done in the sun, so saving any discolouration. Hitherto, the nuts have been sold about equally to the Agents of the Horrekelly Desiccating Mills, and for the manufacture of copra, in both cases, the purchaser, after carefully checking, and rejecting perhaps, five per cent of a plucking of nuts as too small, light, empty or otherwise deficient—dries his copra or removes the nuts to the mills, leaving the husks on the estate. These latter are being utilised freely as surroundings for plants as also for filling up trenches.

The boundaries are generally marked by a

SAPANWOOD

fence which, perhaps, grows too freely, interfering sometimes with the first line of coconuts. We intended in the early days getting Mr. Miller to make a substantial experiment with American cotton and sent him some fine

seed; but we can only trace one surviving plant, also with "kapok," and of this there are some handsome rows of trees.

THE CHANGE.

The change in the appearance of the coco-palms and other trees in 3½ years, since our last visit, is very great. In 1895 even, a planter then resident in the district, we now hear, declared that Toynbee was only fit for a fire-stick, with its beetles and weeds! This gentleman ought to see it now. Another younger man, after a short time in the district has been spreading reports that it is no good for coconuts as trees die out before getting to maturity. We have been unable during the present visit to trace any cases of the kind even on Mr. Miller's neglected place. As regards the district, as a whole, no doubt, the building of the

DEDURUOYA BRIDGE

has had its effect in development since 1895. We can recall the inconveniences and occasional dangers of the old ferry, between 1888 and 1894. But this development is not confined to Rajakadaluwa, but extends right along the road to Batuluoya and even to Puttalam. Given a light 2½-foot gauge railway, and there is no question that very soon after its opening, a continuous scene of prosperous cultivation such as now marks the region from Nagonibo to Chilaw, would cover the whole 30 miles from

THE DEDURUOYA TO PUTTALAM.

Whether we may see cultivation arise alongside the broad-gauge Northern line in a certain number of years is a hard question to answer—at least for 50 out of the 80 miles between Kurunegala and Anuradhapura, if we are to judge by what planters, surveyors, road-officers and sportsmen tell us. However, for the first time in its Railway policy, the Government has chosen to leave the line of population and traffic and to construct a line through poor, unoccupied country,—the responsibility of this course is mainly with the local authorities while that of the broad-gauge employed rests with Mr. Chamberlain. The Colombo and Puttalam 2½-foot line (in connection with the Kelani Valley line) when it comes in the early part of the next century(?) will be found one of the most successful Railway Extensions in Ceylon and will help to make up for financial deficiencies elsewhere.

THE CLIMATE OF RAJAKADALUWA

is undoubtedly a dry and hot one: a rain-gauge has only just been established on Toynbee; but the estimate is of an average annual fall of about 60 inches, but this is aided by the moist character of much of the subsoil. The temperature can be very considerable; but the hot season is not unhealthy,—that is reserved for the land-wind (malarial) months of November and December.

Speaking of the great benefit to the local villagers which the employment afforded by a new series of plantations confers, we are reminded of the great similar benefit derived from the establishment of

DESICCATING MILLS

in our rural districts. To Messrs. Vavasour & Co., the Colony is indebted for first introducing this new manufacture and industry, as also, we believe, for pioneering with the shipment of bristle and palmyra palm fibre, and of whole coconuts on a large scale from Ceylon. Their Colombo Mills was the first and largest for desiccating purposes and they have now established Mills at Lunuwila on the North of the Mahaoya, giving employment to some 1,200 men, women and children; and spending money amongst them, which is changing the face of the villages and their surroundings (where the people keep from arrack drinking). Then this is true also of the

ORIENT COMPANY

with its Veyangoda Mills, and now with its second venture so far North as Horrekelly; while the Ceylon Tea Plantations Company has its Mills at Hunupitiya, near Negombo. Altogether, we may suppose some 6,000 natives to be directly interested in these ventures; besides the large indirect number engaged in carting, buying nuts, etc., etc. All success to our CEYLON DESICCATING MILLS.

CACAO SOILS.

ANALYSES FOR TRINIDAD AND CEYLON.

We are greatly indebted to Mr. Cochran for sending us remarks on certain Analyses of Cacao Soils which have reached us from Trinidad, and still more for supplementing these with analyses of certain Ceylon Cacao Soils. Professor Carmody in Trinidad, after analysing no fewer than 23 samples, had a difficulty in making up his mind about them, so that Mr. Cochran may be pardoned if he is not dogmatic about the results in the two cases on which he has worked. Still, there are certain well-marked features which appear prominently and we feel sure Mr. Cochran's paper will be read with interest by all our cacao planters:—

I have now pleasure in sending you a few remarks on the analyses of cacao-soils made at the Government Laboratory, Trinidad, and published in the "Proceedings of the Agricultural Society" which you were good enough to send me recently. These are analyses of soils said to be of *average* fertility. It may be well, therefore, first to refer to another set of eight analyses of cacao soils from various parts of the West Indies made at the Government Laboratory, in the year 1897; as these, we were told, were types of really fertile cacao-soils. The report on them was to the effect that, "as a rule, these fertile cacao-soils are rich in nitrogen, and contain a somewhat high amount of potash, of which a relatively high proportion was found to be soluble in 1 per cent citric acid solution, whilst the proportion of phosphoric anhydride seems to be of lesser importance. They can, we consider, be safely regarded as reliable types of the composition of really fertile cacao soils." In another part of the report it was stated "we are led to the conclusion that a good cacao soil should be one capable of yielding to the tree in the course of years a somewhat high proportion of the important constituents of plant good without exhaustion, and also capable of rapidly rendering again available

the huge quantities of manurial matter returned to it in the form of prunings, leaves, fallen and broken pods. It must, in addition, be one, in which the course of nitrification readily takes place; in other words, a fairly rich, friable and well-drained soil."

Instead of quoting in full the analyses of the eight samples of fertile soils, I shall simply indicate the range of some of the significant constituents of the soil, and state the average amounts of the more important of these present:—

FERTILE CACAO SOILS.

	per cent.	per cent.	Ave.
	From	to	p. c.
Water retained in air-dried soil ..	1.8	14.3	8.650
Organic matter and combined water ..	do	do	do

Magnesia ..	.356	4.981	1.695
Potash ..	.217	3.367	1.276
Phosphoric acid ..	.118	.619	.300
Chlorine ..	.044	.293	.118
Nitrogen ..	nil.	.007	
	.100	.309	.236

These figures show that these soils are characterised by a high percentage of lime, magnesia, potash and I may add, nitrogen; as only one of them has less than .2 per cent of this substance. The amount of phosphoric acid in most of them is rather low. In five out of the eight samples it is under .1 per cent. The one, however, which contained the largest amount of phosphoric acid was a sample from Nicaragua, and is described by Mr. J. H. Hart F. L. S., who supplied the sample, as a very fertile soil. Mr. Hart also vouched for the high fertility of a Trinidad sample, which contained only .084 per cent of phosphoric acid.

The water retained by the air-dried samples varied to a great extent, viz., from 1.8 to 14.3 per cent. As some of these differences could not be explained by chemical composition only, they must be due to a considerable extent, to a different state of division of the soil-particles.

The amounts of chlorine in the samples are so low, that in two cases the chlorine is recorded as "nil," and in five cases as "traces" only, and only in one sample is there a numerical expression of the amount. All the samples contained appreciable amounts of oxide of manganese.

Professor Carmody, the Government analyst, considering that the data collected with regard to cacao-soil analysis was insufficient for anything like a classification of these soils according to their chemical constituents, had an offer, or rather the second offer, made through the Agricultural Society to estate owners, to the effect that samples of cacao-soils sent to the Government Laboratory would be analysed free of charge. Professor Carmody was anxious not only to be furnished with fertile soils; but with soils in which the cultivation of cacao had been unsuccessfully tried. The report of the analyses you have just sent me is that on the samples sent in response to this second invitation. There are 15 analyses in all, one of which is specially referred to and marked "Venezuela good soil." the others are regarded as soils of average fertility.

Professor Carmody's report on these analyses is so brief, that I may quote it in full. It shows that he still requires more data before he can draw general conclusions from the analyses:—

Government Laboratory, Trinidad, April 28, 1899.
The Secretary, Agricultural Society.

SIR,—I have the honour to forward the results of the analyses of samples of cacao soils sent by members of your Society, in response to an invitation from this department.

In requesting your members to forward samples, the main object in view has been to obtain not only good soils, but also those in which cacao has refused to grow, or to give satisfactory results. The Trinidad soils sent are ordinary cacao-soils of average quality, but I hope that now a larger number and variety of soils will be sent, and will include some bad cacao soils.

General conclusions drawn from the results of the analyses of a few samples are not safe; and, at present, I would simply direct attention to the comparatively large proportions of lime, magnesia, potash chlorine and nitrates in the Venezuelan soil, which is said to yield cacao of excellent quality. The small proportion of phosphates and total nitrogen it contains are also worthy of notice.

My long absence in England during last year contributed to the delay in completing these analyses, which have been made under my supervision by Dr. Ince, Assistant Government Analyst.—I am Sir, your obedient servant,
P. CARMODY, F.L.C., I.C.S.,
Government Analyst.

Here again, instead of quoting the 15 analyses in full, I shall indicate the range and average amounts of several of the constituents of the 14 soils of average quality, and I shall quote in full the analysis of the Venezuelan soil specially referred to as yielding cacao of excellent quality:—

CACAO SOILS OF AVERAGE FERTILITY.

	per cent.	per cent.	Average per cent.
Water retained by air-dried soil ..	From 1.040	to 9.48	5.048
Loss on ignition ..	2.870	9.00	
Oxide of iron and Alumina ..	4.410	14.920	
Lime ..	.084	.700	.309
Magnesia ..	.076	.493	.264

Nitrogen as Nitric Acid ..	.0009	.00335	.00175
Readily available potash and phosphates—			
Potash ..	From .059	1.698	.115
Phosphoric acid ..	.049	.104	.0767

If the foregoing two sets of figures are gone over, it will be found that, in all important ingredients save phosphoric acid, the fertile soils are distinctly the richer, whether we take the minimum, maximum, or average figures; whereas in the case of the soils of only average quality, the minimum and average amounts of phosphoric acid are higher to a marked extent than in the more fertile soils. This is not a little puzzling, and, indeed, before accepting this result, one would fain have the assurance of the analyst or analysts that the same analytical process was followed in both cases as otherwise the results are not strictly comparable. In the second set of analyses, the analyst has gone to the trouble of making two determinations of potash and phosphoric acid, with a view to form some idea of what proportion of these two substances is readily available. Roughly speaking, the readily available is about half of the total, according to these results, but this does not help us to account for the apparent anomaly of the more fertile soils being poorer in phosphoric acid than those of average quality, seeing that the minimum readily available phosphoric acid in the average soil is higher than the minimum total in the more fertile soils.

Supposing the samples to be fairly representative of the soils and the results of the two sets of

analyses to be strictly comparable, the legitimate conclusion is that the minimum amount of phosphoric acid in the fertile soils viz. .044 per cent is still so much above what is required for the immediate future, at least, that it is just as capable as a higher proportion of meeting the wants of the cacao-trees; and, certainly, if we go into the calculation of the ratio of supply to demand in the case of the minimum amount of potash and the minimum amount of phosphoric acid, we find that the ratio of the supply of phosphoric acid to the demand is much the greater. For the calculation to prove this we may assume that 0.1 per cent of a soil-ingredient to a depth of three feet weighs four tons per acre. The minimum amounts of phosphoric acid and of potash to a depth of three feet, in the fertile soils analysed will thus weigh respectively 3,942 lb. and 10,572 lb. per acre. In my analyses of the parts of the cacao tree, I estimated that, between the ages of 4½ and 9½ years, a year's demand* of an acre of cacao trees was for phosphoric acid 13.41 lb., and for potash 78.32 lb. Dividing the supply in each case by a year's demand, we get the ratio in the case of phosphoric acid as 294 times, and in the case of potash only 135 times that of the year's demand.

However, the minimum amount of phosphoric acid was not associated in the same soil with the minimum, but with .169 per cent of potash.

If the same form of calculation as before is made with this percentage of potash, we find the ratio of supply to demand to be 193, still much below that of the phosphoric acid. Again, if the calculation be made based on the average, or maximum of either the total or readily available amounts of phosphoric acid and potash in the two sets of analyses the advantage in favour of supply of phosphoric acid is accentuated. It would thus appear that there is a greater likelihood of potash than of phosphoric acid being deficient in cacao soils.

The following is the analysis of the sample of Venezuelan good soil referred to in the Government Analyst's report:—

COMPOSITION OF AIR-DRIED SAMPLE OF VENEZUELA GOOD SOIL.

Water	10.74
Dry soil	89.26
			100.00

COMPOSITION OF THE DRY SOIL.

a Loss on ignition	7.610

" Nitrogen as nitrates00636

READILY AVAILABLE POTASH AND PHOSPHATES.

Potash1707
Phosphoric acid0820

Why Professor Carmody refers to the proportion of phosphoric acid in this sample of soil as small is not obvious, as the amount is higher than in any of the eight fertile soils, save one. It is, however, slightly below the average of the 14 average soils, with which he is dealing.

As a set-off against the low percentage of total nitrogen, it has the highest proportion of any of the fifteen, of nitrogen in the form of nitric acid, thus suggesting that the soil is possessed of good nitrifying power; but the amount of nitric acid found in a soil is not always an index to the nitrifying power. Nitrates being very soluble substances, the rain carries them down in the soil so that the same soil sampled in different states of the weather would yield differing results on analysis in respect of nitrates.

Warrington and others now employ a process for determining the nitrifying power of soils which is partly bacteriological and partly chemical. It consists essentially in seeding a convenient culture-solution with a few grains of soil and noting by chemical tests at intervals of five days the vigour with which the nitrifying process proceeds after it is started. If the culture solution is not affected, this is taken as evidence that there are no nitrifying organisms in the soil.

In most of the West Indian samples of cacao soil, the moisture in the air-dried earth is higher in proportion to the organic matter and alumina present than in our Ceylon soils. Take, for example, the sample of good soil from Venezuela. Its chemical composition is such as we would associate with about 3 per cent of moisture, whereas it contains 10.74 per cent. The large amount of moisture must therefore be mainly due to the physical condition of the soil.

The high percentage of chlorine referred to in the report on this sample of soil cannot, in view of the very small proportions found in the eight fertile soils, be regarded as an important indication so far as fertility is concerned; but it is of importance as affording a sanction for the use of chloride, that is muriate, of potash as a manure which is a cheaper salt of potash than the sulphate.

I trust Professor Carmody will continue his interesting series of analyses of cacao soils, giving us some results obtained by the analysis of soils in which cacao has failed to grow or to yield satisfactory results.

The following is the portion of Mr. Cochran's report and analyses referring to Ceylon soils:—

Amongst samples of Ceylon soils recently sent to me for analyses, two were Cacao Soils. It may be interesting in the present connection to quote the analyses of these: No. 1 is the analysis of soil from a Forastero cacao field.

No 2 is the analysis of soil from a Caracas cacao field.

The sender of these soils has been good enough to furnish the following description of the fields. "The field where No. 1 sample was taken from has never yielded much cocoa per acre for some reason. The land is steep, and a fair amount of rock in it. The soil is free and deep."

"The soil in the fields from where the second sample came looks much better than No. 1 sample; but the fields have been much longer in cultivation. There are lots of small patches throughout the fields where the cacao has died

* By a year's demand or requirement is meant the plant food appropriated by the annual increment to the trees and by a crop of fruit, i.e., seeds and pod-husks. If the pod-husks were left out of the calculation, as returnable to the soil, the ratio in favour of the phosphoric acid supply as compared with that of the potash would still be much the greater, viz., in the proportion of 337 to 178.

out not from cacao disease. In most of these patches the shade is bad, and, judging from what you say in your report, the trees suffer from want of nitrogen. The land is flat with a stiff dark, brown soil mostly, and has not been manured much for past six years. Where cattle manure has been previously applied, the trees look much better even now."

ANALYSES OF TWO SAMPLES OF CEYLON CACAO SOILS IN THE AIR-DRIED STATE.

MECHANICAL ANALYSIS.

	No. 1. Forastero Field.	No. 2. Caracas Field
	Per cent.	Per cent.
Coarse Earth	60.75	39.25
Fine Earth	39.25	60.75
	100.00	100.00

CHEMICAL ANALYSIS OF THE FINE EARTH.

Moisture	2.950	3.200
a Organic matter and matter lost by ignition	7.994	5.150
Oxides of iron	6.793	5.855
Alumina and oxide of Manganese	8.021	8.253
Lime	.793	.700
Magnesia	1.130	.632
Potash	.884	.274
Phosphoric acid	.062	.192
Silica, insoluble silicates and matters not determined	71.373	75.744
	100.000	100.000
a Containing Nitrogen	.193	.070

The mechanical analysis shews a great difference in the proportions of fine earth in the two samples, which is sufficiently accounted for by No. 1 sample representing steep land, and No. 2 representing flat land.

The only constituent that is apparently deficient in No. 1 is the phosphoric acid, this deficiency being relatively greater, on account of the small proportion of fine earth in the soil. It is true the proportion of phosphoric acid is decidedly higher than that of the minimum of the West Indian fertile soil; but the Grenada soil, which contained only .044 per cent of phosphoric acid, had 14.3 per cent of water in the air-dried soil, shewing that the physical condition of the soil must have been very different. In sample No. 1 it is to be noted that the proportion of potash in the fine earth is exceptionally high.

In No. 2, the only constituent that is apparently deficient is the nitrogen or nitrogenous organic matter; hence the beneficial effect observed on this soil from the application of cattle manure. It is to be noted, however, that the nitrogen in this soil, when calculated to dry soil, as in the case of the West Indian Analyses, is fully as high as in the sample of Venezuelan good soil. The phosphoric acid is also higher, but the Venezuelan soil has more potash and a higher power of retaining moisture. The sender of these soils makes no complaint of cacao-fungoid diseases. It would be interesting to know how far the trees on these soils which are well-furnished with lime and magnesia are really free from cacao-disease. All of the West Indian fertile soils analysed are well supplied with

lime and magnesia. In two of the average soils lime or magnesia is rather low; but in none of them are both lime and magnesia low.

M. COCHRAN.

HOW TO MIX FERTILISERS.

Fertiliser mixtures, uniform in quality and equal in every respect to the best factory-made fertilisers, can be made on the farm without milling machinery. A tight barn floor, platform scales, screen, shovel and hoe are the only utensils needed. The materials having been weighed screened, and lumps pulverised the most bulky stock is spread in an oblong pile from six to twelve inches deep; upon its levelled top the next material is placed, and so on until all have been added like layers on a layer cake. Commencing at one end, the pile is shovelled over, the operator reaching clear to the bottom every time. The pile is then levelled up, and the operation repeated three times. The mixture may then be screened again if desired. In thus mixing his fertiliser the farmer knows definitely what he has purchased. Each ingredient can be tested by itself if desired, and inferior materials are not likely to be palmed off on him. He can also vary the proportions of the ingredients to suit the requirements of varying soils.—*Farmer and Stockbreeder.*

THE COLOMBO AGRI-HORTICULTURAL EXHIBITION.

From an early hour on the 21st July, the grounds of the Agricultural School presented a busy scene, the finishing touches to the decorations being all worked off some time before noon. That things were so far forward, as the earliest visitors (the majority of whom were judges) found then this morning was due to the untiring efforts of the energetic Secretary, Mr. C. Driberg, who has worked with the utmost zeal towards the success of the Exhibition. Exhibits began arriving early yesterday and amongst the visitors then taken round were Mr. Fowler, Acting G.A., Western Province; Mr. F. H. Price, Mayor of Colombo; Mr. Cookson, and Capt. Lowndes, of the Police; to whose plans the efficiency of the police arrangements this afternoon are due. Mr. Nock also visited the School buildings yesterday—ever among the first and, indeed, the most indispensable gentlemen, where a show of our island's products are concerned. Having taken a careful look round in every section we may say that the success of the Exhibition was never quite so marked as this year. In individual sections, more notably the Horticultural ones, there is a regrettable lack of competition. For instance, the Ferns in Pots were conspicuous by their scarcity and those who remember the wealth of "fernery" that adorned the verandahs at the further end of the buildings last year, will have been taken aback today by the want of display in this the most attractive of the finer kinds of greenery. There are numbers of residents in Colombo with excellent ferns in their bungalows, which, for want of a little confidence or enterprise on the part of their owners, might have been seen adding materially to the completeness of the Exhibits. But taken all round, there was a marked improvement, both in quality and quantity of the exhibits. This was seen most especially in local fruits and vegetables, e.g. jaks, pumelos, gourds, pumpkins, and brinjals—bananas alone forming a most surprising exception.

But to take things in order. Approaching the Agricultural School down the long avenue, one of

the most charming in the city of Colombo, the eye is caught at once by the splendid pandal that has been erected at the gate. At the top, the figures of 1899 are entwined in a circle and below the inscription reads:—

AGRI-HORTICULTURAL
SHOW

Welcome

TO HIS EXCELLENCY
SIR E. N. WALKER, K.C.M.G.
THE LIEUT.-GOVERNOR OF CEYLON.

Up the drive the road is lined with the slender rustling arches of young coconut leaves, bent over and fixed into bamboo stems. The front of the School buildings are also suitably decorated. Entering one finds the room devoted to food products on the left. Down the whole length of the left-hand side lie numerous collections of paddy, in which article there was evidently great competition. A highly finished exhibit was in No. 6 (Section III.)—a collection of 15 kinds of grain set in an elegant light wooden case. On opposite side the bales of cinnamon (25 lb. each) and exhibits of cacao and of tea in 2 classes (grown below and above 1,500 ft.) are conspicuous. Amongst the bundles of cinnamon, also, one is noticeable from its being enclosed in a carefully constructed wooden case. The variety of native sweets arranged on the table gave the judges a deal of difficulty. One overheard remarks like the following: A.—“A very striking taste!” B.—“Rather pungent, though?” A.—“Yes, but acceptable to the natives, perhaps.” B.—“Oh! to judge from their point of view,—yes.” A.—“I think it should be awarded the prize.” B.—“I agree, though I shouldn't choose it for dessert.” Along the main and apples from the local Australian stores—bore the happiest appearance. In the first yard on the left were the poultry (Section IV—Class B) most striking of which seemed to be a cage on the extreme left, No. 6—six village-reared fowls—and three other cages, No. 7, of 2 pairs of pigeons reared in Ceylon; in the latter were contained some pretty Fantails (white and black), Egyptian and English pigeons, and Pouters, Jacobins and Nuns. The next rooms, (right and left,) are devoted respectively to Vegetable Products, where picked specimens of coir and other native fibres may be seen, and Arts and Manufactures: here there were half-a-dozen lace women with exceptionally good examples of work on the pillows before them, but the outstanding object was a magnificently carved dressing-table and cabinet, symbolical of harvest. In the centre is Messrs Cave & Co's classic photograph of a single palm by the moonlit-shore—the emblem of the immemorial mainstay of the island's prosperity—while on either side are stout lusty figures, the anatomy of which is so carefully done as almost to fail to attract notice; some minutes' study, however, of the workmanship, of the arms and legs especially, recalled to us the classic casts of the Louvre in Paris. One or two ebony exhibits showed the most finished chiselling and shaping, but the central piece we refer to was a real creation of mature thought, and a design achieved with remarkable success. A fine ebony cabinet too should be noticed. There were some splendid bulls among the cattle exhibits; but the gem of these was a tiny little bull, calf with silver caps on its horns, and scarcely higher but not less proud than the little eight-year-old podian who stood beside it. The Horticultural Room was the chief centre of attraction this afternoon. There were three exhibits of

high quality for the Gold Medal, and the award gave general satisfaction. Most charming perhaps in the whole room, however, was the single exhibit of six orchids, the mauve *Dendrobium Phalenopsis* and *Cattleya Bowringiana* taking the palm for delicacy of colouring and form. Of the Cannas, the *Papa* and *Allemania* showed magnificent blooms, adding materially to the colouring of the radiant display. The ceiling of the room was decorated with greenery and festoons at the junctions of which hung bouquets of blossoms. A large porch-pandal had been erected at the entrance to this, the Flower Section, and the pillars were entwined with spirate greenery. It was here that His Excellency was to alight this afternoon at 4-30 p.m., thereby signalling the opening of the Show. Below will be found the list of Judges, Exhibits and Awards, a Silver Medal being understood in the latter list (which is complete all but about a dozen awards) where no specific mention of a prize is to be found.

LIST OF OFFICERS.

The following are the officers for the show:—
Patron: His Excellency the Governor. President: His Excellency the Lieut.-Governor.

COMMITTEE.

The Hon. F R Ellis (Chairman); H.E. Major-General Hobson, the Hon. Justice Lawrie, the Hon. Justice Browne, the Hon. F R Saunders, the Hon. H L Wendt, Sir Harry Dias, Mr. F Beven, Mr. P Coomaraswamy, Mr. C Drieberg, Editor “Dinakaraprakasa,” Editor “Sarasavisandaresa,” Mrs. F R Ellis, Messrs. J Ferguson, W H Figg, J C Huxley, F G A Lane, F C Loss, S D Mahawalatenne, Jacob de Mel, W Nock, S C Obeyesekera, James Peiris, Henry A Perera, F H Price, J Clovis de Silva, W A de Silva, G W Sturgess, H Van Cuylenburg, J C Willis and Dr. Vandort. Hony. Secy. Mr. C Drieberg.

COMMITTEE OF MANAGEMENT.

The Hon. G M Fowler (Chairman), Messrs F H Price, W Nock, H Macmillan, P D Siebel, T Sammugam, E C Davies, J W Vanderstraaten, James Peiris, Henry A Perera, A FBroun, H T S Ward. Hony. Secretary and Treasurer: Mr. C Drieberg.

The gathering this afternoon was a very large and representative one and among those present were:—Mr. F. H. Price, Mayor of Colombo, Mr. and Mrs. J. Ferguson, Mr. and Mrs. W. E. Davidson, Mr. W. T. Pearce and Miss Pearce, Mr. and Mrs. S. C. Obeyesekera, Mr. and Mrs. H. L. Daniel, Dr. H. M. Fernando, Mudaliyar John F. Perera, the Misses de Mel, Mr. H. J. Soysa, Mr. W. M. Soysa, Mr. and Mrs. Arnold Dias, Mr. and Mrs. Tudor Rajapakse, Mr. and Mrs. Owen de Run, Mr. J. W. Vanderstraaten, Rev. and Mrs. Corlett, Mr. and Mrs. J. Morton, Dr. Attygale, Mr. Sam W. Soysa, Mr. Francis Perera, Mudaliyar Philip Perera, Mr. Meedeniya, R.M., Mr. L. de Livera and the Misses de Livera, &c., &c.

LIST OF AWARDS.

FLOWERS AND PLANTS.

FLOWERING PLANTS IN POTS.

Judges:—Mr. G M Fowler, Mr. Nock and Mr. Macmillan.

Orchids, Foreign (six)—Hon. Dodwell F Browne,
Asters (six)—Mr. P D Siebel.
Cannas (six)—Miss Lily Vanderstraaten,
Chrysanthemums (three)—Mr. H W Grieve.

CUT FLOWERS IN BOXES, STANDS, OR GLASSES.

Judges:—Mrs Fowler, Miss Grenier, and Mr Nock,
Roses (twelve of different varieties)—Mrs H A
Pieris.

Roses (six)—Mr. J R Grieve.
Zinnias (six)—Mr. J R Grieve.
Double Dahlias—Mr. J R Grieve.
Cannas—Mr. H O Beven.
Chrysanthemums—Dr. H Huybertz.
Carnations—Miss E C Elliott.
Pinks—Mr. P D Siebel.
Pansies—Miss Mary Grieve.
Tube Roses—Dr. H Huybertz.
Violets—Mr. K Abram Saibo.
Buttonholes—Mrs. R Samaranayake.
Cross or Wreath—Mrs. Samaranayake.
Hand Bouquet—Miss Jessie Siebel.
Bridal Bouquet—Mrs. S Siebel.
Flowers in Ice—Messrs. J P Morton & Co
Best decorated Dinner-table—Miss N Drieberg.
General collection of Wild Flowers (2 ft. square)
Mr. Jusey Appu.

General collection of Cut Flowers arranged for
effect (12 square ft.)—Mr. H M Alwis.
Special Prize for best collection of Pot Plants and
Flowers to include the following:—12 assorted Pot
Plant, 3 boxes Cut Flowers, 1 Table Bouquet, 1
Hand Bouquet, 3 Buttonholes, gold medal—Mr. P D
Siebel.

CUT FLOWERS IN BOXES, STANDS, OR GLASSES.

Best collection of Jambu (twelve of each variety)
—Mr. A J R de Soysa, certificate.
Best collection of Namnam—Mr. E A Salgado.
Best collection of Guavas, Uguessa, Lovi-Lovi,
Masan, and Nelli (twenty five of each)—Mr. Andris
Mendis.
Best Rambutans (one hundred)—Mr. E de Levera.
Best collection of Imported Fruit—Mr. W H
Thompson
Fruits in Ice—Messrs. J P Morton & Co., recom-
mended for gold medal.
Special Prize for the best collection of Ceylon-
growing Fruit (not less than twelve varieties)—Mr.
S Weerackody.

FOLIAGE PLANTS IN POTS.

Judges: Mrs. Broun, Mr. Macmillan, and
Mr. Percy Bois.

Begonias (six of different varieties)—Jusey Appu,
Colombo Museum.
Anturiums and Allocasias (six of different varie-
ties)—Mr. P D Siebel.
Caladiums (six of different varieties)—Mr. R Sa-
maranayake.
Palms (size of different varieties)—Mrs. Tudor
Rajapakse.
Colei (six)—certificate, Jusey Appu, Colombo
Museum.
Best specimen of hanging Pot Plant—Mrs. Tudor
Rajapakse.
Tastefully arranged Group of Plants for effect
(space allowed 100 sq. ft.)—Mr. P D Siebel, silver
medal.

FERNS IN POTS.

Judges: Mrs. Broun, Mr. Macmillan and
Mrs. Percy Bois.

Adiantum Farlyense (two)—Mrs. Tudor Raja-
pakse.
Best collection of twelve different kinds—Mrs.
Tudor Rajapakse.

FRUIT AND VEGETABLES.

FRUITS.

Judges:—Sir Harry Dias, Mr. Broun and
Mr. Macmillan.

Best Jaffna Mangoes (twelve)—Mr. J R Greve.
Best collection of Mangoes (six of each variety)—
Mr. Andris Mendis.
Best Oranges (twelve)—Mr. Andris Mendis.
Best Mandarin Oranges (twelve)—Mr. L S
Cabral.

Best Lemons (twelve)—Mrs. E M. Gray.
Best Citrons (six)—Mr. Andris Mendis.
Best Limes (twelve)—Mr. J C Drieberg.
Best Pomelos (six)—Mrs. H A Pieris.
Best Mauritius Pineapples (three)—Mr. H A Pieris,
Mudaliyar.
Best West Indian Pineapples (three)—Mr. Andris
Mendis.
Best Custard Apples (six)—Mrs. H A Pieris,
udaliyar.
Best Mangosteens (twelve) L de Fonseka.
Best bunch of eating Plantains—Mr. J P Salgado.
Best Sapodillas (six)—Mr. Alfred Perera.

VEGETABLES.

JUDGES:—Mr. Nock, Mr. W A de Silva,
Mr. P D Siebel.

Best collection of Native Vegetables (twelve distinct
kinds)—Mr. K Abram Saibo, Mr. R S Cabaral and Mr.
R W Fernando (certificate.)

Best collection of Exotic Vegetables (twelve distinct
kinds)—Mrs. W O Garth.

Beans (Exotic, four varieties, 25 of each)—Master
G A Garth.

Beans (Native, four varieties, 25 of each)—Mr. M J
Fernando.

Yams (six edible varieties, two of each)—Mr. R A
Dassanayaka.

Gourds and Pumpkins (six kinds, two of each)—
Mr. Andris Mendis.

Best Tomatoes (twelve) Mr. D C Jayawardana.

Lettuces (three cabbage, three cos)—Master Kids-
ton Garth.

Potatoes (dish of nine tubers) Mrs. W O Garth and
Mohamed Ibrahim Saibo (certificate.)

Sweet Potatoes (twelve tubers) Mr. H A de Silva.

Chillies—Mr. J R De Soysa.

Cucumbers (best pair)—Mrs. Jeronis Pieris.

Ceylon-grown Onions (5 lb.)—Mr. J W C De Soysa.

Breadfruits (six)—Mr. J P Salgado.

Jak (largest single fruit)—Mr. B W Gunawardana.

Jak (single fruit of best quality)—Mr. J D Perera.

Brinjals (twelve)—Mr. H A Pieris.

Collection of Leaves of Native Plants used as Food.

Mr. C D S Jayawardana.

Turnips—Miss M E Garth.

Carrots—Mrs. W O Garth.

Best Beet roots—Mr. K Abraham Saibo.

Celery—Miss Caroline F Garth.

Cauliflowers (three head)—Mr. J M Garth.

Cabbages—Mr D C Jayawardana.

Cabbage (heaviest head)—Mr. D C Jayawardana.

Peas (best dish) Miss C E Garth.

Rhubarb—Master Garth.

VEGETABLE PRODUCTS.

Judges:—Mr. Cochran, Mr. Broun and Mr. S C
Obeyesekere.

Coconut Oil (two gallons)—Gold medal, Mr. G C
Warr; silver medal, Mr. A P Goonetilleke; certi-
ficate, Mr. H L F Dharmaratne.

Kekuna Oil (half gallon)—Mr. G C Warr.

• Lemon and Citronella Grass Oils (one bottle of
each)—Messrs. Winter & Sons.

Cinnamon Leaf and Bark Oils (one bottle of each)
—Mr. H Salgadoe.

Best general collection of oils (two dozen of each)
—1st, Mr. W H Fernando; 2nd, Mr. G C Warr,
certificate; 3rd, Don G Kapurbanda, special cer-
tificate.

Best general collection of Gums and Resins—Mr.
D J Samerawira.

Coir Fibre (one pound)—Mr. D A D S Gunaratne

Kitul Fibre (one pound)—Mr. W H Fernando

Palmirah Fibre (one pound) Mr. A J R de Soysa.

Collection of Native Fibres (quarter pound of each)
—Mr. J H Meedeniya, R.M., certificate.

Ceylon-made Cigars from Country Tobacco (twenty-
five)—Mr. W P Burnard.

Best sample Ceylon Annatto—Mr. A VanStarrex.

Best commercial sample of Rubber (half pound)
—Lady de Soysa.

FOOD PRODUCTS.

Judges: Mr. F Waldoek, Mr. P Coomaraswamy and Mr. H L Daniel.

Commercial sample of Coconuts (twelve)—Collection of Coconuts (space one hundred square feet)—Mr. J W C De Soysa.

Arecanuts (twenty-five)—Mr. Julius Perera.

Judges: Mr. Seneviratne and Mr. W A de Silva. Sample of Paddy (quarter bushel)—Mr. R E De Soysa; Mr. R de Saram, certificate.

Best collection of different varieties of Paddy—Gold medal, Mr. A W D Jayasuriya; Mr. A P Gunatilleke.

Best collection of the following Grains:—Kurakkan, Mineri, Amu, Tanahal, Muneta (one measure of each)—Mr. A P Gunatilleke.

Indian Corn (two measures)—Mr. A J R De Soysa.

Sugarcane (six sticks)—Mr. C E A Dias.

Betel (one hundred leaves)—Mr. H W D Bandaranayaka.

Nutmegs with Aril (two dozen)—Mr. Andris Mendis. Judges: Mr. Macmillan, Meedeniya Ratemahatmaya and Mr. Francis Beven.

Vanilla (one pound)—Mr. Walter Dias

Pepper (five pounds)—Mr. J W C De Soysa, 1st; Mr. C C Barber, special commendation.

Arrowroot (five pounds)—Mrs. Arnold Dias.

Cardamoms (five pounds)—Mr. James Westland.

Judges: Mr. Cochran, Mr. A W Abrew, Mr. Francis Beven

Cinnamon (twenty-five pounds)—Gold medal, Mr. J W C De Soysa; silver medal, Mr. H W de Silva.

Judge: Mr. George Vanderspar

Cacao (ten pounds)—Gold medal, Mr. C C Barber.

Judges: Mr. Lionel Leefe and Mr. James Forbes.

Liberian Coffee (five pounds)—Mr. A J R De Soysa.

Ceylon Pickles: Cabbage, Cucumber and Mixed (one bottle of each)—Mrs. H L Daniel.

Judges: Mrs. F Beven, Mrs. W G Vandort and Mr. Keppel Browne.

Ceylon Chutnies: Mango, Tamarind and Lime (one bottle of each)—Mr. G C Pomam.

Ceylon Preserves: Mango, Pineapple and Embarella (one bottle of each) Mrs. E M Gray.

Judges: Mr. Keppel Browne, Mrs. W G Vandort and Mrs. F Beven.

Ceylon Crystallized or Candied Fruit (three kinds) Mr. J P Salgado.

Sample Loaf of Bread (one pound)—Mr. H Don Simon.

Rich Ornamented Cake (two pounds)—Miss L Vanderstraaten.

Tray of Native Sweetmeats—Mrs. Arnold Dias.

Tea grown above 1,500 feet (10 lb.); Bargany Estate Deyanikelle Estate highly commended.

Tea grown below 1,500 feet (10 lb.), Salawa Estate, Gold medal: Yahalakela, highly commended.

CATTLE AND POULTRY.

CATTLE.

(Only Animals bred and born in Ceylon can compete.)

Judges: The Mahamudaliyar, Mr. Chinniah and Mr. A Y Daniel.

Best Bull of Indian breed—Mr. E L F De Soysa, gold medal.

Best Cross-bred Native Bull—

Best Cow of Indian breed—

Best Cow (Cross-bred English)—Mr. A J R De Soysa.

Best Buffalo (Bull)

A special certificate was recommended by the Judges for the dwarf bull exhibited by Mr. R E S De Soysa.

Best Bull of Native breed—Mr. J W Chas. De Soysa, gold medal; Mr. A S W D Bandaranayaka, recommended for silver medal.

DAIRY PRODUCE.

Judges:—Mrs. Vigors and Mr. Cochran.

Basket of Fowls' Eggs Mr. C. Andree,

Basket of Ducks' Eggs (one dozen) Mrs. A. R. Amaranayaka.

Basket of Turkey's Eggs—Mr. Chapman Dias. Special Case of Goose Eggs—Mr. P C J Fernando, certificate.

POULTRY, &c.

Judges:—Mr. E C Davies, Mr. W L a Brooy, and Mrs. F L Daniel. Cage of Native or Indian Fowls reared in Ceylon (two pairs), Mr. W H Dassanayaka (game fowls.)

Cage of Fowls of Foreign breed reared in Ceylon (two pair), Mr. C P D Bandaranayaka.

Best cage of Turkeys reared in Ceylon (one pair)—silver medal, Mr. George Thomson.

Best cage of Geese reared in Ceylon (one pair)—Mr. George Thomson.

Best cage of Ducks reared in Ceylon (one pair)—Mr. W Chapman Dias, Mr. George Thomson.

Best cage of six Fowls reared in villages by Sinhalese, Tamils, or Moormen.—Mr. A R Samaranyaka.

Best cage of Pigeons reared in Ceylon (two pairs)—Mr. Edwin de Livera.

Best pen of Poultry in the Show—Mr. T Sanmugam, Gold medal: Mr. Arnold Dias, certificate.

ARTS AND MANUFACTURES.

Judges:—Mrs. J Ferguson, Mrs. S Bandaranayaka, Mrs. H L Daniel, Mr. H W Cave, Mr. H H Cameron and Mr. E Vandort.

Best Native Grass Mats (two)—Mrs. A J R De Soysa, silver medal.

Best single specimen of Ceylon Rattan Work—Messrs Jaldéen & Co.

Best single specimen of Ceylon Wood Carving—Mr. P E Pieris, highly commended.

Best single specimen of Ceylon Ivory Carving—Mr. Kandappa.

For the best specimen of Pillow Lace (six yards, six inches wide)—Mr. Sederahamy.

For the best sample of Embroidery—Mrs. A J R De Soysa.

Judges for Kalutara baskets, models, masks &c:—Mrs. Ferguson, Mrs. S Bandaranayaka, Mrs.

A Y Daniel, Mr. H W Cave, Mr. E Vandort, Mr. H H Cameron.

(No entries in the seven classes.)

For the best specimen of Kalutara Basket Work—Mr. J A Weerasooria.

For the best set of Flower Pots (six) Mr. A S W D Bandaranayaka.

SUPPLEMENTARY (FOR WHICH NO PRIZE WAS GIVEN.)

Arrack, Mr. Arnold Dias.

Furniture, Messrs. H Don Carolis & Sons, Mr. R de Soysa.

SPECIAL EXHIBITS NOT IN CATALOGUE

Electric Bell, Mr. J L Dharmaratne; Bambara and Beehives, Mr. Alex. B Heral; Madu Plant with Flower and Fruit, and Flour and Cakes made out of it, Mr. C E Samaranyake; Glass Bottle made in Ceylon, Mr. B J nares; Collection of Birds' Eggs, Mr. F C Potger, Mr. G Mendis; Kola, undried (five pounds), Mr. J P Williams, Messrs. J A P Williams and Bros.; Plantain Flour, Mr. Chas. Stouter; Ceylon Ointment in Case, Mr. Don Gregoris Kapurbandara. Special contrivance by which Coconut Plants may be protected from being damaged by Cattle, R15. Dr. P M Muttukumaru, Mr. Karl Beven, Mr. Francis L Daniel.

Curious Walking-stick.—Mr. John Abeykone, President, Village Tribunal.

Silver mounted Tea Pot made of a Woodapple.—Mr. John Abeykone, President, Village Tribunal.

Straw Watch Chain.—Mr. E Jayatilleke.

Ceylon Curios.—Mr. O D Vigors.

Coconut Poonac.—Messrs. Stevenson Brothers.

Medical Oil (202 kinds).—Mr. Don Gregoris Kapurbandarasinha.

Hat worn by Colombo Chetties.—Mr. Kandappa.

Antique Boxes, edges bound with Silver carved work.—Mr. Kandappa.

Copper Tittle Deed bearing the Initial of Sri Wickrama Raja Sinha.—Mr. Kandappa.

Complete set of Sinhalese Head dresses in Silver.—Mr. Kandappa.

SPECIAL EXHIBIT FROM COLOMBO MUSEUM.

Butterfly.—Kallima Philarchus, Westwood 'This Butterfly, when at rest with closed wings, mimics a dead leaf.'

SCHIZOCEPHALUS?—"A Mantis that imitates grass."
COFFEE LEAVES RUINED BY TINEID MOTH (*Gracilaria coffeefoliella*, Nien).

POLISTES STIGMA.—(Wasp with nest).

SPECIAL LIST.

- 1 The best specimens of pillow lace. Podinona, Paris Exhibition prize.
- 2 Brasswork, named not mentioned first prize, R30.
- 3 Model electric apparatus for lighting, Mr. D. J. Wimalasurendra, special prize, R30.
- 4 Set of Masks, Muhandiram, E. J. Gunesekera, first prize; Mudaliyar, Leveris de Fonseka, second prize.
- 5 Best model arrack distillery, Mr. Arnold Dias, first prize.

THE OPENING CEREMONY.

The Show was open to the general public at 3 p.m., but it was not till 4-30 that the formal opening ceremony by H.E. the Lieut. GOVERNOR, Sir E. N. WALKER, took place when, after presenting the gold medals to the successful competitors, he addressed the gathering. He said:—Ladies and gentlemen, I have great pleasure in responding to the invitation of the Government Agent of the Western Province and the Chairman of the Committee in coming here today, and in having the opportunity of seeing this Show and joining in the distribution of some of the prizes that have been gained. I think that on a comparison of this Show with the one last year we may congratulate ourselves on its success. It is difficult in a large crowd and in a few hurried minutes to make an accurate comparison, but I think that we may comfort ourselves with the assertion that the Show is quite as good as last year, and those who have worked to bring about this Show and the exhibitors are to be congratulated. I am sure it would have given great satisfaction to the Government Agent (the Hon. F. R. Ellis) if he had been present to-day to see the success of that to promote which he has expended such energy. Mr. Ellis seldom puts his hand to anything which does not turn out a success, and when he takes up a thing he generally carries it to a successful issue. I think we may say that he has done so on this occasion. I would, as President of this Society, say that this Society was erected on the Show of last year, and I hope that subscribers will continue, encouraged by the success and pleasure of the meeting to-day, to give it their support and make it one of the established and permanent institutions of the country. As President of this Society I cordially thank all the exhibitors and visitors for the practical manner in which they have contributed to the Exhibition. As an Officer I may say I am only perhaps an official figure-head. I have had nothing whatever to do with the organization of these arrangements, and therefore I have no hesitation in saying that the Committee have been very successful in the Exhibition that we have seen to-day, and in fact I congratulate them upon their labours. I have also to thank Mrs. Fowler, the Government Agent's wife, for having consented to distribute the prizes. (Applause).

Among those present at the opening ceremony were:—H.E. Admiral Bosanquet, the Hon. G M Fowler, Acting Government Agent, Western Province, and Mrs. Fowler, the Hon. L F and

Mrs. Lee, Mr. F H Price, Mayor of Colombo; the Hon. W W Mitchell, Sir Harry Dias, and Mr. C Drieberg (Principal of the Agricultural School and Secretary of the Exhibition); Mr. and Mrs. J Ferguson, Mr. C T D Vigors, A.G.A., Kalutara, and Mrs. Vigors, Mr. and Mrs. W L Kindersley, Miss Lucy Ferguson, the Hon. A C Lawrie, Acting Chief Justice; the Hon. Justice Browne Messrs. F W and P Bois, Mr. W E Davidson, A.G.A., Nuwara Eliya; Messrs. W Anderson, G H Alston, J E Alston, Dr. Attygalle, Mr. and Mrs. C Baur, Mrs. Andree, Mr. Advocate Keppel Browne, Mahamudaliyar Don Solomon Dias Bandaranaike and Mrs. Bandaranaike, Mr. H O Beven, Mr. and Mrs. M Cochran, Mrs. Clark, Miss Swan, Miss Aitken, Major and Mrs. Carey, Mrs. Campbell, Dr. Cinniah, Mr. and Mrs. E Chapman, Major and Mrs. E C Davies, Mr. Felix Dias, Mr. Owen de Run, Mr. Advocate Dornhorst and Mrs. Dornhorst, Mr. C Brooke Elliott, Dr. and Mrs. Ebell, Mr. and Mrs. J Clovis de Silva, Mr. R Freeman, the Misses Garvin, the Misses Gratiaen, Dr. and Mrs. Garvin, Mr. Advocate C M Fernando, Mrs. Greenhorn, Mrs. Hayward, Mrs. Heinemann, Miss Joyce, Mr. and Mrs. E H Joseph, Mr. Jacques, Dr. and Mrs. Johnson, Mr. Advocate H Jayewardene, the Hon. C P Layard, Mr. and Mrs. J P Morton, Mr. and Mrs. James McIntosh, Mr. R H Morgan, Mr. W Nock, Mr. Advocate Maatensz, Mr. S C Obeyesekere, Miss Obeyesekere, Mrs. Potger, Miss Cora Potger, Mr. Potger, Mr. Advocate J Peries, Mr. A C Rudra, Mrs. and the Misses Rockwood, Mr. and Mrs. R P de Saram, Miss Rene de Saram, Mr. Shelton de Saram, Dr. Allan de Saram, Mr. T Sanmugam, Mr. A Thomson, Mrs. F J de Saram, Miss de Saram, Captain Taylor, Miss Swan, Misses Saunders, Mr. Vanderstraaten, Mr. W P D Vanderstraaten, Mr. H M Waldoek, Miss May Walker, Mr. W R Waller (Dikoya), Hon. H L Wendt, &c.

His Excellency who drove up in an open carriage accompanied by Capt. Wyndham, A.D.C., and Capt. Cum Grahame, P.S., and accompanied by mounted orderlies, was received by the Committee under a beautiful pandal at the rear of the buildings, the Volunteer Band, playing the opening bars of the National Anthem. A tour was then made of the exhibition at the close of which the presentation of gold medals was made. At the close of his remarks His Excellency sent for Mr. P D Siebel and personally congratulated him on his magnificent exhibition of flowers, a compliment that was in every way thoroughly deserved.

His Excellency then inspected the cattle, after which he partook of tea in a special marquee erected near the Lecture room, taking his departure at 5-30, the band playing the National Anthem uncovering. We must not omit to mention that Mr. C Drieberg, the energetic and courteous Secretary, was also thanked for his labours.

22nd July, 1899.

The show opened at an early hour this morning and there was soon a sprinkling of visitors, gradually augmented as the morning progressed who were able to leisurely examine the exhibits. Some of these had, especially in the floral department, had lost their freshness and much of their beauty: but care had evidently been exercised by those in charge of the exhibition to do what could be done to preserve the flowers, plants, &c., until the close of the show. Of course a considerable portion of the articles shown are not affected in this way and the exhibits in the art and manufacture classes, as

well as the highly interesting exhibits in the classes devoted to "food products," were examined carefully by the more thoughtful class of visitors.

(From a Lady Correspondent.)

This is the first Show of the kind which I have had the pleasure of attending since I came to Ceylon and I must say that it was rather an "eye-opener" to me. I did not, of course, expect to find such a display as I have seen at flower-shows at home and I was surprised to notice the height of perfection to which natives had attained in the culture of the fruits and flowers of the island. Some of the vegetables, particularly carrots and beet-root, were the best I have seen in Colombo, and I thought the display of fruits was exceedingly creditable. The oranges looked very tempting, so did the mangosteens and I don't think that the people of the country could have passed without admiration the display of jaks. A word of praise is due to Messrs. Thompson and Co. for the very fine and neatly laid out show of Australian garden produce, and one cannot wonder that the firm has gained so much popularity in Colombo. While speaking of fruits I must not forget to mention the delightfully cool, refreshing, skillful and artistic work exhibited by Messrs. J P Morton and Co. In the fruit section, there were two nicely moulded pillars of ice in which were frozen an extra large pine-apple and a big bunch of bananas respectively; and in the flower section there were two similar blocks containing a varied collection of the blooms and leaves that are common in Colombo and of the arecanut flower, which, if I may be allowed to say so was the best of Messrs. Morton's exhibits. The display of table decorations seemed to me to be particularly good, but I had expected to find a much better collection of palms and ferns considering the wealth of those in Colombo. Art Work rather took my fancy and I was very envious of the fortunate possessor of the large and magnificently carved side-board which occupied the centre of the room devoted to this section. I had not before seen lace-workers engaged at their occupation and I watched with great interest their deft and industrious fingers turning out the delicate work for which the women of this country are famed. Poultry appeared to me to be a poor show, but I thought the bulls exhibited in the cattle section were a splendid collection. I did not see any that I could praise for speed, but for draught purposes I think those shown would be hard to beat. I had expected to see an imposing spectacle at the opening ceremony, but must confess to having been somewhat disappointed: it was so simple and so brief. Everywhere there was a delightful harmony of colour, not only in the exhibits but in the dress worn by the ladies, some of them showing exquisite taste and design. I thought we might have had a little more music from the band during the time we were waiting for the arrival of His Excellency. It was a monotonous time, and a sweltering time and anything soothing in addition to Burdayron's ices would have been grateful and comforting.

COFFEE IN NORTHERN INDIA.

More than twenty years ago a well-known Assam planter—the late Mr. C. B. Anderson—visited his brother, Mr. T. C. Anderson, who was at the time resident on Annfield, Dikoya; and he was so struck with the splendid growth of tea bushes in an avenue

leading to the bungalow, that he then and there wanted to start a tea "garden" in Ceylon. Well for him if he had done so! The "avenue" arose from some seed sent from Assam to Mr. T. C. Anderson, which he treated as if it were an ornamental plant, and without the slightest belief in its commercial possibilities in Ceylon. Apart from this want of faith, there was the fact that (although the "leaf-fungus" had already been seven or eight years at work) coffee was at the time "booming"—prices were specially high and no one had the least fear of such young districts as Dimbula, Dikoya and Maskeliya not growing coffee profitably for several decades to come. Accordingly Mr. C. B. Anderson was simply laughed out of his conceit of establishing a tea-garden in Ceylon, some 23 years ago. The Dikoya planters of that time would not hear of it, and, instead, some of them absolutely persuaded Mr. Anderson to take back with him to Assam a select parcel of Ceylon coffee seed and to plant out 100 acres in a favourable situation on behalf of a little Syndicate who joined him in the venture. The coffee grew all right; but so did the inevitable "leaf-fungus" which by 1880, had changed the entire prospect in Ceylon. Mr. Anderson, we believe, abandoned the Assam clearing before anything like a decent crop had been gathered on it and nothing more was heard of the venture. But very bitterly, we have no doubt, did Mr. T. C. Anderson and some other Dikoya men of the "seventies" regret that they had not allowed Mr. C. B. Anderson, with all his Assam experience, to open out a pioneer tea garden in Ceylon, at a time when prices were so good, and competition so limited in the tea market for the India and Ceylon product.

We are led to recall this true reminiscence of a strange experience in our planting world, by the revival of a cry at this time to plant "coffee" freely in Assam and some other parts of Northern India. We have grave doubts of any appreciable success attending the venture. Fifteen degrees on each side of the equator is usually the limit of coffee growing; and the coffee bush is by no means so hardy as tea in respect of standing frost, &c. On the other hand, here is the very encouraging report from a planting correspondent of the *Indian Planters' Gazette*, who writes of what he has seen or heard on good authority:—

Any bushes I have seen in Upper Assam or Sylhet seemed to be in perfect health, and bearing crops which it would simply be impossible to beat. I have it on the best authority that Arabian bushes have been growing in South Sylhet in the planters' bungalow compounds for the last ten years or so, and that they have been fruiting all these years. When this is the case there can be no earthly reason why they will not grow and fruit for forty years. I think the real reason that coffee has not been gone in for more is simply that, from the very start, tea has had full sway, and as it has, as a rule, proved a fairly remunerative investment hitherto, there was no special reason for the tea planter to turn his attention to anything else. There can be no doubt that if tea was wiped out of existence in Assam through any cause, that the Assam planters would be equally as capable of rising

to the occasion as the Ceylon planters were when their coffee was all but annihilated by disease. As tea is not now what it used to be—and there can be no hopes whatever that it ever will be in the position it occupied 20 or 30 years ago—I think you do well when you advocate the planting of coffee, or for the matter of that anything, as an auxiliary to tea. Even if the tea districts of Assam could grow sufficient coffee to supply the consumption of the eastern part of India it would always be something, and a very big something, as by all accounts the consumption is large and increasing.

We, in Ceylon, should be very glad, indeed, if planters in any part of Northern India were able to supplement their tea with coffee and to grow the latter profitably. We wish them a full measure of success; but our doubts can only be overcome when we learn of a 100-acre field of Arabian coffee at four to five years old giving a paying crop of the berry without showing signs of exhaustion from the dread leaf disease (*Hemileia vastatrix*.)

INDIAN AND CEYLON ASSOCIATIONS.

TEA IMPORTERS AND THE DRAFT ALLOWANCE.

(Special Report for "Ceylon Observer.")

A meeting of growers and importers of tea was held on Monday, July 3rd, in the Council room of the London Chamber of Commerce, Eastcheap, to receive the report and recommendation of the joint Committee of the Indian Tea Association (London), and the Ceylon Association in London, on the proposed abolition of the 1 lb. draft allowance on tea. There was a crowded attendance, and late-comers had difficulty in finding standing-room. Sir H Seymour King, M.P., K.C.I.E., presided, and there were present:—Messrs. H K Rutherford, J N Stuart, D Cruikshank, Begg, Dunlop & Co.; H Cholinsley, Charga Tea Association; E L Sparks, Messrs. P R Buehanan & Co.; John M Holt, Messrs. Stewart, Holt & Co.; W Johnson, New Sylhet Company; Douglas R Smith, G G Anderson, Scottish Ceylon Tea Company; Geo. Stehn, Messrs. Wilson, Smithett & Co.; Jas. F Anderson, Messrs. Lyall, Anderson & Co.; W H Anderson, New Dimbula Company; R Gordon Shaw, F D Mitchell, Jno. J Edelman, W J Thompson, Jr. John McEwan, D M Stewart, W Watson, T C Owen, Messrs. Rowe, White & Co.; A Thomson, Wm. McKenzie, P Oswald, C C McLeod, R S Corbett, P G Spence, C A Goodricke, R A Cameron, W S Bennett, Jno. Hamilton, J L Anstruther, H Earnshaw, A Bethune, G J Gibson, J M Smith, J L Shand, H J Vollar, R C Dowling, W J Skene, G A Talbot, F Pook, H S J Osear Thompson, F H Cumberlege, E H Gregory, Alford Want, A Bryans, Messrs. P R Buehanan & Co.; F W Holt, Geo. W Christison, H A Hancock, A B Tomkins, J H Dickson, Robt. Anderson, Hugh Fraser, A Crabbe, G W Payne, A L Hutchison, W G Smith, Scottish Trust & Loan Company; Jas. Sinclair, W McDonald, J Hughes, M P Evans, A W Stopford Sackville, G H Austin, R Hart, J Steel, J W Sidey, A E Butler, W S Warren, K Brown, D Wilson, J A Roberts, C E Strachan, R B Magor, Messrs. Geo. Williamson & Co.; Geo. White, G Seton, S H Smith, Carolina Tea Company; Alfred Brown, T S Dobree, T A Williams, Blackwood Coffee Company; Geo. G Playfair, Leborg Com-

pany; H L Tottenham, A Ledington, L H Pieris; Duncan W H Skrine, N W Grieve, R C Lyall, Lunsden, G A Dalby, Henry Bois, Sanderson, Jas. Wilson, Arthur Thompson, Adams, Doake, A Collingwood Smaill, C Milner, A MacLanghlin, C F Hunt, E G Roek, Doom Dooma Tea Company; A E Watson, Messrs. Geo. Williamson & Co.; C W Wallace, Messrs. G R Shaw & Co.; representatives of Messrs. Geo. Dunlop & Co.; Messrs. Finlay, Campbell & Co.; Messrs. Lister & Biggs; Messrs. Blyth, Greene, Jourdain & Co.; and the Kelani Valley Tea Association; Messrs. Ernest Tye, Secretary, Indian Tea Association; and Wm. Martin Leake, Secretary, Ceylon Association in London; and many others.

SIR SEYMOUR KING'S SPEECH.

The Secretary of the Indian Association (Mr. Ernest Tye) having read the notice convening the meeting,

The CHAIRMAN said:—Gentlemen, the numbers in which you have attended today show that this meeting is one of a historic character in the tea trade. It is one, which must for good or ill influence the course of the history of that trade for a long time to come. We meet here to receive and to deliberate on the report of the Committee of the two influential Associations representing the Indian and Ceylon trade. I owe the accident of having the honour of presiding over your deliberations today, gentlemen, to the fact of my being the honorary president of the Indian Tea Association, and I trust you will forgive me if I do not in every way meet your expectations while I am in a position that might have been filled by others who are more competent to represent the interests of which we have to speak this afternoon. I said this is a historic occasion. We are met to consider the abolition of an ancient custom. There is no doubt as to the antiquity of that custom; there can, equally, be no doubt in the minds of tea growers as to the unreasonableness of the custom (Applause). I have never yet heard, gentlemen, of any custom which long maintained its sanction which necessitated a person giving away, for nothing, a part of what he produced (hear, hear). We are met to consider the question of the one lb. draft on each chest or half-chest of tea which it has been the custom to exact from the growers. If the growers had remained prosperous, perhaps, the question would not have been raised. But there is no one in this room who does not know how real is the necessity for pinching economies in the tea industry, and for casting about for some means of making a "living wage" out of it. The growers and importers have therefore had to consider whether they cannot save a considerable sum every year by the abolition of the 1 lb. draft. (Hear, hear.) They would, I feel sure, welcome some change in the present method of weighing the tea, but that seemed impracticable. The method of weighing already imposes a heavy toll on the producer, who feels that that toll is sufficient without the addition of the 1 lb. draft allowance, (hear, hear.) At the same time we have to remember that those who purchase from us are worthy of every consideration and cultivation on our part. One cannot well exist without the other. Perhaps the producer is more necessary to the retailer than the retailer is to the producer, because, after all, the retailer does not buy our tea because he loves us, but because he must have tea to sell to those who want to drink it. (Hear, hear.) But at the same time it must be obvious to everyone that friendliness, courtesy and

pleasant relations between both parties are essential for the smooth and profitable conduct of the industry—(hear, hear)—and I venture to think your joint Committee—as you will hear when the report is submitted to you—has done all it could do to promote good feeling and harmony. Both sides must recognise that it is a question that appeals to the pockets of both, and that, therefore, it is necessarily a disputable question, and one that will be fought out. But there is no reason why it should not be fought in a pleasant spirit. The retailer must recognise the position into which the industry has drifted. We wish the retailer a prosperous time. But there is nothing to be gained by threats to boycott tea sales and to cease dealing with those who produce what the retailer must have. (Applause.) Has there ever been in the history of the tea industry such unanimity as has been displayed on this occasion? I venture to say, never. (Hear, hear.) There have been in the past many questions that have moved the trade deeply, and to deal with which special committees have been appointed. But on no subject has there ever been such an approximation to absolute unanimity as on this particular question. Now, I think that must impress the retailers and the public at large. (Hear, hear.) Nothing, I venture to say, but dire necessity, the compelling necessity of the *res angusta*, could have possibly driven the producers of tea into line like this. I think that the amount of Indian and Ceylon tea imported into London last year was about 227,000,000 lb., and those responsible for 215,000,000 lb. of that total have already signified their assent to the present movement, and fresh assents are still coming in. So that practically the Indian and Ceylon tea-growing industry is unanimous. Then we have to see what the other side have got to say. Their argument seems to be, “We have always received this little tip for buying your teas, and therefore it must remain a factor in all our dealings.” Time will show which side to prevail. I have now only to thank you for the kindness with which you have listened to these few remarks of mine, and to ask you to listen carefully to those who will follow, and then to signify your opinion as to the course that should be pursued. (Applause.)

MR RUTHERFORD'S VIEWS.

Mr. H. K. RUTHERFORD:—As chairman of the joint committee of the Indian and Ceylon Associations appointed to consider this matter it falls to me to present to you the committee's report, which is already in your hands, and to announce to you the recommendation of that committee. But I daresay, there are some few here who will ask, “What is the use of such a meeting seeing that you have all signified your assent to the proposal?” Well, in its deliberations the committee realized that the more this question was studied the greater appeared the injustice to the importer (hear, hear); and we also wish the importers who are present today to thoroughly understand the matter. We want as much light thrown upon the subject as possible, not only on behalf of yourselves, gentlemen, but of the dealers, the Government and the public. (Hear, hear.) All of these parties are concerned and interested in the weightment of tea. This question of the abolition of the draft cannot be taken apart from the system of weighing-out tea. We must insist upon that. (Applause.) At the mass meeting of dealers and retailers held on

June 7th reference to the system of weightment of tea by the Customs was studiously avoided. Now, we held that the two questions are inseparably connected. (Hear, hear.) It is well that we should all know something about the history of weighing-out tea by the Customs. In October, 1885, a joint signed written agreement was entered into by the Indian Tea Association of London and the Wholesale Dealers' Association—there was no Ceylon Association in those days—that all teas should be weighed net. That, gentlemen, I take it, was an honest attempt to get at an accurate and true system of weighing-out teas. That agreement was in force for 3½ years or so, and then the Wholesale Dealers gave notice that the trade would in future, from June, 1889, refuse to buy any more teas weighed on that system. A joint Committee of the Indian and Ceylon Associations and the Wholesale Dealers' Association was then appointed to consider the subject and if possible to come to some mutual understanding. While that Committee was at work the Wholesale Dealers' Association approached the trade, and then intimated to the Indian and Ceylon Associations that it was useless further discussing the subject as the trade had come to a unanimous conclusion that they would absolutely refuse to buy any teas that were weighed net, and that all tea must in future be weighed gross and tare—a system that on an average gives them 1 lb. more in every package than they pay for, in addition the 1 lb. allowed for draft. You will see by this that it was the Wholesale Dealers who broke away from the joint signed agreement, and the system which they thus arbitrarily brought into force continues at the present time. In October, 1890, Her Majesty's Customs, finding they were losing by this system a certain amount of duty, ordered that in future all teas must be weighed and charged for duty to the halfpound. (Hear, hear.) That was the second attempt to get at a just system of weighing, and it had the support of the Indian and Ceylon Associations. But the trade resolutely opposed the proposal of the Government, and the Government were weak enough—I suppose in view of a general election being near at hand (laughter)—to withdraw or to suspend the operation of their own order, and it has been suspended since that time. Well, you will see from these facts that it has been impossible to get the dealers to accede to any reasonable proposals for the proper weightment of our tea. (Hear, hear.) That brings us up to the origin of the present movement. From time to time the Indian and Ceylon Associations have been approached by the various representative bodies in India and Ceylon, and also by individual growers and importers in this country, asking if nothing could be done to mitigate the great loss in weight the teas suffered when put up for sale in London. Well, after the attempts made by the Associations to get something done they did not see what further they could do in the matter. However, owing I presume to the lessened profits from tea cultivation, owing to the various causes of exchange and low prices, the planters recently approached the Associations more strenuously than ever, and their demands became more accentuated. In March last, the two Associations conferred together to see what was best to be done in the circumstances, and they came to the conclusion that it would be hopeless without the good offices of the Government to try again to get anything done to bring about the proper weighing of the teas. And they came to the conclusion that to meet the case they must approach the

dealers in order to have the draft allowance on teas abolished. (Applause.) It was obvious, of course, that no great change such as this could be effected without the entire support of the importing community, and as you have seen by the circular that the Committee has issued that the support is practically unanimous. (Hear, hear.) I may also add that the Planters' Association in Kandy have passed a resolution entirely approving of this movement, and last which we received a telegram from the Chamber of Commerce in Colombo, informing us that they gave the movement their entire support. (Applause.) Well, gentlemen, such an overwhelming acquiescence in our proposal is a convincing proof, if any further proof were wanted, of the injustice of this 1 lb. draft allowance in addition to the allowance already made in the weighing-up of our teas. (Hear, hear.) I need not tell you anything further about the movement as the account of it is set forth in the Committee's circular to you. That, therefore, brings the whole thing up to date. With your permission, however, I would like to make some remarks as to the arguments of the dealers in opposing this proposal. The reasons they give for their opposition to the abolition of the draft are two: one is that the draft allowance is an ancient custom; the second is that the allowance is necessary, in order to pay for the loss they sustain in leakage of packages, by bad bulking, and by the presence in the packages of nails and lead as well as the loss of weight incurred in the process of packing the tea in small quantities for the retail market. We admit it is an ancient custom, coming as it does from an ancient people. In China tea is subjected to squeezes all through, and the last squeeze was made by Englishmen—though what they took from the Chinaman in this last case they had to give back when the tea got here. (Hear, hear.) But in London the dealers have to deal, practically altogether, direct with the growers of Indian and Ceylon tea. At least 90 per cent of tea in London is in the hands of the producers, and I think we are made of sterner stuff than to submit to be squeezed as the Chinaman does. (Applause.) In recent years India and Ceylon have developed markets for their teas in Australia, Canada, and other colonies in America, and in Russia and other parts of the continent of Europe. In none of these countries are we subject to this 1 lb. draft. It seems a most extraordinary thing that only in this free country of England are we counter-vailed to this extent. (Hear, hear.) We are on the same line as our brother planters in sugar; we want to trade on right terms with all countries alike. (Hear, hear.) As to the re-weighment of tea in small quantities, we were all staggered the other day by the evidence given by some large tea-dealers, who said it was an ancient (not an honourable) and universal custom for tea to be sold short weight to the public. (Laughter and hear, hear.) Well, gentlemen, is it high time that this "ancient trade custom" was swept away. (Hear, hear; and a voice: "But it isn't a custom.") We were told in the police court that it was a custom. Growers have always thought it a mystery how the dealers were able to sell so cheaply to the public. (Hear, hear.) But the recent proceedings have unmasked the mystery. (Hear, hear.) If any of you growers calculate the value of tea given away in draft, the value given away in extra weight by the Customs' system of weighing, and the loss the Government suffer in the amount of

duty not paid on the extra weight, but which the retailer adds to the value of his tea when he sells it, and if you assume that only 50 per cent of the retailers sell short weight to the public, you will find the value amounts to no less than £380,000 per annum! Whether the abolition of the draft is carried through or not, or whether it is equalised by an arrangement of price, still I think that all this indefensible system of carrying on the tea trade of the country ought to be done away with, and the trade put on a more equitable footing all round. (Applause.) The other argument is that the draft goes to cover defects and the presence of foreign substances in the packages. That is the weakest argument of all, because the incidence of the penalty falls on the importer whose work is in good order, more heavily than on the man whose work is defective. (Hear, hear.) If the 1 lb. draft were removed the importer who does his work badly could be made to suffer; while it remains the same defects will remain. This draft allowance is a premium on bad work, and a penalty on those who do their work well. (Hear, hear.) I therefore propose for your consideration the recommendation of the Committee, which is:—"That it is the unanimous recommendation of the joint Committee of the Indian and Ceylon Associations appointed to deal with the question of the 1 lb. draft abolition on tea, that notice be immediately given to the Tea Brokers' and Wholesale Dealers' Association that on and after the 17th inst., all teas shall be sold on the condition that the 1 lb. draft allowance shall not be made to the buyers." (Loud applause.) I trust, gentlemen, this recommendation will meet with your entire and unanimous approval and support, and that we will be able to show the trade that the great tea-planting interest of Indian and Ceylon have at length awakened to the fact that they must have a voice, that they insist on having a voice, in determining how their produce shall be offered for sale. (Loud applause.)

THE FIRST RESOLUTION.

Mr. C W WALLACE (Messrs. R G Shaw & Co.) moved the following resolution:—"That this meeting adopts the unanimous recommendation of the Committee, that on and after the 17th inst. all teas shall be sold on the condition that the 1 lb draft allowance shall not be made to the buyers." (Applause.) The speaker said he agreed with the Chairman when he alluded recently to the applicability of the phrase of Rudyard Kipling about "The men who bear the white man's burden in a foreign land" to the tea-growers in Assam and Ceylon. I hope to steer clear (the speaker proceeded) of anything that sounds either bellicose or hostile to any section of the trade in London. For, sir, I hold that it is necessary for every section of every community to treat every other section with forbearance and good will. But there *will* arise occasions in every community when from some reason or other it is found that one section is appropriating too many of the loaves and fishes which belong to the whole. (Hear, hear.) This may arise in various ways—some fair, some unfair. Those of which I speak today are perfectly fair, but they are none the less hard. In most cases this sort of thing comes about owing to the survival of an "ancient custom," or because changes necessary to the evolution of society have at last made a former practice intolerable. A statement which has been made is that we lose 1 lb in the weighing,

The tea itself is not weighed at all. The package is weighed gross, no fraction of a pound avoirdupois being used, and the turn of the scale being always given *against* the package. If the gross weight of a chest of tea is 130,001lb or anything from that up to 130,999lb it is entered as 130lbs only. Then the tea is turned out and put aside, and the box, the lead, etc., are put together on the scale. Again, no fractional weights are used, but instead of the turn of the scale being now given against the buyer, to counter-balance the effect of the turn on the gross weighing, it is still given against the package. It is like hitting a man on the nose and then hitting him on the back of the head to make up for it (Laughter). If the tare is 30,001 lb it is reckoned as 31 lb. So that by neither of the processes does the grower gain anything; he must on an average lose half-a-pound on each weighing, which means a loss of 1lb on each package of tea. Next he loses 1 lb on the draft. Both these imposts we have borne patiently, with just an occasional grumble, the reason being that up to a few years ago there was shown a fair profit, enabling us to bear a burden, that did not rightly belong to us. But still it was a burden and it was not a just one in either case. I know it is said that some producing companies still manage to pay a large dividend. But, gentlemen, I would point out to the buyers and to you that these dividends which sound very large by percentages are, owing to a curious custom in the tea industry are, not reckoned upon the cost of the gardens, machinery, etc.; but upon the capital. The capital is not watered, and the custom in the industry is to re-invest the profits in increasing the profits, in increasing the output, and so on. If you take the dividends and divide them over the gardens, with what they have cost in buildings, machinery, etc., they would work out at something nearer 3 and 4 per cent than the 12 to 15 per cent that has been spoken of. There are a great number of gardens which cannot make both ends meet, far less earn dividends of 12 and 15 per cent (hear, hear.) The facts are there, and can be ascertained by reference to the newspapers of London and Calcutta and Colombo. We are accused of trying to take the buyers' profits and perquisites. That is not so. Long before this movement was started the growers of India and Ceylon set themselves the task of reducing expenditure in every possible item and that not only in Assam and Ceylon, but in London, as far as their own people were concerned (hear, hear). Commissions have been reduced all round, and every other kind of expense has been reduced (hear, hear). In London I know of many directors of tea concerns returning their fees in the hope of better times, if better times should ever come. Establishments on the other side have been reduced, and in the last cold weather over 200 planters were in Calcutta seeking work without avail. With all this before us, can it be truly said that as soon as our profits are reduced we seek to take the profits and perquisites of the buyers? No, we made all the reductions we possibly could in our own countries of production first, and now we find it necessary to come to London to see if we cannot reduce charges and imports which are far too heavy (hear, hear). Foremost among these imposts are the present system of weighing and the 1 lb. draft. You might say it doesn't matter which of the two we amend. But if we amended the system of weighing, either we should have to incur an extra charge for weighing, or we

should have to get the Government to amend its weighing system, and if the latter then the Government tax upon this article of necessity would be increased. Whether you be all Liberals—and I hope you all are (laughter and "No")—well, some of you may be Conservatives (laughter)—but whatever you are I am quite sure none of you love our Government to the extent of wishing to increase the duty which, by an "ancient custom," is levied upon this necessary of life as if it were a luxury like wine or spirits, or tobacco (laughter.) I therefore come to the 1 lb. draft. Let the buyers leave us that and be satisfied with the 1 lb. extra per package that they already get in the weighing (hear, hear.) That has been felt to be the right course by all the growers and their representatives, and such is the resolution I have just read out to you. There are one or two misconceptions that I should very much like to remove, for the benefit of those outside. There are two misconceptions, and we have throughout had two charges brought against us. The first is a want of courtesy to the buyers, and the want of good faith. As to want of courtesy, I am sure, I carry you all with me when I say that nothing would distress me more than to deserve such an imputation. What are the facts of the case? The Chairman of the Committee has given you the history of this 1 lb. draft movement, and I would only add that the Committee was appointed not with the case prejudged, but appointed to look into the matter and report to us. They have reported to us today, but what have they done in the meantime? They met the buyers and consulted them, hearing all they had got to say; they did not even draft their report till they had heard the buyers' side of the question. It is now for us to say what we will do. The Committees of both Associations have been called bad names and neither of them has even gone so far as to say "You're another" (laughter). The charge of discourtesy is certainly not proved. There are two parties to every agreement or contract, and for one party to alter the terms without the previous consent of the other party is certainly evidence of a want of good faith. That is a truism to which I assent. But there is this fallacy in our case—there is no contract at all (hear, hear.) In our case there is no contract till the fall of the auctioneer's hammer. The Committee proposes that we should do as we please with teas which are at the present moment our absolute property, to do what we like with. If we like we may ship them to America; we may burn them if we like; we may drink them (laughter). None of these courses could lay us open to a charge of bad faith. And how can the carrying out of our present proposal lay us open to the charge? Our teas have an intrinsic value, and if we offer them at public auction, offer them to the world at large, and one man won't buy them—well, other men will (applause). Not the most timid grower need be afraid because one set of buyers abstains from attending one sale (laughter and hear, hear). If these buyers who have made their fortunes out of our teas abstain from buying any more—(laughter)—another set of buyers, of other new companies, will come forward to buy them (hear, hear). I hope the buyers will try to look at the matter from the growers' point of view as well as from their own. (Applause.)

THE SECONDER'S SPEECH.

Mr. ARTHUR BRYANS (Messrs. P R Buchanan & Co.)—I rise to second the resolution. As a member of the Committee I should like to say that

it is only dire necessity that has brought us, to this pass. (Hear, hear.) We had to consider the two points to which reference has been made in order to see what we could do to meet the bad times. There has never been such a year for tea-growers as the past year, and the question of the sale of our teas naturally came under consideration—the two points that came before us being, of course, the system of weighment and the 1 lb. draft. Our duty was to consult you. We asked you what your opinion was, and we received from you what I consider practically a unanimous mandate to go on with the movement for the abolition of the draft allowance (applause.) It was so unanimous that it seemed we could do nothing but move the resolution we have brought to your notice today, unless there was some strong reason against it. Unless this strong reason could be adduced, we as a committee, it seems to me, had no alternative but to proceed. The only way to get reasons against our proposal was to meet the trade. But there was considerable delay. The trade held a mass meeting, and they threw over the Wholesale Tea Dealers' Association and at last appointed a committee representing the retailers and the buyers to meet us. I had great hopes of that meeting, and was woefully disappointed. What was the answer we got? It was simply an answer of *non possumus*: the only plea the trade put forward was "We can't and won't meet you." Some one suggested the possibility of a compromise: they would not listen to such a thing. Under those circumstances I do not see what we could do other than we have done. (Hear, hear.) I am one of those people who consider that we have a right to sell our goods on our own terms (applause), provided those terms are fairly just, and I cannot conceive that making a present of 1 lb. of tea in every chest and half-chest is just, or that to abolish the custom can be called an injustice. (Hear, hear.) One thing that took place at our meeting with the trade took my breath away; I think it took away the breath of the whole committee. The trade said, "We don't get and extra weight at all." (Laughter.) They told us, "You are the sinners, and we are the sinned—against." One importer produced a most elaborate weighment return of a very large number of chests, done to the ounce in his own presence, to show that his loss was $1\frac{3}{4}$ per cent for the whole lot. It was handed to them, and they returned it and pooh-poohed it, and implied that they did not believe a word of what he said. We are not all dreaming: it *can't* be possible that we don't lose any tea on these transactions. (Laughter.) In calculating our averages for many thousands of chests I have always to make an allowance of two per cent to cover loss of tea that we are not paid for. (Hear, hear.) I have found in the course of many years' experience that less than two per cent will not cover it. The trade representatives said, "Oh, but you can't weigh your tea properly." But they know it is not we who weigh the teas, but Her Majesty's Customs. I don't like the system, because it tells against me; but it is not likely that Her Majesty's Customs would cheat themselves. I hold in my hand a letter from the manager of one of the warehouses, in which he says that "the weighment of tea and the 1 lb. draft given from two to two-and-half lb. per chest is against the importer, and the Customs also lose one ounce in duty on each chest." I don't think we have any stronger evidence that the trade pay more than they pay for. Let me draw

attention to the extraordinary notice issued on Friday last, the like of which I have never seen in the City of London. (Applause.) It is issued without signature, and it proposes to condemn, by not buying at the auctions this morning, a resolution to be submitted for approval this afternoon. (Laughter.) Surely this can be only one thing—a threat; it can be nothing else. I have ceased to be surprised at the actions of the body that is manœuvring the opposition to our proposal. There has been made the unwarrantable assertion that there was an understanding that the abolition on draft would not be forced upon the trade against their wishes. I know the whole of the negotiations, and the committee will bear me out when I say there never was such an understanding, and I hope there never will be. (Hear, hear.) I revert to my original proposition: we have the right to offer our goods for sale on our own conditions. Some of the conditions of sale want revising. In two cases I admit they tell hardly against the trade. One clause is very badly drawn, and the sooner it is altered the better. Seeing the lower value obtained for tea, it would, I think, be much fairer that the deposit, instead of being a fixed deposit of £1, should be an *ad valorem* deposit, with a maximum of £1. That is a change that we should insist upon at once. I go further. I say that three days is not sufficient for the trade to inspect their purchases. I would be inclined myself to allow a period of five or six days. (Hear, hear.) We do not want to sell them something that is not tea. If they are correct in their statement that extraneous matters are found in the chests, let us, as Mr. Rutherford said, get at the real offenders. We want to sell nothing but pure tea. But we insist upon being paid for every pound of it. (Applause.) As to the loss in distribution—in the reweighing in small packages—it is not a fair argument. We importers also have a lot of loss in our own factories. But it cannot concern us what loss there is on our teas after they have ceased to be ours. It is said that there are large profits in the tea trade. But it is not the growers who are making the large profits. (Hear, hear.) Turn to the reports published today, last week and the week before, of the large heavily-capitalised concerns of retailers, and you will see who are the people who are making the money. But we, growers and importers, have never been in such straits. The fatal error of the "shilling canister" throughout the country is shelling ruin for us. (Hear, hear.) It is not we who regulate the price for tea; it is the trade. As long as this underselling of tea continues it will redound to our loss. Let us be unanimous today. Let the dissentients from this proposal be only those who have other interests to conserve—the interests of retailing. But let the growers and importers be unanimous. (Hear, hear.) Let us continue our present unanimity, and then the abuse will be corrected and this unjust tax abolished. (Applause.)

Mr. JOHN McEWAN:—You said, Mr. Chairman, that 215,000,000 lb. of tea out of 227,000,000 was on the side of this proposal. I believe, I represent 8,000,000 lb. of the deficiency. There are some points in this movement that have not been adduced today. I admit that we, as growers and importers, apparently lose $1\frac{1}{4}$ per cent on our turnover, taking into account the half-chests, on which we proportionately lose more. But I am not prepared to forego a loss of $1\frac{1}{4}$ per cent at an expense of $2\frac{1}{2}$ per cent. If you adopt this resolution I think

that the dealers with the new conditions coming into effect will lower their bids ("Oh, no.") It is impossible for a dealer with a loss of the 1 lb. draft to bid at the same rate as one who had before got the allowance. I refuse to agree to this proposal for the abolition of the draft. In the price the buyer pays the draft allowance is allowed for. I do not like the system, but the point in favour of the alteration is really the need for more simplicity in our books. Had the buyers been approached differently and the matter put to them differently, in all probability they would have agreed to the change. I think we could have approached them saying we wanted to do away with the draft in order to get more simplicity in our books, and we could have said that we expected to receive lower bids on account of the abolition. (A laughter.)

The motion was carried with only one dissentient.

The proceedings ended in a vote of thanks to Sir H. Seymour King for presiding, Mr. Stopford Sackville, who proposed it, remarking amid laughter that the buyers at their mass meeting had produced a Lord Mayor, but that the growers had gone one better, for they had played the King.

THE GEOLOGICAL SURVEY.

It is, as we supposed: the services of Mr. Oldham have neither been lent by the Indian Government nor is he under an engagement to stay in Ceylon at this time. Mr. Oldham is on furlough, and, having been in correspondence with His Excellency Sir West Ridgeway as to a Ceylon Survey, he has utilised part of his holidays to visit Ceylon in order to get an idea of what is expected by the Ceylon Government, to have a look at the country and, perhaps, to give his opinion as to how a Survey should be carried out. In the first place, it is no secret that Mr. Oldham is of opinion that, in Ceylon, a Geological should be combined with an Agronomic Survey—as has been done in some parts of India with markedly useful results. This brings the work into close connection with the future Agricultural Department or Board, if such should be the outcome of the Agricultural Commission. It should be remembered that Agriculture often benefits even more than Mining by a Geological Survey, not simply from what may be said (agronomically) of soils; but in the discovery of phosphatic rocks or deposits. Besides plumbago, Mr. Oldham is interested in the mica of Ceylon, and he tells us there is one kind exported from this island—probably that found in Uva, below Haldumnulla?—which is very rare in India and is much prized; while the more ordinary kind (probably found in our Western districts?) is commonly associated with phosphates which are of special value in agriculture. Will any of our readers acquainted with mica deposits or workings in the island, kindly inform us of the same, so that Mr. Oldham may be able to judge whether he can visit the place or places during his present stay in Ceylon?

THE AGRI-HORTICULTURAL SHOW.

So much has been written by way of description in our columns that we have only left the pleasant duty of congratulating the

Committee—and especially the Working Committee—on the great success attained with the present Exhibition. Whatever minor defects may be pointed to by critics, no one can deny that the Show as a whole gratified the very large gathering of visitors and admirably answered the end of bringing together, for purposes of comparison, useful products and works of art as well as specimens of live-stock. If we may trespass on the rôle of our reporters, we would remark especially on the floral display, which was very delightful; while regretting with Mr. Nock (who was as usual enthusiastic in his work of arranging and judging) the inadequate show of ferns. For Colombo this was certainly inadequate. In one or two other sections there was room for improvement and we may agree with one gentleman that a little more advertising immediately before the Show would be good. Say for a month previous that a single prominent line about the coming Exhibition appeared in the daily press. But really the wonder is that the indefatigable Honorary Secretary, Mr. Driberg survives his many and prolonged labours. It is questionable, in fact, whether Government does not want to kill off this most useful officer; for even now, what with Exhibition and Commissions, Mr. Driberg will be as three single gentlemen rolled into one, even after he has got his hands clear of the present Agri-Horticultural display. May he survive them all and get the substantial reward he will have so fully earned, apart from the comforting assurance that his work is one directly and decidedly for the public good. We trust further that the COLOMBO AGRI-HORTICULTURAL EXHIBITION may be considered to be established on a firm basis as an annually recurring event, whose influence for good is bound to widen and increase with each succeeding year.

THE INSECT ON YOUNG TEA IN THE MORAWAK KORALE.

A LOCAL EXPERIENCE—NOT LIKELY TO SPREAD.

The attack on young tea in a corner in Morawak Kerale must be quite a local matter, of no special importance as regards the industry generally even in the district referred to. We must, however, confess that we have not yet identified the insect concerned and that from the account given to us lately by the Visiting Agent, it is a novel as well as mischievous and very disagreeable visitor. It cannot be called a beetle, for its motion is crawling after the fashion of the lowest form of life. It is discovered crawling up the tea bush in all sizes from a green speck up to a creature half-an-inch long by one-fourth at widest, nearly oval, green like the tea-leaf save for one or two reddish or orange specks; but the striking peculiarity is in small bristles on the back and sides which when touched give a decided electric shock. This, of course, prevents the coolies from touching them with their hands and the process of gathering is therefore a slow one. There is no sign of the surrounding jungle being affected by them; but they do not despise

cinchona leaves, while the tea leaf they devour, from the toughest to the tenderest. Still, an insect of this kind attaining an appreciable size can be dealt with as a local matter; a deep trench may perhaps prevent its crossing from one field to another, as its locomotion is so slow and altogether it is a very different matter from a fungus pest blown about by the wind, or even from helopeltis which spread and multiply so quickly and resist wind. Still such insects as the present one can do much harm while their day lasts—ten acres of tea stripped to the bare stems and branches (no wood is touched) is no joke; but in Darjiling we read in one year of a 100 acres of young tea being destroyed as soon as planted by a sudden outburst of a white grub beetle. We can see nothing in Cotes' "Tea Insects of India" to answer to the Morawak Korale visitor. We are inclined to think it must be of the weevil family, and here is what Nietner says of one of the kind which had consumed every leaf of coffee on fields in Maturata:—

Arhines (?) destructor.

This is a beautiful green weevil, $2\frac{3}{4}$ long and 1" broad, oval, narrowed in front, covered all over with closely set but isolated gold-green scales, winged. The head is rather short and blunt; antennæ apical, elbowed at the middle, the part beyond the middle being composed of eleven joints, forming a club towards the end, the third joint from the tip being the thickest; they are brown, hairy beyond the middle; the thorax is plump, subconical; the anterior legs are the longest, the second pair the shortest, the tibiæ and tarsi of all are hairy, the tarsi with hairy brushes underneath, especially thick at the third joint which is deeply 2-lobed; the tibiæ of the second pair are long, serrated inside, curved and 2-hooked at the apex. The insect varies considerably in size and colour.

This pretty beetle is common during the dry weather, but I have never found it do any injury to the coffee. Mr. James Rose, of Maturata, who first directed my attention to it, wrote to me:—"The mischief they do to the coffee is really frightful, and if they were as plentiful as the bug, they would be our worst enemies. Five or six acres were completely covered with them, and they consumed almost every leaf. Year after year they appeared upon the same place. This year they appeared upon a neighbouring estate in great force, and ran over at least forty acres. The same thing occurred on three other estates." Mr. Rose conveys a pretty picture to the mind of the entomologist by stating, that in May, when these insects disappear, the logs and rocks may be seen strewed with their bright green elytra.

The family of the weevils is one of the most extensive amongst the beetles, and many of its members both here and in Europe do much injury to agricultural produce. I have seen nearly the whole sweet potato (*Batatas edulis*) crop of the Neginbo district destroyed by one of them, the *Cylas turcipennis*. The common rice-weevil, *Sitophilus oryzae*, is another instance, and one of the coconut destroyers of the low-country belongs also to this family, the *Sphoenophorus platanipennis*.

We now await further specimens from the Morawak Korale to send to Mr. Haly of the Museum to examine under the microscope.

TEA-DRINKING IN RUSSIA.

(Special for "Ceylon Observer.")

"With regard to Russian tea and tea-drinking," a young engineer and surveyor, who was recently Assistant Engineer to a large

Railway Survey party in Eastern Russia, writes to us by this mail:—"The tea comes from China principally and is brought overland. I suppose the [Siberian] Railway will carry it soon. A Russian offers you tea immediately you go to see him, whatever hour of the day or night it may be. The *samovar*—a big brass kettle soup-tureen arrangement—is brought in, full of boiling water which is kept at boiling point by red-hot charcoal in a hollow inside. The tea is made in a small China tea-pot—about one to two inches deep of tea is poured into a glass tumbler and the rest is filled up with water from the *samovar*; a slice or two of lemon put in, and a couple of lumps of sugar thrown in, completes it. It is very weak, of course, with so much water; but they swallow so much of it that if it was strong they could not stand it. It is more straw coloured than English tea. It wants some practice to hold the glass, because it is jolly hot; the spoon always stops in the glass and the first finger of the hand holding the glass holds the spoon against the side opposite one's mouth when drinking. I understand that the Ladies of the higher aristocracy now drink it out of cups and with milk. Not being acquainted with any L's of the H.A., I have not seen this."

[Our correspondent's last letter appeared in our issue of January 24th, and his account of further experiences of railway surveying in Asia Minor will be given in another issue.—ED. T.A.]

WEST INDIA FRUITS.—The report of the Commission which was sent to the West Indian Islands to inquire into the causes of the bankrupt condition of the various industries in the colony was published in these columns at the time of its issue, and it was felt that the Government would be justified in holding out a helping hand in order that a fresh start in life might be given to people who had suffered long and struggled manfully against adverse fortune. There had been too much of the one-basket system; our Government is about to help to inaugurate a new state of things, and we may here briefly epitomise what it is the Colonial Department has made up its mind to do. A contract has been signed by Mr. Chamberlain with the Jamaica Fruit and Produce Association for direct fruit and passenger service between this country and Jamaica, and there are now four steamers being built on the Clyde and the East Coast to run between Southampton and Jamaica, the running to begin in May of next year. This contract will last for five years, and the ships will run fortnightly. The steamers will be fitted for fruit carriage, and will have storage sufficient for at least 20,000 bunches of bananas; a few passengers will also be carried. The subsidy proposed to be paid is £10,000 per annum, of which the Government will contribute half, to be increased to £12,000 if more passenger accommodation is required. Of course fruit other than bananas may be carried, but taste seems to have set that way, and we are asked to believe that 3 lb weight of baked bananas are quite equal to seven times that weight of wheaten bread. It is further stated that banana flour may be profitably utilised for the nursery as well as the adult *cuisine*; but the flour could, of course, be most profitably manufactured where the fruit is produced, as sugar where the cane is ripened.—*Gardeners' Chronicle*, July 15.

TO ALL PARTS OF ASIA, AFRICA, AMERICA AND OCEANIA.

Seeds & Plants of Commercial Products.

Hevea Brasiliensis (Para Rubber).—Orders being booked for the coming crop available in August and September. This is the only crop of seeds in the year. All orders should reach us before the end of July to avoid disappointment, as we have to make arrangements in time; guaranteed to arrive in good order at destination. We have already booked a large number of orders. A Sumatra Planter writes, dating 9th March, 1899:—"I consent to the price of £——per thousand. I herewith order 50,000 upon condition that you guarantee at least 33 % seeds germinating." Plants can be forwarded all the year round in Wardian cases. Price and particulars as per our Circular No. 30.

Ficus Elastica (Assam and Java Rubber).—Seeds supplied by the pound with instructions; price according to quantity. This tree grows equally well in high and low land, in forest and grass land, its cultivation being extended largely by the Indian Government.

Manihot Glaziovii (Ceara or Manicoba Rubber).—Fresh seeds available all the year round; price as per our Circular No. 31. It is superior to Mangabeira rubber and second to Para rubber.

Castilloa Elastica (Panama or Central American Rubber).—Seeds and Plants supplied; price and particulars as per our Circular No. 32.

Urceola Esculenta (Burma Rubber) and **Landolphia Kirkii** (Mozambique Rubber).—Seeds and plants, both are creepers.

Cinchona Seeds.—Different varieties.

Hybridised Maragogipe Coffee.—A large-beaned superior variety of Coffee in demand; seeds.

Santalum Album (Sandlewood).—The cultivation and felling of the tree is entirely under Government monopoly in India, Sandlewoods to the value of over £100,000 being annually exported to various countries from India. The cultivation of this useful tree is now receiving increased attention in other countries; seeds and plants.

Eucalyptus Marginata (Jarra).—Large quantities of this most valuable timber are being annually exported from Australia to London and various parts of the world for street paving and other purposes. Price of seeds on application. 7,846 pieces of Jarra timber has already arrived for Ceylon use.

Seeds and Plants of Cinnamon, Nutmeg, Clove, Kolanut, Pepper, Cardamom, Vanilla, Arabian, Liberian and Maragogipe Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit Trees, Shade and Timber Trees, also Palms, Bulbs, Orchids, &c.

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for Foreign Countries for 1899-1900 are now being forwarded to applicants in different parts of the world.

"SOUTH AFRICA."—The great authority on South African affairs of 25th March, 1899, says:—"An interesting Catalogue reaches us from the East. It is issued by William Brothers, Tropical Seed Merchants, of Henaratgoda, Ceylon, and schedules all the useful and beautiful plants which will thrive in tropical and semi-tropical regions. We fancy Messrs. Williams should do good business, for now that the great Powers have grabbed all the waste places of the earth, they must turn to and prove that they were worth the grabbing. We recommend the great Powers and Concessionaries under them to go to William Brothers."

A leading Planter writes from *New Hebrides* under date 17th January, 1899:—"I shall like a few more of your Catalogues to distribute through these Islands, as I feel sure many would place themselves in communication with you, did they know where to write for Seeds and Plants."

Our New Descriptive Price List of Seeds and Plants of Fruit Trees now being prepared and will be ready shortly.

Agents in London:—MESSRS. P. W. WOOLLEY & Co., 33, Basinghall Street.

Agent in Colombo, Ceylon:—E. B. CREAMY, Esq.

Telegraphic Address:

WILLIAM, VEYANGODA, CEYLON.

Lieber's, A.I. and A.B.C. Codes used.

J. P. WILLIAM & BROTHERS,

Tropical Seed Merchants,

HENARATGODA, CEYLON.

ANGLO-CYLON AND GENERAL ESTATES COMPANY, LIMITED.

Report of the Board of Directors, presented to the Stockholders at the thirteenth annual ordinary general meeting, held at 20, Eastcheap, London, E.C., on Tuesday, July 18th.

The Directors herewith submit their Report, and the Accounts, for the year ending the 31st March, 1899.

The net profit, with the balance of profit carried forward from the previous year, as shewn in the audited accounts annexed hereto, amounts, after payment of the Debenture Interest, to £18,650 7s 10d, and the Directors recommend the payment thereof of a Dividend of 4 per cent. on the Consolidated Stock of the Company. This Dividend will, if assented to by the meeting, be payable on the 1st August, 1899, at the London Office of the Company's Bankers.

In Mauritius the prices for Sugar in the course of the year under review sank, owing to the collapse of the Indian Market, to the lowest point ever known. Fortunately, however, the crop was remarkably abundant, and the cost of production per ton of Sugar was from this and other causes considerably reduced.

Towards the end of the financial year the Indian Market revived to some extent, in consequence of the confidence inspired by the legislation of the Indian Government, by which the foreign bounties were countervailed; the Money Market in Port Louis became easier, and serious difficulties in the Island were averted. 141,619 tons of canes were handled on all the estates in which the Company is interested, producing a crop of 13,526 tons of Sugar as against the very short crop of 8,916 tons in the year 1897-1898.

It is hoped that a condition of greater stability will prevail in the Indian Sugar Market, favourable to Mauritius interests, as an effect of the legislation to which reference has just been made.

In Ceylon the crop of Tea from the Company's Estates fell very short of the estimate owing to the persistent drought and cold wind experienced throughout the tea growing districts; and it amounted to 1,566,812 lb., only as against 1,584,236 lb. plucked from a less area in the previous year. From the same causes the Cocoa crop was reduced from 2,100 cwts. to 274 cwts., being less than one-seventh of its predecessor. The drought caused considerable damage on the Cocoa Estates, and the mortality among the young coconut trees was large; the Cocoa trees in bearing, however, are now reported to be looking well, and the Spring crop just harvested is stated to be satisfactory.

The prevalence of higher rates of exchange, as shewn below, further reduced the Company's profits in Ceylon, which were accordingly much below those of the year 1897-1898.

The gross price of the Company's Tea was 8.59 pence per lb. in London as against 8.17 pence in the previous year, and the gross price of the Company's Cocoa averaged 70/1 per cwt., as against 71/- per cwt. previously.

The result of the working of the Estates in Ceylon and Mauritius respectively is given in the Profit and Loss Account, calculated at the average rate of exchange of 1/4 $\frac{1}{4}$, as against 1/3 $\frac{3}{8}$ in the year 1897-1898.

The Chairman visited the Company's properties in Ceylon, the Straits and Mauritius, during the year, and the Board is confident that improved results will accrue from this inspection.

The condition of the Estates, both in Ceylon and Mauritius, is reported to be excellent, and the prospects for the current year to be encouraging. A statement of the acreages is given in the schedule annexed hereto.

Mr. Quintin Hogg, under the provisions of the Articles of Association, retires from the Board, and being eligible, offers himself for re-election.

The Auditors, Messrs. Welton, Jones & Co., also retire from office, and have expressed their readiness to act if re-elected.

TEA BLIGHTS—AND PLANT DISEASE.*

Just as we were about to publish a brief review of Mr. Masee's important little book on "plant diseases," there comes to hand a special circular by Mr. Willis on "Tea Blights" and how to deal with them, which we fully reproduce in our Daily and T. A. It will be very interesting now to compare what Mr. Masee and Mr. Willis say not only in description of the fungus pests affecting tea, but also as to "preventive means." Our tea planters are unusually fortunate in having the opinions of two such good authorities given simultaneously. We now proceed with our review of the book before us.

Mr. George Masee, F.L.S., Principal Assistant (Cryptogams), Royal Herbarium, Kew, is recognised to be at the head of his own Department in reference to diseases caused by parasites of vegetable origin, and from India and Ceylon, again and again, have references been made to him in regard to fungoid or other pests affecting tea, cacao or other products. His text-book of Plant Diseases will, therefore, be widely consulted; and as it is thrown into the form of a handy book of reference and is, moreover, freely illustrated with descriptions and advice put into plain language, it is just the little book—costing under five rupees in Ceylon—that ought to be in the hands of responsible planters. The preface opens as follows:—

The aim of this book is to enable those directly occupied in the cultivation of plants, and with but a limited period of time available for study, to determine the nature of diseases caused by parasites of vegetable origin; to apply in the most approved manner those curative and preventive methods which experience has shown to be most successful in combating the particular form of disease under consideration; and finally, to include in the daily routine of work precautionary measures which, without being costly, frequently prevent a slight disease from assuming the proportions of an epidemic.

An instructive introduction may be gauged from the following summary:—

Amount and kind of knowledge required by practical men—Familiarity with names and habits of parasites—Preventive measures—Cures—Rule-of-thumb methods of doubtful value.

And no less suggestive are the headings for the chapter on "Fungi":—

Nature of fungi—Saprophytes—Parasites—Mode of growth of fungi—Reproduction of fungi—How parasitic fungi infect their victims—How the spores of fungi are dispersed—Modes of dissemination of disease that can be prevented—Danger connected with pruning—Selection of shade trees.

There are chapters on "Lichens," "Algæ," "Myxogastres," and "Bacteria." Of more general interest is what is said of "Fungicides":—

Nature of Fungicides—Solutions—Powders—Bordeaux mixture—Ammoniacal solution of copper carbonate—Potassium sulphide solution—Iron sulphite solution—

* A Text-book of Plant Diseases caused by cryptogamic parasites by George Masee, F.L.S., Principal Assistant (Cryptogams), Royal Herbarium, Kew, London, Buckworth & Co. New York: the Macmillan Company, 1899.

Pernanganate of potash solution—Sulphur—Lime—Resin wash—Jensen's hot water treatment for wheat and oat smut—Paraffin—Formalin—Lysol—Resin compound—Fumigation with hydrocyanic acid gas—Sterilising soil—Poisonous properties of fungicides.

After this we are treated to some "Economic Considerations" on "Statistics relating to losses caused by grain rust in Prussia—loss through rust of wheat in Australia—destruction of vineyards in the United States caused by fungi"; and to an account of "Various methods of spraying—spraying apparatus"; and still again to "Descriptions, with preventive and curative methods, of the various kinds of parasitic fungi attacking plants of economic importance." Various useful indexes conclude the volume.

But now, in regard to the two products and their diseases in which Ceylon is at this time most concerned, namely tea and cacao, we reproduce all that Mr. Masee has to say even at the risk of some repetition. Here are three pests of tea:—

"BLISTER BLIGHT" OF TEA PLANT.
(*Exobasidium vexans*, Masee.)

Dr. Watt, who investigated the pests and blights of the tea plant in Assam under instructions from the Government of India, says of the present parasite; 'One of the very worst blights on tea is known to the planters as Blister blight. I have seen hundreds of acres completely ruined by it.'

The fungus attacks the leaves, first appearing as a minute pink spot, which continues to increase in size: the under surface of the leaf at this point becomes depressed, forming a circular pit, a corresponding bulging out appearing on the under surface of the leaf at the same point. Several of these warts of blisters frequently form on a leaf. The convex surface of the blister eventually presents a minutely velvety or woolly appearance, due to the formation of the fruit of the Fungus on the surface of the blister. The first fruit consists of small, one-septate conidia, which often commence germination *in situ*. These are followed by basidia, usually bearing two spores each. Sometimes fruit is also produced on the concave side of the blister.

When the disease has gained a foothold on the leaves, it also frequently attacks young shoots.

PREVENTIVE MEANS.—Dr. Watt states that the disease 'invariably appears on tea that has not been pruned in the autumn. About April it extends to the pruned tea, which has by then come to leaf.' As to whether it would not be wise under the circumstances to prune all plants, lack of practical knowledge prevents me saying; however, the statement suggests that the mycelium is perennial in the branches, and produces the first crop of spores the following season, which are carried by wind to the pruned trees. In addition to collecting and burning diseased leaves, it is absolutely necessary to cut off all diseased branches.

Ascertain that the fungus is not also present on wild plants in the neighbourhood of the tea plantations.

Watt, *The Pests and Blights of the Tea Plant*, p. 419.
Masee, *Kew Bulletin*, 1898, p. 109, figs.

"GREY BLIGHT" OF TEA PLANT.
(*Pestalozzia guepini*, Desmaz.)

Said by Dr. Watt to be one of the most destructive and dangerous of parasitic fungi to which the tea plant is liable. It occurs in Assam and Cachar, and probably in all the tea districts of India, also in Ceylon. The disease first appears as minute, brownish-grey spots on the upper surface of the leaves. These spots gradually increase in size and coalesce, forming large, irregular blotches, which finally become grey and sprinkled with minute black points, the fruit of the fungus. During the increase in size the blotches are often bordered by a dark, slightly raised line. Diseased leaves are not at all blistered or swollen; in fact the grey patches are thinner than the uninjured portion of the leaf, owing to collapse of the tissues.

Dr. Watt states that the disease commences for the most part on one side of a bush, very often on the same side of all the bushes over an effected plot—a circumstance that may be taken as indicative of the germs having been wind-conveyed.

In addition to growing on the tea plant, *Pestalozzia guepini* also occurs as a parasite on other species of *Camellia* and on *Rhododendron* in India; in Europe it is not uncommon on cultivated camellias and rhododendrons. In the United States it also occurs on introduced species of *Camellia* and *Citrus*, from whence it possibly passed on to the native *Magnolia*. Finally it is known to occur on indigenous plants (*Niphobolus*) in New Zealand, and on *Alphitonia* in Queensland.

PREVENTIVE MEANS.—The remarks I offered in the *Kew Bulletin* are repeated here. If the diseased leaves were collected with the amount of care and intelligence exercised in collecting sound leaves, and burned at once after being collected, the disease would soon be stamped out, as the mycelium of the fungus is not perennial in the tea plant; consequently infection and a recurrence of the parasite depends entirely on inoculation by the numerous conidia or reproductive bodies of the fungus present on diseased leaves. Remembering the very different kinds of plants on which the fungus is known to be parasitic, it is very probable that it also occurs on wild plants growing in the vicinity of the tea-gardens. If such proves to be the case, all such plants should be removed if practicable, as the conidia of fungi are carried considerable distances by wind, birds, and insects, and no amount of attention in the way of removing the parasite from the tea plants would avail if the supply of conidia requisite for inoculating the tea plants were formed on other plants growing in the neighbourhood.

Watt, *The Pests and Blights of the Tea Plant*.
Masee, *Kew Bulletin*, 1898, p. 106, figs.

THREAD BLIGHT OF TEA PLANT.
(*Stilbum nanum*, Masee.)

Indian tea-planters have known this most destructive fungus for at least the last thirty years. The name 'thread blight' is given on account of the very thin strands or films of white mycelium that are firmly attached to the branches and under surface of the leaves of the tea plant. The mycelium also runs under the surface of the branches, living in the tissues of the bark, and coming to the surface here and there to spread over the outside of the leaves and twigs.

The fruit only appears to be formed on very old, rotten branches that have fallen to the ground and become decayed, and resembles pins in miniature—a very slender stem and a round head, the whole not half a line high. Repeated observation proves the fruit to be very rare, and infection from spores may be left out of consideration, except in the case of reclaimed ground, where the trees have been neglected for some time.

The amount of evidence forthcoming seems to suggest that the mycelium travels underground, and first attacks the root, afterwards passing up the stem, either externally or internally, always finally coming to the surface.

PREVENTIVE MEANS.—It seems to be generally admitted that thread blight is common in the jungle on various plants; and to prevent its spread to the tea plants, narrow trenches should be kept open. These need not be very deep, as underground mycelium runs near the surface. By similar means, diseased patches in the plants should be isolated. Prunings should be burned and not buried, as each buried mass may prove a centre of infection. If quicklime is available, and not in other respects injurious to the tea plant, a shallow trench should be made round the stem, filled with lime, or lime mixed with sulphur, and covered over with soil.

Spraying with Bordeaux mixture or with potassium sulphide would check the external spread of the mycelium on the plant.

Cunningham, *Scientific Mem. Med. Officers of Army of India*, pt. x. p. 20.

Masee, *Kew Bulletin*, 1898, p. 111, figs.

We now take over what Mr. Massee has to say on Cacao and Coffee diseases. As regards "Cacao," we are told of:—

CACAO POD DISEASE.

(*Phytophthora omnivora*, De Bary.)

This disease has been recognised for some years past but has recently become much more general and destructive to cacao pods in Trinidad. The same fungus is probably the cause of the cacao pod disease in Ceylon.

The symptoms of disease are a darkening of the 'shell' of the pod, which almost invariably commences at one end, and gradually extends over the entire surface. After a while the fruit of the fungus shows on the surface as a delicate white mould, often appearing first in the furrows on the surface of the pod.

The white mould represents the conidial form of reproduction, and lasts for some weeks, the numerous conidia produced being carried by wind to other pods, which in turn become diseased.

The mycelium of the fungus permeates and destroys the entire substance of the pericarp or 'shell,' and often also attacks the seeds. Numerous resting spores are formed in the diseased fruit, and are liberated when the tissue decays, when they germinate and start the disease the following season.

PREVENTIVE MEANS.—Spray with dilute Bordeaux mixture, commencing when the fruit is quite young, and continue at intervals as required.

Remove all diseased fruit from the trees, as when once attacked it is valueless, and only serves to spread the disease if allowed to remain.

Do not allow diseased fruit or shells' to remain on the ground in the plantation, as the commencement of the disease each season depends on resting spores present in such material.

The fungus is known to attack a large number of different plants; and it will be important to ascertain whether it is present on other plants in the neighbourhood of the plantation. Seedlings are often attacked.

The disease is most abundant in low, damp situations, or where the trees are much shaded.

Massee, *Kew Bulletin*, 1899.

CACAO DISEASE.

Mr. J. B. Carruthers, who has spent some time in Ceylon investigating the destructive disease attacking the cacao tree, has published his report, of which the following is a summary. The name of the fungus causing the disease is not given, but the account leaves little doubt that it is a species of *Nectria*, allied to the species causing canker in the wood of the apple tree.

The first indication of disease is a darkening of a patch of the cortex; if this patch is cut out it is found to be soft and of a claret colour and full of moisture. At a later stage minute white pustules appear, especially in cracks; these eventually become pink. During the white stage very minute oval conidia are produced in immense numbers, and later on larger, crescent-shaped conidia appear. Finally, when the cortex is dead, or nearly so, a third asclerous form of fruit develops; the sporangia being globose, crimson, and grouped in clusters.

The disease often spreads rapidly; in one instance a diseased patch more than two feet long, and reaching almost round the tree, had formed ten days after inoculation.

PREVENTIVE MEANS.—The most satisfactory method is to cut out the diseased patch, along with a margin of apparently sound cortex. Covering the wound with tar is not recommended.

Carruthers, *The Tropical Agriculturist*, Nov. 1, 1898, p. 359.

Finally, here is how our poor old coffee and its bitter fatal foe are treated:—

COFFEE LEAF DISEASE.

(*Hemileia vastatrix*, Berk. and Broome.)

This terrible scourge, which was first observed in small quantity on a single estate in the Madulsima district, which occupies the south-western portion of the hilly country of Ceylon, is now widely distri-

buted—India, China, Malay Peninsula, East Indies, Philippines, Natal, German East Africa, and probably wherever coffee is cultivated in the old world.

The leaves are most frequently attacked, spots being also sometimes present on young shoots and even on the fruit.

On the leaves the earliest stage of the disease is indicated by the presence of more or less circular, discoloured spots. These continue to increase in size for some time, retaining their irregularly circular outline, become pale yellow, and studded with bright yellow clusters of spores, which soon change to a bright orange colour. The patches show on both surfaces of the leaf, but the spores are confined to the under surface.

The spores are produced in dense clusters on the tips of hyphae which come to the surface of the leaf through the stomata. Those surfaces of the spore that are in contact when the spores are growing are smooth, whereas the outer, free portion of the surface is coarsely warted.

PREVENTIVE MEANS.—Very little success in this respect attended the efforts of those investigators of the disease, whose primary object was to discover, if possible, some means of checking the epidemic. Probably some of the modern fungicides, as Bordeaux mixture, etc., might prove more effective. Diseased leaves should be collected and burned on all occasions.

Full notes respecting the distribution of the different species of *Hemileia*, along with the dangers arising from want of discrimination in the selection of 'shade trees,' will be found on page 27 of this book.

Berkely, *Gard. Chron.*, p. 1157 (1869.)

Morris, *The Coffee Leaf Disease of Ceylon and Southern India*.

Marshall Ward, *Sessional Papers*, xvii., Colombo, Ceylon, 1881.

There are also two other "coffee diseases" reported, the account of which we may as well quote:—

COFFEE TWIG DISEASE.

(*Necator decretus*, Massee.)

Bursting through the epidermis of young shoots as minute white spots, which soon become orange-red and gelatinous. Said to be a destructive parasite on coffee trees at Singapore. Commencing at the tips of young branches and extending downwards. Removing diseased branches checks the spread of the disease.

Massee, *Kew Bulletin*, 1898, p. 119.

AMERICAN COFFEE DISEASE.

(*Stilbum flavidum*, Cooke.)

= *Pistillina flavida*, Speg.)

This disease is [almost as destructive to the coffee industry in the New World as *Hemileia vastatrix* is in the Old World.

The symptoms of the disease are unmistakable; circular whitish blotches occur on the leaves, often in considerable numbers, and are equally marked on both surfaces. Using a pocket-lens, very minute fungi resembling a miniature pin in shape, and of a clear yellow colour, can be seen grouped on the spots on the upper surface of the leaf. The berries are also sometimes attacked, being marked with circular spots. On the young shoots the pale diseased spots are elongated.

The disease occurs in Costa Rica, Venezuela, Guatemala and New Granada.

PREVENTIVE MEANS.—Although by no means a new disease, no serious attempt appears to have been made to arrest its progress. Being quite superficial, it is quite probable that spraying with Bordeaux mixture, or with ammoniacal solution of carbonate of copper, would prove effective. All diseased leaves and fruit should be collected and burned, otherwise spraying is of little avail.

STILBUM FLAVIDUM, Cooke *Grav.*, 1890, p. 11.—Forming circular bleached spots on living leaves, the bleached patches pass quite through the leaf; sporophores occur on upper surface of the leaf, gregarious on the patches, very minute, entirely clear yellow, 1-2 mm high, stem

• very slender, straight or flexuous, head globose; conidia elliptical or subglobose, 2-2.5 × 1.5-2 μ .

This is considered by Spegazzini to be a *Basidiomyce*, and renamed *Pistillina fluvida*; however, I have failed to find basidia, and so prefer to retain the species under *Stilbum*.

These are but samples of Mr. Masee's valuable work which we have much pleasure in recommending to the attention of our planting readers,—a supply of the book is shortly expected.

TEA BLIGHTS.

CIRCULAR FROM THE ROYAL BOTANIC GARDENS, CEYLON.

TEA BLIGHTS.—The following notes on tea blights have been prepared at the request of Mr. F. G. A. Lane, Chairman of the Planters' Association, and to a large extent in consultation with him. The immunity from disease that tea has enjoyed in so marked a manner for many years is now disappearing; many insect and fungus enemies, some of local origin, some introduced from Assam and elsewhere, are now attacking tea in many parts of the Island, and it behoves all interested in the cultivation to be upon the watch to recognize the signs of disease as soon as possible after they appear and to at once attack and as far as practicable eradicate the disease. The diseases are here, and all experience of cultivators in all ages and lands shows that such disease come to stay; they cannot be completely eradicated, but they can be kept in check if taken in time. Of course this involves a certain expenditure, but if the disease be early recognized and properly attacked this need not be large. Planters should make it a regular part of their work to learn to recognize the diseases and to teach this knowledge to conductors, kangaries, and coolies, and should remember that one diseased estate may reinfest all its neighbours in a few days, if there be any wind, and thus cause them much loss or trouble.

The two chief fungus blights that are attacking tea in Ceylon are the Gray Blight, well-known in Assam, and a blight which has so far only been noticed in Ceylon, and which I have called the Brown Blight. Both are now to be found in most of the districts, but the latter is the more common of the two. It is not always easy to distinguish without the aid of the microscope which of the two diseases is present in an affected leaf, but this is of less practical importance, as the effects of the two are the same, and also the methods to be adopted for their treatment. Several other fungi have been observed attacking tea, and careful watch should be given in case of any spread of these. When a disease is observed to be spreading, no time should be lost in dealing with it.

GRAY BLIGHT.—This disease is due to the attack of a parasitic fungus, known to science as *Pestalozzia Guenpinii*. It attacks tea in Assam, from which country it has very probably been imported with tea seed. It also occurs on camellias in India and Europe and on citrus (orange and lime genus) in America, as well as on other plants in various countries.

It is purely a leaf disease. It is found chiefly, if not only, on mature leaves, and does not affect the flush by direct attack, but reduces it by injuring the older leaves, on whose proper performance of their duties the rate of flushing largely depends. If many of the old leaves are attacked by the disease, the amount of flush may fall to less than half what it was before the attack.

The first thing to look out for is leaves showing dead portions. If part of a leaf is dead and shows a gray or brown colour, the probability is that it has been attacked by one or other of the blights we are now considering. Of course we know that drip of water on the leaf will produce this result, and it may also follow from the attack of insects; and sometimes from other causes. If the appearance results from any other cause than the attack of an insect or fungus blight, it is of little or no importance, is not in-

fectious, and will not spread, and consequently the removal of the few leaves that may come under this category need cost little in time or trouble. The blights are foes of a different order, and spread so quickly, when once started on an estate that they should be at once attacked. Therefore, bearing in mind that the blights in question are present to some extent in nearly all the districts, it will be good policy for planters to make a point of getting all injured leaves plucked and destroyed, as explained below.

In the case of the gray blight, the injured portion of the leaf usually turns of a light gray colour, which is fairly characteristic of the disease. The edge of the injured part where it joins the green part of the leaf is usually dark brown, and the edge of the yet living part where it meets the dead portion is yellowish when held up to the light owing to the destruction of the green-colouring matter which is going on under the attacks of the fungus, which spreads from the dying portions into the living. When the fungus starts from one spore only upon the leaf, the disease appears as a small gray spot, which widens rapidly, but remains approximately circular, except where its growth is interfered with by the veins or edge of the leaf. Most commonly, however, the fungus spreads from several places at once and forms an irregular patch, which may at length occupy almost the whole leaf. The patch is, however, usually bordered by a dark line, behind which, in the dead portion, may often be seen other faint lines concentric with it. These when present are very characteristic of the attacks of blights. As the attacked part of the leaf dies, it turns grayish or whitish in colour on the surface. On the dying portion the spores or reproductive organs of the fungus are produced in vast numbers. Millions may be formed on one leaf, and each one may, if it reach the surface of another leaf, cause an attack of blight there. The spores are extremely small and light, and consequently float in the air like fine dust, and may be carried a long way by wind, especially in dry weather. One estate may thus easily infect others to leeward of it, though the wind belts, now so general, will tend to largely check this. When a spore reaches the damp surface of another leaf, it promptly germinates and a few days a patch of disease appear on the leaf and new spores begin to form.

BROWN BLIGHT.—This is also due to the attack of a parasitic fungus, which appears to be new to science, and has been named by Mr. G. Masee, of Kew, *Colletotrichum Camelliae*. To the eye it closely resembles the gray blight: the chief distinction is that the attacked portions of the leaf turn to a reddish or chocolate brown colour as they die. The edge of the diseased part is, as in the case of gray blight, bounded by a dark line, and the adjacent edge of the green part of the leaf, into which the fungus is growing, shows a yellowish colour when held up to the light. The spores are chiefly formed on the under side of the leaf, and appear near the edge of the diseased portion as little reddish eruptions, about the size of a very small pin's head. In all other respects the appearance of leaves attacked by brown blight is practically much like that of those suffering from gray blight.

OTHER BLIGHTS.—Several other fungus blights may at times be found attacking the leaves of the tea plant, but the result is always much like that caused by the gray and brown blights—a more or less irregular diseased portion, the centre of which is dead and at the edge of the dark part an extension of the fungus into the still living portion of the leaf, which shows a yellowish colour where first attacked. One very common blight, found in all parts of the island, is the "Spot Blight," the affected leaves being covered with small, roundish gray spots, rarely as large as a 10-cent piece. This blight does less harm than gray and brown blights, but is troublesome enough, and is worth keeping down by the same methods as will be used for the others.

GENERAL PRINCIPLES OF TREATMENT.—When the disease has been recognized on leaves that have been largely damaged by it, a close study should be made

of the features described above, and early stages should be looked for on other leaves until the attack can be recognized at a very early stage, even before the gray or brown colour has begun to show (when this shows it means that that part of the leaf is dead or nearly so and is beginning to form spores to spread to new leaves). By tracing backwards this way a series of stages may often be found, and it will be seen that when the disease first begins it is indicated by the leaf at the points of attack beginning to turn yellow, especially at first upon the upper side. This appearance can be produced by artificially infecting the leaf with spores from a diseased leaf: the yellow colour will make its appearance in a few days after rubbing with a diseased leaf, unless it be very dry weather. This experiment is best tried indoors with a branch of tea cut and placed in water, and as soon as the leaves begin to turn dark-coloured they should be burnt before they can produce any new spores.

The general principle to be kept in mind in any attack on the leaf parasites we have been describing is this: the disease is confined to the leaf, and is not perennial there; to survive for more than a limited period it must be able to form spores, which may reproduce the disease on new leaves. If, then, we can destroy all leaves bearing the disease, we shall at once reduce the extent of the attack very much. There will still be many spores about, however, and these will soon cause a fresh outbreak. If the new crop of diseased leaves be plucked and destroyed, a further reduction of the disease will be made, especially if the destruction be carried out before any new spores are formed. The next crop of disease will be smaller, and if we go on upon the same lines the disease may at length be practically stamped out. In theory this would be quite possible, but in actual practice the expense would be prohibitive, and we must simply do the best that can be done within reasonable limits of expenditure, remembering that the great object in view is to destroy all existing spores and prevent the formation of any new ones. Leaves begin to form new spores soon after the gray or brown colour appears, and leaves which drop from the bush will produce spores as they lie on the ground.

METHODS OF TREATMENT.—The chief measure recommended is constant plucking and burning of all diseased leaves. On most estates, at moderate or high elevations, the cold prevents the very rapid formation of new spores, and probably if the diseased leaves be plucked at the same time as the regular flush this will be found sufficient. On low-lying estates, especially in warm damp weather, or where the blight is very common, probably at first it would be well to pluck twice as often. The regular pluckers may be provided with bags, or special podiyans put on to pluck the diseased leaves.

The leaves should be taken off right at the base, so as to leave no portion in which the disease may continue to grow.

The bags or baskets used should be airtight, otherwise the spores on the diseased leaves they contain will be simply sown all over the estate as the bags are carried about.

The contents of the bags should be immediately burnt when brought in and never left lying about, and the bags themselves should not be kept anywhere that they may infect tea bushes. It would be well perhaps to disinfect them before putting them away by aid of a little Bordeaux mixture or other poison.

The pluckers should be instructed to pluck diseased leaves by taking hold of the healthy portion. If they touch the diseased part they will be liable to get a number of the spores upon their hands, and then afterwards they will deposit these upon other leaves. Remember that fungus blights are very infectious. Do not allow an uninjured leaf to be touched by a diseased one or by hands which have touched a diseased one, if it can be helped.

Plucking of diseased leaves should be done through the estate in the direction of the wind as far as possible. If the diseased leaves be removed from a field which has other diseased fields to windward of

it, the former will be reinfected from the latter. Special care should be taken not to allow fields that lie to windward of other estates to become infected with disease.

If the ground be covered with dead leaves on a part of the estate where there has been blight, many of these are sure to be covered with spores. They should be swept up and burnt or buried with a little lime, say, an ounce for each bush.

Special onslaugt should be made upon disease at pruning time. The diseased leaves, including those that show any sign of the yellowing above described, should be plucked and put with the prunings, and the whole, together with all dead leaves and twigs lying on the ground, should be burnt or buried. If a little manure is buried with the prunings their decay will be more rapid, and the fermentation set up will help to destroy the spores.

The most common method of attacking leaf parasites—spraying—is impracticable in most cases on tea estates on account of the steepness of the ground, the cost of application, and the great difficulty of getting a fine enough spray to cling to the hard glossy leaves of the tea. If only one small patch of disease is found on an estate, however, it might be worth while to spray the bushes there and all those round them, after plucking and burning the diseased leaves, with Bordeaux mixture, as described in the circulars on cacao canker. Care must be taken that the spray is so fine that it hangs in the air like a mist, otherwise it will form drops on the leaves and run off. The spray should be applied to the debris on the ground as well.

These notes have been hastily put together from incomplete knowledge of the diseases as present in Ceylon. Planters would confer mutual benefit upon one another by making notes upon the extent of the disease, the methods tried for reducing it, their effect, and so on, and communicating these to me on my return towards the end of the year.

JOHN C. WILLIS,
Director, Royal Botanic Gardens.
Peradeniya, June 6, 1899.

COCONUT PLANTING IN VEYANGODA.

A PLANTER writes:—"We have not your quick growth of Rajakadaluwa to show. In this district, the soil, which is generally stiff, has to be quite conquered by the roots before the palms are in full bearing—or say 10 to 15 years to come into bearing, and 20 to 25 to get to full bearing, which should last 40 to 50 years under care and cultivation; and then the decline might commence. That is my idea and observation. Trees slow of growth last longer than quick growers—nature's compensation; and I believe our trees will last longer than those of Rajakadaluwa; but I agree with you that trees on soil like the latter can be maintained in good heart, long enough to be a really good investment by liberal treatment. In a reclaimed paddy field and in a sandy loam patch, my trees have come into bearing in five and six years, but that is exceptional. The village theory is that the trees here benefit by proximity to the clouds! This estate was opened in patches, first by Sir R. F. M., 27 or 28 years ago; then completed by H. D. Andree 17 or 18 years ago. Little was left for me; and my patches of five to eight years are very promising.

"My best recommendation for nuts here is that Mr. Jardine is a buyer of local seed. He took 4,000 last February, and last week we sent him 4,000 more. I wish the natives understood the exchange and improvement of seed better.

"My acreage in bearing is about 120 acres of coconuts, and I got 292,000 last year; and my June

crop this year was 92,000, so that I shall be safe for about 325,000 this year. I shall be quite content to get 750,000 nuts from my 250 acres; but prices here are generally good. Rajakadaluwa seems more hopeful; and the experience recorded with a 10-year plantation fairly justifies it; while mine is 18 to 28 years."

We have had the pleasure of visiting the estate referred to, and may add that the trees, doubtless as a result of utmost care expended on them, show an exceedingly solid build. The straightness of the trunks was remarkable, and, though slow of bearing, on the older trees almost without exception we saw fine clusters of large nuts. The grass beneath the palms seemed of excellent quality and kept exceedingly clean, so much so that it brightened up one's dimmer recollections of an English garden far more than the bare earth of the tea-field could ever do. The cinnamon shrubs looked exquisitely fresh and green, and the prospering verdant growth of these bushes seemed to drop into the place of the border of laurels beside an emerald lawn in the home country—the land of many a spacious park and smiling hedge-row.

THE FUTURE OF CINCHONA.

The note which we published last week regarding the trouble in the Company which established the Bandung Quinine Works, was fair evidence that all is not happy there, but more recent news which has come to hand indicates that the trouble has been smoothed, if not settled, and, a decision arrived at which will have a far-reaching influence upon the supply of cinchona bark and quinine to the world. On the 16th ultimo, a meeting of bankers and cinchona-planters was held at Bandung to consider the whole question of the export of cinchona and quinine, when it was decided to establish in Batavia a regular cinchona market, whence the bark will be sent and sold by auction to exporters. At the same time an agreement was entered into with the Bandung Quinine Factory, under which that Company agree to send to the Batavia market before the end of January, 1900, not less than 10,000 kilos. (350,000oz) of quinine sulphate for disposal by auction, and the Company also undertake to supply advance samples of the quinine, so that samples may be distributed to buyers in the neighbouring colonies, and in Australia in October next. These are the brief details which have come to hand by cable. Brief as they are, it will be seen that they embody a principle which has not hitherto been recognised by the cinchona planters, and it is evident that, if the planters are all in it, and stick together, the days of cheap bark and quinine under 1s per oz. are practically over. It is well known that the planters live by virtue of advances made to them by bankers and financiers, who have always grumbled at the want of control over the European markets. This new proposal seems to supply what they lacked, for it will at least give them the grip on the local market, and ensure minimum rates for the bark—always assuming, of course, that there is in Batavia a sufficient number of buyers to ensure the competition requisite for fair prices. The Java people have learnt by the incidents of this year that the world is practically dependent upon them for this indispensable drug, and although speculators are mainly responsible for the great appreciation of bark and quinine, the speculation was based upon the insufficiency of Java supplies. Seeing, therefore, that the supplies to the European market will, in future, pass through the Batavia gauge, and that that gauge will be controlled by those having pecuniary interest in keeping it high, it does not seem likely that we shall see a return to penny units. India and Ceylon are now out of the running in cinchona production. They cannot grow the rich Ledger trees for want of the suitable soil at

the requisite elevations. Gradually India is dropping all the species except Officialis, and although Mr. Standen's visit to Java may help him to more hopeful experiments on the Indian Government plantations, no market influence can be looked for from that quarter during the next dozen years—if ever. We are in the hands of Java, and the Batavians know it. When the new Convention comes into force the despatch does not say, but we imagine that it is forthwith.—*Chemist and Druggist.*

SCIENCE AND TEA.—Replying to various enquiries made by Sir Patrick Playfair, Dr. George Watt, Economic Reporter to the Government of India, has stated at some length his views in regard to the employment of a scientific officer for the tea districts. His remarks—says the *Madras Mail*—will be of considerable interest to planters throughout India, for they are an exposition of the need that there is, not for one scientist but for several. Dr. Watt says, in fact, that he would urge "that there is not scope for one scientific expert for a few years but for half a dozen for a life-time." As, however, it is improbable that the Indian Tea Association can afford to employ more than one, and as the Government does not appear disposed to do more than assist the Association in regard to one scientist, we need not at present travel beyond the question of what particular branch of agricultural science that one should deal with. After showing that one man could not be an expert in the several very important branches that need investigation in the tea districts of Northern India, Dr. Watt brings the matter to a point by saying that if funds will not admit of the whole question being dealt with, the Association should decide whether it wishes to secure a biologist (a) to investigate pests and blights and discover remedies; (b) to bring to light practical improvements in the quality and treatment of the plant, or (c) to suggest improvements in methods of manufacture. As regards the investigations conducted by himself in Assam, Dr. Watt explains that they lasted only two months and a half and were conducted in only one district—Assam. On the point of probable cost he states that if an officer were employed permanently, it might be possible to get a Doctor of Science with special qualifications in the chemistry of plant-life for R1,000 rising by annual increments to R1,500. If only engaged for a term of five years, the expert should receive not less than R1,500 a month, all expenses paid to and from India, and customary travelling allowances. A central head-quarters is desirable—Shillong, if work is to be conducted in Assam alone; if it is to extend to Darjeeling, the Duars, Assam, Cachar, &c., Darjeeling might prove to be the best place for the head-quarters laboratory, if Calcutta be thought too far off; but in that case there should be small laboratories also at Dibrugarh and one or two other centres. A distinct period of every year should be spent on tour, and every garden under the Association visited in turn. A hard and fast rule should also be made that every discovery made by the scientist becomes the property of the Association, and that he should not be allowed to patent any process or method within a fixed term of years.

PLANTING NOTES.

THE MOROWAK KORALE TEA PEST.—The further specimens of the devastating pest that has been at work on Sylvakande, which we received—included as we stated several cocoons. These we submitted to Mr. Mackwood, as before, for inspection, and the verdict tells of the fertility of the pest. The fact that several of the ‘caterpillars’ are found clustering together in forming their cocoons shows that they have been allowed to spread far too prolifically. Other specimens of cocoons of the same pest have been received in Colombo today and a careful examination of them shows that the moths have escaped from *every one!* Nothing but the severest measures, cutting down the bushes and burning the prunings—cocoons and all, will prevent a large extension in the work of the “grub.”

PLANTING AND AGRICULTURAL PESTS.—The absolute necessity for a Cryptogamist as well as Entomologist on the Government Staff is every day becoming more and more apparent. The sooner the “gray” and other blights are investigated on the spot, the better for all concerned:—*taxpayers and Government* as well as the planters. We speak unto wise men (if there are any such in the Executive),—judge ye what we say. A leading planter writes today on the serious character of the tea blight in some parts and the need of speedy investigation. He adds:—“Planters are burning and burying prunings—it must do good, but it will add to cost of production, and we do not seem to have any chance of a rupee less than 1s 4d. The only good thing about the rate is that it may check extensions into tea in India.” There is plenty for Cryptogamist as well as Entomologist to attend to, in respect of the staple and other industries of the country.—Since writing the above the letter from Mr. Chas. Gibbon comes to hand, taking the same strong view with regard to cacao.

THE MOROWAKKORALE TEA PEST.—We have two interesting letters on this subject, and both writers consider that a caterpillar is responsible for the mischief described on the 10-acre field of Sylvakande estate. Mr. Geo. Thornton Pett identifies the insect as the *Parasa lepida* described by Mr. E. E. Green, while “Thosia Recta” considers another caterpillar of this name is to blame. One difficulty is to reconcile Mr. MacLean’s description of the insect (and the absence of any sign of cocoon or moth) with either of these caterpillars. Mr. Pett refers to Nietner’s *Limacodes Graciosa*, and we quote what he says in our daily and T.A. The only thing to settle the matter now is to get fresh specimens from the Superintendent of Sylvakande, and we are glad to see Mr. F. Mackwood mentioned as able to help in identification as Mr. Haly may be absent from Colombo. Mr. Mackwood is inclined to think the caterpillar must be the *Parasa*; but he can only be sure on seeing specimens which we hope will come by an early post. Meantime he advises the tea attacked to be pruned down to the ground and all the prunings burnt, lest there should be an outburst of moths flying all over the estates and depositing their eggs.

TEA CONSUMPTION IN GERMANY.—Mr. Frederic Harford, Second Secretary in Her Majesty’s Legation at Munich reports that the consumption of tea in Germany, which averaged ‘05 kilo. per head up till 1897, rose to ‘07 kilo. per head in 1898, and the imports of tea from 2,669 tons in 1897 to 4,116 tons in 1898. This increase is chiefly due, he says, to the import of tea from China, rising from 1,661 tons in 1897 to 2,593 tons in 1898, from which it would appear that Indian teas are not so much appreciated in Germany as Chinese teas. In any case coffee is still the national drink of Germany, and not tea, *which is twice as dear as it is in England.* [We italicise the last few words, as a hint to South Indian planters and Ceylon.—ED. T.A.]—*Planting Opinion.*

THE TEA CRISIS.—Here is how the *Indian Daily News* refers to this subject. It will be observed that the system of “outside” sales in Calcutta is considered as more objectionable than the open sales of Colombo:—

Yesterday’s Meeting of the Tea Association which was convened to “discuss the situation with reference to the stoppage of public auction sales of tea in Calcutta in connection with the proposal to abolish the 1 lb. draft allowance on teas sold by public auction in London,” has afforded another sad exhibition of the lack of organization which has unfortunately distinguished the campaign so far. Nothing definite was decided upon, and as far as we can see, the meeting has only served to further impress buyers, and dealers’ agents with the weakness of the growers’ position. It was announced that the Ceylon men definitely refuse to stop the Colombo tea sales, thus affording the London dealers an easy means of filling their requirements.* How the Indian Association ever came to open the campaign, without first assuring themselves of the co-operation of Ceylon, is a pitiable example of the lack of the most ordinary business caution, and Indian growers, especially those who usually sell on the Calcutta market, have, we consider, a very genuine grievance against the Association, for the false position in which they have been placed. We understand the Committee have recommended a sale here next week for outside markets only, and meanwhile are wiring the London Association suggesting that sales and exports of Indian teas should be suspended for a fortnight. We are of opinion that these outside market sales are a great mistake, and should not be held. If sales must be held then have them open as in Ceylon. There is no doubt that at present Calcutta sellers are greatly dissatisfied at the way their business has been upset by the precipitate action of the Association, more especially as the majority of the Committee are not interested in this market, and are hurrying their crop to London, where the trouble will probably have ended one way or the other, by the time the teas arrive. Failing combined action, such as we have suggested by suspending all sales and shipments, we think the Association should immediately throw up the sponge and let the auction sales go on as before. If it be desirable to put an end to the system of giving 1 lb. of tea per chest to the London dealer, the sales in that city can be made under the condition that this privilege is to cease. This only means that buyers will give a proportionately lower price than they would have paid had the 1 lb. been given. The matter is as long as it is broad and makes no difference to the growers. What is urgently required is a campaign against the wharves, the successful issue of which would help both growers and dealers. Why does the Association shirk this duty? For no selfish reasons we hope.

* Not so easy as our tea sales have been very limited in quantity and chiefly for the benefit of other countries than Great Britain.—ED. T.A.

THE PINE HILL ESTATES COMPANY, LTD.

The sixth ordinary general meeting of this Company was held on the 11th, Aug. in the office of Messrs Mackwood & Co. Mr. Bowle-Evans occupied the chair (and the others present) were: Mr. T B Campbell, Mr. McGillivray, Mr. R E Prance; by proxy Messrs. Yeoll Thorne, Frederick Hunter, S H Dyer, Mrs. J Kennedy, Mr. C D M Hunt, Mrs. Prance, and Mrs. E L Owen.

The report was submitted as follows:—

The Directors have the pleasure to submit their Sixth Annual Report.

The unsuitable weather experienced on the estates both in the first and second halves of the year has resulted in a considerable shortage of crop, 124,000 lb., being manufactured against an estimate of 150,000 lb., exclusive of bought leaf.

In spite of this, the profit and Loss Accounts after writing off fifteen per cent for depreciation on machinery, shows a balance of R10,627-77

Which the Directors propose to use in paying at once a dividend of five per cent, absorbing R10,437-00

And carrying forward to the present season .. 190-77

R10,627-77

NEW CLEARING.—The 101½ acres has been nearly completed, and the Visiting Director reports that the work has been carefully carried out.

The Directors are of opinion that improved Teas might be made in a larger and better equipped Factory, and as this new expenditure will be necessary in any case when the new clearing comes into bearing they have authorised the expenditure of some of the uninvested capital on Factory extension, machinery and water-course. The work has already been begun and the estimate of cost is R12,200-00.

The Directors in view of shortfalls of crop in recent years, think that a regular system of manuring should be adopted, and suggest that one-third of the Estate should be taken in hand annually. Ninety acres for this year has already been begun.

According to the Articles of Association Mr. H. St. C. Bowle Evans retires from the Board of Directors, but being eligible offers himself for re-election.

On the motion of Mrs. KENNEDY, seconded by Mr. DYER, the report was adopted.

On the motion of Mr. PRANCE, seconded by Mr. CAMPBELL, a dividend of five per cent was declared.

Mr. Bowle Evans was unanimously re-elected a Director as was Mr. Guthrie an Auditor, and the proceedings terminated.

CEYLON INVESTMENT ASSOCIATION.

GENERAL MEETING.

The ordinary general meeting of the Ceylon Estates Investment Association, Limited, was held recently.

Mr. Robert King, Chairman of the Association, presided. In submitting the annual report, the Chairman said that the result of the year's working was £344 better than the previous year. It was still disappointing, however, owing entirely to the smallness of the crop through unfavourable weather. The crop for the past year was 237,152 lb., as against 255,820 lb., a decrease this year of 18,668 lb. While the crops were smaller, however, prices had been higher. For the current year the crop harvested since 1st April was 13,172 lb in excess of that harvested for the same date last year, so that, if it only kept up, the future prospects were very good.

The report was adopted.—*Dundee Courier.*

THE SCIENTIFIC OFFICER FOR THE TEA DISTRICT.

VIEWS OF DR. WATT.

The following is the text of the letter from Dr. Watt to Sir Patrick Playfair on the subject of a scientific officer for the tea district:—

DEAR SIR PATRICK PLAYFAIR,—I shall answer your enquiries categorically. You ask my opinion regarding the proposal to employ a Scientist to investigate numerous difficulties connected with the cultivation and manufacture of tea. Hitherto I have been consulted mainly as to the employment of an officer to investigate the problems that hinge on the pests and blights of the tea plant. It is true these would be very nearly covered by the investigation of the difficulties connected with cultivation, but I presume are altogether unconnected with the problems of manufacture. It would thus seem to me that the first step would be to definitely fix the field of operations contemplated for the proposed Scientific officer. If the Association expect to find a man capable to deal as an expert with every aspect of tea I venture to think that they are mistaken. It might be possible to secure a Biologist who could conduct useful and practical investigation into pests and fungal blights of the tea plant (but even here Entomology and Mycology are two widely different studies, and no single person can be an expert in both sciences). But that a Biologist could be an expert chemist at the same time, is contrary to all experience in such matters. Some few years ago the Association brought to India a chemist (Mr. Bamber), and he furnished a report which no doubt most of the members of the Association have read. Its practical value is, therefore, a point I need not deal with. At the present moment the Ceylon planters have engaged Mr. Bamber as Chemist, but they have secured also the services of Mr. E E Green, an Entomologist of the very highest European repute. Mr. Green is himself a tea planter of many years' experience, but has consented to become Government Entomologist mainly with the view to devote his entire energies to the investigation of the pests of the tea plant. With a Chemist and Entomologist at work, Ceylon may reasonably hope to make some progress, but I do not look with much favour to a scheme that would secure one officer, in the hope that he would be an expert on every scientific problem of tea planting. I should, therefore, recommend the Association to carefully consider whether they want a Chemist or Biologist as the first and most important consideration.

You ask me whether I approve of the proposal. Yes I do, subject to the qualification involved by the above remarks. That those responsible for the tea industry should bestir themselves to (a) discover remedies for the pests and blights, (b) to bring to light practical improvements in the quality and treatment of the plant, and (c) to perfect their methods of manufacture seem to be truisms that I should hardly be asked to state. I know of no industry of a similar magnitude where empiricism is allowed to have such limitless sway. In my report I have given numerous illustrations of diametrical opinions held by well informed and successful planters on almost every aspect of the industry. And this statement is admissible because of the immense capabilities and vast powers of endurance of the plant. Both opinions may be equally wide of the mark and the profits obtained far short of the practical possibilities. But there is a limit to this blindfold trusting to Providence and to the endurance of the plant, and that limit, in my opinion, is not very remote. I would, therefore, urge that there is scope for not one scientific expert for a few years but for half a dozen for a life time. If funds will not admit of the whole question being dealt with, the Association should decide whether they wish to secure a Biologist to investigate (a) above, or an Agriculturist to enquire into (b) or a Chemist to suggest improvements in (c).

You next ask me, could the officer work in connection with my Department. I have no doubt he could, and that I should be able to suggest many lines of enquiry that would save him from much loss of time through fruitless investigations. I was asked a similar question on a former occasion, and the Government of India submitted to your Association the appended passage from my reply (of which for convenience of reference I furnish herewith a copy). It will there be seen that I assumed chemistry was to be the primary qualification of the officer. That I also proposed (para 5) his association with the laboratory of this office, but that he would require several other laboratories and a camp laboratory to conduct investigations while on tour through the tea districts.

You next ask me how far my investigations would render the employment of such an officer desirable or unnecessary. My personal investigations were conducted in one province only—Assam. They lasted for 2½ months, and were and are now intended purely and simply as denoting the urgency of the work. If they serve the further purpose of affording a useful programme for detailed and final operations they will fulfil all that I ever contemplated. I may add, however, that my report has been so favourably received that I have been looked upon as more or less an expert and have been constantly consulted, since its appearance, by planters all over India. As the result, much new information has been brought to light, so that already a second edition (if called for) would be a considerable improvement on the first.

What remuneration should the scientific officer receive?

The answer to this question turns on the term of years for which employed. If the Association were to seek for the services of an officer to be permanently employed the course which I should recommend—it might be possible to get a doctor of science with special qualifications in the chemistry of plant-life for R1,000 rising by annual increments to R1,500. This appointment would of course carry no pension, therefore would have to commence at a higher figure than would be the case with a Government servant. But if the appointment is to last only five years and it is desired to secure an officer of made reputation, the Association would have to offer not less than R1,500 a month, with all expenses paid to and from India. The Government of India engaged an agricultural chemist and paid R1,500. That circumstance, I think, is a fairly good reply to the question you put to me. Of course whether permanent or temporary, provision would have to be made for travelling-allowance, framed on the scale granted by Government to its servants, *viz.*—double first class ticket by train or steamer. This covers servants, excess luggage, etc. A halting allowance of R5 a day while away from head-quarters should also be made. In Assam everything is very expensive, hence the rates allowed in that province are higher than in most other provinces. The planters would no doubt assist the Scientific officer very greatly, but I may say that with all the assistance rendered to me, I was out of pocket by my tour in Assam, over and above the allowances made to me according to rules under which I come. I mention this circumstance in order to show that the scale I have proposed is the lowest possible rate that should be contemplated. In some instances Government commutes travelling allowances into a monthly grant, but I should think the Association would be safe in putting down R300 a month as sufficient to cover these charges.

Where should his headquarters be? That is a very difficult question to answer. Were he to be employed in Assam only I should instantly have said Shillong. There is no occasion that he should be confined to an unhealthy climate, or one in which laboratory work would be difficult if not impossible. But as he would, I presume, have to investigate tea in Darjeeling, the Dooars, Assam, Cachar, etc., Shillong might not be the most central. I half think that if Calcutta itself was thought too far off, he might be located in Darjeeling. But he should have a small house with laboratory constructed in Dibrugarh

and in one or two centres as well. I should insist that he spent a distinct period of every year on tour and visited in turn every garden under the Association. I should also lay down a hard and fast rule that every discovery he made, connected with tea, became the property of the Association. In other words he should not be allowed to patent any process or method within a fixed term of years.

I think the above fully disposes of all the questions raised by you, but if there were other points on which you wish my opinion, I shall be happy to be of service.—*Planting Opinion*, July 22.

WHITE SPOTS ON PASSION FRUIT.

Mr. A F T Somerville, of Kurrajong Heights, mentions, that nearly all the passion fruit in his district is affected to some extent by a little white spot. Mr. W J Allen, Fruit Expert, reports, that the spots are due to a fungus disease, which may be kept in check by spraying occasionally—when the fruit is small—with Bordeaux mixture, and later with ammonia carbonate of copper. The vines should be pruned well back once a year and receive in all three or four sprayings. Such treatment will entirely prevent the appearance of the disease.—*Agricultural Gazette*, July.

FERTILIZERS FOR FRUIT-TREES.

The manuring of fruit-trees has recently undergone considerable modification, it having been found that the plant food whose application is most beneficial is potash, and that it pays best to considerably increase the amount of this ingredient, the phosphoric acid and nitrogen being of less importance. It is better to limit the amount of nitrogen applied, and to apply this ingredient in quantity only if the tree requires it, and then in the form of a top-dressing, before the flowers are out, and not at a later stage. All manures for fruit-trees should be well worked into the soil.

For Citrus Fruits.

	No. 7.	
	Quantity per half ton.	Cost.
	lb.	£ s. d.
Bone dust	520	1 3 3
Superphosphate	250	0 10 6
Sulphate of potash	350	2 7 3
	10 cwt	£4 1
This contains—		
Nitrogen... ..	2 per cent.	
Phosphoric acid	15½ per cent. (4 per cent water-soluble).	
Potash	18 per cent	

Apply at the rate of 4 lb. per young tree, at a cost of little under 4d per tree, or £1 12s per acre of one hundred trees.—*Agricultural Gazette* (New South Wales), July.

THE COORG COFFEE CROP.

The official forecast of the coffee crop in Coorg for 1899-1900 is calculated at 1½ cwt. per acre for European estates and ¼ cwt. per acre for Native estates, and it is estimated that the total out-turn will be about 2,800 tons—2,100 from European and 700 from Native estates. The estimated average yield per acre of ordinarily well-cultivated coffee in full bearing for the present year is only 2 cwt. as against 3 cwt. last year. Last year's yield was estimated at 4,200 tons, and the toll-gate returns showed that 4,134½ tons had been passed through. The amount of coffee exported during the ten previous years was 33,268 tons, or an annual average of 3,326 tons. No particular reason is assigned for the comparatively small crop expected this year.—*M. Mail*

Correspondence.

To the Editor.

MORAWAK KORALE TEA PEST.

July 27.

SIR,—The caterpillar alluded to as having done damage on Silvakande is most probably *Thoesa Recta*. If the Superintendent will examine his bushes, he will probably find that a certain number of the caterpillars are spinning their cocoons. If he places a few cocoons in a box, he will (after they hatch out) be able to identify the moth, or butterfly. This is small and insignificant, but, if observed in large numbers, a look-out should be kept in the spots where they are seen; and the trees (on which the eggs are laid) pruned down, and the prunings burnt before the caterpillar hatches out. Prevention is better than cure, which is difficult. As the caterpillars can only crawl, a cordon of quicklime is about the best thing to stop their advance with. Carbolic spray and disinfectants appear to be of very little use. When the caterpillars begin to spin up their cocoons the affected bushes should be pruned and all prunings burnt.

The writer has seen two severe attacks in 1885 and 1897, on different estates at 1,500 odd feet elevation. In neither case was there any repetition of the attack in the following year. Neighbouring estates (rather than the one attacked) should be on their guard.

Mr. Frank Mackwood could probably tell a good deal more than the writer about this pest.—Yours, &c., THOSEA RECTA.

THE TEA PEST AT MORAWAK KORALE.

Pati Raja Estate, Elpitiya, July 23.

SIR,—Is it not possible that the tea pest now reported to have done such damage in the Morawak Korale is the blue striped nettle grub (*Parasa lepida*) described on page 66 of a little book by E E Green, called "Insect Pests of the Tea Plant," published by the "Independent" press in 1890. Mr. Green mentions that Nietner included the pest under the name of *Licomodes graciosa*, in his "Enemies of the Coffee Tree." Will you kindly look up Mr. Green's article on this pest and reprint it if you think the description applies.—I am, etc.,

GEO. THORNTON PETT.

THE BLUE-STRIPED NETTLE GRUB (*Parasa lepida*.)

There is a family of caterpillar (the *Lima* colidæ) many species of which are armed with stinging hairs, and which for this reason may appropriately be called 'nettle grubs.' There are several kinds that feed upon the tea plant, the most conspicuous amongst them being the larvæ of the *Parasa lepida*. They are gregarious and are sometimes present in such large numbers as to completely defoliate the trees upon which they are feeding. A neighbour who sent me specimens told me that more than fifty of them had been removed from two adjacent tea bushes, in another instance a group of four or five trees were left quite bare, and the superintendent, searching for the cause of the mischief, received practical demonstration of the stinging properties of the caterpillars.

The same species is frequently found on coffee and occasionally upon cinchona trees. Mr. Nietner included it, under the name of *Licomodes graciosa* in his catalogue of "Enemies of the Coffee Tree."

Upon the first occasion that I saw a cooly stung by this caterpillar, I had the curiosity to experiment with it upon myself. I touched it lightly with the back of my hand and immediately felt a sharp stinging sensation similar in kind to, but rather more intense than, that produced by the common stinging nettle. Small white lumps were raised where the poison had penetrated the skin. The pain though severe at first did not last very long.

The eggs are generally attached to the under surface of the leaves. Their form and colour make them very difficult to see. From fifteen to twenty are laid together closely overlapping each other like the scales of a fish, which they resemble also in their flattened oval shape. They are almost transparent; the dull-yellow ring-shaped embryo can be seen through the shell.

The full grown larva is of a brilliant yellow green colour, with a rich lilac stripe along the middle of the back, and a bright blue stripe on each side, each stripe bordered by a darker line of the same tint. The poisonous spines are arranged in tufts along the body; they are pale green, four tufts near the head and another pair near the tail tipped with scarlet; there are four large black spots at the hinder end of the body.

Specimens of this kind of caterpillar that have been feeding upon tea are much more brightly coloured than those that have been reared upon coffee leaves. The latter are ornamented with green stripes and shines upon a pale greenish white ground, they might easily be mistaken for a distinct species. Another peculiarity of these caterpillars is the rudimentary condition of their legs. *Their movements are more like those of slugs and snails than of ordinary crawling insects.* The cocoon of the 'nettle-grub' is hemispherical, of a dark brown colour, closely resembling the tea stems upon which it is usually placed. It is thin but very compact, formed of silk strengthened with a tough cement secreted by the insect.

The moth escapes from the cocoon by a lid-like opening at one end. It is a gaily coloured insect; its front wings are chocolate-brown with a broad emerald-green band stretching obliquely across them, the hind wings buff, tinged with chocolate at the margins; front and side of the thorax emerald-green, and a small spot of the same colour at the base of the two front legs.

As in the case of most of the leaf-feeding caterpillars, the injury to the tree is only temporary. The grubs when found should be removed and destroyed, but, under the circumstances, some other method than 'hand picking' will be found advisable.

July 29.

DEAR SIR,—The Superintendent of the estate attacked is apparently satisfied that it is the 'nettle-grub' described by Mr. E Green, and so-called on account of its painful stinging capabilities. The term 'grub,' by the way, is rather misleading, as it is usually applied to caterpillars which live underground. The 'nettle grub,' which is occasionally found feeding on cacao trees, and is apparently slowly increasing on that product, may easily be identified by its *excreta* which are cup-shaped. If the Superintendent of Silvakande is right, his simplest remedy is to prune every branch of tea, or other vegetation, on which either the caterpillars or cocoons can be found, and burn them before the moths emerge from their cocoons and a new brood develops. The caterpillars when disturbed cling very tightly to the leaves instead of dropping, as many species do, to the ground.

There must be something wrong in the condition of the affected tea fields to predispose them to such wholesale devastation as has been described, and the forking of the soil and the application of lime and wood ashes would probably be of great

benefit. Every tea-field in the neighbourhood should be carefully examined for caterpillars and cocoons. Specimens should be distributed through the district, especially to native gardens.—Yours faithfully,
STUDENT.

B. C. AFRICA : TEA AND COTTON.
REPORT OF EXPERTS AS TO QUALITY.

Mlanje, B. C. Africa, June 9, 1899.

DEAR SIR,—I send you a report on tea and cotton grown here, which may be of interest to your readers. The tea was rolled and fired by my cook in the oven, so that would account for any defects in the samples sent home. I have for some years made tea from time to time, and my servants know how to do it as well as I do; but the African Negro wants more looking after than the Asiatic: in fact you can never trust the best of them.

Mr. Moggridge made some very nice tea quite as good as your medium elevation teas from some leaf grown here and pronounced it a very good marketable article, and this gentleman has had considerable experience, at least more than I have had, of tea in Ceylon. I am going in for extending in tea, and have considerable nurseries laid down. So Ceylon may have a dangerous competitor in the course of years in this country, for our climate and soil is A1 and our labour average only 1½d per diem.

Many planters in British Central Africa would plant tea if they could get the seed into the country. The Nyassaland Co. imported a lot of seed with praiseworthy enterprise, but it turned out a failure as not a single seed germinated.

The only tea in this country is from a few plants originally imported by the Blantyre Mission and Mr. J. Lindsay of Limbe estate, who got his lot from Messrs J. P. Williams Brothers, of Henaratgoda. This is a good hybrid, but the jât does not come up to most of the teas I have seen on estates in Ceylon with fine large dark green leaves; but it is quite good enough and seemingly quite suited to our climate.
H. B.

Copy.

41, Mincing Lane, London, E.C. Dec. 22, 1899.

DEAR SIR,—In reply to your letter of yesterday we have to report that on examination of the accompanying samples of tea from Thornwood estate, Mlanje, British Central Africa, we find them to compare unfavorably with the low grades of East Indian British grown and Java teas.

The sample of No. 1 is a very small one, but it appears to be rather better leaf and not quite so mixed as No. 2, and in the present strong market for the lowest grades would be worth 4½d or 5d per lb. in bond. No. 2 is an unassorted tea rather rough in leaf worth about 4½d or 4¾d per lb. The liquors of both are practically identical, being thin and flavourless, but quite clean and marketable.

The defects in the teas, both as regards leaf and liquor, are, however, in our opinion capable of removal and appear to be due rather to faulty manipulation than to any lack of virtues in the leaf. In the first place the plucking does not seem to have been very carefully performed, there being too much stalk and a coarse leaf. Again neither withering nor fermentation seems to have been satisfactorily carried out. From the brown appearance it would appear to have been withered too long and to have been dried rather than withered and the fermentation seems to have been very irregular. A few of the infused leaves are of a good coppery colour, but the general appearance of the outturn is too dark, although in some measure this is due to some of the leaves having been scorched in the firing; a lighter fermentation however would we think, give more point and pungency to the liquors. The rolling process also does not seem to have been quite effectual enough. If after withering the leaf, the leaf had been rolled sufficiently hard, enough to break the cells of the leaf, the made tea would have drawn stronger liquor and have had a better "twist."

With due attention to plucking and manufacture we see no reason why the tea from this estate should not prove of good commercial value.

We are etc., (signed) WILSON, SMITHETT & Co.
The Director of the Royal Gardens, Kew.

Copy.

Secretary, Manchester Chamber of Commerce, to Royal Gardens, Kew.

I am now able to report to you upon the sample of raw cotton from Mlanje, British Central Africa, received from you a short time ago.

The gentleman by whom it has been examined states that it is very difficult to form an accurate judgment of the quality and market value of cotton in the seed. This you can readily understand since the process of ginning alters, often substantially, the characteristics of the cotton—especially with regard to the length and evenness of the "staples" and the presence or absence of impurities.

With this reservation the report is that the sample represents a long silky and fairly strong fibre and that in the ginned state it would be worth in Manchester today from 3½d to 3¾d per lb.

"A BAMBOO IN BLOSSOM."

Dea Ella, Madawalatenne, July 21.

DEAR SIR,—Not long ago I read in one of the Ceylon papers that a bamboo (Ceylonese unagaha) in blossom was a rare curiosity. Is this true? I have seen a bush on this estate blossom almost yearly, and even today I got one brought to the bungalow, simply because I read it was a thing worth possessing. Would any of your observant readers kindly let me know if they had ever experienced a thing like this?—Yours faithfully,

W. L. VAN D. S.

[We read in *Tropical Agriculturist* of September 1881 that "Bamboo blossoms every 15 years." Let our correspondent collect seed carefully and send it to the Director, R.B. Gardens, Peradeniya; also some flower specimens. As regards the dwarf mountain bamboo and other small species, the late Dr. Trimen thought they might flower yearly. Not so the larger kinds.—ED. T.A.]

GALLE AGRI-HORTICULTURAL SHOW:
A CORRECTION.

Kollupitiya, 31st July, 1899.

DEAR SIR,—The gold medal for the finest plumbago in the Island was awarded to me at the Galle Agri-Horticultural Exhibition and not to Mr. A. P. Perera, as was stated by a mistake in the local papers recently. He is the manager of my branch establishment at Galle, who on my behalf sent the article for the Exhibition.—Yours truly,
N. D. P. SILVA.

MR. CARRUTHERS: GOVERNMENT
CRYPTOGAMIST.

DEAR SIR,—At last Cacao is to have another innings after all. Now that we have influential men at home alive to the importance of Ceylon having its own Government Fungologist, we may hope the N.D.P.A. will forward on a strong resolution promptly, and urge the importance of Mr. Carruthers' immediate return as Government Cryptogamist. *Immediate*, because the year before last he, arrived rather too late for N.-E.

monsoon work, when the canker fungi flourish most, and we want him *in the island* early in October.

The Chairman, N.D.P.A., should call a general meeting at once as there are other important matters for discussion: Rinderpest, Murrain; Cruelty to animals; Cacao traders licensing; Supply of medicines to dispensaries; Road-metalling and Labor Federation district rules.

I hope the Kelebokka, Madulkele, and Knuckles men will rally to our aid now, if they do not wish to follow the example of Rangala, and join and strengthen the Northern districts. Unity among ourselves and the SPIRIT of Federation is all that is wanted to reduce labor troubles to a minimum.—Yours truly,
CHAS. GIBBON.

THE TEA DUTY AND DIRECT SUPPLY.

London, July 21.

DEAR SIR,—In regard to the question of the sale of tea in this country, the demand of the one pound on each package is a remnant of an old regulation which ought to be done away with. It is what is called in China a "squeeze." I have no doubt you will have one of Messrs. W. J. and H. Thompson's circulars, and under the head of "Ceylon" you will see that, although there was not much sold in the room, still the sales went on, and I am convinced that if independent sales were made of tea at 14 days, the same as other produce, the planters would find it greatly to their advantage. The old regulations of giving long credit, added to the loss in the docks, and the sweepings, all go to reduce the return to the planters. It is well-known that it answers remarkably well the purpose of houses here who nurse their tea along, to effect private sales. The Customs arrangements favour the liberal free trade in tea, and anyone who purchases tea in Ceylon or in India can have it through the Customs, and as soon as the weights are known and agreed, there is no necessity for re-packing or bulking, and you take delivery without any loss whatever. There is a very strong feeling in England at present that the Government will have to yield on the question of duties, and if they do not take off the 4d at any rate that 2d will be knocked out in the next budget, to be followed in a later budget by another 2d. The public are getting enlightened on the subject of tea, and they see in the Press that such a large proportion of tea is sold at 6d to 8d per lb. in bond and they are well able to calculate that 4d duty means 50 per cent., which is considered not only a frightful tax upon the consumer but that it militates very much against the producer in India and Ceylon. There is no doubt but that the large firms here who are getting their own warehouses will reap enormous profits when tea is free.—Your truly,
THO. CHRISTY.

A PLANTAIN PEST.

DEAR SIR,—I am somewhat surprised that none of the public have called attention for the fact that you can seldom now get a bunch, or even

a "ring," of plantains without many of them being more or less diseased, the disease showing itself as a dark brown spot, penetrating from the skin into the fruit. Is our tea pest to be supplemented by a Plantain Pest? Will any of your scientists look into this matter, and advise as to what should be done? Pity it is that our Botanical officers do not bestow a little attention to our native friends or rather island fruit, and vegetables and endeavour to improve them. Then our Agricultural Shows would be worth,—so far as these products are concerned, going to see.—T.

THE GOLD PROSPECTING SYNDICATE.—The representative of the Syndicate in Ceylon, Mr. Goldie, has we learn, ceased operations for the present in the Rakwana district, where he has been working for the last year and more with "Lockhart's Patent Separator," but he hopes to recommence work again shortly. In many respects, we learn, the Separator has exceeded the expectations formed of it, and it is capable of dealing with 40 to 50 tons of gravel a day. The trouble has been in finding sufficient *illum* to feed it, for it has not been possible to work more than one pit at once, as the mines requires European supervision to prevent theft, and Mr. Goldie has only one European assistant. The sifting of the residuum supplied by the eight separators keeps Mr. Goldie pretty busy while the machine is at work; while it is also necessary to see that the separators are not fed too fast, or with unsuitable gravel, for in such case they stop working automatically. Mr. Goldie has sunk his pit as deep as 120 feet, and says he could go to 200 feet with his present appliances, but after that ventilation would be necessary. Great credit is due to those who, like Mr. Goldie, have sunk money and given their time and abilities to put our mining industries on a better footing, and we trust they will receive valuable assistance from the geological survey of the island which Mr. Oldham has come down from India to see about.—Local "Times."

STRANGE RECOVERY FROM SNAKE-BITE.—A remarkable case of recovery under the "Calmette" method of dealing with snake-bite, we hear, has recently occurred at Meerut under the care of Major Rennie, R.A.M.C. Since the introduction of this remedy, some three years ago (the first case treated in this country was, if we remember aright, also at Meerut), its efficacy has been abundantly proved by experiment in the laboratory and also in actual practice; but the present instance is specially noteworthy in that it would seem to demonstrate that the serum may be used with success in an apparently hopeless case, the patient, we are informed, being practically in the last stage of all when he came under treatment. It should be noted that the evidence of the poisonous nature of the snake is absolutely unquestionable, though the reptile was not actually caught. The well-known symptoms of the poison had fully developed themselves: in fact to such an extent that the patient was to all appearance dead, and was kept alive only by artificial respiration until the serum remedy had had sufficient time to permeate the whole system, and counteract the colubrine virus. This fact is vouched for by six medical officers, amongst whom was the Civil Surgeon, and the case was also seen by the Commissioner and by the Cantonment Magistrate, who, although not professional men, are men of long experience in India.—*Pioneer*, July 21.

KANDAPOLA TEA COMPANY.

The report of the directors for the year ended December 31st last, states that the profit and loss account shows a profit on the working of the estates of £1,843, and adding transfer fees and the amount brought forward from last year, there is a total of £2,103. The directors paid during the year the interest on the debentures and sundry charges, and the balance after these payments amounts to £467. The directors propose to pay off £250 of the preliminary expenses, leaving £250 to be provided hereafter, placing to coast advance reserve account the sum of £133 to provide for doubtful coast advances, carrying forward the balance of £84. The directors regret that the season's operations have been so unfavourable. The profits have been reduced principally by a heavy loss on working the Protoff group of estates, which amounted to £1,058. The estimated yield of tea for the season was 503,000 lb., but owing to the unfavourable season, the actual yield was 369,994 lb. the shortfall, amounting to 133,006 lb. being 79,466 lb. less than the previous year.—*Grocers' Journal*, July 15.

COONOR NOTES.

COFFEE seems to be improving under the conditions and preparing for a good late blossom. Let us hope that two cwt. per acre will be added by a September blossom. Cultivation has not been much abated, in fact upon this estate it is being vigorously pushed. More power to it. When prices were high some stuff made up of three parts dry pulp and one part broken coffee was sold in the Coonoor market at six annas a measure; now the finest parchment beans can be had for that and broken at annas 2/6. This will stimulate demand among the poorer natives very much. A native can go without food a whole day if he can get coffee ad lib. He can drink a gallon a day of weak coffee made up with jaghery.

THE NILGIRI RAILWAY improves daily and is becoming more and more popular. The one 3rd class carriage is generally quite full and many passengers have to be accommodated in the 2nd class. The 2nd class going into the 1st, one half the 1st class carriage being reserved for first. One engine is burning

PETROLEUM

and can run a train up in 50 minutes from Hill-Grove including a stoppage of 6 minutes at Runnymede, the distance being 6 miles. With this fuel steam can be got up in a few minutes and the engine arrives with her fire almost out, there being thus no waste. The furnace in the oil is carried in a reservoir over the boiler, a jet of steam is admitted into it, which forces the oil into the furnace in the form of a beautiful spray, which ignites into an intense flame from some coal kept burning at the bottom of the furnace box.

A dense smoke issues from the chimney at the start, and this lasts a few seconds after which there is hardly any smoke at all to be seen. It is charming to hear the beat of the pistons as compared with the laborious sound with ordinary fuel. It would be a help to many if

CHEAP CARRIAGE FOR FUEL

be arranged down, during the slack season to Coimbatore. The price at Coonoor is now R4, per ton, at Coimbatore perhaps 7 a ton. This leaves a margin of R3 for railway carriage.—*Nilgiri News*, July 22.

THE ANAMALAI HILLS.

CEYLON MEN OWN HALF THE ESTATES
OPENED UP.

(From a Correspondent of the Madras Mail.)

With the rapid extension of tea and coffee cultivation in Southern India, any information throwing light on the tracts of land still available for such enterprise should prove welcome and valuable, especially to those anxious to invest in either undertaking, and who may be on the *qui vive* for latest details on the subject. The districts which hitherto been exploited include Coorg, Mysore, the Nelliampathy Hills, Travancore, Wynaad, the Shevaroy's and Pulueys, while more recently the Anamalais, or Elephant Mountains, have been coming into prominence. The first four tracts lie outside the limits of British India, while the other group is situated within the confines of British territory, and of these the least known, though in many respects the most important for planting purposes is the Anamalais. It seems explicable that the Madras Government should have for such a lengthened period pursued the fatuous policy of allowing the magnificent Forest tract on the Anamalais to remain unoccupied while other districts have been developed and the exports from the country materially increased, but until the last seven or eight years, Government to all intents and purposes, passively acquiesced in persistently ignoring the most obvious interests of the planters. As instances, Waste Land Rules were framed, which literally discouraged the enterprise of the European planter, and during the past 40 years the planting industry in Southern India has been severely handicapped by the inadequacy of the Labour Law (Act XIII of 1859) then introduced, and which, so far as its effective working is concerned, practically offered a premium to unscrupulous maistries and coolies to defraud their employers. Fortunately, H E Sir Arthur Havelock, who enjoyed much valuable experience in Ceylon, fully realises the importance of the planting industry. So it came to pass that, nearly three years ago, the Board of Revenue recommended to the Madras Government the leasing of lands on the Anamalai Hills, and the report indicates that by September, 1896, applications had been received from several Madras firms and planters, and from a well-known firm largely interested in Ceylon, and with a still greater stake in Travancore. The applications embraced tracts of forest from 500 to over 12,000 acres in extent, and aggregated 63,500 acres, or somewhere about 100 square miles. The Government disposed of the matter by assigning 1,000 acres apiece to each of the original 15 applicants. These selections have since been demarcated, and include some of the richest land in India, thoroughly suited in every way for growing coffee, tea, pepper, rubber trees, and other products, while ranging from an altitude of 3,500 to 5,500 feet and enjoying a well distributed rain-fall from 100 to 120 inches. The experience of planters who have resided there during the past two years is that the climate is delightful and exhilarating. The plateau commands magnificent scenery, and at 7,000 feet offers unique advantages for the establishment of a sanitarium in this region. Although the Madras Government restricted the first leases to some 15,000 acres, should the properties now being developed prove a success, a further allotment of similar lands, purchasable at auction, will no doubt be initiated. In fact, several such blocks for 844, 717 and 400 acres, respectively, are already advertised for sale by public auction at the Collector's Office, Coimbatore, on the 2nd October, 1899, when the upset price is fixed at Rs 5 per acre.

The total area of Forest lands on the Anamalais is estimated to cover 80 square miles. As regards terms of leases, these seemed to be framed and on equitable scale, the cultivation tax of R2 per acre being leviable from the 6th year, on one-twentieth of the holding, only continuing in progressive increments. And in the interim the balance of the land is taxed at 8 as per acre. One provision remains to be reconsidered

by Government, and refers to the gathering of Forest products by the Hill men, or Kadirs, who, under instructions from the Conservator of Forests, collect cardamoms and wild pepper. Obviously, this system would prove impracticable when similar products came to be cultivated by planters. But as this tribe is believed to number only about 100, Government should be able to provide for them, though some difficulty may be confronted in the matter, as these men prefer an existence on forest produce, such as yams, fruits, &c. With the establishment of a sanitarium, and the immigration of Missionary settlers, it is probable that some of these difficulties may be dissipated.

Under the ægis of the present sympathetic Governor of Madras, a new policy for the development of the resources of the country is being inaugurated, as is already shown by accelerating the completion of the new road, and by the erection of the iron bridge over the main river, while it is said that the Government projects a line of railway from Podanur to Dindigul *via* Pollachy, which would bring the Anamalai region within touch of Madras, Calicut, Colombo and other parts of India. Irrespective of the Water-fall Estate, and the area opened with coffee in 1897, there are already about 1,500 acres planted this year. Approximately half of the 15,000 acres taken up by planters is held by Ceylon men.

THE MICA INDUSTRY IN INDIA.

The attention that has begun to be paid to mica in the island,—one among the many valuable minerals soon to be extensively worked in this island, we may hope, assisted by the proposed Chamber of Mines whose existence was inaugurated the other day—lends peculiar interest to what is going on in India where, too, mica claims more attention than it used to do. Mr. T. H. Holland, a young geologist with an excellent reputation, recently wrote a sketch of the mica industry of India, which has been published in the Annual Report on the work of the Geological Survey for last year. The Report, we learn from a Calcutta contemporary, was the outcome of a tour of inspection, in the course of which Mr. Holland, with two others, examined the mica-bearing areas of Bengal and Madras; and the conclusion arrived at was that the large and profitable industry might be rendered far more remunerative by more scientific exploitation of the fine pegmatite sheets which have been almost untouched hitherto. The system adopted in Bengal, where the field is 12 miles by 60, is described as most wasteful and primitive, the mines being narrow irregular holes, following

“The pegmatite sometimes to a depth well over two hundred feet. The whole of the materials—mica, rubbish, and water—are brought by coolies to the mouth of the hole, which is often very near the summit of a hill, being the point where, on account of better exposure, the pegmatite outcrop was originally discovered. On account of the accumulation of water, all mining operations are suspended during the monsoon season, and at the close of the rains the process of forking a mine occupies several days, and sometimes weeks. In the same way, an hour every morning is spent in bailing out the water accumulated over night.” With a single exception, at Bendi, we are told, “there is not a single vertical shaft in the whole mica mining area of Bengal, not a single drive or cross-cut to show that the miners have appreciated the actual disposition of the pegmatite as normal intrusive sheets, and, notwithstanding the favourably shaped natural contours of the ground, not a single adit for the removal of water. Contrary, too, to the explicit

regulations on the subject, no plans of the mines have been prepared to show the disposition of the workings.”

In the Madras area, the system is only one step in advance of that which obtains in Bengal, being of the open quarry plan. Notwithstanding that “none of the mines have attempted to deal with the pegmatite vein by vertical hauling shafts and drives, after the fashion pursued in all modern methods of mining for minerals occurring in regular veins or sheets,” the industry is flourishing. The yearly exports of mica are valued at a million rupees, and we told that there is no reason why, with careful treatment of the abundant material available, India should not continue to hold her place easily as the first mica-producing country in the world—the more so, as it is likely that mica can be found in other districts, and other minerals are generally associated with gneissose rocks in which mica is found. Among the minerals, some new to India, found in Bengal, were arsenic of iron, in lumps weighing in some instances as much as 20 lb.; phosphate and floride of iron, and manganese, in thick masses; and appatite in such abundance that, out of 100 lb. of material collected at a pit's mouth, 76 per cent of phosphate of lime was obtained. In the scarcity of phosphates in India, the find is naturally considered of importance, as the appetite has hitherto been thrown away and the expense of treating it as a by-product will be almost wholly confined to “coolly labour to pick over the waste heaps, royalty and transport.” The Madras area is described as less rich than Bengal; and though larger crystals have been found, the ruby tint which has made Bengal famous in the market remains to be found. All this is of as great interest almost to us as to India; and now that the Government is awakening to the importance of the mining industry generally, and is in communication with India about a geologist, we trust that the Geological Survey we have advocated for years will soon be undertaken and disclose new sources of wealth and industry for us. The primitive and wasteful methods described above almost exactly represent the system generally pursued in the gem and plumbago industries; and the recent discovery of asbestos which we recently noted, should induce the Government to give all the help it can, through a Geological Survey, to capitalists to utilise every available mineral which the island affords.

FACILITIES FOR MAKING TEA.

Two circulars have turned up from Northern Districts which deserve some notice. The drawbacks to one division North of Kandy are said to be:—Previous chenaing of lands, and, partly, full exposure to S.-W. monsoons, and possibly no appliances for cool fermentation. The *jât* is said to be quite up to the average, but mixed in the oldest instances. There is very little virgin soil and much variation from iron-stone and red loamy clays, to clays, quartzes, gravels and gritty cabooks and micaceous talc, plumbago lands. Any estates worn out?—Yes, in two distinct cases, but one is now being worked

up. Would manuring improve the tea and be profitable, in your opinion?—All analogy goes to prove it,—why should tea be an exception? Has the pruning been too severe, or too frequent?—In some cases distinctly so, in others decidedly not: heroic pruning requires as great skill as heroic surgery (and very careful tipping after). Averages of 600, 640, 550 and 500 lb. an acre are ample evidence of the suitability of the district for tea.

In the case of the other report from farther North, better tea cannot be made "because it is not in the leaf," although the jât is generally good, and the soil particularly so. Manuring could be decidedly beneficial and factories are not yet equal to a big rush in most instances. The neighbourhood has proved itself very suitable for tea: what it lacks in quality, it makes up for, in quantity.

[Buyers were getting better value some months back than ever before in the history of tea. It is not to talk of wholesale falling-off in quality. There is more care exercised in manufacture universally, but there is less competition for medium teas in markets.]

DR. GEORGE WATT'S COMING TOUR.

COMMERCIAL SECTION OF THE INDIAN MUSEUM.

Dr. George Watt proceeds to Simla at the beginning of next week, and after spending about a fortnight there, starts on a lengthy tour throughout India, in the course of which, he will visit all the commercial centers from Peshawar to Tanjore. The object of the Reporter on Economic Products, the *Englishman* says, is to gather material for exhibiting in the commercial section of the Indian Museum, which it is hoped to throw open to the public by next cold weather. The plan of this exhibition is at once simple and comprehensive, although the work of classification and arrangement is involving an immense amount of labour. Dr. Watt's idea is to give the economic history of every product in a nutshell. Thus, if it is a plant, it is shown by specimen at every stage from the tree to the finished article, while statistics of every kind are given in connection with it, and a map of India placed alongside show at a glance the various parts of the country in which it may be obtained. And all this cyclopædia of information lies within the compass of a small glass case! It is difficult to estimate the usefulness of this department when once the commercial world appreciates the fact that it embraces every one of the manifold industries on which the economic life of the country depends. Nor is the artistic sacrificed to mere utility. For instance, an enterprising firm of ropemakers display their productions in the form of a large arch, surmounted by their name in letters of rope. Again, a kind of dado is formed right round the room—and a big room it is—by polished slabs representing the various timbers grown on the peninsula and among the Himalayas. Altogether, the economic department of the Indian Museum promises, when it is completed, to render notable service in helping forward the development of the resources of India, and reflects the highest credit upon the learning and ingenuity of Dr. Watt.—*Pioneer*, July 27.

RUBBER DISCOVERED IN CUBA.

It is the positive conviction of Major J. Orton Kerbey, who returned lately to the United States from a tour of Cuba, that he found there the true rubber tree of Central America (*Castilloa elastica*) growing native, and that the conditions for its cultivation are more favorable on the island than even in Mexico or Nicaragua. Major Kerbey pursued his investigations further into the interior of Cuba than any recent visitor, from America, at least, has done in recent times, being aided in his search for the rubber tree by orders from the government at Washington which gave him command of the facilities of the United States military establishment on the island. On the southern coast of Cuba, in particular, he personally saw the trees which he has identified as the *Castilloa elastica*, while he was assured by old residents of good standing that such trees were to be found in abundance. Moreover, he was assured that, in former years *goma* (rubber) figured in the exports of Cuban produce, going presumably to Spanish ports. Major Kerbey is writing some results of his discoveries for *THE INDIA RUBBER WORLD*, and the information he has to give may be looked for with interest.—*India Rubber World*.

TEA IN AUSTRALIA.

The tea statistics for the port of Melbourne for the week ended Saturday, 15th instant, compares with the previous week and the corresponding week last year as follows:—

	July 16, July 8, July 15,			
	1898.	1899.	1899.	
	Lb.	Lb.	Lb.	
Entered for bond	.. 85,797	196,857	819,389	
Duty paid, ex-ship	.. 28,672	7,638	46,690	
Duty paid ex-bond	.. 150,432	139,799	133,206	
Exportations, ex bond	.. 31,174	68,600	97,662	
Exportations under drawback	47,796	41,230	23,533	
The Custom-house statement of receipts and deliveries at the bonds for the week ended 15th inst., together with the stocks in bond at the close of the week, is as follows:—				
	Deliveries			
	Receipts into Bond.	For Home Consumption.	For Ex-port.	Stocks on July 15.
	Lb.	Lb.	Lb.	Lb.
China	.. 760	32,259	40,486	323,939½
India	.. 49,166	34,164	15,030	273,519
Ceylon	.. 156,995	56,783	42,146	343,101
Total	.. 206,921	123,206	97,662	940,559½

At the corresponding date last year bonded stocks consisted of 423,713½ lb. China, 323,754 lb. Indian, and 327,137 lb. Ceylon; total, 1,074,604½ lb.—*Melbourne Argus*, July 19.

COLLECTORS.—Noticing the work of Mr. Whitehead, the Bird Collector in the Far East, the *Spectator* says:—

The time must be approaching when there will be no more unknown birds or beasts to discover. Then the explorer will perforce fall back on the less exciting search for new insects, or new plants and flowers. The botanists and florists have still a field before them, and a new orchid is a valuable discovery, and a new dye or fibre plant potential wealth. If the green indigo, reputed to exist in some country in the Far East, were found, its discoverer's fortune would be made; and a real rival to indiarubber, or a substitute for Manila hemp, would enrich a whole community.

BY RAIL IN BRITISH NORTH BORNEO.

(From Our Own Correspondent.)

Bukow, 16th July.

"No country can advance unless it provides and maintains a comfortable means of rapid transport," is, I believe, an accepted axiom in these days of progress. A few words on the means of communication, present and future, of this new country, will perhaps be of interest to your readers. I left Sandakan on the 3rd July in the coasting steamer "Labuan," north about, to Labuan, calling at the ports. These form a special point in the coast line of Borneo and British North Borneo can boast of better and more numerous harbours than can be found in this part of the ocean's boundaries. Calling in at Jambanjon, Kudat, Ambong, Santian, we arrived

AT LABUAN

on the third day. From Kudat onwards, the hill ranges on a fine day form a fine feature in the view. Kudat is a thriving town, in a good agricultural district, which in 1883 brought in a Revenue of \$14,000 to the Treasury and this year the estimate is \$123,000 to which increase, tobacco, coffee, and Chinese immigration have helped. The soil is good and the records of the old East India Company, who had stations here about, show that the Kudat district contained 30,000 fighting men. In these days, the word "fighting" would not apply to the peaceful people who now sparsely occupy the ground, but owing to epidemics in the past, to piracy and to war, the population, though now increasing rapidly, was very small in 1881, when this country came into the hands of the British North Borneo Company. The next port,

AMBONG

is in a pretty land-locked bay. It has only lately been opened and is doing a good cattle trade supplying Sandakan and Looloo where there now are 750 American soldiers. The Government charges an export duty of one dollar per head. The cattle cost about fifteen dollars laid down in Sandakan and sell for twenty to the butcher.

From Ambong a bridle path twenty miles long runs up the Tampassuk River and

THE GREAT MOUNTAIN KINABALU

can be ascended from here; but the best route is from Santian, the new port in Sayah Bay. Mr. Little, the Acting Governor of Labuan, who has ascended Kinabalu, tells me the trip can be done for \$300. The officer-in-charge at Santian, Mr. Haynes, is very kind and would lend his assistance in collecting transport coolies. I believe the ascent has only been made five times. The upper part of the mountain is smooth rock with low vegetation in the sheltered ravines and crevices. The last village is something over 4,000 feet up and there is a large cave at a 12,000 or about two thousand feet below the top. The cold at night is great and the coolies suffer from want of suitable clothing. To a naturalist the mountain affords a grand field for research.

Labuan is the departure point for the mainland. At present there is only one launch available for the crossing to Weston, the sea terminus of the railway, but I hear rumours that the Sabah Steamship Co., which runs the three local coasting boats, propose to keep a fast launch at Labuan, capable of doing the trip in three hours or less. The present available launch takes five hours and is in a chronic state of breakdown. The line from Weston (so named after Mr. A. J. West, the Railway Engineer) to Bukow, eight miles, is almost complete. I

came the whole distance in a truck drawn by the construction engine without a jolt in less than an hour which included two stoppages and taking in firewood and water. At Bukow river, the want of suitable timber has caused delay in building a bridge, but when this has been done the twenty three miles

FROM WESTON TO BEAUFORT JUNCTION

on the Padas River will easily be done in an hour or so. I am now staying the night with Mr. West, the Engineer-in-charge of the construction, and tomorrow we go to Beaufort in a comfortable first-class carriage. Mr. West has shewn me the train consisting of a light engine appropriately named "Progress," one first-class car, one third-class and four waggons (one closed) all built of local wood in Mr. West's workshop. This he runs twice a week from Bukow to Beaufort. The third-class car holds thirty and is generally full, (fare twenty-five cents); so are the waggons when going up. Coming down they get a return cargo of rotan, etc., and a little gutta.

The land from Weston to Bukow is

SPLENDID COCONUTS AND RUBBER LAND

and there are a lot of native gardens and paddy fields. The railway overseer at Weston, who lives a couple of miles from the terminus, told me the country was very healthy with good drinking water. It is cold at night. At Weston the people get fish every day. I saw two fishing-boats come in and we took some fish up to Bukow. The price at Weston is three cents a catty. Weston is now beginning to wake up. Up till now all the traffic has gone by the River Bukow to and from Bukow, but a railway bridge across the Bukow will make Weston the terminus. No town lots have been sold as yet at Weston as it is desirable to raise the ground first; but the engine will be at Weston immediately and ballast will soon be run down and thrown over the low land from a hill one mile along the line. A stone pier has also to be made. The hill is a mass of ready-made ballast and at present produces a wonderful crop of pineapples. The pigs take a large share and the balance sell for two cents each (three cents to a European!) This is a wonderful fruit country. Durians sell at five cents and can be had in great quantity next month—and I hope to be here. I remember meeting an ex-Ceylon Engineer in Singapore who told me:—"When I scented a durian my mouth waters and I gaze around with fingers itching to *clutch* that durian!" The fall of the year is our chief fruit season.

Tomorrow I go to Beaufort and up the River Padas with Mr. W. Towers who has laid out a railway from Beaufort north along the Coast to Santian, 63 miles, on a metre gauge like this one. Mr. Towers is now inspecting the ground between Beaufort up river thirty (?) miles which he says resembles the Haputale line in point of difficulties. Mr. Towers was seven years in Ceylon and must be well-known to you. I will send you a line on my experiences on my return to the Coast.

NEW CEYLON.

A SAMPLE PACKET OF MALACCA TEA has been sent to the editor of the *Straits Times* who has tried it, and who writes:—"It seems very good tea of a distinct and wholesome flavour, and pure; and one is not surprised to learn that large quantities of it are now being sold in the Straits. The Malacca tea is also being shipped to Egypt and to London, so much so that a new drying machine will shortly be added to the factory."

THE "CAUCHO" RUBBER OF PERU.

A despatch received at the Foreign Office from H. M. Consul at Para states that the tree which produces the quality of india-rubber exported from Peru through Para under the name of *caucho*, has recently been determined by M. Huber, a botanist, who is on the scientific staff of the Museum of Para. M. Huber lately visited the Ucayli region in Peru, and discovered that the tree was a *castilloa*, and he will shortly be able to decide by comparison whether it is the same as the *castilloa elastica* of Central America, or a variety of the same genus. It has been surmised previously that the tree might be a *castilloa*, but it is said that M. Huber is the first authority who has settled the point. With this knowledge it results that the distribution of the *castilloa* is wider than was previously thought to be the case. *Caucho* is also produced in the neighbourhood of the Bolivian tributaries of the River Amazon, and from parts near the said tributaries that pass through Brazilian territory. A sample of *caucho* exists in the Para Museum that came from the banks of the River Tocantins. It is said that *caucho* is also produced near Macapo and Mazagao, on the north bank of the river Amazon, near its estuary. A recent statistical return on the exports of the State of Para shows that this produce was exported in small quantities (altogether about 10 tons) from Aveiros (River Tapajos), Santarem, Alemquer and Obidos, on the River Amazon.

The total shipments of *caucho* from Amazonian ports amount to about 2,000 tons annually. M. Huber describes the process of tapping of follows:—The trunk is almost severed in two at a distance of about 3 ft. from the ground, and the tree is allowed to fall in such a manner that is supported in the inclined position by its branches, and still holds on to the part that remains standing. The Sap is collected and poured into a hole made in the ground, and is coagulated by means of the juice of certain local *lianas*. The natives state that this is the best method of tapping, and if the trees were treated in the same manner as the *heveas* they would soon be destroyed by insects which would attack them where the bark would be injured by incision. This may be only an excuse for unnecessary destruction, which might be avoided. However, it must be considered that as these trees grow far apart from each other in their native state it must be inconvenient, if not impossible, to attend to more than one tree at a time. Trees that have been tapped in the manner described do not survive the operation. In the course of time their places are no doubt taken by young trees that grow from seeds. The Amazonian *castilloas* are found on elevated land which is beyond the reach of floods, whereas the *heveas* thrive best in the lowland that are periodically inundated by the River Amazon. Sir W. T. Thistleton Dyer, Director of Kew Gardens, in a communication to the Foreign Office, states that *caucho*, of which caoutchouc is probably an expanded form, has been hitherto identified with "India-Rubber" par excellence, the produce of one or more species of *hevea* indigenous to the basin of the Amazons and exported from Para; it would now however, appear that the *caucho* tree of Peru is a *castilloa*. One or more species of this genus produces the india-rubber of Central America. In South America the *castilloa* has been known to extend as far as Ecuador, where it is called *jebe* otherwise *jeve* or *heve*. According to Aublet, this latter name was given in Northern Ecuador to a species of *hevea* and in founding that genus he derived its name accordingly. In the Amazon basin the name for the species of *hevea* is "Seringa," and in Central America for those of *castilloa* "Ule" or "Tunu" (see Kew Bulletin, 1898, pp. 141, 142). Perhaps in Western South America the names *caucho* and *jebe* are applied indis-

criminatedly to rubber-producing trees. According to a report by Mr. D. B. Adamson, H.M. Consul at Iquitos, dated 24th December, 1898, and published in the "Transactions" of the Liverpool Geographical Society for the same year, Peru has two kinds of rubber-producing trees—*caucho*, which appears to belong to *castilloa*, and *jebe* or *hevea*. Both Mr. Adamson and Mr. Churchill also state that the rubber is extracted from the *caucho* tree by felling. The *jebe* is always tapped. The former process results in a district being "worked out." In consequence, according to Mr. Adamson, "many of the 'cauehe ros' (or rubber collectors) are working in Brazilian rivers, where the supply is yet more plentiful." It is not, however, necessary to fell the *castilloa* trees to collect the rubber.—*India-Rubber and Gutta-Percha Trades Journal*, July 10.

ANGLO CEYLON AND GENERAL ESTATES COMPANY, LIMITED.

The ordinary general meeting of the Anglo-Ceylon and general Estates Company, Limited, was held on Tuesday, July 18, at the offices of the company, 20, Eastcheap, London, C.C., Mr. Alex. W. Crichton presiding.

The Secretary (Mr. Henry Grey) having read the notice convening the meeting,

The CHAIRMAN said: I am sorry to have to take the chair at this meeting on account of the absence of your chairman, Mr. Quintin Hogg, and I particularly regret that this should be the case on this occasion, because I understand that some of you, at all events, have come here in the expectation, and with the desire, of hearing from him personally some account of his tour in the East, and of the opinions and estimates which he formed there with regard to the affairs of the company. He is, however, unfortunately not able to be present, and I am sure that you will be sorry when you hear that family bereavement is the reason of his non-attendance, and why his presence is absolutely necessary elsewhere. As regards ourselves, this alteration came upon us quite suddenly, and I have no time for the preparation of any statement to lay before the meeting, and, consequently, if in the course of what I am about to say I omit anything, or fail to make anything clear, I hope that you will, by questions, elicit from me that which you want to know. With regard to Ceylon, we state in our report, and I think that you must have had an opportunity of satisfying yourselves repeatedly of the truth of that statement from the number of reports of Ceylon tea companies which have been issued in the course of the last two or three months, that the year under consideration has been a remarkably unfavourable one. Prolonged drought, cold winds, and low temperatures prevented the usual flushing of the tea bushes, and from an estimate which we had of the 1,720,000 lb of tea we only got at the end of the season 1,540,000 lb. This constituted, therefore, a loss of nearly 200,000 lb of our crop. Nor was this the only mishap; for the same causes affected the cocoa crop, which in our case is an important one, and instead of 2,100 cwt. which we received the previous year, we were only able to harvest 274 cwt. This, of course, is an extraordinary diminution, and shows a loss on the working of the cocoa estates. These again, were not the only unfortunate circumstances. In the first part of the year the rice for the coolies had still to be bought at a very high rate, and freights during a great part of the time were also high. On the other hand, there was one point of consolation, and

that you will see reflected in our report, namely, that whereas the general average price of Ceylon tea during the year in London fell from 7.85d, which was the average rate during 1897, to 7.70d, the price which was received for our tea, on the other hand, rose from something over 8d in the previous year to something over 8½d in the year under discussion. This was, of course, something in our favour; but it was not sufficient to counterbalance the disadvantages which I have previously spoken of. On the whole, therefore, there was a very much reduced profit from Ceylon; but I am glad to say that these causes of loss have now, I believe, almost entirely passed away. So far as the reduction of our crop is concerned, they are due, of course, to climatic causes which were merely temporary, and we hear now that the tea is flushing very well, and with regard to the cocoa, the spring crop, which has already been harvested, is a most satisfactory one. The benefit of this, however, did not accrue to the year under consideration, but will be secured by the current year. Mr. Hogg r the course of his tour, visited most of our Ceylon estates, and he has often told me that he was exceedingly satisfied with the work of Mr. Campbell, who appeared to him to be a most excellent manager, and one in whom we could have the fullest confidence, and whose services he considers we are fortunate to possess.

THE POUND DRAFT DISPUTE.

With regard to the sales of tea, you will have read, no doubt, in the papers—and it is hardly possible to avoid knowing—that a dispute has arisen between the growers and importers of Indian and Ceylon tea on the one hand, and the buyers on the other, and the curious part of this dispute appears to be that, whereas the growers assert that they have to give to the buyers, in addition to the 1 lb. draft, at least ½ lb. or more on account of the turn of the scales, the buyers consistently deny they receive much benefit from this. If that is so, where does it go to? I think to those who are conversant with the subject it is pretty clear from its history that they must receive something considerable. Originally, in the old days—that is, in the days of China tea—there was a 1 lb. draft allowed by the importers to the buyers, and, in addition to that, there was a 1 lb. overdraft—that is, altogether, 2 lb. allowed on every chest of tea, and no doubt the importers got that gratis from the Chinese. Well, when the second pound—the overdraft—was discontinued as compensation to the buyers this turn of the scale was allowed to them, and therefore it is clear that it was allowed to them as some substantial benefit which they received. The growers have, of course, had opportunities frequently of going into this matter, and have repeatedly verified their assertions. I well remember, not with reference to this dispute, but on a former occasion, trying to ascertain exactly how the tea was sent off from our factories in Ceylon. I remember very well a garden invoice which was sent here, and in which it appeared that the superintendent had, with regard to one break, placed it in chests, the average weight of which was 16 lb. and 2 oz., and they, of course, were taken, according to the customs weighment, as weighing 17 lb. Now of course, there are only two things imported, the chest and the tea which it contains, and if you have by some fictitious method of weighment increased the weight of the chest, inasmuch as the total weight of the chest and the tea together cannot alter, you take

from the estimated weight of the tea. Well, now, how did these 41 chests work out? They worked out in this way—that the tea as sent from the estate weighed on an average in each chest 108½ lb., and although every chest contained 108½ lb., yet, by the method of Customs weighment, we got paid for only 107 lb. That is a loss of 1½ lb. in every chest in addition to the 1 lb. draft, that is, a loss of 2½ lb. Well, now I admit this is somewhat exceptional, but there must be plenty of cases in which that happens every year, and I believe that growers are not far wrong in saying that at least ½ lb., if not a good deal more than that, is given gratis to the buyers in this way. I will not detain you further on this subject, because it has been so amply discussed; but I cannot help thinking that some equitable means may be found of settling this dispute, which must naturally, if prolonged, mean a loss on both sides, because when these trade disputes take place they are generally followed by a reduction in consumption.

MAURITIUS

I will now pass on to the subject of Mauritius, where the price for sugar during the beginning of the campaign was, as we state in our report, disastrously low, and owing to the disorganisation of the market in Bombay—our principal market—from various causes, have sunk lower and lower, and the falling in the price really reminds me of the story of the man who tried how little he could feed his horse on, till when he reduced him to a straw a day the poor animal died. We have known within the last few years R10 as the price per cental for sugar; then it fell to R9 and then to R8, and now, in this year under discussion, it was only slightly over R7 per cental. Most fortunately for us, the crop was an abundant one and, as you will see from the figures, we harvested from our own estate and those in which we are interested no less than 13,000 tons of sugar, as against some 8,000 tons in the previous year. With regard to the sugar which came from our own estates, you will see that although it was very much more abundant, the expenses really increased very little—only by £3,000; that is, from £66,000 to £69,000. Mr. Hogg was also in Mauritius during the crop time and he made various arrangements. In the first place, I believe that he was the first to introduce there a first-run sugar of low grade, which is now called in Mauritius Grey Vesous, and which has the advantage of being prepared much more cheaply than the white sugar we make for Bombay. This somewhat reduced the expense, and as usual in a good year, all the different items of expense were less in proportion. The general result was that we made a profit which was three times that of the previous year, and amounted to some £10,000. But these causes of profit and advantage to our Mauritius estates are not to be compared to that amelioration which we have to some extent secured, and to which we look with the greatest confidence in the future from the legislation of the Indian Government. I think that every grower of cane in India and Mauritius owes a deep debt of gratitude to the Indian Government and to the ministers here who have supported their action in imposing countervailing duties on the bounty-fed sugar which is imported into India. (Applause). You know, and on the last occasion on which I presided over this meeting I explained to you, the extreme injustice of the conditions under which that sugar is imported, and that this bounty-fed sugar has created fluctuations in the market, which have been extremely prejudicial

us. That state of things has, I hope, now finally passed away. At all events, we look forward in the near future to a much greater stability with regard to our Mauritius interests. Now, with regard to the accounts, you will see that the acceptances and accounts payable are less by some £9,000 than they were in the previous year. With regard to Mauritius the item £99,753 for Mauritius Sugar Estates, including land under realisation, has been reduced by £2,000, because in the previous year it stood at £101,000 odd. This we have received on account of the capital due, and, with regard to the interest which is due, that has been fairly met. I think the matter is therefore in a satisfactory state. There is a new item advances to coolies, which was formerly included in the sundry accounts receivable. That item has been stated separately in order to show what these advances were. The Ceylon expenditure is £40,000, as against £39,000 odd in the previous year. You will say it is a curious thing that whereas your crop was less in Ceylon than in the previous year, the expenses have been somewhat greater; but that is not so, because in rupees the expenses were £15,80,000, against £6,01,000 in the previous period. It is the higher rate of exchange which makes the amount appear larger. I think that is all I need say to you, and, in conclusion, you will see from the accounts of our estates in Ceylon that there are now 5,200 acres of tea in bearing and 800 acres of tea not in bearing. When all that comes into bearing we shall have over 6,000 acres of tea, and although some of our estates increase but slowly in productiveness, yet our manager tells us that our crops of tea must eventually largely increase. With regard to Mauritius, I believe the Indian legislation which I have alluded to, in the opinion of all people connected with Mauritius, puts a very different aspect on the sugar industry there, and I consider, therefore, that I may confidently say to you that the outlook for the company this year is an encouraging one. (Applause.) I would say only one word more with regard to dividend: we recommend that a dividend be paid at the rate of four per cent. I now beg to move: "That the directors' report and statement of accounts to March 31, 1899, now submitted, be, and they are hereby, adopted."

Mr. Claude E S Bishop seconded the motion.

In the course of a discussion which ensued, in which Surgeon-Colonel Porter, Mr. Parsons, Mr. Gillingham, and Mr. Nicholson took part, the latter gentleman stated that he had a great deal of experience of Ceylon and Mauritius, and he considered after the year those countries had passed through the directors had managed the company exceedingly well to have been enabled to pay a dividend of 4 per cent. He also considered the shareholders owed a debt of gratitude to Sir James Westland for the steps he had taken in promoting the Indian legislation with regard to the sugar alluded to by the chairman.

On the proposition of Chairman, seconded by Mr. Macaskie, Mr. Quintin Hogg was re-elected a director.

The motion was then put and carried unanimously.

Messrs. Welton, Jones and Co, having been re-appointed auditors, a vote of thanks was given to the chairman and directors, and the proceedings terminated.—*H. & C. Mail*, July 21.

COFFEE IN HAWAII.

The export of coffee from the Hawaiian Islands amounts to about 3,000 hags early, nearly all of which goes to United States ports. The finest coffee is produced in the Kona district, Hawaii, where the trees are cultivated 2,000 to 2,500 feet above the sea level. The industry is still in the experimental age, having promise of a great future. A personal study on the spot has led Caspar Whitney, a contributor to *Harper's Weekly*, to the opinion that coffee-growing is the industry which is going to settle up the islands especially Hawaii. Coffee lands are to be found on all the islands, but Hawaii is the only one of the group that has land for public settlement.

The principal coffee districts in the island of Hawaii are Kona (48,000 acres), Puna (67,000 acres), and Hilo (195,000 acres); but a comparatively small percentage of this acreage is planted with coffee or suitable to its cultivation. In all three of these districts, and especially in Hilo, the Government is surveying and opening land for settlement as rapidly as possible. And as fast as the land is put on the market it is being taken up; for the Government sells it for from \$5 to \$10 per acre, while the boom at the town of Hilo—Hawaii—enables speculators to get \$50, \$60, and even \$100 per acre for the same land, while about \$30 to \$40 per acre must be reckoned on additionally for clearing off the dense jungle and forest.

Careful figuring reckons the cost of caring for a coffee plantation at from \$150 to \$200 per acre for five years. There is a comparatively small quantity of land for outright sale—nearly all the desirable land on all the islands is owned or held under long leases, some of them so long as thirty years, which is the limit of life of the coffee tree under cultivation. On Maui, Kauai, and some little on Oahu, coffee has been planted, and prospects reported "flattering," but only on Hawaii have there as yet been results tangible enough for some estimate of profits. Fortunately, on none of the islands has any species of blight made its appearance. Taking a fair average of success at this stage of the industry, a conservative estimate on the commencement of the fifth year places the profit at 15 to 20 per cent on the original investment. The Waianai plant (Oahu) paid for itself in six years, and last year produced sixteen tons of coffee besides.

Furthermore, coffee planters purpose setting out bananas on their coffee fields, thus making the soil do double service without injury to either crop, and yield double profit to the grower. Half a ton of coffee and 300 bunches of bananas per acre, as confidently expected from good average soil, are not a bad return by any means. The coffee boom is on the island of Hawaii, and so fast as the Government opens new roads into the coffee belts and plots public land for settlement, just so fast is it being taken up.—*American Grocer*, July 12.

THE MORAWAK KORALE TEA-PEST.—The tea-pest on Silvakanda Estate, Morawak Korale, has, we are glad to learn from Messrs. Boustead Bros., been at length cleared, but 25 acres have suffered and, through the severity of the treatment meted out to them with the pruning-knife, been thrown back for several months. It is hoped that it has been entirely got rid of, but there is no certainty as to the whereabouts of the *larvae* of the pest. No doubt a strict watch will be kept not only in the Morawak Korale, but in several other planting districts, where rumours of pests and gray blight (the latter most especially) are in the troubled air. We trust that the present mining craze will not lead to the neglect of tea plantations for pursuits less safe, and to the consequent spread of the enemies of tea through insufficient vigilance at the outset.

Ceylon Rainfall.

S. G. O. METEOROLOGICAL OBSERVATIONS FOR MARCH, 1899.

We append the total fall of rain from which it will be seen that the highest fall was at Gammuduwa Estate, Rattota 12.38 inches, and the lowest at Kotta Estate, Pallai 0.03 inches.

THE CHINESE TEA TRADE.—Consular reports do not offer encouragement to those who are looking for the rehabilitation of the tea trade of China. From Canton Mr. Consul R. W. Mansfield reports that the decaying tea trade again diminished by over 500,000 lb. A dry spring and an insurrection in June in close proximity to the tea districts may to some extent have affected the trade, but the real reason for the decline is the steady falling off in the demand for Canton scented capers on the London market. What demand there is more and more for low-priced teas for blending purposes, and a few more years will probably see even this small demand disappear. The quality of the teas was fully up to the average standard, and they were exceptionally well scented,

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce.)

Colombo 29th Aug, 1899

EXCHANGE ON LONDON:—Closing Rates: Bank Selling Rates:—On demand 1/4; 4 months' sight 1/4 1-32; 6 months' sight 1/4 1-16.

MARKET RATES FOR OLD AND NEW PRODUCTS.

(From Lewis & Peat's Fortnightly Prices Current, London, August 12th, 1899.)

No Price Current having reached us by latest Mail, we omit the usual quotations and fill with other matter,

FOREIGN MARKETS FOR TEA.

At the meeting of the United Planters' Association of Southern India on the 16th inst.,

Mr. ACWORTH said:—You are doubtless all aware that, some few years ago, the Indian Tea Association and the Ceylon Planters' Association started a fund to push the consumption of British grown tea on the American Continent. This Fund was called the American Market Fund and its success has justified expectation. It began work in the face of the greatest opposition and the position seemed at first almost a hopeless fight, and yet from a consumption of nothing per annum when they started, the returns last year showed that 12 millions lb. of British grown tea were consumed in the United States of America and Canada; and I have no doubt that the consumption is annually increasing. I am afraid, gentlemen, it is only fair to say that the joint action of the two Associations would have had far greater success had the Indian subscription to the Fund been on the same lines as in Ceylon. In India the subscriptions were voluntary; in Ceylon, by the wish of the planters themselves, it was compulsory. Now there is much to be said for voluntary contributions when all do their duty, but the policy of the Indian governing body did not meet with a very liberal response from the Indian planters, some 40 per cent. holding aloof. We are larger producers than Ceylon, yet the Fund fell short of that raised in Ceylon, by almost half. I am proud to say, however, that my own Association has from the inauguration of the Fund subscribed annually its full quota throughout. I believe I am right in saying we are the only body throughout the length and breadth of India that has done so, and that several of our members are so disgusted with the inaction, apathy and sheer selfishness shown by others that they are inclined to hold aloof. To me it appears that the apathy of India in this matter is more than unfortunate, it is almost disastrous. Messrs. Gow, Willson and Stanton wrote that the London market had been relieved of 58 million lb. of tea. I tremble to think to what point the market would have dropped if this had not been accomplished by the joint action of the two Associations. Again a prominent member of the Indian Tea Association, speaking at Calcutta in May last, stated that the London market had been relieved of an additional 10 million lb. We would never have seen the slump that did take place, and could have been averted, if India had done its duty. There is no doubt to my mind that we have only just reached a critical state. Production is increasing and competition is increasing. Japan, our shrewdest and most popular rival, is making gigantic efforts to oust us from our present position and improve her own. She has spent already £80,000 in pushing her produce and is prepared to go further. Who can foretell the enormous injury the opening of China and her vast tea districts will do? Thus I believe, gentlemen, the fight for the tea markets of the world has only just begun, and it depends on our own action whether the fight shall be for us one of life or death. The Anglo-Saxon is never beaten when he sets his teeth and determines to fight; but the time has come when he must make that determination. They raise by a levy of a cess of 29 cents per 100 lb. of tea in Ceylon rather over R3 lakhs a year, and by spending this money in judiciously advertising and pushing their produce they are able to relieve the London market and raise the average prices of British grown tea from 8½d to 8¾d per lb. That is to say the producer gets an extra farthing on the lb. of his crop. This sum on the total output of India for the year amounts to 2½ million, omit-

ting Ceylon from the calculation altogether. Will any one tell me the game is not worth the candle? The thing is self evident and requires no argument. The only pity to my mind is that the Indian Tea Association did not some years ago move on the same lines that Ceylon has done (cheers). I therefore beg to move "That the Secretary be instructed to write to the Indian Tea Association and press upon that body the great importance of obtaining funds for the American and Continental Funds and to request it to approach the Supreme Government with the object of securing an act on the same lines as Ceylon Act IV of 1894."

The resolution was seconded by Mr. H M Knight. Mr. HOBGSON said the subject of Mr. Acworth's speech was new to him and he was not prepared to vote for it without first consulting his Association. The principal was fair, no doubt, but the Resolution called upon all planters in South India to consent to a self-imposed taxation, which was a proposition he was not prepared to assent to without consideration.

The Resolution was carried, coffee planters holding aloof and not voting.—*M. Mail*, August 17.

"ALL ABOUT RUBBER."

The third edition of this useful compilation has been issued by Messrs. A. M. & J. Ferguson, of Ceylon. It is revised and enlarged and brought thoroughly up to date, having the latest statistics and information with regard to cultivation, and scientific experiments in Trinidad and Ceylon. The table of contents shows how thoroughly every source of information has been ransacked, and in the 350 pages of the book there is a vast amount of information useful and instructive to the planter of what is believed to be the coming industry.—*S. F. Press*, Aug. 12.

ASBESTOS IN CEYLON.—Supplementing previous information respecting Asbestos in Ceylon, the discovery of which the *Ceylon Observer* was the first to announce, we quote the following lines (signed J. J. G.) from our evening contemporary:—

On enquiry from one of the largest owners of plumbago mines in the Province, who has an experience of over thirty years' mining in different localities, I learnt that he came across "asbestos" in several of his pits; but he did not take any notice of it beyond looking at it out of curiosity, as he was not aware of its value. Some two or three years ago he came across a pretty large quantity of the "oily stuff"—that is what he calls it—in one of his pits. It was so oily that, if it touched the body of a man while working in water, he says not a drop of water remained on the man's body. Asked as to the nature of the soil in which the "stuff" is usually found, he replied that all the instances he came across in pits on the slopes of hills adjoining fields. It is found at every depth at which plumbago is found, but only in a peculiar kind of soil which is dark-coloured and clayey; and which, when exposed to the sun, turns to a red colour. "Asbestos," so far as he has seen he says, is found in small crevices, about the size of the pockets of a billiard table, between the "illam" rock and plumbago. It is of a whitish colour, weighing one to two pounds, and has the appearance of well-prepared putty. The pits in which he found asbestos were situated in the following villages:—Karayaldemiya, Hali ela and Atanikita—about thirteen miles from Galle, near about Ahangama.

THE

BEE-KEEPING.

We are glad to be able to announce that the experiment in bee-keeping at the School of Agriculture has now had a fair start. A couple of frame hives specially constructed by Mr. Charles Andree of Kurunegalla (whose name is always associated with apiculture in Ceylon) were obtained some time ago, but these remained empty for a while owing to the difficulty experienced in securing a swarm near Colombo. During the late Show, however, Mr. Andree brought over a glass hive for exhibition purposes (and for which he was awarded a special Silver Medal), and kindly left the swarm to start the experiment at the school. The variety of bee chosen is the most satisfactory of the honey bees of Ceylon, known in Sinhalese as the "*me-messa*" (*Apis indica*). The hive as constructed by Mr. Andree, after many years of close attention to the subject, is specially adapted to the requirements of these bees, so that the modern and enlightened process of bee-keeping has been undertaken as it should be, not by the wholesale adoption of European appliances, but by a judicious modification of them to suit local conditions. A small bee-house has been constructed on the premises of the School of Agriculture, in which the main swarm has been located. In the original hive may be seen four parallel combs, and as there is a second casing of glass within the wood structure, the progress of the work of the bees can be watched from day to day.

It is high time that the barbarous method of collecting honey in vogue among the natives, accompanied as it is by the great loss of bee-life, should give place to the more humane modern method of bee-keeping we are trying to popularise. Honey is admitted on all hands to be one of the most wholesome and palatable foods, particularly for the young, and while it is so largely produced and consumed in other countries, it is a reproach that in this Island where there are such facilities for carrying on apiculture, it should not be possible to purchase pure honey—the stuff offered as such being in most cases an unwholesome compound of filthily-extracted bees' honey and "jaggery" (or palm sugar boiled with water).

We can think of no more suitable occupation for the women and children and older members of a villagers' family than that of bee-keeping on modern lines. Practically the only expense is the cost of the hive which should not exceed three or four rupees, and then bee-keeping makes but a small demand on the time and attention of the keeper. So that for the inactive villager this is the ideal occupation! As an interesting pursuit there is nothing to beat it, while as a means of occupying the mind of the idle, whose thoughts from stagnation become foul and breed crime, the introduction of bee-keeping among the village population is a measure that deserves all the support that the authorities can give it. And who can say but that the industry of the insect may put the lazy man to shame and urge him on to emulation! So may it be.

OCCASIONAL NOTES.

The following is the result of a sale of cattle held at the Government Dairy on the 18th August:—

The prices obtained are highly satisfactory, the average working out Rs7 a head, while Rs10 for a bull calf is quite a record price.

We are now able to supply our readers with an index to the Tenth volume of the Agricultural Magazine.

A meeting of the Commission appointed by H. E. the Governor to consider the advisability of having an Agricultural Department and to submit a report thereon, was held at the Agricultural College yesterday morning, when there were present the Hon. Mr. Justice Lawrie (Chairman), the Hon. Mr. L. F. Lee, the Hon. Mr. A. de Seneviratne, the Hon. Mr. J. N. Campbell, Messrs. F. G. A. Lane and Don Solomon Dias Bandaranaike, Maha Mudaliyar. A letter from Mr. J. H. Starey, Nuwara Eliya, was read. Mr. Lee's amendment on the report was placed before the meeting, and after some discussion. The Chairman proposed that Mr. Lee's report be adopted with the amendment, and that it be printed and circulated among the members for any additions they think proper to make. The proposal was agreed to, and the proceedings terminated.

The Colombo Agri-Horticultural Society offered a gold and a silver medal for country-bred horses exhibited at the Horse, Cattle, and Dog Show held in August. Both awards went to the Maha Mudaliyar who is foremost among horse-breeders in the Island.

The local Paris Exhibition Committee has recommended to Government that Mr. W. E. Davidson, who is Vice-Chairman and Secretary General of the Committee, should proceed to Paris as official representative of Ceylon. Mr. Davidson was one

of the officials connected with the representation of Ceylon in London at the Indian and Colonial Exhibition of 1886, and we do not think a wiser selection could have been made than has been done by the Paris Exhibition Committee, and the interests of Ceylon should be perfectly safe in the hands of the Commissioner elect:

VETERINARY ITEMS.

It is high time that some organization was brought about in the Veterinary Department of Ceylon which at present consists of the Colonial Veterinary Surgeon and an assistant. It is of course impossible for these two officers to make any impression on the stock diseases and especially the contagious diseases of the Colony. Not even when rinderpest rages in a dozen different centres has it been thought practicable to increase the veterinary staff in such an emergency. And while Koch's method of inoculation is being adopted under Government auspices wherever rinderpest occurs, it no decided official recognition of this new discovery appears to have been given to it in Ceylon.

The following is the Government Resolution on the Report by the Imperial Bacteriologist on the results of the inoculation against the disease in the Bareilly district:—

In the Resolution of the Department of Revenue and Agriculture, No. 8-94-8, dated the 5th May, 1898, on the subject of the demonstrations made by Dr. Koch at Mukhtesar of his methods of immunizing cattle against rinderpest, the Government of India asked for the hearty co-operation of Local Governments and Administrations in the carrying out of experiments in different parts of the country, more especially in the districts in the plains. The opportunity has recently occurred of making such experiments in

Bareilly; and as the results, though the experiments were on a small scale, were satisfactory, the Lieutenant-Governor considers it advisable that the procedure adopted should be made generally known. On receipt of information regarding outbreaks of rinderpest in the Bareilly district, Captain Rogers, I.M.S., the Imperial Bacteriologist, in March last, addressed the Collector of the district, stating that he would shortly have a supply of serum for use in inoculation, and asking for assistance in carrying out the process. The Commissioner of Rohilkhand submitted the correspondence to Government for definite orders as to the nature and extent of the assistance to be given, pointing out that any mistake at the beginning might have serious effects. The Commissioner was informed by the Government that the Bacteriologist should receive all possible assistance in the prosecution of his work in Bareilly, the results of which might be of the greatest benefit to the country; but that care should be taken that no pressure was brought to bear on the villagers, and that no experiments were made without their full consent. To secure these ends the following procedure was prescribed. On hearing of an outbreak in a village conveniently situated for the Bacteriologist's action, a sensible and trustworthy Deputy Collector or Tahsildar was to be deputed to go at once to the spot, assemble the landlords and chief raiyats, explain to them the object of inoculation, and strive to get their consent to its being tried. On their consenting, but not otherwise, the Bacteriologist was to be allowed to inoculate the cattle.

The Bengal Veterinary School has been raised to the status of a College which is under the management of a committee appointed by Government and consisting of Government officers and native gentlemen. The college consists of a large building in which are three lecture-rooms, a museum, library and reading-room, pharmacy, lecturers' room, and a photographic room. A Veterinary Hospital is attached to the College, consisting of four horse wards, *post mortem* and dissecting-room, shoeing-forge, operation, shed, and store-room. Special isolation wards for the contagious and infectious cases are provided outside the College compound, so as to prevent any chance of communication between the infectious and non-infectious cases. There is also a hostel attached to the College, which has been expressly provided for the benefit of the students of this College. It consists of eight large and three small rooms, with quarters for the Manager, and has sufficient accommodation for fifty boarders. Full clinical and other facilities will be afforded to meet the educational requirements of veterinary students in the Bengal Presidency. Students may also be admitted from any other part of India. The special objects of the College are to train thoroughly practical and competent men for veterinary service under Government, Native States, Municipalities, District Boards, and private employers. Government have undertaken to bear the cost of the establishment, which consists of a Principal, and assistant principal, three lecturers, an Hospital Surgeon, and a considerable working staff. Rules for the admission of students to, and

regulation of their studies in, the Bengal Veterinary College, and for the admission of animals into the hospital of the Bengal Veterinary College, are issued provisionally, and are liable to be modified hereafter, if found necessary. It is a pity that Ceylon is so backward as regards veterinary education, which is more or less confined to a short theoretical course which is of little benefit to the students attending it.

This procedure was adopted with successful results, and without any friction of any kind, but, as the outbreak was on the decline, the Bacteriologist was unable to make experiments on a large scale. In one village in which nearly a third of the cattle had died, twenty-four animals were treated; a fortnight later none of them had been attacked, while out of thirty-nine healthy animals which had not been inoculated, seven had contracted the disease, and of these three died. In another village five were successfully inoculated; but the disease was at the time on the decline, and their subsequent immunity from it may possibly be due to this cause. The experience gained in Bareilly is important, as indicating that with judicious explanation the villagers can be induced to consent to the experiments; and the Lieutenant-Governor desires that District Officers will in a similar way arrange to give assistance to the Bacteriologist when similar outbreaks occur. In this way inoculation against rinderpest may become in time so popular that the ordinary district veterinary staff may be able to practice it, to the great benefit of the people and the country.

At the Cape, the services of the Veterinary Surgeons are placed at the disposal of farmers and others. The following notification is worthy of being read and digested by our local authorities. As things go in Ceylon, the Colonial Veterinary Surgeon has first to get authority before he can visit the scene of some serious epizootic outbreak, while attendance on individual cases of serious non-contagious disease do not seem to come within the scope of that officer's duties:—

"Farmers and owners of stock throughout the Colony frequently telegraph to the Department of Agriculture requesting that one of the Government Veterinary Surgeons should be sent at once to them to attend to some valuable animal which has been taken seriously ill. It is rarely possible to comply with these requests; in the first place, because it is seldom that the Veterinary Officers can be communicated with immediately by telegraph, as they are generally engaged in the country at some distance from a telegraph station; and in the second place, because the only Veterinary Officer who may be at liberty to leave the work upon which he is engaged at the time, may be two or more hundred miles away, and can hardly be expected to arrive in time to be of any real service in an urgent case. Hence much valuable time is wasted, the owner of the animal is dissatisfied, and the Veterinary Staff discredited. It would be much more satisfactory, therefore, in all such cases in which veterinary advice and assistance are required, if the owner would telegraph the nature of the complaint that the animal is suffering from, giving as full and accurate description of the symptoms as possible. This

would enable the Veterinary Surgeon to telegraph advice at once, and state whether he were able to give personal attendance to the case or not, and thereby save valuable time, which is always of importance in acute and urgent cases."

ORIGIN AND FORMATION OF ORGANIC MATTER IN PLANTS.

(Continued.)

It does not suffice to know that the leaves, saturated with water, absorb the carbon dioxide of the air, and under the influence of the sun's rays evolve oxygen. It is necessary to define this process and to explain how organic matter is derived from the product of this decomposition. Maquenne and the author, in the article already referred to, report the result of studies on the quantities of carbon dioxide absorbed by leaves, taking into account also the quantities which would be absorbed by a volume of water equal to that contained in the leaves under experiment. The results, as already stated, indicated that the absorption is not simple solution of carbonic anhydride in the water of the leaves, but a chemical combination of the dioxide with water to form the acid CH_2O_3 . This carbon dioxide decomposes in the leaves, giving off a volume of oxygen (O_2) equal to that of the carbonic anhydride absorbed as observed by Boussingault, and leaving a residue of formic aldehyde (CH_2O). The fact that formic aldehyde has never been found in plants might be taken as casting doubt upon the correctness of the above hypothesis, but the hypothesis is strengthened by the fact that the molecules of this aldehyde combine easily with each other, and although we do not find formic aldehyde itself, we may safely assume that some at least of the bodies present are the result of combinations of molecules of formic aldehyde.

As a matter of fact, bodies which might be thus formed are extremely abundant in the vegetable kingdom, as will be seen hereafter. It is known also that the aldehydes combine readily with oxygen and hydrogen, and it is of great interest to ascertain whether there are not present in plants some products thus derived from formic aldehyde. As a matter of fact such substances have been found. By oxidation formic aldehyde yields formic acid, which gives to nettles their irritating properties. The addition of hydrogen to formic aldehyde in proper proportions yields methyl alcohol, which Maquenne found in all the plants which he studied. While the presence in plants of these two compounds so closely allied to formic aldehyde supports the hypothesis of the formation of this aldehyde in the chlorophyll cells at the moment of the decomposition of the carbon dioxide by the sun's rays, there are other proofs of a more convincing nature. The reducing sugars are widely distributed in plants. Loew, and later Fischer, starting with formic aldehyde, have prepared these sugars artificially.

They succeeded in linking together six formic aldehyde molecules, and thus formed a reducing sugar resembling those found in plants. This

beautiful synthesis convinced the physiologists that the primary organic compound from which all the others are derived is formic aldehyde produced by the decomposition of the hydrated carbon dioxide. Many other compounds common in plants are formed by the combinations of molecules of formic aldehyde, such as glycerin, which exists in all oils and which contains three molecules of formic aldehyde combined with hydrogen; the gums, which readily yield a sugar containing five molecules of formic aldehyde; and persite, found in the fruit of the alligator pear which contains seven molecules of the aldehyde. Starch is easily transformed into glucose by simply heating the starch with weak acid solution. This in fact is the method employed in the commercial preparation of glucose. Starch is also transformed into glucose during germination by the action of a ferment present in the seed. This change is so easy and so frequent that there is no doubt that the transformation could be reversed; that is, the glucose could be changed into starch. Up to the present time, however, this has not been done by purely chemical means, but when leaves are placed in a solution of glucose, starch soon appears in them. The starch is formed from the glucose through the combination of several molecules of the latter, water being eliminated. Starch is very abundant in leaves which have been exposed to sunlight. Its presence is more easily detected than that of glucose. The latter is but a transition stage, while the starch is reserve material which remains in the tissues much longer than glucose. The starch which is so abundant at the end of the day disappears during the night. The leaf is thus seen to be both a laboratory and a store-house which is continually emptying and filling itself. The starch disappears from the leaves in the form of glucose. Adult plants utilise this transfer form of starch in the formation of cellulose, just as young plantlets utilise the glucose formed from starch in the cotyledons of the seed during germination. The different steps have now been traced in the formation of the organic matter of plants from the simple carbon dioxide absorbed to the complex carbohydrates of the plant tissue. It only remains to briefly discuss the derivation of some particular forms of these carbohydrates. Among the most important of these is cellulose, which forms the envelope of the cells and which is easily changed into reducing sugars under the action of acids. It appears during the germination of seeds simultaneously with the disappearance of starch. There is little doubt that it is derived from glucose, and consequently from formic aldehyde. It seems clear, therefore, that all the carbohydrates, the gums, sugars, starch, inulin, and cellulose originate in the activity of the chlorophyll cells. The same is probably true of the tannin and resin groups. There are, however, certain plants which contain a group of sugars known as the inosites, which are true carbohydrates, but whose molecular construction is different from that of the other glucoses, since their derivatives belong to the aromatic series and not to the fatty acid series, to which the other groups belong. There is one other important point which needs some explanation. If we study the phenomena of

assimilation in a leaf which has been exposed to sunlight, we shall find that the volume of oxygen evolved equals that of the carbonic acid decomposed. The plant utilises the carbon, but the proportion of oxygen which it contains remains unchanged. This is not true, however, when we determine the changes in composition which the air in which a plant is living undergoes.

Schloesing found that under such conditions the volume of oxygen evolved was larger than the volume of carbon dioxide absorbed. This indicates that the evolution of oxygen is not due simply to decomposition of carbon dioxide. Doubtless the greater part of this excess of oxygen is due to reduction of nitrates which the plants take up from the soil, but, as is shown below, a study of plant respiration reveals another source of oxygen.

FIBRES.

(Continued).

[By DR. CHAS. RICHARDS DODGE].

Turning to the Western World and to the aboriginal civilization of the Lukas, we find the ancient Peruvians, with their simple handlooms, were enabled to produce fabrics that were marvels of design and exquisite in color and finish. Both cotton and wool were used in the different articles of dress of these people with other fibres. The Aztecs, or ancient Mexicans, were familiar with cotton, as well as several other vegetable fibres. With cotton and feathers we are told they produced a soft and beautiful fabric, which was used for mantles and blankets, and examples of their plain cotton fabrics are said to have been as fine as some of the imported linen of the present age. Regarding the early use of cotton on this Continent, there are abundant records to show that it has been cultivated more or less generally for four or five centuries. How long it has been known to the early ancestors of some of the native Indian tribes of our own country will never be known, although from the fact that its use is required in religious ceremonies, as in the Hopi Indian tribe, for example, we may be sure that such use is no modern innovation. Among the ancient fibres of India, we have early allusions, in the Institutes of Menu, to several prominent fibres, particularly where the material of the sacrificial thread is prescribed. Cotton, sana, and woollen thread are mentioned. Sana has been supposed to refer to Sunn hemp, one of the commercial fibres of the present time (*Crotalaria juncea*). Dr. Watt says the possible Sana fibres of the Sanscrit authors were Sunn, above mentioned, Saupat, or *Hibiscus cannabinus* and common hemp (*Cannabis sativa*). On the whole, the evidence is in favor of Sunn. Hemp grows wild throughout India, just as it is found in a wild state in many parts of our own country, but is regarded as the source of the drug known as bhang, or hashish, rather than as a fibre plant. We know that the use of hemp among the ancients was very limited. It has no mention in the Scriptures, and it is rarely referred to by the heathen writers of antiquity. It was used by the Scythians at least five hundred years before the Christian era, and some writers attribute to its

cultivation an antiquity more remote by a thousand years; and it was known to the Chinese at a period quite as remote. The Romans were familiar with the use of hemp for sails and cordage, though not until after the dawn of the Christian era. The China grass fibre, more popularly known as ramie, has been grown in the Orient from time immemorial, and modern writers have attempted to prove that it was contemporaneous with flax several thousand years ago in Egypt, if indeed it was not used for mummy cloth. Dr. Watt also advances a suggestion regarding ramie which would give it a great antiquity in India. He states that frequent reference is made in the Ramagana to a garment called the k-shauma, and goes on to say that while k-shauma is generally regarded as a name for linen, the word strongly resembles the Chinese name of the grass-cloth plant, or ramie, which is Chuma, Schou-ma or as now most commonly written, Tehou-ma. The use of ramie fibre is undoubtedly old, but how ancient, history does not inform us. The date palm, as we know, afforded a valuable material for cordage in Egypt in very early times, as the modern excavations have revealed to us, and the fibre is valued quite as highly by the present inhabitants of the country; and the ancient Chaldeans, or Babylonians, are said to have used this palm for everything—food, clothing, wine, and the timber for their habitations. There is plenty of evidence that palm fibre was employed throughout this entire region of the ancient world. Pliny tells us that even the papyrus (*Cyprus papyrus*) was used for cordage in Egypt, as well as for matting, curtains, and sails, and Warden says that small boats were sometimes made from the plant. Ancient vessels of bulrushes are mentioned by Isaiah, and Lucan alludes to the manner of binding and sawing them with papyrus. The use of papyrus for paper is even more interesting.

In the realm of rank aquatic vegetation we may note a reed known as Aruadodonax, which has been regarded as the "reed" of the Scriptures: "A bruised reed shall he not break, and the smoking flax shall he not quench." (The Hebrews employed flax for their lamp wicks.) Dr. Moore tells us that the heroes of Homer made their arrows of the Arundo (Iliad XI.), and that the tent of Achilles was thatched with its leaves. A coarse grass (*Spartium junceum*) has been used in Italy as a fibre plant from ancient times, its Italian name being Giuistra de Spagna. It is mentioned by Pliny. It was also largely used by the Greeks and Romans for many purposes. Another ancient Egyptian fibre grass is known as Tef (*Poa abyssinica*), said to have been the "straw" that was used by the ancient Egyptians in brick-making. The ancients were also familiar with the use of flexible twigs for tying material, the name viburnum being used for such substances. Twigs of *viburnum cassinoides* are used for such purposes in the present age. In the Western Hemisphere the fibre of two species at least of agave were employed by the ancient Mexicans or Aztecs, together with palm fibre and very coarse cotton, as clothing for the poorer classes. Cloth from the agave was called nequen, and today the Yucatan name of the commercial sisal hemp, or *agave rigida*, is henequen. This may have been one of the ancient Mexican species, but as the history of

their civilization was grotesquely recorded by the use of idiographic paintings, and not by means of written language upon books or scrolls, such fine distinctions as botanical species are not possible. Agave fibre was also used to a limited extent by the ancient Peruvians, though wool and cotton were held in first esteem. In the burial mounds of the south-western United States the remains of fibres are frequently found, Agave and Yucca fibre being common. Remains of bast fibres are also found, but they have not been identified. The subject is interesting, but it is not possible on these pages to give more than an outline, chiefly for the purpose of showing that the most valued of the commercial fibres of today were among the useful fibre species of the ancient world.

RINDERPEST.

D. HUTCHEON, COLONIAL VETERINARY SURGEON,
CAPE COLONY.

(Continued.)

Pure fresh bile should not be used in an infected herd, if any of the other inoculating materials can be obtained, as it tends to intensify the character of the disease in those already infected, and its immunising effect is too slowly developed to protect the healthy cattle against infection, if they are left in contact with those already sick. If no other means are available, however, the temperatures of the whole of the cattle in the infected herd should be carefully taken by the clinical thermometer, and only those which register a normal temperature should be inoculated with pure bile, the others should be separated from the inoculated lot at once, and carefully tended. If glycerine be obtained, the spare bile should be mixed with it in the proper proportions—one part of glycerine to two parts of bile. This mixture, after standing forty-eight hours, may be injected into the affected animals in large doses not only with safety, but with marked benefit.

A similar line of treatment should be adopted where Rinderpest appears amongst a herd of cattle which has been previously inoculated with bile. Much will depend, however, upon the length of time which has elapsed since the previous bile inoculation. In the large majority of instances that would now be nearly eighteen months, except in those herds in which it has for some special reason been repeated. Hence the amount of immunity remaining would in most instance be small, while in the remainder it would have practically passed off. It is impossible, at the present time, to form any estimate of the strength of the immunity which remains in any individual herd, as it varies so much. In some bile-inoculated herds all immunity appears to have passed off in a few months, while in others the immunity has been strong enough to resist natural infection after twelve months. As an example of the latter, Rinderpest appeared at Tafelberg Hall amongst the young calves which had not been inoculated, and four had died and several more were sick before the nature of the disease was discovered, or the affected animals removed from the rest of the herd. But although this occurred over thirteen months after the cattle were inoculated, the outbreak was confined to the calves; not a single previously inoculated animal

contracted the infection. If such a herd had been re-inoculated with any kind of bile, pure or glycerinated, or even with serum, the inoculation would have got the credit of arresting the progress of the disease at once, whereas it was entirely due to the lasting immunity conferred by the previous bile inoculation. To quote an instance of an opposite character, the disease appeared in a herd of cattle on a farm near Molteno, about five months after being inoculated with Koch's bile. The owner inoculated all that were visibly sick with serum, but not in doses large enough to do any good, and the remainder he inoculated with pure bile, after Koch, with the result that the serum did not save any of the visibly affected cattle, and the majority of those inoculated with bile, many of which would be already affected, also succumbed. In such a case if the whole herd had been inoculated with serum, giving large doses to all indicating the presence of fever, by a rise of temperature, (and the usual doses to the others, the probability is that those which were bad at the time of inoculation would have died, but the others would have been protected. Similar results would have followed if the herd had been inoculated with glycerinated bile, for, as already remarked, glycerinated bile contains strongly curative as well as immunising properties. Veterinary Surgeon Armstrong discovered that fact as far back as September 1897. While in the district of Graaff-Reinet, Rinderpest appeared in a herd of cattle unexpectedly, and he could not procure serum in time to be of any use, so he injected 20 c. c. of glycerinated bile direct into the jugular vein of the sick and apparently healthy alike, with marked beneficial effects; only one animal died out of the twenty-four treated. Since that date, the curative action of glycerinated bile has been repeatedly witnessed by farmers, as well as by different members of the Veterinary Staff. Its action in this respect is similar to that of immunising serum, the strength of the antidotal action varying in different samples of bile.

The reason why glycerinated bile can be injected into healthy animals with perfect safety, and into sick animals with marked beneficial results, whereas fresh pure bile frequently communicates the disease to healthy cattle on inoculation, and if it is injected into animals already infected, "shortens the period of incubation," and intensifies the attack—is explained as follows:—The addition of glycerine to the bile has the effect of destroying, or rendering inactive, the infective organisms of Rinderpest which are present in the bile, leaving the passive immunising substances uneffected. On the other hand, to quote Drs. J. W. and Otto C. H. Krause, *vide South African Medical Journal*, vol. vi., part 2, p. 29:—"Pure fresh bile contains the Rinderpest organism, but its activity is restrained by the presence of the immunising substances in the bile and by the bile salts." Further on these authors quote a conversation which one of them had with Dr. Koch respecting the way in which the bile of a Rinderpest animal acted. Prof. Koch's opinion is as follows:—"The bile is very gradually absorbed into the system of the animal, the minute doses of poison the system resisted forming a chemical protecting substance, which conferred a weak immunity, and which immunity

again increased as the further absorption of the remaining bile went on, until on or before the tenth day of gall inoculation the animal could withstand the enormous dose of 10 c.c. of virulent blood injected without contracting the disease. On the contrary, it was found that the injection of 10 c.c. of virulent blood fortified this immunity to a much higher degree. Bile is an aseptic fluid, which has the property when injected into the intercellular tissue of passing very slowly into the circulation. In some instances the absorption of bile takes place quicker than others, hence the gall acts with varying intensity. Thus in accordance with Prof. Koch's view, slow absorption of rinderpest bile confers immunity on an animal; quick absorption would cause rinderpest. This will depend on the amount of immunising substances in the gall; where these immunising substances are contained in the bile in the lesser quantities and not sufficient to modify or mitigate the action of the rinderpest organism, disease will supervene. Here, however, we meet with individual differences."

"Experience has taught us that, after bile inoculation of clean herds, several animals contract rinderpest from about the 8th day after the infection. The incubation period of rinderpest when acquired in the natural manner from infection through the mouth and nose, will vary depending upon the amount of poison entering the system. When an animal is infected by means of an injection of virulent blood this period is shorter; where a large dose (10 c.c.) is used the incubation period is mostly from 60 to 96 hours; when a smaller dose (0.2 c.c.) is injected, 6 to 7 days; and when a still smaller dose is employed, the period is longer. In an animal inoculated with serum after the French method, the incubation period is prolonged, and the disease appears between the 8th and 10th day, in some cases even at a later period. Where glycerinated bile (Edington's) is injected, which contains only the passive immunising substances, and after ten days 0.2 c.c. virulent blood, the incubation period is prolonged, and the animals in the majority of cases contract the disease on the 9th or 10th day after the blood injection, depending on the amount of immunising substances; where these substances in the glycerinated bile are too powerful, no outbreak of the disease will occur.

If, now, the animals had been infected on the day of inoculation with bile, in the natural manner the disease would appear on the 5th day. The outbreak taking place so regularly on the 8th day (after bile inoculation) "conclusively proves that no infection was conveyed to the animals at the time of inoculation, and must have been subsequently communicated to the animals by means of the rinderpest organism contained in the bile."

After adducing very strong evidence in favour of the fact that rinderpest bile does communicate the disease to healthy cattle, Drs. Krause propose, in order to minimise the loss arising from that, to give two inoculations instead of one. They say:—"To procure a long immunity, and at the same time to minimise the mortality after bile inoculation, we recommended two successive bile inoculations in the following manner, and obtained excellent results. The first inoculation was to be

made with bile older than three days, and not older than seven. Twelve to fourteen days after this inoculation the second inoculation followed, on condition that the animals showed no signs of disease. We found further by experiment that it was safest to use for the first inoculation 8 c.c. and for the second inoculation 15 to 20 c.c. of bile. Should, however, some of the animals sicken this second inoculation was postponed to the 20th day."

Whilst I thoroughly agree with Drs. Krause in their opinion with respect to the capability of certain fresh biles, under favouring conditions, to communicate rinderpest to healthy cattle, and accept the explanation which they offer as probably being the correct one as to how this infection is effected by the bile, I differ from them as to the method in which they propose to overcome this drawback, and procure a long immunity with safety.

With respect to their recommendation to keep biles from three to seven days until their infective properties have passed off, this is impracticable for either a Veterinary Surgeon or a farmer situated in the country districts. Bile cannot be kept sweet and fit for use for that period without ice, and it is both difficult and expensive to obtain ice in districts some distance from a railway. But I cannot understand why, under the circumstances, Drs. Krause should not use glycerinated bile for the first inoculation when they admit that it possesses the same properties as pure bile which has been kept for four days and over. It is absolutely safe to use, and equally effective.

With regard to their recommendation to use only 8 c.c. instead of 10 c.c. of Koch's bile for a first inoculation,—if this applies to bile which has been kept for four days and over, I do not see any necessity or advantage in reducing the dose, because a full dose of bile of that age would be safe to use. And if it refers to comparatively fresh biles which have been kept from 24 to 48 hours, I regret to have to state that in our experience we did not find the small dose any safer than the large one. We tried the method of twice inoculating with bile as far back as the beginning of May 1897, but the results were not satisfactory. The disease appeared in the herds following inoculation with the smaller dose as frequently as when the full dose was used, it being the quality rather than the quantity of the bile to which we attributed this result: and when the disease did appear in a herd after being inoculated with the smaller dose, it showed a greater tendency to spread through the herd, as the immunity was not so strong as when the full dose of bile was injected at first; and if a second inoculation with pure bile was resorted to before the disease had ceased in the herd, it intensified the disease and increased the mortality, while to wait until the disease had ceased in the herd, was to wait until the second inoculation was of no immediate practical value except to extend the immunity. We had therefore to abandon that method and resort to the old dose of 10 c.c. for the first dose, a second dose could then be injected at any convenient date if the owner wished to further fortify his cattle.

Moreover, it is very evident that the Drs. had no great confidence in the success of this small first injection of bile themselves, for they make provision for, and give directions how to act should the disease follow the first inoculation with 8 c.c.

But with glycerinated bile, the case is entirely different, it can with perfect safety be injected into healthy susceptible cattle in doses sufficiently large to give complete immunity against the danger of a second large dose of fresh pure bile communicating the disease. Considering, therefore, that Rinderpest has practically died out in the Colony, no farmer with a clean herd would willingly run the risk of introducing the disease amongst his cattle, if he could get them protected without the necessity of doing so. I have no hesitation, therefore, in reply to the question,—What method of inoculation should be adopted in the case of clean herds which are in danger? to recommend that they be at once inoculated with a large dose of glycerinated bile (from 20 to 30 c.c.) corresponding to the size of the animals, and follow this inoculation in from eight to twelve days with an injection of a large dose (10 to 20 c.c.) of strong pure bile. If this is properly carried out, such inoculated animals would have a lengthened immunity conferred upon them sufficient for all practical purposes.

With respect to Drs. Krause's recommendation to follow these two bile inoculations with an injection of virulent blood,—there is no part of South Africa in which an injection of virulent blood after bile inoculation has been so largely practised as in Cape Colony, and our experience is that one dose of virulent blood injected on the tenth day after bile inoculation does not strengthen or extend the immunity conferred by the bile, if such bile possessed strong immunising properties and the blood inoculation that followed produced no fever reaction. If, on the other hand, the bile was weak in immunising properties, the mortality that followed the virulent blood inoculation was very high, in many cases 75 per cent. and even more.

In controverting our expressed opinion on this point Drs. Krause make a very important qualifying remark. They say "It is an established fact that once an animal is rendered immune, and *gradually infectious* materials are conveyed to its blood, the greater the increase of the immunity will be." Quite so; we never disputed that inoculation with virulent blood in *gradually increasing* doses, injected at short intervals after bile, will increase the immunity conferred by the bile. We emphasized this fact, *vide* my annual report for 1897, p. 25. The point that we disputed and still maintain is that if *one dose* of virulent blood is injected into an animal ten days after that animal was inoculated with Koch's bile, when the latter confers an immunity which resists the action of the dose of virulent blood so completely that no reaction follows, then the immunity of that animal is not perceptibly strengthened by such an inoculation with virulent blood. I do not think that any one who reads the account of our experiment at Taaboschfontein in the Herbert district in 1897 can entertain any doubt on that point, *vide* my annual report for 1897, p. 14.

But apart from its utility or otherwise, there are very few farmers in the Cape Colony who

would now favour the blood inoculation after bile in healthy herds owing (a) to the danger of introducing active rinderpest amongst them, and (b) the danger of introducing other diseases such as red-water by the blood inoculation.

These are also the chief reasons why the serum and blood method of inoculation should not be applied to healthy herds, in the majority of the cattle districts of the Colony, at least not unless the disease should again assume an epizootic form, which we sincerely hope it may not. But independent of the undesirability of introducing the disease into clean herds now that it has become sporadic in its character, it will be impossible to obtain any strong serum after our present limited supply is exhausted, as there will be no suitable animals available for its immediate production. As Dr. Turner remarks, "such highly fortified animals as would produce strong immunising serum could not be prepared in less than three months. Hence bile must of necessity be used for the inoculation of herds in fresh outbreaks of an isolated and sporadic character." I would therefore strongly recommend that in every outbreak of the disease that occurs, every drop of suitable bile obtained from the animals which die should be mixed with glycerine in proper proportions, two parts of bile to one of glycerine, so that it may be preserved and made available for the inoculation of infected herds, and also for the first inoculation of clean herds which may be considered in danger. Pure bile for the second inoculation of clean herds can always be obtained when the disease appears in any locality, which would be the only reason for inoculating clean herds in the immediate vicinity. The method of inoculation which I would recommend in future sporadic outbreaks of the disease is briefly as follows:—

Infected Herds.—These should be inoculated at once with either serum or glycerinated bile; every animal which indicates infection by a rise of temperature should receive a large dose of not less than 100 cc. of serum, or 30 cc. of glycerinated bile, the latter should by preference be injected into the jugular vein, so as to secure its immediate action. Then from eight to twelve days after, all the animals in the herds which give no indication of being infected with the disease or fever should receive an injection of pure bile; not less than 10 cc., and for large animals 20 cc. This will confer a lasting immunity sufficient for all practical purposes.

Clean Herds.—When it is decided to inoculate a clean herd which is in danger of becoming infected through its proximity to diseased cattle, I would recommend that the animals composing the herd should be inoculated first with 20 cc. of glycerinated bile, and to follow this inoculation in from eight to twelve days with an injection of from 10 to 20 cc. of pure bile. This will confer a strong and lasting immunity on the animals in the herd, and will be free from risk arising from the inoculation or of introducing the disease.

DIRECTIONS FOR PREPARING THE BILE.

The bile should be taken from an affected animal immediately after death, or from one which is killed in the last stage of collapse.

Biles of all shades of colour—except those which are red from the presence of blood—may be

used, so long as they are clear and free from a putrid smell. Thin, light, yellow biles should also be rejected.

All the galls extracted at one time should be mixed together, after standing separately for twelve to eighteen hours, so as to render them uniform in strength and immunising properties. Pure bile should be used on the second day after being drawn, unless it is kept in an ice chest, when it may be kept sweet much longer. But if pure bile is used as a second inoculation only as above directed, it is not desirable to keep it longer than twenty-four hours.

Glycerinated bile is made by adding one part of glycerine to two parts of bile, stirring the mixture well, then mix all the biles taken at one time, and allow them to stand for eight days. But if there is urgency, the glycerinated bile may be used forty-eight hours after it is mixed.

Cleanliness and all antiseptic precautions formerly published, and with which the public are familiar, must be carried out in extracting the bile and inoculating the catte.

TAGASASTE.

Very full information respecting the useful fodder plant known in the Canary Islands as Tagasaste has been given in the Kew Reports, 1879, p. 18; 1880, p. 16; 1881, p. 13; 1882, p. 22, and in the Kew Bulletin 1891, p. 239. This plant was brought into notice by the late Dr. Victor Perez of Orotava, Teneriffe, and it was entirely through the personal exertions of this estimable gentleman that so much information has been obtained respecting it, and that seed of so useful a plant has been placed at the disposal of persons in various parts of the world for experimental purposes. Dr. Perez sent many supplies direct to Kew with results that have already been recorded. During a visit to Teneriffe in the early part of this year I had many opportunities of seeing the Tagasaste growing and of realising how valuable it proved in dry localities unsuited to the growth of any other kind of herbage plant. This note is to be regarded as supplementing in a few particulars the general information already given in the Kew Bulletin. The ordinary *Cytisus proliferus*, Linn. f., or "Silky Cytisus" is a plant widely distributed in Teneriffe. It is known locally as "Escabou." It was observed growing plentifully at elevations of 3,000 to 6,000 feet. According to specimens in the Kew Herbarium it is found also in Grand Canary, but probably to a much less extent than in Teneriffe. It is not infrequently seen as a cultivated plant in English greenhouses where its silky leaves and abundant white flowers render it a very attractive object. In Teneriffe it forms a large bush or tree with a stout woody stem sometimes attaining a height of 8 to 10 feet. The branches are of a slender drooping habit plentifully covered with ternate leaves on short petioles. The leaflets are oval-lanceolate pointed at both ends and clothed on the underside by copious silky adpressed hairs. These hairs are generally white, but in some cases they are fulvous or even of a rich brown colour. The flowers (also silky in bud), are snow white when fully expanded

and attached in loosely packed umbels on the sides of the branches. The pedicels are of a rosy colour. After flowering the bud in the centre of each umbel usually grows out into a branch, an appearance of proliferation which has suggested the specific name. The pods are slightly narrowed at the base and produced abundantly. They are sismous, oblong pointed and densely pilose in the young state. This is the typical plant known as "Escabou," ordinarily met with in the mountainous parts in Teneriffe. There are several forms differing slightly in the size of the leaves and the colours of the flowers.

None of them, however, possess any special merit as fodder plants. The Escabou itself is seldom browsed upon by animals unless pressed by hunger, and it probably contains cytisine—an active poisonous principle known to exist in the common laburnum and other members of this genus. The tagasaste on the other hand evidently contains little cytisine, for it is readily eaten by animals and especially those that have become accustomed to it when young. The tagasaste is known in the wild state only from the island of Palma where it grew originally on the hills above the celebrated chapel of our Lady de las Nieves at an elevation of about 1,000 feet above the level of the sea. It acquired considerable reputation locally, and it was gradually distributed by cultivation all over Palma. The first person who carefully studied the tagasaste and wrote about it was Dr. Victor Perez. He introduced it into cultivation at Teneriffe and published a pamphlet on its merits as a fodder plant nearly 30 years ago. The plant was quoted in Dr. Victor Perez's writings simply as an unnamed variety of *Cytisus proliferus*. Although in botanical characters it differs only in a slight degree from the type, it has nevertheless deserved to be regarded as a distinct variety and to bear a distinguishing name. The name that might very appropriately have been associated with it was that of Dr. Victor Perez. As the matter now stands, however, the tagasaste has been described by Dr. H. Christ in *Spicilegium Canariense* published in Engler's "Botanische Jahrbuch," IX. 120, as *Cytisus proliferus var. palmensis*. This name therefore distinguishes the Palma Tagasaste from the ordinary Teneriffe plant Escabou. *Cytisus proliferus*, Linn. f. var. *palmensis* differs from the type by its more robust growth and a laxer habit. It often attains a height of 12 to 15 feet in good soils, and all parts of the stem and branches are enveloped in leaves. In fact its very leafy character is one of the marked features of the plant. The leaflets are ovate oblong, somewhat obtuse and dark green in colour. The young growths, as may be seen in growing specimens at Kew, are almost entirely destitute of the silky hairs so abundant on the species. Dr. Christ's Palma specimens were obtained on the margin of woods above Barranco Carmen and at Dolores in March 1884. It only remains to add a few words respecting the economic value and the uses of tagasaste for fodder purposes. Like all Canary plants it sends its very long tap roots deep into the ground, and it is thus enabled to bear prolonged periods of drought without injury. In many instances tagasaste was the only plant that thrived in loose volcanic scoria and ash. Bushes of it more than

20 years old, existing under the most arid conditions were still yielding regularly large crops of fodder. A plant or two is cultivated near every cottage in the neighbourhood of Orotava, and it is planted along the principal roads to afford food for the animals kept by the road labourers.

The tagasaste evidently prefers a loose friable soil, for then its roots can penetrate far into the earth. It grows moderately well also in somewhat clayey soils, but it is impatient of stagnant moisture. The climate where the tagasaste thrives best is mild and equable. The plant is well known not to bear frost, but on the other hand, it will probably bear considerable heat, and it might on this account be suited for most tropical and sub-tropical countries with a friable soil. As already stated the tagasaste is readily eaten by domestic animals. Cattle, sheep, goats, and pigs evidently thrive upon it. It is said not to be so suitable for horses in the green state. This practically the only drawback to its general use when freshly cut. It makes, however, an excellent hay, and as a dry fodder or after being treated in silos its value is greatly increased. A sample of dried fermented tagasaste was forwarded to Kew by Dr. Perez through Her Majesty's Consul at Teneriffe in 1886. It is said that in this state tagasaste is particularly palatable to both horses and ruminants. Another interesting point about tagasaste is that its flowers are frequented by swarms of bees, and it has already proved at the Cape and in Australia of great value to beekeepers. The late Dr. Schomburgk states that the tagasaste trees in the Botanic Garden at Adelaide "were covered with bees during the flowering season." In countries with bare hilly tracts denuded of forest tagasaste should prove of the utmost value. It requires no irrigation, and once it is planted it lasts for 20 years or more. When overgrown and cut down it yields excellent firewood. In very dry countries with light friable soils there is probably no plant that would so well repay cultivation as the tagasaste.

GENERAL ITEMS.

The Mangosteen is a native of Malacca (Straits Settlements) it is said that in the early days of the French occupation of Cochin, China several naval officers who had been invited to the table of the Emperor Napoleon III. were unceasing in their praise of the delicious mangosteen, at that time unknown in Europe. The curiosity of Her Majesty the Empress Eugenie was aroused, and, wishing to taste for herself this famous produce of Cochin China, she requested an Admiral to accomplish the im-

possible and to procure for her at least a dozen mangosteens. Great efforts were made, the ice-room of a man-of-war taking troops home was appropriated to the purpose, and out of several thousands of the selected fruit a hundred arrived in good condition.

The Rev. W. H. Hollister, of Kolar, in the Mysore province, has says the *Indian Agriculturist*, sent us a small pamphlet in which he discusses the "plough problem," and hopes that his endeavours "will lead men of influence to adequate consideration of one of India's great needs." In the author's opinion a good plough costing Rs. 15 to Rs. 20 will pay for itself in two years and then be good for ten years' service, and a good plough drawn twenty-five miles will accomplish as much as a country plough drawn 100 miles. Mr. Hollister then discusses the relative advantages of the improved and country ploughs and lays down the following propositions: Improved ploughs are an important factor in promoting general prosperity and preventing famine in India, for they will largely increase the productive areas, besides increasing the production of present cultivated areas by bringing unused portions under actual cultivation, by destroying noxious weeds and grasses that cause many acres to lie waste or produce scant crops, and by improving the soil in many places. Other advantages claimed by the author for the improved plough are that the use of it will lead to improvement in the quality of the cattle and will help directly in solving some famine problems. Mr. Hollister, proceeding to discuss what should be the attitude of Government in this matter, makes some very sensible remarks. He says that Government action in this matter would be in perfect accord with its generous, humane, and paternal efforts for the people on other lines, and it is as legitimate a line for Government effort as are irrigation works. As to the efforts that Government may wisely make in this matter, the following are some of the suggestions of the author of the pamphlet. (a) Let careful and exhaustive tests be made of all ploughs that appear likely to be of real value to ryots. The more meritorious should be brought to the notice of the people and be placed within reach of the more intelligent ryot, since these will use them to their best advantage; (b) men of practical experience in agriculture and the use of ploughs should be appointed Superintendents of circles of greater or less extent; (c) during the infancy of the industry Government should manufacture ploughs in such a manner as to reduce their cost to a minimum; (d) Government should establish numerous depots.

MERCHANT, PLANTER AND EDITOR, 1841-1870.

R. R. E. LEWIS deserves a place in our roll of pioneers if for no other reason than that, so far as we can recollect, he was the writer of the first little history of systematic “Coffee Planting,” ever published in Ceylon. But Mr. Lewis has special claims arising out of his arrival at an early date in the Colony and to his interest in its development, not only as merchant, but also as planter and editor. He is now a veteran of 82 years in retirement in England, but, like so many other old pioneers, is still active, both mentally and physically, as may be judged by the following little note which reached us by a mail in July last from our old friend:—

“You will be glad to know that in my 82nd year I am in good health though not without infirmities; still active and energetic, for which I cannot be too thankful, still enabling me to make walking excursions into the country by the help of railways, for which the position of my residence offers great facilities, not only for all the Southern lines, but also several of the Northern. These excursions afford healthful changes of air and exercise. My oldest Ceylon friend, Mr. Robert Nicol (A. & R. Crowe & Co.), passenger with me in the ‘Achilles’ to Colombo in 1841, still survives at Bervie, N.B.”

We may now proceed to a sketch of Mr. Lewis' career which will be chiefly autobiographic:—

The subject of the following memoir brought with him a nine years' experience of London business, especially in connection with the Colonial Produce Markets of Mincing Lane, and the wholesale trade in that produce in all parts of England and Scotland. The equalisation of the duties on all British-grown coffee persuaded him that Coffee Planting in Ceylon would very soon become a new enterprise for the employment of British capital, and prompted the desire to go out to the Colony to become a planter. By his father's advice, on the score of his youth, his voyage out was postponed until 1841, when it took place in Mr. Tindall's ship, the “Achilles,” which arrived at Colombo in October, 1841. At the time of Mr. Lewis' arrival, there were only two vessels in the Colombo roadstead, and both belonged to Mr. Tindall, whose ships carried nine-tenths of the cargo and nearly all the passengers to and from Europe during the early “forties.” Mr. Lewis was at once received into the office of his father's friend, Mr. H. I. Albrecht, whom he had known for many years in his connection with the Produce Markets in Mincing Lane. The Colombo business passing through many vicissitudes was known then as Parlett & Co., and ultimately Parlett, O'Halloran & Co., which firm, after the death of Mr. Albrecht,

in later years suspended. The opportunity occurring, Mr. Lewis embraced the offer of the charge of a Coffee Plantation, Hatterebage, in Safragam, in 1843. This had long been his wish before leaving England. Having noticed the fiscal changes which had equalised the duties on Coffee from the West Indies and the Colonies, he had been confident from the first, that planting in Ceylon by Europeans would soon follow. Here, notwithstanding the intense solitude of the place, a happy three years were passed, 150 acres planted and partially brought into bearing at a reasonable expense. The proprietor, his friend and fellow-passenger by the "Achilles" died, and troubles arising with his representatives, Mr. Lewis' connection with the estate ceased. He was soon called down to Colombo to undertake to bring into shape the accounts of an Agent for Proprietors in Europe, who had bought and carried on many estates at a vast expenditure of capital. This he did not fully accomplish for reasons which need not be stated, and he declined to proceed further with them. At that time 1846-7, a Conveyance Company was projected in order to bring down the coffee crops from Kandyan districts with better dispatch than could then be accomplished by bullock carts, which usually took from five to seven days between Kandy and Colombo. For this it was proposed to establish stations on the road for providing fresh bullocks to draw the loads and to make the journey continuous and not intermittent by the work and rest of the same cattle. A fair salary being offered for a Secretary, Mr. Lewis applied for and obtained it. Outside attendance at meetings of Directors and receiving subscriptions for shares, his first work was to determine the sites of the stations and to negotiate with native owners and Government officials for the land required. Having accomplished this and secured a terminus in Colombo, other business of a more pressing nature having come upon him, he resigned his position with the Company. Mr. Lewis then held the Power of Attorney of a merchant who was leaving for Europe, and contributed some assistance to the "Examiner" newspaper then but lately commenced. This last led to lending his savings to the then proprietor, of which being unable to obtain the repayment for good or for evil, and very unwillingly he had to take over the paper on the return of his merchant friend to Ceylon. This was in the year 1848, and his connection with that paper, of which he was sole Editor, continued until June, 1853, when the "Examiner" was disposed of to three gentlemen now all gone to the majority. The year 1848 was notable for a partial rising of the natives in the Central Province and the means used for sup-

pressing it, which gave rise to a lamentable controversy between the "Examiner" and the *Observer*, which had hardly subsided when Sir George Anderson succeeded Lord Torrington as Governor. The proceedings in Parliament at home were no less stormy; an exhaustive Parliamentary enquiry took place, and many Ceylon officials were removed to other Colonies. The two last acts of the drama being the Court Martial demanded by Major, now Colonel Watson, by which he was acquitted, and another enquiry by two members of the Indian Civil Service with the same charge in connection with his action whilst on duty in the disturbed districts. Before parting with the "Examiner" it may be mentioned that though it did not enjoy a large circulation, it was an authority on mercantile questions, always siding with the new departure, Free Trade then coming forward at home. Many improvements, arising from the Editor's early business experience at home in regard to preparation and packing coffee for shipment, were advocated in its columns, many suggestions for improvements in coffee cultivation were put forward which have borne fruit in later years.

At the Great Exhibition of 1851, Mr. Lewis contributed Models of Buildings and Machinery on Coffee Plantations for which he received a Medal, and the smaller contributions mostly passed through his hands, sent in to the "Examiner" Office.

Leaving Ceylon in November, 1853, he arrived home in the following March in fine health, just as the Fleet was leaving for the Baltic; the Crimean War having broken out during the voyage round Cape. After parting with the "Examiner," on his passage to England round the Cape in the "Symmetry" in 1853, Mr. Lewis, besides other things amused himself with writing a short "History of Coffee Planting" and the *modus operandi* which after his return to Ceylon was published in chapters in the "Examiner," and afterwards gathered into a pamphlet for distribution to his friends. This little work was used and favourably acknowledged by Sir Emerson Tennent in his great work on Ceylon. Later it was plagiarised by several writers on the same subject, whose names and works need not be mentioned. It is only fair to say, that an ampler historical account of the commencement and progress of Coffee Planting in the various districts, was published by Mr. A. M. Ferguson in his Ceylon Commonplace Book in 1859. Having married, he returned to Ceylon arriving in September, 1855, ostensibly to undertake the management of a plantation in Dimbula; but the arrangement falling through, at the invitation of his old friend, Mr. Butler, he became assistant to, and holding the Power of Attorney of, Messrs. Darley, Butler & Co., which power he was called upon to

exercise to the full during the absence of both partners in Europe. In the same year in conjunction with the late Mr. S. T. Richmond he was appointed Assignee in the Bankruptcy of Messrs. James Swan & Co. In 1861, Mr. Darley, then resident partner in Colombo, going home, not intending to return, and Mr. Stephen Darley coming from Cochin to Colombo, as partner in conjunction with Mr. Mitchell, who had recently joined the firm, Mr. Lewis moved with his family to India to the vacant Cochin post, which he held, after good success in which he participated, until 1866, when the firm gave up business at Cochin. After visiting the Travancore Coffee Plantations, Madras, Colombo, and Bombay, on his way, he rejoined his family at home in the same year. Not seeing his way to enter business in England, Mr. Lewis, at the instance of the partners in London, returned to Ceylon as assistant to Mr. Mitchell, at that time Mr. Stephen Darley had retired from the firm. The death of the elder Mr. Darley in 1869, obliging Mr. Mitchell's absence from Ceylon, during which Mr. Lewis took charge of the business, also brought about changes which made an opening for Mr. Lewis' retirement, then necessitated by the state of his health which had broken down, Mr. and Mrs. Lewis leaving Ceylon and their many friends in November of 1870, after twenty-nine years connection with the island.

Before closing, we may take over a contribution made by Mr. Lewis some four years ago to the *Ceylon Observer*, giving some recollections of his early days in Ceylon:—

The writer's recollections commence in

THE YEAR 1841,

when Sir Colin Campbell was Governor of Ceylon. It was then ceasing to be merely a military dependency of the British Crown, but was becoming a Colony, while Mercantile and Planting enterprise were beginning to develop. It is not intended to give a history of these enterprises, but something may be said as to the causes for this change. In a word, it was the abolition of differential duties on coffee, which had been imposed on the produce of Foreign Countries and even on that of our own possessions in favor of the West Indies.

In these days, when few middle-class families have not some friend or relation connected with the Island, it may sound strange, that Ceylon in the "Forties" was very often confounded with Sierra Leone, and intending voyages were sympathized with as going out to one of the most unhealthy countries in the world.

As nearly as 1837—perhaps earlier—some few plantations had been commenced; the Governor Sir Edward Barnes had himself opened land near Peradeniya, rendered possible by the opening of the road to Kandy under his energetic rule.

PLANTING

was very experimental in those days, and much capital was wasted by planting in unsuitable situations. The great rush for land however began in 1841, and land was then readily sold by the Government at 5s an acre, as a reference to the *Government Gazette* for that year will show. Unhappily much land was bought and planting commenced by Civil Servants and Military men and much disaster followed leading to regulations which have lately been

revised prohibiting such investments. Experience in cultivation and finance had to be acquired, wanting which many proprietors were ruined, and by the year 1847 few estates remained in the hands of the original owners. Experience at last came,—not a little assisted by the local press, through which every improvement became common property, producing valuable discussion. Wave after wave of alternate prosperity and depression have characterised the enterprise up to the time when Coffee had to give place to Tea.

In those early days the

SOCIETY

outside the Civil and Military offices was very limited. A few merchants had officers in the Fort where their assistants mostly lived to protect the hard cash in the strong room; no Bank having been established until 1841, when the "Bank of Ceylon" was opened. There was no decent hotel in those times: the Colombo Resthouse would now be a disgrace to an outstation; but there was much hospitality to strangers, and Captains of ships were always entertained by the merchants, to whom their vessels were consigned. Admission to the use of the Library with the privilege of attending the dances every fortnight, was by ballot. There were then two Regiments of Royal Troops besides the Ceylon Rifles, Artillery and Gun Lascars. Not long before there had been

FOUR REGIMENTS,

stationed in the island. With the influx of new people, houses and furniture were wanted, and except old Dutch furniture in the houses of Burghers,—often very handsome and made of valuable woods,—there was little to be had, except a few articles manufactured outside and brought in for sale on pingoes chiefly. It was not an uncommon thing for somebody to say to another about to leave the Island:—"I am sorry you are going away,

HAVE YOU ANY FURNITURE TO SELL?"

Not only furniture, but gentlemen's and ladies' clothing articles were difficult to obtain beyond plain things which could be made by local tailors and needlewomen. The writer not knowing what head covering might be worn, brought out with him a silk hat costing 6s 8d which was admired by all beholders: many were the enquiries "Where did you get your hat?" At that time the Colonial Secretary was wearing a beaver, the color of a fox's brush. Soon after, things changed by a curious circumstance. A new Chief Justice came out, and in his train a Scotch gentleman, who practised as a notary afterwards, and later on as a magistrate at an outstation. His wife, with an eye to the main chance, brought with her an invoice of ladies' goods which were sold off at once. This lady saw at a glance the nakedness of the land, and having a brother in the drapery trade communicated her views to him, which resulted in the establishment of

A GENERAL STORE

of high character and which celebrated its jubilee only lately. Retail business by Europeans has since progressed largely in all its branches. One of the most pressing wants at that time was

ROADS IN THE INTERIOR.

The Kandy, the Kurunegala, the Galle, the Gampola, the Negombo, the Puttalam and the Matale roads alone existed. Estates which did not adjoin these roads were reached at best by bridlepaths, but most often by a mere track through jungle over rock and river which caused those clever and sure-footed Pegu ponies to be in great request,—rice and stores reaching the estates by coolies and tavalam bullocks. The facilities for locomotion now enjoyed independently of railways, are chiefly due to the late Major Skinner and his able assistant Capt. Evatt and his subordinates. There were then mail coaches (so-called) on the Kandy and Galle roads which started daily at morning gun-fire. Our merchants were few; the business of coffee curing and shipping had no then come into existence; nor had the trade i

piece goods and European articles been developed by the circulation of money on the plantations. A merchant leaving for Europe would be always accompanied to the Wharf by his brother merchants. Intercourse with Europeans was then almost entirely by

SAILING SHIPS;

merchandise and produce coming and going in the same way. Mr. Wm. Tindall of London and Scarborough was the owner of nearly all the vessels which traded with Ceylon; their Commanders being well-known men well received everywhere. Any one who wished to use the Overland Route organised by Waghorn, would go up to Bombay by our little mail-steamer "Seaforth," going on by Indian Navy steamer to Suez, and thence in a very rough way across the desert to Cairo and to Alexandria and onwards. Our Overland Mails came in and went out once a month. During the monsoon they were brought down by Dak from Bombay. In the North-East monsoon they came by the Colonial steamer "Seaforth" from Bombay. The arrival of the

ENGLISH MAIL

was a very exciting thing; for it happened mostly that the outward mail had to be despatched in a matter of hours after. Perhaps there is no European now living in Ceylon who remembers the arrival of the mail announcing the birth of H.R.H. the Prince of Wales and the Breach promotion in 1841. On that occasion after the steamer was signalled, Civilian, Military and Mercantile men were at the Wharf awaiting the Captain of the steamer to land. When he came, he announced to the recipients themselves their new honours. That gentleman after a prosperous career as a merchant in Colombo is now at a good old age, living near London. The passage of the mail was then about a month—possibly more—for when Capt. Ingledew, the Pioneer of the P. & O. Company, brought letters to Galle in the steamer "India" in 30 days, it was considered a great feat. Since that time the large and powerful steamers of the P. & O. and British India Company, besides many other modern lines, with the opening of the Suez Canal, have reduced the time occupied in transit and expenses of travelling to about half of what they were up to as late as 1871. Postal facilities of all kinds now exist which were undreamed of in the 40's, 50's and 60's. The early planters had among other difficulties, that of

FETCHING THEIR MONEY

in hard cash up to the estates which generally required a personal visit every month to Kandy. The provision of this money was by Government notes cashed at the Kandy Kachecheri. Considering the temptation to highway robbery and the facilities for it in lonely corners, it speaks well for the natives, that the number of these crimes might have been counted on the fingers of one hand. A greater trial to the planter was

THE LABOUR QUESTION

especially for clearing jungles for which Sinhalese villagers are specially adapted; those were not the days of contractors for felling and burning, and the immigration of Tamils for all the after operations had not been systematised.

AMUSEMENTS

were few, Governor's Balls, Race Balls and dinner parties in Colombo were about all. In the Planting districts perhaps the monthly visit to Kandy where the pioneer enjoyed himself very much like Jack ashore, was a beneficial change while the circumstances of his life required. It might then have been said,

"The sound of the church-going bell
These valleys and rocks never heard."

There were Chaplaincies in Colombo, Kandy, Galle and Trincomalee; Missionaries both Church, Presbyterians and Nonconformists at several stations with Churches and Chapels in Colombo and Kandy, but the privileges of public worship which dwellers in

the jungle now enjoy, though these might be improved and extended, did not exist. The most important improvement, and the cause of the great contrast between the present and earlier times has been the introduction of

RAILWAYS.

The facile communication between the Plains and the Hills is a boon to the health of Europeans, whilst it is an enormous advantage to the Planting Interest, on the prosperity of which, as seen by its ups and downs in sixty years, the well-being of the island depends.—R. E. L.

PHILIPPINE HEMP INDUSTRY.

Among the chief industries in the Philippine Islands is the gathering and export of Hemp. Manila hemp is known the world over for its fine quality and its value for making all kinds of rope, from the highest hawser down to the finest piece of twine, and it would be very much in order to devote a little of our space to this important feature of Manila's commerce.

The scientific name of this hemp is "Musa Textilis," and the tree belongs to the banana family; thus the banana is classified as "Musa Edibilis," the latter names of each respectively showing one to produce the textile or fabric, and the other the edible fruit.

"Manila hemp" is the name invariably used by the merchants of England and America to distinguish it from the Russian an Indian hemp, which is much inferior. In the Philippines, however, it is not regarded as a product of Manila and district, but chiefly of the southern islands, and it is called "abaca," with accent on the last syllable.

The hemp trees of the Philippines, have been tried to be introduced in Borneo and India but without much success. The trees grow best on the Pacific slopes of the Southern islands. South Luzon furnishes the best quality and greatest quantity, but there is little difference between Samar and Leyte of the archipelago as producing districts. The roots of the plant cannot exist in damp soil; volcanic soil where the ground is dry and plenty of moisture overhead is essential to getting the best results.

Here, in these localities we find large plantations among the hills with the hemp trees in different stages of growth. They require little cultivation; once a week the native cleaner or gatherer goes through the plantation and does the little weeding that is necessary while in performance of his duty of cutting and stripping the trees.

The trees are planted from shoots and grow to a height of ten feet and from five to seven inches in diameter. In appearance they appear to an unpracticed eye like the banana tree, and if these trees were allowed to grow five or six years they would develop a fruit something like a plantain; it is said by some that this fruit is poisonous.

When the tree is three years, then it is the proper time to cut it down and strip it of its fibre. This stripping is a most difficult and important point in the production of hemp and requires great experience. The native cleaner, as he is called, goes up into the hills armed with his bolo and a hag of rice. He enters the plantation and glances to right and left as he walks along. Experience has taught him to tell at a glance if a tree has reached the age for cutting. One slash with the bolo and the tree is cut down close to the roots. The first thing he does is to plant a cutting or shoot in close proximity to where the tree grew. This is invariably the rule, that when a tree is cut down another is immediately planted in its place, so there are at all times trees in different stages of development. As soon as this is done he strips the shrub of its leaves and commences on the long stalk eight or ten feet in length: He strips off the extreme outer skin and then commences the real work. In the centre of the stalk is a stout pith, and around this grow alternate layers of fibre and a sappy, vegetable matter. These layers of fibre must be carefully stripped off the stock at once for fear of the sa

rotting the fibre. The cleaner in a couple of minutes has cut a small bamboo tree and made a rough bunch. With a bamboo strip fastened to his knife and that in turn fastened to his foot, he stoops over to the ground in front and then makes a full backward sweep as far as his arms can reach stripping a layer of fibre which he throws off to one side. This is repeated until the fibre is all taken off, and after spreading the strippings on the ground to dry in the sun he continues on to repeat the work in another spot wherever he may find a tree in the proper stage of maturity. The work of stripping is heart-breaking and causes many a lame back; even the native who is accustomed to the work finds it no sinecure. A full tree will yield about one pound of fibre and a native can clean fifty pounds in a week. The length of fibre is from six to eight feet.

The natives are exceedingly independent and work as long as it suits their convenience. When a cleaner has got what he considers enough fibre cut, cleaned and dried, he ties it up and takes it down to market, where he sells it to the middleman and receives in return the market value of the fibre. The plantation owner receives one-half this remuneration and the native keeps the other, and this is the only time the plantation owner figures in the whole proposition, i.e., when he gets his share. He simply watches to see that he gets his share.

In the hemp ports representatives from the business houses here in Manila buy from those middlemen. They are either Spanish, Chinese or native dealers, who collect the hemp and barter with the native cleaners, using rice as the standard of exchange.

GRADES.

Ordinarily, the hemp arrives here classified according to grade by the middlemen, but sometimes it is sent here to be classified and the experienced eye of the merchant spots at once all defective or injured fibre.

The quality depends a great deal upon the original cleaner and the state of the weather at the time the tree was cut.

To turn out the best grade the cleaner must be very careful in his stripping and have the fibre dried at once, whereas, if allowed to stand awhile, the fibre loses its fine color and some of its strength. Hemp is graded according to fineness or coarseness, color, length of fibre and its tensile strength. The latter depends greatly upon the age of the tree. The color and coarseness show the quality of the Hemp and this depends, as mentioned above, wholly upon the cleaner. Sometimes he is careless, and more especially when high prices prevail in Manila he does not trouble himself about the quality of his work, but aims only to turn out as much as possible while that market condition prevails.

VALUE.

The value of hemp varies. It has been known to be as high as £60 per ton and then again as low as £14 sterling. Of late the price has fluctuated continually, owing to the war and the political situation in the Philippines. The average rate per ton, however, is about £25 or £30 sterling.

There are between 800,000 and 1,000,000 bales of hemp produced and shipped from these islands annually. The United States, acting as a centre for South America, Cuba and Canada; and England; as a centre for Europe and Western Asia take the bulk of the trade in about even quantities.

The bales are packed by both hand and steam presses and weigh about 28 pounds each. They are thus conveniently handled. About half a dozen of the shipping houses here do the bulk of the export trade and, perhaps, forty steamers are utilized in the carrying of rice to the ports and a return cargo of hemp to Manila.

The handling of the business requires years of experience and a long residence in the country, to be successful in coping with the business methods of the wily Asiatic, both Chinese and Filipino.

We all remember how in visiting the owner of an orchard he takes us through his fruit preserves and can tell every grade and species of apple tree. They appear to the unpractised eye to be all apple trees. It is the same with the hemp plantation. There are great varieties of hemp and the native showing a visitor through the groves points out the different grades of trees, giving its native name and whether the quality is better or inferior to the ordinary.

There are all residents here in Manila, foreign as well as native, who from long experience in handling hemp, can tell at a glance just which ports certain bales of hemp have come from. It is indeed a great business and cannot be learned in a day.

From the outer layer of a properly matured tree comes the finest of fibre, and if this is carefully cleaned and dried, it is sometimes used by the natives to weave into cloth. They mix it with silk and make a sort of Indian muslin, in fact it makes the finest of hemp cloth. Some of the natives in the hemp growing district make coarse cloth to wear while others make fishing nets, the fibre being exceptionally good for this purpose as it is so strong.—*Manila Times* July 23th.

CONNECTION BETWEEN THE ROOTS AND LEAVES OF PALMS.

I am sending you some samples of Sago Palm (*Caryota urens*: Telugu, "Bakinimanu," Uriya, "Solopo") collected from the Nallamalai Hills in the Kurnool District, where the species grows in great profusion in damp localities, covering the soil with a regular carpet of seedling. From these specimens several points may be noticed. First: when one leaf is developed there is one root; when two leaves are developed there are two roots, and generally when three leaves are developed there are three roots, but sometimes more. There seems, therefore, to be a very intimate connection between the number of roots and number of leaves developed; it may be that, where the number of roots exceeds the number of leaves developed, more new leaves are developing. I send also (but regret it has been much damaged) a specimen of grass which has, or has had, 28 leaves developed and has 28 main roots; whether this is merely a coincidence I cannot say.

I send also a portion of a *Caryota* stem, from which I have cut the leaves just above where they separate from the stem. Each leaf completely surrounds the stem at the base of the petiole; in the samples of leaf sheaths herewith sent; I was obliged to cut the net-work of fibres, which was continuous all round the stem for from 2 to 4 feet in length, so as to take the leaf off the stem. One leaf is developed at each node, and between the nodes the petiole of the leaf forms part and parcel of the stem. In the Kistna District I found that 3 leaves were developed at each node in the Paimyra (*Borassus flabelliformis*) and in the date (*Phoenix sylvestris*) even a greater number seem to be produced (I hope to investigate the date more carefully next month).

The stem of the *Caryota*, thus deprived of leaves, resembles a drawn-out telescope, the object glass of which is at the roots, and the eye-piece points upwards.

Referring again to the seedlings, it will be seen that the first root almost resembles the tap root of an exogen, but that the monocotyledonous formation is so distinct. The collum in the dicotyledon is an indefinite point between the cotyledons; in this, what corresponds to the collum (which term, though not botanically correct in this case, I shall adopt) is a most distinct point. There is not the slightest doubt that at this point, the fibro-vascular expansion from the seed, the root, the first leaf and its sheath diverge. When the second root forms, it develops higher up than this collum point, and immediately below the sheath of the first leaf. The first leaf develops between its sheath, almost surrounded by it, and the fibro-vascular expansion from the seed, and is, therefore, in the middle of the plant. When

the second leaf appears, the seed and its expansion have dropped off, and it comes from the base of the petiole of the first leaf, which forms a sheath for the second leaf, and between the first leaf and the sheath of the first leaf. It thrusts the first leaf out of the central part and takes the centre of the plant itself. The third leaf acts in the same way to the second leaf, and the fourth to the third leaf, and so on, just as the second did to the first. The third root forms just below the first leaf, the fourth root below the second, and so on, the roots getting gradually higher and higher up above the collum point the later they develop. There seems to be a centrifugal tendency about these roots. This can be further observed from the fact that young palms have none of their roots above ground surface level; but, the older they become, the more such roots above ground appear; and in hamboos sometimes they are seen springing from the lowest two or three nodes above ground level, when the rhizome is fully crowded out. The same is seen in *Caryota* and *Borassus*, but ordinarily the nodes are not so distinct, and they seem to come out between the nodes.

Endogenous growth of wood is generally said to consist of a cellular tissue in the centre with a compact network of fibro-vascular bundles outside it, forming a rind. It was generally supposed that these fibro-vascular bundles came from the outside of the rhizome, passed in towards the centre of the stem, and passed outwards again towards the rind and into the leaves. A celebrated botanist (French, I think) whose name I cannot just now recall, took exception to this, as it was found that tracing some of the fibro-vascular bundles back from the leaf they passed towards the centre of the stem, then came back to the rind considerably higher up than the rhizome. I think an investigation of these specimens will explain the matter. The fibro-vascular expansion from the seed forms the fibro-vascular bundles of the first root; those of the first root form those of the first leaf and sheath, those of the sheath form those of the second root and those of the first leaf from those of the third root; and so the bundles are formed in succession from root to leaf and from leaf to root. In the mean time cellular tissue is being formed in the centre of the plant, kept there and prevented from expanding much outwards by the fibro-vascular tissue. As each leaf develops it takes the centre of the plant, forms a small portion of stem (between the nodes), and is then pushed on one side by the next leaf. As each root develops it takes a position more and more away from the centre, and higher and higher up the stem; but it must be remembered that above ground it cannot come out of the stem, *i. e.* it must lie dormant until the sheaths of the leaves have fallen away from the stem. As the tree develops the fibro-vascular bundles have to pass from the side of the root (*i. e.* not the centre) to the centre of the stem when the leaf develops at the top and centre of the stem, and is pushed back to the side of the stem by the development of the fresh leaves; and the more the stem increases inside, the greater will be the curve of the fibro-vascular bundles, until it is flattened by other bundles coming inside it.

It does not necessarily followed that, because the fibro-vascular bundle has to pass to its root, that it necessarily passes to the bottom of the tree; for the roots appear on the tree higher and higher up the stem, as the tree becomes older; and there must be many dormant roots which have been prevented from coming to the surface by the persistent sheaths of old leaves.

It seems rather curious that weight is attached to the difference in growth between endogenous palms and acrogenous Tree Ferns; for the difference seems merely in degree. Both consist of cellular interior tissue, with fibro-vascular exterior tissue; in the case of palms the fibro-vascular tissue from a leaf appears to descend to form a root before forming another leaf, whilst in the case of tree ferns it

appears to ascend direct to form the next leaf. The rind of endogenous is consequently far stronger and more continuous. The term acrogenous, too, seems to be misleading, for in the endogenous palms, each leaf comes to the central summit before being pushed aside by a new leaf; the same happens with the Tree Ferns.

A. W. LUSHINGTON.

PROFITABLE TOBACCO GROWING.

By R. S. NEVILL, TOBACCO EXPERT.

To the question, "Is the growing of heavy export tobaccos profitable, or can Queensland growers compete with other countries in other markets?" the answer is—Yes, if the farmers are willing to adopt modern methods, and conduct their farming operations upon lines followed by other agricultural communities. Not only that, but they can practically monopolise the market for this class of tobacco in these colonies, as it is conceded that, so far, this colony gives promise of being able to produce the best tobacco grown in Australia. Given the soil and a sufficient rainfall, the cost of production in this colony should be less than it is in the United States, for the following reasons:—The Queensland farmer does not require to feed his working stock through a long hard winter, his taxes are little more than half those imposed on the farmer in the United States, and he gets a larger yield than the latter, while the price of a labour is about the same.

Ordinarily, the amount of tobacco produced here is not commensurate with the labour performed, and for the reason that the labour is often not properly directed.

It is doubtful if any one crop, to the exclusion of all others can be made profitable one year with another, employing only one-third or one-half of a man's time, and the balance idle or doing wage work when he can get it. By diversifying the crops of the farm, and making tobacco one of the crops, the farmer does not then depend upon the one crop for the whole of his income and sustenance, and he is sure to get a good price for one or more of his products, besides producing his own food, which he can do cheaper than he can buy it out of his tobacco money.

METHODS.

It goes without saying that the one-crop system requires a higher average of prices to be profitable than that of several crops. By diversifying their crops, the farmers of the United States have found tobacco-growing fairly profitable at 3½d. per lb.

The cost of production in Queensland can be materially lessened by substituting the plough for the hoe, as I have heretofore suggested—a process which will increase the quantity and improve the quality. Improved curing-sheds and improved methods of curing will also give additional weight to the tobacco, besides improving its quality. The labour of transplanting can be much lessened by a thorough preparation of the ground beforehand, by deep ploughing and deeper cross-ploughing, and thorough harrowing, and getting the soil into the best of tilth. By this means a proper arrangement of soil particles is obtained, and the land is in the best physical condition, influencing beneficially both the temperature and the moisture; the free access of air is secured, supplying the necessary amount of oxygen, and the soil is in such a condition of fineness as to allow a perfect root development.

These are all essential to healthy plant life; and when these conditions exist, the farmer will have fewer plants dying from transplanting, and the labour will be materially lessened. It should be evident to everyone that the soil in such condition as to supply, fully, all that plant life demands of it, will give the best results in every particular, and this condition cannot be obtained without the free use of the plough.

USE OF THE PLOUGH.

A cloddy soil will certainly defeat all efforts to get a good and uniform stand in the field, and care should be taken to plough the ground when it is in proper condition. A tobacco-field should be ploughed after each hard rain—after the ground has sufficiently dried, until the plant is too large. When the plants are kept in a perfectly healthy and vigorous condition, they are less susceptible to disease. Pruning, or taking off the bottom leaves in order to allow ventilation under the plant, is also a condition to healthy fields. The amount of water in the soil to produce the best results for heavy pipe tobaccos is estimated to be from 15 to 20 per cent. "Below 15 per cent. the line of drought is reached, and the methods of cultivation should have for their prime object the maintenance of the water supply above the line of drought, so that the growth of the plant shall receive no check."—*Whitney*.

PRODUCT.

It is important that growers should take notice of these things, for when they seek an outlet for the surplus product they must offer an article quite as good as others, and one which is produced as cheaply. This cannot be done unless the best methods are adopted—the best are the most economical.

The appreciation of the necessity of proper methods, and their adoption, will save fully 25 per cent. of labour, besides giving better and increased results.

The various pests of the tobacco plant can be controlled by the use of Paris green, as a spray, but this must not be used after the tobacco has been topped. It is very effective in the case of the Miner.

The lands best suited to growing heavy export or pipe tobaccos are friable and well drained. Limestone soils, with a small percentage of the clay and a large percentage of silt, are the best. Wet or forcing soils will not grow good tobacco, as the product will be rank and woody.

Climate has much to do with the quality, and this can only be determined by experiment. For cigar tobacco sandy soils are preferred, some of the best cigar lands of Florida having 50 per cent. of sand. This is confirmed by Mr. Whitney in his report on the tobacco soils of the United States.—*Queensland Agricultural Journal*.

THE VELVET BEAN.

A few words about the velvet bean as a source of forage as well as a renovator of the soil be very opportune, and I would suggest to those who are unaware of the value of this bean to try a small patch of it and just watch the result. Those who have already grown the bean will bear me out when I say that we have nothing in its own line to equal it. It is a great forage producer, and the grain, both in the green and dry state, is equal to anything grown for food for any stock, and it is not too much to say that everything that walks on four feet is fond of it.

The velvet bean grows and makes a fair crop where cowpeas would scarcely germinate the seed. It is an excellent improver of the soil in that it is the best nitrogen gatherer among all the known legumes. Its foliage is so dense that it shades the land completely during our hot days of summer, and by shedding the leaves nearest the ground it forms a mulch that conserves the ordinary moisture in the soil. In short, we have in the velvet bean what the Southern farmer have so long been looking for, that is, something that will produce a good profitable crop and at the same time help to put backbone into the poor sandy soils of the South.

I have said that it will make a fair crop on land too poor for cow peas, but it will repay its grower for a little commercial fertilizer applied to the soil previous to planting time. Some farmers are sanguine

enough to think that there will come a time when commercial fertilizers might be entirely dispensed with. There is no indication that will ever come; in fact, the tendency is rather the other way, as every year sees a marked increase in the fertilizers used, and every broad-minded, observing farmer knows that for every dollar thus invested he gets back ten and sometimes twenty, according to the intelligence and wisdom exercised in the selection of the proper kind of fertilizer and the method and time of application.

Like every other crop, the velvet bean has a preference, if we may use the term, for a certain kind of food which is best suited to its requirements and which enables it to return the most profitable crops. It wants a fertilizer analyzing high in phosphoric acid and potash. Being a natural nitrogen gatherer, it does not require any nitrogen fed to in the shape of fertilizers. If we cannot get a fertilizer containing no nitrogen, the best way to get over the difficulty is to buy our phosphate and muriate of potash, and prepare our own fertilizer, bringing the analysis as near as possible to ten per cent potash and seven to eight per cent phosphoric acid. Four to six hundred pounds of this per acre, broadcasted and mixed in the soil a short time before planting will pay for itself at least twenty-fold. On poor, worn-out soils it is best to drill in the fertilizer and plant the bean in the drill after it has had a good rain on it.

In preparing the land for this crop the best method in my experience has been to run off furrows about five feet apart and drop a been every ten to fifteen inches; this will give a good stand, and as the crop is a long season one it should be planted as early in the season as possible. Some time in late June or July make a very thin sowing of Giant beggar weed in the water furrow, this will spring up quickly and be ready just in time for the bean to climb all over it (for the latter undoubtedly does best when it has something on which to climb). If the bean has been planted early in April, which is really the proper time, a thin sowing of fodder corn in the water furrow in June will answer the purpose as well as beggar weed. This combination will give an exceptionally heavy forage crop, ready to cut in early September, and it will make a good second crop after that which can be allowed to remain in the ground and be ploughed under in the winter to improve the soil and restore its fertility.

If simply grown as a soil renovator it can be planted four feet apart and every two feet in the furrow and allowed to remain where it grows. If wanted for pasture for stock or hog feed, beggar weed, millet, or anything of that kind planted along with it, will prove a decided benefit, as in itself it is somewhat laxative at first in its effect on stock, and other forage mixed with it helps to counteract this effect somewhat.

In cutting to cure for forage is where the real trouble is encountered, as its growth is so enormous, and if it is growing on anything the tangle of vegetation is such that it is a hard matter to get at it well. If cut in the forenoon, after the dew has dried off, and hauled to the barn without delay and spread over poles (I use my tobacco barn for the purpose), it cures excellently and makes the finest cattle forage I ever saw, and I feel confident that it only needs a proper trial by every Southern farmer to secure its general adoption all through the Southern States.

I do not think the velvet bean can be grown north of Kentucky successfully. A friend in Kentucky grew some of it last summer and he reports an extraordinary growth of vime but no gain, the season being too short for it to form seed. He grew it in a field adjoining the turnpike road where a telegraph line ran along. The vines went through the fence and climbed to the very top of the telegraph poles, showing that Kentucky soil is well adapted for the vine—at any rate.—C. K. McQUARRIE.—*Planters' Monthly*,

CULTIVATION OF THE COCONUT IN THE PHILIPPINES.

WHAT EVERY MAN INTERESTED IN THOSE ISLANDS WANTS TO KNOW.

Coconut plantations pay very well and there is a certain demand for the fruit in China, beside constant local sales in native markets. The uses of the tree are various. Some tap the tree by making an incision in the fruitbearing stalk, under which a bamboo vessel called a bombon is hung to receive the sap. This liquid, known as tuba, is a favorite beverage among the natives. As many as four stalks of the same trunk can be so drained simultaneously without injury to the tree. In the bottom of the bamboo vessel is placed as much as a dessert spoonful of pulverized tong bark, to give a stronger taste and bright color to the tuba. The incision, renewed each time the vessels is replaced, is made with a very sharp knife. The sap drawing of a stalk continues incessantly for about two months, after which it ceases to yield and dries up.

The vessels containing the liquid are removed and empty ones put in their place every twelve hours about sunrise and sunset. If the tuba is allowed to ferment it is not so palatable and becomes an intoxicating drink. From the fermented juice the distillers manufacture a spirituous liquor known locally coco wine.

The trees set apart for tuba extraction do not produce nuts, as the fruit forming elements are taken away. The man who gets the tuba has to climb the trunk of the tree, on which notches are cut to place his toes in. Occasionally a man falls from the top of trunk 70 or 80 feet high and breaks his neck. The occupation of tuba drawing is one of the most dangerous.

When the tree is allowed to produce fruit instead of yielding tuba the nuts are collected about every four months. They are brought down by either a sickle-shaped knife lashed on to the end of a long pole or by climbing the tree with knife in hand.

When they are collected for oil extraction they are carted on a kind of sleigh, unless there be a river or creek providing a water way, in which latter case they are tied together, stalk to stalk, and floated in a compact mass like a raft upon which the man in charge stands.

The water or milk found inside a coconut is very refreshing to the traveller, and has this advantage over fresh water, that it serves to quench the thirst of a person who is perspiring without doing any harm.

At seven years' growth the coconut palm tree seldom fails to yield an unvarying crop of a score of large nuts monthly. In the provinces of Tayabas, La Laguna, Batangas and district of La Infanta the coconut palm is extensively cultivated solely for the purpose of extracting the oil. The coconut oil factories are very rough, primitive establishments, usually consisting of eight or ten posts supporting a nipa palmleaf roof and closed in at all sides with split bamboos. The nuts are heaped for a while to dry and concentrate the oil in the fruit. Then they are chopped mere or less in half.

A man sits on a board with his feet on a treadle from which a rope is passed over and works to and fro a cylindrical block in the end of which is fixed an iron scraper. He picks up the half-nuts one at a time, and applying to the scraper in motion the white fruit falls out into a vessel underneath. These scrapings are then pressed between big blocks of wood to express the oil and the mass is afterwards put into cast-iron cauldrons of Chinese make with water which is allowed to simmer and draw remaining fatty particles off the surface. When cold it is sent off to market in small straight-sided kegs on ponies which carry two kegs—one slung on each side.

Small quantities of coconut oil are shipped from the Philippines. In Europe coconut oil is white and solid and is used in the manufacture of Soap and candles.

In the tropics it is seldom seen otherwise than in a liquid state, as it fuses a little above 70 deg Fahr.

In 1891 a coconut oil factory was started in Manila with modern appliances. In the Philippines themselves it is an important article of consumption. Every dwelling, rich or poor, consumes a certain amount of this oil nightly for lighting purposes. It is largely employed as a lubricant for machinery, for which purpose however, it is very inferior. Occasionally also, it is used for a medicinal application.

COPRAH.

It is only in the last few years that coprah has acquired importance as an article of export. In 1890 the total amount exported was 4,653 tons. In 1897 it had reached 50,714 tons, about 85 per cent of it being handled by English firms.

A variety of useful domestic utensils are manufactured by the poorer class of the natives out of the hard shell of the coconut. Also when carbonized the shell gives a black dye, used for dyeing straw hats.

COIR.

Very little use is made of the coir or outer fibrous skin which in other countries serves for the manufacture of coconut matting, coarse brushes, hawers, etc. It is said to rot in fresh water, where as salt water strengthens it. As it floats on water it ought to be of great value to ships. In the Philippines it often serves for cleaning floors and ships' decks when the nut is cut into two equal parts across the grain of the coir covering, and with it a very high polish can be put on to hard woods.

NIPA PALM.

The nipa palm is found in many salt swamps and flooded marshy lands. It has the appearance of a gigantic fern. The leaves, which are very long and about three to five inches wide, are of immense value in the country for thatched roof. Nipa is not to be found everywhere; one may go many miles without seeing it in the districts devoid of marches and swampy low lands.—*Manila Times*, August 21st.

THE WORLD'S COFFEE TRADE.—“Coffee Statistics, 1899-1900,” by Messrs. C J Leech & Co., of Mincing-lane, contains a mass of statistics relating to the trade of the world in coffee. Much of this information is of value only to those engaged in the trade; but some of the figures are of more general interest. The chief coffee markets are London, Havre, Hamburg, the Dutch ports, Trieste, Antwerp, Bordeaux, and Marseilles. The total production during the current year (*i.e.* up to June 30 next) is estimated at 15,285,000 bags of 60 kilogrammes or 132½ lb. each. Of this over 10½ million bags belonging to Brazil, Santos coming first amongst Brazilian ports with 6,000,000 bags, and Rio next with over 3¾ millions. Mexico and the Central American States come next 1½ million bags, then Venezuela and Colombia with 1¼ million; Java supplies 650,000 bags, the West Indies (chiefly Hayti, Cuba and Puertorico) 550,000; British India and Manila, which are classed together, send 300,000 bags, Africa and Arabia 250,000, and the small balance comes from Sumatra, Ceylon and the Eastern Archipelago. During recent years the production has fluctuated considerably; in 1894-95 it was over 11½ million bags; the next year it fell to 10¼ millions; in 1896-97 it rose to over 13½ millions, and in the following year to over 16 millions, while last year it again fell to over 13¼ million bags. The prices show still greater fluctuations. The figures given by Messrs. Leech show how completely the world depends for its coffee on Brazil and how dependent the market prices are on the production there.—*London Times*, August 14.

REMEDIAL MEASURES AND INSECTICIDES.

By E. E. GREEN, GOVERNMENT ENTOMOLOGIST.

In the following pages I have endeavoured to bring together scattered information on the various methods that have been employed in dealing with insect pests of the family *Coccidæ*. Though such treatment may in many cases be found suitable to insect pests of other families, I do not propose to give here a general treatise on insecticides, but to confine myself to measures applicable to the subject of the present work.

Little or no originality can be claimed for the following remarks. They are very largely compiled from the published work of trained entomologists (chiefly American) in different parts of the world. America has long been in the forefront in the practical application of economic entomology.

Remedial measures may be discussed under two main headings: Prevention and Cure. The former, being by far the more important, will be dealt with first:—

PREVENTIVE MEASURES.

Of first importance amongst preventive measures, I would place Quarantine Regulations. It is a fact, repeatedly demonstrated, that imported pests, are the most serious. An insect may attract little or no attention in its original home, where it is kept in check by its own natural enemies, a system recognised as 'the Balance of Nature.' But take it away from its home; place it in a congenial climate with an ample supply of suitable food, and it will multiply without the checks that have prevented its increase in its original habitat. The very fact of extensive damage by any insect may of itself almost be accepted as proof of its foreign origin. Looking through the list of the different scale-insects occurring in Ceylon, I find that all the more troublesome species have been previously described from some other country, and are, therefore, presumably imported insects. The home of the 'Lantana bug' (*Orthezia insignis*) is now supposed to be some-where in S. America; and there is evidence in favour of the supposition that we owe our 'green coffee bug' (*Lecanium viride*) to Western Africa. *Aspidiotus cydoniæ*, *Chionaspis biclaris*, and *Mytilaspis citricola* were originally described from America. *Aspidiotus camellie*, *A. cyanophylli*, *Chionaspis aspidiotre*, and *Dactylopius citri*, are all well known on the continent of Europe. *Aspidotus aurantii* and *Pulvinaria psidii* have their home in Australia. Our former coffee pest, the 'brown bug' (*Lecanium coffeæ*) might perhaps be quoted as an exception to this rule, as it was first recorded from Ceylon. But this insect is now considered to be merely a local variety of *Lecanium hemisphericum*, an insect found all over the world, and whose origin is uncertain. On the other hand, not a single undoubtedly native species has attracted any notice as an insect pest in Ceylon.

We have only to recognise these facts to appreciate the importance of a properly conducted system of quarantine for all imported plants and fruit. Our insular position in Ceylon, with but one main port of entry, gives us a peculiar advantage in carrying out such a system. A single quarantine station, with a single fumigatorium, will be sufficient in our case to deal with the whole importations of the island. It is true that, in spite of quarantine regulations, particular pests have found their way into protected countries. In such cases failure must be attributed to incompleteness of execution. And, though some few pests may have evaded all precautions, how many others must have been refused entry? The records of existing quarantine establishments give long lists of dangerous insects detected on arrival, and destroyed before they have had the chance of obtaining a footing in the new country. I believe it is the custom at most quarantine stations to examine imported plants and fruit, and if they appear to be free from blights, to pass them with-

out treatment. But I maintain that not even the most experienced entomologist could guarantee a plant as absolutely free from insect life. Minute larvæ and eggs may lurk beneath bud-scales, in the axils of leaves, or in unnoticed crevices of the bark. To be really effective, quarantine must be complete. Every live plant and fresh fruit should be subjected to treatment, whether it appear to be free from disease or not.

The only sure way of reaching every hidden insect is by fumigation. If properly conducted, there is little danger of permanent injury to the plant. Even though some few delicate plants may be injured, or actually killed by the process, this is a very small consideration in comparison with the damage that may be effected by a single imported pest. What, for instance, must have been the pecuniary loss to the colony from the ravages of the 'green bug'—a loss that, in all probability, might have been prevented. And compare this loss with the value of all the delicate plants that have ever been imported into Ceylon! But, for such tender plants, it is possible to employ other treatment than is recommended for hardy shrubs and trees.

For wholesale fumigation of plants and fruit there is nothing to equal hydrocyanic acid gas, generated by mixing cyanide of potassium, water, and sulphuric acid in certain proportions. This treatment is cheap and effectual. The gas is of the most deadly nature, and will penetrate every crack and crevice, and do its work thoroughly. The application is quite simple. All that is required is a close-fitting chamber, provided with a fine for the escape of the gas after the operation. The more air-tight the chamber, the more complete will be the work. It should be fitted with racks to receive removable trays, upon which fruit may be spread. The objects to be fumigated are placed into position; the chemicals are mixed in leaden or earthenware pan and placed on the floor, the door shut, and the room kept closed for from half to three-quarters of an hour. The fumes then opened, and, after a sufficient time (about half an hour) has been allowed for ventilation, the door is unlocked, and the plants, &c., removed. It is not advisable to take the subjected plants directly into the open air if the sun is shining. They should be kept for a few hours under shade, which will greatly lessen any danger of damage.

Mr. C. P. Lounsbury, official Entomologist at Cape Town, has kindly supplied me with full particulars of the work of the Fumigatorium at that place. From his letters and reports I have extracted the following directions and suggestions:—

For each 300 cubic feet of space enclosed (and in proportion for greater and smaller spaces) 1 ounce of 98 per cent. potassium cyanide, 1 ounce of sulphuric acid, and 2 ounces of water will be required to generate gas of sufficient strength to kill the insects. Double this strength, or the same amount of materials to 150 cubic feet enclosed, may be used upon woody plants without danger of seriously injuring them. The greater strength should be employed whenever practicable, as it will ensure the death of the eggs as well as the active insects.

Imported plants are usually in a more or less dormant condition, which lessens danger of injury. Mr. Lounsbury writes, in his Report of June 1897. 'Injury to the tips of new growth generally results. This injury is in no wise serious, and is quickly outgrown. The operators consider it a favourable indication, as when such injury results it is quite certain that the gas has been present in sufficient strength to destroy all of the insects.'

With respect to fruit, I again quote from Mr. Lounsbury's letter: 'I had lemons and oranges analysed after treatment, and found that after a few hours not more than a trace of the gas remained in the rind. There is much more natural cyanogen in a single seed (so the analyst told me) than what remains in the fruit from fumigation. We have no complaints of any effect on the keeping qualities of the fruit.'

To generate the gas 'the required quantities cyanide and water are first placed in the generating vessel, the cyanide being broken into small pieces about the size of lump sugar. The operator then adds the acid, pouring it slowly into the vessel to avoid splashing, and immediately withdraws.'

The above treatment is suitable for fruit and hardy plants. Tender garden plants are usually imported in Wardian cases, and may be treated separately. We have—in the 'Wardian case'—an air-tight chamber ready to hand, in which the plants can be fumigated before their removal. After a large series of experiments with various fumigating media, I find that hydrocyanic acid gas remains by far the most efficient insecticide and the least injurious to the plants. But with delicate succulent plants I find it has to be applied rather differently. A more concentrated dose of the gas applied for a shorter period is most satisfactory in its results. In a Wardian case, containing about sixteen cubic feet, I find a dose of $\frac{1}{2}$ ounce cyanide, $\frac{1}{2}$ ounce acid, and 1 ounce water, with an exposure of half an hour, will kill every individual of a colony of *Orthezia* (the most resistant of all Coccids) without in the least affecting the plants. The treatment should be carried out only after sunset. According to Mr. Lounsbury's tables, these proportions of chemicals should be sufficient for a space of 140 cubic feet with a longer exposure.

The other materials tested were (1) a preparation of concentrated nicotine, sold by the XL-all Company; (2) McDougall's fumigation paper; (3) Jeyes' fluid; (4) naphthaline; and (5) common tobacco leaves. Nos. 1, 3, and 4 were evaporated by means of a small spirit lamp inside the case; Nos. 2 and 5 were lighted and allowed to smoulder. All these materials, applied in different lengths of time, resulted similarly in more or less complete injury to the plants, and very incomplete destruction of the insects.

If there be no Government quarantine establishment in the general planting interests, importers should safeguard themselves individually by properly disinfecting all foreign plants before distributing them or putting them out in their gardens.

Further directions or the application of the 'gas treatment' will be found in the sections treating of CURATIVE MEASURES. (See pp. xxvii—xxxi.)

Perhaps of equal importance as a preventive measure is the maintenance of plants in a vigorous free-growing condition. This is a fact that has been recognised by gardeners for many generations. Anything that interferes with the free flow of sap immediately lays a plant open to attack from its insect enemies. A weakly, hide-bound plant falls an easy prey to every pest. Scale insects in particular, with a few exceptions (and such exceptions chiefly imported series), seem to avoid a free-growing plant, possibly finding the healthy rush of sap too strong for them. Unremitting attention to cultivation will go far towards the prevention of insect pests. Amongst causes predisposing to disease may be mentioned: (1) Careless selection of plants and the retention of weakly seedlings; (2) Insufficient or injudicious drainage; (3) Unsuitable condition of soil, want of tillage, and—perhaps—of fertilisers.

Under the category of remedial measures may be mentioned the use of resistant stock. In the history of nearly every extensive plant disease it has been observed that individual plants—or established varieties of the plant—may show a marked freedom from the disease prevalent upon the less favoured type. By breeding from such individuals, or accidental varieties, a more or less completely resistant stock may be established. This fortunate fact has been frequently used with great success in dealing with fungal diseases. Thus a special variety of the potato plant—proof against the well-known potato disease—has been extensively cultivated. Some varieties of wheat are found to suffer but little from 'wheat rust' (*Puccinia*). We have also examples of certain established strains of cultivated plants that repel particular insect pests. In Europe the vine growers have found an American stock that to a large ex-

tent resists the attack of the dreaded *Phylloxera*; and by grafting on to this hardy stock they have been able to immunise their more delicate and valuable varieties. In Ceylon we have the strongest evidence that certain varieties of the tea plant (especially the Assam indigenous stock) are most markedly free from injury by the so-called 'mosquito blight' (*Helopeltis*). In any serious epidemic that may threaten the profitable cultivation of an economic plant, we should at once be on the look-out for any accidental varieties or strains that may prove resistant to that particular disease. In cases where the hardier stock is not otherwise so profitable as the more delicate variety, by grafting upon it a more valuable scion the latter may sometimes be rendered equally immune.

CURATIVE MEASURES.

Where preventive measures have failed, as—even with the greatest care—most often happen, recourse must be had to curative measures.

In no single connection can the old proverb, 'A stitch in time saves nine,' be more aptly applied than in dealing with insect pests. In this case the 'stitch in time' is more likely to save ninety, or nine hundred, or nine thousand!

If a pest is to be eradicated, *immediate* treatment is the most important part of the process.

And the first step towards treatment should, when possible, be the insulation of the infected area. All ordinary work amongst the affected trees should be deferred until after treatment. The young larvae of scale-insects are very minute and active, and one of the most fertile sources of their distribution is by means of clothing. The rough 'cumblies' used by the estate coolies are particularly well adapted for their transport.

Another important point is that the treatment should be applied *on the spot*. If the infected branches are cut down and carried off to some other part to be burned, they may be shedding the germs of the disease all along the way.

It is difficult to lay down hard-and-fast rules for action, so much depends upon circumstances, *e.g.* the nature of the particular pest, its extent, the nature and value of the plant attacked, &c., &c. But for the sake of example, we will suppose a case in which three or four tea bushes are found to be infested by some scale-insect that is considered to be a dangerous pest. First dig a fair-sized hole in the midst of the affected clump, and place in it some dry grass and sticks as foundations for a fire. Fill two or three buckets with one of the insecticide washes described below. Prune back the branches one by one; immerse each branch completely in the insecticide and throw it into the hole, until nothing but the bare framework of the tree is left. Sweep all fallen leaves and rubbish from beneath the trees into the hole. Next, pat over the bare stems with the same insecticide, using a large paint brush and taking great care to saturate the entire surface down to the ground. Then set fire to the heap of prunings, and cover up the remains with earth. To kill off possible stragglers, the unpruned trees immediately surrounding the affected patch should be thoroughly sprayed with the mixture. If carried out in time, these measures will probably stamp out the pest; but a careful watch should be kept for any fresh outbreak.

The above treatment is suitable only for such plants as may be cut down without permanent injury. We may now consider the case of some larger tree to which this method would be inapplicable—say an orange or cacao tree. In this case the gas treatment is the most suitable. The application should be repeated after an interval of about a fortnight, to ensure the death of larvae subsequently hatched from eggs that may have survived the first operation. Full directions for gas treatment are given below. (See pp. xxvii—xxxi.)

In other cases a combination of these two methods might be adopted. If two or three coffee trees should require treatment, all superfluous branches

might be pruned, dipped, and burned, and the standing trees fumigated with gas. Modifications of the treatment will be required to suit particular cases.

When a serious pest has once firmly and widely established itself, little hope can be entertained of exterminating it, though much may still be done to keep it in check.

Where trees are large and more or less detached, as in orange groves, and the crop a valuable one, the gas treatment is again the most satisfactory one. But where the cultivation is denser, and the crop not so concentrated, spraying is found to be more practicable.

The choice of the insecticide must be regulated by the nature of the crop. Arsenious compounds cannot be safely applied to food crops—such as fruit and vegetables—during the cropping season. And they can on no account be recommended for such a product as tea, unless employed exclusively after pruning. For, however minute may be the actual amount of active poison deposited on a single leaf, when we consider that it takes some 400 lb. of leaf to make sufficient tea to fill a chest, and that about 3,000 of the green leaves go to the pound, or 12,000 leaves to a pound of the finished product, it is evident that the amount of poison in a single chest of tea might be considerable. And further, during the processes of packing and transport, it is by no means improbable that this mineral poison—which would dry off in fine powder—might gravitate and become condensed towards the bottom of the chest, with dangerous results to the consumer. The danger may be considered far-fetched; but I think it should be recognised.

For the above reasons no patent preparations should be employed to any large extent, unless the ingredients are well known. Such mixtures, being designed for general use, may contain several different poisons acting in different ways, either externally by contact, or internally through the alimentary system. The proprietors of patent insecticides not unnaturally object to disclose their formulae, and put off any questions by asserting that the amount of active poison in the mixture is so very small as to be practically harmless. This may very well be true in most circumstances; but, as shown above, in other cases the poison might become concentrated into a small portion of the product.

For other reason compounds that depend upon arsenic or other mineral poisons for their killing properties are of little use against *Coccidæ*. Insects that subsist upon the sap of the plants should be treated with insecticides that kill by contact, such as soap, petroleum, pyrethrum, &c. Arsenic, which adheres to the surface of the plants, is useful only against pests such as caterpillars, grubs, and slugs, that take in solid food. Mr. Maskell puts the matter concisely. He says: 'Whatever damage is done (by scale insects) is effected by the sucking of the juices of the plant through the rostrum (beak) of the insect. It follows from this that applications of any fluid to the tree externally, with the object of poisoning the insects in their feeding, would be useless, as their food is drawn from beneath the surface.'

There are many substances fatal to insect life, but perfectly harmless to the higher animals, that may be safely used. A list of the principal insecticides, with directions for their preparation and application, is appended. (See pp. xxxi et seq.)

The most suitable season for spraying is when the young larvæ are hatching. They are then in the most unprotected condition. In temperate climates this season varies with different species, and should be made the subject of careful observation. In tropical countries many species, and those naturally the most pernicious, appear to produce a constant succession of broods throughout the year.

To produce any permanent result, spraying must be very thorough. The success of the treatment depends upon the actual contact of the liquid with individual insects. Even when the work is done by

a trained man, it is practically impossible to secure the destruction of every individual. The difficulty is greatly increased when the work has to be entrusted to natives. In conducting the operation, the position of the insects upon the branches and foliage must be carefully noted, and the nozzle of the machine manipulated accordingly, so as to throw the spray upwards against the backs of the leaves, or downwards on to the upper surface, or horizontally against the stems and branches.

A few words may be said as to the apparatus for spraying. This is not the place to advertise any particular make of machine; but some general principles may be given to help the would-be purchaser in his choice.

Points to be considered in the selection of a machine should be;—

I. *Adaptability to Transport.*—For ordinary use, where small trees only have to be treated, there is no form so convenient as the knapsack pump. This consists of a metal vessel that rests upon the back, and is supported by straps passing over the shoulders of the operator. The handle of the pump (in the best patterns) comes forward under the left arm, and is worked by the left hand, leaving the right hand free to direct the nozzle which is attached by flexible rubber tube. The vessel usually contains the pump cylinder, and space for about four gallons of liquid. Where a larger apparatus is required, a barrel pump may be used. In this form the pumping apparatus is fixed in a barrel to which handles are attached, so that the whole apparatus can be carried from place to place by two men. Where the land is flat the barrel, or a metal tank, may be mounted on wheels for transport; but it should be designed so that the vessel may be dismantled and carried by hand to such places as are inaccessible to the wheeled vehicle. Where the lay of land is suitable, and large trees have to be treated, a more powerful apparatus may be mounted on a cart, and drawn by horse or bullock power. In such cases two or more lines of hose and nozzles can be worked from the same tank.

II. *Strength.*—The materials employed in the construction of the machine should be such as are not readily corroded by the mixtures used. Mr. Lounsbury, in his report for the year 1896,* gives the following very practical hints on this subject:—

'Iron is so quickly corroded by many of the common insecticides and fungicides that pumps in which the working parts are of this metal are not desirable. These parts of the pumps should always be made of hard brass. For the sake of economy, the bodies of most pumps are made of iron, but even here the use of brass lends greater durability, and is an advantage which in the end will probably pay for the additional initial cost. Rod-like parts and thin handles of cast iron are objectionable because so easily fractured. Any parts of rubber are damaged by contact with paraffin. Ignorance of this fact has led to the ruin of a large number of Vernorel knapsack pumps, in which a circular rubber disc is used for the propulsion of the liquid. The paraffin causes the rubber to swell, and thus becomes useless for its purpose.

'Copper is the best metal for tanks in knapsack pumps, and attention should be paid to the thickness of this metal. Thin copper will rapidly wear through. Tanks of sheet iron or tin are soon ruined by contact with liquids containing copper compounds, such as Bordeaux mixture and Paris green, and these preparations are also injuriously affected. But even copper tanks are not suitable for use with all spraying mixtures, since this metal is acted upon by the sulphur in such compounds as "eau grison" and lime-sulphur-salt mixture. In these cases, the sulphur leaves the lime, with which it had united during the process of cooking, and unites with the copper to form copper sulphide. This compound forms in a thick black layer over the copper, which, if it would remain intact, would preserve the metal

* *New Zealand Scale Insects*, p. 26.

* *Report of the Government Entomologist for the Year 1896*. Cape of Good Hope, pp. 139-140.

from further action; but, unfortunately, some of it usually breaks away, exposing fresh surface to the injurious action, and also proving an annoyance by passing through the hose and clogging the nozzle. For these reasons it is best not to use these sulphur mixtures in knapsack pumps.'

III. *Simplicity*.—All the parts of the pump should be readily accessible and removable, so that, should anything go wrong, they may be taken to pieces and cleaned, or damaged parts renewed. The want of these facilities is a serious fault in many machines, the slightest injury necessitating the sending of the whole apparatus to the repairers.

IV. *The Production of a Uniform and Effective Spray*.—The continuity and force of the flow is dependent upon an air chamber in the pump, this feature constituting a 'force-pump.' On this account all hand syringes are almost useless. The nature of the spray is regulated by the form of nozzle employed. The chief object is to break up the liquid into such a fine spray that it will penetrate the thickest foliage in the form of a dense mist and come in contact with every part. For this purpose one of the 'cyclone nozzles' is most admirably adapted, but where it is necessary to throw the liquid to a considerable distance, as, in spraying large trees, a nozzle throwing a coarser spray must be used. It is advisable to have several interchangeable nozzles to suit the different kinds of work. There should always be a detachable cap to the nozzle, so that any obstruction may be quickly and easily removed. Many nozzles are provided with a fine point, held back by a spring, but which, when pushed forward, clears the aperture.

A few further remarks may be quoted from Mr. Lounsbury's report, in which he gives some recommendations for the care of spray pumps. 'Before a spray pump of any kind is put away after use, it should be thoroughly washed and clear water pumped through it; hot water answers much better than cold if stickily or soapy washes have been used. The working parts should be occasionally oiled, and if the paint on the iron parts becomes worn away it should be renewed. Attention to these details will preserve the pump for a long period, while, if they are neglected, the pump may never save its initial cost.'

(To be continued.)

CACAO POD DISEASE.

In December, 1898, my attention was specially called to the fact of the presence of a disease of Cacao pods on several large estates. Examination proved them to be attacked by a parasitic fungus, the full characters of which have not yet been worked out. From literature recently received from Professor Harrison, it is seen that he reported the existence of a disease in Grenada in April, 1895, and also described the conditions in such a way as to leave little doubt that it was identical with that now recognised as affecting the Trinidad trees. Professor Harrison also alludes to the presence of the same disease in Surinam, and refers to my report on specimens sent by him, in the following words:—

"J. Hinchley Hart, Esq., F. L. S., the Government Botanist of Trinidad, to whom I submitted some of the diseased pods from Surinam has informed me that a similar disease occasionally occurs on cacao in Trinidad, but is not there looked upon as being in any way serious, and is generally ascribed to an excess of moisture." Professor Harrison's conclusions have been recently confirmed by the receipt of infected pods from Grenada, which show identical characters with the infected pods from Trinidad estates. From these pods I was able to reproduce the disease in healthy pods, as in the first instance, and also to make pure culture for the study of the various forms of the fungus, and it has now been grown through its entire cycle of existence in several separate experiments.

Remarks upon the forms assumed during the growth of the fungus are however withheld, until they have been confirmed by the expert to whom they have been submitted, and it will be sufficient to note that the life history of the fungus promises to be of an interesting character. This disease, therefore, has long been recognised in Trinidad in Surinam and in Grenada, but its infectious character was first proved by reproducing the disease by inoculation again and again at the Royal Botanic Gardens by the writer, in December, 1898. Professor Harrison observed in 1895, that where an affected pod touched a healthy one the disease was communicated, but it does not appear that special inoculations were made. Mr. Whitfield Smith, now of the imperial Department of Agriculture for the West Indies also noted the disease in Grenada while travelling with Professor Harrison. Mr. Massee of Kew makes the following *interim* Report, pending the receipt of full material for further investigation:—

INTERIM REPORT ON CACAO POD DISEASE.

1. The fungus appears to belong to the *Peronosporæ*, but cannot as yet be determined with certainty, as the spores in spirit will not of course germinate.

2. The pods sent are completely covered with a dense felt of variously coloured hyphæ and have completely lost all trace of the fungus causing the disease which can only be seen in the spirit material sent.

3. If the Superintendent could send a couple of Hensen's flasks with germinating spores, perhaps something might be done to determine the nature of the fungus.

4. Preventive Measures.—Spring with potassium sulphide solution ($\frac{1}{2}$ ounce to one gallon of water) would destroy zoospores and germinating conidia; Bordeaux mixture might answer, but a very dilute mixture should be used at first, as it appears to frequently injure foliage in a warm climate.

5. All infected pods should be removed and burned. The disease can hardly exist on the pods only and search should be made to find its source. The conidia are frequently distributed by insects and if the trees are infested with winged insects an insecticide should be used.

On receipt of this Report I immediately applied to several planters for further material, and was met by the statements that on account of the dry weather, no diseased pods were to be found.

As, however, pods were obtainable in Grenada, there is evidence that the disease is not restricted to any certain time of the year, but is more prevalent under conditions which prevail during the wet season.

The work of investigation is being continued, and when complete a Report will be published giving full details. The remedial measures to be adopted are those laid down in my Report to the Government, viz.:—

1st. To gather and destroy all diseased pods.

2nd. The early removal and destruction of the empty pods, after the beans are removed for curing.

3rd. The dressing of all badly infected trees with sulphate of copper solution.

A strict attention to these primary recommendations will probably result in confining the disease to small areas, but more summary measures must be taken if it is seen to make way. As however, it is fairly evident from the Reports of experienced planters, from the Report of Professor Harrison, and from my own observation, that the disease is no new thing; there is every reason to think that with due care on the part of planters, the disease will not increase. On the contrary, there is every reason to hope that when the full-life history of the organism is known, it may be possible practically to eradicate it. This hope is further justified by a Report from one of the most careful of our planters, who has adapted the tentative course laid down for treatment, as he states that the number of pods affected is rapidly diminishing on the estate he manages.—*Trinidad Bulletin*.

TEA AND COFFEE DISEASES.

(With Plate.)

BROWN BLIGHT OF TEA.

The "blights" which affect tea in Assam were investigated and described in the *Kew Bulletin* for last year (pp. 105-112). Another and different one has made its appearance in Ceylon, and has been transmitted to Kew for investigation by Mr. J. C. Willis, M.A., F.L.S., Director of the Royal Botanic Gardens, DIRECTOR, ROYAL BOTANIC GARDENS, PERADENIYA, CEYLON, to ROYAL GARDENS, KEW.

Royal Botanic Gardens,
Peradeniya, Ceylon,

April 10, 1899.

Sir, By parcel post this week I send you a tin containing some specimens of a fungus blight which is causing considerable injury to tea in many of the planting districts of Ceylon. It resembles the "grey blight" of Assam (which is also common here) in its action on the leaf, and I have recommended similar measures for its eradication to those used for that pest. The specimens enclosed show the conidial fructification of the fungus, and I am sending them in the hope that you may be able to give me the name of the fungus to enable me to round off my investigations into its ravages and life history. In the event of your publishing any account of this disease, I have to request that the name of the estate mentioned on the specimens be withheld from publication.

Notes upon the disease are given below.

I am &c.,

(Signed) JOHN C. WILLIS.

The Director, Royal Gardens, Kew.

Specimens from Maskeliya district, 4,000 feet above the sea level, sent to Kew. Fructifying specimens pinned. Collected, 7th April, 1899.

Disease like grey blight in appearance and effect, but characterised, by chocolate-brown colour of fully diseased spots on the leaves attacked. Common in the Central Province.

Shows first on upper side of leaf, and soon afterwards on lower also. Appears as yellowish-brown patches, which rapidly spread and to a chocolate or almost black colour, and as they extend their central parts dry up, die, and often fall out if the leaf is roughly shaken. When the leaf is held up to the light, a yellowish band, 1.3 mm. wide, is seen round the infected area, due to the spreading of the mycelium into the still unattacked area of the leaf, which loses its green colour.

Fructifications not often seen; on the accompanying specimens they show in typical form, as pinkish spots, more or less concentrically grouped. The spores are oval-oblong, unicellular, hyaline. The blight spreads very rapidly, and does much damage. Measures of treatment recommended are the same as for grey blight.

J. C. W.

10th April, 1899.

The specimens were examined by Mr. Massee, the Principal Assistant for Cryptogams in the Herbarium of the Royal Gardens. He furnished the following report:—

The fungus proves to be undescribed, and may be known as *Colletotrichum Camellie*.

All the many known species of *Colletotrichum* are parasites, and many are destructive to important economic plants.

Spraying with Bordeaux mixture, or with ammoniacal solution of carbonate of copper has proved effective in checking the spread of other species of *Colletotrichum*, and would probably prove beneficial in the present instance. In spraying plants like the tea, having glabrous leaves, success mainly depends on the fineness of the spray, which should hang like a fog. A coarse spray causes the solution to form drops which roll off the polished surface of the leaves.

In addition to spraying, all diseased leaves should be collected and burned, as *Colletotrichum* is a form-

genus (=the conidial condition of an ascigerous), and if the leaves are allowed to fall and remain on the ground under the trees, the higher form of fruit would form on the decaying leaves and inoculate the new leaves the following season.

G. M.

3rd May, 1899.

The following description has now been prepared by Mr. Massee:—

The fungus present on the leaves proves to be a species of *Colletotrichum*, a genus perhaps too closely allied to *Gleosporium*, differing only in the presence of a variable number of coloured spines being intermixed with the conidiophores. Numerous species belonging to these genera are known as destructive parasites, attacking more especially leaves and fruit.

The leaves of the tea plant are probably infected in the first instance by floating spores settling on their upper surface when damp. The discoloured portion of the leaf corresponds to the range of mycelium in the tissues. Eventually the central portion of the blotch changes to a dull grey colour, and becomes studded with numerous very minute black spots, which are often arranged in irregular circles. These points correspond to the clusters of spores which rupture the epidermis of the leaf and become free on the surface, whence they are washed by rain or carried by wind to other leaves. After the spores are mature, those portions of the leaf on which they are produced become dry and brittle, and are blown about by wind, and as many spores still adhere to such floating fragments, it is not difficult to understand why the disease spreads so quickly when once established in a plantation.

As the species proves to be undescribed, the following diagnosis is given:—

Colletotrichum Camellie, Massee (sp. nov.) *Maculæ* amphigenæ effuso-indeterminatæ, primo flavo-brunneæ, dein nigrescentes, denique griseo-arescentes, postremo frustulatum deciduæ ac folium perforatum relinquentes. *Acervuli* centro maculæ laxè insidentes, epiphyllii. *Conidia* cylindraceo-elongata, continua, utrinque obtusata, hyalina, episporio levi donata, 15-17 μ 4.5 μ . *Cystidia* lineari-cuspidata, septata, olivacea, 100-135 μ 7-8 μ .

CEYLON. CENTRAL PROVINCE. On living leaves of *Camellia Thea*.

Preventive Measures.—Bordeaux mixture has been proved to arrest the spread of disease caused by other species of *Colletotrichum*, as *C. lindemuthianum* on scarlet-runners and French beans, *C. Altheæ*, on hollyhocks, &c., and would probably prove effective in the present instance. Care should be taken to experiment at first with a very dilute solution until its action on the leaves is ascertained.

Diseased leaves should be picked before the spores are mature; that is, as soon as the first indications of the presence of the fungus are observed. If this practice was universally followed through the infected area, the disease could be readily exterminated.

CENTRAL AMERICAN COFFEE-DISEASE.

This disease has attracted attention for rather more than the last twenty years. But it is, perhaps, only of late that it has attained serious dimensions. Apparently, the first notice is contained in the *Kew Report* for 1876 (p. 21), where it is noticed as "Mancha de hierro" or "Iron stain." Berkeley attributed it to a minute fungus, *Depazea maculosa*, which was the only organism he could find on the diseased leaves. Dr. Ernst, however, in his *Estudios sobre las deformaciones, Enfermedades y enemigos del arbol de Cafe en Venezuela*, Caracas, 1878, was unable to accept this as the cause of the malady:—

"Berkeley opina que la *Depazea* es causa de la 'Mancha de hierro,' sin duda porque las hojas que le fueron remitidas, vinieron con esta denominacion. No queremos contradecir el aserto de tan respetable autoridad, pero tendremos más adelante ocasion de comprobar que la enfermedad llamada así es generalmente de otro origen" (p. 17).

He further expressed the opinion that "iron stain" was to be attributed to more than one cause, and that

while in some cases it might be due to a fungus, it was generally the work of the "Coffee-leaf Mite," *Cemiotoma coffeellum*. An account of this will be found in the *Kew Bulletin* for 1894 (pp. 130-133).

"Comprendense acaso bajo este nombre tambien otras manchas de aspecto semejante, pero dehidadas á la vegetacion de un hongo, como se ha dicho mas arriba; pero generalmente es la 'Mancha de hierro' el resultado de la presencia de la larva de una pequena mariposa nocturna, que en la zoologia lleva el nombre de *Cemiotoma coffeellum*, Stainton" (p. 17).

This opinion is important as showing that at the date (1878) when it was written the injury done by the fungus was inconsiderable.

What appears to be the same disease was the subject of a note in *Nature* by Dr. Ernst (July 29, 1880, p. 292). He says:—"There appear on the leaves small spots of a lightish green colour, which in two or three days turn brownish." Hence the name of "Iron stain."

Dr. Cooke detected upon these patches a fungus of an entirely different kind, which he described in *Grevillea* [vol. xi., p. 11] as *Stilbum flavidum*. He further discussed the whole subject in the *Journal of the Linnean Society (Botany)*, vol. xviii., pp. 461-467.

Spegazzini has recently suggested the name of *Pistillaria flavida* for the fungus on the assumption that it belongs to the Basidiomycetes. This view is not, however, supported by a microscopic examination of authentic specimens.

Of late years the ravages of the fungus have assumed more serious dimensions. It has proved very destructive in coffee plantations in Costa Rica, Venezuela, New Grenada, and Guatemala; it is also said to have occurred in some of the West Indian Islands.

The Government of British Central Africa, apparently under the impression that it is the leaf disease of Ceylon (*Hemileia vastatrix*), which it is not, has "temporarily proclaimed" Guatemala and the Central American States generally "to be prohibited countries" for the importation of seeds and plants.

A lengthy correspondence has taken place with the Foreign Office on the subject, of which the following is the most material portion:—

MR. CONSUL-GENERAL JENNER TO FOREIGN OFFICE.
MY LORD, Guatemala, February 7, 1899.

With reference to your Lordship's despatch, No. 14, commercial, of the 4th of November, I have the honour to enclose herewith copy of a despatch from Mr. Consul Harrison, enclosing a short report by Mr. H. Pittier on the diseases which have at different times appeared in the coffee plantations in Costa Rica.

The samples of the dried leaves are being sent to your Lordship by parcels post.

I have, &c.,

(Signed) G. JENNER.

The Marquess of Salisbury, K.G.

[Enclosure.]

Report of Mr. Henri Pittier on the diseases which have at different times appeared in the coffee plantations of Costa Rica.

During the existence of the Instituto Físico Geográfico several coffee diseases were submitted for study to the botanical department.

Firstly, the so-called "Maya," characterised by circular zones of dead tissues on the leaves, black rotten spots on the fruit, and by the subsequent falling off of both. The fungus which causes the destruction of the tissues has been identified independently by two specialists: Messrs. Rolfs, of the Florida State Agricultural College, and Spegazzini, of the "Facultad de Agronomía" of La Plata, with the *Stilbum flavidum*, Cooke (*Pistillaria flavida* Spegazz.).

Secondly, the "Hollin" or "Fumagina," which appears as a kind of a soot covering the leaves of the coffee tree, and which is also a fungus (*Capnodium trichostomum* Spegazz.); but in this case the fungus is only a secondary symptom, as it grows on a honey-like exudation of an insect (*Coccus*, scale insect, mealy bug) which settles on the tree.

Thirdly, several cases of distinct appearance, one due to the invasion of legions of caterpillars of a moth, the

name of which I do not now remember, and others which were ascribed to overcropping, to rot caused by imperfect drainage, or to the presence of foul wood in the soil.

These last were all more or less localised and disappeared after a time, but the two first are rather common in the neighbourhood of San Jose, where they reappear every year with a gradually more epidemic tendency.

However, so far they cannot be said to have assumed a very alarming character, and the majority of the planters have not paid attention to them.

Owing to the excessive draught I have not been able to find any trace of the fungus on the diseased leaves; but these are sure to appear with the first rains in April and May, and if not too late for you, I shall gladly endeavour to obtain some good samples for you.

(Signed) H. PITTIER.

MR. CONSUL HARRISON TO ROYAL GARDENS, KEW.

British Consulate,

San Jose, Costa Rica,

February 28, 1899.

SIR,

In accordance with a circular I received from Her Majesty's Minister in Central America, I sent His Excellency for despatch to the Royal Botanic Gardens, Kew, some pamphlets and notes on the diseases which have appeared in the coffee trees in this Republic.

I also forwarded some samples of leaves affected by the disease which the Government obtained for me,

I now under separate cover forward you direct some samples of diseased leaves, collected for me by Monsieur Pittier, and two photographs of trees effected. These trees have recovered, but in some instances look sickly.

I send these direct as Monsieur Pittier tells me the less they travel the better, as the fungus is liable to be rubbed off.

I have, &c.,

(Signed) PERCY C. HARRISON.

W. T. Thiselton-Dyer, C.M.G., F.R.S.,

Director, Royal Gardens, Kew.

The leaves are most frequently attacked, and within a short time become dry and fall to the ground, so that the tree is soon completely denuded of foliage. The growing berries also dry up and fall before maturity. New leaves are formed after some months of rest, usually to be again attacked in a similar manner, and after the consecutive loss of foliage for two or three years, the tree dies.

Diseased leaves are at once known by the presence of one—or usually several—more or less circular pale green, then brown, and finally whitish patches, which extend quite through the substance, appearing equally marked on both sides of the leaf. Grouped on these bleached spots, on the upper surface of the leaf, are several clear yellow drum-stick-like bodies standing erect. Each of these bodies, which are only about one-twelfth of an inch high, is a perfect fungus, bearing myriads of reproductive bodies or conidia on its globose head. One or more similar circular bleached spots bearing fungi also often occur on the berries.

On young twigs the bleached spots are elongated, varying from half to one inch in length. If the diseased patch completely girdles the twig, the portion above the wound dies.

Preventive measures.—Those recommended for the arrest of brown tea blight would probably be effective in the present instance also. Cleanliness is of primary importance. It is impossible for the disease to appear unless spores of the fungus are present in the neighbourhood, and the most effective means for reducing this possibility to a minimum is to collect and burn all diseased leaves and fruit that have fallen to the ground. Photographs received from Costa Rica showing coffee trees completely defoliated by the disease also show the fallen leaves lying in heaps under the trees.

Diseased twigs should be removed, otherwise, should solerotia be formed, and the mycelium become perennial in the tissues, a yearly crop of conidia would be produced.—*Kew Bulletin*.

RUBBER IN THE BASIN OF THE AMAZON.

CRUISE OF THE U.S. GUNBOAT "WILMINGTON."

The United States gunboat "Wilmington" has arrived at Manaus, a thousand miles up the mighty Amazon, says the *N.Y. Tribune*. Here the wide, deep Rio Negro mingles its placid black water with the swift yellow current of the sealike Amazon thus joining the Amazon with the Orinoco.

The credit is given to Captain A. S. Crowninshield, of Washington, for the present extensive cruise of the "Wilmington" in South American waters, a cruise which was interrupted by the Spanish war. Her primary object is to show the American flag in ports where it is seldom, if ever, seen; cultivate friendly relations with the officials and encourage American merchants and commerce wherever possible. So far the "Wilmington" has visited over twenty ports, among them being such important commercial and political centres as Trinidad, Barcelona, Carupano and La Guayra (the seaport of Caracas), on the Spanish Main; Las Tablas, Barranca and Ciudad Bolivar, on the Orinoco; Georgetown and Paramaribo, in British and Dutch Guiana, and Para and Manaus, Brazil.

The "Wilmington" will ascend the Madeira River for six hundred miles to the first cataract, near the Bolivian boundary. Thus her voyage will open up to the knowledge of the world the great Amazon basin, the extent of which is enormous and the resources of which are unlimited. But the high price of rubber to-day (\$1 a pound for the crude article, in the United States and Europe has stopped for the present, and undoubtedly for many years to come, any other form of industry. The Indians and halfbreed Portuguese demand and get their own price for working in the rubber forests, and only they seem able to stand the deadly fevers and miasma. To-day the rubber industry is both the blessing and the curse of Brazil, though for the moment it appears to be the former, as every one seems to be making money. This can be easily understood when it is known that the Amazon basin, with its sparse population, exports nearly \$50,000,000 worth of rubber annually. The key to this rich product and regino is Para, a thriving, rich city of about 10,000 inhabitants, seventy miles above the mouth of the Amazon. As is well known, the delta of the Amazon for several hundred miles is composed of large low islands, covered with water at "big river," (July and August), and abounding with rubber trees, the product of which is known commercially as "islands rubber," and it extends three hundred miles up the Amazon to Gurupa. Thence for several hundred miles the forest, though densely tropical, is sparse in rubber trees. They become thick again, however about Abidos, three hundred miles further up, and around and above Manaus is the fine Upper Amazon rubber, coming from the Rivers Tuara and Tavary, Rio Negro, Rio Branca, Solimoens, Puras, Madeira and hundreds of other streams tributary to Manaus.

While Para, by its wealth and situation is the key to the rich Amazon country, entirely controlling the valuable delta district output and largely that of the up-country, it has a new rival for the Peruvian, Bolivian and Upper Amazon rubber output in Manaus, a young giant of about thirty thousand inhabitants of recent and mush-room growth but having a beautiful opera house, palace of justice, electric railroads, electric lights, modern waterworks, sewers and asphalt streets, and is altogether such a remarkable city of great commercial future as to deserve a special letter.

Exact knowledge of the rubber districts, the gathering of the crop and the curing and transporting of the same is confined at present to three classes. The first are the "aviadores," or buyers, merchants who advance large stocks of goods, gawags and rum to headmen in the forest. The aviadores are mostly Portuguese, and having a "good thing," will not tell much. The second are the men or branch storekeepers in the jungle, usually half Portuguese, half-Indian, who are suspicious and secretive and great liars. They absolutely control the third class, the Indians, who work in the dense tropical forest, and

gather and cure (smoke) the rubber. Left to themselves, the Indians are generally hospitable and communicative; but their dialects are little understood and their knowledge is local.

Recently a ship of only 2,500 tons left Para for New York, with a cargo of rubber, which was insured for \$3,000,000. Nowadays only a bulion ship or one loaded with fur seal skins from the Pribylov Islands would carry such a valuable cargo. Naturally this valuable and constant output demands many large cargoes in return payment. Heavily loaded steamers leave New York and Europe for the Amazon three times a month, and this number may soon be increased. The United States is getting a large part of this rich trade and can increase it by judicious efforts.—*The American*.

A TEXT-BOOK OF PLANT DISEASES.

Whilst much may be effected to prevent the occurrence of disease in plants, and to put a stop to its diffusion, and whilst something may be done to mitigate its consequences, little or nothing can be done in the way of cure. Day after day we receive samples of diseased plants with an enquiry as to the nature of the disease, and almost invariably an enquiry as to a remedy. Sometimes no information is vouchsafed as to local conditions, and as to the method of cultivation adopted, and often, indeed, nothing but continued inspection during growth would enable us to arrive at a satisfactory diagnosis. In most cases absolute cleanliness and free ventilation, together with the methods of cultivation appropriate to each plant, will suffice to keep plants in health. Indeed, in very many instances it is obvious from the specimens sent to us, that slovenly or careless cultivation has been practised, perhaps unavoidably, from adverse circumstances not known to us. However this may be, disease and parasites, whether vegetable or animal, often find the condition suitable for their growth and propagation in plants whose cultivation is neglected. This is, however, by no means invariable. Many of the samples sent us come from establishments where rigid care is exercised, as in market establishments where superb cultivation is the rule. Nevertheless, a fungus may make its appearance, and quickly destroy the hopes of the cultivator. Over-crowding, and the growth of the same crop in the same houses year after year necessarily favour the spread of the disease when it does break out. How often do we find the Tomato crop spoiled from this cause?

We see the same carelessness in woods; the unfortunate trees get injured in a variety of different ways, but all resulting in an open wound. Nothing is done to cover this over, and so the wound, it may be a mere crack, offers a resting place for the spores of the fungi, which, as in the case of canker of the Apple, eventually compass the destruction of the tree. Now the main reason for this loss—much of it avoidable—the main reason, is sheer ignorance—indifference and apathy do the rest.

It cannot be expected that the cultivator who has his business to attend to can attain that knowledge of detail that it is the duty of the expert to accumulate, but he should get a sufficient grasp of general principles, and sufficient information as to the manners and customs of fungi and insects, to be able to avail himself of the teachings of the expert, and turn them to practical account. It is with this object in view that we desire now to call attention to Mr. Masee's recently published *Text-book of Plant-diseases caused by Cryptogamic Parasites* (Duckworth & Co.) After some generalities, the author proceeds to describe seriatim the chief parasites which affect our cultivated plants. The order followed is that of the botanist, the author going from order to order in systematic series.

We have waited long indeed for anything like a complete handbook of this kind. We have had special books like those of Marshall Ward and Worthinton Smith, excellent in their way, but strictly limited; we

have had various translations from the German, and we have had endless articles in our own columns and those of our contemporaries, but Mr. Massee is the first to give us in anything like a complete form, a combination of these scattered records into a systematic whole. This will be invaluable as a book of reference. Our gratitude to the author is proportionate.—*Gardeners' Chronicle*.

THE OIL TRADE OF SOUTHERN INDIA.

The Oil Trade of Southern India, which in 1897-98 was represented by an export of 46,804,81 gallons, valued at 58,699,30 rupees, and accounted for an area of 1,646,628 acres of cultivation, is one of those branches of industry which possesses the remarkable characteristic of never, under any circumstances, suffering from under-production. The supply at all times is equal to the demand. Domestic consumption is largely in excess of export, but can never be exactly ascertained, as much of the oil used is obtained from trees and shrubs growing in a wild state, and manufactured by the poorer classes. Among plants regularly cultivated for oil are the coconut, the gingely, two species of the racinus from which lamp and castor oil are made, and linseed-coconut oil is exported from the Western Coast and from Ganjam, Rajamundry and Tanjore on the Eastern Coast. It is extracted from the *dry* kernels of the nut by expression in the ordinary native oil mills. When made with care, the oil is colourless and solid at a low temperature, but very liable to become rancid by keeping. For edible purposes it is made from the *fresh* kernels, which are rasped, and the milk, being squeezed out, is boiled with a little water. The Cochin coconut oil is reputed the best, and is exported in large quantities to the United Kingdom and to France, where it commands good prices, and is used for the manufacture of candles and soap. Coconut oil soap is lighter than water and is the basis of the floating soaps of the perfumers. Inferior soaps made from coconut oil are liable to melt away if exposed to damp, and if allowed to dry will shrink. For these reasons, and to prevent loss, only small quantities of the article are made at a time. The method of manufacture in the coast is exceedingly simple. Two cisterns are built one above another; the upper filled two-thirds full with the compounds above specified and tightly pressed down; water being poured on the lye filters through and is received in the lower reservoir. About two-thirds or so of this lye is stirred with oil and allowed to stand for three days with occasional subsequent stirrings. The solution is then removed and boiled in a copper cauldron until the soap separates. Pure water is poured on the mass and stirred to clarify it, and the soap is then moulded and cut into bars, when it is ready for sale. Coconut oil is to the inhabitants of the Western Coast what *ghi* is to the Hindu elsewhere. Property in the coconut tree is considered a sound and profitable investment, as each tree is calculated to yield 2½ gallons oil per annum, and the refuse after the oil is extracted finds a ready sale as cattle-food or as manure—to say nothing of the coir and thatching that form bye products of the palm. Before the introduction of kerosine oil, coconut oil was a very popular illuminant. It still enjoys a great deal of favour in this respect, as it gives a bright light, and there is no risk whatever in its use.

Among the poorer classes Gingely Oil is much used for domestic cookery, sometimes by itself, but more frequently as an adulterant of *ghi*. Care is necessary in the preparation of the oil, which becomes discoloured by the matter from the epidermis of the seed, which should first be repeatedly washed in cold water or partially boiled in water to remove the reddish-brown colour before passing it through the mill. In the northern districts of the Presidency, the babool gum is added to the seed

before expression, but it is doubtful whether this is done exclusively to improve the oil, for it also confers an increased value on the oil cake as a cattle-food. The manufacture of the oil is primitive, and the mills used in the present day are the same as were employed for the purpose thousands of years ago. By throwing in the seed without any preliminary cleaning the oil becomes discoloured and depreciated, but it can be made very clear, when high prices are obtained. This clear oil is the yield of a white seed, which however is not so profitable as the black seed or *Sesamum orientale* of commerce. The price of the oil varies according to the district, but a uniform rate is obtained in Europe, where it is imported for the manufacture of soap.

Two oils are extracted from the *Racinus communis*: one known as castor oil, and the other the real lamp oil of the country. *Racinus communis minoribus* is a small-seeded variety, that after being sifted and cleaned is slightly crushed between two rollers; then freed from husks and coloured grains and enclosed in squares of clean gunny or canvas. These squares are put into a mould to give them uniformity, when they are known as bricks. The bricks are then arranged alternately in a screw or hydraulic press with sheets of iron, and pressed till the oil exudes through the pores of the gunny, and is received into clean tins. After boiling the oil is filtered through blankets, and forms the castor oil of commerce. Much less care is exercised in pressing the larger-seeded variety of the *Racinus* and the seed is partially roasted before passing through the mill—both imparting the dark and even dirty red colour which this oil has when sold in the bazaars. As much as 50 per cent in weight of oil can be obtained from the seeds, and the price of the oil is always maintained. The ground or Manila nut is largely grown in Madras more particularly in North and South Arcot and in Nellore and Tanjore. The cleaned seeds yield by cold pressure 43 per cent by weight of a clear, straw-coloured, edible oil possessing all the qualities and characteristics looked for in imported salad oil—which often is nothing more than Indian ground nut oil clarified and reimported from Europe. This oil is seldom used by the natives, but they eat the nut after being slightly roasted over a charcoal fire. From the trade statistics it appears that 19,631 acres of ground in Madras grows linseed, and that the crop is raised principally in the northern districts. It is not, however, easy to arrive at the actual acreage of linseed because it is sown in furrows on the borders of fields, and so escapes calculation. The introduction of linseed into the Punjab, and especially into Sind, is credited to a military settler on the Nilgiris, General Wormald, before his retirement. He appears to have tried it at Jamadar-ka-Sandee, and the experiment is said to have been thoroughly satisfactory from the commencement, the yield being tenfold. The above are the staple oils of the Presidency, but the list might be easily multiplied by local products of which no account is taken, such as poppy oil, the oil of the *neem* tree, cotton seed oil, the oils of various woods, and fish oils. Few of us in fact remember what a great part oil plays in the economy of the country.—*Pioneer*.

NEW SOURCE OF GUTTA-PERCHA.—M. Jouffroy d'Albans, the French Consul at Singapore, writes to the *Courrier de Saigon*, regarding an invention made by a Frenchman in the Straits to extract guttapercha, principally from the leaves of *Isonandra Hookeria*. The leaves, dried, are sent to Belgium and France for the extraction of the gutta. This trade in dry guttapercha leaves has considerably increased at Singapore and Penang. The gutta thus produced is said to be of such high quality that the Eastern Extension Cable Company has contracted with the inventor for a supply of it.

COCONUT CULTIVATION.

MANURING.

I had the privilege lately of discussing the above subject with a veteran, and as his opinions are entitled to much weight as being those of one of the foremost coconut planters, I trust he will pardon me for making them public and for discussing them. Apart from the fact that his long experience, his well-known intelligence and his close observation entitle his views to respectful consideration, his having been a pupil of the late Mr. Davidson of Jaffna in early youth and imbibed the wealth of scientific wisdom which places that gentleman far above his fellows then or since, is an additional recommendation in his favour.

My friend holds very decided views that coconut rees should be manured every alternate year. That if manured at longer intervals, it represents to a large extent money thrown away, as a large proportion of the manure goes towards helping the trees to regain lost ground and a small proportion to putting on crop. In his experience he has found ashes a valuable, nay indispensable, fertiliser for coconuts, and trees which responded in a sort of way to the application of castor cake and bones, showed wonderful results as soon as ashes were added to the mixture. By a systematic and intelligent system of manuring he has known an estate increase its yields, not in one leap of course, but gradually to three times its old average yield. The system was for half the trees to be manured one year and half the next. The manure used was castor-cake, bones and ashes. In addition to that, the husks were carted to the fields and the husks of about 50 coconuts were dropped between every four trees and together with all the branches, were burnt and the ashes spread over the ground. This was done from end to end of the estate with the results indicated above.

I may be pardoned the tenacity and the presumption of discussing the views of so high an authority. But no one more than he will appreciate the good resulting from such discussion, and the unwisdom of blindly following a system simply because it is practised by an acknowledged authority. Circumstances alter the experience of different persons and the observation of one man may not be in accord with another.

I am at one with my friend that it is desirable and more than desirable, necessary, that half an estate should be manured one year and half the next. But I would say as a general and not invariable rule. Experience and observation show that a sandy and therefore hungry soil takes up manure very much faster than a heavy soil with body, or to be more precise, coconut trees growing on a sandy soil derive benefit from an application of manure very much quicker than trees growing on a heavy soil and in proportion to the quickness of the benefit is the quickness with which the results disappear. I therefore think that the rule of my friend is a necessity on a light, sandy soil, and is not so much of a necessity as a desirability on a heavy soil. On such a soil, digging it up and mixing it can be resorted to in the interval between two manurings.

However desirable or even necessary frequent manurings are, it is not everyone that can manage to manure half of his estate annually. Many circumstances, not necessary to be detailed, will stand in his way. Under such circumstances the object of the Planter should be to try to minimize the acknowledged running down of the trees. I think this could best be done by the use of such fertilizers as yield comparatively slow results. In my opinion, bone meal is one such. Bone in its raw state is insoluble or not readily soluble. In contact with the soil and the moisture in it, it decomposes slowly, the length of time depending on the minuteness of the particle and the composition and quality of the soil, among other causes. It is generally believed that bones are of value chiefly, if not entirely, according to the phosphates in their composition. This is to a certain extent true, but bones in their decay

yield ammonia which assists the action of the phosphate of lime. I have always held consistently to the opinion that quick-acting manures are of value chiefly in the cultivation of annuals, where the result are required in a given time. For the cultivation of perennials, and especially of coconuts, slow-acting manures are the most desirable. The trees are not stimulated to heavy-bearing and then quickly fall off, the bearing is steady, even and continuous. It is for this reason, I do not favour the use of steamed bones or of super-phosphate for coconuts. When raw bones are used, the effect is spread over a number of years and after a few applications, the quantity of available phosphates and ammonia in the soil will, if necessity become large, and the benefit to the trees will be in proportion.

Now as to the value of ashes as a manure, there are now two opinions. Their composition is dependent on the substance of which they are the result. Mr. Cochran has made known the great value of the ashes of husks, and people can easily realise by the light of his analysis, to what extent their soils are being impoverished by the removal of husks or their non-return to the soil in the way practised by my friend. Would not economy be attained by carting to the field the ashes of husks instead of husks in bulk? I am not of those who believe in the fertilising properties of manure; but I believe in the value of fires at nights in coconut fields. They help to attract and destroy injurious insects, such as red-beetles and the moths of caterpillars.

I have heard

THE PRAISES OF ASHES

sung very loudly but unfortunately my experience with them hardly accords with that of others. I know an estate where the branches had been burnt between the trees for a number of years. The ground was black with ashes. Anxious to see the extent to which the roots of the coconut tree availed themselves of this rich store of manure, I had the ground dug. My disappointment was great when I came across a few straggling rootlets and not the mass of rootlets within the experience of others. I have had ashes lying in heaps between coconut trees and yet they were not attacked by the rootlets in anything like the way in which a heap of cattle manure or any other heap of decaying vegetable matter with a lot of moisture in it is attacked. I have often wondered how roots take up the fertilising matter in ashes when so few are seen to attack them. Again I have applied wood ashes and the ashes of coconut branches in large quantities of from two to three basketfuls to coconut trees both by themselves and in conjunction with castor-cake and bones with no striking results.

My experience has been that there is no application for coconut trees to equal

THE DROPPINGS OF CATTLE

under the trees. I have tied one animal for ten days to trees that had been neglected and not manured for a number of years and growing on poor white sand and the results were such as to make me most enthusiastic on the benefit of droppings. The branches of these trees were of a yellow, sickly hue and the bearing was being reduced to zero. Within six months the trees were carrying dark, green heads and commenced to throw out large bosoms. The effect, as regards crop, lasted for two years, as the trees were weakly, but the colour of the foliage did not relapse to its original colour. My method was to tie the cattle to the trees without removing any soil and then to dig in the droppings after rain had washed in the ammonia. I think digging in before rain has washed in the ammonia, will help to dissipate it. I am inclined to think that this most encouraging result is due almost entirely to the urine. The solid excrements of ten nights from ordinary village cattle that are grazed on poor pasturage, hardly equals two basketfuls. It will be useful to find out what the composition of the urine of cattle is to enable us to make up a mixture to resemble

it as closely as possible. In the stall-fed cow leaving out of consideration the water which is nine-tenths in weight, we have Organic matter .. 60
Containing nitrogen equal to ammonia .. 9
Inorganic matter .. 20
Containing phosphoric acid .. 7

That does not look formidable. Perhaps, Mr. Baur, with that enterprise which is his characteristic, may find out what the total solid and liquid excrements of one animal is for one night, analyse that and multiply it by ten and give us a mixture representing the application per tree. It is impossible to entirely manure an estate, or even a large part of it, by tethering cattle to the trees, so the next best thing to be done is to secure a mixture resembling it as closely as possible, for the efficacy of the droppings of cattle in the immediate neighbourhood of trees is assured.

I have had the opportunity of watching the difference in effect between the droppings of cattle and an application of cattle manure, castor cake, bones and ashes. The former was to a field that had been neglected and unmaured for a number of years. The latter to a field that was in cultivation and had been manured a couple of years before. Both fields were composed of poor, white sand. The former field responded at once with beautiful dark green heads and a brave show of blossom and very good yields for two years. Though the crop fell off after that, the appearance of the trees did not. The better part of the application to the latter field was appropriated to bring up the condition of the trees and but a little went towards the putting on of crop. We read a great deal last year about "denitrification." That may be responsible for the disappointing results, which, however, are no general.—*Cor.*

PRODUCE AND PLANTING.

BACTERIA AND TEA.—Mr. Allen Cooper, of Southampton, quoting the article in the "Contemporary Review," in which it was asserted that the particular flavour of different growths of tobacco is "attributable to the agency of microbes alone," these microbes being generated during the process of fermentation, thinks that an interesting question for tea planters arises in connection with it. Not only is poor tobacco transformed, but it has also lately been discovered that it is possible to have living cultures of Bacteria which can give a delicious flavour to butter and a fine taste to cheese. "It occurred to me," says Mr. Cooper, "that the distinguishing flavour of teas from different countries might be attributable to a similar cause. It may not be the plant so much as the Bacteria generated during fermentation that gives each district its distinctive character. All tea planters are agreed on the importance of the fermenting process for the proper development of flavour, and the necessity of arresting this fermentation, or 'fixing' it (as it is called) at the critical moment, over-fermenting producing a peculiar rancid odour and flavour. Mr. David Crole, in his lecture on the Chemistry of Tea (given on February 10th, 1897, at a meeting of the Society of Arts), was very emphatic on this point; and some tea planters I was fortunate enough to meet on the s.s. "Nubia," four years ago also emphasised the importance of this part of tea manufacture. They all agreed that the fermentation period was the critical one for the proper development of flavour. This raises an interesting question. Is it possible to alter the flavour of teas from poor districts by the introduction of living cultures of Bacteria developed from micro-organisms taken from fermenting tea in the more favoured districts?" Perhaps Mr. Watt or Mr. Bamber may have something to say on the subject.

A DECLINING MARKET FOR TEA.—Under the above heading "The Grocer" discusses the tea market as follows: "It is now three months since the market for tea was in a buoyant condition, with prices of the common descriptions astonishingly high for these modern days of cheapness, and when, moreover, the

position of the distributing trade in April last was exceedingly strained and awkward. The subsequent trend of the market has proved that at the period referred to quotations had touched their highest points, when at public auction the Indian growth fetched the following rates: Common to good leafy Pekoe at 8d to 1s 3d; Broken Pekoe at 8d to 1s 4d; Orange Pekoe at 8½d to 1s 5½d, with finer grades up to 1s 10d and 2s 3½d; also Broken O.P. from 10d to 1s 6½d; Pekoe Sonchong and Soucbong both at 7½d to 11d; fannings at 6d to 1s 4½d; Broken tea at 7d to 11½d; and dust at 6d to 8½d per lb. Also at the same time Ceylon tea was readily taken off as under: Common Pekoe Soucbongs at 7½d to 8½d; Pekocs at 8d to 8½d; ordinary broken teas at 6d to 8½d; with fine broken and Orange Pekoes at from 1s to 1s 4d. From these extreme rates there has latterly been a gradual, though uninterrupted, decline of 1½d to 2d per lb., so that common grades of Indian Pekoe and Soucbong now are not worth more than 6½d to 7d, and those of Ceylon realise only 6d to 7d, with the medium sorts in proportion."

A RETURN TO LOWER RATES.—"This reduction in the value of both Indian and Ceylon tea marks a great step towards a return to lower rates, such as will enable the dealers and retailers once more to push the sale of the article with their accustomed vigour and success; and, provided that the rupture between importers and the wholesale dealers is soon healed up, there is a prospect of business being renewed with increased activity during the remainder of the year. At first, when 'top' prices were the rule, operations were more or less cramped, partly by the manipulations of speculative members of the trade, and also by reason of the fix in which many blenders found themselves in having no reserve or precautionary stocks to fall back upon at the moment they were most needed. The comparative dearness of teas that had to be pressed in to do duty for the popular 'shilling canister' like-wise helped to instil a fresh spirit of cautiousness in all bona-fide purchasers for home use, and for several weeks in succession considerable difficulty was experienced in satisfying all retail requirements with the same promptness and satisfaction, as when in the latter part of 1898 clean leafy teas were easily procurable at 5d to 6d per lb. Stiff prices, nevertheless, wrought good service in hastening forward the arrivals of new season's teas from India, which came to hand in larger quantities and earlier than they did last year. Besides this the merchants were willing sellers on terms which continued to show a distinct improvement on the lowest rates that were current before the extraordinary rise commenced, and enough tea was secured by the blenders and others to keep matters going on pretty smoothly at a season of the year when, as if by universal consent, the wants of consumers generally are neither so large nor so urgent as in the cooler months, when supplies are superlatively abundant."

A STRONG AND UNSURPASSED DEMAND.—"Notwithstanding the fact that the clearances of tea in the United Kingdom have been somewhat inflated by the heavy duty payments made in March and April last, in anticipation of an increase in the Customs' impost, there is reason to believe that the rate of consumption is fully equal to, if not decidedly beyond, that in 1898, or indeed, in any previous year, and this may be regarded as a guarantee for the continuance of a strong and unimpaired demand on home trade account. Granted this much, it naturally follows that, with a plentiful supply of new season's teas coming on from all parts, the necessities of the market here will be well provided for, and orders to any extent will be capable of fulfilment at more reasonable prices than were demanded in the spring of this year. Other questions of vital importance have also to be considered just now, and it will be greatly to the advantage of both importers and dealers if they can succeed in arriving at a friendly understanding where any cause for disagreement is supposed to exist, and so keep the whole machinery of the London tea in perfect working order."—*H. & C. Mail*, July 21.

TEA PESTS AND SCIENTIFIC REMEDIES.

The Kunaon correspondent of the *Planter* writes:—

I suppose all have read Dr. Watt's remarkably candid views on this matter of a scientist for tea, and if one or two of his observations do not strike home then surely nothing will. "I know of no industry of a similar magnitude where empiricism is allowed to have such limitless sway." Such is the opinion of a dispassionate and perhaps the highest scientific authority in India at the present moment. It amounts surely to the severest condemnation of current tea methods that has as yet seen the light of day, and besides which Sir Alexander Mackenzie's observations were nowhere. I note Cachar votes for an entomologist, but Dr. Watt states that Ceylon has, in addition to their chemist, appointed an entomologist of the very highest European repute, and with the incomparable advantage of himself being a planter. Why then, I would venture to ask, should India spend a lot more money on another entomologist? Ceylon planters are surely fellow men, and nothing discovered there in the way of entomology is going to be hid under a bushel, because, as I understand, Mr. Green is Government entomologist. In my very humble opinion, entomology without direct reference to renovation, and great improvement in cultural methods will turn out to be of the least real advantage to tea. I speak in this matter as one with twenty-six and a half-year's consecutive horticultural practice in its every branch of fruit, plant, and vegetable life. Now if there is one fact borne out by all experience and a multitude of observers, it is this:—No sooner does any kind of plant become enfeebled, than in come the insect pests. As sure as the sun rises in the east and sets in the west do insects show at all times a marked preference for the weak or enfeebled, no matter from what cause arising, and I am perfectly sure—setting aside the scientific aspects of the matter and looking at exactly where it affects the planter, this matter of insect pests and plants is for all practical purposes in the nature of cause and effect. There are quite a number of most effective insecticides. I do not believe for example any green fly exists that will for a moment stand against a strong decoction of quassia; thrip also succumb to its intensely bitter qualities. Again, the Bordeaux mixture, consisting simply of sulphate of copper and lime, is remarkably effective against a number of insect pests and I know that even water heated to 180° F. will effectively destroy green fly. Here is a remedy which in the abstract costs nothing at all, but the moment one comes to practical details and its application to thousands of acres of tea plants growing out in the open what of the expense, and what of the expense still more in the case of remedies costing money and their application to thousands of acres of tea. It will surprise me exceedingly if the salvation of tea is found in entomology. Of course, it would be of the greatest interest and probably no small value to know the exact life-history of each pest and how best to take the pest at the greatest disadvantage. All the same we shall, of course, see what we do see, but entomology is not going to stamp out mosquito, thrip, red spider, and green fly while the inducing cause remains, or at all events, there is such a magnificent field for their existence. If I may venture an opinion, I would say tea today stands in need of two conspicuous reforms above all others first—tea manufacture reduced to a scientific basis in its every process. Secondly, absolute reform in culture, which includes pruning. If this be so, then it indicates a chemist in the factory, and what Dr. Watt terms an agriculturist in the field, but which, I think, would be much more correctly termed a horticulturist or at all events, an agriculturist. It is not by any means clear what

an agriculturist, as such, can know about the tea plant or is likely to discover. . . . At the present moment this is how I have for a long time conceived the matter stands:—The planter has by his methods of culture and ghostly pruning, produced a sickly bush, constitutionally. A vast acreage of tea is not what it ought to be, and might be, or rather should have been; the food and drink of this sickly out of sorts bush is wrong, but the planter now demands a doctor and medicine to beat off the pests that beset its enfeebled frame. Now if experience is worth anything at all, this is not the way to go to work to effect a permanent cure. There must be a radical change in the methods that make the pests so plentiful. Without this it will be a ceaseless warfare, and Assam may be filled with entomologists, and as time goes on they will get more and more to do, because, however much you may destroy on the spot, you can't at any price destroy surroundings of unlimited dimensions without reform in the plant and culture. It is my firm conviction the phrase "let 'em all come" will be a very painful reality for tea, and this will be constantly growing worse until the root of the matter is energetically dealt with.

COCOA PLANTING IN SAMOA.

A report on cocoa planting in Samoa has been received at the Foreign Office from H. M. Consul at Apia. In an introduction to the report, the Consul states that it would seem, assuming the price of cocoa not to fall radically and no cocoa disease to arise, both of which events seem unlikely to occur, that a potential commercial future has at length arisen for the Samoa group, after years of depression owing to the fall in the price of copra and the apparent unsuitability of the climate for other cultivations, such as rice, sugar, tea or cotton.

Small capitalists (£500 to £2,000) going to Samoa and purchasing or leasing land for the purpose of cocoa planting, would stand a good chance of making a fair income after the first three or four years—provided that they either possess a practical knowledge of tropical planting or will take advice from those in Samoa who have experience in the matter.

Cocoa was first experimentally grown in Samoa by "Die Deutsche Handels und Plantagen Gesellschaft der Südsee Inseln zu Hamburg" on one of their plantations near Apia. In 1892 a favorable report on the quality of the bean was received from Germany. In 1893-4 a large number of seeds were distributed among the Samoans, and a few small plantations were started by some of the more enterprising of the British and other foreign residents, which are now coming into bearing. The number of small plantations are rapidly increasing and the amount of land at present bearing cocoa trees is estimated to be 75 acres.

The most encouraging reports continue to be received from Hamburg, San Francisco and Sydney regarding the quality of the Samoan cocoa, the price varying between £60 and £80 per ton. An English planter in this island has an agreement with the German firm to cut and take all his cocoa, he paying freight to market and receiving two-thirds of proceeds, and the firm one-third, but it is stated that this arrangement has not as yet been extended to others. However, there need be no difficulty as to drying and preparing the cocoa for market, as another planter who prepared his own in a rough manner received 16 cents (about 8d) per lb. in San Francisco, whereas the cocoa prepared by the German firm realised 18 cents (about 9d) per lb. in Hamburg. The expense of fitting up, drying and preparing rooms would not be great if divided amongst several planters. Small plantations are

to be preferred, at all events at present, to large ones as in the former personal supervision can be given, and the initial and working expenses are of course a mere fraction of what a large plantation would entail.

A small plantation of 6 acres holds about 1,200 trees, and these in the third year produce about 140,031 pods, and it is apparent that, even with the liberal allowance of 15 pods to the pound of marketable bean, each tree would produce from 6 to 8 pounds of prepared cocoa bean per annum. The trees begin paying in the third and fourth years after planting, and are in full yield after the fifth. Apparently there is practically no age limit to the bearing of a cocoa tree. The two heaviest cuttings are in April and September, and between times there are cuttings about every three weeks. The full grown pods, the immature one, and the blossom may all be seen on the same tree.

The best and cheapest way of preparing bush land for cocoa growing is to thin out the undergrowth but to leave the trees standing so as to afford shade to the young plant. The cost of clearing and planting ought not to exceed £4 per acre. The young plants are raised in small coconut baskets filled with earth in well shaded nurseries and planted out; or the seeds are planted in holes well covered with topsoil, 15 by 15 apart, and when the cocoa trees have attained two years' growth, banana trees are planted between the rows of cocoa, the shade trees are ring-barked, and when dead are felled and allowed to rot in situ. It is surprising to see how very little damage—in fact practically none—is done to the plantation by the fall of these trees.

The cocoa tree seems to be able to bear an extraordinary amount of rough usage in Samoa. When the trees are about three years old the banana trees are cut down and rooted up. The tree with a single trunk is not considered desirable in Samoa, and by allowing two or three main stems to grow and training the laterals to branch out well a comparatively low bush is obtained, which does not attain the height to which the cocoa tree is allowed to grow elsewhere, and consequently is not so much damaged by hurricanes, and produces a larger crop of pods than the other variety.

The kinds of cocoa planted in Samoa were Caracas and Forastero, but as usually happens by hybridization, a distinct kind has been produced, partaking of the best qualities of each variety. The Samoan cocoa is prepared in the Ceylon manner and is especially well adapted for confectionery purposes.

It is advisable not to prune the trees, as this entails stunting them in Samoa. In fact the golden rule for would-be planters in Samoa is not to follow any rule blindly, however well established, but to adapt the general rules of cocoa planting to the special factors out here, and not to try and make Samoan nature follow scientific rules, but vice versa. The cost of land near Apia is about from £1 10s to £3 per acre if purchased from whites, and about 4s to 8s per acre if leased from the natives on a 20 or 40 years' lease. The soil is rocky and volcanic, and well adapted for cocoa.

Although labor in large masses is practically unobtainable in these islands and the native Samoan is by no means an energetic and hard-working laborer, yet sufficient floating labor for small plantations is to be had. The price is about 2s to 3s a month per laborer, his food costing about 16s per head a month. One man ought to be able to look after six acres of well grown cocoa in the dry season, but two are required during the wet season from December to May.

In Samoa the cocoa is a robust, hardy tree, growing luxuriantly, and yielding abundant crops with but trifling cultivation.—*Cultivator*,

HYBRIDISATION.

In connection with an International Conference of Hybridisation held under the auspices of the Royal Horticultural Society during the past two days a dinner was held last evening in the Whitehall Rooms, Hotel Metropole. Sir T. Lawrence, President of the Society, was in the chair, and the company included the Netherlands Minister, the Belgian Minister, Earl Annesley, the Master of the Rolls, Sir E. Fry, Mr. Herbert J. Webber, and the Rev. W. Wilkes (the Secretary). The tables were beautifully decorated with roses, carnations, orchids, and other flowers, the gifts of members of the Society, who also presented the fruit for dessert. The toast of "Horticulture" was proposed by the Rev. Professor Henslow, and acknowledged by Mr. H. J. Webber (United States), Professor H. de Vries (Holland), and M. H. de Vilmorin (France). Mr. Webber remarked that the possibilities of hybridisation had hitherto been little realised, and the few examples which had been brought to notice were simply heralds of the advances that were likely to be made in the future. He thought it a matter for regret that there was no way in which the originator of a new fruit or a new flower might derive due benefit from his labours. Every endeavour ought to be made to popularise horticulture, so that any discoveries that were made by hybridists might meet with their just recompense. Mr. W. Bateson, in giving the toast of "Hybridists," insisted on the importance of bringing about a permanent investigation in this country of the problems of hybridisation, such as was now being conducted in the United States. (Applause.) Mr. W. T. Swingle (Washington) replied. The Master of the Rolls proposed "The Royal Horticultural Society," and Sir Trevor Lawrence, in responding, observed that it was owing to the fact that Robert Fortune was sent out by the Royal Horticultural Society to China that the cultivation of tea was undertaken in India, and ultimately spread to Ceylon, and that now the bulk of the tea consumed in Western countries come not from China, but from the country into which Fortune introduced it. The Society now numbered nearly five thousand Fellows, and, though not wealthy, was in fair water. It needed, however, two things, which he hoped would soon be forthcoming, namely, a hall in London and a new garden larger than that at Chiswick, and not so near London. (Applause.) Other toasts followed.—*Morning Post*, July 13.

MR. JACKSON'S NEW TEA MACHINERY.

Hitherto it has been impossible, even under most careful factory management, to prevent dust, powder and foreign matter, such as hair-like splints of bamboo and fibre from green leaf jute hessian withering tats, being mixed with the tea in packing. From careful experiments, made with various grades of tea of their appearance, the amount of foreign matter contained in them varied from $\frac{1}{2}$ per cent to $2\frac{1}{2}$ per cent. To obviate this a new

PATENT TEA DUST EXTRACTOR, for use in tea factories, warehouses, and packing rooms has been designed by Mr. Jackson.

By a series of simple adjustments, the machine can be made to remove only powder, or light fibrous matter; or all the dust may be removed, and the residue thoroughly mixed; or the dust may be extracted, and the residue divided into two grades, medium and large. The design of the machine is such that a fluted feeding roller in hopper regulates the supply of tea, so as to spread it into a thin stream, four feet wide. It passes down a series of steps, arranged in a

zig-zag form, all the while being subjected to a current of air, which may be regulated to any necessary pressure, by means of shutters, to suit the material to be operated upon. The capacity of the machine is from 500 lb to 1,000 lb per hour, according to the thickness of feed, and the quality of tea to be dealt with. The materials used in the construction of the machine are of the best possible description, the framing being of the best selected pitch pine, lined with sheet steel, and the machine body is mounted on four strong cast-iron standards. The fan is powerful, and accurately balanced, and the bearings are fitted with special oil-catching devices. The discharge doors are both moved by one bar and handle, and arranged so that they may be shut, or kept partially open, while the machine is at work.

Mr. Jackson has also constructed a new balanced SELF-CLEANING TEA SIFTING MACHINE with a view of giving every facility to the factory manager to produce the best grades of tea required by the market. Its advantages may be summed up as follows: First. Balanced Action. There are two superposed carriages containing the sieves, supported, and held in their track by wooden springs, securely bound to angle foundation plates at their lower end, and pivoted at the top. Motion is imparted to the sieve carriages by a crank shaft with double throws, the crank pins being arranged opposite each other, thus producing a perfect balanced action, reducing the action of wearing parts to a minimum, and making heavy and costly foundations unnecessary. Second. Adjustable Incline of Sieves.—The two carriages are hinged at the end next the driving shaft, and the other end can be set level, or at any necessary incline, to suit the nature of the tea to be operated upon. Ready means for attaining this object are provided by a clamp-device, which is free to revolve and accommodate itself to any angle at which it may be desired to set the sieve carriage. Third. Self-Cleaning.—It is generally known that to keep the wire meshes of sifting machines free from entangled leaves has been one of the most difficult problems for any designer of this class of machinery to solve, and we believe that Mr. Jackson has overcome this by introducing a cleaning device underneath the sieves. The self-cleaner consists of numerous wooden splints attached to sliding rods, and pitched to suit the exact travel necessary to thoroughly free the wire meshes from curly tea leaf. The sliding rods are secured by clips, which can be instantly released by the attendant, and all that is necessary to clean the sieves is to set them at liberty, and hold them by hand for a few seconds, and the movement of the machine will do the rest. When the cleaning arrangement is not in use, its splints act as bearers to support the wire mesh without in any way reducing the efficiency of the sieves. Fourth. Interchangeable Sieves.—Two wire mesh frames and sieves are supplied with each machine, the numbers of mesh to suit option of purchasers, these are interchangeable, and can be instantly taken out to give place to frames with different sized meshes to suit various classes or methods of sifting. The crank shaft is bent from the bar, and mounted in a massive pedestal, with oil catching devices arranged in bearings, the shaft runs a hollow casting which is practically dustproof; but immediate access can be had to shaft for the purpose of lubrication or

clearing when necessary, by simply lifting a lid. Being accurately balanced the power required is nominal. The driving pulley is ten inches diameter, by three inches wide, and the speed is 265 revolutions per minute.

The following report on the working of Jackson's Patent Tea Packing Machine, by a planter of long experience, has recently been received from Ceylon: "I am much pleased with Jackson's No. 1 Packer. It is an excellent machine, works noiselessly, speedily and packs well. I should not like to revert to the coolie trading system of packing again, after using Jackson's Packer."

The following is a copy of a letter received from one of the proprietors of the above estate: "I am very glad to inform you that our first invoice packed with your machine had not to be rebulked in London; formerly most of our grades in an invoice had to be re-bulked. This of itself represents a good saving in the twelve months."—*H. and C. Mail*, July 21.

CEYLON CHAMBER OF MINES.

The meeting which was held on Aug. 8 afternoon was very largely attended and the proceedings lasted about an hour and a half. Mr. F. M. Mackwood, Chairman of the Chamber of Commerce, occupied the chair.

The following are the official minutes of the resolutions passed:—

1. To form a Chamber of Mines.
2. That all gentlemen interested in mining be eligible as members.
3. That membership be divided into two classes, viz., full members and associated members.
4. That entrance fees and subscription be as follows: full members—entrance R50, and annual subscription R50; associates—entrance R10, and annual subscription R10. Associates to enjoy all the privileges of full members, except that of voting on any resolutions brought before the Chamber.
5. That all the members registering their names (*i.e.*, sending them to the Secretary *pro tem*) by 31st August shall be original members, after which date all candidates for membership to be balloted for by Committee.
6. That a Provisional Committee to hold office for six months be appointed consisting of the following gentlemen: Capt. Tregay, Messrs. Jacob De Mel, E C Skrine, Rajapaksa Mudaliyar, A S Berwick, J W C De Soysa, S P Jeffery, R Fielding, J Clovis de Silva and N D P Silva. Four to form a quorum, and that Mr. Geo. Armitage be appointed Secretary *pro tem* and a member *ex officio*.
7. That the Committee shall draw up rules and regulations for the working of the Chamber of Mines and report progress to a general meeting of members to be convened about the end of September.
8. That minutes of the proceedings be sent to the Hon'ble the Colonial Secretary, Colombo, and through him to the Secretary of State for the Colonies, the Crown Agents for Ceylon, and to H. E. Sir West Ridgeway.

RUBBER FROM PERU.—Much indiarubber is brought from Peru to Para, in Brazil, for exportation. It is traced by M Hubert of the Para Museum, to a species of *Castilloa*, possibly identical with the *Castilloa* of Central America.—*Globe*, August 4.

CEYLON FOREST DEPARTMENT.
THE CONSERVATOR'S REPORT FOR 1898.

AFTER a careful reading of Mr. Broun's report for the past year we are struck with the moderate tone of his really telling criticisms upon the Government interference with the Department that took place during his absence from the Island last year. Opportunity was then taken to obtain a report upon the state of the Department, Mr. F. C. Fisher, C.C.S., Acting Conservator, being chosen to draw it up. The conclusions of this report were, it will be remembered, at variance with the Conservator's opinions, and Mr. Broun found it necessary to reply. As a consequence of his report—the necessity of which has not been proved—Mr. Fisher was requested to submit proposals for the re-organisation of the Department. And what was the substance of these proposals? It was very much that of similar proposals made in the opening chapter of Mr. Broun's report for 1896. On the latter's return to the Colony, he was graciously included by Government in the Committee appointed to report on Mr. Fisher's proposals. But—and here must have lain a source of the utmost annoyance to the Conservator who has been so continuously badgered—partial effect had already been given to these proposals before Mr. Broun returned. Yet we find the mere fact alone chronicled—nothing more. Perhaps silence is stronger than words, and the Government will be warned in time not to try the patience of their trained officers beyond the limits of natural endurance.

The following changes, which were described less specifically in the Commissioner's report (extracts from which appeared in our issue of February 23rd), are those that have come into effect with the present year—changes which Mr. Broun has accepted and therefore, no doubt, intends to make the best of:—

(i.) Separation of the *General* from the *Provincial* Forest Administration, the former including the management of areas to be reserved as permanent forest estates under the direct control of the Conservator, while the latter dealt with forests and waste lands available for the extension of cultivation. In the Western and Sabaragamuwa Provinces and in the Galle and Matara Districts of the Southern Province, however, this separation was not recommended for the present for any forests whether reserved or not, but it may take place when the rights of the Crown in and over waste lands have been determined after survey. The inclusion of certain valuable forest blocks which have for the present been left under the charge of Government Agents has been left for discussion later.

(ii.) Division of the forests under General Administration into the following six charges or "circles" each under an Assistant Conservator, viz:—

(a) *Northern Circle*, including the valuable forests in the Northern Province and serving the export centres of Jaffna, Mannar, and Mullaittivu.

(b) *North-Eastern Circle*, comprising the forests of the Trincomalee District, West Tamankaduwa, and the eastern portion of the North-Central Province, and serving the export centre of Trincomalee.

(c) *Eastern Circle*, consisting of the valuable forests of the Batticaloa District (excluding the Panawa pattu), Tamankaduwa east, and the Nilgalla pattu, Province of Uva, and serving the export centres of Kalkuda bay, Batticaloa, and Arugam bay.

(d) *South-Eastern Circle*, composed of forests of the Panawa pattu, Eastern Province, the Hambantota District, and the southern portion of Uva, and serving the ports of Okanda and Hambantota.

(e) *North-Western Circle*: valuable forests of the North-Western Province and a few in the western portion of the North-Central Province, serving the port of Puttalam and the market centres of Kurunegala and Chilaw.

(f) *Hill Reserves*: hill forests of the Nuwara Eliya District and Haputale and in Matale north, Central Province, serving the planting districts and the town of Kandy.

(iii.) Working of the forests under the Conservator of Forests on a more systematic and concentrated plan, and of those not required for reservation by a system of licenses.

(iv.) Reduction of the number of officers and of expenditure on staff, while providing an improvement of the prospects of the superior and clerical staffs.

The effect of these changes will be, in Mr. Broun's opinion, to injure the finances of the Department for a while, because of the large area now made available for obtaining timber for sale, and the low rates at which this timber will now be sold. On the other hand, the Department will benefit by the P.W.D. being henceforth allowed to supply itself in the open market, the Forest Conservancy being thus enabled to relinquish the practice of keeping deteriorating stock on hand to wait the good pleasure of the P.W.D. With regard to the area of the circles above specified, these are the figures supplied, with the Conservator's comments thereon:—

	Square Miles.
Northern Circle	1,587.50
North-Eastern Circle	1,858.00
Eastern Circle	2,200.00
South-Eastern Circle	2,297.00
North-Western Circle	1,556.75
Hill Reserves	513.00
Total	10,012.25

It is however not to be understood that all this area is forest, much less *good* forest. Considerable areas will have to be excised and placed again under the control of Government Agents, and they will possibly amount to from one-half to two-thirds of the total area. On the other hand, there are certain valuable forests which have not been included within the circles which it will be desirable to place under the control of the Conservator.

A good deal of demarcation has gone on during the past year, the Central, Uva and Sabaragamuwa Provinces alone being untouched.

The enumeration of the bits of surveying done reads somewhat jaggedly, and after vainly endeavouring to grasp a solid estimate and a fairly lucid idea of the work accomplished, we come on the following paragraph as upon an oasis, and we most heartily re-echo the cry for method, *METHOD*, which is there very soberly expressed:—

It is necessary that all the areas placed under the Conservator be now worked on a systematic plan. The enumeration surveys and measurements of sample plots which have been hitherto made are unfortunately not sufficient for fixing a possibility, either by volume or by area, for our principal species. It is however imperative that the past disconnected way of carrying on operations here, there, and everywhere, should be changed, and I have assumed for the present that most of our important species take about forty years to grow from the second girth class (4 ft. 6

in. girth) to first class (6 ft. girth). For the present therefore, and until we can get more reliable data from sample plots, about one-fortieth of the area will be worked each year, taking only such first class trees as can be spared for exploitation. Before long I hope that a reconsideration of this system can be made. It is intended that cleanings and seed fellings should precede the principal fellings by a few years. The fuel reserves will be worked on a rotation of twenty years.

On the subject of sample plots further interesting information is supplied. The measurement of these is, we are glad to learn, becoming more universal in the different Provinces; but unfortunately several that were started have been left neglected. On them the different species of trees have not been sufficiently represented and deductions as to rate of growth have been rendered unreliable. Valuable material is expected in a few years; but, meanwhile, as Mr. Broun says, "ten years have passed during which most important data might have been got together."

The reorganisation of the superior staff has now come to pass, and effected a reduction in the number of officers—a course which is to a certain extent satisfactory to Mr. Broun, since, as he points out, it is a one which he has advocated as far back as 1891. Even with the 34 rangers, which form the executive staff—at salaries ranging from R1,500 to R360—under the new scheme, the staff, including 17 rangers, under the Conservator, it is shown, is still somewhat small, considering that some 10,000 square miles have to be administered; and this fact will scarcely be affected if more than half the total area is given back to the Provincial Administration. The Conservator very wisely remarks, however, that it is better at the outset not to overman the Department, but to add to it as fresh requirements are proved.

The review of the plantations for Artificial Reproduction shows every promise and a rebuke is duly administered for the previous disparaging remarks on them, made by Mr. Fisher, apparently without personal inspection of the plantations. This portion of the Conservator's report we shall reproduce in full. The indiscriminate issue of free grants in the little populated districts of the North-Central Province and Trincomalee is also deservedly condemned as tending to foster unthrift and a want of self-reliance. Nor is it, we may add, likely that the native estimation of the value of land in the neighbourhood of the Northern Railway likely to be increased by these doles from the Government landlord.

With regard to the financial results the surplus has fallen short of what was anticipated—partly because of the value of plumbago lands leased, (the rents R20,105 not being put down as forest revenue) and partly because the value of timber on lands in the N.-W. Province (R20,000) was not credited to the Department in actual cash. The net surplus (R14,738) would, with these additions, have attained R51,843 or more than double that of last year. In 1896 it was R9,605, but in 1897 we are at a loss for the correct figure; for in Mr. Fisher's Report for 1897, it is put down at R23,573 and in the comparative table in Mr. Broun's statement for 1897 and 1898

it is given as R27,372. This is entirely due, we notice, to the surplus for the Eastern Province being given in the former table as R15,368 and in the latter as R19,167; similarly the total Eastern Province and receipts differ in both cases. In conclusion we have the following paragraph accounting for the delay, upon which we were about to comment, in issuing the report:—

There is again delay in the submission of this report on account of the lateness in receiving the provincial reports. This is due to the precipitate hurry with which officers were transferred to new headquarters just before my return from home, the consequence being that the record, are in one place with the Government Agents and the Assistant Conservator and his clerical staff in another. The result is delay in obtaining necessary data and in submission of reports. In view of this we do not see how any blame can attach to the Conservator himself, and further we have to thank him for a peculiarly interesting and succinct account of the Department under his charge—one which stands in the first rank of public importance to the people and colonists of Ceylon.

SCIENCE FOR AGRICULTURE.

WE have often noted the backwardness of British Colonial Governments, in recognising the importance of providing scientific help for the furtherance of agriculture, as compared with Continental Governments. In the case of German and Dutch Colonies, a staff of scientists is always attached to public institutions, so that their services might be available to planters and others; and specially is this the case in Java. We need not go far back to recall the official refusal at first to enlist the services of Mr. E. E. Green for the benefit of the Island, and his subsequent appointment as Honorary Entomologist; and then the confession, or rather pretence of inability to find a cryptogamist to inquire into the cacao disease, which led to the engagement by private proprietors of Mr. Carruthers, whom the Government afterwards consented to subsidise. The lesson taught the nation in industrial and commercial matters, in which Great Britain is paying the penalty of a narrow conservatism which has enabled American and German goods to oust British goods even in British Colonies, ought to be laid to heart, and applied to matters agricultural, if there is to be progression, rather than stagnation and retrogression. We refer to the subject just now, in view, of the movement to secure Mr. Carruthers' return to the Island as a Government servant, and of certain correspondence which has come under our notice between the Government of Bengal and Dr. Watt, the Reporter on Economic Products with the Government of India. Dr. Watt, in a letter bearing date the 17th May, from Calcutta, in replying to inquiries in connection with grants of R5,000 a year sanctioned by the Lieutenant-Governor of Bengal, and R2,500 a year for three years by the Chief Commissioner of Assam, towards the cost of employing an expert to study and report upon the cultivation and manufacture of Tea in Assam and Cachar, writes to Sir Patrick Playfair in very explicit terms which have some ap-

plication here. He draws a distinction between the cultivation and the manufacture of Tea; and while admitting that the problems on which he had been previously consulted, touching blights and pests, are connected with cultivation, he points out that it would be vain to expect the officer proposed to be employed to deal with those problems, to be able to advise as an expert on all questions relating to Teas. Even in respect of pests and fungal blights, Entomology and Mycology are two widely different studies; and it is almost impossible that a Biologist could be an expert in both branches, though he may conduct useful investigations in both. But Dr. Watt regards it as contrary to all experience that a Biologist could be an expert chemist at the same time, and he proceeds to refer to our own proceedings in the following terms:—

Some few years ago the Association brought to India a chemist (Mr. Bamber), and he furnished a report which no doubt most of the members of the Association have read. Its practical value is, therefore, a point I need not deal with. At the present moment the Ceylon planters have engaged Mr. Bamber as chemist, but they have secured also the services of Mr. E. E. Green, an entomologist of the very highest European repute, Mr. Green is himself a tea planter of many years' experience, but has consented to become Government Entomologist mainly with the view to devote his entire energies to the investigation of the pests of the tea plant. With a chemist and entomologist at work, Ceylon may reasonably hope to make some progress, but I do not look with much favour to a scheme that would secure one officer, in the hope that he would be an expert on every scientific problem of tea planting. I should, therefore, recommend the Association to carefully consider whether they want a chemist or biologist as the first and most important consideration.

The action of the Government there having been inspired by the local Association, Dr. Watt approves of its action, subject to the foregoing qualifications; and while appreciating the desire of those engaged in the Tea Industry to discover remedies for pests and blights, to cultivate the bush to the best advantage, and to perfect the methods of manufacture, he declares that he knows "no industry of a similar magnitude where empiricism is allowed to have such limitless sway." These are strong words; but do they go beyond the truth? It is easy to blame the Government here for inaction; but it was not so long ago that our "preachings," on the need of calling science to the aid of cultivation and manufacture—to decide on the choice of manures and to study the chemical changes which the leaf underwent from the plucking to packing—were regarded as mere vapouring. And Dr. Watt justifies his language by reference to a former Report, in which he gave instances of the diametrically opposite views held by "well-informed and successful planters on almost every aspect of the industry." It is only "the immense capabilities and vast powers of endurance of the plant" which have been the safeguard of planters, as their conflicting opinions might both be wide of the mark and the profits obtained be far short of what they should be. Holding, as he does, that the limit to the blindfold trusting in Providence and to the endurance of the

plant, is not very remote, he declares that there is scope, "not for one scientific expert for a few years, but for half a dozen for a life time." These are words the truth of which our Government should recognise not only in connection with the immediate demands of the Planting Community, but also in connection with the project of a Department of Agriculture, or a Board, which is under inquiry by a Commission. Dr. Watt's advice is that, if funds will not permit of the whole question being dealt with, the Association should decide whether it wants (a) a Biologist to inquire into pests, (b) an Agriculturist to inquire into cultivation, or (c) a Chemist to suggest improvements in manufacture. These are precisely the departments in which knowledge and help are needed here; and it behoves the Government to consider the question, not merely by the light of the immediate present but as one intimately connected with the maintenance and extension of an industry on which the progress in prosperity of the Island so largely depends.

In this connection we may call attention to the very encouraging report of the Superintendent of the Agricultural School, the bulk of which we reproduce elsewhere.

CHINA TEA NOT POPULAR IN AMERICA.—An interesting report of Mr. Consular-General Brenan has just been published by the Foreign Office. He says that the Ping-suey teas were the purest and best that have been brought to market for thirty years, and yet they met with a poor reception in America. This is partly attributed to the absence of colouring matter, which caused the leaf to be unattractive to the eye. Seeing that the tea is only wanted for making an infusion, and not for putting on the table in the shape of leaf, it is strange that consumers do not prefer to have the pure uncoloured leaf as it is used by the Chinese themselves. Colouring enables the tea-ers to hide defects which would otherwise be exposed. The crop was 80,000 half-chests against 112,000 half-chests last season.

TEA PLANTING IN THE UNITED STATES.—Here are further particulars from the *American Grocer*, regarding a subject which we treated editorially quite recently:—The Secretary of Agriculture is following in the foot-steps of former Commissioner Le Due, in furthering tea planting in the Southern States. Secretary Wilson regards a domestic tea industry as one of the hopeful problems of the day, if, indeed, it has not been demonstrated to be a success already. From the specimens sent to the Department of Agriculture, he is induced to believe that the plant can be produced at a profit in the United States, and to this end he is prepared to use his best efforts. Fourteen thousand tea plants have been secured and sent to the South in continuation of the experiments started by General Le Due several years ago, when the labour question was the difficult problem to solve. Since then machinery has come into use for the preparation of the leaf for market, but there still remains the question of labour for picking. In Ceylon and India, pickers receive a few cents per day and it is doubtful if tea planting in this country can be made a profitable industry until labour is as cheap as in China and other tea growing countries.

"ALL ABOUT RUBBER."*

A planter writes:—"I have been utilising all my spare time lately in studying the book you have just brought out under this title. The wealth of information you have gathered together on the subject is amazing. I had no idea there was so much literature and knowledge of the product, its cultivation, &c., &c., extant! As a present day experienced Ceylon planter, I have been through the usual mill, beginning in coffee while it was still our staple, then doing a full time at cinchona with half-holidays at cacao and cardamoms, and the last few years at tea; so it is quite on the cards that I rush into rubber yet. Should the fates ordain it thus, I shall enter on the job with a light heart, as with your book as a guide one should be able to steer clear of the *puthuarle* mistakes that were made when most of the other products were first undertaken on a large scale in Ceylon. The book fully merits its title and the re-printing in full of the recent circulars from Peradeniya, brings it quite up-to-date. The only thing I note with regret is that you have not been able to include the figures promised by E. S. G. (on page 13), presumably because the tappings for rubber, he mentions, are still in progress? As those figures will be most interesting and useful might I suggest, that when they are available you have them printed on slips and post one to each local purchaser of the book, so that it can be pasted in rendering the volume more complete."

Other planting friends have written as follows:—"The latest edition of this valuable compilation comes at a most opportune time, when the attention of enterprising planters is directed to new fields, and when it is so important that their efforts should be well and properly directed, and that they should not be misled into ventures of doubtful issue by reason of scanty acquaintance with the requirements of the cultivation, the markets, and the various methods of meeting the new wants of modern trade; the book is full of information and right up to date; with all the recent experiments made in preparation, &c. in Ceylon, and statistics and news relating to the industry, from all parts of the world. The scientific side is not lost sight of either, and the Botanical list of rubber-yielding plants is included. Mr. John Ferguson seems to have a special gift of compiling these works of reference, but this volume on rubber is not only about the *best manual* he has given us, but it is issued exactly at the *right time* and with the latest and best information available, and should be read by all proprietors and planters interested in the lowcountry and by men who look for additional sources of income and investment.

"The latest report and tests from the Peradeniya Gardens are fully given and there is not an item of intelligence up to the present time that is omitted in this most useful volume."

"I think the book will be most valuable in the hands of all growers of rubber, not in Ceylon only, but wherever rubber is cultivated by English readers. Hoping you will have a large and ready sale for the book as some recompense for the trouble and expense you have been to in bringing all up-to-date information together in so handy a volume."

INDIAN TEA ASSOCIATION (LONDON.)

The following is from the annual report to be presented at the meeting on Tuesday, July 25th;

The General Committee have the pleasure to submit to members the following statement on the conclusion of the 19th year of its operations. On the resignation of office by General Henry Hopkinson, C.S.I., at the last annual meeting—on account of advancing years and ill-health—Sir Henry Seymour King, K.C.I.E., M.P., was unanimously elected Chairman of the Association for the year under review.

FORWARD ESTIMATES OF THE INDIAN TEA CROP.

With a view to ensure greater accuracy in estimating the volume of the coming crop, it has been arranged that the Indian Tea Association, Calcutta, should procure special estimates from managers to be submitted by the end of June, and published immediately afterwards, and that no estimate be published before that time.

CROP OF 1898.

The original estimate and actual outturn of tea from the several districts in round figures (millions of lb.) were as follows:—Assam, estimated 64, actual crop 62; Cachar and Sylhet, estimated 49, actual crop 45; Darjeeling and Terai, estimated 11, actual crop 11; Dooars, estimated 26, actual crop 26; Chittagong and Chota Nagpore, Kangra, Kumaon and Dehra Dun, estimated 4, actual crop 5; Private and Native Gardens, estimated 4, actual crop 4; estimated total, 158; actual crop total, 153. Of this crop there were shipped direct from Calcutta to places outside the United Kingdom over 18 million pounds, leaving 135 for shipment to this country.

The chief places to which the direct exports from Calcutta went were as follows:—Australasia—1898: 6½ million lb.; 1897: 7 million lb.; 1896: 5¾ million lb.; Indian Ports—1898: 4 million lb.; North America—1898: 3 million lb.; 1897: 2½ million lb.; 1896: 2¼ million lb.; Turkey—1898: 2½ million lb.; China—1898: 1 million lb.; Germany—1898: ½ million lb.; elsewhere—1898: ¾ million lb.; 1897: 6¼ million lb.; 1896: 5¾ million lb. Total—1898: 18 million lb.; 1897: 15¾ million lb.; 1896: 14 million lb. *H. and C. Mail*, July 21.

NATAL TEA.

At the Durban Agricultural Show on July 12th, prizes were offered for tea and with regard to the single exhibit the "Natal Mercury" says:—"The tea is disappointing, because only one exhibitor has come forward—Mr. J. A. McMillan, of Barnsdale, whose teas, however, are pronounced to be of first-class quality. Mr. McMillan secures two first prizes. It is said that the conditions are in some respects rather stringent, and that this accounts for the absence of competition. This rather enhances the value of the prizes won by Mr. McMillan, as he complied with the conditions, and has the satisfaction of knowing that his tea has been very favourably commented upon by those competent to judge."

* ALL ABOUT INDIA RUBBER AND GUTTA PERCHA—Third Edition R5, cash R4, postage 20 cents.—Observer Office, Colombo.

ON THE PREVENTION OF TEA PESTS AND BLIGHTS.

BY OLIVER COLLETT.

(Read before the Ambagamuwa Planters' Association, Aug. 21st, 1899.)

The Director of the Royal Botanic Gardens in his recently issued Circular on the subject of Tea Blights says:—"The immunity from disease that tea has enjoyed in so marked a manner for many years is now disappearing; many insect and fungus enemies, some of local origin, some introduced from Assam and elsewhere, are now attacking tea in many parts of the Island, and it behoves all interested in the cultivation to be upon the watch to recognise the signs of disease as soon as possible after they appear, and to at once attack and as far as possible eradicate the disease. The diseases are here, and all experience of cultivators in all ages and lands shows that such diseases come to stay; they cannot be completely eradicated, but they can be kept in check if taken in time."

Here is good and sound advice to which we are all, I am sure, prepared to give our best attention. At the same time many of us may not be inclined to fall in with the opinion of Mr. Willis, that the health of the tea-plant in Ceylon is now for the first time being seriously threatened by the attacks of fungus and insect-pests. On the contrary, I think, it is the experience of most of us that these pests have always been with us; and when we come to consider the fact that millions of insects and of parasitic fungi are daily brought into existence, apparently for the sole purpose of feeding upon the alimentary juices of plants, the wonder rather seems to be that plants which are kept under constantly cropping conditions—as in the case of tea—should be able, season after season, to retain their natural vigour and keep their foes at bay.

The test, of course, comes when an unusually unfavourable season occurs, and the resources of the plant are naturally tried to the utmost. If it is left, as not infrequently happens, in a weakened and impoverished condition, it becomes, according to a well-known law in nature, a ready prey to the attacks of disease. Thus, insect and fungus pests find the opportunity that they have been waiting for; and they very soon make themselves known to us—both in our tea fields and in the columns of the public press.

Now, the present season (1899) has been, up-to-date, a distinctly *abnormal* one. We had a severe drought in the early part of the year, followed by an excessive rainfall in the months of May, June and July—just the sort of season in fact, which would be likely to do harm to our tea-bushes—and the consequence has been that they have been exposed to an outbreak of disease of unusual severity with a smaller chance of warding it off than has been the case in former years.

It is, therefore, our business to consider—and that very seriously—whether, in our general system of cultivation, we are doing all that is needed to help the bushes to preserve the necessary amount of strength and vigour that shall enable them, in an unfavourable season, to combat successfully with the attacks of disease.

It is, I believe, the opinion of Indian planters that we, in Ceylon, predispose our bushes to the attacks of enemies by our system of plucking from them all the year round, and of only allowing them a rest—if rest it be—during the time that they are pruned down. Now, it is possible that there

may be more truth in this than we have hitherto supposed. You are aware that all plants under cultivation must have a resting season; and it is perhaps a question whether we ought not to be satisfied with a slightly diminished yield per acre, in order to allow our bushes to have a complete rest for a month or two, at the least, between each pruning. Certain it is that resting has an enormously beneficial effect upon tea under any circumstances; and I can quite conceive that the time will come when we shall find it ultimately profitable to allow a small proportion of our acreage—say one-eighth or one-tenth—to remain unplucked (but of course meanwhile weeded and cultivated) every season.

Again, there is much to be done in the way of systematically removing all lichenous growth and moss from the stems of our bushes after every pruning. I am aware that a great many planters regard this as an altogether unnecessary operation but, there can be no doubt whatever that the removal of this growth invigorates the bushes to a great extent; and that where it is left to grow upon the branches it affords a dangerous refuge and breeding place for all manner of fungus and insect pests.

There is one more point to which I should like to refer, and that is the question of the abandonment of fields of diseased and unprofitable tea in the midst of cultivated areas. A patch of tea, once abandoned, becomes a spore-nursery for every kind of disease, and a source of considerable danger to all estates in its immediate neighbourhood. It is possible that this question, which, in my opinion, involves more serious issues than any of those just discussed, may be one which the Planters' Association may not be sufficiently powerful to cope with. If so, our only resource will be to ask Government to introduce measures which shall render compulsory the destruction of all abandoned areas of tea by fire.

In these remarks, which have been hastily drawn up to be in time for this meeting, I have confined myself to a general consideration of what, in my experience, are likely to be the best methods of protecting our tea bushes against the attacks of disease. I have not attempted to discuss the nature and treatment of fungus and insect pests. The former are treated of by Mr. Willis, in the Circular already referred to; and the latter are fully described in the little work by my friend Mr. E. E. Green, entitled "Insect Pest of the Tea Plant," with which most planters are already familiar.

A LESSON IN TEA.

(From the *American Grocer*.)

This is not a made-up story, but a true narration of facts. Many readers may at once recognize the parties concerned—for my part I am under a promise not to mention names.

A certain firm purchased a large quantity of tea in the foreign markets two years ago. Almost immediately after the purchase the price of tea went down and the speculation turned out to be a failure. The firm was in a quandary, as it had over \$100,000 expended in the purchase, which would not then realise more than three-fourths of that amount. The dilemma was explained to a wise man, and he said he would think over the matter and report next day. When he came back in the morning he asked the firm if they would turn over one-fourth of the stock to him and he would guarantee to get full price for it. They

did so, and a large quantity of tea, which was then stored, was consigned to the wise man.

About three weeks afterwards a new brand of tea was widely advertised. It was in pound and half-pound packages, and had a pretty and distinctive name. It was advertised at 50 cents a pound, and in less than two weeks the supply was exhausted. The name of the tea and its peculiar quality was widely talked about.

Another lot was put on the market and the advertising kept up, and then a third and last lot was advertised, but in the meantime the firm had "smelt a rat" and had been let into the secret. They went out into the market and bought a whole lot more of the tea they had been "stuck" on, and in another month they had duplicated the order. Their failure turned out to be howling success, and all through the machinations of the wise men, who had conveyed the idea of giving this tea—which was of the most ordinary quality and cost but 25 cents a pound in bulk—a distinctive name and putting it on the market as a package tea, well advertised to the consumer. It cost 3 cents a pound to pack it in neat shape and about 4 cents a pound to advertise it, leaving a profit of 18 cents a pound on 400,000 pounds of tea—\$72,000 profit in about nine months!

The whole scheme, be it remembered, originated in a direct loss of 25 per cent. on the first purchase, and it was only the genius of the wise man who was called into council that turned the failure into a success by the simple process of giving the goods a distinctive name, putting them up in attractive form and advertising them liberally to the public. The same tea was being sold by grocers at the time for 30 cents a pound, in loose form, but the wise man rightly conjectured that in a better and more presentable shape it would sell at a better price, provided that it was properly advertised.

The same tea is being advertised and sold today, and that is why I cannot mention its name.

But there is a great advertising moral for consideration. To take any article that is a failure at its own price, make no change in the goods intrinsically, but merely in the outside appearance; advertise it judiciously and create a steady demand for it at twice the price in the short space of a few months, ought to be the best kind of an answer to the cranks who have the audacity to tell us, in these enlightened days, advertising does not pay."

—John C. Graham in *Printers' Ink*.

The above is very suggestive of the power of advertising to create demand; that a convenient package is a great factor in securing public favor; that cutting prices is not essentially a factor in winning trade; that it is easy to humbug some of the people at some time; that grocers are forced to sacrifice a liberal profit on bulk goods for small profit on proprietary brands of inferior quality.

We also note that this tea episode is denominated "a scheme" and that its author deliberately states that the tea sold at fifty cents per pound in packets, was the same tea that was sold in bulk at the same time, for thirty cents per pound.

The moral is plain that consumers are willing to pay more for goods put up in attractive shape than for the same articles in bulk at much lower price. This fact is clearly demonstrated by the preference given to crackers, put up in neat packages, over the same sort sold at less price in bulk; to the sale of cereals in packages at double the cost to the consumer that the same can be bought for in bulk. It is evident that package goods are most in favor with consumers, and that they are quick to pay an extra price for the more convenient service.

Is not the above narrative of "facts" also illustrative of how the consumer pays for advertising and makes it possible and profitable for plucky fellows to avoid a failure and make a "howling success?"

There is a sermon with many valuable lessons in Mr. Graham's story which grocers should take to heart,

WANARAJAH TEA CO., LD.

REPORT OF THE DIRECTORS.

ACREAGE.

Tea in bearing acres	956		
planted in 1895	72		
	1896		
	1898		20
			1,060 in Tea.
Timber Trees	20
Forest	27
Gross not available	27

Total 1,134 acres.

The Directors have the pleasure of presenting to the Shareholders the Report, Balance Sheet and Profit and Loss Account for the year ending 30th June, 1899.

The crop harvested amounted to 336,692 lb., against a Revised Estimate necessitated by abnormal weather of 321,000 lb., of which quantity 228,420 lb. have been sold in London to date at an average of 54.98 cents, and it is hoped that the balance of the crop will be equally well sold, but in the present condition of affairs in London with the dispute between the dealers and importers still in an acute stage, it is difficult to speak with any degree of certainty upon this point. The high quality and excellence of manufacture of Wanarajah teas have been fully maintained during the year, notwithstanding a severe drought in February-March and an enormously heavy flush of tea in April-May, which tested the capacity of the Factory to the uttermost.

MANURE.—The area completed amounts to 182 acres and the cost R5,631.01, but of this amount R2,219.32 for artificial manures for 55 acres has not been charged.

The amount at the credit of the Profit and Loss Account is R74,737.34, including a balance carried forward at the commencement of the year of R21,678.40.

After payment of the Interim Dividend at 4 per cent there remains a sum of R58,861.34 available, which the Directors recommend be applied as follows:—

To a final Dividend of 9 per cent making	
a total of 13 per cent per annum	R34,020.00
To be carried forward	.. R24,841.34
	<u>R58,861.34</u>

The estimated Crop for the season 1899-1900 is 370,000 lb. of made Tea, at an expenditure of R126,171 including expenditure on young clearings not yet in bearing.

The Visiting Agent's Reports can be seen by Shareholders at the Company's Office.

We regret to say that during the year our late Chairman, Mr. Thos. Mackie, died, and Mr. Dunbar was elected in his place. Mr. Dunbar is now in England and Mr. Wernham has been chosen to succeed him. Mr. Creasy became an additional Director during the year.

Messrs. Cantlay and Wernham retire from the Board by rotation, but are eligible for re-election.

The Shareholders are invited to elect an Auditor for the ensuing year, and Mr. Guthrie again offers his services.

THE PASSION FRUIT.—We direct special attention to a well-informed article on page 251, dealing with this growth. It is indeed curious that the passion creeper should be allowed to run wild, instead of being cultivated for the excellent flavour of its fruit. The taste of the latter is, however, an acquired one; and its votaries are not over numerous. Hence, we think, arises the inattention the passion fruit has received,

HAPUGAHALANDE TEA COMPANY.

ANNUAL REPORT.

Acreage:—

Tea in full bearing ..	235 acres	
New clearings ...	150 "	
Jungle &c. ..	369 "	1r 3p
Total estate ...	754a	1r 3p

Your Directors beg to submit their annual report and accounts for the twelve months ending 30th June, 1899, which they trust may be considered satisfactory.

The quantity of tea manufactured for the season (including estate and bought leaf, but exclusive of that manufactured for other estates) was 138'750lb.

Estimating the unsold tea at a safe valuation, and excluding a surplus of R290'91 on previous crop, the net amount realised for this product totals R47,960'02, being an average of 34'57 cents per lb.

After setting aside R2,641'28 for depreciation on buildings and machinery, the sum available for distribution (including R123'61 brought forward from last account) is R23,134'41. From this sum the directors recommend payment of a dividend of 12 per cent, absorbing R20,400 and leaving R2,734'41 to be carried forward.

In terms of the Articles of Association Mr. Keith Rollo retires from the office of director, but being eligible, offers himself for re-election.

The appointment of an auditor for the current season will rest with the meeting.

PRODUCE AND PLANTING.

THE OUTLOOK FOR CHINA TEAS.—Consular reports from the Celestial Empire are not encouraging as regards tea. A report from Kiukiang remarks: Tea shows (for 1898) an improvement as against previous year's statistics, but the total falls short of what it used to be in former years, and British merchants are not sanguine as to the future. Ningchows until of late years were the favourite Russian teas. Recently, however, Keemuns seem to compete with them for Russian favour especially in the finest grades, and this, combined with low exchange, has consequently driven prices up. This is probably caused by the Russian taste following the British, and preferring stronger liquor teas, and is leading them to take more and more British-grown tea each year. It looks as if Russian requirements would prevent any further falling-off in production. Export to the United Kingdom, however is steadily shrinking, and threatens to become nominal. The taste of the British public in the matter of tea has undergone a marked change of late years, says the Consul who is undoubtedly right, and consumers have no appreciation of light flavoury teas such as China produces. The introduction of machinery might revive the trade with England and the colonies, but this seems as far off as ever, the Chinese being quite satisfied with the prices paid for their tea prepared according to their own methods.

CHINA GREEN TEA.—After all that has been said against the colouring of green tea leaf, the Chinese growers and manufacturers do not find much encouragement in abandoning the use of colouring matter for the United States market. The British Consul-General at Shanghai, Mr. Brennan, tells us that during 1898 the green tea market was subject to unusual depression in consequence of a duty of 10 cents being imposed in the United States; stocks already in the States were exempted from this duty, and as large stocks of old tea were held, duty-paid teas had no chance till the existing supplies were exhausted. The Pingsuey teas were the purest and best that have been brought to market for thirty years, and yet they met with a poor reception in America. This is partly attributed to the absence of colouring matter, which caused the leaf to be unattractive to the eye. "Seeing that the tea is only wanted for making an infusion, and not for putting on the table

in the shape of leaf, it is strange that consumers do not prefer to have the pure uncoloured leaf as it is used by the Chinese themselves. Colouring enables the tea-curers to hide defects which would otherwise be exposed." The crop was 80,000 half-chests, against 112,000 half-chests last season. In country teas (Tienkais Moynnes, and Fychows) transactions were not profitable. Most of these teas lost in America, and barely paid first cost in England. The crop is reckoned at 177,000 half-chests, against 192,000 half-chests in the previous season. In Hysons the competition to secure the choicest teas for the Central Asian markets, via Batoum, forced prices up to an unprecedentedly high point, 60 to 65 taels being paid for teas which usually fetch from 35 to 45 taels. The Central Asian markets promise to become important consumers of all kinds of green teas. Much dissatisfaction was caused by the arbitrary rejection on the part of the United States Customs inspectors of teas which were "perfectly pure and unadulterated, but which failed to come up to the requirements of the Government standard." The season opened on May 18, but business in black tea was restricted till the second week in July, when a fair business was done in second-crop Keemuns; and these have been the only varieties that have given satisfaction. In common teas business was very dragging throughout the year, although prices were 15 per cent over those of last year. In volume it was the smallest for the last twenty years, the settlements being 37,000 half-chests, against 68,000 half-chests the previous season.—*H. and C. Mail*, July 28.

CLUNES ESTATE CO. OF CEYLON, LTD.

ANNUAL REPORT.

CLUNES DIVISION.		ERRACHT DIVISION.	
Supt.—T S Luce, Esq.	Acres.	Supt.—C F S Shaw, Esq.	Acres.
Tea in bearing ..	340	Tea in bearing ..	365
New clearings ...	50	Tea planted 1896-7	50
Forest ..	174	"	1938 92
		Forest & Waste Land	246
Total ..	564	Total ..	753
		Grand total	1,317 acres.

The Directors now submit to the Shareholders the Accounts and Balance Sheet of the Company for the year ending 30th June, 1899.

The crops secured amounted to 395,486 lb tea, as against 395,535 lb last year, being 4,514 short of the estimate. The nett average sale price was 34'29 cents per lb, the cost laid down in Colombo being 20'29 cents per lb, both of which figures the Directors consider may be deemed satisfactory.

After providing for Depreciation of Buildings and Machinery, the result of the year's working shews a nett profit of R38,142'30 equal to 11½ per cent on the paid up Capital of the Company. To this must be added a balance of R4,413'87 brought forward from last year making the total at credit of Profit and Loss Account R42,556'17.

Out of the above profit the Directors recommend that R12,500 be transferred to an Extension Fund Account to provide for the capital already spent in opening clearings, and extending Factory accommodation, which has hitherto been financed by loans.

They further recommend that out of the balance then available a dividend be paid for the year of 8 per cent on the paid up capital which will absorb R26,560, leaving R3,496'17 to be carried forward to next year's account.

The estimate for the 1899-1900 season is 430,000 lb tea against an expenditure on Working Account of R92,311.

The estimated expenditure on capital account amounts to R5,596, mainly for upkeep of young clearings, to provide a new sifter for Clunes and improvements to the cart road to facilitate transport from this estate.

During the year Mr. S. L. Harris resigned as he was leaving the island and Mr. W. J. Smith was appointed to fill the vacancy on the Board.

In terms of the Articles of Association Mr. V. A. Julius now retires from the Board but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the Meeting.

COOLGARDIE EXHIBITION AWARDS.

TEA, COFFEE, COCOA, ETC.

Blended teas, pure Ceylon, Ch. and A. Bohringer, extra special 1st; Lethenty Tea Estates Ass., Ltd., special 1st; W. Paterson and Co., Fremontle, Diamond Jubilee brand 2nd. Blended Indian and Ceylon—Amgoorie, Fowler and Co., 1st and 2nd. Blendid China and Indian—Viking brand, G. Wood, Son and Co. Fremontle, 1st. Low Grown—Nahalma Estate and Eila Estate, 1st each. Green Teas—Hyson, Brunswick Estate, Ceylon, special. Highgrown Teas—Brookside Estate, Talawakelle Estate, Hornsey Estate, Dotala Estate, Ormidale Estate, Sutton Estate, Oliphant Estate, Diyagama Estate, Excelsior Estate, Concordia Estate, Holmwood Estate, 1st each; Carolina Estate, Minna Estate, Fairlawn Estate, Alnwick Estate, Brunswick Estate, Dambattenne Estate, 2nd each. Pure Ceylon Teas—Fancy teas, golden tip, Lipton's Dambattenne Estate, Ceylon special. Coffees.

Ground Coffees—Amgoorie, Fowler and Co., 1st and 2nd; G. Wood, Son, and Co., 3rd.

Essence of Coffee—Symington, 1st. Coffee, Raw, Arabian—Lipton's Dambattenne Estate, 1st.

THE COFFEE CROP IN COORG.

A forecast of the coffee crop in Coorg for 1899 has been received from the local Administration, and the figures are appended, together with those of the estimate of 1898, for comparison:—

	1898.	1899.
	Tons.	Tons.
Estimated yield (2 cwt. an acre for Europeans in 1898 and 1½ cwt. in 1899)	2,730	2,089
Estimated yield (½ cwt. an acre for natives in 1898 and ¼ cwt. in 1899)	1,470	683
Total	4,200	2,772

Estimated average yield per acre of ordinarily well cultivated coffee in full bearing 3 cwt. 2 cwt.
 Export of coffee taken from the toll gate returns 2,462 tons 4,134 tons
 Average annual export of coffee in the ten preceding years 3,189 tons 3,326 tons

Taking the average annual crop at about 5,200 tons, the forecast of 2,772 tons for the coming season represents 53·3 per cent, against 79·2 per cent in 1898.

THE PASSION FRUIT.

ITS VALUE FOR LOCAL USE AND FOR EXPORTATION.

The lowcountry of Ceylon generally fares better in the matter of fruits than upcountry estates do, the former claiming such delicious fruits as mangosteens, mangoes, durians, and pineapples, all of which are now more or less in season. While fruits of temperate countries, such as apples, pears, peaches, &c., have refused to thrive to any extent at elevations of 4,000 feet to 6,000 feet, the Passion-fruit not only thrives exceedingly well there, but has become practically naturalised, being apparently as much at home as in its native country, Brazil. No other exotic fruit—and the Upcountry native fruits need hardly be taken into account—thrives here with such luxuriance as this, and probably also no other fruit would better repay systematic cultivation on upcountry estates. Indeed, it is but little cultivation that is required, judging by the way the Passion-fruit, having escaped from gardens and estates, grows wild in ravines and by the sides of streams at fairly high elevations—creeping among tall-growing grasses or climbing over shrubby trees, with its dark-purple tempting egg-shaped fruits bringing moisture to the teeth of those passers-by who know its delicacy.

The plant, however, is hardly, if at all, productive at elevations under 3,000 feet, but it is surprising that its fruit is not seen in larger quantities in the lowcountry markets. It only requires to be appreciated, and few who taste it but will not pronounce it delicious. Besides being an excellent fruit for local consumption, being palatable and most refreshing in itself and makes a delicious Jam, it is also of commercial importance. In Australia it is cultivated, and fairly successful trial shipments of it have recently been made from there to London, with a view of establishing a new industry. Notwithstanding the wrinkled appearance of the fruit on arrival in London owing doubtless to the long voyage, some were sold for as high as one shilling per dozen. An impetus is thus given, it appears, to its cultivation in Australia, and further shipments thence are promised, it being hoped that the heavenly-fruit (as the Passion-fruit there is sometimes called) may become as important an article in the export fruit trade as the Australian oranges now are. Our Australian cousins are thus aware of the wisdom of not having all their eggs in one basket, though as a matter of fact they produce already in their various latitudes almost every product it is possible to mention, from gooseberries and strawberries to grapes and coconuts; also cacao, coffee, &c.

At the higher elevations in Ceylon the conditions of climate and soil are obviously most congenial to the Passion-fruit, so that here its cultivation

should be easier and its crops less precarious than would be the case in countries where less favourable conditions obtain. Ceylon is only about half the distance from London than Australia is, so that the fruit from here could be landed in London, by means of steamer cold storage, in a comparatively fresh condition. Labour here is also relatively cheap. There would thus appear to be favourable prospects of the Passion-fruit becoming an important article of export in the island. Upcountry planters have frequently remarked on the enviable and neglected advantages of the lowcountry for producing the choicest fruits, both for export and for local consumption, but now that they have the monopoly themselves of so fine a fruit as the Passion-fruit, it is to be hoped they will not long show the same vein of apathy as their lowcountry brethren.

Those who are not acquainted with this plant may be interested to know that it is a climber, belonging to the same genus as the Granadilla, which has a much larger but inferior fruit and thrives only in the lowcountry. The former has also very ornamental foliage, and makes a handsome and quick-growing screen over fences, palings, &c.

The fruit, when obtainable, is often recommended as a special delicacy to invalids and convalescents, and is said to be also used in medicine. A most palatable way of taking it as a dessert is, to empty out a few of the fruits into a tumbler, adding a pinch of carbonate of soda, also some sugar or sherry, according to taste (although some prefer eating the contents as they are from the shell); then stir it up briskly. It may also be made into a delicious jam, in this case the shell and all being used.

The name *Passion-fruit* is a derivation of "Passion-flower" (the flower of the same plant), which is so named on account of the supposed resemblance of its component parts to the Crucifixion, the various parts representing the "crown of thorns," the ten Apostles and Peter and Judas, the "scourge," &c. The fruit was formerly called Sweet-cup, which is a more appropriate and a better name.

UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA.

BANGALORE, August 14th.—A conference of the United Planters' Association of Southern India assembled here to-day in the Cubbon Rooms, the delegates present being:—Central Travancore, Mr G Acworth; Coorg, Messrs W H Sprott, A Lambert Murray, Aynsley; Kanan Deven, H Knight; Nelliampathies, Mr J Ahott; Nilgiris, Messrs Hodgson and Edmiston; North Mysore, Messrs Scott, Skirving, and Parsons; South Mysore, Messrs Grahame-Anderson, Horne, Crawford, Park, and Pleyfair; Shevaroyes, Messrs Lechler, Messrs Gompertz; Wynaad, Mr Kockin.

Committee work occupied from 10 o'clock till 1. At 2 the Agenda was taken up, the Secretary's annual report and Statement of accounts being duly passed.

THE CHAIRMAN'S ADDRESS.

THE CHAIRMAN (Mr. George Romilly) delivered his address. He said:—The Secretary has told you in his Report, clearly and concisely, about all the work that the Association has carried out during the past year, but naturally does not touch on those subjects in which, although they affect our interests, we have not been actively engaged. I will in consequence confine my opening remarks to these matters and in the forefront stands out the great question of exchange.

THE CURRENCY QUESTION.

A strong and impartial Committee has given its verdict in favour of an attempt at a gold currency

and a 1s. 4d. rupee, and this notwithstanding that our plea for re-opened Mints was backed up not only by all other *bona fide* producers, but also by the leading exporting and importing merchants, and a vast amount of evidence was given in favour of this view. It seems to have been a fight between conflicting interests, the trade and people of the country on one side and the Government and their supporters on the other. The evidence of the experts was pretty equally divided. Unfortunately for us, Government has won, and we must accept the verdict. I don't want to dispute it, but I want to call attention to one or two points that seem to me worthy of study. The whole trend of the evidence, from Lord Northbrook on the Government side to the most ardent of our own supporters, seemed to be that the prosperity of the country depended on its exports, and that nothing must be done in the way of export duty to check exports. This seems to be a generally received axiom and the logical conclusion would be that some recommendations would be made, whereby exports might be stimulated. But instead, they are left to do the best they can for themselves under a crushing, but indirect tax. Another argument, which seems to me anomalous, is that export must be encouraged but only moderately, for if there is an excess of encouragement, overproduction ensues. Now I will give you an illustration of these two theories in one of our own trades. Our coffee has been competing with the produce of a country where production has been stimulated by abnormally low exchange and where, in consequence, over-production has ensued—I speak of course of Brazil. Now, who in this case are the real sufferers? Profits in this country among coffee planters have, in recent years with high exchange ruling, been small and now, except in especial cases, are non-existent—in fact many of us will have to face a loss in the coming year. Things will right themselves, no doubt, but in the interval the unfortunate Indian planter has but little saved wherewith to tide over the bad days. Against this take the case of the Brazilian. Even supposing that he can no longer harvest and ship at a profit, let alone his cultivation expenses, he has been steadily making four years past abnormal profits owing to a falling exchange, and if he has been a sensible man and foreseen the undoubted fall in prices that must follow on over production, he has saved his profit and now has capital to turn into other channels. If this logic is right, poor India, you will admit, is the greater sufferer. I don't for one instant deny that unnatural profits, owing to a falling exchange or indeed owing to any other cause, will bring capital rushing into the enterprise and lead to eventual over-production, but in the meantime the producer is laying up for himself the wherewithal to face the cat's-ropes, and profits and capital in the country are accumulating. Another argument that has been brought up before the Committee is that a fixed exchange will attract capital, and I suppose from their recommendations that they have accepted this as correct. It may be so, but I cannot myself understand why the mere fact of being able to withdraw your capital at a fixed exchange should attract it for long investment when profits have been reduced to a minimum. I have always regretted that native public opinion was not more forcibly expressed over this currency question in India, as it was in Ceylon.

THE FIGHT IN THE TEA TRADE.

First as regards the fight in the Tea trade that has recently been going on. We were not consulted by the Indian Tea Association, as of course our interests in the Tea trade are too small to influence the position, so I do not know how negotiations were carried on before the deadlock, but judging from what one can read in the papers it does not seem to me to have been good generalship. Of course our sympathies must be with the Indian Tea Association in their demand, as doubtless the distributors and grocers can very much better afford to lose the 1 lb. draft than the unfortunate producers can; but yet, if that was all that was

in dispute, it seems to me a pity that the compromise now effected was not arrived at by a little more negotiation, instead of plunging into so bitter a contest with our best customers.

COFFEE PRICES.

The fall in coffee prices during the past year has been, I think, quite unprecedented, and I fear that many a one among us, who at this time last year counted on a good profit, has heavily paid his expenses. The extraordinary variation in prices, too, is something new to us and shows, I think how little can be done on the lines suggested by Mr. G. Anderson in his speech last year on the classification of coffees. The fact is that when a market is glutted with a produce, the buyers get fanciful, and fashion rules the price. In former years, and even until quite recently, the demand was for peaberry and coloury coffees, but this year it seems to have been entirely for size, and coffees of the same mark have varied quite £40 a ton between the prices paid for their A and C sizes. However, any one who has read "Planter's" cogently reasoned letters to the *Madras Mail* will agree with him that the crisis has been reached and that we shall very shortly begin to recover.

CINCHONA.

The same improvement in prospects may also be predicted, I think, for the small band of cinchona planters. As you are doubtless aware, Mr. Hodgson, to whom our thanks are due, was instrumental in getting the Madras Government to send their director of cinchona gardens, Mr. Standen, to Java to report on the cinchona trade of the island. Mr. Standen has now come back full of valuable information which you will doubtless find in his Report. It seems to me that the ball is now at the foot of the Java planters. If, only they will combine now and restrict their output instead of rushing it forward, as they have been doing during the last 12 months, they can rule the price in the European markets. An eventual rise is a certainty and the longer it is deferred by these abnormal harvest, the greater must be the re-action.

ELECTION OF OFFICE-BEARERS.

The meeting then proceeded to elect office-bearers for the ensuing year.

Mr. Sprout was unanimously elected Chairman.

BANGALORE, 15th Aug.—The delegates met to-day at 11 A.M. when Dr. Lehmann, Agricultural, Chemist to the Mysore Government, and Mr. J. Camron, the Mysore Government Botanist, were present by invitation. The sitting was accordingly devoted to discussing agricultural questions. Proceedings commenced by a number of subjects being added to the Agenda paper, after which the Chairman welcomed Dr. Lehmann:—

FERTILISERS.

The CHAIRMAN asked Dr. Lehmann to address the meeting in connection with his experiences in regard to coffee.

Dr. LEHMANN said that he had no experience in regard to coffee except the little he had acquired during his tours. If the meeting, however, wished him to say anything, he would prefer to speak on the subject of fertilisers.

The meeting having notified its willingness to hear what Dr. Lehmann had to say on this most important subject, he said:—I have first of all to thank you most cordially and sincerely for your kind invitation asking me to be present at this meeting to-day. I am but a novice among you, as I have had but little experience in coffee, but I shall try to study the subject as much as I possibly can. I do not want to lay any remarks before you that are not based on experience or experiment, and I do not want to give any assurance or opinion that is not based on knowledge. I hope therefore you will excuse me if I do not touch upon coffee questions, such as leaf disease, black rot, &c. because although I have seen something of them, I have formed vague ideas as to how we are to set about discovering a remedy, and I have as yet been unable to try them, and before

I have tried them, I should not like to say anything on the subject. I have not been long enough in the country to establish a library or a laboratory, and without these a chemist is almost as much at sea as a captain of an ocean vessel is without his compass and chart. You will understand how diffident I am in addressing you just now on the subject. The climate of Germany is totally different from that of this place and the crops too are very different, and I require time to study the subject carefully before pronouncing an opinion. A subject, however, that will interest you very much is that of soil analysis. It has almost been looked upon as a panacea for all ills that crops are heir to unfortunately I cannot quite agree with that. Soil analysis is very valuable, indeed it is absolutely necessary for making experiments, but it won't tell you everything. Soil analysis is not advanced enough for us to tell you what constituents of the soil are really directly available by the plant. Chemists are striving to attain that end, but they have not attained it yet. There are a large number of experiments being tried, and each chemist may think that he has overcome the methods that can be employed but unfortunately all other chemists think the same. The great difficulty in studying the soil at all depends on the mechanical conditions taking place in it as well as its chemical constituents. Mechanical conditions have a great deal to do with it, but some of the matter is such that we can't easily ascertain its physical attributes—as for instance the distribution of the plant and the fineness of the soil. The fineness with which the plant food is distributed is an essential factor as I shall point out when I am talking of fertilisers. Then another matter which affects the growth of a plant is the nature of the plant itself. All plants have not the same ability to absorb plant food. Some plants may be peculiarly adapted to particular forms of plant food. The Leguminosæ always appear to be absorbing potash, although they contain a large amount of nitrogen; still virtually what they require is more potash than nitrogen. In the same way with the Graminae; they contain but little nitrogen, and yet they are peculiarly benefited by a nitrogen fertiliser. What is the particular fertiliser that is beneficial to coffee. What particular plant food coffee has a tendency to absorb from the soil is a question that will have to be solved and presents very considerable difficulty. Again, climate affects the productiveness of the soil to a large extent. The climate here is different to that of countries in which agricultural chemistry has made the most rapid advances and in which it has been reduced more to a science than it has elsewhere, so we can't apply what has been discovered there directly to our conditions here. So we are placed in peculiarly trying circumstances. We are beginning afresh to find out what can be used. What has been used is a guide, but it is not an infallible guide, and we must go carefully and cautiously. In regard to fertilisers there is some peculiar idea—some want of accuracy if I may say so—in regard to the relative values of soluble and insoluble fertilisers. As regards the value of superphosphates and fine ground bones, I may say that the chief value of superphosphates over ground bones is that superphosphates is soluble and percolates through the soil with the rain and soil water. The advantage of a soluble fertiliser is not that the plant can absorb it in a soluble form but that in that form it spreads and mixes more intimately with the soil and the plants roots can get at it better. I might illustrate this by an example. If we take a piece of sugar candy and put it in water it dissolves very much more slowly. If however, we grind the sugar candy to a powder and put into water, it will dissolve very much more quickly. The same arguments hold good with regard to soluble manures, the rain and soil water dissolve them more rapidly and mix them more intimately with the soil. I wish to bring this point before you in a practical way in regard to the fertilising of your fields. I have seen in my tours in some instances, say, basic slag used. A little brow-pit is made near the coffee and

the fertilisers dumped in an covered up. Now for all practical purposes that is like what the natives of this country do with their gold, they bury it instead of putting it into a Bank. The plant may make use of that fertiliser but only in a long course of time. But if, on the other hand it is spread finely over the surface broadcast and then dug into the earth, the plant would be in a better position to get at it than if it was covered and hoarded up. Of course there is no rule without an exception. There may be steep lands on which you are using a comparatively easily soluble manure where it might be necessary to make a browpit and bury the fertiliser, but whenever it can be done, by all means always broadcast your fertiliser; then when you dig it in the plants get at it more easily than when it is heaped together in a pit. A matter which also is of great interest to you is the use of saltpetre. Saltpetre is a fertiliser which is beneficial no doubt, and you are fortunately located in being able to get it comparatively cheaply; but great care should be taken in its application. You should not apply it just before heavy rain or in the rainy season. Saltpetre, as you know, contains two of the three most important constituents of plant food, nitrogen and potash. Nitrogen in the form of nitrate washes into the soil readily, and if there is vigorous vegetation going on these nitrate will be absorbed by the plant and it is this nitrate which gives the flush of wood with the large deep green leaf. I am aware that my remarks are rather rambling, but before sitting down I would like to refer to the action of lime. Lime in the soil has a two-fold action. It serves the purpose first of a plant food, and secondly it aids in decomposition, not exactly in a chemical way but by combination with certain bacteria in the soil. Lime in the soil is almost absolutely necessary, as it helps very much in the process of nitrification—the nitrification of the comparatively inert nitrogen in organic matter in the humus into nitric acid which is absorbed by the plant. If heavy rain comes, it has a tendency to wash the lime out of the soil; but it always remains in the soil provided you have a sufficient amount of moisture and a sufficient amount of heat, of which there can be no doubt in this country. (Cheers).

The Chairman said:—It only remains for me to thank Dr. Lehmann very much for the most interesting little lecture he has given us. I am sure it has given us a great deal of information and is the precursor of a great many more. The Mysore Province is bound to benefit very much by his residence in it.

Mr. SCOT SKIRVING proposed and Mr. Hodgson seconded "That the U. P. A. S. I. send a cordial vote of thanks to the Mysore Government for appointing an Agricultural Chemist of such ability as Dr. Lehmann and thereby rendering a great service to the planting community of South India."

The Resolution was carried with acclamation.

Dr. LEHMANN then made some further remarks on the proper method of conducting experiments with fertilisers and answered several questions put him by the Chairman and delegates.

LEAF DISEASE, ETC.

Mr. J. Cameron, the Mysore Government Botanist made the following remark:—This is the third, occasion on which I have been honoured in being invited as a visitor to this meeting. Needless to say, I am proud of the honour for which I thank you very much. I have embodied my view on coffee planting so recently in the form of a Report that there is a very little more to be said to-day. There are one or two things, however, which I omitted to put fully before you in the Report and for which I have been called to book more or less severely. One of these is that I took no notice whatever of the ripening and colouring of the berry, and also the colouring of the bean, which I understand is an important matter. I have repeatedly, during the last season's harvesting, seen that a great deal of green coffee has found its way into the market or which low prices were paid. Now, what was the reason for this green coffee being so abundant? It might be one of various reasons. It might be due to being planted on high levels and a very wet

season late in the year; it might be overcrowding or overshadowing and one or two other causes. Now, gentlemen there are things I would like you to take up practically. See if you cannot ripen your coffee more fully by given it a lighter shade. Of course you can't alter the rainfall or the season but by giving a lighter shade in the colder parts of country where the coffee is not likely to ripen well, you will be helping yourselves. In the same way you can help by draining the ground properly. Probably it is due to a want of drainage that you have some bushes which do not fully ripen. This question has to do not only with the ripening of the bean itself but also with ripening of the wood. There is a time of the year when you like to have your bushes more fully exposed than at any other time, and the wood at that time may be partially ripened or it may be fully ripened. It is important that it should be fully ripened if you wish to have not only a full crop but also ripened fruit which produces good prices in the market—fruit with a high colour and well formed. I will now mention another thing which I don't think I touched on sufficiently in the Report, namely, what practical steps should be taken in the matter of leaf disease. In travelling through Coorg last November, I found the bushes were healthy looking and that they had an abundance of young healthy leaves and also an abundance of old leaves underneath piled one over the other and in some parts these were diseased and in others were showing signs of disease. Now I believe the old and partially decayed leaves which formed underneath in layers were carefully removed and burnt and the ground swept and the debris burnt, you would do much to suppress the disease. To enable you to do this thoroughly in a District like Coorg, you should have burning grounds, open spaces here and there in the marshes, where the leaves could be collected and burnt. If this could not be done, the next best thing to do is to collect the leaves in convenient sized pits and cover the whole thing over with caustic lime. If this was done it would prevent the spores of the disease being carried over the whole of your estate of your neighbour's. I don't think it would hurt the shrub to remove half the leaves, as it produces at the time new leaves very quickly. I don't think I have any more to say to-day, but before sitting down I would thank Mr. Graham Anderson for the kind way in which he has spoken about my report. I may tell you that I spent an enjoyable and instructive time in Coorg and should you wish me to visit any other District hereafter, I shall be glad to do so with the permission of my Government (Cheers).

Mr. SPOTT moved a hearty vote of thanks to Mr. Cameron for his interesting and instructive Report on his tour in Coorg and also for the instructive remarks he had just made.

The vote was carried with acclamation.

Mr. Cameron then gave a short account of some successful cross fertilisation experiments he had succeeded in making; and dwelt upon the importance of hybridisation, quoting from the remarks of the President at a Horticultural Conference which was recently in England.

COPRA IN TONGA ISLANDS.—News from this islands dated July 4th says:—Copra is steadily coming in, and the statistics of this year—if the Government sees fit in its wisdom to compile any—will show a more satisfactory state of affairs than those of the last few years. The price is somewhat easier, the current quotation being about £10 at steamer's side; in Vavau it runs somewhat higher. Heavy and continuous rain has interfered much with the northern island, but the crop is excellent. Very favourable reports, too, come from the Niua. Some 400 tons go to Messrs. Lever Brothers by steamer from the Tongan group. Shippers are still complaining of the unsatisfactory returns from fruit consignments, but they go on shipping.

PLANTING IN PERAK.

(From the Perak Administration Report for 1898.)

LIBERIAN COFFEE.—Continued and continuing low prices make this cultivation at present unprofitable. The natives are practically abandoning their small gardens, but European and Chinese planters are exhibiting the pluck of the old Ceylon planters and are planting up with Para and other rubbers, coconuts and other products, and waiting for better times for coffee. Probably greater care and more experience in curing and packing Native States coffee will eventually secure a better price for in the home markets.

PARA RUBBER.—This product is being cultivated to a large extent. From the Government gardens 32,000 seeds and 59,718 seedlings were sold, and the Forest Department has extensive nurseries. The rubber flourishes in Perak, and the samples from the Government gardens obtained good quotations in London. His Highness the Sultan has applied for a reserve of 15,000 acres for Gutta Rambong, and proposes to form a company amongst native gentlemen.

SUGAR has received a considerable impetus climate, labour supply and silver-currency favouring it. Inclusive of reserves, 11,000 acres of land for sugar cultivation, in the Lower Perak District, were granted on special to the Penang Sugar Estates Company, which Company has also acquired a portion of the Gula Company's sugar estate in the Matang District and is buying up padi land, for sugar culture, from native owners. This Company is said to meditate inaugurating the central factory system, which had proved successful in the West Indies. Chinese planters have also acquired extensive areas for this cultivation in Matang, and are also buying up padi land from the natives.

COCONUTS.—This product has continued to be in favour with planters, and the establishment of a large mill and factory in Singapore will encourage the industry. During the year 3,280 acres of land for coconuts were alienated to a British concessionaire in the Lower Perak District, and Chinese and natives are extending their plantations, especially in Matang. The coconut palm flourishes luxuriantly in Perak, and is currently reported to be more prolific than in Ceylon. There has for long been a controversy as to whether sugar-cane can be grown in the neighbourhood of coconut palms without a danger of breeding the beetles which are so inimical to the latter. The Curator has recently published an exhaustive treatise on the subject, which goes to shew the innocence of the cane.

PEPPER.—High prices have encouraged natives and Chinese to re-open and extend their plantations. In Matang particularly there has been activity among the Achinese pepper planters.

RAMIE.—A considerable concession of land was made to some foreign concessionaires in the Larut District, but operations have not yet commenced. It is hoped that ramie may soon rank in the list of products successfully cultivated in this State.

RICE.—The Padi harvest was, on the whole a fair one. Krian still takes the lead, but the high price of rice has caused considerable extension of padi cultivation in the Matang, Lower Perak and Kuala Kangsar Districts.

IRRIGATION.—The Krian Irrigation Scheme, under consideration for some years past, is now under way. Mr. R O N Anderson, formerly Personal Assistant to the State Engineer, and since

appointed Irrigation Engineer, revised and completed previous reports and estimates, and a final report having been received from the Hon. A Murray, Colonial Engineer, Straits Settlements, whose services were kindly lent by His Excellency the Acting Governor, a provisional estimate of \$656,000 has been sanctioned, and work has been commenced. The acreage commanded by the scheme is reckoned at 63,000 acres, and the estimate includes drainage and the supply of water for domestic purposes.

TEA IN THE PHILIPPINES.

Yet another rival for Ceylon is looming in the far future in the matter of tea cultivation. What place should this be, but those interesting islands, the Philippines, the resources of which have as yet been gauged only in a very small degree. The following cutting is one which appears prominently on the front page of the *Manila American*, of date August 9th:—

TEA CULTURE WILL BE TRIED.

A Chino named Yee Ah Hing, said to be a wealthy tea merchant of Formosa, intends to see if tea culture can not be profitably carried on in the Philippines. Conditions for the successful growth of tea plant are said to be fully as favorable here as in Ceylon. It is claimed that Yee Ah Hing is negotiating for a large tract of land on the island of Negros and will go into the business of raising tea there on a big scale.

But we learn, by the mail which brought the paper above-named, from a Manila gentleman formerly in Ceylon, that China teas will not make much headway if Ceylon seed is imported quickly. He says he has advised the Government not to allow the Chinamen to import China seed, owing to the inferiority of the tea grown in the Celestial Empire. He is himself importing good jat seed from Ceylon and will do his best to prevent the cultivation of inferior tea being inaugurated. If the Government at Manila are inclined to agree to this, Ceylon planters should have a good market for seed in that city, if indeed a few of the said planters do not go and start plantations at once, as soon as peace is assured over the bulk of the islands. Today Reuter's news is to the effect that General Otis has applied the Chinese exclusion law to the Philippines; and we presume that the Philippine Government will not be loth to act still further in the spirit of this regulation, and exclude the introduction of China tea for cultivation.

EILA TEA COMPANY OF CEYLON LIMITED.

REPORT.

The following is the directors' report:—

The Directors have to submit their Report and Accounts for the year ending 30th June, 1899.

The Crop on Eila Estate was 43,314 lb. and on Kanangama 4,160 lb. short of the estimates, but the unfavourable season may be considered to be the main cause of the deficiency. On Eila also the easy treatment of the bushes referred to in the last report has been continued.

The total amount of Tea manufactured was 357,852 lb. and the cost of production including the purchase of 101,299 lb. of green leaf was 23.06 cts per lb.

The average price of the Tea after estimating the value of that unsold was for the two Estates 33.11 cts. per lb. as against 28.58 cts. for last season. Every

effort will be made to improve the quality of the Tea and keep up the prices.

During the year £500 was repaid to the Standard Life Assurance Company on account of their loan of £7,000.

Your Directors regret that the R3,000 of Coast advances mentioned as doubtful in their last report have proved to be irrecoverable and this amount together with an irrecoverable debt of R488'38 on Kanangama Estate has been written off the Reserve Account.

The net profit for the past season, after writing off depreciation on Buildings and Machinery, is .. R22,175-63
To which must be added the balance carried forward from last season .. 5,481-86

Making in all .. R27,657-49

Out of this your Directors propose to pay a Dividend of 8% absorbing .. R24,000-00

To grant a bonus to the Superintendent of Eila of 750-00
And carry forward .. 2 907-49

R27,657-49

The Estimates for the current season provide for a crop of 391,000 lb. of Tea at a cost of R86,736-70.

The Estates of the Company on June 30th, 1899, consisted of—

Eila—564 acres Tea 5 years old.
62 " " 3 "
90 " " 2 "
240 " Forest.

956 acres.

Kanangama—215 acres Tea 5 yrs. old and upwards.
108 " Chena and patana.

323 acres.

During the year Mr. F. W. Bois was elected to the Board of Directors in the place of Mr. H. G. Bois who has left the Island.

Mr. Giles F. Walker retires in accordance with the Articles of Association, but being eligible offers himself for re-election.

The shareholders will have to appoint an Auditor for season 1899-1900.

NEW TEA COMPANY.

(Investors' Guardian, Aug. 12.)

GALKANDEWATTE TEA CO., LTD. (63,189).—Registered Aug. 2nd, with capital £21,000 in £1 shares to acquire lands and buildings in Ceylon or elsewhere, and in particular the Galkandewatte Estate, in the Dimbula District, to adopt an agreement with J. Tilly and J. D. Ellershaw, and to carry on the business of planters and growers of tea, coffee, cocoa and other crops. The subscribers are:—

	Shares.
J. Tilly, 48 Kimbolton Road, Bedford, tea planter	1
J. Ellershaw, 79 Queen Square, Lancaster, drapper	1
A. T. Johnson, Rayne, Essex, gentleman	1
Mrs. L. Tilly, 48 Kimbolton Road, Bedford	1
Mrs. J. Jowett, 5 Gosvenor Road, South Norwood	1
Mrs. A. Johnson, Rayne, Essex	1
Miss M. E. Tilly, 48 Kimbolton Road, Bedford	1

The number of directors is not to be less than 2 nor more than 5; the first are J. Tilly and J. Ellershaw, senior: qualification £500; remuneration £50 per annum dividend. Registered office, Howard Chambers, Mill Street, Bedford.

THE LONDON CUSTOMS' SYSTEM OF WEIGHING CEYLON TEAS.

UNDER THE NEW REGULATION EXPECTED TO COME INTO FORCE ON OCT. 1st, 1899.

(Instructions showing how to prevent a loss on Garden Weights.)

At the settlement of the recent dispute between Growers and Buyers, the Joint Committee of the Growers and Buyers' Associations arrived at the following decision with regard to the *Weighing of Tares*.

"If the empty package weighs an even pound it is to be entered as such; if it weighs an even half-pound or over it is to be entered as the next pound above, and if it weighs less than half a pound it is to be entered as the pound below; boxes are to be weighed and tared as heretofore."

In order to fully benefit by the above change from the system of weighing now in vogue by the London Customs' Authorities, the following hints will prove of value to Proprietors and Superintendents of Estates.

1. The Customs will in future give the turn of the scale on the *Gross against the Importer*, but on the *Tare either for or against the Importer* when it weighs under or over the half pound.

2. The *Tare* (that is the weight of the empty package, complete with lid, lead, hoop-iron and nails) should weigh *four ounces over the pound*, whether the package be chest or half-chest.

3. The *Gross Weight* of a package must in all cases weigh *four ounces over the pound*, whether the package be chest or half-chest.

4. Subjoined is an example of the *correct method* of weighing a package containing 100 lb. of Tea.

GARDEN WEIGHTS, CEYLON.		
Tare.	Tea Net.	Gross Weight.
27 lb. 4 oz.	100 lb.	127 lb. 4 oz.

CUSTOMS' WEIGHTS, LONDON.

Gross Weight.	Tare.	Net.
127 lb.	27 lb.	100 lb.

From the above it will be seen that a margin of 4 oz. remains for any slight variations in weight of package during transit, and that *no loss* need result from the Customs' Weighing under this system, whereas, now a minimum loss of 5 oz. per package is unavoidable.

5. Should the present system of weighing in Ceylon be continued after the new regulations has been put in force by the London Customs the following would be the result.

GARDEN WEIGHTS, CEYLON.

Tare.	Tea Net.
No. 1. 27 lb. 14 oz.	100 lb. 5 oz.
No. 2. 27 lb. 9 oz.	100 lb. 5 oz.

CUSTOMS' WEIGHTS, LONDON.

Gross Weight.	Gross Weight.	Tare.	Net.
123 lb. 3 oz.	123 lb.	28 lb.	100 lb.
127 lb. 14 oz.	127 lb.	28 lb.	99 lb.

No. 1. Shews a package, correctly packed under the old system, and shows a loss of 5 oz. but No. 2. incorrectly packed, would result in a loss to the grower of 1 lb. 5 oz.

6. It is most important that the weights of the Weighing Machine, used on the Estate, should be constantly checked and for this purpose a set of testweights should be kept—A beam scale is to be preferred to a platform one, as the former is the more accurate.

7. When a Superintendent, to equalise the tares of his package, adds pieces of lead or wood for that purpose, the material so added should be fixed inside the package, so as to prevent it falling out when the package is opened in London.

8. A Superintendent may "tare" and pack his teas with the greatest care, but if he afterwards permits his Carpenter to plane away from the top of the package before nailing down, all his careful work may be wasted.

The METROPOLITAN BONDED

WAREHOUSES, Limited,
Crutched Friars,
London, August 1899.

N.B.—These Instructions revoke those issued by us in June 1898.

THE RECENT TEA DISPUTE.

Comments, by some importers of Ceylon Teas, on proposed settlement of Tea Dispute, as given in the Joint Committee's Circular, No. 17, dated 2nd August, announcing an "agreement with the Buyers' Association" as a settlement of the question of the abolition of the 1lb. draft on Tea, to come into force 2nd October.

No. 1—1 lb. Draft to be allowed as heretofore—the first stipulation!

No. 2—Gross weights to be taken and recorded as at present.

That is, ounces above a number of pounds to be ignored; e.g., 77 lb. 14 oz. gross will still be recorded as 77 lb. only.

ALTERATION IN WEIGHT OF TARES AS FOLLOWS:—

Clause a—If the empty package weighs the even pound it is to be entered as such.

Clause b—If it weighs the even half-pound or over, it is to be entered as the next pound above.

Clause c—If it weighs below the half-pound, it is to be entered as the pound below.

This will be a gain to some growers to the extent of, perhaps, $\frac{1}{2}$ lb., as hitherto 1 oz. extra has counted as an additional pound in tare weights.

Clause d.—No "overtakers." No explanation of this Clause.

Clause e.—Boxes to be weighed and tared as heretofore to the pound weight.

Clause f.—Increase of number of Tarers for Factory Bulked Teas as agreed upon.

Any increase of number of tarers (at present it is 1 in 10, or 10%) means increased cost of turning out additional packages and increased risk of the tares taken varying more than the Customs' limit of 2 lb., necessitating the whole break being tared separately.

The Joint Committee might have said who called for the change, and in whose interests. It seems only in the interests of the warehouses.

Clause g.—If parcels are bulked in London separate Tare must be taken of each package.

At present "average Tares" taken are allowed to stand, even though the teas be afterwards bulked.

The change will put an end to the advantage gained by having average tares taken of London bulked Teas, and will increase the charges considerably.

Teas which are not Estate bulked or are insufficiently bulked on the Estate and require bulking here, will in future, under the new regulations, incur an extra charge of 5d for chests and 4d for half-chests, for cost of separate taring, thus increasing warehouse charges 10 per cent., and costing the Garden extra about $\frac{1}{2}$ per cent. on value of Tea.

No reason or explanation is given for this new heavy charge, or any hint why the change is made. It seems made in mere wantonness or in crass ignorance of the trade. The Tea buyers will not gain; the Tea producer certainly loses; but it will put money into the pockets of the warehouse-keepers. It is, at all events, difficult to see why

"the Joint Committee," supposed to be acting in the interests of Tea producers, should now insist on a separate tare being taken of each package (e.g., in a case of a Tea shipment in Venesta or other packages running even and weighing exactly the same), except to increase warehouse charges. The Estate proprietor, to avoid the increased charge, will have to bulk on his Estate, whether he considers that desirable or undesirable, and in many cases will have to increase his factory accommodation at some cost. It will fall heaviest on those who can least afford it; and after the outlay has been incurred to enable factory bulking to be carried out. Tea buyers who have paid too much may dispute the factory bulking; and the cost of bulking and taring will still fall on the Tea producer.

THE QUESTIONS ARISE—who is this Joint Committee, and who appointed it to deal with the alteration in weight of Tares?—and as there is a Tea and Produce Committee of the Ceylon Association, why was not that called together to discuss a matter so affecting it, and, further, is this agreement binding in any way or degree on Importers of Ceylon Teas?

If the Ceylon portion of the Joint Committee are now in some way authorised to bind Importers of Ceylon Produce, without consultation or asking their assent, cannot the Ceylon Association be at once called together to withdraw the authority before the Committee perpetrate further mischief on the Ceylon Trade?

10th August.

ST. HELIER'S TEA COMPANY, LD.

REPORT OF THE DIRECTORS.

ACREAGE.

250 acres	in bearing
29 do	planted in 1896.
34 do	do do 1898.
<hr/>	
313 acres	
114 do	Jungle, &c.

Total 427 acres.

The Directors have now the pleasure to submit their Seventh Annual Report to the 30th June last, which they trust will be considered fairly satisfactory by the Shareholders' shewing as it does a nett profit of about 10 per cent on the year's working.

The crop which was estimated at 95,000 lb. of made tea to 30th June, has turned out only 89,973 lb. and has realised an average price of 38'69 cents per lb., against 36'21 last year.

The cost of the tea in Colombo, exclusive of the sum of Rs. 2,438'74 expended on Capital Account, works out at 25'56 cents per lb. as against 25'24 cents per lb. last season.

The balance at credit of Profit and Loss Account, after writing off the sum of Rs. 1,618'42 for depreciation of buildings and machinery, but including the sum of Rs. 1,203'11 brought forward from last year, amounts to Rs. 5,205'42; and out of this sum the directors recommend that a dividend of 9 per cent be declared, absorbing Rs. 4,500'00, leaving the sum of Rs. 725'42 to be carried forward to next year.

Mr. Percy Bois retires from the board by rotation, but being eligible offers himself for re-election.

The Shareholders will have to elect an Auditor for season 1899-1900.

NYASSALAND COFFEE CO., LTD.

The report was as follows:--

ACREAGE:			
10	acres	Coffee planted	Dec. 1895.
240	do	do	1896—Feb. 1897.
383	do	do	1897—Feb. 1898.

633 acres under cultivation.
2,843 acres reserve.

Total...3,476 acres.

SUPERINTENDENCE.—Mr. Moggridge tendered his resignation as Superintendent, under his agreement, which the Directors have now agreed to accept, being satisfied with the arrangements that gentleman has made for the working of the estate during Mr. Robin's absence on furlough.

The thanks of the Shareholders are due to Mr. Moggridge for the work he has done, although the Directors are of opinion that he did not attach sufficient importance to the advisability of opening with large enough plants.

Mr. George Napier Barclay whom Mr. Moggridge appointed to act until Mr. Robin's return is reported as being a coffee planter of many years' experience in the Wynaad; and judging from his letters and that of the Visiting Agent, Mr. Henry Brown, to the Company, the Directors are of opinion that the estate is in capable hands.

PROGRESS OF WORK.—During the financial year under review no more land has been opened, the energies of the Superintendents having been devoted to supplying.

This work has been completed, although it is a matter for regret that the plants which had to be put out were of small size.

However, Mr. Barclay in his last letter dated 7th June, 1899, states: "The young clearings are looking remarkably well and have made wonderful progress the past month. I think that all plants alive now may be calculated to survive the hot weather, if we have any, there being no indication so far of the present weather changing."

During the season a small crop of 341 bushels cherry was picked and sold in the cherry at 6s 6d per bushel to a local trader. Of this Mr. Barclay remarks:—

"The coffee I am pleased to say is of exceptionally good quality, and the trader referred to speaks very highly of it. There is no light berry to speak of, and the bean is a fine large compact one, as good as I have seen anywhere.

"The soil on this place being excellent there is no reason why this should not be the case with succeeding crops

"Personally I think you have picked out an ideal place for a coffee estate, though a slightly heavier rainfall would be an advantage."

"With regard to next year's return there will be pickings over an area of about 200 acres calculated as fully planted up, and you ought to get at least 30 tons from it."

FINANCIAL POSITION.—From the Balance Sheet it will be apparent that the capital of the Company is exhausted.

In the meantime and pending further particulars from Nyassaland as to the probable expenditure and crop for the two following years, the directors have arranged with Messrs. Carson & Co., that the latter should lend £500 sterling to carry on with, until it is seen what further additional capital is required and can be raised, or whether a loan for the requisite amount can be arranged in London.

FINANCIAL YEAR.—It is proposed to alter this to 31st December instead of as at present. By the end of 1900 the Directors hope to be in a position to state whether the success of the Company is assured or not.

Mr. G. Kent Deaker retires by rotation, but is eligible for re-election.

The appointment of an Auditor for the ensuing year rests with the Meeting.

NOTES FROM NORTH BORNEO.

(By a Ceylon Correspondent.)

When I last wrote you, I was on my way to the interior, using the 20 miles of railway now open to Beaufort. This line leaves Brunei Bay at Weston—named after Mr. A J West, the Engineer in charge—a town in name only at present—situated on the Bukow River. It consists of a small number of (15) native huts and a telephone office. It is not proposed, to sell any shop lots until the ground has been raised a little. At the back of

THE FUTURE TOWNSHIP,

there is a large gravel hill, excellent ballast, and this is now being used to form a mole cut into the Bukow River, which at this point more resembles an inner bay. When the mole has sufficiently advanced, say 80 yards, a pier will be run out into deep water. From Weston to Bukow, the line runs for eight for miles through level ground, well-cultivated paddy fields and fruit trees abounding. This land is very well suited for coconuts. Bukow is the present headquarters of the railway officials, but its cluster of shops will probably have to be removed to Weston or up the line when the railway works are more advanced. Beaufort at the 20th mile, is situated on the great Padas River, which will require a bridge of some length, about 500 feet.

THE RAILWAY WORKS

are progressing up the Padas Valley, but, as the rails are only laid for a mile or so, I continue my journey by boat, taking one and-a-half day to reach the foot of the Penotal Gorge. At Rayoh I met Mr. W Tower, the Railway Engineer, who is drawing up a report for an extension of our railway, and together we walked up the Gorge, taking two days inspecting the more difficult places and camping half way. At the top of the Gorge, we stayed with the District Officer, Mr. Charles Keasberry, in his comfortable new bungalow which overlooks the plains, or patanas as they are called in Ceylon. These plains contain numerous small villages, irrigated paddy fields, the water for which is sometimes brought along the contour of the land for miles, and clumps of coconut and other fruit trees. The plains are narrow—under ten miles broad—but they extend fully thirty miles and over. Tradition says a great lake existed here until the Genii of the lake lost his daughter who fell over the brim. This caused the Genii of the lake to break the brim so that he might join his daughter, which he could only do by allowing the water to convey him. This

ACCOUNTS FOR THE GAP IN THE HILLS, through which the Padas flows in one continual roar, 13 miles down to Rayoh. The fall is about 400 feet, there are no actual waterfalls, and navigation is impossible. There is a story that 30 Dyaks descended the Gorge—that only eight lived, and their boats and all their gutta were lost.

The bridle-path through Gorge is a great boon to the natives, who formerly had to walk over Rayoh Hill 3,400 feet in elevation. Rayoh is only 150 feet and the path was so bad that no cattle could use it. Mr. Tower walked up and down the bridle path with me and he said it was quite as good a bridle path as the hill paths of Ceylon. We could not ride it; first, because we had no ponies, and second (if another reason is wanted) a small landslip and a fallen tree barred the way, but these little difficulties could be obviated by the telegraph coolies. There are tele-

phones at all the places I mentioned and we found the telegraph line and

TELEPHONES VERY USEFUL

in communicating with Labuan; but communication with Sandakan, on the other side of the territory, has not yet been established, chiefly owing to want of battery power. This will probably soon be in order.

On our return to Beaufort, Mr. Tower proceeded to Labuan and England, taking with him the plans and sections of 90 miles of railway. I stayed at Beaufort and met

MR. H. W. BAILLY, OF YOUR ISLAND,

who had come to inspect land supposed to be suitable for gutta and rubber, and I understand that he has reported favourably on a large block of 20,000 acres on the railway line and 10,000 acres to the north of Sandakan.

THE EASTERN EXTENSION TELEGRAPH CO.

who have a principal station on Labuan Island are interested in the above lands, 20,000 acres of which were given them by the Chartered Company in return for their establishing themselves at Labuan and laying a cable to the mainland, and I hope to see the planting of rubber and gutta taken vigorously in hand. Of the suitability of British North Borneo for their cultivation, there is no doubt as gutta and rubber are exported from every port varying in value from \$30 to \$380 a picul, say 5½d to 5s 9d per lb. In one district, the natives cultivate a rubber creeper and tap it periodically, selling the rubber per \$80 a picul.

I made enquiries from Mr. Keasberry

ABOUT LABOUR.

He is opening an experimental garden at Tenom, about 800 feet above the sea, and can get plenty of labour, men and women, and frequently has to refuse small gangs of natives from the far interior who wish to earn wages. Mr. Keasberry is of opinion that a large number of coolies, say three or four thousand, can be got from the Upper Padas. This is corroborated by the headmen with whom I spoke. The climate at Tenom is delightful, and although only 800 feet in elevation; it is as cold at night as at 2,000 feet in Ceylon and a warm night is unknown. The rainfall is probably 70 to 80 inches, but so well divided throughout the year that the paddy fields are planted

WHENEVER THE NATIVES WANT FOOD.

This applies to the dry paddy grown on the hills as well as to the irrigated paddy on the plains. I saw some Arabian coffee plants in Mr. Keasberry's nurseries, looking very well—he is planting Arabian and Liberian and is opening a clearing at 1,500 feet for tea and cinchona. When the railway reaches thus far, it will afford a delightful change. Tenom is particularly healthy, and the plains afford

SPLENDID SHOOTING,

—deer and wild cattle. I have counted 35 sambar deer in one morning. I prefer stalking, accompanied by our follower, but a popular method is the drive which is done by the villagers and their dogs while the guns are placed at the edge of the clump of forest. This necessitates very quick sighting, but there is great pleasure in

ANTICIPATING THE OUTWARD RUSH

of the driven game. The railway in use at present is only 20 miles long; and, at the eighth mile, a bridge is unfinished, over the Bukow; but there is a construction engine on each side, and the (unloaded) cars can be pushed across the temporary bridge. Mr. West has

BUILT ALL HIS ROLLING-STOCK

with local timber of a remarkably good quality and is running one first-class car, a dining car, one third-class car, and as many trucks as required, twice a week from Weston to Beaufort. This interferes a good deal with the ballasting operations, but it is desirable and traffic is already leaving the river Padas for the railway. Transport is cheaper, and a very good class of shop is to be found both at Bukow and Beaufort. I noticed that the

FUEL USED IS WOOD;

previously it was coal, which is cheap, quarried in Labuan. There are large coal seams at Bukow which were purchased from the Sultan of Brunei before this province, Province Went was taken over by the Chartered Company. These now belong to the Rajah of Sarawak, and it will be a good thing both for the Rajah and the railway when they are worked.

Arrangements are being made for the transfer of the Customs Office and Police Station, now situated at Batu Batu, which commands the entrances of the Padas and Bukow rivers, to Weston, the railway terminus. This means the migration, also of about 150 natives whose chief occupation is fishing. The fishermen will then be in touch with a large population and obtain a better sale.

FOOD SUPPLIES.

The price of fresh fish is three cents a catty. Fowls are dear and beef is rarely obtainable. Wild pigeons and other birds are snared in great quantities, and are very cheap, and vegetables, thanks to the Chinese gardens on the railway line, are plentiful. Fruit is plentiful and cheap. It is very satisfactory to note that the

CHINESE ARE PLANTING COCONUTS

in their gardens, and they are doing well. Two applications from Chinese engaged on the railway works for 20 acres and 25 acres have just been approved. The price is \$3 an acre, beautiful soil and a healthy climate. Marco Polo mentioned the Chinese in Borneo (how many years ago?) and today they are becoming as numerous as they were in his time. They are kept out of the Australias and the Americas, and possibly the occupation of the Philippines by the Americans will mean restricted intercourse with China—but we have only one remark, to Chinese or to any decently behaved people—

LET THEM ALL COME!

GREY AND OTHER BLIGHTS: THEIR STUDY AND THEIR REMEDY.

(By a Ceylon Planter.)

In writing the following notes on grey and other blights, I must ask your many readers to excuse shortcomings and I can only hope that this article may be of interest to some.

Grey and brown blight seem to be of the same family and both live on the matter found in the leaf-cells of the hop plant. The mycelium of these pests ramify through the intercellular tissues and reproduction is carried on by spore-bearing hyphae, which may be seen on the decayed leaf surface. It is a curious fact that fungi similar to grey blight (in its effect) may be found on almost all trees, etc.—coffee, gums, jungle and so on. If such are the same as is found on tea, it shows how widespread the pest is; otherwise it is reasonable to suppose that the present increase of blights is entirely due to

climatic reasons, and that such will decrease as rapidly as they came.

It is the general opinion among planters that—especially where the bushes are healthy and vigorous—no decrease in yield has occurred or is likely to occur; and it is easily noticeable that—though these blights increase on shuck patches—healthy tea seems to hold its own; and the disease though present seems unable to make headway.

Dr. Watt speaks of increase occurring vegetatively and the spread of disease by mycelia: this may be so, but spores carried about by the wind seem the chief means of reproduction. This is especially noticeable now when the prevailing direction of the wind is from the South-west. Slopes with that aspect are much more affected than others.

There seems to be a great diversity of opinion as to the seriousness of these pests. Some planters take a morbid pleasure in prophesying horrors, against which the coffee trouble pales into insignificance; others and, I am glad to say, the majority, take a much more favourable view of the matter, and it is significant that in the ranks of the latter may be numbered not only the majority of the ablest and leading planters, but men whose experience of coffee would tend to (were such a thing necessary) make them be among the worst alarmists. The general opinion seems to be that, while no real danger need be apprehended still precautions should be taken to prevent further increase. It is a strange fact, that, while Dr. Watt, Mr. Bamber and other scientific men should lay such stress on the necessity of prompt and drastic action, as well as talk so largely of the fearful rapidity with which such pests spread—we find Assam, for instance, has been the home of gray blight for many years and that although yields may have been reduced on shuck estates, healthy places there can even yet boast of bumper crops. As for Ceylon, an old and experienced planter remarked the other day that he recollected grey blight causing a great scare some 12 or 15 years ago, and how at the time he and others thought that tea was going the way of coffee. However, the blight decreased just as rapidly as in the first place it increased; and, though I am not sure on this point, I believe he remarked that the weather at the time was as abnormally wet as it has been during the last few months. The local "Times" of Thursday last speaks of mopping and asks whether estates on which such work is carefully carried out, show any freedom from pests. From observation I should say that they do not, and I have found blight almost as bad on one of the most carefully and systematically cultivated estates in the island as on less-cared-for neighbouring places. A planter further asks whether grey and brown blights respect jāt and what jāt seemed to be most affected. Personally I should say China jāt seems to escape easiest, and that the better jāts suffer most: the latter seem affected most from pruning to about 18 months on, after which, the bushes being denser and the leaves harder, blight is not so noticeable.

Now for remedies: in order to do any real good some uniform system must be adopted,

and an economical as well as efficient treatment has yet to be found. In this we seem to have to depend on our own resources. Science can tell us that this or that treatment will kill fungi, but is quite at a loss as far as remedies suiting the peculiarities of tea are concerned. Most estates, however, are trying something; but I doubt whether in some cases good is being done, and it is reasonable to suppose that blight is being sown broadcast by some of the supposed methods of cure which have been adopted. Among other methods the following may be worthy of trial:—

1. Collecting and burning the prunings when green.
2. Collecting and burying of all prunings with lime.
3. Picking off infected leaves from bushes and burning same.
4. As well as picking off, etc., sweeping the ground and burning the leaves so collected.
5. Pruning strips of from 20 to 40 lines leaving strips unpruned, heaping prunings in unpruned parts and firing same.

Possibly the most effective method would be a combination of Nos. 1 and 2 followed by No. 3. The great advantage of the first two methods is the value of such in cultivation. Where land is not too steep burying prunings makes a valuable bulk, and the soil being light, it is one of the only available ways of building such up and creating humus. Where land is too steep for this process, prunings could, while quite green, be collected in ravines and on roads and burnt: the resulting ash, collected and returned to the soil, is the cheapest potash manure we have—not to speak of the great value of the large amount of carbon in the ashes as a collector and retainer of ammonia. If tea so treated was afterwards gone over and blighted leaves picked off, it should not be either a difficult or expensive way of keeping blight in check.

Picking off blighted leaves has, from what I hear, not given entire satisfaction—this may in some cases be due to the pickers not being provided with proper receptacles. Personally I have provided them with thick canvas bags; notwithstanding this I find the blight increased after the first round of treatment, the second round taking twice as many coolies as the first. This might be due to climatic reasons, as I find the third round to be fairly free from infested leaves. Various methods are being tried in picking off leaves:—giving each plucker a bag and making them—while doing ordinary plucking—remove sickly leaves, is one; this may do when blighted leaves are few and far between, but personally I think a special gang doing nothing but this work is cheaper and the work done is much cleaner. It is quite possible that handling these leaves on dry hot days may scatter spores largely; but when this work is done in damp rainy weather, this should not occur. On the other hand wet weather is more favourable for the germination of the spores. No. 4 method is being employed on some estates, and no doubt is effective; but I doubt whether the good done is worth the heavy expenditure that this method of treatment entails. No. 5 method seems drastic, but I

believe has been tried in some cases, I should say that where blight is so bad as to require such treatment, the sooner such tea is pulled up and destroyed the better, as such bushes would never stand the shock of being killed back—which most of them would be—and at the best surviving bushes would be nothing but typical nurseries for parasites; and I may add that methods even more drastic than this have been tried in Assam, and in nearly every case the new bush grown has within a year been as bad with blight as ever. Blight, it seems to me, should be looked upon more as an effect than a cause. What has been the history of first coffee rather than tea? We have in most cases steadily drained the soil of its nourishing properties and, as long as dividends were forthcoming, have been content to ignore the laws of nature; with what result?—a decrease in both quantity and quality, as well as an increase in cost of production. Too late we turn our thoughts to manuring and general cultivation of the sickly and hide-bound bush we have left and by many years of ill-treatment trained into a nursery for all kinds of diseases which are afterwards distributed in the tea of more healthy and neighbouring fields. Having done all this we commence manuring and in many cases with disappointing results—why, it is not difficult to see: as with the bush so with the roots. And the latter in consequence—until new and healthy root stems are formed—are unable to utilize manures to the best advantage.

The chief thing necessary now is either the entire clearing out of tea on sickly ridges or the building-up of the same by a system of bulk manuring. In the latter case many methods might be adopted, burying of prunings, decomposed vegetable matter (cheddie could be collected into pits for this purpose) heavy dressings of castor cake and where available application of cattle manure and I believe much might be done by planting cuttings of say *Adhatoda vasica* (a highly nitrogenous plant, also making a good fungicide) amongst tea on poor soil a few months before pruning, to be afterwards buried with the prunings. In conclusion I might again repeat that the general opinion of practical men is that no real danger need be apprehended in connection with the present increase of blights; and I think we shall find these parasites will shortly play a more important part at annual company meetings than on the estates.

MINOR PRODUCTS REPORT.

CINCHONA.—In addition to the quantities announced by us last week to be offered at the Amsterdam auctions on August 24th a further 2,251 bales and 93 cases (192,726 kilos) been brought forward. This now brings the total to 7,564 bales and 276 cases (688,364 kilos). The shipments from Ceylon for the week ending July 18th were 30,647 lb, and from January 1st to 18th they were:—

	1899	1898	1897	1896
Lb ...	277,336	277,755	304,311	193,398

Five brokers have declared auctions in London on August 15th the total at present amounting to 1,132 packages, of which at least 800 are East Indian bark.

CITRONELLA OIL.—Quiet and unchanged at 11d to 11½d per lb on the spot in drums. The Ceylon exports for the week ending July 11th were 23,270 lb, of which 21,002 lb were for London.—*Chemist and Druggist*, Aug. 12.

LABOUR AND TRANSPORT IN THE PHILIPPINES.

Mr. Dean C. Worcester, Assistant Professor of Zoology at the University of Michigan, in his book "The Philippine Islands and their People," says:—

"The labour problem is a serious one. There is little trouble in getting a limited number of fairly good workmen, but when it comes to conducting any enterprise necessitating the employment of men in large numbers, difficulty is sure to be encountered.

"Wages are low, running from four to eight dollars per month, but one is often compelled to seek labourers at a distance, and to make them heavy advances against salary account. Should they desert before working out the debt, there is, under existing conditions, no legal redress.

"It is often necessary to sub-let parts of large estates to natives who work for a percentage of the crop raised, but they improvidently spend their wages as soon as earned, or sooner, and have nothing left to live upon. It is, therefore, necessary to loan them money on security of a crop not yet harvested, perhaps, not even planted; and should it fail, one is left out of pocket. Considerable losses from this and similar causes are inevitable.

"At the best the native is an intermittent worker. He is indisposed to exert himself unnecessarily, and is apt to relapse suddenly into idleness when he has accumulated a small sum in cash. It is to his dislike for steady, systematic labour, that the failure of so many mining enterprises has been due."

Concerning transport, Mr. Worcester says:—

"The lack not only of railroads, but of roads of any description, has impeded communication and transportation.

"There is but one railway in the islands. It extends from Manila to Dagupan, a distance of about 120 miles. Elsewhere transportation must be by water, by carts or sledges usually drawn by buffaloes, but sometimes by bullocks, or finally by coolies. The last method is often the only practicable one.

"This lack of any adequate means of over-land transportation has contributed as much as any one cause toward retarding the commercial development of the colony. There is fairly regular communication between the more important islands by means of steamship lines, but freights are high."

PRODUCE AND PLANTING.

INDIAN TEA COMPANIES' RESULTS.—Mr. Seaton's annual tabular return shows the results of the working of forty-five Indian tea companies. The paid up capital of these companies is £7,047,885. The average dividend distributed on this capital was 5½ per cent. which is a shade below that of the previous period. The reserves are also a little lower, being £534,000 against £559,000. These results follow naturally upon the fact that the profit per pound earned was only 1'45d representing £392,000, against 1'5d per lb. representing £413,000 in the 1897 season. The dividends distributed by these 45 companies varied considerably, and it may be interesting to shortly summarise them,

Thus, five companies distributed from 12½ to 15 per cent, seven from 10 to 11 per cent, thirteen from 5 to 8 per cent, and nine from 2 to 4½ per cent, while eleven companies paid nothing. The company which has distributed the best dividend is the Brahma-putra, whose shareholders have received 15 per cent. The Amalgamated Estates, Assam, Dooars, and Doom Dooma companies have distributed 12½ per cent., the Jorehaut 11 per cent., and the Balijan, Consolidated Tea and Lands, Jokai, Lebong, Moran, and Rajmai 10 per cent.

TEA CULTIVATION IN SOUTH CAROLINA.—Periodically we hear of the success of tea cultivation in South Carolina, based upon experiments made on about 50 acres at Summerville. In his report made to the United States Secretary of Agriculture, Dr. Charles U. Shephard states that "last year 3,000 lb. of tea was sold at a profit of 25 per cent. The quality of the leaf is said to be good, and as the plants lived through last winter, the coldest ever experienced in the district, Dr. Shephard expresses the belief that the weather conditions are suitable for tea growing. It is estimated that when all the plants now growing arrive at maturity they will yield 10,000 lb. annually." This is satisfactory as far as it goes, but as these tea experiments have been conducted in South Carolina for a long time now, those who have the conduct of them are evidently proceeding cautiously, and South Carolina tea will not prove an important factor in the American tea supply just yet, notwithstanding the fact that a school has been established to educate the negro children in tea picking in order to solve the labour problem.

FRESH FIELDS.—Will afternoon tea become a popular institution in Abyssinia? A correspondent of the "Times" who is journeying in that land has done something towards the introduction of tea. He says in the course of one of his letters: "On one occasion the wife of one of these generals determined in her own mind that she could never allow the Ingliz to pass through without giving him a tender shake of her delicate hand, and, true to her decision, she appeared in great state before the door of my tent, and, followed by her lady-attendants, was ushered into my presence. The questions she asked disclosed an intellect of no mean order. But whilst she was listening attentively to the best replies I could give her and thoroughly enjoying the first cup of tea she had ever drunk in her life, it was suddenly announced by one of her followers that the general was coming. 'Oh! Oh!' she cried, and something else I did not understand, and, hurriedly swallowing the sweet dregs of the tea, she rushed out of the tent, mounted her mule, and swept away with her suite only just in time. When the general arrived I told him of the honour that had been paid me. He was exceedingly amused, and forthwith presented me with a magnificent riding mule, all ready saddled and bitted. I hope that he was equally considerate to his charming wife."

DETECTING ADULTERATION.—Tea, coffee, and tobacco-growers will take some interest in the work done in the Government laboratory, in the matter of testing adulteration. Among the Parliamentary papers issued on Saturday is the report of Dr. T. E. Thorpe, F.R.S., the principal chemist of the Government laboratory, upon the work of that department for the year ended March last. Its business is mainly in connection with the Inland Revenue, of which it is practically a sub-department. Dr. Thorpe points out that the chemical and testing work in connection with samples of foreign produce is done partly at the laboratory at the Customs House and at stations at the docks and outports, and partly at the laboratory in Clement's Inn Passage, Strand. The work of the Customs House laboratory is mainly to determine the dutiable value of samples of imported wines, spirits and beers, and a great variety of other pro-

ducts are examined for alcohol, or for evidence that alcohol has been used in their preparation. Samples of leaf and manufactured tobacco from the factories under the supervision of the Customs are examined for the amount of moisture they contain, whilst samples of manufactured tobacco, mainly seizures, are examined for sweetening material. "Offal" tobacco is also inspected for genuineness prior to its examination for drawback value. Samples of tea, selected at the discretion of inspectors, are also sent for chemical and microscopical examination, and during the year fifty-seven samples, representing 1,616 packages, were found to contain exhausted leaves or to be mixed with other substances within the meaning of the Sale of Food and Drugs Act. These were refused admission for home consumption, or were forfeited and destroyed or otherwise disposed of as being unfit for human consumption. It may be of interest also to note that tea which cannot be admitted for use as a beverage is "denatured" by being mixed in bond with assafoetida and lime, and used for the manufacture of caffeine, coffee is examined for chicory and coffee substitutes, and several cases of adulteration were discovered, the payment of drawback on these being refused. Roasted cereals imported for used as coffee substitutes are examined for chicory, which, if found, renders them liable to duty.

COFFEE ADULTERATION IN SOUTH AFRICA.—Tea, for some mysterious reason, has not as yet increased its popularity in South Africa, where coffee at present holds sway. It might be thought that consequently the coffee would be pure and good, but this is far from the case. The "Cape Argus" remarks that everybody knows that his morning cup of coffee is not the product of the pure berry, and this view is corroborated by the report of the Cape Public Analyst, just published.—*H. and C. Mail*, Aug. 18th.

TEA PESTS.—With reference to the Tea pest notes, given on page 271, we may say that the serial *Indian Museum Notes*, from which they are taken, are issued by the Trustees of the Indian Museum, Calcutta, under the authority of the Government of India, Revenue and Agricultural Department to take the place of *Notes on Economic Entomology*, of which two numbers have appeared. The parts of the serial are published from time to time as materials accumulate. Communications are invited by the editor, *Indian Museum Notes*, Calcutta. Correspondence connected with Economic Entomology should be accompanied by specimens of insects to which reference is made. Caterpillars, grubs, and other soft-bodied insects can be sent in strong spirit; chrysalids and cocoons alive, and packed lightly in leaves or grass; other insects, dried and pinned, or wrapped in soft paper. Live insects should be sent when there is a reasonable probability of their surviving the journey. Caterpillars, grubs and other immature insects can often be only approximately determined; they should therefore, where possible, be accompanied by specimens of the mature insects into which they transform. Insects forwarded for determination should, in all cases, be accompanied by a detailed report showing precisely in what their economic importance is believed to consist. When the Agricultural Department of Ceylon is established we trust we may not require the valuable assistance which is now offered by the Indian Museum authorities; meanwhile Ceylon is not too far off for considerable use to be made of it.

TO ALL PARTS OF ASIA, AFRICA, AMERICA AND OCEANIA.

Seeds & Plants of Commercial Products.

Hevea Brasiliensis (Para Rubber).—Orders being booked for the coming crop available in August and September. This is the only crop of seeds in the year. All orders should reach us before the end of July to avoid disappointment, as we have to make arrangements in time; guaranteed to arrive in good order at destination. We have already booked a large number of orders. A Sumatra Planter writes, dating 9th March, 1899:—"I consent to the price of £——per thousand. I herewith order 50,000 upon condition that you guarantee at least 33 % seeds germinating." Plants can be forwarded all the year round in Wardian cases. Price and particulars as per our Circular No. 30.

Ficus Elastica (Assam and Java Rubber).—Seeds supplied by the pound with instructions; price according to quantity. This tree grows equally well in high and low land, in forest and grass land, its cultivation being extended largely by the Indian Government.

Manihot Glaziovii (Ceara or Manicoba Rubber).—Fresh seeds available all the year round; price as per our Circular No. 31. It is superior to Mangabeira rubber and second to Para rubber.

Castilloa Elastica (Panama or Central American Rubber).—Seeds and Plants supplied; price and particulars as per our Circular No. 32.

Urceola Esculenta (Burma Rubber) and **Landolphia Kirkii** (Mozambique Rubber).—Seeds and plants, both are creepers.

Cinchona Seeds.—Different varieties.

Hybridised Maragogipe Coffee.—A large-beaned superior variety of Coffee in demand; seeds.

Santalum Album (Sandlewood).—The cultivation and felling of the tree is entirely under Government monopoly in India, Sandlewoods to the value of over £100,000 being annually exported to various countries from India. The cultivation of this useful tree is now receiving increased attention in other countries; seeds and plants.

Eucalyptus Marginata (Jarra).—Large quantities of this most valuable timber are being annually exported from Australia to London and various parts of the world for street paving and other purposes. Price of seeds on application. 7,846 pieces of Jarra timber has already arrived for Ceylon use.

Seeds and Plants of Cinnamon, Nutmeg, Clove, Kolanut, Pepper, Cardamom, Vanilla, Arabian, Liberian and Maragogipe Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit Trees, Shade and Timber Trees, also Palms, Bulbs, Orchids, &c.

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for Foreign Countries for 1899-1900 are now being forwarded to applicants in different parts of the world.

"SOUTH AFRICA."—The great authority on South African affairs of 25th March, 1899, says:—

An interesting Catalogue reaches us from the East. It is issued by William Brothers, Tropical Seed Merchants, of Henaratgoda, Ceylon, and schedules all the useful and beautiful plants which will thrive in tropical and semi-tropical regions. We fancy Messrs. Williams should do good business, for now that the great Powers have grabbed all the waste places of the earth, they must turn to and prove that they were worth the grabbing. We recommend the great Powers and Concessionaries under them to go to William Brothers."

A leading Planter writes from *New Hebrides* under date 17th January, 1899:—"I shall like a few more of your Catalogues to distribute through these Islands, as I feel sure many would place themselves in communication with you, did they know where to write for Seeds and Plants."

Our New Descriptive Price List of Seeds and Plants of Fruit Trees now being prepared and will be ready shortly.

Agents in London:—MESSRS. P. W. WOOLLEY & Co., 33, Basinghall Street.

Agent in Colombo, Ceylon:—E. B. CREASY, Esq.

HANKOW, THE TEA MART OF CHINA.

(From "The River of Tea" by E. R. Scidmore in the "Century Magazine" for August).

Hankow, the great tea-market of China, and six companion cities of Hanyang and Wuchang, six hundred miles up-stream from Shanghai, together present one of the greatest assemblages of population in China. Abbé Huc, who passed this way in 1845 and wrote the most interesting and still useful travelers' book about China, estimated the combined population of the three great cities at eight million, and drew amazing pictures of the crowded river life of the Han and Yangtze, a floating population depleted by thousands in the miles of burning junks when the Taiping rebels got their first taste of blood and plunder in the destruction of the three cities. For half the year the Yangtze runs at the foot of a forty-foot stone embankment where broad flights of steps lead up to the park, or bund, of the British concession, a model foreign settlement extending from the walls of the native city for three quarters of a mile along the river-bank. For the rest of the year the Yangtze rises higher and higher, until it often overflows the parapet and the great esplanade, the settlement streets and the race-course being navigable by small boats for weeks at a time. Since the opening of the port in 1861 this British concession, with its smooth, clean streets shade-trees, and flower-beds, has been an object-lesson in municipal order wholly thrown away on the Chinese wallowing in the filth of the native city. Only the magnificent, red-turbaned Sikh police have really impressed the natives, and with their splendid scorn and contempt of the yellow race, these men from the Punjab have maintained order, in fact the most serious decorum, in the settlement. The Chinese have conceded land along the river-bank adjoining the British concession for a Russian settlement, and beyond that tracts for French and German settlements, which when embanked and improved, will give the great foreign city of the future a continuous bund, over three miles in length.

THE CHANGE THAT HAS TAKEN PLACE.

Hankow, so long the chief source of supply of British tea-drinkers with fifteen or twenty tea-steamers in port at a time loading for London, has undergone a change in this decade. As Chinese teas deteriorated in quality and tea-farmers became more careless and dishonest, India and Ceylon teas began to win favour, and with the enormous increase of production in those two British dependencies Chinese tea has lost its place in the British market, furnishing only one-ninth of England's import in 1896. At that same time began the general awakening of Russia. At Hankow the Russian has come, and to stay, and the shadow of the Muscovite is over it all. The Russian is not only established at the gates of China, but also at its very heart, the invasion and absorption being as remarkable in this British settlement at Hankow as everywhere in Korea and Manchuria. Hankow is fast becoming a Russian city or outpost, a foothold soon to be a stronghold in the valley of the Yangtze, which China has given her word shall never be alienated to any power but England. Some alarmists may even view the Siberian merchants at Hankow as emissaries, like those armed Russian monks who first established themselves

in the Caucasus and Asia Minor in stronghold monasteries. Although the Russians have their own concession at Hankow, they do not care to build upon it and live there, amenable then to Russian laws and consular jurisdiction, to Russian restrictions and espionage; and the consulate and a few warehouses were the only buildings on the Russian concession in 1896. The Russians prefer the laws and the order of the British concession, crowding in upon it at every opportunity, competing for any house that comes into the market, and building closely over former lawns and garden-spaces. They compete with and outbid the few British tea-merchants who remain in these days of active Russian trade aggression. Only one tea-steamer took a cargo to London in 1896; two more British firms closed out and left Hankow that year; and, still more significant, only one pony showed the colors of the one British racing-stable at the autumn races. In the retail shops prices are quoted and bills made out as often in rubles as in taels or dollars, and the Russians have gradually assumed an air of ownership, of seigniorial rights, as complete as if they held the lease or diplomatic deeds to the place for ninety-nine years.

THE ANNUAL MARKET.

This great tea-market of foreign Hankow is a city of six weeks only, the heads of the great hong, or their managers, occupying their residences from the first of May to the middle of June each year. Leaf-teas are fired and shipped until September and even later, and brick-tea is made until January, but the choice tea is all looked to in those few weeks. For that first quality the Russians buy only the first "flush," or crop of young leaves unfolding at the tips of the new twigs of the evergreen camellia-bush each April. These pekoe and souchong "leaves of the second moon" are carefully picked by hand, while the next crop of tougher leaves is cut with a knife, and at the third and fourth gleanings the knife takes whole twigs, woody stems as well as leaves. The first crop of pale, downy leaflets is cured, or put through the wilting, rolling, fermenting and drying processes, at the tea-farm, the fermentation changing the colour of the leaf to a reddish brown, and converting part of the tannic acid to sugar, in which regard black teas differ from green teas, the leaves of which are dried as they come from the bush. With all the machines invented and used on tea-plantations in India and Ceylon, a drier has only once been used in China. All attempts toward greater care and cleanliness in preparation have been as vain as attempts toward introducing machinery at the tea-farms themselves. Not declining trade or prices—for the tea trade is not nearly what it was eight years ago—can stimulate the tea-growers to any change, and only when the whole country is open to foreign trade and residence will each village or valley have its own tea factory to cure and pack the tea for final shipment on the spot.

THE COMMENCEMENT IN MAY.

The dried tea leaves of the first crop are gathered up by middlemen and brought to Hankow, and on some day in the first week of May the Chinese brokers, in silk array, are borne in sedan-chairs from the native city and set down in the compounds of the great hong to offer their first *musters*, or samples of tea. The high season begins at that moment, and for six weeks, in the first scorch and stew of its summer climate, Hankow runs at high pressure. The *musters* are tested by foreign ex-

perts, the skilled tea-tasters, whose acute and highly trained senses render their judgment and appraisal unerring. A few leaves are carefully weighed from the muster into a shallow cup, and boiling water poured over them. The tea-taster notes carefully how the leaves unfold in the water, how the liquor colours and deepens to a rich, clear coffee-brown, and inhales the fragrance of the essential oil as it is borne off in vapor before he takes his judicial sip. He carefully analyzes its qualities for the second it rests on his tongue, and then ejects the liquid, never by any chance swallowing it. A price is agreed upon, and the tea is brought in chests and thick paper sacks and dumped into great bins at the factory, where it is refired, or toasted slowly in iron pans over charcoal fires, to dry it thoroughly, then sealed in air-tight lead cases within wooden chests, which are papered, varnished, covered with matting, and hurried abroad the waiting ships. The average price at Hankow for the first quality black leaf-tea, which is all shipped to Odessa, is about 40 Mexican dollars for each ninety-pound chest. Twenty-five half-chests of this first crop's pekoe leaves are sent to the Emperor of Russia for palace use. Several times it has happened that the whole crop of some particular farm or hillside has been brought up by the Russians and shipped before Chinese connoisseurs, who would drink no other tea, knew it. At once they cabled to Odessa and had the tea bought on arrival and shipped back to China. Twice on the Yangtze I used a rich and fragrant tea from the Keemug hills that had performed that journey to Odessa and return, because some mandarin knew what he wanted and was willing to pay for it.

THE TEA-TASTER.

The tea-taster is king at Hankow for the six weeks of his exclusive reign, and whatever he may do during the remainder of the year, he is a most rigid total abstainer during the high season, when every faculty of his keenest senses is on the alert. Although he never swallows a sample sip, the tea-taster's nerves and digestion are impaired at the end of ten or twelve years, even the stimulating effect of the strong, volatile aroma in the tea-hongs sometimes giving retired tea-tasters attacks of that tea-tremens which the Chinese and Japanese recognize as a disease; while temperance reformers, usually green-tea drinkers, seem ignorant of the fact that other stimulants than alcohol may be abused. The professional tea-taster at Hankow is said to drink only soda or mineral waters during the scorching weeks of his exacting season, and when word goes round the settlement that such a one of the great experts was seen to take sherry and bitters at the club, it is a signal that the great tea season is declining, that little choice tea is being brought in. Then the tension relaxes, and a certain section of Hankow gives itself over to a jubilation and indulgence that are the scandal and byword of the other ports. Although the tea firms are all Russians or Siberians now, the tea-tasters are Englishmen, and, for reasons not flattering to Russian character, it is said that the tea-tasters will always be English. No green or oolong teas, no perfumed or fancy teas, are included in these great summer shipments, those being specialties of the southern ports. Several times I was regaled on Pu'erh-cha, the greatly esteemed "strengthening tea" from Pu'erh Fu in Yunnan. It had a mildewed, tobacco, weedy flavor, a bitter draught which is warranted to strengthen the

system, clear the brain, relieve the body of all humors and bile, and serves high-living mandarins as a course at Hamburg does European bonvivants. This plant grows in the Shan States, and the leaves are brought to Pu'erh Fu to be steamed and pressed into large, flat cakes, which, being packed in paper only, soon mildew. The long, viscous leaves are probably from some variety of the wild Assam tea-plant, and the taste of the dried leaves themselves is a little like the *yerba buena* of the California foot-hills. The Chinese consider the Pu'erh-cha the better by age, and do not heed the mildew flavor. It promotes longevity along with its therapeutic qualities, and is sent regularly to the emperor at Peking. Despite the distinguished consideration implied, I should not care to have the costly herb offered me again, and, with all the craze for cures, I doubt if Pu'erh-cha would ever find favor abroad.

RUSSIAN CUSTOMERS.

The Russians buy the best and the worst, the dearest and the cheapest teas in Hankow's market, the chests of choice tea going to Odessa for European Russia, and the compressed brick-or tile-tea to Mongolia and Siberia. By September the best leaf-teas are fired, and some tea-steamers are back at Hankow for second cargoes, Odessa ships trying to make two round trips in each season. After that the tea-farmers send in the bags of coarse leaves, broken and refuse tea, the dust from their tables, bins and floors; the factories have bins of such leavings and sweepings too, and the manufacture of brick-tea begins, and continues until January before all such accumulations are disposed of. Tokmakoff, Molotkoff & Co.'s brick-tea factory, which is managed by a Scotchman, who invented and adapted several of the machines and processes employed, is the largest factory in Hankow, employing fourteen hundred workmen through the long season, and shipping nearly a million bricks a year, with an almost equal output from their factory at Kewkiang. All the way to their compound the settlement is fragrant with toasting tea-leaves, delightful whiffs coming from the rows of windows at that end of Hankow, where walls are higher and longer, and chimneys rise significantly. They showed us first the bins of fine dust, ground and sifted by wretched, sallow, greenish-hued coolies, whose nostrils were filled with cotton-wool to prevent their breathing in the insidious dust. Two pounds of tea-dust are weighed into a cloth, which is laid on a perforated plate over a caldron of boiling water and covered for a few minutes, when it is poured into a clumsy wooden mold, and a half-pound of finer dust added as a surface. The mold is covered, put under a screw-press, and clamped shut. The noise around this press is deafening as the heavy molds are clanged about on iron tables and the stone floor, and with the half-clothed workmen moving in clouds of steam from the caldron and shouting their hideous dialect about the dark warehouse, a short inspection of the process satisfies. The bricks remain in the molds for six hours to cool, and are then removed, weighed, and stacked in endless rows in an upper story to dry and shrink, before being wrapped in paper, furnished with red labels in Russian, and packed in baskets holding seventy bricks each. All defective or under-weight bricks are broken and ground to dust again, and it takes heavy blows with an iron, or sharp raps against the stone floor, to break one of these inch-thick black tiles, which are nine inches wide and

twelve inches long. A larger and a smaller size of green-tea bricks are also made at this factory, into which the coarse leaves and stems go entire, without grinding. One naturally wonders that machinery is not employed for all these simple processes, and that some Yankee does not start a factory where a stream of tea-dust would go in at one end and rows of bricks come out at the other; but human life is so over-abundant in China that hand-labor is cheaper than any steam-driven machinery coolies' food worth less than engine coal.

BLACK BRICK TEA.

The black brick-tea for Mongolia and Siberia, and in fact almost the whole tea-supply of Russia, used, long ago, to go from Hankow by boat for three hundred miles up the Han River, was portaged across, and taken a distance up the Yellow River, and then loaded on camels and carried across Shansi to Kiakhta, on the Siberian frontier. The caravan trade from Kiakhta and Kalgan to the Volga was the subject of negotiations by the embassy Peter the Great sent to the Emperor Kanghsi, and ever since there have continued, winter and summer alike, the mending processions of camel trains back and forth across Siberia. Nijni-Novgorod was then the tea-market of Russia, and the water and land transportation across Siberia was so cheap that tea could be delivered in Nijni-Novgorod by caravan more cheaply than by tea-steamers to European ports. The opening of the Suez Canal gradually moved the tea trade to Odessa; the tea brick is no longer a unit of exchange at Nijni, and the great fair on the Volga has lost its most picturesque feature with the vanishing of the camels and the great tea-caravans. When all the Russian tea came by caravan to Nijni, "caravan tea" had a deserved repute in Europe. About the time that the Russian tea trade shifted to Odessa, the name of "caravan tea" reached America, and dealers, not always informed themselves, played with the catching word. One is offered "Russian tea," and assured that "caravan tea" is better than other teas, because a sea voyage spoils the flavor of tea. One must not inquire how the tea crossed the Atlantic, evidently. If all leaf-teas were not sealed in air-tight lead cases, the sea air and ships' hold odors could not taint them as unspeakably as the proximity of camel's wool, pack-saddle coverings, and the belongings of the filthy Mongol caravan-men on their three months' journey across Siberia.

A FEW FIGURES.

Hankow's trade statistics deal in large figures for the export of tea. In 1896 there went out from that port 470,063 piculs, or something over sixty million pounds, of leaf-tea, and 434,107 piculs of brick-tea; yet the tea trade has fallen off, and the figures are not so large as when the English were the great consumers.

CEYLON EBONY.

DIOSPYROS EBENUM—Koenig.

(From the *Indian Forester for August*.)

The name Ceylon Ebony for *D. Ebenum* is not absolutely correct, for this species is found in Southern India, nor is it only Ceylon *Diospyros* which has a black heart-wood there being others such as *D. ovalifolia*, *D. crumenata*, *D. Melanoxylon* and *D. oocarpa* which furnish a certain amount of ebony. It is even not cer-

tain whether the species will not have to be subdivided into two on account of the varied arrangement of the fruit, whether solitary or in clusters in the axils of the leaves. It is however convenient for me to use this name as it is used in the timber trade, and also because my acquaintance with it is limited to Ceylon.

HABIT.—Without going into botanical details it may be said that this is a large evergreen tree, attaining a girth of up to 14 feet. It has a roughish bark of a dark colour which, in exposed situations, has a greyish tinge. The leaves are also dark and appear as if sprinkled over with fine charcoal dust. Several other species of *Diospyros* possess very similar characteristics and it requires a certain amount of experience to distinguish the species, especially saplings and young trees.

DISTRIBUTION.—Ebony has almost the same range of distribution as satinwood as the annexed sketch map will show, but it is found more abundantly in the intermediate zone and in the south of the island it penetrates even into the moist zone. But it is most abundant in the dry zone and the richer forests are all in the Northern half of the island, especially in the Eastern portion of the North-Central Province. It is also well represented in the Northern and North-Western Provinces.

SOIL.—The best ebony is found on rocky well-drained soil. It is at times found on soil containing a larger proportion of clay than satinwood can endure but, generally speaking, it is found like satinwood on sandy loam with a good subsoil drainage. It is frequently found near watercourses, which are dry during a part of the year, but in swampy soil never. It differs in this respect from *Diospyros Embryopteris* which is frequently found near rivers, pools or tanks.

COMPANION SPECIES.—As I have stated before, satinwood is frequently a companion of ebony, as also *Mimusops hexandra*, *Nephelium longana*, *Glenicea zeylanica*, *Diospyros ovalifolia*, *D. crumenata*, *D. oocarpa*, *D. montana*, *Vitex altissima*, *Albizia odoratissima*, *Berrya Ammonilla* on the moister soils, and many others. I have never seen ebony growing pure and the proportion of this species to the many others is always small. In the richer forests there may be 10 to 15 trees per acre or, taking the saplings into account, perhaps 50 trees, but this percentage is high. I have only heard of one instance, in the Mannar District, where there were 40 trees (exclusive of saplings) per acre. In an enumeration survey made recently over 50 acres in a fairly rich ebony forest in the North-Western Province, 26 trees over 6 feet in girth, 65 from 4 feet 6 inches to 6 feet and 120 trees between 3 feet and 4 feet 6 inches were counted. This gives a total of 4 trees over 3 feet in girth per acre. In average ebony forest, enumeration surveys both linear and by sample area made in the Northern, Eastern and North-Western Provinces, have shown that there are generally not more than 3 to 4 trees over 9 inches in girth per acre. This is, no doubt, partly due to the extensive and wasteful fellings which were carried on for many years over the Ceylon forests, and partly to the absence of improvement fellings required for furthering the growth of the young trees and saplings.

SYLVICULTURAL REQUIREMENTS.—Unlike satinwood, ebony does not require much light for its

seedlings. As a rule, it will suffice to cut the underwood and to girdle here and there a low-crowned tree. But after the seedlings have established themselves it is necessary to remove the cover which is directly overhead, not more. When the trees reach their maximum height, it is time to give more room to their crowns, but until then it is best not to let in too much light. It is difficult to see how the seed gets distributed over the soil of the forest, except in hilly ground, where it rolls down the slopes, or near streams or foot paths acting as such during wet weather, and yet trees are found, as often as not, at the top of a slope although the seed is neither light nor apparently palatable to birds or mammals although it becomes a prey to weevils, which would be rather a factor in the destruction than in the distribution of the seed. The seed usually ripens before the North-Eastern monsoon, but the good seed-years are not regular nor is the seeding equally good all over the forests at the same time. Observations taken in the forests since 1890 have not recorded a single universally good year, but the years 1891 and 1896 appear to have been the best while in 1892-93 and 1897 the seeding was fair. The good seed-years do not appear to come in any regular rotation but are dependent chiefly on rainfall at the right time. Occasionally, ebony seeds twice in the year. (*Ceylon Forester*).

RATE OF GROWTH.—There are, unfortunately, not yet sufficiently reliable data to show the rate at which this tree grows. Several sample plots have been started but they contain so few trees, sometimes not even all girth-classes being represented, that it is not possible to take the measurements as absolutely reliable. As a rule, after passing 3 feet in girth, ebony is very slow growing, more so than satinwood. From the data which I have been able to collect the rate of growth in the forest appears to be about the following, but, as I say, the figures are very liable to correction. The present measurements see to show that a tree reaches a girth of 18 inches at the age of 25 years, 36 inches at 75 years, 54 inches at 135 years and 6 feet in girth at the age of 200 years. On deep soil these figures are probably below the mark and the trees grow faster.

THE TIMBER.—The proportion of heart-wood to sap-wood varies a good deal. It is commonly considered that timber grown on deep soil contains a smaller proportion of heart-wood than trees growing on rocky slopes. My own experience coincide with this theory, not only as regards *D. Ebenum* but also as regards *D. Melanoxyylon*. As regards the latter, I remember that small trees on the stony slopes of the Ganges division gave a far larger supply of black-wood than comparatively large trees growing on alluvial soil in the western part of the Sharanpur division. Recently, 15 trees of Ceylon ebony, varying in girth from 6 feet to 12 feet were measured carefully. The gross volume of these trees amounted to 1,208 cft. while the volume of Blackwood was 282 cft. or less than one quarter of the volume, the proportion of heart-wood in the individual logs varying from 0.14 to 0.35. This was in good soil and measurements have yet to be made to find out the proportion of blackwood on rocky soil. As a rule, I do not think that the thickness of the sap-wood cylinder is much less than 3 inches. The largest log of ebony, which I have seen, measured 7 feet in girth after the sap-wood had

been removed. Together with the sap-wood it must have been very large; for, of the 12 feet logs mentioned above, one gave a measurement of blackwood of 5 feet 3 inch while another measured only 4 feet in girth after peeling. The sap-wood is very light coloured and soft. It is peeled off by means of heavy felling axes. Circular incisions are made round the log at distances of about 2 feet apart and the portions between trimmed off. It is possible to get the wood naturally peeled by leaving the logs in the forest for some years, but timber merchants do not like these logs and consider them to be dead wood. They, therefore, fetch lower prices. The hart-wood is not necessarily black throughout. On the contrary, streaks of white or pale brown colour are not infrequent. Some forests of the island produce blacker wood than others. For example, ebony from the western side of the island is usually less streaky than that found on the east. Generally speaking, the market favours the black ebony, if it is of as good dimensions as the streaky logs, the China market especially requires the wood quite black. For cabinet work, however, especially for ornamental beading and framing, the streaky wood is in request as it is used as a substitute for calamander. As regards the comparative value of the different ebonyes in India and Ceylon, it is somewhat difficult to make a comparison. *D. Ebenum* usually gives logs of larger dimensions and is on that account more valuable. In the local market, Indian ebony does not fetch as high a price as Ceylon ebony. Some years ago a local merchant imported a parcel of logs from India. The logs were of fair girth and very black, and yet they only fetched poor prices. The explanation given was, that Ceylon ebony takes a much better polish than that from India. I was not able to ascertain whether the logs referred to were *D. Melanoxyylon*. If so, they were remarkably fine. Of the different ebonyes which I am acquainted with, *D. Ebenum* seems to be the most close-grained. Its surface, when polished, feels more greasy to the touch than others and this, no doubt, accounts for the higher degree of polish which it can take. The weight, according to Gamble, varies from 61 to 81 lb. per cubic foot. I have weighted carefully six well air dried specimens from different parts of the island and found their weights to have varied from 90 lb. to 77.7 lb. per cft. the average being 73.9 lb. per cft.

MARKET.—The prices realized for ebony in Ceylon range up usually to R180 or R185 per ton (weighed) for good lots. I have once known the price to go up to R210 per ton, but it rarely exceeds R185, and I have never known the price of first-class ebony go below R150 to R160 per ton. The price not only depends on the state of the market in Europe and China but on freight available. If freight is scarce or high the price naturally goes down. I may add that it is by no means an easy matter to obtain freight for timber, especially when large consignments of tea are being sent home.

It may be of interest to Indian readers to know how the sales are conducted. All ebony, excepting branch-wood, top pieces and dead wood remaining from former fellings which are sold in the forest or at minor depôts, sent is to Colombo, where it is sorted at the Central Timber Depôt in lots, as homogeneous as possible.

THE SETTLEMENT OF THE DRAFT DISPUTE.

The following petition has been addressed to the Board of H. M. Customs by the Secretaries of the Indian Tea Association (London), the Ceylon Association in London, and the Tea Buyers' Association:—

Ceylon Association in London, 61 and 62, Gracechurch Street, August 4, 1899.

To the Hon. Board of Her Majesty's Board of Customs:—

GENTLEMEN,—We, the undersigned, representing the importers of Indian and Ceylon tea, and also the tea buyers of the City of London, ask your kind and favourable consideration of the following petition:—

You are doubtless aware of a dispute between importers and buyers of tea at present unhappily existing in the Port of London.

The importers having given notice of the withdrawal of the usual pound draft, and the trade having refused to buy their tea without the allowance, representatives from both sides have met and have arrived at a settlement, which, if it be accepted by your honourable board will terminate the dispute.

The settlement agreed upon consists in a modification of the system of weighing of tares.

We do not petition for any alteration in Her Majesty's Customs present method of gross-weighting packages of tea on arrival, but we do petition for an alteration in the method of taring packages with the exception of boxes weighing 28 lb gross or under.

We petition your honourable board to take the tare with a half-pound weight in the scale, giving buyer the tare as heretofore, on the half-pound or any fraction between that and the pound above, and per contra, if the scale does not lift on the weight side, showing that there are only, say, from one to seven and three-quarter ounces over the pound, we petition your board to take the tare at the lower pound weight.

Thus:—

26 lb. and up to 26 lb. 7½ oz. to be called tare 26 lb.
26 lb. 8 oz. and up to 27 lb. to be called tare 27 lb.

Under your honourable board's orders, parcels of tea are allowed to be tared on an average tare if the parcel does not vary more than 2 lb. in weight.

In order that these average tares may be arrived at with greater precision, we petition that your honourable board will order the number of packages to be taken for ascertaining the average tare in various parcels to be raised, and that the packages be selected fairly by your officer and not by the warehouse foreman.

Present arrangements:—

From 1 to 10 packages	1 tarer
From 11 to 40 packages	3 tarers
From 41 to 120 packages	5 tarers
From 121 packages up	7 tarers

We propose the following alterations:—

Up to 20 packages	3 tarers
From 21 to 60 packages	5 tarers
From 61 to 120 packages	7 tarers
From 121 packages up	9 tarers

To arrive at the average tare we suggest the following method of dealing with the fractions of a pound, viz:—

1 lb	1 lb		
22	23		
23	23		
24	117 divided by	24	118 divided by
24	5 equals	24	5 equals
24	23 2.5.	24	23 3.5.
—	Tare 23.	—	Tare 24.
117		118	

We also petition that your honourable board will order each package in every parcel of tea bulked in London to be tared separately, and that you will instruct your officers to see that the entire bulk of tea, as landed including overweight, is replaced in the packages.

The reason we accept boxes of 28 lb. gross and under is that there is no trade draft on them, and it is likely that they would be made habitually to tare below the half-pound, and the buyer would in each case not get full weight.

If, on consideration, your hon. board can see their way to accede to our petition we shall be glad if you will issue an order to that effect, as dated from October 2, 1899.

Awaiting the reply of your hon. board, We remain, gentlemen, yours faithfully,

Indian Tea Association (London).

(Signed) ERNEST TYE, Secretary.

Ceylon, Association in London,

(Signed) WM. MARTIN LEAKE, Secretary.

Tea Buyers' Association, (Signed) A. JACKSON,
Hon. Secretary.

The following reply has been received by the Secretaries of the Associations:

Custom House, London, August 14.

GENTLEMEN,—The Commissioners of Customs direct me to acknowledge receipt of your letter of the 4th instant, and to express their hearty satisfaction at the prospect you hold out of a termination of the dispute between the importers and buyers of tea in London through the adoption of special arrangements for taring on the part of this department.

1. The proposal to tare to the half-pound (instead of the pound as heretofore), rounding up if the fraction be an exact half pound or over, and rounding down if the fraction be less than half a pound, will be gladly accepted by the Board of Customs, subject to the concurrence of the Treasury.

2. As regards the method of striking the average tare, the Board see no objection to your proposal that a larger proportion of packages be selected for taring, viz:

3 out of 20 or less.

5 out of from 21 to 60.

7 out of from 61 to 120.

9 out of 121 or more.

The method of calculating the average seems to be practically that now in force.

The selection of the packages will rest on the responsibility of Customs officers, as at present.

3. Your request that each package in every parcel of tea bulked in London should be tared separately, instead of leaving separate taring to be optional, as prescribed by general order 102/1894, does not seem to command the support of all the importers, as you will see from the enclosed copy of a letter, dated the 9th inst., from Messrs. Hadden and Co., and the Board suggest that you should give it further consideration before pressing it.

4. Your concluding proposal is that the officers of this department should insist on the entire bulk of tea as landed, including overweight, being replaced in the packages, instead of allowing the use of "overtakers," as at present. The Board regret to say that they would not be justified in imposing on their officers so heavy and novel a responsibility as would be involved in the suggested arrangement. Customs officers are answerable for the security of the revenue derivable from goods in a bonded warehouse, but not for the custody of the goods themselves, and could not keep guard over every package of tea, after taring, until it had been nailed down.

If importers and buyers are agreed upon a certain way of treating overweight, after bulking, they should adopt their own precautions for ensuring that this method is duly carried out.—I am, gentlemen, your obedient servant,

(Signed) JOHN COURBOUX.

The Indian, Ceylon, and Tea Buyers' Associations in London, 61 and 62, Gracechurch Street, E.C.

The letter from Messrs. Hadden & Co., referred to in the foregoing reply, is as follows:—

25, Fenchurch Street, London, E.C. Ang. 9, 1899.

The Hon. the Commissioners of Her Majesty's Board of Customs.

Hon. Sirs,—General Order, 102/1894.

As importers of Ceylon tea, ourselves benefited, and acting for others benefited by the above Order, we humbly pray that there be no alteration with regard to it.

We are led to this petition hearing today that there has been a petition, dated 4th inst., sent to your Honourable Board, requesting that the order may be cancelled, which petition has been signed by the Secretary of the Ceylon Association in London jointly with the Secretary of the Indian Association, and we are convinced that the petition has been signed without proper thought.

The members of our firm belong to the Ceylon Association—have belonged to it from its commencement—and in it there is a special Tea and Produce Committee (of which they are also members), for the purpose of considering such questions as these. The matter has not been directly brought before this Association or its Committee. Had it been brought before them we are sure the request to have separate rates taken of London bulked teas would never have been made.

Under your general order of December 22nd 1894, a practice has sprung up in Ceylon of packing teas on the day they are made, and leaving any bulking that may be required to be done in the warehouse here. If such teas are separately tared, the warehouse charges will be increased some ten per cent, and the proprietors of the tea plantations will suffer accordingly. Probably they will have to abandon their present practice and, as many of them will consider, to the injury of their tea, and do all the bulking on the estates, and this will require enlargement of factories. It is a serious question to some planters.

If you cannot refuse that portion of the petition that refers to the separate taring of London bulked teas, we humbly beg that you will postpone your assent to it for some months. Apparently all those connected with the little-considered petition to you of August 4th are now out of town holiday-making. Your very obedient servants, (Signed) JAMES A. HADDEN & Co.

—H. & C. Mail, August 18th.

THE CHINA TEA-TRADE.

AT KIUKIANG.

The British Consul at Kiukiang reports that tea shows an improvement as against previous years' statistics, but that the total falls short of what it used to be in former years, and British merchants are not sanguine as to the future. The season, it is said, was a specially good one for native dealers, but foreigners also appear to have done a profitable business. Ningchows, until of late years, were the favourite Russian teas. Recently, however, Keemuns seem to compete with them for Russian favour, especially in the finest grades, and this, combined with low exchange, has consequently driven prices up. If it be the case that this is caused by the Russian taste following the British and preferring stronger liquory teas, and that this is leading them to take more and more British-grown tea each year, there is very good hope for Ceylon and Indian teas in Russia. Mr. Consul Brady quotes the remarks of a gentleman, well conversant with the tea trade, who appears to be very despondent as far as regards the prospects of exports to Great Britain. He says, "Teas from the Keemun and Ningchow districts have been of superior quality, and have sold at good prices. The total yield for the season was about the same as last year, and it looks as if Russian requirements would prevent any further falling-off in production. Export to the United Kingdom, however, is steadily shrinking and threatens to become nominal. The taste of the British public in the matter of tea has undergone a marked change of late years, and consumers have no appreciation of light flavoured teas such as China

produces. The introduction of machinery might revive the trade with England, and the colonies; but this seems as far-off as ever, the Chinese being quite satisfied with the prices paid for their tea prepared according to their own methods." It is added that green teas pass through Kiukiang, but no business has taken place for twenty-five or thirty years.

AT CANTON.

The British Consul at Canton reports that the decaying tea trade has again dismissed by over 500,000 lb. A dry spring and an insurrection in June in close proximity to the tea districts may, to some extent, have effected the trade, but the real reason for the decline is the steady falling off in the demand for Canton scented capers on the London Market. What demand there is more and more for low-priced teas for blending purposes, and a few more years will probably see even this small demand disappear. The quality of the teas was fully up to the average standard, and they were exceptionally well-scented. Taken as a whole the year was a fairly profitable one, both to the foreign merchants and to the native dealers. Long leaf scented Orange Pekoe and Canton Congous seem to be going entirely out of consumption. The total export of tea for 1898 was 4,163,000 lb., of which nearly three-quarters was sent by junk to Hong-Kong and does not appear in the tables at the end of this report, which are compiled from the Imperial Maritime Customs Returns.

COCONUT GROWING IN THE PHILIPPINES.

It is stated that the coconut palm will grow anywhere along the sea coast of the Philippines and flourish even in the poorest soil. Under present conditions it is ascertained that there is lots of money in raising coconuts and it is prophesied that numerous new coconut groves will be planted. The Spanish method of managing a coconut plantation is described as being very simple. The trees are set out about eight feet apart and until they begin to bear which is at the end of the eighth year the ground may be utilised for other crops the same as young orchards are at home.

After the grove comes into bearing, the owner has a steady income for life. Spanish proprietors, it is said, usually lease their groves to native tenants, who pay for each tree an annual rental one dollar mex. At this rate an acre would bring in from \$200 to \$300 mex a year without any effort of collecting the rent. The owner of a bearing grove of 200 acres can afford to take life very easy, and as the prolific coconut tree, produces from fifty to 200 nuts a year the tenants also have a pretty good thing of it.

A trio of clerks in the "palace" are said by their fellows to be "nutty" on the subject just now. However, this may be they are "reading" on coconut palms and planning to become rich, poco tempo, by investing jointly in a plantation.—*The Manila American*, Aug. 24.

MATE: PARAGUAYAN TEA.

Yerba mate, or Paraguay tea, is a popular beverage in South America that has been used for centuries. In 1898 the exports of this leaf from Montevideo, Buenos Ayres, and Valparaiso were over 50,000,000 pounds.

For a long time Paraguay enjoyed the reputation of producing the largest quantity and the best quality of mate, but it is surpassed to-day by Brazil. The State of Parana alone exports annually 22,000,000 kilograms (48,501,200 pounds),

The cultivation of this shrub has assumed such proportions that in the interior of the country there are whole forests of mate. Mr. Barbier, who was sent by the French Government on a scientific mission to South America, estimates that more than 11,000,000 people use mate.

In a volume published in Paris in 1716 occurs the following description:

"During the day, they make much use of the herb of Paraguay, which some call St. Bartholomew's herb, who, they pretend, came into that Province, where he made it wholesome and beneficial, whereas, before it was venomous. Being only brought dry, and almost in powder, I cannot describe it. Instead of drinking the tincture, or infusion, apart, as we drink tea, they put the herb into a cup or bowl, made of a calabash or gourd, tipped with silver, which they call mate; they add sugar, and pour on it the hot water, which they drink immediately, without giving it time to infuse, because it turns as black as ink. To avoid drinking the herb, which swims at the top, they make use of a silver pipe, at the end whereof is a bowl, full of little holes, so that the liquor sucked in at the other end is clear from the herb. They drink round from the same pipe, pouring hot water on the herb as it is drank off. Instead of a pipe, which they call *bombilla*; some part the herb with a silver separation, called *apartador*, full of little holes."

The Minister from Brazil to the United States Senhor Joaquin Francisco de Assis (Brazil) prepared an article for the Bureau of American Republics, describing yerba mate, which comes to the market in the form of broken leaves, coarse powder, or in stalks, and is prepared by infusion in boiling water, like tea. It is taken with or without sugar, according to individual taste. Mate is also prepared in a small vessel called *cuita*, from which the tea is sucked by means of a tube which terminates in a hollow perforated sphere called a *bomba*.

Doctor Peckholt, of Rio de Janeiro, makes the following comparative analysis of green tea, black tea, coffee and mate:

	[In 1,000 parts.]			
	Greentea.	Black tea.	Coffee.	Mate.
Essential oil	7.90	6.00	0.41	0.01
Chlorophyl	22.20	18.14	13.66	62.00
Resin	22.20	36.40	13.66	20.69
Tannin	178.00	128.80	16.39	12.28
Caffeine ortheine	4.50	4.30	2.66	2.50
Extract matter, etc.	469.00	390.00	270.67	238.83
Fibres and cellulose	175.80	283.20	174.83	180.00
Ashes	85.60	54.40	25.61	38.11

From this analysis, Doctor Caminhoa, professor of the faculty of medicine of Rio de Janeiro, draws the following conclusions:

First—Mate contains less essential oil, is less stimulating than coffee, black or green tea, and is, therefore, a beverage especially suited to nervous people, women, and children.

Second—Mate contains more resin than coffee, less than green tea, and very much less than black tea; it is, therefore, more diuretic than coffee, and as a stimulant rivals green tea.

The opinion of Doctor Caminhoa has been confirmed by other scientific men, among whom may be cited Doctor Lancaster, superintendent of the department of animal and food products of the South Kensington Museum; Doctor Schnepf, assistant inspector of the Bonnes waters, and Doctor Conty, the French savant, besides many others who have used and analysed the product.

Mate is prepared by infusion or decoction. Ordinarily one uses 25 grams of Mate to 1 liter of water, but this, of course, is regulated according to the individual taste. It is allowed to steep ten to fifteen minutes, and after being strained is served. It is sweetened to taste, and a little milk or rum is sometimes added. The use of utensils of iron should be avoided, as they give a dark color to the beverage.

On account of its peculiar taste, mate is frequently not liked at first. It acts as a powerful tonic, es-

pecially for invalids and those who are given to excessive physical or intellectual labors, and for all those who endeavour to solve the problem of excellent nourishment at a small expense. The journal *La France* declares that it was mate that enabled Doctor Tanner to endure forty days of fasting.

Mate is a quencher of thirst *par excellence* and a great restorative. It is a beverage specially adapted to men of studious habits to whom the use of coffee is harmful, as it gives the same results without unduly exciting the nervous system. It may be drunk cold, but it is generally served hot, and lovers of mate, absorb it by means of a *bombilla*, which is a diminutive *bomba*.

In Brazil the collection of mate is begun in December and continues until August. A company of gatherers set out, taking with them such provisions, tools, and cattle as are required for the expedition. On arriving at a suitable locality, they establish a camp or ranch, and immediately begin to gather mate, which is dried and packed on the grounds. The process is as follows: The leafy branches of the mate are cut down and placed in a pit about 6 feet square, where they undergo a roasting from a bright fire. This operation demands much care, since it is upon this process that the aroma of the mate depends, and the required amount of heat is only learned by long experience. After two or three days of drying, the leaves are reduced to coarse powder, and are packed in *serons* or bags made of raw hides, which are then exposed to the sun.*

The quality of the mate varies according to its origin and the method of preparation. That which is gathered from regions along the coast is the poorest, being less rich in gum and resin and having less aroma than that from the interior of Parana Paraguay. Leaves a year old have few of the properties required, while those of four or five years, being darker in color, thicker, and having a larger number of glands, give the best mate.—*American Grocer*.

TEA IN INDIA.—Unless manuring is taken in hand energetically, the shutting up of the larger portion of the Surma Valley plantations is merely a question of time—says *The Indian Planters' Gazette*. We have heard even old planters, employed on these places, congratulate themselves upon being able to get a thirty-mile nerriek done on such lands, not reflecting upon the unprofitableness of constantly turning up simple sand that results in a poor sixpenny average tea. It is not going too far to say that all north of the Puttareah range, and as high up as the meridian of the Goomrah in north-west Cachar, there is not one concern that can be classed as a first-rate garden. They may be kept going, but only by the adoption of the means we have pointed out.

We are fully aware that there are in the area indicated isolated patches of good productive land, but these bear but a very small proportion to the rest of the property, as is proved by the averages obtained for the factories' outturn. Were it feasible to keep the produce of these plots separate from the rest of the outturn, things might improve, but unfortunately in bulking the whole gets mixed together, hence the stronger leaf is pulled down by the more insipid and weak. Manuring would go a great way to ensure uniformity; the want which in our Indian teas forms the chief complaint of dealers, and we must admit this complaint is justifiable.

* This was the primitive method of preparing mate. To-day, however, perfected machinery does the same work better and more rapidly in large central mills, whither the product of an entire district is taken.

TEA PESTS.

BEING EXTRACTS FROM NOTES ON INSECT-PESTS FROM THE ENTOMOLOGICAL SECTION, INDIAN MUSEUM :

(By E Barlow, Assistant in charge of Entomology.)

1. EUPROCTIS LATIFASCIA, WALKER.

(sub-ord. Heterocera, Fam. Lymantriidæ.)

In March 1897, from Messrs. Andrew Yule & Co., were received some living specimens of a caterpillar which had been doing a great deal of damage to tea plants in the Darjeeling district. The caterpillars were said to be in millions and to be quite stripping the bushes of their old leaves.

The caterpillars forwarded were evidently full-grown specimens, as immediately on their arrival in the Museum, when transferred to a rearing cage, they began to transform themselves into chrysalids. The moths which emerged after about twelve days, were identified as belonging to the species *Euproctis latifascia* of Walker, who describes the female as follows:—

White. Antennæ with testaceous branches. Abdomen brown, white at the base, luteous at the tip. Length of the body 6 lines; of the wings 20 lines.

Hab.—Nepaul.

According to Sir G F Hampson, the species is identical with Walker's *Euproctis antica* and *E. postica*, and Moore's *E. abdominalis*, which have been described thus:—

Euproctis antica, Wlk, ♂ and ♀. White head, palpi, fore part of the thorax and fore legs. luteous in the male, testaceous in the female.

Female.—Abdomen and fore wings with a very slight testaceous tinge. Length of the body 5-7½ lines; of the wings 12-18 lines.

Hab.—Nepaul, Hong Kong, India.

Euproctis postica, Wlk. ♀. White. Palpi porrect, smooth, hardly extending beyond the head; third joint conical, not more than one-fourth of the length of the second. Antennæ very broadly pectinated. Abdomen brown above; apical tuft, small, white. Legs pubescent; hind tibiæ with four long slender spurs. Wings rather short. Fore-wings rounded at the tips; exterior border convex, very slightly oblique. Length of the body 6½ lines; of the wings 14 lines.

Hab.—Hindustan.

Euproctis abdominalis, Moore, ♂ and ♀. Cream-white; abdomen blackish; and tuft ochreous; legs white.

Expanse, ♂ 1 1/10, ♀ 1 3/10 inch.

Hab.—Dharmasala.

Allied to *E. postica*. Wings comparatively longer and narrower.

2. THOSEA CERVINA, MOORE.

(Sub-ord. Heterocera, Fam. Limacodidæ.)

In July 1894* were received from Messrs. Finlay, Muir & Co. specimens of live cocoons, the caterpillars of which were reported to have done a good deal of damage to tea plants on the Rungamuttee garden in Jalpaiguri.

From the cocoons, two moths, a male and female, were successfully reared in the Museum; these, however, proved to be unrepresented in the Museum Collection, but they were so far identified as belonging to the genus *Thosca*. For more precise determination, the female moth was sent to Sir G. F. Hampson of the British Museum who very

kindly identified it as *Thosca cervina*, Moore. His description of the moth is given below:—

Male.—Head, thorax, and abdomen red-brown. Fore-wing silky gray-brown, with a dark speck at end of cell, and a slightly incurved line from costa just before apex to near outer angle which is red-brown with a pale outer edge. Hind wing and underside dull brown. Antennæ with basal joint pale; a conspicuous white spot at end of fore tibia.

Female.—With the sub-marginal line of fore wing erect; the basal joint of antennæ dark: no white spot on tibia.

Larva green, with a yellow-bordered dorsal irregular band, linear and purplish anteriorly, dilated at middle and cleft behind, purple streaked, and with the angles at middle red; anterior and posterior subdorsal spinous tubercles; lateral and sub-lateral series of longer tubercles.

Hab.—Sikkim; Ceylon. Exp. 3 3/8, 44 millim.

The remedial measures suggested were that children might be employed to remove and destroy the caterpillars. If this were carefully done, and if also the cocoons were searched for, in and on the ground near the affected trees, and were destroyed, it would (if not of any immediate benefit) at any rate be likely to prevent or to alleviate a recurrence of the pest in a future year.

3. THOSEA DIVERGENS, MOORE.

This insect is another addition to the Indian Tea pests, of the genus *Thosca*.

In March 1897, specimens of a living cocoon were sent to the Museum by Mr. J. W. Fleet, with a note, that they were taken from the Bishnauth Tea Gardens, Darrang, Assam, where they had been doing damage to tea bushes.

From the cocoons, several moths emerged in the latter end of the month. They appeared to be new to the Museum collection and were forwarded to Sir G. F. Hampson who determined them as belonging to the species *Thosca divergens* Moore, = *Aphendala divaricata* Moore.

As the Museum Library does not possess Mr. Moore's description of *T. divergens*, it is not printed here, the description of *A. divaricata*, however, is quoted below.

Aphendala divaricata ♀. Upper-side pale purplish, brownish-ochreous. Forewing with a slender dark ochreous-brown band curving upward from posterior margin at one-third from the base to one-third before the apex, and from which a straight erect similar band extends from its costal end to the posterior angle. Body dark ochreous-brown. Expanse 1 3/8 inch.

Hab.—Sileuri. Cachar.

4. BELIPPA LOHOR, MOORE.

(Sub-ord. Heterocera, Fam. Limacodidæ.)

In March 1897, Mr. W. J. Fleet forwarded to the Museum several living specimens of cocoon, with the statement that he had collected them from the Salolah Tea Estate, Assam. About the same time similar (live) cocoons were also sent to the Museum through Dr G. Watt, Reporter on Economic Products to the Government of India, as infesting tea plants in the Doom Dooma Tea Gardens, Dibrugarh, Assam.

The samples of cocoons were separately confined in a breeding cage, from which, after a lapse of a week, moths began to emerge. These on examination proved to belong to the genus *Belippa*; the species being new to the Museum collection.

On submitting specimens of the moth to Sir G. F. Hampson for identification, he pronounced it to be identical with *Belippa lohor*, Moore, the female being almost indistinguishable from that of *Belippa taleana*, Moore, and hitherto unknown to entomologists.

* The account of this pest should have appeared in the preceding number of *Indian Museum Notes*, but owing to the delay in ascertaining the identity of the species it was withheld.—Ed.

Mr. Moore describes the male, as deep ferruginous: fore-wing with patches on the disc, and a small patch at the apex, black hind wing with a triangular hyaline space from exterior margin; the anterior and abdominal margins fuliginous-brown; thorax with two black spots in front, and one on each side; base of abdomen black. Expanse $1\frac{1}{2}$ inch.

Hab.—Cachar, Java.

5. ASTYCUS LATERALIS, FABR.

(Order Coleoptera, Fam. Curculionidæ.)

Through Dr. G. Watt, Reporter on Economic Products to the Government of India, were received in the Museum in July 1897, specimens of a weevil said to be attacking tea plants in Assam. The original sender wrote concerning them that "they came during one night in thousands and simply stripped the bushes they were on." Fortunately they are easy to catch.

The specimens proved to be the same as *Asticus lateralis*, Fabr., which has previously been recorded as attacking various plants in different parts of India.

In 1889, Mr. Beck submitted specimens of this insect for examination, and reported that they attacked the leaves of the "Some" plant in the Raj Gardens, Darbhunga. In Vol. II, *Indian Museum Notes*, page 151, it is referred to as "a small greenish weevil reported in the beetle stage as defoliating mulberry (*Morus*) bushes in Rangoon. Also thought to be the species which has been reported by Mr. Thompson as tunnelling into the timber of Chir (*Pinus longifolia*) in the North-Western Provinces; in this case the injury is no doubt done by the larvæ of the insect."

6. DIAPROMORPHA MELANOPUS, LACORD.

(Order Coleoptera, Fam. Chrysomelidæ.)

In July 1897, specimens of a beetle which proved to be *Diapromorpha melanopus*, Lacord, were sent to the Museum by Messrs. Williamson, Magor & Co. who reported that it had been doing damage among the tea bushes on one of their Assam estates in the Jorehaut district.

This insect (known as the "Orange" beetle) is commonly found in tea gardens in Assam, where it no doubt does a good amount of injury by eating up the tender stems of tea-shoots.

Specimens accompanied by complaints of damage done by it are annually sent to the Museum, but no action, it appears, has hitherto been taken to ascertain the life-history of the pest.

7. CREMASTOGASTER ROGENHOFERI, MAYR.

(The Red and Black Ant of the Tea Bushes).

In his report on the "Pests and Blights of the Tea Plant of Assam, 1898," Dr. G. Watt, Reporter on Economic Products to the Government of India, makes mention, in page 257, of a red and black ant which he had observed infesting tea bushes in Assam.

His elaborate account of the habits, etc., of the insect is very interesting, but his identification of the species with *Cremastogaster contenta*, Mayr., is incorrect. Dr. Watt was good enough to present specimens to the Entomological Section of the Indian Museum, these are undoubtedly identical with authentically named specimens of *Cremastogaster rogenhoferi*, Mayr., in the Museum collection.

To make quite certain, a few examples of the insect were despatched to Dr. Forel, of Zurich, who confirmed the identification as "*Cremastogaster rogenhoferi*, Mayr., one of the commonest species of India."

8. EUPROCTIS CATERPILLAR.

On the 19th March 1897, from Dr. G. Watt, Reporter on Economic Products to the Government of India, were received specimens of a caterpillar reported as doing a deal of damage to the tea bushes in Darjeeling. The following is an extract which he forwarded regarding the pest:—

"A new sort of this blight has developed. A blackish-brown hairy species, they attack the old leaves and strip the trees. This pest does all its ravages at night and hides itself under clods and stones during the day. I have boys on catching some thousands daily. They appear on the dry ridges and are not found in any damp hollows. They have stripped some 50 or 60 acres on an adjoining garden and are now attacking the bark. On lower portions of Lebong and M. S. they have now appeared and are now doing considerable harm. I am sending you a bottle-full in spirit. I fancy they will disappear with rain, but of this there is no sign."

The specimens appeared to be the larvæ of a Lymentriid moth probably of the genus *Euproctis*, and not unlike the tea caterpillars sent in by Messrs. Andrew Yule & Co. from the Darjeeling district. (See p. 180).

9. PSYCHID CATERPILLAR.

In July 1897, specimens of a bag-worm said to be doing great injury to tea plants in the Golaghat district, Assam, were forwarded to the Museum through the Secretary, Agricultural and Horticultural Society of India.

The specimens proved to be the larvæ of a Psychid moth probably belonging to a species hitherto undescribed. We have only a few examples of the larva-case of this insect in our collection, but unfortunately we possess no moths, and Sir G. F. Hampson does not mention this species in his catalogue of moths of British India, Ceylon and Burma.

The most curious thing noticeable in this interesting group of moths is their larva-cases or protective coverings, which are usually composed of a silk lining with twigs, grass, and bits of leaves or vegetable matter attached on the outside, and are so constructed as to resemble little bundles of dried sticks, leaves, etc. In this insect, however, the larva-case is smooth and is covered with a coating of very finely divided vegetable matter and exactly resembles a thorn.

10. COLEOPTEROUS LARVÆ.

In July 1897, Mr. D. Hooper, Curator of Economic Museum, sent to the Indian Museum specimens of grubs reported as tea pests for identification. He wrote:—

"A correspondent in Nazira Division, Sibsagar, has sent me the accompanying bottle of white grub (*Lachnosterna impressa*) as a tea pest. Most of the smaller forms seem stages of the larvæ of that beetle, but I cannot think the very large ones can be the same species. I shall be much obliged for your opinion and, if possible, determination. I have found the very large one all over Assam imbedded in hard mud-houses of which I send a sample. It is particularly common in hard clay soils and does much damage to rice. These I at first mistook for queen whiteant houses until I dug them out for myself and found them invariably occupied by identically similar larvæ to the large ones herewith supplied. They are no doubt a species of *Lachnosterna*, but are they *L. impressa*

"I shall be very glad of any suggestions, more especially whether the very large larvæ have been known to injure the tea in the event of their being pronounced distinct from the smaller form."

The specimens proved to belong to two different species of insects, namely:—The large grubs are the larvæ of a Melolonthine beetle probably belonging to the genus *Lepidiota*, and the smaller ones are apparently the immature forms of *Lachnosterna impressa*.

11. COCCIDS.

Four bottles containing specimens of scale insects reported as infesting tea plants in the Darjeeling district, were received in the Museum through the Reporter on Economic Products to the Government of India. The following particulars regarding the insects are taken from his forwarding letter, dated 28th May, 1897:—

"No. 1, seems somewhat like *Aspidiotus flavescens* and is said to be the most dangerous of the series. It attacks the young twig of young tea, the scale-insects inserting themselves below the bark and thus raising and distorting it, in older twigs the life seems sucked out of the plant through this rupturing of the bark and the withdrawal of the sap. The young insects are alive and seen escaping."

"No. 2, is said to be a twig with long white blotches."

"No. 3, a twig with large wax insects."

"No. 4, similar insect of smaller size and with orange-coloured central portion."

The specimens proved to belong to four different kinds of Coccids, namely:—No. 1 consisted of badly preserved specimens of larvæ apparently of *Aspidiotus theæ*, Mask; No. 2, consisted of examples of an unknown Coccid not represented in the Museum collection; No. 3 consisted, of a few larva-scales probably belonging to the species *Ceroplastes ceriferus*; and No. 4 contained specimens of a Coccid hitherto not reported as occurring in India.

Specimens Nos. 2 and 4 were forwarded to Mr. W. M. Maskell for identification, and his report on them is given below:—

"The two parcels of tea leaves with Coccids. One of these insects is evidently a *Pulvinaria*, but only the white cylindrical cottony sacs remain: the insects themselves (as usual in the genus) have fallen off: therefore I cannot identify the species.

"The other (No. 4), of which you sent three specimens and a small coloured drawing, is a *Ceroplastes*. The specimens are not sufficient for clearness. They seem to me to be, nearly certainly, either *C. vinsonii*, Sign. (Mauritius), or *C. floridensis*, Comst., which Green reports on tea in Ceylon. Very probably both these are the same species; but your insects are not in the full-grown stage or at least I think not. Every character corresponds to *C. vinsonii*, but also nearly all to *floridensis*. If you could let me have undoubtedly adult specimens and larvæ, I should be more positive. However, the thing seems to be one or other of the two species named."

12. CERONEMA SP. [COCCID].

In May 1897, the same officer forwarded to the Museum specimens of tea leaves attacked by scale-insects. No report accompanied the specimens and no locality was mentioned in the forwarding note.

The insects appeared to be new to the Museum collection and were forwarded to Mr. W M Maskell

who very kindly identified them as belonging to the genus *Ceronema*. He wrote, "this is a peculiar and abnormal form which I have had a few months ago from Japan, on *Ilex crenata* and an unnamed plant. I am very much inclined to attach it to my genus *Ceronema* of 1894: the main difference from the single species *Cero. banksiae* being that the curling white processes in your insect spring from the middle region and curl outwards, while in *C. banksiae* they are marginal and curl inwards. But I have not yet made up my mind, at least on some minor points."

VI.—SOME BENEFICIAL INSECTS IN INDIA.

The following letter from the Superintendent of the Indian Museum, to the Honorary Secretary to the Trustees, covers a valuable report from Mr. E. Barlow, the Assistant in charge of Entomology, on this subject:—

With reference to your endorsement No. 187-RR, dated 27th September, 1897, forwarding a letter No. 1427-39-2, dated 18th September, 1897, from the Officiating Under-Secretary to the Government of India, together with copies of correspondence from the Government of Madras Nos. 634 and 635, dated 27th July, 1897, relating to the very promising subject of utilizing Lady-birds and other natural enemies of the insects pests of the country, I have the honour to submit the following report by Mr. E. Barlow, the Assistant in charge of Entomology:—

"In India there is already known a good number of indigenous insectivorous insects belonging to the three orders of Coleoptera (beetles), Diptera (two-winged flies), and Hymenoptera (Ichneumon flies, etc.), which have proved to be more or less beneficial to agriculture by keeping down insect pests.

"I.—SOME BEETLES KNOWN TO BE DESTRUCTIVE TO PESTS.

"(a) Among the Lady-birds I may mention—

"(i) *Chilocorus circumdatus* Schonh, which is said to prey upon the brown bug (*Lecanium coffea*) of coffee plants in Ceylon.

"(ii) *Scymnus rotundatus*, Motsch, which is parasitic upon the white bug (*Pseudococcus adonidum*) of coffee bushes in Ceylon.

"(iii) *Platynaspis villosa*, Mulsant, attacks the scale-insect (*Icerya aegyptiacum*) in Calcutta.

"(iv) *Vedalia fumida*, var. *roseipennis*, Muls., said to prey upon the Coccid *Icerya aegyptiacum* in Calcutta.

The last named was submitted to Mr. L. O. Howard, United States Entomologist, for identification who wrote regarding it (see *Indian Museum Notes*, Vol. 4, No. 1, p. 28). 'It is interesting to find that this Coccinellid is not distantly related to the well-known *Vedalia cardinalis*, Mulsant, which Mr. Albert Kæbele of this department, brought from Australia some years ago, and which destroyed *Icerya purchasi* on our Western coast. It is Mulsant's *Rhodolia roseipennis*, which according to Crotch's revision of the Coleopterous family Coccinellidæ, is a colour variety of *R. fumida*, Muls. Accepting the nomenclature given by Crotch, the name of the insect is therefore *Vedalia fumida*, var. *roseipennis*, Muls.' It may be mentioned that the *Vedalia cardinalis*, here referred to is an Australian species of Lady-bird which on introduction into America is said to have at once cleared thousands of orange trees of destructive scale-insects of the species *Icerya purchasi*.

“(b) Among beetles other than Lady-birds are—
“(v) A tiger beetle of the species *Cicindela scappunctata*, Fabr., which devours the rice-saw (*Leptocorisca acuta*) in Chumpanun.

“(vi) A Carabid beetle *Calosoma orientale*, Hope, which destroys the young locusts of the species *Acridium peregrinum*, Oliver.

“II.—SOME DIPTERA (TWO-WINGED FLIES)

KNOWN TO BE DESTRUCTIVE TO

INSECT-PESTS.

“(vii-viii) *Syrphus nictneri*, Schinr., and *S. splendens*, Dolesch, the larvæ of these two flies are said to prey on the coffee Aphid (*Aphis coffeæ*) in Ceylon.

“(ix) *Anthomyia peshawarensis*, Bigot, parasitic upon the eggs of the locusts (*Acridium peregrinum*) in India.

“(x) *Masicera subnigra*, Wulp., parasitic upon the larvæ of the moth *Oleoc mendosa*, Hubn., which attack tea plants in Darjeeling.

“(xi) *Masicera castanea*, Wulp., said to prey upon caterpillars of the moth *Leucania extranea*, Guen., which attack the young paddy plants in Bengal.

“(xii) *Masicera dasychira* Wulp., parasitic upon caterpillars of the moth *Dasychira thwaitesii* which does much damage to tea plant and sal tree in Assam.

“(xiii-xiv) *Demoticus etrigipennis* Wulp., and *Calodexia lasiocampe*, Wulp. The larvæ of these two flies are parasitic upon a hairy Lasiocampid caterpillar destructive to rice in the Central Provinces.

“(xv) *Mittogramma 12-punctata* Wulp., which preys upon the locust (*Acridium peregrinum*) in India.

III.—SOME HYMENOPTERA (FAMILY CHALCIDIDÆ)

KNOWN TO BE DESTRUCTIVE TO

INSECT-PESTS.

“(xvi) *Chalcis (Brachymeria) euplæa* Westw., preys upon the Dooars tea and sal caterpillar *Dasychira thwaitesii*.

“(xvii) *Cotesia flavipes*, Cameron parasitic upon the Sorghum-borer (*Diatraea saccharalis*).

“(xviii) *Aphelinus theæ*, Cameron, a minute fly-like insect that attacks the tea scale bug (*Chionaspis theæ*, Mask).

“(xix-xxvi) *Cirrospilus coccivorus*, Motsch., *Encyrtus nictneri*, Motsch. *E. paradisiæ*, Motsch. *Scutellista cyanea*, Motsch, *Marietta leopardina*, Nietner, *Cephalota purpuriventris*, Motsch., *C. brunneiventris*, Motsch., and *C. fusciventris*, Motsch., are said to be parasitic upon the Brown bug (*Lecanium coffeæ*) of coffee plant in Ceylon.

“(xxviii) *Chartocerus musciformis*, Motsch., said to attack the white bug (*Pseudococcus adonidum*) of coffee plant in Ceylon.

“(xxviii) *Pteromalus oryzae*, Cameron, a minute coppery green-coloured Ichneumon-fly believed to be parasitic upon the wheat and rice weevil (*Calandra oryzae*) in India.

The above are some of the indigenous species of insect-parasites of insect-pests that have come to light without any special inquiry, and no doubt systematic research (which certainly ought at some day to be undertaken, would reveal many more. In the face of Mr. Barlow's report it can hardly be hoped that the introduction of a single foreign

species of Lady-bird—even if that species be able to hold its own against the native species—will have any very marked effect.

PRODUCE AND PLANTING.

SOME EXCUSE FOR RETRENCHMENT.—Commenting on Mr. Geo. Seton's table of the workings of Indian tea companies the “Grocer” sees some “excuse for the Indian tea planters' recent anxiety to retrench.” The forty-five registered Indian tea companies did worse financially during 1898 than they did in the previous year. Then the profit on their joint capital was, as our authority shows, only 5.56 per cent., whereas in 1897 it stood at 5.98 per cent. This diminution in their profits is elaborately demonstrated in the tables referred to, wherein it is seen that the paid-up capital was £7,017,885, against £7,215,498 in 1897; also that the “cultivated area” was 175,427 acres, instead of 173,071 acres in the former year; that the actual sale weight of the crop was limited to 65,706,075 lb, as opposed to 65,726,558 lb. in 1897; and that the “ratio expenses to receipts” were 84 per cent, as compared with 82 per cent in 1897, and 77 per cent only in 1896. “Here,” says the “Grocer,” “certainly, is matter for serious consideration, and we may proceed to point out a few facts embodied in Mr. George Seton's statement which cannot be easily gainsaid. We have already alluded to the capital involved, the lands planted, the aggregate quantity of tea produced, and the net average cost of its production. A further question of interest is the profits realised. These, we find, varied from 0.11 to 4.01 pence per lb, as many as seventeen companies (out of forty-five under review) making less than 1d per lb profit on the whole year's working, and only four or five managing to earn about 2d per lb over and above their ordinary outlay to keep their concerns in going order. It is true that two companies, more fortunate than the rest, succeeded in netting a gain of 3.21 and 3.87 pence per lb, and one as much as 4.01 pence (quoted above), but these were rare exceptions, and served only to accentuate the poorness of the returns that fell to the lot of other cultivators and shippers acting in the interests of British consumers. Next we notice the rates of dividend, the natural and final test of all industrial undertakings, and these, on the whole, turn out to be smaller than they were in previous seasons. Only a single company, the Brahmapootra, was successful enough to pay a dividend of 15 per cent; followed at a short distance by the Amalgamated Estates, the Assam, the Dooars and the Doom Dooma companies with their 12½ per cent ‘divi’; and a little further behind came the Jorehaut with 11 per cent, and the Balijan, Consol. Tea and Lands, Jokai, Lebong, Moran and Rajmai tea companies with their distribution of 10 per cent on their paid-up capital. An 8 per cent dividend was declared by the British Assam, Lankapara and Meenglas proprietors; 6 per cent by the Chubwa Company; and 5 per cent by the Darjeeling, Derby, Eastern Assam, Jhanzie, Longai Valley, Majuli, Moaband, Sephinjuri Bheel and Tingri interests. Others doled out the more modest rates of 2 per cent to 4½ per cent, whilst the payments of eleven Indian tea companies were simply nil; and this notwithstanding that the total receipts from the 45 workings were £2,383,000, as contrasted with £2,304,000 sterling in 1897, when the profits were larger. As we observed a twelve-month ago. All this was too well-known beforehand to occasion any surprise amongst those acquainted with the secret movement of the tea trade at home; and there can be no doubt that the combined ill-effects of the ‘1897’ famine, the frontier disturbances, and damage done to crops and outbuildings by earthquakes in our Indian Provinces, told seriously upon the industrial pursuits and conditions of life of the native populations. Bearing these cross circumstances in mind, it is no wonder that, though an enormous tea crop was raised, its quality generally was that of a poorer class, which consequently failed to yield a higher price with which to defray the heavier expenses of cultivation, and contribute towards more handsome dividends.”—*H. and C. Mail*, Aug. 25,

Correspondence.

To the Editor.

PLANTERS' ASSOCIATION OF CEYLON.

RUSSIAN DUTIES ON TEA.

SIR,—I enclose for publication copy of a communication received from Government on the subject of the duties levied on Tea by the Russian Government.—I am, sir, yours faithfully,

W. D. GIBBON, PER H. W. GAVIN.

Colonial Secretary's Office, Colombo, 25 Aug. 1899.

SIR,—Adverting to my letter of the 17th, January 1899, forwarding for the information of the Planters' Association, a copy of a Despatch from the Secretary of State for the Colonies together with a copy of a communication from Her Majesty's Ambassador at St. Petersburg, on the subject of the duties levied on Tea by the Russian Government, I am directed by His Excellency the Lieut. Governor to forward for the information of your Association, a copy of a despatch, received through the Secretary of State, from Her Majesty's Ambassador at St. Petersburg to the Marquess of Salisbury reporting certain alterations in the duties payable on imported tea under the Russian Customs Tariff.—I am, sir, your obedient servant,

(Signed) J. J. THORBURN,
for Colonial Secretary.

[Copy Referred to.]
St. Petersburg, July 12th, 1899.

My LORD,—I have the honor to report that according to a decision of the Council of the Empire, passed on the 4/16 June, 1899, and published in the Bulletin of Laws of the 25th June—7th July, 1899, the following alteration under the Russian Customs Tariff in respect of the duty payable on tea are decreed:—

1. Brick Tea, Black and Green, imported into Russia, across the European frontier to pay duty at the rate of 11 Roubles, 25 Copecks per pound (former duty 31 Roubles 50 Copecks per pound.)

2. Black, flower, green and yellow teas imported at the frontiers of the Steppe, Irkutsk and Cis-Amur Governor-Generalship's to pay duty at the rate of 22 Roubles 50 Copecks per pound. (Former duty 19 Roubles 50 Copecks per pound.)

With the completion of the Russian Lines of rail to the Pacific the rates of duty on tea will be subject to further consideration.—I have, &c.,

(Signed) CHARLES S. SCOTT,
The Marquess of Salisbury, K.G., &c., &c., &c.

THE PROPOSED ABOLITION OF THE ENGLISH TEA DUTY.

Kandy, August 26.

SIR,—I enclose copies of some correspondence re the abolition of the English Tea Duty, which will no doubt be of interest to your readers.—Yours faithfully,

W. D. GIBBON,

Per. H. W. GAVIN,

Acting Secretary to the Planters' Association of Ceylon.

Kandy 23rd May, 1899.

The Secretary, Indian Tea Association, Royal Exchange Building, Calcutta.

DEAR SIR,—Adverting to my letter of the 14th ultimo, I now herein annex for your information and guidance copy of Resolution passed by the Committee at a recent meeting when your letter was considered.

In terms of the first part of the resolution I transmit herewith printed copies of the correspondence that passed between a member of the Committee (Mr. E. J. Young) and some of the leading London Brokers which probably to a certain extent inclined the Committee to take the view expressed in the resolution to which you draw attention. I also hand you extract of a speech made by the Chairman, Planters' Association on the subject at the annual general meeting.

It may be added for further guidance that the Committee of the Planters' Association hesitates to support an agitation for abolition of the Duty on the ground that there would be no check on teas entered for home consumption and that without this check, the market might be flooded with *rubbish teas*, which it is understood under present conditions are stopped at the Customs. There is also some doubt whether a reduction of the Duty would directly benefit the consumer and would not chiefly benefit the *low priced Teas* of China and other competing countries.—I am, Dear Sir, Yours faithfully,

(Signed) A. PHILIP,

Secretary to the Planters' Association of Ceylon.

RESOLUTION REFERRED TO.

"That for the guidance of the India Tea Association, copies of the correspondence that passed between Mr. E. J. Young and the London Brokers be forwarded with connected papers, and that the India Tea Association be asked if they will favor the Planters' Association with a full expression of the views of the India Tea Association in support of the opinion so strongly held that the total abolition of the English Import Duty should be agitated for."

Indian Tea Association, Royal Exchange Building, No. 463—O. Calcutta, 17th August.

The Secretary, Ceylon Planters' Association.

ABOLITION OF THE ENGLISH IMPORT DUTY.

DEAR SIR,—I am directed by the General Committee of the Indian Tea Association to address you, in continuation of my No. 334-O, of 16th June, and with reference to your letter of 23rd May, on the above question.

The resolution passed by your Committee, and the papers to which it refers, have had their attention. In giving expression to the views held by my Committee it will, I think, be convenient to first of all deal with the points referred to in your papers.

The reasons given for the attitude taken up by your Committee may, I think, be summarised as follows:—

1. That abolition will remove all check upon teas entered for consumption and that thus the market might be flooded with "rubbishy" teas,
2. That reduction or abolition might chiefly benefit low-priced teas from China.
3. That the time is not propitious for agitating the question.

In regard to the first objection I am to point out that whether an article of food is dutiable or not it is subject to the same laws in respect of its fitness for human consumption. Abolition would not remove any of the checks imposed as obstacles to adulteration so far as the law goes, and the question resolves itself therefore into this: as to whether or not the Customs no longer having to carefully weigh the tea would relax their vigilance, and whether, if they did, other checks in existence, or which might readily be introduced if required, would not operate sufficiently. Is there any reason to suppose that adulterated tea would escape detection when other imported non-dutiable foods do not? One does not hear complaints on this score in connection with grain, cheese, butter, eggs, tinned provisions, and so on, and my Committee think the objection is hardly worth considering. They observe, however, that you use the word "flooded" in connection with the expression "rubbishy teas," and they think you may include under the adjective "rubbishy," teas that are not adulterated in any way, but merely extremely poor. If so, they would ask you whether these come into the question at all. My Committee are under the impression that tea, however poor, so long as it

is tea, and not unfit for human consumption, cannot be stopped under present conditions, any more than it would be in the absence of an import duty.

Your second objection is of course the more important and it covers more ground. Arguments supporting this objection are all based on the fact that as the duty of 4d bears a greater proportion to the average cost of China tea in bond than it does to British grown tea, reduction or abolition of duty would amount to a larger percentage in the case of the former than of the latter, and on the idea that this relatively larger reduction would have an appreciable effect upon consumption, also relatively. It is admitted that reduction of duty in the post has tended to increase consumption as a whole, and that further reductions would have similar effects. Why should the relative effects be different? The reduction of duty from 6d to 4d did not check the progress of British-grown teas, and my Committee do not believe that a further reduction would do so. They cannot find anything in the history of India and Ceylon tea in any country to support the assumption that a high or low duty affects the progress thereof in relation to China tea. British tea has won its way so far because it is a better article, and where known meets better the public taste, and, in the opinion of my Committee, it will continue to hold its own in any field where it has an equal chance. Therefore anything that tends to increase the consumption of tea as a whole will be to the benefit of India and Ceylon. They further direct me to point out that this argument has never yet been brought forward in any other connection. India and Ceylon have never considered the question of duties when attacking new markets, but have spent money freely in countries where tea was free, and where duties range from 1d up to say 1s 10d per lb. in the United States there was no duty when the joint campaign was begun there, nor did anyone suggest that it would be advisable to attack Russia first because she levied a one and tenpenny duty. On the contrary the 10 cents duty levied by the United States in consequence of the Spanish war was looked upon as a misfortune, and India and Ceylon do not so far as my Committee know consider its imposition an advantage to them in endeavouring to obtain an increased share of the American trade in tea. My Committee then contend not only that all experience bearing upon the subject is against the assumptions upon which the second argument is based, but that the policy of both Ceylon and India in capturing fresh markets has hitherto ignored all considerations of the kind. They think that the same principles may be applied in endeavours to expand old markets as to the exploitation of new ones.

With regard to the remarks made by your Chairman in this connection about the blending of cheap common teas, I am desired to say that, in the opinion of my Committee, everything which tends to lessen the cost of delivering good teas to consumers will tend to an increased use of such teas in blends. The 'shilling canister' undoubtedly has a depressing effect upon wholesale prices, and your Chairman is no doubt correct in his description of the present tendency in blending, but my Committee think that the best way of curing the evil is to make an honest shilling canister of British-grown tea possible.

The third point I have noted above is that the time for agitating for the reduction or abolition of duty is not propitious. My Committee would certainly not advocate an agitation which was not backed very strongly by proprietors and all interested in Indian and Ceylon tea as growers, but granting reasonable unanimity, which is the first thing to be obtained, my Committee advocate agitation at every possible opportunity. It is true that the British Government are meantime committed to an unprecedented rate of expenditure and may be unable to forego immediately any existing source of revenue, but a further expansion of revenue, or a change of policy, or of Government, may come very soon, and sooner or later may certainly be expected. It is very desirable, therefore, that Ceylon and India should come to one mind on

this subject now, and be ready to take advantage of every opportunity to strengthen the sentiment which already exists in favour of a "Free Breakfast Table" in the United Kingdom.

I now turn to a matter upon which my Committee lay considerable stress, but which is only hinted at by one of the correspondents quoted in the papers you sent to this Association. I mean the saving in London warehouse charges—now felt to be so grievous a burden—which would inevitably follow abolition of duty. A duty imposes upon any trade affected, charges amounting to a considerable percentage in addition to such duty. In the case of tea this percentage would be but a moiety of the saving which Messrs. Walker, Lambe & Co. refer to when saying "the conditions under which teas must be entered and warehoused and handled for the mere purpose of securing and collecting the duty are necessarily cumbersome and expensive." When added together all these charges direct, and incidental, must be very heavy indeed, whilst if importers were freed from the necessity of going into 'Bond,' it is obvious that the field for warehousing would be extended, and the possibility of reducing such charges as would still be incurred much increased. At present, as you are aware, the London Warehousing Companies refuse to consider any suggestion to reduce charges, and under existing conditions they have practically a monopoly. My Committee believe that abolition of the duty would weaken, if it did not destroy this monopoly, and that a further reduction of the then remaining charges would be possible. These advantages would only accrue in the event of abolition, and this is why my Committee strongly advocate an agitation with this end in view in preference to asking merely for a reduction of duty.

In urging upon you these further reasons for agitating this question, my Committee would call attention to the fact that if the argument of what I may call relative effects upon the trade of British and China-grown teas holds good at all, it is good against a reduction of any charges that affect all teas imported into London and which are levied upon weight. This fact of itself seems to them to reduce the argument to an absurdity, and they trust your Committee will not be led to accept a theory which would logically debar any endeavour to reform any charges coming within the above category.

I regret that there has been so much delay in answering your letter, but my Committee thought that figures from Australia, where rates of duty have varied much, and are still variable, might throw some light on the discussion. Those from New South Wales are only just to hand. These figures, so far as they go, show that in Australia experience does not justify the fears expressed in regard to the future in England should the duty there be reduced or abolished. Abolition in New South Wales did not stop the decline of the China trade nor reduction in Victoria a very largely increased share to British-grown teas in a trade of greater total volume, and the causes for variations from year to year in the relative progress of the rival Empires, must be sought for elsewhere than in alterations of duties.

I send copies of the statements received which relate to Victoria, New South Wales and Queensland for your information.

My Committee hope that you will see your way to join them in urging upon both the Associations in London the desirability of pressing for abolition.—Yours faithfully, J. TAYLOR, Acting Secretary.

ACCOMPANIMENTS:—Three Statements, A, B and C, (The first shows the imports into New South Wales between 1889-98 with the duty imposed each year; the second those into Victoria and the third those into Queensland.)

The earliest records available shew that in 1853 a duty of 3d per lb. was in force in Victoria. The following year the duty was raised to 6d per lb., and no alteration took place till 1865 when it was lowered to 3d per lb. and remained so till the 31st

December 1889. From the 1st January 1890 the duty was reduced to 1d per lb., but on the 13th July 1892 it was again raised to 3d per lb. and has remained so ever since.

H. V. P. WOLLASTON,
Secretary for Trade and Customs.

Department of Trade and Customs, Melbourne, June 28th, 1899.

THE BRITISH TEA DUTY.

Dessford, Nannoya, 12th Sept. 1899.

SIR,—The attitude of Ceylon tea producers towards the question of the abolition of the English import duty on tea, is, I think, that of sitting on the fence until they are convinced that they will benefit by such abolition. This is my excuse for trespassing on so much of your space, in the hope of inducing a careful consideration of the question.

It is a trade axiom that the reduction of the selling price of any commodity to the consumer stimulates the consumption of that commodity, the converse of course being equally true. As an example, have we not always seen a prolonged season of low prices in the tea market followed by a rise, and we are told in the Brokers' circulars that "the recent low prices have stimulated consumption" and so reacted on the selling price.

Hitherto the reduction in price to the seller has been entirely at our expense, and the immutable law of supply and demand made such a lowering of price necessary in order to get the tea consumed.

When it is suggested that we should cheapen the cost of our teas (which, other things being equal, must mean an eventual reduction of price to the consumer) by the abolition of the one pound draft or the reduction in warehouse charges, &c., we have the whole of the producers with us, but, when the reduction or the abolition of the duty is mentioned, many producers seem to think that some occult force will be set in motion, by which the laws of supply and demand would be stopped if not reversed.

What would naturally follow the abolition of the duty is as follows: For the first year, possibly longer the 4d saved would be divided in some proportion between the producer, the middleman, and the consumer, but sooner or later the consumer would be the only one to benefit so far as price is concerned, the middleman would do a larger turnover from the increased consumption and the producer, supposing he is able to keep the ratio of supply to demand as it is at present, would then make the same profit per lb. as at present on a larger number of lbs. The price paid to the producer is and can only be governed by that ratio, always supposing there is free competition and no buyers' combination and the sudden rise in the lower qualities of tea during the early part of this year is to my mind sufficient proof that no such combination exists.

Again, the abolition of the duty reduces the amount of capital necessary to deal in tea and thus helps the small dealer against the large capitalist which in itself would tend to make a buyers' combination more difficult and increase competition, all in the favour of the producer.

In an article communicated to the *Observer* of the 5th inst., the writer bases his arguments largely on the number of gallons of liquid tea drunk, reasoning from his figures that there was no increase from the reduction in duty in 1890, but can he say or does he think that the lower classes do not drink a very much stronger brew than they did formerly?

Our deliveries of Ceylon teas increased nearly 11,000,000 lb. in the year 1890-1891, or the year following the reduction and nearly 19,000,000 lb. in

the following year which shows that we certainly did not suffer from the reduction.

He also states that the producer gets a better living out of dutiable articles than out of free, and instances sugar, possibly forgetting that it is the bounty fed beet sugar that has caused the fall and that English consumers are buying their sugar at a lower price than the consumers in the sugar producing continental countries.

In other words if the continent chose to subscribe together in order that the Englishman can have cheap sugar, it is hardly a sound argument to instance it as a free article. Again last year wheat was a most remunerative crop, and I suppose that most shareholders in coffee concerns will agree that that product was as unremunerative as it well could be, the reason having nothing to do with duties, but being merely an instance of supply and demand, and the existing ratio of the one to the other being upset.

There are many other points such as the reduction of warehouse charges, which I have not touched on, as, though important, they are really side issues.

Apologising for the length of this.—I am, &c.

EDWARD ROSLING.

"MUTATO NOMINE."

The *Ceylon Observer* reads the Government of Ceylon a lecture on its apathy in regard to the scientific aspect of planting. Well might we turn upon the Government of Madras, say *mutato nomine de te fabula narratur*, and then declaim in like manner, and with emphasis. In Ceylon they have tea-pests in full bloom, so to speak; they are feeling the effect. The present blights are, the *Observer* is informed, steadily spreading through the planting districts, and as our contemporary says, "if they get a firm hold, it will mean a great deal to the colony, and the Government as well as the planter will feel the sad effects." The ravages of leaf-disease in coffee in Ceylon have not been forgotten. The memory serves as a standing lesson as to the need for prompt action when pests and blights threaten in seeming force. In Madras also, many planters have suffered, and, although the Government has certainly assisted them to a small extent, it still refuses to give the agricultural industry the assistance of a permanent scientific expert. A botanist has been appointed, certainly, and from the fact that his main work hitherto has been with respect to sugarcane-diseases, we judge that he may, at some future time, be allowed to bestow some attention upon tea and coffee. But the appointment of one scientist is not enough for a Presidency like that of Madras, nor is the botany of the Presidency by any means the section that most urgently calls for scientific study. Financial difficulties are decreasing now, and we trust that the Government of Madras will shortly take into serious consideration the question of establishing a well-organized scientific department. There is an admirable model in the United States, and something of the same kind, on a reduced scale, would no doubt prove very valuable here.—*Planting Opinion*, Sept. 9th,

In these tables all packages are chests unless otherwise stated. $\frac{1}{2}$ c for half-chests; p for packages, prices marked thus † represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

THE TEA DRAFT DISPUTE.

The Birmingham Grocers' Association in their quarterly report presented at the meeting held on Aug. 22, after stating the conditions agreed to, say:—

The Committee trust that all importers who joined in the movement will also view the settlement in this light. The Committee desire to record that each section forming the joint committee has throughout the negotiations worked together in the fullest accord in a common cause, and where any interests of the one producing country may seem to have been at variance with that of the other, a mutual understanding of unity of action has been loyally adhered to. The new system of weighing teas cannot be put into force until it has received the sanction of H.M. Customs, and a petition will immediately be preferred by importers and buyers to have the alteration carried out. It is hoped that the new regulations may come into force on October 2, but until that date all teas will be sold on the old conditions. In view of the recent cessation of sales and consequent accumulation of teas in London, the Committee urge upon importers the necessity for at once instructing their brokers to offer their teas under the rules of the Regulating Committee formed for the purpose of controlling the supplies to be offered for sale. The Committee congratulate the trade upon having resisted the demands of the tea associations. The result will have a far-reaching effect, as it is now highly improbable that dealers in other commodities

will attempt to abolish the draft. While the dispute with the Indian and Ceylon Tea Associations was on hand it was rumoured that one of the members of the Birmingham Association, and a prominent tea dealer, had broken the compact in purchasing Indian and Ceylon teas on the market. Fortunately the Committee were able to give an assurance that such was not the case, and they thank the whole of the traders of the district for loyally supporting the trade associations in the course they adopted for the purpose of enforcing their demands.

MONSTROUS ROSE IN PERADENIYA GARDENS, CEYLON.

Monstrosity is of common occurrence in flowers as in other forms of creation, and it does not seem to effect any one class in particular. Scarcely, however, is a more curious and interesting freak seen than that in the case of a rose which Mr. J. Ferdinandus, chief clerk at Peradeniya Gardens, has discovered the other day in his compound. This is a well-formed rose flower with stalk, petals and sepals complete, growing out of the ovary of another rose which has shed its petals, who can say but this may be the origin of a new type specially suited for button-holes, as the neat knot (swollen ovary) at the base of the new development seems to be an improvement on the old-fashioned spiny and slender stalk.—*Jor.*

A PRACTICAL TEST OF THE NEW TEA-TRADE CONDITION.

An aggrieved London firm writes to us as follows, adding a practical statement showing the injury wrought by an increased number of tarers:—Even this week numbers of the "Joint-Committee," in defence of their insisting upon separate tares being taken, have said they "don't believe it would make any difference to anybody."

This is a strange argument to use for insisting on a clause to be inserted in an agreement and for petitioning the customs to insist on it also, viz, that it would make no difference to any one. The following however shows the injury inflicted on some, and the difference it may make to a good many of those concerned:—

292 Packages Ceylon Tea, ex "Ophir," of value £650, sold 1st August, 1899, chested as soon as made, and bulked in London.

Tares ran even and average tares were accepted. There were tared 5 chests at a cost

of 1/ each
12 chests at a cost of 10d each £0 15 0

17 chests.

There were bulked 74 chests at a cost of 1/ each
218 chests at a cost of 10d each £12 15 8
292 chests.

The taring and bulking together... £13 10 8 actual cost.

Under the Clause G, proposed by the Joint Committee for the so-called agreement, 2nd August, 1899, insisting on separate tares being taken, the charge would have been—
bulking and taring 74 chests at 1/5=£5 4 10
218 do 1/2= 12 14 4

292 packages. £17 19 2

say extra charge ... £4 8 6 proposed.

The above were bulked in London, because the Proprietors are of opinion that London bulking is better in several ways than Estate bulking.

Had the London bulking been forced on the Proprietors, as may occasionally happen to every garden Proprietor through the Tea being thrown up by buyers after sale on grounds of irregularity, the same extra charge would be incurred in every case, even if previously Estate-bulked and tares unquestioned, viz. : £4 8 6

and in addition
new Warrants at 4d. } say=1d. per 1 4 4
Weight-notes at 2½d. } package

an extra charge proposed by the Joint Committee for reasons known only to themselves } £5 12 10

London, 25th August, 1899.

AUSTRALIAN AGRICULTURAL NOTES.

SYDNEY, Aug. 24.

Yesterday I paid a visit to the Land Office, round which I was conducted. Part of it is devoted to Agriculture, and in the Agricultural Library I saw pamphlets and reports from all

parts of the world. The librarian told me that Mr. Jackson, the principal of the Hawkesbury Agricultural College, considers the *Tropical Agriculturist* one of the most useful publications he receives. I was introduced to Mr. Campbell, the head Agricultural inspector in the Colony. "Yes;" he remarked, "tea grows like a weed here." In response to further inquiry, he showed me some that had been plucked close to Sydney. He said, however, it would never be a paying industry in this Colony as the labour was too dear compared with coolly labour in tea growing countries, and New South Wales will never enter into competition with Ceylon in that respect. At the present time the Government are experimenting in tea growing in the north of the Colony. "Here's some coffee," he said, showing me a tin full, "as good as you have in Ceylon."

I lent Mr. H. C. Russell, the Government Astronomer, my copy of the *T. A.* and he returned with the following note:—"Very many thanks for letting me see the *Tropical Agriculturist*. I am very pleased with the Magazine, it is full of carefully prepared data valuable to readers."

RAMIE FIBRE IN ALGERIA.

A NEW PROCESS OF EXTRACTION.

A Calcutta correspondent sends us the following interesting extract upon a subject which is of importance to several Ceylon planters at the present time:—The splendid possibilities of the Ramie fibre have long been recognized in the United States as well as elsewhere, but the processes of extracting the fibre have either been defective or too costly, except in China, the land of cheap labor. However, a Parisian House has here on exhibition a machine which, if its claims are justly founded, solves the problem satisfactorily. Along with it were specimens of ramie branches, fibres, balls of binding-wool in various weights and colours, skeins of beautiful embroidery thread, cord and tassel of artistic design and finish, and passementerie trimming. The treatment of the plant is said to consist in the introduction under pressure of carbonic acid gas and the gas of hydrochloric acid, alternately, which in five minutes' exposure so acts on the branches that the fibre is then easily crushed out. As to the details, the exhibitor apparently did not wish to say too much, but as to the results, he affirms that one machine is capable of treating sixteen tons per day of ten hours. A company is said to be forming for its manufacture and control and rumour hints that at least one contract has already been made in Algeria, for all the ramie that a certain property can produce. M. Bachelerie, 60, Rue Canmartin, Paris, is given as the address of the inventor.—*Philadelphia Manufacturer.*

THE CONGO BOTANICAL GARDENS.

VISIT OF THE NEW DIRECTOR TO CEYLON.

We referred a few days ago to a paragraph contributed to the *Morning Leader* by a Belgium correspondent regarding the formation of a botanic garden in the Upper Congo, the Belgian colony in Central Africa. This is probably the first botanic station (or experimental garden, one might say) of the kind which the Belgians have started, much unlike the British

colonies, in which the formation and development of such institutions have long been recognized to be of paramount importance to the prosperity of the land. There is however only one Kew gardens, and how the imagination could dignify an infant botanic station in the wilds of Africa by the name of "Kew" can only be accounted for by the fact that our London Garden, the greatest emporium of plants and botanical knowledge in the world, is a model to copy, though never imitated. The officer appointed, Mr. Leon Pynaert, of Ghent, as Director of the above scheme is also a recent student of Kew. Previously to starting on his new duties, the Belgian Government has sent him out to Ceylon and Java to gain a knowledge of tropical cultivations, especially cacao, coffee and rubber. Having spent a pleasant fortnight in Ceylon, visiting all the botanic gardens and meeting co-Kewites, Messrs. Nock and Macmillan, he left on the 14th inst. by the ss. "Tonkin" for Java, where he hopes to make a longer stay.

Mr. Pynaert has been particularly pleased with what he has seen of Ceylon, and was agreeably surprised at the advanced state of the civilisation of the country. He could not help contrasting the state of Colombo with electric tramcars, &c., and also of Kandy and Nuwara Eliya with that of Coquilhatville, his headquarters in the Congo, which he said has only sixteen white people, all told.

THE PACKET TEA QUESTION.

SUCCESSFUL PROSECUTION.

The World's Tea Company was summoned at Kingston-on-Thames on August 29, for having unlawfully, and with intent to defraud, applied a false trade description within the meaning of the Merchandise Marks Act 1897 to tea sold by them in packets. The prosecution was instituted by the Surrey County Council, whose inspector, Mr. R. A. Houghton proved purchasing at defendant's premises in Kingston Market Place on July 30th, a half-pound packet of tea, which on being weighed, showed a deficiency of three drachms twelve grains; and a quarter-pound packet, which was deficient to the extent of three drachms 23 grains.

Mr. Bodkin, for the defendants, said that unless there was some written or printed representation applying to the article purchased, there could be no false trade description within the meaning of the Statute. In this case the wrapper of the packet bore the words: "Ceylon and Indian Teas, 1s 6d per pound," and gave no indication whatever of the weight of the article sold. The Bench held that the wrapper gave an indirect indication, and imposed a fine of £5 and costs.

BOUNTY TEA TRADING.

A copy of a resolution, passed by the Birmingham Grocers' Association having been forwarded to Mr. Chamberlain, asking him to use his influence with the Home Office to put a stop to the lotteries in connection with what is known as the bonus tea trading system, the following reply has been received:

Highbury, Moor Green, Birmingham, Aug. 25, 1899.

Sir,—I am desired by Mr. Chamberlain to acknowledge the receipt of your letter of the 24th inst. and copy of resolution adopted by the Birmingham Grocers' Protection Association on the subject of bounty tea trading. At first sight Mr. Chamberlain

imagines that the proper course would be to institute private prosecution under the Lotteries Act. He does not think that the Home Office has any power to undertake prosecutions in the name of the Government. He will, however, keep your request under consideration.—I am, sir, yours obediently,

J. WILSON.

PRODUCE AND PLANTING.

TEA TRADE OF JAPAN.—The tea trade of Japan is not in a very flourishing condition. The action of the United States Government in imposing a duty of 10c. gold a lb from June 14 on all tea imported had a marked effect upon the Japan tea season of 1898. The new Restriction Act, prohibiting the importation into the United States of inferior teas, continues to be strictly enforced, and many cases of rejection occurred during the year. Common teas have, therefore, for the most part been forced to seek a market in Canada, which has so far imposed no restrictions upon its admittance, but where, to judge from recent discussion in the Canadian Houses of Parliament, it appears by no means unlikely that similar precautionary measures will be taken for the exclusion of inferior teas. The total export of tea from Japan to Canada amounted to 11,512,145 lb, as compared with 8,605,492 lb during a corresponding period of the year before, an increase of 2,906,653 lb. In the United States tea costs 40c. gold per lb, with the new duty of 10c. gold per lb, and the beverage is therefore at a great disadvantage as compared with coffee. General depression of business followed the announcement of the enforcement of the duty, and in several cases large orders were cancelled. Most of the tea shipped to America has remained in bond owing to the lower price of that which reached the country prior to June 14. As nearly all last season's tea remains unsold, it does not look as if the season of 1899 would be a prosperous one. In Japan, moreover, the cost of tea-firing materials and labour has continued to increase, as compared with former years, and, strange to say, since the imposition of the new duty the prices asked for by the growers have likewise risen. The total export for 1898 amounted to 41,102,118 lb, valued at £828,740, as compared with 43,510,244 lb, valued at £798,327, in 1897. Of this quantity 31,861,149 lb. went to the United States of America, 7,680,644 lb. to Canada, and the remainder to various other countries, of which China with 501,660 lb, took the largest proportion.

HER MAJESTY'S CUSTOMS AND PRODUCE.—In the annual report of the Customs Department just issued there is a table which analyses the items in our dutiable imports for the ten years 1889-98, showing the increase or decrease in each year of the quantities imported for home consumption. The most notable increase is to be found, under the head of Cocoa, which recorded a growth, between 1896 and 1897, of no less than 32.7 per cent., the total figures being 28,270,562 lb. in 1896 and 37,528,246 lb. in 1897. If the fiscal years 1896-97 and 1897-98 be taken, and the comparison confined to manufactured cocoa, an even greater proportional advance is observed—viz., 80.4 per cent. We are glad to see, however, that the home manufacturer's competitive instincts have awakened, with the result that in the last fiscal year imported manufactured cocoa went down from 8,029,151 lb. to 6,366,120 lb.—a decrease of 1,663,031 lb.; while the imports of raw cocoa rose from 30,087,311 lb. to 34,634,962 lb.—an increase of 4,547,651 lb. Going back to the table of calendar years, we find that between 1889 and 1898 the import of cocoa (both raw and manufactured) increased from 20,541,254 lb. to 40,199,049 lb.—that is, nearly doubled itself: a testimony at once to the growing favour of the beverage and to the fact that the "masses" are taking their share in the national taxation. These facts are further exemplified in the case of tea, the consumption of which grew from 185,578,298 lb. in 1889 to 235,353,767 lb. in 1898—an increase of

nearly 26·8 per cent. This increase is attributable also, in part, to reductions in duty and price; but it is noteworthy that with rising prices there was in 1898 an increase of 1·7 per cent. over the 1897 imports.

COFFEE PRODUCTION.—From figures compiled by Messrs. During and Zoon, of Rotterdam, some idea of the importance of Brazil as a factor in the coffee supply may be gathered. Since 1895, when 13,283,800 bags coffee were produced in all the countries of the world, the aggregate yield has considerably varied, sinking to 11,729,500 bags in the following year, increasing to 15,000,000 bags in 1897, and afterwards expanding to about 17,745,000 bags in 1898. This seems to have been the heaviest quantity ever raised in a single year. At the end of 1893 the aggregate quantity of coffee on hand, so far as it could be ascertained, was only 1,585,000 bags; whereas at the close of last year it embraced 4,734,000 bags, or about treble the former amount, and this great excess has been looked upon as a very serious matter for the importers.

THE OUTLOOK.—First, says the *Grocer*, excessive stocks must be worked off; next, supplies must visibly decrease; and thirdly, to strengthen the position all round, the consumption of coffee must steadily progress onwards without a break. With these conditions fulfilled, importers and growers may have the satisfaction of seeing their hopes of higher rates realised.

ASSAM RUBBER TREES FOR THE SOUDAN.—According to a report of Sir William Garstin, K.C.M.G., to the Foreign Office, there is a good prospect of the Soudan becoming a rubber country. There is, of course, an increasing demand for india rubber owing to its electrical and vehicular uses, while the natural supply is diminishing. It must, therefore, be cultivated, and it is believed that the rubber tree of Assam would flourish in most of the Soudan, especially south of Khartoum.

BIG FIGURES.—It is pointed out by a correspondent that the Chancellor of the Exchequer in his Budget speech on April 13th seems to have understand the revenue brought in during the past financial year by the tea duty. According to the annual report of the Commissioners of Customs the amount of the increase was not £62,000, as Sir M. Hicks-Beach is reported to have said, but £155,297. Altogether £4,023,503 was realised in the shape of tea duty, which appears to be the largest yearly sum received since Mr. Goschen in 1890 reduced the duty from sixpence to fourpence. In weight the tea on which duty was paid exceeded 240,000,000lb—9,318,000lb more than in the previous twelve months. The whole of this amount, however, must not be credited to the year's consumption. As the Commissioners point out, just before March 31st, when the year ended, a big cheque was handed in at the Custom House, this large payment obviously covering tea which we are now consuming. Still, after allowance is made for this there was an advance in the clearance of about 3,000,000lb.

INDIAN TEA COMPANIES.—The list of Indian tea companies registered in England, giving the acreage, capital, secretaries or agents, offices, directors and agents, compiled by Mr. George Seton, has been revised and brought up to date. From this it will be seen that the seventy-six companies have an acreage of 238,440 acres, and a capital of £9,578,440.—*H. and C. Mail*, Sept. 1.

“SIROCCO” MACHINERY.

A new and delicately-bound catalogue of tea machinery, issued from the well-known Belfast “Sirocco” Works, serves to confirm the recent reports that the presiding genius of that establishment, Mr. S. C. Davidson, has recently made some new and interesting discoveries in a wider field of engineering science than that with which he has hitherto been associated. While true to his early love, the tea industry, he claims to have attained results in his experiments with air forces which are calculated both to extend the scope of his operations as a successful engineer and en-

hance his reputation as an original thinker, who, untrammelled by usually accepted theories, boldly strikes out a course for himself, and offers to the sceptical striking proofs of the success of his achievements. The catalogue we have just received is therefore of more than ordinary interest, in that it describes and illustrates the results arrived at by this new departure in the

CONSTRUCTION OF CENTRIFUGAL FANS.

Before referring to that portion of it devoted to Fans, we will glance briefly at the machinery in the order in which it is found, the first place being given to tea machinery, which Mr. Davidson supplies for “every process in the manufacture of the leaf,” the description of which, accompanied by suitable illustrations, is full and explicit on all points, including approximate dimensions and cost.

We have on previous occasions described the “Sirocco” tea machinery in detail, so that it is unnecessary to do more than chronicle their order in the list before us. First we have a useful machine known as a Leaf-Conveyor or Elevator. This, it is pointed out, is a convenient and expeditious machine for the conveyance of the tea-leaf from one part of the factory to another. Next we come to the

TEA LEAF WITHERING MACHINE,

which is now reported as doing its work in a remarkably short time, irrespective of atmospheric or other conditions, the leaf when thus withered producing, it is mentioned, a stronger liquoring tea than that obtainable by natural withering. The machine, we understand, is capable of keeping two rollers going, and is driven by a new and ingenious engine which proved quite a success. The “Sirocco” Rolling Machine, which comes next in the catalogue, is of the type which works without a top pressure cap, and it is claimed to be “up to date” in every respect. The Roll Breaker, Cooler, and Sorter, it is stated, carries out the operation of sorting and cooling freshly-rolled leaf, breaking at the same time any lumps and balls there may be in the tea. Then come full descriptions of the tea-drying machines—first, the Auto-Sirocco Tea Drier, which automatically subjects the wet leaf at the start to a high temperature, which immediately checks fermentation on the leaf entering the machine, and then finishes off the drying at low temperatures.

There is the well-known

DOWNDRAFT “SIROCCO”

with Multitubular Air Heater, and also with Cast-iron Vertical Flue Air Heater; and the various types of Self-acting Updraft “Siroccos,” with their varieties of Side-drawer and Endslide tray arrangements, and fitted with similar Air Heaters. Following these, are illustrations of the new patent metal trays for “Sirocco” Driers; while a further section of the catalogue is devoted to Tea Sorters and Cutters, and the Davidson-McGuire Tea Packer, all of which are well known and do not need further description.

There is, too, a Tea Pellet Compressing Machine for dealing with tea dust, which is simple in construction, and converts the tea dust to pellet form, thus enhancing its value in the market.

While these machines, the use of which is confined to tea gardens and factories, have until recently formed the chief output of the Sirocco Works, Mr. Davidson has, as we have stated, been occupied of late in solving other problems in the domain of engineering, and he now claims to have brought about a revolution in the construction and manufacture of Fans, a new departure, which has not only astonished engineers, but has rendered an early enlargement of his Belfast

works a necessity. Apart from their use as adjuncts of tea machinery there is a great demand for

"SIROCCO" FANS

in nearly every department of the industrial world. The illustrations of these Fans are accompanied by particulars of surprising trial tests. The leading features of this new departure are concisely described in the catalogue before us by the following comparison between the centrifugal fans at present familiar to us and Davidson's patent. Under the former we find as the hitherto accepted data for best construction:

"BLADES.—Comparatively few; radially deep; outer edges short axially, and either straight or curved backwards from direction of rotation; ends unclosed their full depth, from the outer to the inner edges; and the inlet opening for admitting the air to the centre of the fan approximately one-half of the fan diameter; it having been accepted as an axiom that a small inlet (although detrimental to volume) was necessary for pressure."

In the "Sirocco" Fans, the construction above referred to is practically reversed on every point, viz:—

"BLADES.—Very numerous; radially very shallow; outer edges long axially, and curved forward in the direction of rotation; ends open towards the inflowing air, from the outer to the inner edges; and the inlet opening for admitting the air to the fan, of approximately equal diameter to that of the fan itself, whereby in the "Sirocco" fan maximum volume is combined with maximum pressure, which combination has not been obtained in any other fan hitherto made."

Mr. Davidson has thus evidently inaugurated a new and important change in the entire principle of construction of fan blades, and also as regards the inlet opening for the air, which in the "Sirocco" fan is about four times larger in area (relatively to the diameter of the fan) than in centrifugal fans as generally made; whereby the frictional resistance to the inflow of a given volume of air is only a sixteenth of what it is in other centrifugal fans. With his usual objection to half measures and premature disclosures of experimental work, Mr. Davidson, before making full announcement of his revolutionary discoveries in connection with the operative principles pertaining to fan construction, satisfied himself in the most thorough way as to the results. The catalogue before us contains data on the subject of "Sirocco" versus other centrifugal and propeller fans which testify not only to the thought and labour necessary in the process of evolving practical issues from theory, but demonstrate the remarkable success achieved. One result not mentioned in the catalogue is that Mr. Davidson has

SUCCESSFULLY VENTILATED

several of the Courts in the Royal Courts of Justice, and has lately received the order to similarly ventilate a further number of them. Many other systems for the ventilation of these Courts have been tried and found wanting, and Mr. Davidson's success is in itself a convincing proof of the efficiency of his new fans.

It is not to be wondered, therefore, that

"A PHENOMENAL DEMAND"

has already arisen for "Sirocco" Fans, and that the Patentee is making arrangements on an extensive scale to meet this demand. We wish every success to his new invention, which seems destined in the wide field of engineering to which it applies to rapidly develop into a more extensive business than his now large and highly successful business in Tea machinery; but we at

the same time hope that this development may not involve a lessening of his interest in, or withdrawal of his inventive abilities from, the further development of machinery for Tea manufacture, which would be a serious loss to the Tea Planting industry.—*H. & C. Mail*, Sept. 1.

CEYLON TEA IN GERMANY.

THE YEAR AT HAMBURG.

Business in tea at Hamburg was limited, last year to about the same extent as in 1897. It is considered that the mild autumn and winter of last year were unfavourable to the increase of tea consumption in Germany and Austria. The importations of Indian and Ceylon teas were, however, in excess of those during 1897, and the consumption of these sorts appears to be developing, though slowly, in Germany. It is thought that the present efforts towards exploiting and developing the resources of China are likely to lead to the resuscitation, by European assistance, of the cultivation and export trade of Chinese teas at a near date.—*Planter*, Sept. 16.

THE SHIPMENT OF TEA-CHESTS.—The Captain of the "Clan Macdonald" makes a small, but very useful appeal to planters to mark as "top" one of the non-morticed sides of their tea-chests—a practice which Messrs. Freudenberg are in the habit of doing. If this were done in the factory there would be a trifle less of the "loss in transshipment" which the draft-allowance is still held to account for in part.

THE PEARL FISHERIES OF THE DUTCH EAST INDIES.—A report by the United States consular agent at Macassar, in the Celebes, on the pearl fisheries in the Dutch possessions in the Eastern Archipelago, has been issued by the Department of State in Washington. The shells of the pearl oyster form one of the most important exports from Macassar; and, up to the beginning of the present decade, they were sought almost exclusively by natives who fished in the shallow water of the bays without using a diving apparatus. In 1893 a London company sent a schooner, with some luggers to the Aru Islands to try fishing in deep waters; but the little fleet was compelled to leave the Archipelago in consequence of a law that only vessels under the Dutch flag, owned by Dutch subjects or companies, should be allowed to engage in pearl fishing. Residents in the Eastern Archipelago now began to give more attention to the fisheries, and Europeans, Chinese, and Arabs made arrangements with native chiefs in whose waters shells were supposed to be, by which a rent or royalty was paid for the right to fish. At present fishing is prosecuted on the east coast of the Aru Islands, on the east of New Guinea, off Celebes and Timor. The chief market for the shells is Paris, London and other Continental cities taking but small quantities. Two hundred and fifty tons were exported from the Dutch East Indies in 1897, and the quantity is increasing. Aru shells sell at £140 a ton, those from New Guinea, Timor, and Celebes fetching from £80 to £100 a ton. The regulations permit of fishing all the year round, but, in fact, the monsoons prevent this. Natives of the Philippines are mostly employed on the work as they are better than those of the islands close to the fisheries. A cheaper kind of shell is also fished largely, and is sent to Germany and England where it is used in the manufacture of buttons.—*London Times*, Aug. 29,

Ceylon Rainfall.

RATWATTA COCOA CO., LIMITED.

REPORT.

THE P. W. D. METEOROLOGICAL OBSERVATIONS FOR AUG 1899.—We append this Monthly Return of rain from which it will be seen that the highest fall was at Padupola in the Central Province, 21.20 inches, and the lowest at Maha Uswewa tank, in the North-Western Province 0.07 inches.

The Directors beg to submit their report and statement of accounts for the season ended 30th June, 1899; The shareholders were duly advised that for convenience of working it had been decided to extend the season to 30th June so as to secure all the cocoa crop, and the agricultural year from now onwards will date from 1st July to 30th June.

The season has been one of growth and development, and a first crop from the oldest cocoa field has been harvested.

The cocoa crop from the 1893 clearing (72a. 1r. 23p.) turned out 172 cwt. 1 qr. 11 lb., or say 2½ cwt. per acre. This was sold in the country at an average of about R43 60 per cwt. The estimate of 300 cwt., justified by the profuse blossoms, has not unfortunately been realized. The trees, it is thought, are too young yet to mature more than a small percentage of the blossoms, and that percentage is very difficult to gauge.

The Tea crop, including 23,395 lb. bought leaf, turned out 60,601 lb., which is calculated to be about 460 lb. per acre from the acreage plucked. This sold at an average of a little over 3½ cents.

On the 18 months' working there is a profit from the crop-bearing portion of the Estate of R5,738 23; but, on the other hand, there has been a further outlay of R20,203.74 on Buildings and Machinery and fields not in bearing, including a new clearing referred to below.

During the season under review 75 acres of forest were cleared and planted with Tea, the most suitable portions being also planted with Cocoa.

The young Tea clearings are not so far advanced as they should have been, owing to a conflict with weeds and the plants having been somewhat immature. These faults, however, are now less apparent, and good progress may be expected during the current season.

A survey of the whole property has been made by a competent Surveyor, and his plan is now in the hands of the Surveyor-General for examination and verification.

The following is a definition of the Company's property as at 30th June:—

	A.	R.	P.
Cocoa planted 1893 ...	72	1	23
Do do 1894 ...	85	0	29
Do do 1895 ...	65	2	07
			223 0 1
Tea planted 1890 (and cocoa) ...	118	3	27
Do do 1896 do ...	24	0	00
Do do 1897 do ...	99	3	27
Do do 1898 do ...	75	0	00
			317 3
Grass	3	0	00
Total cultivated ..			543 3 33
Jungle	181	0	00
Total acreage ..			724 3 33

Mr. Huxley visited the estate in July along with Mr. Pyper, the Managing Director, and both are satisfied with the prospects. There was no disease of any kind visible either on Cocoa or Tea, and it only wants time now for the land to come into bearing to secure profits.

Next year's crops are estimated at 300 cwt. Cocoa and 50,000 lb. of Tea, together with 16,000 lb of Tea from outside leaf. The estimate of expenditure has not yet been finally passed by the Directors, but they will be in a position to give information regarding the same at the meeting.

It will be seen by the Balance Sheet that the Capital and Mortgage money is now practically all expended on property and Coast Advances; and, as there is not likely to be a sufficient surplus on current season's Revenue account, arrangements will have to be made to meet present liabilities and any further capital outlay.

Mr. Gordon Pyper having been appointed Managing Director for a term of years, Mr. Edmund Jeffries only retires from the Directorate by rotation, but he is eligible for re-election.

INDIAN TEA PROSPECTS.—The prospects of the Indian tea industry, the Calcutta correspondent of the Allahabad Pioneer reports, continue to brighten very considerably. With the dispute in London brought to a favourable termination, with values in Calcutta distinctly improving, a better demand from the outside markets, and better weather in most of the districts which will afford a chance of desirable quality being soon available, the hopes of those interested in tea are on a higher level than of late, when the outlook was decidedly gloomy. The weather in the tea districts has been generally favourable, except in North Assam, where it has been too cold,

THE
AGRICULTURAL MAGAZINE,
COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for October:—

Vol. XI.]

OCTOBER, 1899.

[No. 4.

OCCASIONAL NOTES.

THE *Kew Bulletin* for January and February last contains a reference (with plate) of cacao disease in Trinidad. It would appear that the disease is almost entirely confined to the pods, and is caused by two species of fungi, *Phytophthora omnivora* and *Nectria bainii*. The latter is said to be of the same character as the cause of the cacao disease of Ceylon as described by Mr. Carruthers. Mr. Hart of Trinidad is inclined to think that the cacao in Ceylon has a much lower vitality than in Trinidad, and consequently more liable to disease. The pod disease is of course no new thing, but it is said to have been more than usually severe last year, in some districts causing a loss of as much as 50 per cent of crop. The fungus *Nectria bainii* has been so named in complement to Mr. Bain who first called attention to the disease, by Mr. Massey of Kew, and is fully described by the latter.

The Committee of the Colombo Agri-Horticultural Society met on the 19th September, and considered a report made by the Honorary Secretary (Mr. C. Driberg). Annexed to the report was a statement showing the financial position of the Society, which showed that there was a fairly large balance on hand. No arrangements were made for a Show being held next year, pending the arrival of the Hon. Mr. F. R. Ellis,

the permanent Chairman of the Society, though the Committee appeared to favour the idea of holding future Shows annually in the rural districts, and only once in three years or so in the capital.

Mr. Pearson who left Ceylon last year after making scientific investigations in connection with the extraction and preparation of Rubber, is we see appointed assistant (for India) in the Harbarian of the Royal Gardens, Kew, in succession to Dr. Stapf.

We are glad to hear of the success which has attended Mr. Veterinary Surgeon Chinniah's inoculation of cattle against rinderpest on Oodeville Estate, Kandy. We understand that Mr. Chinniah finds pure bile more satisfactory than glycerinated bile as an inoculating medium.

It is reported that the Commission appointed to consider the advisability of establishing a Department of Agriculture are about to recommend that a Board of Agriculture will suffice for present needs, and further that the School of Agriculture should be transferred to Kandy. As a centre where both low and upcountry products could be grown, Kandy is much to be preferred to Colombo as a site for the school, but it is to be hoped that there will be ample scope for practical work, of which there is little opportunity under present conditions, and that the classes will move about the country instead of being confined to one spot.

COLOMBO SCHOOL OF AGRICULTURE.

(From Mr. C. Driberg's Report to the Director of Public Instruction.)

No changes have taken place in the constitution of the School of Agriculture during the past year. The Commission which was expected to deal with the question of re-organising the Institution did not meet, and the work was carried on the same lines and under the same conditions as before. With the appointment of another Commission to consider the larger question of organising an Agricultural Department for the Island, it is to be expected that there will be some important changes, whereby the scope of work and the usefulness of the School of Agriculture will be extended.

The importance of Agricultural Shows from an educational point of view is admitted on all hands, and on the occasion in question the promoters took advantage of the opportunity to give practical demonstrations on special subjects, such as budding and grafting, cream separating, &c., which greatly enhanced the importance of the Show as a medium of instruction. Agricultural Shows are of rare occurrence in the Island, and the students of the School of Agriculture were singularly fortunate in the fact that the last Show was held at their very doors, and in being so closely associated with the undertaking from which, as an object lesson in their course of instruction, they were able to derive the maximum benefit. I have in my previous reports strongly urged the importance of regularly holding Agricultural Shows, which, had Government seen its way to guarantee a vote against possible losses, might have been held annually. As it was, the last show paid its own expenses, and there was no necessity to draw upon the guarantee which was so liberally made by Mr. Davidson, the Mayor.

As in other years, a large amount of correspondence was gone through in reply to letters received from correspondents in and out of the island, and in consulting others with the object of furthering the agricultural interests of the Colony. As an instance of such an intercommunication I might mention the fact of the opening up of a trade in kekna oil (*Aleuritis triloba*) to meet the demand that has arisen from abroad for this long-neglected product. I have been working a good deal with other oils so as to bring such merits as they might possess to the notice of the trade, while the question of making plantain flour a marketable commodity has also engaged my attention. On this latter subject I have made two reports to Government. The nurseries of the Rhea or Ramie plant have been practically abandoned, owing to the lack of interest shown by local growers in the fibre industry. The more important introductions in the way of new plants are the Florida velvet bean (*Mucuna pruriens*), highly recommended as a soil renovator (though useful in other ways), a new variety of the sweet potato (the *Nancinumi*) and seeds of the early amber sugarcane. My thanks are due to the Director of the Royal Botanic Gardens, Peradeniya, Mr. Williams of Henaratgoda, Mr. John Ferguson, Mr. George Warr of New York, the U.S. Department of Agriculture, Mr. Church of Japan and others, for seeds and plants presented to the school.

The reading room has been well supplied with agricultural papers and reports and the publica-

tion of the Agricultural Magazine, which completed its ninth volume in June, 1898, is kept up with regularity.

The second batch of students trained in the Forestry School passed out at the end of February. They are now employed in the Forest Department as follows:—

Mr. Footyn, Forest Ranger, Kurunegala; Mr. C B Karumaratne, Forest Guard, Hanwella; Mr. B L Mendis, Forest Guard, Hambantota; Mr. M A Fernando, Forest Guard, Passara; Mr. R de Silva, Forest Guard, Kandapola. The first two were drafted from the Department and the others were admitted from the School of Agriculture after a competitive examination. The new class should have begun work in March, but owing to the delay in the arrival of the Forest Officers who were to form the class, regular work did not commence till May. The new class, consisting of Messrs. J S Perera, M B Seneviratne, G Rajapakse, W C Rowlands, W Ferdinands, and D E Tiathonis, was taken on tour by the Conservator of Forests in November and travelled to Kurunegala, from where the Sundapola, Aivandrum, Rukgolla, and Kalngalla forests were visited, and thence to Galboda, Nanuoya, and Haputale.

There is nothing of special importance that I can refer to in the Training School and Practising Schools. The Veterinary classes were kept up by Mr. Sturgess, who reports that Mr. J. E. Fernando was the best student of the year and will have his recommendation for the Government Veterinary Scholarship when it next falls vacant. The Government Dairy has grown since my last report was written; the demand for milk has increased, and additional accommodation had to be provided for the stock. On December 31, 1898, the entire dairy herd consisted of 84 cows, 94 calves, three stud bulls, and four draught animals. It will be observed that we have a large number of young stock on hand, many of them half-grown animals, which take up a good deal of room. On the recommendation of the Colonial Veterinary Surgeon, Government have decided not to sell such young stock which the dairy can spare, in Colombo, but to send them to the Provinces to be sold by the Revenue Officers, where it is expected they will come under the notice of the smaller native landowners and cattlekeepers, by whom they will be purchased. The object of the new arrangement is a good one, but it is doubtful whether it will be attained in practice. For one thing the dairy will not be a gainer by the sales being conducted in the Provinces instead of in Colombo, where there is naturally more competition at the sales. Again, the wealthier landowners of the Provinces, who have hitherto had to purchase our stock in Colombo, would under the new arrangements be able to secure the animals at lower rates owing to comparative absence of competition; while few, if any, of the small landowners who are expected to purchase the cattle can afford the expense of keeping young stock for a year or two till they can be made use of. But even if purchased by such people, the animals would probably be allowed to lead the vagrant life of village cattle, with the result that the ultimate object of the scheme will be frustrated. It would be a better plan for the Kachecherries to own the animals, which should be placed in charge of headmen, so that the animals may be well cared for, and the villagers permitted to make use of them at nominal rates, if not free of charge. So far no young stock has been sold in

the Provinces, as owing to the prevalence of cattle plague in the Kururegala District, where the first lot of animals was to have been sold, the Government Agent did not think it advisable that any of our stock should be sent to him. The dairy was free from any epizootic disease, though rinderpest prevailed more than once in Colombo, and even in the immediate vicinity of the dairy. This I attribute to the careful measures adopted during times of disease. At such seasons our stock were confined within the "ring fence" area, and the buildings and premises kept thoroughly disinfected. These precautionary measures entailed some expense in the matter of disinfection and extra provision for feeding the dry cows and young stock that at other times are to a great extent kept on the pasturage of the Havelock racecourse (rented by the dairy for R60 per mensem as pasture ground for the stock), but the money is, I think, well spent. During the year there was but one suspected case of rinderpest at the time when the disease prevailed among the Turf Club draught bulls a few hundred yards from the dairy. At the first indication of illness the animal was removed to the quarantine shed, and on the symptoms becoming aggravated it was decided to destroy it. This was done and the carcass buried deep with lime. There were only six deaths during the year, two among the cows and four among the calves.

On March 8th a batch of 31 cows (with 14 calves) and a bull came over from Sinde, having been imported at a cost of R3,310.17, while 20 cows, 16 calves and one bull were sold on the 4th March and brought in, after deducting all incidental expenses of the sale, R1,358.85. The total quantity of milk supplied was 136,405 pints, of which 111,225 pints were produced in the dairy. The largest quantity produced in any one month was 9,000 bottles in July, when the dairy met the whole demand. The revenue of the Model Farm after deducting expenses and the annual rent of R1,350, aggregated R3,281.61. The Farm is a much-frequented resort since the opening of the golf links and the clearing of the low jungle by the Golf Club. The grass lands attached to the dairy were, as before, worked departmentally as an annexé of the Dairy Farm, with satisfactory results.

To briefly state the financial history of the dairy: Government voted a sum of R19,539.12 in 1893 (the year in which the dairy was established) for building, stock, utensils, &c. In 1894 an advance of R11,500 more was made for working the dairy. The latter sum was repaid in 1895, while of the original capital voted (R19,539.12) R8,890.51 had previously been repaid to the Treasury. This left R10,648.61 as the balance due on capital cost. At the end of 1898 the balance of cash in hand or due to the dairy was R9,604.29, so that with stock in trade to the value of R15,000 it will be admitted that the dairy is in a very solvent condition. I would even add to the assets a further sum of R4,400 paid as compensation to the late lessee of the Model Farm, when the property came into the possession of the dairy, as this sum should without difficulty be recovered from any future lessee. The income from the Farm has more than doubled since 1893 when it was acquired; and who would not be willing to invest R4,400 to secure an income (after deducting rent and other expenses) of over R3,000 per annum? So that the former sum might reasonably be put down as a "debt receivable" and the present assets of the dairy increased from R13,955.68 to R18,355.68.

C. DRIEBERG, Superintendent.

OBSERVATIONS ON AGRICULTURAL EDUCATION IN CEYLON.

(Concluded.)

I have tried to ascertain the views of some of the leading native agriculturists of the island, and from all that I could gather, they expected that the Agricultural School would carry out experiments on the various products tried on a small scale at the school itself and on a large scale outside, with a view to showing how economic products could be cultivated on a commercial scale. But this, I think, was too much to expect from a school which was commenced in such a humble way. There is a great deal for it to do before venturing upon such speculative enterprises. The Director of the Royal Botanic Gardens has already set to work in this direction, and we have had valuable reports of his experiments in the cultivation of Para-rubber. Other products will, it is to be hoped, also receive due attention in time. The students of the school ought to be given an opportunity of acquainting themselves with the nature of such experiments, and to this end should be taken on tour at stated periods during the year and not kept confined to Colombo alone.

The improvement of native agriculture is so directly connected with the education of the people, that I do not think it would be wise to sever the School of Agriculture with the department of Public Instruction.

The Sinhalese villager is, as a rule, not over-industrious. There are a great many products that he can grow in his garden if he will only take the trouble to do so, and learn how to grow them. He will allow the jungle to grow up to the very door of his house, whereas if he will clear it and plant something useful it will add a charm to his dwelling, while at the same time he will reap the produce which he can himself use or sell and procure the means of securing additional home comforts. Pepper, different kinds of yams, betel, onion, ginger, turmeric, chillies, cocoa, a few medicinal, foliage and flower plants, some vegetables, &c., are what should be seen around the dwelling of every villager, in place of weeds and filth as is more often the case. Now and again we find an industrious villager grow some of these products near his house, but it often happens that his neighbours help themselves to the produce. If such cultivation as I have referred to be more generally adopted, I am inclined to think that there will be less thieving and generally less crime also in the villages. Betel and ginger may be said to be necessities of daily life in the villages; the former for masticating, the latter for use in curries and as a remedy for almost every little ailment. A common complaint of the villager is that he cannot grow anything near his house because his cattle destroy or consume it. This raises another question which requires attention. The neglect of village cattle is a notorious fact, and a more rational system of cattle-keeping is much to be desired. If the cattle are looked after as they should be the crops will not suffer. Another thing which the villager must be taught is the value of cattle

manure which is generally allowed to run to waste and often becomes a serious nuisance. In garden cultivation this manure will be of the greatest value. If the younger members of the family could be induced to take an interest in gardening, I anticipate a great improvement in the character of the future men of the villages.

I have stated so much in order to point out in what direction we should work for improvements in native agriculture. How easy will it be to bring about reforms in this line if all our Mudaliyars and Ratemahatmeyas are trained agriculturists. They will then have model gardens round their walanwas and could exercise their influence among the villagers in distributing the various products that are useful to the people and showing them how, and encouraging them to grow them. The experimental garden that I have started in my own property in Kandy with the view of helping the teachers in my district is, I am glad to say, already beginning to bear fruit. I have put almost every bit of it into some use and various products are grown with success. Some of the teachers who have visited the garden have taken a lesson from me, and are trying to establish similar gardens in connection with their schools. The most prominent school gardens so far as I can remember just now are those at We-onda, Morape and Pannela. I am particularly pleased with the garden of the We-onda teacher. My time is so much taken up with examination work that I do not find sufficient opportunity of attending to agricultural work of this nature. School teachers must be taught in the first place, as most of them are as ignorant as the villagers themselves on those matters.

Ceylon in my humble opinion is not yet ripe for an Agricultural Department on as elaborate a scheme like those which are at work in America, Australia, &c. Let the Government by all means appoint a consulting entomologist, and if funds are available an agricultural chemist too. Their services can be profitably utilised in connection with the Agricultural School also, and should add much dignity to that institution. A reorganised Agricultural School in conjunction with the Royal Botanic Gardens as at present constituted are amply sufficient to effect the necessary improvement in native agriculture.

I could submit the following recommendations in this connection :—

1. The School of Agriculture should remain under the control of the Director of Public Instruction. A few gentlemen should be appointed as an Advisory Board, which should consist of the Director of the Royal Botanic Gardens, Scientific experts, Government officials and leading cultivators.

2. The school should be allowed to remain where it is at present, for various reasons, and with the Government dairy attached to it. There is every prospect of reviving the old Normal School also in the same place. The students, however, should be taken to different parts of the island at stated periods during the year with the view of giving them lessons in Practical Agriculture on a large scale, as may be illustrated by such experimental gardens as may be established or shown in actual cultivation on a commercial

scale. The period of training should extend over three years.

3. The Syllabus of Instruction should be revised, and the services of a really competent Practical Instructor trained at the Saidapet Agricultural College at Madras should be engaged. Mr. Jayewardene, the late Practical Instructor, who had received only a year's training at the Saidapet College, proved to be an acquisition to the school, and since he resigned his post the want of a good instructor has been much keenly felt. There are a great many things that the Ceylonese can learn from the Indian Agriculturist. A man trained at Saidapet College is just what is wanted here. His salary may begin with R150 a year and rise by annual increments to R200. The present Practical Instructor is an old boy of the school, and he can be easily provided with a place elsewhere. The Syllabus may be revised to include the following subjects only :—

1. English language, such as Reading and Essay writing.
2. Theoretical and Practical Agriculture.
3. Chemistry, Botany and Geology.
4. Veterinary Science and Entomology.
5. Dairy farming including cattle management, butter-making, &c.
6. Elementary surveying.
7. Arithmetic and Book-keeping.

4. The Superintendent will be directly responsible for the working of the School. His time will be fully taken up with the general management of the school, dairy, &c.; he must be provided with a competent staff of teachers to assist him in the teaching of Science, &c.

5. Provision must be made to allow both the Superintendent and the Instructor to travel about in the country with a view to studying its agricultural requirements.

6. In every district which is in charge of a Mudaliyar or a Ratemahatmeya there are a certain number of Government Schools over which they exercise some supervision. Each school should be provided with an acre of land, and the school bungalow should, if possible, stand on it. This land should be laid out and planted in such a way as to serve as a model for the boys to copy.

7. Every boy attending school should be encouraged to have his own little garden near his house, the plants to be grown there should be supplied to him from the school garden. These gardens should be periodically visited by the teacher or the Agricultural Instructor.

8. Prizes should be offered to the best-kept garden and small annual Agricultural Shows held in connection with schools; at which the boys must exhibit the products from their own garden. The prizes offered need not be expensive; books, slates, paper, pencils, &c. will be sufficient to begin with, and such prizes will be much appreciated by the boys. A separate vote should be allowed by Government to meet the expenses of prizes, &c.

9. These Agricultural Shows should be gradually extended, so that others, besides school boys, may exhibit and compete for prizes. A fresh impetus will thus be given to village school education.

10. The Mudaliyar or the Ratemahatmya must take a leading part in organising village Shows.

11. Theoretical agriculture is at present taught in every village Government School from the Fifth Standard upwards. It is important that some competent man should teach this subject. In addition to his routine work such a man could arrange to give popular lectures in Agriculture and allied Sciences. Such lectures should be carefully prepared so that they may be interesting, instructive, and entertaining to the villagers.

12. A competent Agricultural Instructor should be appointed to take charge of the agricultural education of each district, and he must work on the lines indicated above. His work should be constantly supervised by somebody from the Parent School.

13. Every Mudaliyar and Ratemahatmya should in future be required to pass an examination in Agricultural Science. This should be made one of the qualifications for appointment to such posts. When the Agricultural School is re-organised and a competent staff appointed such as will command the confidence of the public, there is no reason why some of the younger Mudaliyars and Ratemahatmeyas should not be asked to go through a course of study in it and obtain diplomas.

14. The village Agricultural Instructor should also be the village Veterinary Surgeon. He should teach the people how to tend cattle. They must be induced to grow fodder for their cows and attend to the sanitation of their dwellings.

THE ANNATTO DYE OF COMMERCE.

The oldest book on the agricultural products of tropical countries that I have come across is of George Richardson Porter published in 1833. Cacao is there described as the chocolate tree of Mexico, but no mention whatever is made of annatto. Evidently this new product was then unknown to be of a commercial value. Its use in the preparation of cacao for the table by the Spanish seems to have first brought it to the notice of the other nations of Europe and put into different other uses. This might possibly have been in the middle of the present century. But in Ceylon no attention seems to have been attracted by the plant, although it was found to be growing almost wild—if not cultivated as an ornamental tree or merely as a fence or hedge-row—until the year 1880, when Eliot James' *Indian Industries* appeared in print, the coffee enterprize was coming to an end, and planters began to turn their attention to other products. It was the late Mr. George Wall and his friend the late Mr. A. G. K. Borron that made the first attempt to include annatto amongst other new products cultivated on their partly-abandoned estates Ankanda and Crystal Hill in Matale East; and the first crop from these trees was the first parcel of annatto seed exported from the island when the price paid for West Indian seed in London was 5d. to 6d. per lb. But the employment of Tamil labor, and the process in which this crop was harvested was so expensive—not to speak of freight and other incidental charges—it was found that in the long

run annatto sent to Europe in seed would not pay. It is interesting in this connection to notice what the late Director of the Royal Botanical Gardens wrote in his report for the year 1881. Under the heading *annatto* there is a long paragraph with this sentence in his own words:—

"Several gentlemen have made inquiries as to the mode in which this is prepared for the market; and as I could find no very definite published account, I applied to the authorities at the Royal Gardens, Kew, for information." The gentlemen referred to were evidently those who were disappointed at the result of their exports to London; and in future, instead of shipping the seed, intended to convert their crops into the manufactured dye, by which means not only a saving of 20% was expected to be made in the freight, but also keep pace with the other countries that sent the article to the market. The information obtained through Dr. Trimen's efforts given in the report were however not of much value; and if anybody had succeeded in producing a marketable sample of the dye in the island subsequently, it was the late Mr. Borron. The writer who was then his assistant need not dilate on the subject here. Their united exertions in this respect is well known to those who are interested in that line of business. It may however be remarked that before the development of anything like a paying business which required time and more capital, it was very fortunate for the planters that Sinhalese labor should have at that time become very plentiful and cheap in the country. Hitherto it was only the adult male that sought employment on estates as coolies, whilst his family remained in the village tending to their cattle and their small coffee gardens. The coffee leaf disease came on and destroyed these village gardens, and starvation stared in the face of those who depended on them for their support. Hence scores of Sinhalese women and children became only too happy if they could have got any work to do on the neighbouring estates, and were willing to do it for merely a day's meal. The first European capitalist who employed this cheap labor was Mr. Borron to harvest the crop of annatto on Crystal Hill in July, 1884. Then followed a revolution in the annatto trade, and the writer had the satisfaction of seeing that (instead of worrying his head to discover the secrets of manufacturing the dye) he was able to place the seed itself on board the ship at Colombo at a cost of 6 cents per lb. against 20-25 cents a lb. it had cost before. Encouraged by this success large areas of abandoned coffee lands were immediately brought under cultivation in the Matale district. Others followed suit, and in a couple of years later there sprang up flourishing fields of annatto in Wattagama, Kurunegala, Kadugannawa, Gampola, and even far away in the Kelani Valley and Badulla districts. Even the villagers introduced it into their gardens and gave the Moorish boutique-keepers another commodity to their petty trade. In fact, it was an Assistant Government Agent who told his immediate superior that this new product would be the salvation of the natives, and got a monograph treating on its cultivation published in Sinhalese. There was one person, Dr. Trimen, who stood against these widespread extensions; those were

his words written in the report already mentioned: "The trade in annatto is a limited one. It is used as a dye occasionally, but its principal employment is for colouring cheese and butter." But this timely warning was disregarded, and no wonder that when at last this "annatto craze" had reached the climax, a reaction should have set in, and over-production should have brought down prices in the home market. The following are the words, one in the trade (Messrs. R. J. Fullwood and Bland of 61, Beverden St., Hoxton, N.) wrote at the time: "The Ceylon people made a great mistake in 1888, in sending one consignment of 150 barrels; the consequence of so large a quantity being thrown in the market was, that they were sold for less than cost of freight, dock charges, &c." *vide Kew Bulletin*, July 1890, p 143.

Then followed what was quite natural, namely, the wholesale destruction of the annatto trees on most of the European estates and the lands put under tea or cacao. It was very fortunate for those who had resorted to this bold alternative; for, by the time these tea fields commenced to bring in handsome returns, and the cacao come into bearing, annatto, wherever it was still allowed to stand began to show indications of exhaustion and decay; and the fact was then found out that it was a permanent tree. Its natural limit was to grow for seven or eight years, and then die off. If it stands longer, it will be after it had ceased to bear fruit. This is the opinion of your humble servant the writer, whose practical experience in growing this product extends to a period of fifteen years. Opposed to this, instances might be pointed out where the trees have been known to be growing for a longer time, but they are only isolated cases—exceptions, not the rule.

In my next I shall dwell upon the cultivation and diseases incident to this product, with some other notes as may be interesting to the readers of your popular Magazine.

A. VAN STARREX.

VETERINARY NOTES.

THE AGE FOR CASTRATING DOMESTIC ANIMALS.

The question when an animal should be castrated has often been asked. In cases of surgical interference, necessitated by pathological changes in the glands, no age has got to be observed excepting the fitness of the system in general to stand the effects of an operation. But in ordinary instances of castrating farm or domestic animals either with a view of fattening them, preventing the propagation of weeds, or checking vice, &c., the earlier the animal undergoes the operation the better. Any time after the development of the gland has taken place and before the animal is half-grown the operation must be performed. For example, a horse is full grown at six years and the gland is developed at one year; and so the best age for castration is between one and three years in the colt. When an animal is castrated early, his tissues being young and healthy, help to bring about a healthy

termination of the operation within a short time, and at this period of the animal's life feel there is less chance of the animal's death from shock unless he is allowed to bleed severely.

A CASE OF TETANUS DUE TO THE SYCE REPLACING A BROKEN NAIL OF THE SHOES.

In answer to a call I proceeded to see an animal belonging to Dr. Muttucumara, who told me that the horse limped badly, but as it was dark, I was not able to examine the animal well. I told the owner that the lameness was either due to some injury to the foot or to splints. On examining the foot later nothing was noticeable, and when the horsekeeper was questioned whether he removed any nail from the hoof he denied flatly. On the third day I received a message that the animal felt pain at the fetlock. On examination, found that the horse flinched when the inferior suspensory ligament was pressed, and accordingly the region of the ligament was blistered. The following morning the animal showed symptoms of tetanus and succumbed. On postmortem a nail was found to have penetrated the sensitive hoof at the outside quarter. It was only after the death of the animal that the horsekeeper admitted his interference.

TRACHEOTOMY IN A CASE OF ROARING.

A case was brought to me with the history that the animal emitted a loud sound while galloping and that he was unable to breathe freely when driven for a short distance. I saw the animal trotted and found that he was a roarer. I suggested tracheotomy as the only means of enabling the animal to prolong his life. The owner (Mr. Babapillai) consented and the operation was performed standing, on the 25th of May last. The horse is being worked since the 15th day after the operation. The tube was devised and made to my order, and a gauze shutter was also devised to prevent exposure of the wind pipe to chill and also to prevent dust &c. falling into it.

PRESERVATION OF EGGS.

The appended report has been sent us of trials made at the Central Experimental Farm, Ottawa, Canada, of the two best reputed methods of preserving eggs, viz:—Solution of water glass, (silicate of soda), and lime-water. Out of twenty different materials and plans which were tried, only three of which were found to be effective and reported "all good." These were varnishing with vaseline, lime-water, and water glass, and we find that the last two were found effective at Ottawa:—

CENTRAL EXPERIMENTAL FARM,
OTTAWA, May 19th, 1899.

Sir,—Having received numerous inquiries from farmers during the past two months respecting the merits of "water glass" as a medium in which to keep eggs, we are led to think that certain conclusions drawn from an experiment, lately brought to a close, with this and other preservatives will be of interest to your readers. The investigation was commenced last September, perfectly fresh eggs from the Farm poultry house

being used for the test, which consisted in immersing the eggs for varying lengths of time, from a few hours to six months, in (a) lime-water, and (b) 10 per cent solution of "water glass." Those eggs which were treated for a few hours, days or weeks, as the case might be, were subsequently placed, together with the untreated eggs to be used as a check, in a rack within a drawer in the laboratory till the close of the experiment, March 30th, 1899. All the eggs were at a temperature from 65° to 72° F. throughout the trial. The testing consisted in breaking the eggs into a glass and noting the appearance of the 'white' and yolk, whether the yolk was stuck to the shell, size of air-space, odour, &c. The eggs were then poached and again the odour, appearance, &c. noted. Without giving in detail the results of the various trials, it may suffice for the present purposes to summarize the conclusions reached, as follows:—

CONCLUSIONS.

1. In no instance, either of treated or untreated eggs, were any 'bad' eggs found.

2. In all cases where the eggs were not kept covered throughout the period of the test with the preservative solution, shrinkage of the contents had taken place, as shown by the larger air-space, less globular form of the yolk, and in many instances by the adherence of the yolk to the shell. The eggs treated for seven days and less with lime-water showed somewhat less shrinkage than those treated a similar length of time with silicate of soda.

3. It would appear that lime-water and 'water-glass' used continuously are equally efficacious in preventing shrinkage. They may also be said to give practically the same results as regards both external and internal appearances, flavour, &c. of the eggs preserved. Since 'water glass' (silicate of soda) is more costly and more disagreeable to use than lime-water, we could not from the present results recommend the former as the better preservative.

4. The albumen or 'white' in all the preserved eggs was very faintly yellow (though not to the same degree in all the eggs), the tint becoming deeper on boiling.

5. No offensive odour was to be perceived from any of the eggs when broken, but in all instances a faint but peculiar musty or slate odour and flavour developed on poaching.

6. It is probable that no preservative will prevent the loss of flavour possessed by the fresh egg, but those which wholly exclude the air (and thus at the same time prevent shrinkage from evaporation) will be the most successful. Continual submergence is evidently better than treatment for a few days. The lime-water may be made by putting two or three pounds of good fresh lime in five gallons of water, stirring well at intervals, for a few hours and then allowed to settle. The clear supernatant fluid can then be poured over the eggs, which have been previously placed in a crock or water-tight barrel.

Some authorities recommend the addition of a pound or so of salt to the lime-water, but the writers are of the opinion that this is unnecessary, and probably leads to the imparting of a limy flavour to the eggs by inducing an interchange of the fluids within and without the egg. The all

essential points to be remembered are:—(1) That the eggs to be preserved shall be perfectly fresh, and (2) that they shall be covered with the preservative fluid.

MUSHROOMS.

Mr. Tardent, a frequent contributor to the *Queensland Agricultural Journal*, supplies some useful information regarding mushrooms to the September number of that journal, quoting Mr. A. de Zaczewsky, who is referred to as one of the greatest living authorities on mycology, in saying that "from the most ancient times mushrooms have been considered as an extremely healthy esculent. Modern science has confirmed that opinion. According to analysis made by the greatest authorities known to chemical science, mushrooms are by far the most nutritious of vegetable substances, not excluding bread. The proportion of protein they contain brings them nearer to meat than to plants. In addition, they contain an important proportion of assimilable phosphorus."

In Paris alone over £1,500 worth of mushrooms are being sold *daily*. In Italy and Germany they form an important part of the alimentation of the people. For Russia there are no available statistics, but the writer of these lines can affirm, with Mr. de Zaczewsky, that in certain localities the people live nearly exclusively on mushrooms, especially at the time of the heaviest outdoor work.
