COMMENCED IN 1881.

top after step the ladder is ascended."—George Herbert, *Jacula Prudentum*.

THE TROPICAL AGRICULTURIST:

A MONTHLY RECORD OF INFORMATION FOR PLANTERS

OF

TEA, CACAO, COFFEE, PALMS, RUBBER, CINCHONA, SUGAR,
COTTON, TOBACCO, SPICES, CAMPHOR, RICE,
AND OTHER PRODUCTS SUITED FOR CULTIVATION IN THE TROPICS.

EDITED BY

J. FERGUSON,

of the "*Ceylon Observer*," "*Ceylon Handbook and Directory*," &c.

"It is both the duty and interest of every owner and cultivator of the soil to study the best means of rendering that soil subservient to his own and the general wants of the community; and he who introduces, beneficially, a new and useful *Seed, Plant or Shrub* into his district, is a blessing and an honour to his country."—SIR J. SINCLAIR.

VOL. XVI.

[Containing Numbers I. to XII.: July 1896 to June 1897.]

Colombo, Ceylon:

A. M. & J. FERGUSON.

LONDON:

WEST INDIES AND CENTRAL AMERICA: C. H. CALDERON, ST. THOMAS.

STRAITS SETTLEMENTS AND EASTERN ARCHIPELAGO: JOHN LITTLE & Co., SINGAPORE.

JAVA: MESSRS. JOHN PRYCE & Co.; G. KOLFF & Co., BATAVIA.

MDCCCXCVII.

TO OUR READERS.

In closing the Sixteenth Volume of the "*Tropical Agriculturist*," we would as usual direct attention to the large amount of useful information afforded and to the great variety of topics treated in the several numbers. From month to month, we have endeavoured to embody in these pages the latest results of practical experience and scientific teaching in all that concerns tropical agriculture; and our ambition has been to make our periodical not only indispensable to the planter, but of service to business men and capitalists, never forgetting that agriculture trenches upon every department of human knowledge, besides being the basis of personal and communal wealth.

While directing our attention chiefly to the products prominently mentioned on our title-page, we have always taken care to notice minor industries likely to fit in with sub-tropical conditions: and our readers have an ample guarantee in the index pages before them, that, in the future, no pains will be spared to bring together all available information both from the West and East, the same being examined in the light of the teachings of common sense as well as of prolonged tropical experience in this, the leading Crown and Planting Colony of the British Empire.

Special attention has, during the past year, been given to the extension of the fibre industry (rhea, sisal, &c.); rubber; cacao in Guiana and the West Indies as in Ceylon; coffee and other products in Nyassaland, British Central Africa; Liberian coffee and other products in Sumatra, Java, the Straits Settlements; and to other new developments in coffee, coconuts and tobacco planting, &c., in the Malayan Peninsula and North Borneo.

The Tea-planting Industry has sprung into so much importance in India (South as well as North) and Ceylon, as also in Java, that a considerable amount of space is naturally given to this great staple; and we think it will be admitted by impartial judges that the *Tropical Agriculturist* should be filed, for the convenience of planters, in every Tea Factory in this Island, in India and in Java.

A full and accurate Index affords the means of ready reference to every subject treated in this, the sixteenth volume, which we now place in our subscribers' hands, in the full confidence that it will be received with an amount of approval, at least equal to that which has been so kindly extended to its predecessors.

To show how fully other Products besides Tea are treated in this volume we may mention the number of entries under several headings as follows:—Coffee (including Liberian) 86; Cacao 16; Indiarubber 26; Coconuts and other Palms 20; and Miscellaneous Products nearly 1,000. In the 16 Volumes, the references to Coffee, Rubber, and Cacao number many thousands, as also to Coconuts and other Palms.

We are convinced that no more suitable or useful gift can be made to the tropical planter or agriculturist, whether he be about to enter on his career, or with many years of experience behind him, than the sixteen volumes of our periodical which we have now made available. They are full of information bearing on every department and relating to nearly every product within the scope of sub-tropical industries.

In conclusion, we have to tender our thanks to readers and contributors, and our wish that all friends may continue to write instructively and to read with approval; for then, indeed, must the "*Tropical Agriculturist*" continue to do well.

J. FERGUSON.

COLOMBO, CEYLON; 1ST JULY 1897.

ERRATUM AND CORRIGENDUM.

On page 120 of this volume is a stupid paragraph which we inadvertently took over from the *Fruit Grower* entitled "The Pimeloe in England: the Ignorance of Kew Gardens." This was shortly after corrected, justifying the Kew Gardens authorities, in an article which is given on page 371.

Covers for binding the Sixteenth Volume, July 1896 to June 1897 (890) pages can be obtained for R1.50. Cost of binding and cover R2.50.

WHAT IS THOUGHT OF

THE "TROPICAL AGRICULTURIST."

A gentleman resident in the Central Province, who has as good opportunities of knowing what is of benefit to Planters as anyone we know, sent us the following explicit testimony to the value of the "T.A.":—

"Since its commencement, I have regularly seen and perused the *Tropical Agriculturist*. There can be but one opinion that its scope and object are highly important, and that it supplies a distinct desideratum, which it is to the interest of every estate proprietor to have available in the bungalow for the use of his *locum tenens*, or superintendent. As a magazine it provides varied and instructive fresh literature at intervals; deprived, as most in Ceylon are, of easy access to libraries; and as years go by it will growingly become 'The Ceylon Encyclopædia' with reference to agricultural operations. Viewing estate property as practically a permanent investment to any proprietor, the trifling charge of R12 per annum—a rupee a month—is certainly of no account, provided the separate numbers are kept, and bound together yearly as a book of reference, for the benefit of the manager and his successors. In that light, as the property of an estate to be handed over just as much as its office furniture, few proprietors would probably refuse to authorise its being taken and filed regularly (if the periodical was brought under their notice), more especially as on looking over the most recent volume one cannot fail to see how much valuable information on 'Tea' has been collated. In the belief that 'Tea' has restored prosperity to Ceylon, and that plantation property is a good investment for capitalists, such should not omit the office and connected equipment so advisable on all 'pucka' estates, a part of which should be the *Tropical Agriculturist*. I find I have gone on writing, but, as I am getting the numbers for the past year ready to be bound, the volume is before me."

Mr. W. T. Thistleton Dyer, F.L.S., C.M.G., of Kew Gardens:—"Sir Joseph Hooker and myself always look out for the successive numbers of the *T.A.* with eagerness, and I keep a file in my office for reference. It is impossible to speak too highly of the utility of such a publication and of the way it is managed."

Dr. King, of the Calcutta Government Museum:—"I know your *Tropical Agriculturist* well, having carefully secured every number since the beginning. You have succeeded in making it a wonderfully useful magazine of information for planters."

Surgeon-Major Bidie, F.L.S., of the Government Central Museum, Madras:—"I find the *Tropical Agriculturist* a most interesting and useful publication. It finds a place on the table of our Public Library, and is much prized."

THE VALUE OF THE "T.A." TO CEYLON ESTATE OWNERS.—A planting correspondent wrote some time ago:—"I think proprietors should supply every tea estate with the *T.A.* The information in it with regard to everything in connection with tea &c. is invaluable: it would pay its value over and over again. Owners of estates should not leave it to hard-up superintendents to take it in."

A Correspondent writes:—"I venture to say the volumes of the *Tropical Agriculturist* will be at a premium a few years hence: it is a book which is bound to rise in value as time rolls on, and subscribers will probably, if they so choose, be able to sell at a handsome profit, besides having had the benefit of using the information in the meantime!"

From a Proprietor:—"I wonder how many planters knew what they lose in not subscribing to your wonderful publication? The cost is absolutely nothing, compared to the convenience of having in a bound book all that is interesting and necessary in the literature of their calling. Information culled from a thousand sources, price lists of all produce sold locally, and home advertisements not seen elsewhere, and a hundred other things necessary for them to see and to know. The *T.A.* is, in fact, a convenient file of useful information daily arising and permanently preserved."

[No. 1.

CEYLON AND ITS RESOURCES.

THE COLONY'S CENTENARY.
INTERVIEW WITH MR. J. L. SHAND.

[By Our SPECIAL COMMISSIONER.]

WHO that has read up the history of the British Empire or has travelled round the world has not fallen in love with Ceylon—the “pendent jewel of India”—the “gem of the Indian Ocean,” with its varied climate, its luxurious vegetation, its tropical products, its grand scenery, and its interesting native population? Its very antiquity makes it exceptionally interesting to the student of literature. The great Indian epic, “The Rāmāyana,” has a chapter describing Ceylon at least ten centuries before the Christian era, but the authentic history of the island begins at the fifth century B.C., when an Aryan invasion from the valley of the Ganges established the Sinhalese dynasty. Visited in the early days by the Greeks, Romans, and Venetians, the Portuguese formed settlements on the west and south of the island in 1505, but in the next century they were dispossessed by the Dutch. A hundred years ago last Monday—February 17—Ceylon passed under the authority and protection of the British Crown, and no doubt the centenary of this interesting colony was suitably celebrated in Colombo under the ægis of its new Governor, Sir West Ridgeway, K. C. B., K. C. S. I., who left London last month to take up his gubernatorial duties. Prior to his departure he was entertained at a banquet by the Ceylon Association in London, and but for this recent dinner the planting, mercantile, and shipping interest connected with the colony would have celebrated the centenary in the customary manner by meeting together round the festive board.

HOW STANDS CEYLON TO-DAY?

This was the question that occurred to me on Monday, and I felt that I could not do better than call upon Mr. John Loudoun Shand, late Member

of the Legislative Council, who has lived in the colony for twenty years. He has been a tea-planter, has had the management of large estates, and was the chairman of the local Planters' Association. On his return to England to take up his residence here he helped to found the Ceylon Association in London, and is now the senior partner of the firm of Shand, Haldane & Co., of Rood-lane.

I was fortunate in finding both partners in. Having explained the object of my visit, Mr. Haldane said, “Ah, tea is now our great staple in Ceylon. Twenty-one years ago I exported 20 lb., which was a tenth of the whole production of the colony. Last year the total exports amounted to 97,000,000 lb.”

“Yes, I know tea has made wonderful strides. But first let me know something about

THE CEYLON ASSOCIATION IN LONDON.”

“Well,” replied Mr. Shand, “that is an association without a constitution. We felt that some organisation was needed on this side to watch over the interests of the colony, and to advance the same in this country. The association has for its president Lord Stanmore, better known, perhaps, as Sir Arthur Gordon, a former Governor of Ceylon, and is composed of merchants and shippers who are interested in the colony, exofficials of the Colonial Government, and planters. The members of the Chamber of Commerce in Colombo and of the Planters' Association are also members of an association while at home.”

“And you watch over the interests of the colony generally?”

“Yes, the general body has interested itself lately in the question of the military expenditure, and then we have a special tea committee, which comes together pretty often. Before we started we had no separate days of sale for Ceylon teas; they were sold as Indian teas, and we had to break down several trade barriers. Everything is now overshadowed by tea, as it formerly was by coffee.”

OPENINGS FOR BRITISH CAPITAL.

"The one great object of these interviews, Mr. Shand—and I should explain that this is only one of a series—is to make City people acquainted with the vast resources of our colonies, and the opportunities they offer for the introduction and profitable employment of British capital."

"There has been a great deal of capital sent into Ceylon during the last ten years, and up to the present it has all been most advantageously invested. But the area of land suitable for tea-planting—and bear in mind that this is now our chief industry—is limited. We have over 300,000 acres planted now, giving employment to nearly 2,000 British managers and superintendents, and about half a million British subjects from India and Ceylon, and the probabilities are, that this acreage will not be very much increased. Of course, the tendency of things in Ceylon, as it was in India, has been very much to turn estates into companies. When coffee cultivation was at its height there were only two or three London companies, but in the case of tea it has been found desirable to join two or three estates together and form them into public companies."

"And I see by an article in the *Financial News* of to-day, quoted from the *Times of Ceylon*, that they are all doing well, and that the price of the shares has risen in value during the past year from 18 per cent. up to 86 per cent."

"Yes they are all doing well, as you say; in fact, there has been an all-round rise. And yet, when we started to grow tea, every conceivable difficulty was raised. 'The soil is not good enough.' 'You may grow tea, but you will never make it in sufficient quantity to make it pay.' 'You may get quantity but you will never get quality.' 'It may go on for years, but it won't last.' These were but a few of the expressions of doubt hurled freely and without foundation at tea-planting in Ceylon, but it has lived them down. The yield from many of the older gardens has far exceeded the most sanguine expectations, the average price obtained has exceeded that of other tea-producing countries; the older tea fields—and it must be remembered that they were formed on land not selected for its suitability for tea but for its unsuitability for coffee, some of which are now thirty-years old—are giving a steadily increasing yield, maintaining quality and showing no signs of exhaustion. But wait, while I just copy down for you a few figures showing the

TOTAL EXPORTS OF CEYLON TEA		during the past twelve years:—	
Year ending	December,	'85,	4,400,000 lb.
"	"	'86,	8,100,000 "
"	"	'87,	13,800,000 "
"	"	'88,	24,300,000 "
Year ending	December,	'89,	34,000,000 "
"	"	'90,	46,900,000 "
"	"	'91,	68,200,000 "
"	"	'92,	71,100,000 "
"	"	'93,	84,400,000 "
"	"	'94,	84,500,000 "
"	"	'95,	97,800,000 "
"	Estimate	'96,	101,000,000 "

"Certainly a most remarkable and wonderful progress, Mr. Shand?"

"I think so, too. In a paper I read before the Royal Colonial Institute in 1888 I stated that the probable export of tea in 1890 would be 40,000,000 lb. It exceeded that by over 6,000,000 lb., and the late Sir John Coode, in the course of the discussion that followed, ventured to predict that it would reach 100,000,000 lb. by the end of the century. It has topped that already."

"And as regards the price?"

"Well, here is a table which my partner, Mr. Haldane, has drawn up, showing the average value of Ceylon tea sold in London from 1889 to 1895. In the first place there has been a steady increase in the quantity sold from 440,161 packages in 1889 to 970,269 lb. last year. In 1889, you will observe, the average price per lb. was 11d.; in 1890, 10½d.; in 1891, 10d.; in 1892, 9½d.; in 1893, 9d., in 1894,

8½d.; and in 1895, 8¼d.; so that there has been a steady decline until last year, when there was a slight rise. But you must remember that whereas the average value of the rupee in 1889 was 1s. 4½d.; last year it was only 1s. 1¾d.; so that the planters are quite as well off with the lower price as with the higher, so long as they and theirs remain in the land of rupees, and do not require to convert rupee into sovereigns.

"But there must be a price, of course, at which it would not pay to grow tea?"

"Undoubtedly. But we have two good things in our favour, good labour and good transport, and most of the Indian tea-growing districts would have to give way first. Our labour on the estates is almost entirely imported from Southern India. We give them a small advance, which we recover from them."

"Over and beyond tea there are

OTHER PRODUCTS.

What can I say about these?"

"When coffee failed us we ransacked the world of tropical agriculture for substitutes, and among other things we grew cinchona so successfully as to bring the price of quinine down to about a tenth of what it had been. Ceylon is capable of producing an almost unlimited quantity of cinchona bark, but at present prices it cannot be grown profitably. All the same, it was the sheet anchor which enabled us to ride out the financial storm, and to regain prosperity."

"And what about coffee?"

"I think we may see a good deal of Liberian coffee coming from Ceylon in the near future. As you know, our coffee failed through a fungus. Then we introduced Liberian coffee, and cultivated it on a considerable scale. Since those days the trade has come to appreciate this Liberian coffee, and if we had known as much about it in the old days as we know now we should have seen a much larger area under cultivation."

"And as to cocoa?"

"We have been exporting a great deal of cocoa, and have got for many years an excellent price for it, but there has been a heavy fall in values during the past two years, on account of the enormous supplies coming forward from South America, and as the area of cocoa land is limited—it requires a very good soil and exemption from wind, two things which do not go well together in Ceylon—I do not expect to see a very great increase in the production."

"What about sugar?"

"Sugar cultivation was tried many years ago, but our rainfall is the great drawback to the growth of the cane. There is never a certainty of dry weather, and as sugar-growing was not a success when it had not Continental bounties to compete against, it is not likely to be a success now."

"Then there are your coconuts?"

"Yes, a very large area is under coconut cultivation. Hitherto the industry has been almost entirely in the hands of the natives, but recently European planters have taken it up. New markets are opening up constantly, and the demand increases. In addition to coconuts we have spices of various kinds—cinnamon, pepper, cardamoms, and such like, but they are all minor industries."

"And how stands

THE FINANCIAL POSITION OF THE COLONY

to-day?"

"The financial position is very strong indeed. The only debt we have are sums that have been borrowed for public works, which will prove remunerative, and that debt is very small—only 2½ millions in fact. Our revenue is bounding up tremendously. It is now about 20 million rupees, and the expenditure, including interest on debt and sinking fund, is about the same. The Government is pursuing a spirited public works policy, and we have a network of railways all over the island."

CEYLON AT THE IMPERIAL INSTITUTE.

"By the way, Ceylon has a court at the Imperial Institute, has it not?"

"Yes; but I do not know that it is of any use. The building is out of the way, and it seems difficult to combine business with pleasure. Then all the information one wants about the colony can be obtained without going to South Kensington for it. I have only been in the Institute twice in my life, and as far as serving any useful purpose it is, I fear, a failure."

"Then, generally, I may say that Ceylon is in a flourishing condition."

"It has never been so flourishing as it is today, and its prosperity—thanks to the tea industry—was never based on a firmer footing. Even in the good old days there was never the same division of prosperity as now—everybody, from the public bodies downwards, being distinctly better off."

"And there are still openings for the introduction of capital?"

"I am not quite sure Ceylon is the place I should invest money in. You must remember that the island is not like Australia or Canada, with a large territory to fall back upon. It is quite possible to attempt too much in Ceylon. We have had an enormous number of young men go out, younger sons of well-to-do people with a little capital. Some have done well, but the present is rather a time for big companies than small estate proprietors."

"What about the climate?"

"Of course we have got variable climates. You have it uncomfortably hot in the lowlands, but we have nothing like the African fevers, being on the high road to India and Australia. Ceylon is of course largely resorted to by visitors, who are very often so enchanted with the colony as to break their journey at Colombo and stay in the island until the arrival of the next steamer. There is a sort of open hospitality. Anyone taking out a letter of introduction to a well-known colonist or official is franked on and on, and in this way he makes a number of good acquaintances. There are something like 2,000 planters, largely recruited from England, Scotland, and Ireland, and their friends are often visiting them. Then it must be remembered that the conveniences of life on the island are vastly different to what they were thirty years ago. Yes, sir, Ceylon is flourishing, and long may it flourish."
—Citizen.

THE TRADE IN VANILLA.

In the number of the *Journal* for March 27th, see *ante* p. 453, some facts were given on the condition of the quinine market and an incidental reference made to vanilla. In this connection it will probably be in the memory of many readers that the history and botany of the plants furnishing this useful product have recently been fully dealt with in the *Kew Bulletin*, and to the matter to be found therein the following extracts from the same number of the *Chemist and Druggist*, which contains the foregoing remarks on quinine, will be supplemental, and of value as completing the commercial side of the question. In consequence of the high price that vanilla always commands in the market, the crystalline principle has been imitated by a substance generally known as vanillin.

"When this substance was first introduced as a commercial article, now a good many years ago, the planters and others interested in the vanilla trade were much scared at the new competition, but events have shown that their fears were unfounded, for although the use of vanillin may have prevented the consumption of vanilla from assuming such large proportions as it would otherwise have done, it has not in the least proved an obstacle to the profitable culture of the vanilla plant, and it is notorious that the employment of vanilla has greatly increased of late years. It is also noteworthy that vanillin is now lower in price than it has ever been, while fine vanilla realises higher figures than it has done for years. It seems, in fact, that in many instances the commercial preparation of a synthetic product, after creating a temporary depression in the market of the natural drug which it is intended to replace, finds a place side by side with the sale of that product, and remain thereafter comparatively powerless to affect the commercial position of the natural article. Cumarin and artificial musk are cases in point, in addition to vanillin.

"The future course of the vanilla market will be largely influenced by the receipts of Réunion (Bourbon) and Seychelles vanilla in the course of the next three months. When the first arrivals of the new vanilla crop came to hand in October, the stocks had fallen to a very low point everywhere; since then there has been but little chance of accumulation, owing to the strong demand, but at present the bulk of the crop is coming in, and it remains to be seen whether buyers will be able to absorb it with a rapidity approaching that with which it arrives. The principal stock of vanilla in Europe is usually kept in France, especially at Paris and Bordeaux, where the bulk of the Bourbon crop is received in consignment, and whence considerable quantities are habitually sent to London for sale. In September, just before the arrival of the new crop, a stock of from 15,000 to 20,000 kilos, in Bordeaux, and as big a one in Paris and Marseilles combined, used to be a fair average, but during the year the supplies in France did not by any means reach the lowest of these figures, while the London stock was below rather than above its usual scanty figure of about 2,000 lb. The crops of vanilla in Réunion, Mauritius, and the Seychelles have been unusually small, and it is said that the crop which is now beginning to arrive will again be a very poor one, while reports of total failure have come from Mexico for many weeks. As the United States require from 130,000 to 150,000 lb. of vanilla every year, they have been obliged for some time to purchase vanilla in Europe, and their orders have helped not a little to increase the competition and advance the market price of the drug. The American requirements are probably larger than those of the rest of the world together, and we do not estimate the total consumption of vanilla at much over 250,000 lb. a year, setting aside the Mexican production, and that from the smaller sources of supply. We cannot count upon an average output of about 160,000 lb. a year in Réunion, and of about 60,000 lb. a year in Mauritius and Seychelles. With an average crop, therefore, the present production of vanilla is ample, and if the exceptionally high prices of this year should lead to an extension of cultivation, we may be confronted with a large

over-production within a very few years. For, although vanilla is very sensitive of climatic influences, the plant is easy of propagation, and yields a rapid return, as the vines begin to bear in their fifth year, and may continue to yield fruit until their fortieth.

"Fortunately for those who sell the article, it seems that comparatively few planters can grow it successfully. In Java, where vanilla was introduced in 1819, the culture was at one time of great importance, but at present the island scarcely counts as a producer. In Mauritius also, vanilla-growing seems to be dying out. The exports from that island fell from 37,600 lb. in 1892 to 15,400 lb. in 1893, and 9,100 lb. in 1894. Réunion exported her first vanilla to Europe in 1849. That shipment was only 7 lb. but in 1870 the exports had grown to over 20,000 lb. Since then the largest Réunion crops have been 190,000 lb. in 1891, 207,000 lb. in 1892, and 175,000 lb. in 1893, but last year there was a great decrease. The production of Seychelles has been exceedingly erratic lately. These islands first sent their produce to Europe in 1885. In the succeeding years they quickly rose to an output of about 80,000 lb., but equally thickly dropped off again to about 17,500 lb. a year. According to the latest reports, however, the output next year is likely to show a great increase. The Seychelles and Mauritius vanilla is generally shorter, paler, and fainter in odour than that from Réunion, and realises lower prices."—*Journal of the Society of Arts.*

LIBERIAN COFFEE.

In the *Selangor Journal* of 6th March there appears, reprinted from the *Journal of the American Colonization Society*, a very interesting article by a Mr. Johnson on Liberian Coffee. The information it gives is extremely valuable and will be found well worth studying by all interested in this product; but it is not so much what Mr. Johnson says that I wish to comment upon here, as the notes on the paper written by a Selangor planter.

To judge from these notes it would seem that coffee planters in Selangor have arrived—not without good reason no doubt—at conclusions directly opposite to those we have reached in North Borneo; we are quite with the writer when he states "nothing suits coffee over here better than a strong moisture-retaining soil," but when he goes on "For this reason amongst others flat land is most sought after and I imagine few planters would care to plant up hills from choice," he makes it clear that the conditions in Selangor must be quite different from those in North Borneo, where we never plant on the flat and always ask for undulating land, not so hilly that much wash of soil is entailed but sufficiently so to let the rain run off with little or no cost for drainage. This is the lay of land we like best, but it cannot of course always be got in perfection.

The next statement of the writer's is, to say the least of it, rather appalling. "There are few estates here on which cannot be found sturdy well-grown trees flourishing and cropping freely in places where water may be found a foot or 18 inches down." And this on the flat too? All I can say is that in North Borneo ninety per cent of the trees would go out from root rot in a couple of years under similar conditions. Are our Selangor friends quite sure they are right?

A good deal of discussion has been proceeding in the Singapore papers as to some of the coffee lands in the Straits, not necessarily of course any of those referred to in the *Selangor Journal's* notes; during this discussion reference is made to the heavy percentage of "struck" plants (what is a "struck" plant?) while as to soil we are cheerfully given a choice of all peat, half peat, land with water 18 inches below, blue clay, or sand. For myself I should decline to have anything to do with experiments as to whether coffee died sooner on "blue clay" or "peat."

On the question of topping, the *Selangor Journal* writer has a fairly open mind. I give his remarks in full.

"The process of topping is restored to in Liberia though we are not told at what height, the objects being cheap gathering (the crop being brought within the coolies' reach) and additional spread, which of course means a larger plucking surface, whilst the other advantage claimed for wide-spreading trees is that they keep the grass down more than those which are allowed to run up. We, however, weed our estates so regularly over here that though the greater the spread the coffee acquires the less is the cost of weeding, this fact even combined with cheap harvesting would not be considered a sufficient reason for topping our coffee. There are many of us, however, who believe that by cutting the heads off our trees, we not only drive the strength of the tree outwards into the primary and secondary crop-bearing branches instead of letting it run off into "top," but by this process also secure a sturdier, healthier and equally heavily cropping tree. As nevertheless opinions are divided on this subject, some planters claiming that trees allowed to run up give larger returns, it is important to note that nowhere does Mr. Johnson, who would scarcely be likely to lose sight of such a material point, make any allusion to this whatever. By inference therefore the Liberian coffee tree in the habitat to which it is indigenous yields no less when its growth is artificially cut short and directed in an unnatural direction. It appears to me perfectly clear, then, that we can gain nothing in the way of increased returns by letting our coffee run up, whilst the disadvantages of this system, some of which have been already noticed, are innumerable. The question we now have to solve, is at what height to top."

This question of topping is a most important one, I have lately seen a lot of trees on two estates in North Borneo which were undoubtedly much damaged by being topped too low, but there was still one point not clear: whether they had not been allowed too great a growth before being topped; however this may have been in a great many cases the trees almost died, and had not fully recovered their cropping power at the end of two years, while others, untopped growing close by were clothed with a luxuriant foliage and were heavy with fruit. Speaking for myself 7 feet is (now) the lowest height at which I would top while I am sure that trees should not be topped too far down when they have once grown up, always keeping in mind on the other hand that to top green wood stems is to kill the tree bark for a foot or 18 inches lower than the cut top.

In Mr. Lyall's half-yearly report on coffee in the Straits we read "coffee 2½ to 4½ years has parted hands at from \$300 to \$600 per acre, and it is reported that \$700 has been refused for some 5½ years old coffee." These figures are worthy of the most consideration by all interested in North Borneo.

MYNAB.

—British North Borneo Herald.

THE TRADE OF JAVA.

BY M. QUILLET ST. ANGE.

Java's commercial situation did not improve appreciably during the last nine months of 1894. But the crisis became a little less acute on account of the gradual diminishing by sale of the stocks of sugar which had been lying in warehouse for over six months. The planters at last resigned themselves to selling part of their stock at cost price—about 7 fl. 50c. the picul in warehouse—as some of the banks were refusing further credit, and others were asking exorbitant rates of interest. On the other hand, the rainy season, which usually comes to an end in May, lasted in 1894 till July. The plantations suffered severely in consequence. On large areas of land, situated at some distance from the factories, the crops had to be totally abandoned, as the buffalo waggons could not be used, owing to the softness of the water-soaked earth. As the net result, the embarrassment caused by the plethora of 1893 will be succeeded by trouble due to the failure of the 1894 harvest. "Java" coffee production has

rapidly decreased, having fallen, in a few years, from 1,100,000 to 370,000 piculs, and the situation is becoming worse and worse owing to the ravages caused by the *hemileia vastatrix*. The Government, which has been deeply affected thereby, is energetically pushing the cultivation of "Liberia" coffee, which has hitherto appeared proof against the disease, but it takes not less than five years for a plantation to produce a satisfactory crop.

Among the smaller traders, the recoil of the misfortunes of the two great industries is necessarily felt, bankruptcies being pretty numerous. But the importance of these must not be exaggerated. The bankrupts are mostly Chinese and other Asiatics; whose commercial methods—due to excessive toleration—are so well-known to European merchants that not even the most confiding of them allows himself to be dragged into the smash which is the frequent epilogue of the Asiatics' adventurous speculations. Europeans are chiefly affected by the stagnation of trade which causes them material losses. Certain articles—and they are fairly numerous—must be sold quickly in this warm, damp climate. Such are provisions, preserves, silk stuffs, &c.; if kept in stock too long they are injured and have to be sold by auction. To make up for losses of this description, the retailer tries to make a profit of 70 to 100 per cent. on what he sells. French merchants, I am glad to say, have suffered less comparatively than those of any other nationality, through the crisis which has now lasted for over a year.

Perhaps their business would, however, be more prosperous, their orders placed in France better understood and executed, if there existed among them that union which assures everywhere the success of the Germans. French merchants, lacking information themselves, send incomplete instructions to their agents at home, consequently the orders are often badly executed, and the result is disputes, refusals of payment, etc., things which are all hurtful to credit, and to the progress of business. It is to be regretted that the French Colony is not large enough to study the possibility of creating a Chamber of Commerce. I think, however, that such an institution would be a precious guarantee of success for the increase of French trade in the Netherlands Indies, if it included in its membership a few men capable of properly directing its efforts. I took the initiative some time back in bringing together the French merchants on the first and third Sunday of each month. My object was to place before them the commercial publications which I received, to show them correspondence which had arrived, and to submit to them offers from French producers. The merchants came regularly at first, then came more seldom, and finally, either through indifference, or because they did not like to lose their Sundays, they ceased coming altogether. I see, in reading the reports of my colleagues of the French Consular service, that the same errors are repeated by French merchants in nearly the same form in all exotic countries.

As regards everyday articles of domestic consumption, cheapness is the first quality looked for, and to this, French exporters do not seem to be able to resign themselves. Apart from alimentary produce the inhabitants of the colonies are inept to distinguish good manufacture from bad, and if, by experience, they discover the distinction, their in-providence prevents them from taking advantage of the knowledge. Fully understanding this appears to me to be the true cause of the success of German industries in many centres where French industries fail. But if colonial consumers accord little favour to French produce on account of its high price, they know how to appreciate French workmanship, executed under their eyes. It is a Frenchman, M. Roussel, boot and shoe manufacturer at Batavia, who has secured the contract, over the heads of five Dutch competitors, to supply footgear to the army for ten years, the minimum supply being 2,000 pairs a month. The native soldiers of the colonial army formerly went barefooted, but during the Lombok expedition a great number died

pany's option at par. The above conversation will, on the amount issued, effect an annual saving of £975 in interest, a result which cannot be regarded as other than highly satisfactory.

The paid-up Capital of the Company now stands as under—

9,000 Preference Shares of £5, fully paid ..	£45,000
1,000 " " £5, £1 paid ..	1,000
800 Ordinary " £5, fully paid ..	4,000
17,088 " " £5, £3 paid ..	51,264
Calls paid in advance on Preference Shares ..	320
4½ per cent. First Mortgage Debenture Stock ..	65,000

£166,584

The amount at credit of profit and loss account after paying Debenture Interest and all charges, and providing for depreciation of buildings and machinery is £9,342 2s. 5d., and after deducting the Interim Dividend paid upon the Preference Shares in November last, there remains a balance of £8,800 16s 4d. which the Directors recommend be apportioned as follows:—

To reduction of Debenture Issue Expenses Account	£3,500 0 0
„ payment of the Preference Dividend for the 6 months ending 31st December last (making 6 per cent. for the year), less tax	649 18 6
„ payment of an Ordinary Dividend at the rate of 8 per cent. per annum (free of tax)	4,421 2 6
„ carry forward to next account.. .. .	229 15 4

The Directors have much pleasure in again recording their satisfaction with Mr. Denison's management in Ceylon, and the work done by the Superintendents. The retiring Directors are Mr. T. J. Lawrence and Mr. Thomas Mearns, who being eligible, offer themselves for re-election. The 6 per cent. Debentures having been paid off, the appointment of Auditor rests with the Shareholders, and Mr. A. N. Flower, Chartered Accountant, offers himself for election.

HUGH C. SMITH, Chairman.

J. HUNTLEY THRING, Managing Director.

HUGH CHAPMAN, Secretary. London, April 27, 1896.

The above may be considered an exceedingly satisfactory report, and I may deal editorially with one or two special features.

CEYLON TEA IN AMERICA.

Everybody in Ceylon knows how cautious is the Planters' American Commissioner. One is always safe in adding something to Mr. Wm.

* Also 5 acres cardamoms.

† Also 120 acres coffee, and 100 acres cocoa.

‡ Also 55 acres cocoa and 3 acres cardamoms.

Mackenzie's anticipations, because they are nearly always sure to err on the safe side, just as in the case of some other authorities, one is inclined to allow for over-sanguineness. Well, from Mr. Mackenzie I have had a very interesting and satisfactory account of the continued progress made by his own and Mr. Blechynden's mission, on behalf of our and Indian teas. That these are gradually getting a firm hold of the American market is the great fact, the large dealers being forced by the badness of the Chinese "black" teas, to take ours instead. The campaign against the adulterated "green" teas has not developed yet, but will come later. Lipton has now commenced tea dealing in America on a very large scale and so has the Mazawattie Co., as well as the Messrs. Tetley. Mr. Mackenzie does not expect a great increase in the consumption of Ceylon-Indian teas this year over 1895—the great rise has been in 1894—for it is every alternate year that indicates special progress, it requiring at present a second year to work off the teas poured in, say in 1895. But I cannot see why an accelerated rate of progress should not shortly be expected; for the trade now being built on a sound basis is bound to develop widely. Indeed, one firm of dealers in our teas already spends in advertising in its own way as big a sum annually as the "Thirty Committee of Ceylon" allot to America! Mr. Mackenzie has certainly surprised me as to the cost of advertising in the leading papers and periodicals of the States, and I question if in England, so large a price was ever paid, as £750 for one page on the back cover of a leading monthly—just for the one insertion, but that I am assured is the rate demanded!

Mr. Mackenzie, who looks very well, would like Mr. Melville White (now on his way home) to take his place for the summer or autumn tour of two months across the Atlantic; but the ex-chairman indicates he is coming home for a holiday rather than to attend to business.—The dispute between

SIR JOHN MUIR AND MR. JAMES SINCLAIR over Belgravia and Elgin estates is, of course, much talked of in Ceylon circles in the City. There is a general feeling that there is bound to be a settlement, if not a compromise, satisfactory to the shareholders. Mr. Sinclair, I hear, is personally in exceedingly strong legal hands who have been very careful about his position; while the opinion of the Solicitor-General for Scotland has been taken on the dispute and is very clearly against Sir John Muir. Still, for aught I know, there may be strong legal opinions the other way. The question has been asked why the statutory meeting is delayed; well, the due date is not yet fully up, I hear; and it would obviously be unwise to make a statement while negotiations are pending, which it is generally hoped will obviate a case in the courts.

NEW TEA LAND CLEARINGS IN HALDUMULLA.

There are several new clearings and extensions for tea cultivation in progress. Mr. Anderson, of Trompe estate, Talawakella, proprietor of Ohiya estate, in the Kalupahana Valley, adjoining Meriatenne estate is clearing nearly 200 acres for tea land. Ohiya estate adjoins Udaveria on one side, and at the last sale in the London Market Udaveria tea fetched a very good price. The tea bushes in the latter estates are worth looking at, they are a fine sample of the best tea grown in the island.

Mr. W. Hermon, the Superintendent of Golconda no bo half of the proprietors, Capt. Farquharson

and Mr. Buckworth, is busily engaged in felling and clearing an old estate called Talapotte, close to Nikapotu, and expects to open and plant nearly 100 acres of tea this year.

Mr. B. J. Wyllie, Superintendent of Kalupahana estate, on behalf of Messrs. Hope and Bailey, is opening a new estate called Horagonne, close to Saldummulla, and intends planting 200 acres of tea shortly.

Mr. A. Orchard, who bought some plots of land between Beauvais estate and Blackwood at the recent Government sale, has made a bargain by selling them to Mr. Hudson, who will open the land for tea and reside on it.

The estate called Bandara Eliya is a new one adjoining Dambattenne, and opened only three years ago. The property belongs to Mr. Lipton, and is under the management of Mr. Maitland. It was the tea from this estate which was purchased for Her Majesty the Queen at the recent sale reported in your paper of the 13th inst.—*Cor.*, local "Times."

KADUGANNAWA AND ALAGALLA.

Taking a leisurely stroll through Kadugannawa and Alagalla last week, I was struck with the slow progress much of the tea is making in this very fair soil and not unkindly climate.

Tea is not a particularly fastidious plant but where the surface soil has been scraped and washed away, it is apt to sulk for a few years till at length the roots make a desperate plunge into the subsoil and the tree becomes established, not quite so firmly or vigorously as in the clays of some of the upper regions but flushes more in proportion to its size and appearance. There are splendid exceptions even in this locality and these exceptions chiefly lie at the opposite ends of the district where the plants come away in a manner so magical as to astonish nobody so much as the lucky proprietors who sometimes remark that when they tried tea they knew as much about it as they did of the apple which Eve ate.

So much for sheer luck—or call it by any other name that pleases you, and I am equally satisfied; but it rather amuses an onlooker to see London correspondents falling down to worship the "far-seeing intellects" who created those estates and knew to a dead certainty, before planting them the number of lb. leaf each acre would produce—the men who can now by a wave of their magic hand decide the fate of investors.

KADUGANNAWA has quite a unique history. Its planting record dates back for fully 70 years—even to the first initiation of practical planting in the island. Alas! how much has been lost and won, learned and forgotten, during these three-score-and-ten years! Some have accidentally as it were, stumbled upon fortune and had honours thrust upon them, while many capable, careful, plodding men have died in the vain attempt to acquire a competence. Some there are who never touch a thing but it turns into gold, while others.

"Never loved a tree or plant but 'twas the first to fade away."

To ascribe all success to one's own superior intelligence is to mock an inscrutable Providence.

Take first the extreme South end of this district. Everybody knows *Mariawatta* but everybody does not know the history of *Weyangawatte*. We can imagine with what eager hopes poor George Bird began his experiment there; now 72 years ago, how he loved to look upon the beautiful young coffee plants; with what delight he gathered the bumper maiden crops; and then as years rolled on with what anxiety he watched the gradual decay of the once promising plants. Then came the wise-aeres who said "coffee growing is all a fraud let us turn to Dairy farming," and now see the plough at work, followed by the grass planting the luxuriant meadows, the browsing cattle. All in turn to be abandoned, and then *there is a lull*.

Again arose the wise-acre saying "the old fogeys didn't know how to plant coffee, let us plant it properly and no fears." Again history repeated itself, again there was rejoicing over the bumper

maiden crop but again—sooner than before,—came the day when all was leafless Shillelahs

And now came the strangest epoch in the history of this wonderful *Watte*. Despised and abandoned once more, hope seemed to fly and sigh farewell. In the midst of the desolation stood the empty bungalow, now gladly lent to shelter a sub-contractor on the railway extension.

This sub-contractor by the way was once on a time a leading V.A. an M.L.C. and a planter of long and varied experience. His dictum with regard to poor *Weyangawatte* was that he had never seen a more hopeless subject; the roots of the coffee tree as he pointed out would take no hold of the soil but running along the surface soon exhausted all the suitable food and died of what R.B.T. called '*insidious defunction*.' Ultimately the place was sold for a few hundred pounds to the Railway Contractors who though giants in railway engineering were as yet infants in agriculture, and as such were chosen to teach the proud V.A. and conservative planter that there were other paying products beside coffees.

"A tree of deeper root was found

Less willingly to quit the ground."

Of the present condition of *Mariawatte* and *Sinapittiya* it is needless to say more than that the appearance could scarcely be improved upon. Yet some of the adjoining places are backward to a degree, while over the ridge the comparatively rich Valleys of *Godadessa* still hang fire, but it can only be a question of time. On the opposite side of the *Oya* lies *Franklands* where in the fifties we found *Forest Harper* busy taking in a first rate crop, shortly after which he went home for some years and when he came back the *Watte* was gone! Coffee did well here for many years, but when it made up its mind to die it didn't hesitate about it or wait for leaf disease. *Forest Harper* was a favourite spouter at the P. A. meetings and immediately on his return we saw him at the big yearly gathering listening eagerly to the appointment of district members, but *Kadugannawa* was never mentioned. Indignantly the old member rose and demanded to know who struck out *Kadugannawa*. "*It went out*" was the laconic reply. All along the eight miles leading to *Bellongalla* the district is still in a semi-abandoned state, but the land after 30 years rest ought to do very well in tea if it gets a fair chance. *Bellongalla* itself is now looking very promising, but has taken a somewhat unconscionably long time about it. On the other side of the line "*The Farm*" has made a good start and will in time become an excellent estate. Further north, on the *Nanuoya* there are some scattered patches of fairish tea, but at the extreme end of the district near to *Bollagalla*. There is an estate 400 acres, than which there is no better tea in the island.

There is plenty of room for extension, both in North and South *Kadugannawa* and the marvel is,—considering its proximity to road and rail that it has been left so long uncultivated. The longer rest the better perhaps, but better still would it have been for this district had the fine old shade trees never been cut down. A writer in the *Observer* 40 years ago remarked "In 1840 we found Mr. Northway busy girding and taking down the trees which had originally been left for shade, the idea of the benefit being about that time finally exploded." But alas! to this idea we were indebted more than to anything else for the rapid ruin of *Kadugannawa* as a coffee producing district.—*Cor.*

THE WYNAAD.—A correspondent of the *Madras Mail* writes:—"Tea planting, in the opinion of many, is superseding coffee in the Wynaad and is fast attaining the position of the staple industry. Mr. W. B. Liddle, Managing Proprietor of the Liddlesdale Tea and Cinchona Company, has just brought out from England a 40 horse power engine to drive the machinery in the tea houses on the Pilly-Mullay estate. This fine property is 7 miles from Gudalur in the Nadahnagny direction."

SCOTTISH CEYLON TEA COMPANY,
LIMITED.

HALF-YEARLY REPORT.

The Directors have now the pleasure to submit to the shareholders the accounts and balance-sheet for the year ending 31st December 1895.

The net profits for the year amount to £8,801 9s 8d, which, with £669 10s 9d brought forward from previous year, gives a total sum available for distribution of ..

	£	s.	d.
..	9,471	0	5
An interim dividend on the ordinary shares of 5 per cent (free of Income Tax) was paid in September 1895, absorbing ..	2,050	0	0
Dividends on the 7 per cent preference shares have also been paid, amounting to ..	630	0	0
It is now proposed to pay a final dividend on the ordinary shares of 10 per cent (free of Income Tax), making 15 per cent for the year, absorbing ..	4,100	0	0
To add to Reserve Fund (raising it to £6,000 ..	1,000	0	0
And to write off for depreciation on buildings and machinery ..	838	6	8
	8,618	6	8

Leaving a balance to carry forward to next account of £852 13 9

Although all the buildings and machinery on the Company's estates continue to be in efficient order, it has been thought advisable to continue writing down their cost, and the amount which it is now proposed to write off represents 10 per cent on their value as it stands in the Company's books at 31st December.

The estimate of made tea from the Company's estates for the year was 661,000 lb., and the actual out-turn was 668,049 lb., shewing an excess over estimate of 7,049 lb., which the Directors consider very satisfactory.

In addition to the foregoing, a total of 220,743 lb. Tea was manufactured for others, the tea actually turned out by the Company's factories during the year thus amounting to 888,792 lb.

The average yield per acre was 433 lb., which shews a steady advance on the figures given in last report.

The average price realized in the London market was a fraction lower than previous year, being 8904d against 9233d in 1894, and 9190d per lb. in 1893.

The Ceylon Manager, Mr. Kerr, who is now on his way home on short furlough, reports that all the Company's estates are in good condition, and his estimates for the current year, which have been framed with his usual care, foreshadow another satisfactory year's working of the properties.

The acreage of the Company's estate remains unaltered at 1,963 acres, and no extensions have been made to the area under tea cultivation, which stands at 1,707 acres, of which 1,544 acres are in full bearing.

The Directors again take the opportunity of expressing their appreciation of the services of both the Ceylon and London staffs.

In accordance with the articles of Association Mr. Donald Andrew retires from the Board, and, being eligible, offers himself for re-election.

Mr. J. B. Laurie, C.A., also offers himself for re-election as Auditor.

H. L. FORBES, Chairman.

London, 1st May 1896.

THE TEA MARKET

has further developed in buoyant tone. China Tea is in better demand; and no wonder, seeing the heavy drop in prices for the first crop leaf still held by importers. Indian growth shows the most marked advance, the lower grades as much as 1d. per lb. from the lowest point. Supplies are becoming much reduced as deliveries are on a large scale.—*L. and C. Express*, May 1.

MARKET FOR TEA SHARES.

Thursday Evening, April 30, 1896.

There has been further strong buying, at advancing prices, of most of the better known tea shares, and again the "Official List" quoted advances in no less than five of the leading shares—Jorehaut shares having been twice advanced within the week. Even unquoted shares show in many cases advances in price since a few weeks ago.

Mincing Lane is again firmer, with an all round advance in prices, consequent on the shortness of the supply of Indian still left out of the 1895 crop to come to the hammer.

QUOTED SHARES.—East India and Ceylon, both Ordinary and Preference are asking for a price.

UNQUOTED SHARES.—CEYLON SHARES.—C. T. P. Co. Ordinary have again been taken at 30½, but some shares are now offering ex div. The Prefs. are wanted, but ask £18 or so.

Eastern Produce and Estates Co.—A large business has been done in the shares of this company at prices rising to 5½ x.d., and also in the new ½ per cent debentures at 105. We now quote the company in our table, as it is the largest single tea company in existence, having over 11,000 acres under cultivation (tea, coffee, &c.).—*H. and C. Mail*.

PLANTING AND PRODUCE

A NEW INDIAN TEA COMPANY.—The Borholla Assam Tea Company, Limited, has been formed, with a capital of £50,000, to purchase as from January 1, 1896, the well-known Borholla Tea Estate, situated in the Golaghat district of Assam. The estate comprises an area of about 2,932 acres, 1,538 of which are held in fee simple, and 1,394 are held under leases, all of which are direct from the Government of India, and the greater part renewable in perpetuity under the Government regulations. There is therefore ample room for large extensions, which will be made as circumstances permit. The cultivated area is 520 acres, ten of which are in their first year, leaving 510 in full bearing. The directors of the company are Lord Kingsale, managing director of the Moran Tea Company, Limited, East India Avenue, E.C., late of Assam, and Charles Lionel Prescott White, Esq. Kniphill, Cobham, Surrey, proprietor of Lungsoong Tea Estate, late of Assam. Frederick William Jamieson, Esq. (Messrs. F. W. Jamieson and Co.), 9, Mincing Lane, E.C., merchant, late of Assam, will join the board after allotment. The offices of the company are at 9, Mincing Lane, E.C.

POPULARISING TEA.—If the British public does not increase its knowledge of tea and learn the reason why Indian and Ceylon teas have displaced China it will be due to indifference on the subject. In various towns lectures on tea are given, and in some instances representatives of the tea trade are the lecturers. Mr. Allen Cooper, the Southampton representative of Messrs. Appleton, Machin, and Smiles, recently entertained about fifty ladies and gentlemen at that firm's sample and tasting rooms, 126, High Street, Southampton. Mr. Cooper gave a short address on the different growths of tea, and in the course of his remarks said the displacement of China teas by the growths of India and Ceylon was due not only to the superiority of the Assam plant itself, but also to the better mode of preparation employed. The use of machinery, introduced by British skill and energy, had reached such a pitch that in some gardens tea was fully manufactured within eight hours

from plucking the leaves. In China the grower had sometimes to transport the plucked leaves many days' journey before they could be manufactured into properly prepared tea, and this preparation was done by the slower and less wholesome process of hand labour. The public should, as far as possible, buy small young leaf tea of high quality. Such tea always fetched a higher price on the market, and he impressed upon his hearers the desirability of procuring high-priced teas from their grocers.

THE DECLINE OF THE CHINA TEA TRADE.—The Customs returns for 1894 show that in 1890 our imports from China were £4,830,850, but that in 1894 they had fallen to £3,543,362. This decrease of £1,287,488 is entirely due to our having imported less tea, the difference in value between that imported in the above years being £1,285,802.

JAPANESE PLANTING ENTERPRISE IN MEXICO.—It is stated that a Japanese Company has purchased a large tract of fertile land in the State of Chiapas, Mexico, and that tea, coffee, tobacco, and any tropical cultivation likely to prove profitable will be grown there. Japanese labour is to be employed.

SAN DOMINGO COFFEE.—The cultivation of coffee as well as sugar is making rapid progress in San Domingo, and the next crop promises well.

THE SUMATRA TOBACCO INDUSTRY.—A monograph upon this profitable industry, prepared for his Government by Mr. E. Spencer Pratt, the United States Consul at Singapore, gives the profits for each year of its existence of the Deli Maatschappij, a Dutch company formed at the close of 1869 for the purpose of introducing the growth of tobacco on the east coast of Sumatra. In the first year, 1870, the profits of the company were at the rate of 20 per cent. on the capital invested. In each succeeding year there was a steady and important increase, until in 1876 the earnings reached 113 per cent. The company then enlarged its capital, and in 1877 only about 22 per cent. was realised. The previous high degree of prosperity soon returned, however, and in 1882 the profits slightly exceeded 100 per cent. Down to 1886 the average returns continued for four years at very nearly the same rate, falling in 1887 to 45 per cent. In 1888 the capital was doubled, amounting then to £335,000, but even upon this increased sum the earnings exceeded 25 per cent. In 1889 they were nearly 80 per cent., but 1890 was a disastrous season, showing a loss of about 9 per cent. This was soon recovered, however, and in 1891 profits were realised of 30 per cent., in 1892 of 50 per cent., and in 1893 of 100 per cent. The great success of this enterprise is due primarily to the excellent quality of the leaf produced by it, which is extensively used, particularly in the United States, for the outer "wrappers" of cigars. There are now twenty-six companies and about twenty-five private planters engaged in this industry in Eastern Sumatra. The total production of the district in 1893 was 160,000 bales, of which the Deli Maatschappij grew nearly 53,000 bales. With much difficulty Mr. Pratt has obtained a supply of seed of this tobacco, which he has forwarded to a Florida planter and to the Department of Agriculture at Washington, with a view to its cultivation in the United States.—*II. and C. Mail*, May 1.

TEA IN AMERICA.

NEW YORK, April 16.

Not a ray of light to brighten the situation, unchanged from a week ago. When brokers issue circulars for China once every three or four months, there is little to be said by newspaper reports from week to week. Low-grade Japan firm; high grades steady; fine Formosa wanted at full figures; low grades weak. Greens dull and easy. Ceylon and India well supported and in fair demand.

Last week the Montgomery Auction and Commission Company sold 11,084 packages teas as follows: Moyne—400 Hyson, 5 to 6½c; 1,327 Young Hyson, 6 to 24c; 582 Imperial 5½ to 17c; 643 Gunpowder, 6 to 30½c. Pingsuey—1,821 Gunpowder, 6½ to 21½c. Japan—147 pan-fired, 15 to 16c; 185 basket-fired, 6½ to 8½c. 120 sun-dried capers, 15c; 917 Congou 7½ to 23½c; 121 India and orange pekoe, 10½ to 20½c. Oolong—890 Foochow, 8½ to 17c; 302 Amoy, 8 to 9½c; 3,746 Formosa 12½ to 31c.

Today at noon the Montgomery Auction and Commission Company will sell 6,503 packages, viz: 1,506 half-chests Moyne, including attractive chops; 1,419 half-chests and boxes Pingsuey, new season's; 1091 half-chests and boxes Congou, comprising all grades; 20 boxes Foochow pekoe; 97 packages India Java and Ceylon pekoe; 100 half-chests Foochow; 2,270 half-chests and boxes Formosa, all new season's and comprising a large offering of high grades.—*American Grocer*, April 15.

TEA IN AUSTRALIA.

Friday Evening, May 1.

TEA.—A moderate business has been done in China tea, sales being reported of 120 half-chests common congou at 4½d, 450 half-chests panyong at 5d to 5½d, 170 half-chests panyong at up to 6½d, 500 half-chests kooloo at 4½d to 7½d, 350 quarter-chests buds at 5d, and 100 half-chests buds at 4½d. Of Ceylon teas, 300 packages have been sold at 7d to 8d, and 20 chests at 11d. At the auction sale on Tuesday 184 chests and 166 half-chests Ceylon were offered. The prices realised and bid showed no change in the market, late rates being maintained, but the sales made amounted only to 42 chests and 78 half-chests at 8d to 9½d for broken and orange pekoe, 7d per pekoe, 6½d for pekoe souehong, and 4½d for souehong.—*Australasian*.

GREAT WESTERN TEA COMPANY OF CEYLON, LTD.

A general meeting of the Great Western Tea Company of Ceylon, Ltd., was held at noon today in the office of Messrs. J. M. Robertson & Co., the Agents and Secretaries. Mr. John Tilly presided and present were Messrs. F. W. Bois (also representing Mr. H. Bois and Messrs. J. M. Robertson & Co.), Charles Cantlay (also representing Mrs. Thomas Mackie), Thomas Mackie, E. Vanderspar (representing Mr. George Vanderspar), W. Moir, and C. Ryan (also representing Mrs. Margaret Ryan.)

Notice calling the meeting having been read and minutes of previous meeting read and confirmed the Chairman submitted

THE REPORT.

It is in the following terms:—

The Directors submit their annual Report and accounts for the season ending 31st March, 1896, which may be considered satisfactory:—

The yield of tea during this period has been 438,425 lb, which is 66,192 lb. over the amount secured for the previous season; and 38,425 lb. in excess of the estimate. The cost f. o. b. in Colombo is 29.78 cents per lb. including 3.27 cents per lb. on manuring. There has also been unusually large expenditure for additional line accommodation as foreshadowed in the original prospectus of the Company.

After estimating the unsold tea at a safe valuation, the amount realized for this product is R246,664.13, which is equal to 56.26 cents per lb., shewing a nett profit on the cultivation of about 26½ cents per lb.

An interim dividend of 8 per cent for the half-year ending 30th September, was paid in November, 1895; and after providing for this, and writing off the usual amount for depreciation, the sum still available is R68,517.89. Your Directors propose to place R10,000 to Reserve Fund, to pay a final dividend of 10 per cent, making 18 per cent for the year, and carry forward R117.89 to next account

The prospects for the season 1896-97, are favourable and the crop is estimated at 140,000 lb.

Mr. Dunbar and Mr. Henry Bois having left the island and resigned their seats on the Board of Directors, Mr. John Tilly and Mr. F. W. Bois were appointed to fill the vacancies.

In terms of the articles of Association, Mr. Thomas Mackie retires by rotation: but, being eligible, offers himself for re-election.

It will also be necessary to appoint an Auditor for the new year.

The CHAIRMAN said:—The reports and the accounts have been in your hands since 1st May so that you have had time to peruse them, and I suppose we will follow the rule of taking them

as read. Since the accounts were issued we have had telegraphic advices of several other sales, and there is only one sale of which we have not had a report from home. This gives us a satisfactory addition to the amount received during last season—and I should scarcely during the season—and it will give us an extra R4,000 which has not appeared in this year's account, but it will be added to the amount carried forward—R117·89. The Directors propose as you will see by the account to allow for depreciation, the payment of an interim dividend of 8 per cent, the transfer to the Reserve of R10,000 and a final dividend of 10 per cent. The crop has been very satisfactory—450 lbs. to the acre. I don't think there is any other information I can give beyond what is given in the report unless any shareholders wish to ask any question.

Mr. RYAN:—I understand that the R4,000 is over and above what you estimated as the crop.

The CHAIRMAN:—Over and above R117·89 carried to next account. If you look the profit and loss account for 1895-6 you will see the sum of R4,047·16 which was the surplus proceeds of the previous year. This R4,000 will be carried forward in a similar way this year.

After a pause.

The CHAIRMAN said:—At the request of one of the shareholders we have worked out the gross average price of the tea in London from all the sales of our knowledge—there is only one which we had had to estimate. The gross average in London has been 9·31d, the charges coming to a little over 1d leaving a net average of 8·30d.

Mr. VANDERSPAR:—Is that the London charge.

Mr. BOIS:—The London charge is 1·01d.

The CHAIRMAN:—Exchange has been against us this year a little making a difference of nearly four cents.

Mr. BOIS:—Mention the rate.

The CHAIRMAN:—The average rate has been 1s 1d 15-16. I propose that the report be now adopted.

Mr. RYAN:—There is one question regarding an item I do not understand "Directors Travelling Expenses R350."

Mr. BOIS:—The expenses are those of up-country Directors coming down to meetings.

Mr. VANDERSPAR:—They are in excess of the Directors' fees?

Mr. BOIS:—Yes. You will find the item in the previous accounts.

Mr. RYAN:—I think it quite right and a proper thing. I have not noticed it in the accounts before.

Mr. BOIS:—Last year they were R804.

Mr. MOIR:—I suppose the Directors' fees remain at R2,000.

Mr. BOIS replied in the affirmative.

Mr. VANDERSPAR:—Is there any limit to the travelling expenses?

Mr. BOIS replied that the expenses were kept within reasonable limits.

Mr. VANDERSPAR:—Last year you say it was R804.

Mr. BOIS:—It depends on the meetings that are held. The Directors are not called for meetings unless it is necessary.

Mr. MACKIE:—They do not come for amusement.

Mr. MOIR:—I have pleasure in seconding the adoption of the report and accounts.

Mr. RYAN said:—There is one question I should like to ask. On what principle is the rate for depreciation fixed?

Mr. BOIS:—It is fixed at 15 per cent on the machinery and other movable property, and at 10 per cent on immovable property.

The report and accounts were then unanimously carried.

THE DIVIDEND.

On the motion of Mr. RYAN, seconded by Mr. VANDERSPAR, a dividend of 10 per cent making 18 per cent for the year was declared, to be paid forthwith.

ELECTION OF A DIRECTOR.

The CHAIRMAN:—In terms of the Articles of Association, Mr. Mackie now retires from the Directorate, but is eligible for re-election and offers his services.

Mr. MOIR moved the re-election of Mr. Mackie as a Director.

Mr. VANDERSPAR seconded, and the motion was carried unanimously.

THE AUDITOR.

Mr. RYAN proposed, Mr. MOIR seconded, and it was unanimously agreed to appoint Mr. John Guthrie, Auditor for the current year.

This was all the business, and the meeting terminated with a vote of thanks to the Chairman.

"GUP" FROM MINCING LANE.

May, 1.

There was active bidding at Tuesday's Ceylon sale which comprised the heavy total of 26,000 packages. Prices in most instances were $\frac{1}{2}$ d to $\frac{3}{4}$ d higher, quality going for something. The deliveries for April were large and the orders for Russia go on increasing. According to common report the Russians have sent greatly diminished orders for the new season's tea to Hankow intending to buy in this market, as it has for some years been much cheaper than buying direct. We may therefore perhaps look for higher prices for China tea at the opening of the market in July than has been the case for some years, and this cannot fail to divert some of the Russian orders to Ceylon Tea.

THE RHEA INDUSTRY.

Sometime ago an effort was made in Ceylon by a well known resident to secure a concession from Government for the purpose of planting rhea, and although His Excellency Sir Arthur Havelock did all in his power to promote the scheme the negotiations unfortunately fell through. Since then, however, we hear that one or two planters have been experimenting in the rearing of the plant, and hopes are entertained of a successful issue. From London we hear that the operations of the Rhea Fibre Treatment Company are being attended with a large measure of success, orders having been received from leading houses in Manchester and Nottingham, and the Drury Lane and Empire Theatres for silk garments which require to be of special strength and take on the dye well. We have seen a sample of the lace curtains manufactured at the Castleton mills belonging to the Company and it is of very fine quality and strength. Further we hear that Mr. Lane Fox, who has taken a very great interest in the matter is now in America establishing the industry and his efforts are being attended with much success. The patent has already been purchased in India and other countries are negotiating for it. The Rhea Fibre Treatment Company, as its name indicates, deals entirely with the treatment of the bark and all the planters have to do is to decorticate and dry and bale the bark.

HOW TO SECURE "PURE CEYLON TEA" BEING SOLD IN ENGLAND.

It has struck a gentleman largely interested in the home tea trade, as well as in the prosperity of Ceylon as an old planter, to suggest a novel check on the sale of our tea in the big towns of the old country. It seems that packets labelled "Pure Ceylon Tea" are now very common and very popular; but our friend maintains that the said packets contain a good deal other than "Ceylon" tea. It is to cheek, expose, and stop this blending system that the proposal is offered and this is how it has been laid before us:—

"Messrs Cadbury Bros., the chocolate and cocoa manufactnrers, have a system of annually sampling the whole of Glasgow and other large towns in Scotland and England. This is done in the interests of their cocoa trade and to let people see what like their pure cocoa essence is. I am under the impression that a similar procedure with small packets of pure Ceylon tea would do a lot of good. Even now there are thousands upon thousands of our people who do not know what it is to have a cup of pure Ceylon tea. The packets must be put up in lead—and $\frac{1}{4}$ oz. packets would be large enough, or even less. Something after the following style printed on the packet might be adopted:—*Pure Ceylon tea—ask your grocer for it and see that you get it.*"

"If the Planters' Association will take it up, I will supervise it in Glasgow only. I can't do it outside of Glasgow. The system of sampling is done as follows: A map of Glasgow is purchased and a given number of strong young men with samples 600 each, proceeds to sample a given street, which at end of every day's work is marked in red. And so on, day by day and street by street, until the whole of the city has been gone over. This system has been going on now for years and Messrs. Cadbury find that their sales increase year by year. It will take six strong active young men four months to go over Glasgow. It is undoubtedly hard work as the stairs are very trying and six hours a day is all that a man can stand. The probable cost would run as follows:—

6 men for 16 weeks at £1 per week	£96 0 0
Cost of 5,400 lb. of tea landed in Glasgow at 1s per lb.	270 0 0
Prime cost say 8d per lb. packing in lead and printing in Colombo, say 2½d per lb. duty on 5,400 lb. at 4d per lb.	90 0 0
Clerk for 5 months £24; stamps and stationery, storage &c. £19 say	44 0 0
	£500 0 0

If you think the above plan or sketch would be worth submitting to the Planters' Association, please do so. I believe myself that a great deal of good can be done by such sampling. As you are aware, our trade does not lie in this direction, so that directly we shall drive no benefit although indirectly we may do a little. My experience is that there is still a fairly large quantity of cheap Indian tea mixed with Ceylon, and the whole sold as pure Ceylon. The population of Glasgow is 800,000.

We doubt if the same system of sampling can be applied to tea—as to cocoa—and this seems borne out by the information gathered in "the Lane" as to the difficulty experienced even by "experts" sometimes, in identifying different teas. Buying to blend, being also so great a part of the business done in Mincing Lane, it is doubtful if earnest support could be looked for from experts in that quarter. At the same time, if "Pure Ceylon Tea" is advertised, only Ceylon tea in common honesty should be supplied and it ought not to be impossible to ensure this; for there is some point in the further remarks of the writer quoted above when he says:—

"If all the tea sold as *pure Ceylon* was really

Ceylon tea, the price in the London market would be pence per lb. more than what it is. The sooner steps are taken to ensure this the better. Why do we see advertised freely *pure Ceylon tea* and very seldom *pure Indian tea*? Why was it India was not able to oust China tea. Because Ceylon and China teas are self-drinking teas and Ceylon by far the best of the three—Ceylon tea improves many of Indian teas, but it is doubtful if India improves Ceylon. In fact they don't. The consequence is that heaps of Indian tea is sold as pure Ceylon. In most cases the difference is as great as margarine is from pure butter. Nothing ought to be left undone to let the public know what is pure Ceylon and what is Indian, and I venture to predict that the Ceylon planter and proprietor will largely benefit thereby. Now that China is out of the running this is really a serious matter for Ceylon, and the sooner it is tackled the better."

We leave the Planters' Association and Chamber of Commerce to say if any—and what—steps should be taken on the above suggestion.

INTERESTING NOTES FROM CALIFORNIA.

San Francisco, California, U.S.A.,

10th April 1896.

MY DEAR "OBSERVER."—Your lately received issues have continued many

COMPANY REPORTS

the perusal of which must have been most gratifying to the lucky shareholders, and some of my friends, who have requested the loan of your "Overland" from me, think that "Ceylon Tea" must be a veritable gold mine, and certainly the number of concerns paying from 12 per cent up to 50 per cent justifies them in forming such an opinion. I notice a healthy sign in many Companies, is the desire to build up gradually a good reserve fund, and this is but right after their big crops and low exchange. I wrote privately, many months ago, that silver was going to increase greatly in value, and you must all be prepared for this. I regret to see however, that in conjunction with the rise in silver, there is no improvement in the price of tea in London. I hope this will come about ere long.

I was much interested in reading the paper on "National Defence," by Lieut.-Colonel Sir George S. Clarke R.E., K.C.M.G. read by him at the Royal Colonial Institute on 11th February, the "Journal" of which Society was sent me by our good friend John Ferguson. In the discussion which followed the reading of this interesting paper, Admiral the Hon. Sir Edmund Fremantle, K.C.B., C.M.G. referred to Colombo, Kandy, Trincomalee and Ceylon generally, and what I may term the "local or narrow" way in which the so called

"MILITARY CONTRIBUTION"

is looked at in the Colony. The security enjoyed by every British vessel on every sea in any part of the world, the safety of our immense commerce, as also that of our outlying and scattered possessions, is entirely due to the size and the high state of efficiency of the British Navy. In times of trouble it is the Navy that will be called upon to defend our scattered possessions, and there can be no strong and effective Navy without naval harbours, where supplies, coal, and refits are maintained and can be had in time of war. Our "endless chain," forged by the masterly minds of former times, to enable us to hold our supremacy at sea, and, beginning at Gibraltar encircles this globe by way of Malta, Cyprus, Egypt, Perim, Aden, Trincomalee, Hongkong, Esquimalt, Halifax, Bermudas, with branches to the Cape, and Australia, via St. Helena, &c.—this grand line *must* be forever defended, or else we will cease to be the "Mistress of the Seas," our commerce dwindle to nothing, and starvation stare the "bright little, tight little Island" in the face. The time will come when closer federation of the Great Empire will necessitate the "pooling" of the immense sum required annually for defence, and when, with a larger and juster understanding of the matter, each colony and community will cheerfully

and willingly contribute its share towards the safety of the magnificent Empire of which it is privileged to form a part. With great pleasure I read yesterday the letter from our worthy member in Council, the Hon'ble Giles F. Walker, on the subject of the "Military Contribution," and he takes a fairminded and statesman-like view as opposed to a narrow and selfish one, of the question. Ceylon's responsibility does not end with the "3 mile radius" outside Colombo, Galle and Trincomalee: our produce has to reach London, Australia, and now America and Canada are to be large consumers also, and we *must* contribute some share of the cost of the protection afforded our produce by the British Fleet, on this long journey.

The extracts given from time to time from Major Wilson's report on

THE CEYLON GOVERNMENT RAILWAY

are most interesting reading, but what will be the result? Will there be any improvement? Will the report be pigeon-holed with so many others? Rates are high, consequently working expenses must be high, if they absorb about the same proportion of revenue as in other lines, where rates are very much lower. This is a point that is often lost sight of.

My meeting and conversation with Mr. T. Fairhurst of China and Ceylon, the well-known proprietor of Ferham and St. Andrews estates, gave me great pleasure.

It is about 19 years since I first met him in Bogawantalawa, I think it was his first visit to Ceylon, when he was on the lookout for an investment. He accompanied Mr. G. Rollo (of whose death I was sorry to hear), and I recalled this fact to him. I was told at the hotel office, Mr. Fairhurst was in his room, and was going towards the Elevator. When he came down by it, (this may sound rather strange), I stepped forward, and knew him at once. This is most flattering to his youthful appearance, and as luck would have it, the day was his birthday, which fact he had forgotten. We had a long reminiscent chat, and interesting facts were given me about.

THE "AMERICAN CAMPAIGN"

for Mr. Fairhurst had been all over the States and Canada, where he had met your worthy delegate and Mr. Blechynden. Mr. Fairhurst spoke of the difficulty he experienced in repeating orders for Ceylons to come up to standards, and the broken and dusty character of many grades of Ceylons that should not have these characteristics at all, and compared them very disadvantageously with the fine bold clean teas from India. I lay stress on this point, so that it may be remedied by Ceylon men. I saw Mr. Fairhurst off on the China steamer on the 8th, meeting a number of the leading tea importers and brokers. He was glad to have the loan of your latest *Overland* issue, which I had received on the 7th inst.

I have heard some rather distressing rumours about

MR. JOS. H. STILES,

Director-General of the British Empire Exposition, Montreal, Canada. I have heard that the proposed Exposition has been abandoned, and that there is some difficulty in Mr. Stiles meeting the heavy obligations he is under as Director-General, for a large sum already expended in furtherance of the now abandoned undertaking. I hope he will eventually succeed in making satisfactory arrangements and meeting all his obligations, as he was well-liked here and most honourable in all his dealings.

I am sorry my approaching departure for Southern California, (during the 1st week of May) will deprive me of the pleasure of meeting once more

MR. N. V. WEBSTER,

as he is not expected to reach here until about the 15th prox. I hope he will have a more than ever successful and pleasant trip this time. Several brokers and business houses wish to meet him, and I will leave the necessary "introductions," and hope some beneficial trade will result.

Another

EASTER SUNDAY

has come and gone. Here we had a very wet

day, much to the disappointment of the ladies no doubt. I braved the elements in the evening and went to Grace Church, Episcopal. The music was of a very high order. It was a "festival" service, no sermon, prayers and singing, male voices, solo and quartettes. I have assisted at many church decorations, both in the old country and Ceylon, but I have never seen anything so pure, chaste refined, and artistic, as were the decorations on this occasion. Nothing but white flowers was used, with maiden hairs ferns, and smilax; the effect was very beautiful and elevating. I found myself in the Stanford pew; the late Senator and Millionaire Stanford having built and endowed the magnificent University in memory of his lamented young son Stanford junr. after whom the famous seat of learning is named. Nothing but white lilies of all kinds were used, from the beautiful and fragrant lily of the valley to the large Calla lily, some white pinks or carnations, and camelias were also used, and the perfume was almost overpowering.

I notice many of the papers, with circulation of from 40,000 to 90,000 persist in calling them Eucharist lilies; and in talking of the French prince who has been somewhat prominent lately, they write of his relationship to the "Duc De Chartreuse" (presumably Duc De Chartres.) Probably a large number of Americans will imagine he makes the liqueur of that name, as the Benedictine monks make the liqueur named after them! In writing of the advance of the Egyptian forces up the Nile mention was made of the arrival of the British Expedition at Wadi-Alfalfa. Wadi Halfa was meant I suppose, but where ignorance is bliss, 'tis folly to be blistered," I understand Alfalfa is the clover food stuff, I think called in Ceylon, Luceru.

I was the means of securing from my friend Mr. Cawston, the proprietor of

THE FAMOUS OSTRICH FARM IN SOUTHERN CALIFORNIA

a fine donation of Ostrich feathers, eggs, and photographs, for the Park Museum here. The curator, a Mr. Wilcomb, a most intelligent gentleman informed me they would soon be in a position to effect "exchanges," and when talking of our fine Museum at Colombo, he asked me if I thought anything could be procured from there. Now I am sure Mr. Haly must have many things he could exchange profitably. He must have dozens of duplicates of such things as the famous cobra de capello (skins) also the polonga and other deadly snakes, cheetah, boar, jackal, &c. &c., also some of the prettier birds and insects. I will be very glad if you can inform me as to the likelihood of obtaining any of these as exchanges. It will do Ceylon no harm, as during the first year of its existence, this Museum was visited by over 500,000 people, a much larger number than attended the world-famous Smithsonian Institute! From the Planters' Association samples of all the different grades of teas, both fancy and commercial, would be acceptable, and of benefit to Ceylon I am convinced. I would respectfully direct the attention of A. W. Stopford Sackville, Esq., to this, and the expense to the "Thirty Committee" would be very little.

The annual meeting of

"THE ASSOCIATION"

was most successful, and the hearty vote of thanks to Mr. A. Melville White, the retiring Chairman, thoroughly well-deserved. I consider that, during the last decade, with Walker, Kelly, White, and now with Sackville, the Association has been most fortunate and its usefulness and prestige well maintained.

SIR WEST RIDGEWAY

appears to have made very favourable impression on his arrival amongst you, and I sincerely trust there will be more common sense and less red-tape and obstruction evinced in the matter of roads and other requirements for the good of the country, than has lately been the case. You have a good man, and although he is already famous in many ways, his appointment to Ceylon may be considered "the tide in his affairs," which will I hope "lead on to fortune." May he "take it at the flood," and so carry Ceylon along with himself to fortune.

The short accounts published in reference to the burning of

KINAGODDE TEA FACTORY

near Lunugalla, lead one to think there has been some foul play in the matter, and I hope the rascals may be punished severely. The difficulty will be in getting good reliable evidence. It must be very annoying to the proprietor and Superintendent, just as the busy flushing months are coming on.

My attention has been called to a communication in your "Overland" some time ago, from a

MR. BELING

in reference to his brother here. I have not time to look it up now, but he, I believe, stated I had forwarded to you some information that was wrong, or *too previous* was it? Nothing of the kind, everything was correct. Mr. Beling of America had *nothing to do with* the Ceylon Importing Coy. of Davenport, Iowa, and New York at the time I wrote. By the way this Coy. has now nothing to do with New York.—They have closed up there some considerable time ago, and I believe W. Beling of America, is at work with a W. Bottomby of "Assam," selling Indian tea.

I corresponded with the Ceylon Importing Company of Davenport Iowa, and furnished all the information I could for them as requested. I have written to Ceylon praising them for their efforts in introducing our teas, and cannot understand what prompted your correspondent's somewhat unfriendly remarks. I am surely not to blame that Mr. Beling, of America, neglected to inform his friends as promptly as he might have done, of his movements, or change of address. I merely mentioned the matter casually, as an item of news, or gossip. I have never belittled Mr. Beling or his company or their efforts to push "Ceylons" here, and my criticisms of our worthy Delegate have been fair and open. I take it he holds a public position, drawing his salary from the Planting Community, and is therefore open to criticism, and where that is honest, and based upon three years' experience in close touch with the trade here, it can do no harm. Our Delegate is all right, and not so thin-skinned as is "Mr. Beling of Ceylon." However I will endeavour to make my letters more interesting in future, by leaving out all mention of Mr. Beling or his movements.

TIMES MUST BE IMPROVING

in the old country, for the figures published by the Board of Trade for the 1st quarter of the year, to 31st March last, show a tremendous increase both in imports and exports, compared with 1895. I trust this improvement will continue throughout the year.

I was glad to learn

THE IMPORTS OF "CEYLONS" TO CANADA AND AMERICA

were increasing so largely, and I hope America will soon take 10,000,000 lb. I forgot to mention the strong point Mr. T. Fairhurst made by the Russian Campaign. He says our teas are well known and are being pushed in Canada *by the trade*; less money must be spent here, and every effort put forth in Russia. Here I may note that the Hon. Giles F. Walker has never lost sight of this point, and has ever been a strong advocate of Russia receiving a share of available funds, this is as it should be.

THE "BELLICOSE" SENATE

are still making a laughing-stock of themselves to the world in general, and the better class of the people and press here. They want to "lick" somebody, not much matter who, but as the good papers point out (those not written for the rabble) the Senate had better give them something wherewith to fight, as they have no guns, few ships and fewer sailors and marines. This is the fact, and after all the bullying bluster of the last few months, the great Naval appropriations, which were to enable America to wipe everything off the face of the earth except America, have dwindled down to a paltry sum for three battleships and 12 torpedo boats; the former taking from three to five years to finish! I will arrange to send you regularly the leading "weekly"

which I am sure will prove very interesting to Ceylon readers. The opinions of the "Argonaut" are always quoted respectfully in London and elsewhere. This publication is intensely American in the best sense of the word, and thoroughly patriotic, not written for the rabble and the lower classes of speculating politicians. It is strong for decency in all things, the Press in particular and is "down" on the national traits, vulgarity and display, which eulminate in appraising everything at its dollar cost, irrespective of artistic merit or true value. A case in point was the recent Vanderbilt-Marlborough wedding, with its rehearsals in church, like some theatrical or circus performance!

My next will be written from the Sunny South, probably describing some of the beautiful "Floral Fiestas" that take place in the early summer all over the state. The elections of beautiful young ladies as queens, to preside in state, with court ladies and attendants, &c. &c., are now going on.

And now Mr. Editor, with Salaams to yourself and your readers, I am, yours truly. T.A.C.

MR. CHAS. LEDGER AND THE DUTCH GOVERNMENT.

In our issue of March 21st we printed the letter in which the Dutch Minister of the Colonies refused to entertain Mr. Ledger's application for additional remuneration in respect of services rendered by him thirty years ago in supplying the Dutch Government with South American cinchona-seed. Mr. Ledger has addressed to the Dutch Government a spirited reply to their refusal of assistance. He says:—

When in 1865 I sent the cinchona-seed (the origin of the now famed "Ledgeriana" variety to my brother in London, the then Consul for Holland, was introduced to him by the late Mr. J. E. Howard, who, among other statements, said: "In Java they are scientifically cultivating and propagating the cinchona more successfully than our own Government are doing in India. We are working, too, in the greatest harmony." With the understanding that, after consultation with his Government, a fair price would be paid for it, half of the seed (about 20lb.) was handed over to the Consul. No price was demanded. Some twenty days after 400 florins (about 35l.) was sent to my brother. Now, I would respectfully ask the Hon. Minister who were the experts that, without trial of assay, took upon themselves the responsibility of valuing what was more than standard gold at the price of copper? That the valuation was not fair was admitted when, sixteen years later, a further and quite inadequate 100l was paid to me by your Hon. Government.

In all my appeals for justice or return of moneys actually expended by me in adding so materially to the wealth of your country and people I have only once asked for a "reward," and to that I was impelled by despair on finding myself destitute through unforeseen misfortune in my old age.

For every pound paid to me your Hon. Government has gained hundreds—nay, thousands—of pounds, without taking into account future moneys. I respectfully apologise for trespassing on your time and attention. I am desirous that in due time the public may be informed as to the true "character of the commercial transaction" the Hon. Minister quotes as reason for refusing the respectful appeal for reimbursement of moneys expended by me, and so enormously adding to the wealth of your hon. country and people.—Your humble servant,

(Signed) C. LEDGER

Mr. Ledger has a good case, and he cannot be blamed for stating it with vigour. But we fear that Ministerial skin is too thick to be penetrated by any representations on Mr. Ledger's part or on our own. It would have been a gracious and, we think, a wise act of the Dutch Government to have given a small pension to an old gentleman whose efforts have admittedly been a source of great wealth to Holland and her

Colonies and who never asked for generosity so long as he was able to work for his living. Mr. Ledger is now 75, but even at the eleventh hour there is time for repentance for His Excellency at the Hague. Does Holland really wish to be just as mean to the cinchona pioneers that have added to its wealth as Britain has been to hers!—*Chemist and Druggist*, May 2.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, April 30.

ARECA-NUTS.—Small sales have been made privately lately at 12s 6d per cwt. At auction 12s per cwt. was accepted for 10 bags of fair quality.

CROTON-SEED.—Slightly easier. Five 1-cwt. bags of good bright quality sold today at 65s per cwt., the same price at which a much darker lot found a buyer at the last auctions.

OIL (Essential).—Citronella oil continues to decline. A few days ago, 15 tons in drums, were sold at 1s 2½d per lb., c. i. f. terms, for steamer shipment to London until end of June, and 1s 2d, c. i. f. for ditto until end of August. Both sales were for oil standing Schimmel's test.

VANILLA.—In fair supply and good demand, an advance of 2s per lb. being paid for Mauritius and Seychelles beans, which realised the following prices:—Good to fine chocolate, partly crystallised, ½ inches to 5 inches, 22s 6d to 38s 6d; medium to good, ¾ inches to 5 inches, 21s to 24s; brownish, ¾ inches to 7½ inches, 23s 6d to 26s 6d; common, 6s to 16s 6d per lb. A parcel of fine dried Ceylon beans realised the highest price ever paid for this variety, viz., 19s 6d per lb.

SEEDS (various).—Annatto seed rather firmly held for good quality. Fifty six packages Madras were bought in today, 4½d per lb. being refused for a fine bright lot. Nine packages low West Indian sold, without reserve, at ½d to 1½d per lb.

THE AMSTERDAM CINCHONA AUCTIONS.

Our Amsterdam correspondent telegraphs on Thursday evening:—At today's public auctions of Java cinchona-bark 5,558 packages were offered. Nearly the whole of this—viz., 5,237 packages—sold, with fair competition, at firm prices, the average unit being 2s 5½c per ¼-kilo, an advance of 0.05c on the March sales. The principal buyers were the English and American manufacturers, who bought 6,373 kilos sulphate of quinine; the Auerbach factory 5,402 kilos; Brunswick factory, 3,281 kilos; Mannheim and Amsterdam factories, 5,342 kilos; Frankfurt-on-Maine and Stuttgart factories, 3,417 kilos; and various buyers, 3,682 kilos. The range of prices was as follows:—Manufacturing barks, from 7½c to 40½c (equal to 1½d to 7½d per lb.); Druggists' bark, from 11½c to 155c (equal to 2d to 2s 4d per lb.).—*Chemist and Druggist*, May 2nd.

THE CITRONELLA-OIL CASE IN COURT.

Few persons in the drug-trade knew that the citronella-oil case was to be brought before Baron Pollock and Mr. Justice Day in the Court of Queen's Bench on Wednesday, and that circumstance, no doubt, accounts for the absence from the court, with one or two exceptions, of the Mincing Lane produce brokers and merchants, whose interests are touched so closely by the general features and the broad principle of the case. It would have done good to some of the gentlemen who appear so much attached to the principle (said to have been held by the late Mr. John Bright) that adulteration is only a form of competition had they been present to hear what the Judges thought about that view. The case, of which a report appears in our Legal section, was decided in the manner which from the beginning has been urged in this journal as the only reasonable one: it was remitted to the arbitrators for reconsideration, with a judicial order that they must take into account the question of description as well as that of equality to sample; and Mr. Justice Day, while expressing his general concurrence with Baron Pollock's judgment of that effect, significantly added that, personally, he would have felt inclined to set the award aside altogether. Mr. Treatt, the defendant, has to pay the costs of the proceedings.

The parcel which was the subject of judicial inquiry on Wednesday was the third one purchased by Messrs. Domeier & Co. from Mr. Treatt. It had been treated in a manner resembling the first, only more so, and a touch of artistic blending had been added to the mixture by the addition of 10 per cent of oil of lemon to the 55 per cent of kerosene and 35 per cent of citronella oil composing the remainder. Mr. Chitty, who appeared on Mr. Treatt's side, tried hard to bring in the question of the first parcel, on which the arbitrator's award, given against Messrs. Doincier & Co., had been accepted by that firm but it was rightly held that that lot was to be considered as a "dead-and-gone" transaction. Some pleasantries, not unnatural under the circumstances, were made at the expense of Mr. Domeier's "thirty-five-year-old nose," for that gentleman, in an affidavit read in court, deposed that he had been identified with the trade for thirty-five years, was considered one of the best judges of essential oils in the world, so far as his sense of smell was concerned, and had failed to detect, by olfactory examination, any impurity in the citronella oil now in dispute. This only shows the necessity of applying tests more scientific than those which the nasal organ affords to the examination of essential oils. A little cloud of dust was also raised by Mr. Treatt's counsel on the question of price. Pure citronella oil, that gentleman contended, was selling in the market at from 1s. 8d. to 5s. per lb. at the time when Mr. Domeier paid 1s. 10d. per lb. for the parcel in dispute. The higher price quoted could have only referred to a special brand, and was certainly not an indication of the market price of oil such as that contracted for. The question of price will not confuse the arbitrators.

When we first commented upon the citronella-oil case, in our issue of February 29 last, we called attention to the applicability to the dispute of a clause in the Sale of Goods Act of 1893, providing that if a sale be by description as well as by sample the bulk of the goods must correspond with the description as well as with the sample. We commended this section to the consideration of the arbitrators, and were laughed at for our pains by those luminaries. Now that the Judges have remitted the case, partly upon the strength of that very same clause, the arbitrators, may possibly begin to grasp the fact that the customs and prejudices of Mincing Lane are not the alpha and omega of commercial law. They are now ordered among other things to say whether a mixture composed according to the formula—take of citronella oil 3½ parts by weight, add 5½ parts of kerosene, mix (*secundum artem*), and flavour with 1 part of oil of lemon—constitutes fair merchantable oil of citronella. If they answer in the affirmative, the case may again be carried into court by Mr. Domeier; in fact, the law seems to put no limit upon the process of remission. A mistake in accepting or rejecting evidence, however, is a mistake of law, and may bring about the setting aside of the award; and it has also been decided that, when arbitrators obstinately or recklessly reject evidence which they are bound to consider according to the contract adjudicated upon, the award may be set aside.

We have commented repeatedly upon this case for the past two months, simply because the Mincing Lane brokers award appeared to us to strike at the root of honest trading. After the practical admission that the parcel of citronella oil now in dispute contained oil of lemon as well as kerosene it cannot be seriously maintained that the oil was imported in an adulterated state from the producing country, for the natives of Ceylon or India would hardly have had resort to oil of lemon. Hitherto, in the face of vigorous and well-conducted competition from abroad, English essential-oil merchants and distillers have held their own mainly on account of the reputation of their oils for excellence of quality, and we think it of vital importance that anything which might diminish the reputation of this country in that respect should be guarded against.—*Chemist and Druggist*, April 25.

TOBACCO IN INDIA.

Notwithstanding all that has been written against the use of tobacco, from the day that King James the First of England penned his famous "counter-blaste" down to these times of later day saints, the solaceful herb has so recommended itself to the human race that it now ranks as the most widely distributed luxury on the face of the globe. When first introduced into Europe, the virtues of the plant were extolled with the wildest exaggeration, and it was supposed to cure almost every imaginable malady. Practical experience, however, soon proved the fallacy of this opinion, and when the inevitable reaction set in, every effort was made by kings, popes and emperors to stamp out a habit that was now denounced as morally and physically degrading. Laws were promulgated forbidding the consumption of tobacco in any shape or form under the penalty of severe and sometimes cruel punishments. In Turkey, in ignorance of the value of this gift of nature which so well suits the contemplative and some what taciturn character of its people, persons convicted of smoking were made a terrible example of by having their lips cut off, while others found addicted to snuff-taking were deprived of their nose. Even drastic measures such as these, however, proved as ineffectual as the remedy tried by King James of raising the tax on tobacco at once from 2d per lb. (the duty primarily levied on imports of the article from Virginia) to 6s 10d per lb. The fashion introduced by Sir Walter Raleigh spread from country to country with the rapidity and irresistibility of a prairie fire. The world's consumption of tobacco must be now something enormous; a French statistician about ten years ago estimated it at 4,480 million lb. annually.

Tobacco was introduced into India about 1605, the last year of Akbar's reign, by the Portuguese, whose influence in the East was then in its zenith. Here as in Europe its use was interdicted by those in power, and it is related that in Lahore, during Jehangir's rule, smokers had their lips cut off as in Turkey, although a milder penalty was sometimes imposed, *viz.*, that of being forced to ride through the town on a donkey with face blackened and turned tailwards. Even to the present day the luxury of tobacco is denied to Sikhs, Wahabis and certain Hindu sects by their religious guides, although indulgence in hemp and opium is permitted *ad lib.* Measures of repression, however, were no more successful in the East than in the West, and long ago the use of the fragrant weed became practically universal all over India. In 1888-89 the annual value of the sales and of the local consumption was estimated by Dr. George Watt at not far short of 25 millions sterling. The most important producing districts are Coimbatore, Godaver and Kistna in the Madras Presidency Rangpur and Tirhoot in Bengal, and Kaira in Bombay, but there is hardly an out-of-the-way village where the familiar patch of tobacco, grown as a garden crop, is not to be seen. In fact it is looked upon really as more among the necessities of life than a luxury, and there is a Behar proverb which may be taken as applying with equal force to the greater portion of India: *Khaine khac, na tamaka pie, Se nūr batawa kaise jie, i. e.*, "show me the man who can live without either chewing or smoking tobacco." In Madras the area under cultivation, 125,000 acres according to the latest statistics has extended by about 50 per cent within the last ten years, owing doubtless chiefly to the growth of the cigar industry. The Kistna and Madura districts produce the famous *Lanka* leaf, used for making Trichinopoly cheroots. In Bengal, the crop which in 1893-94 covered an area of 730,500 acres, is grown more or less extensive in every district, but somewhat restrictedly for trade and export. From Rangpur it is despatched in some quantity to Chittagong for transport to Burma. In Behar, where cultivators have been said to derive the handsome profit of from R60, to as much as R80 per bigha for the crop, the produce is partly exported in carts to Nepal, to Hajepur and other river ports in the district; partly bought up by travelling merchants who transport it by rail and river to the Upper Provinces and Bengal, and partly sold to purchasers from

Gorakhpur—sometimes before the crop has been cut. Cultivation in Bombay fluctuates much; in 1887-88 about 87,000 acres were under the crop; in the following year a contraction of about 30,000 acres took place; while in 1893-94 the area had expanded again to 98,498 acres. In the Punjab the crop also fluctuates considerably, in 1883-84, 1886-87 and 1893-94, the acreage was respectively 85,400, 46,437 and 68,153. In the Jhang district, however, at all events, tobacco is regarded as most profitable of all crops. Neither the soil nor the climate of the North-Western Provinces and Oudh are favourable for the production of good leaf—at least above Ghazipur—still cultivation has been steadily increasing, and in 1893-94 the area was recorded as close on 86,000 acres. In Lower Burma, where all the inhabitants, men, women and children, smoke, nearly the whole of the tobacco produced is consumed locally, in addition to large quantities imported from Bengal and Madras. Very fine leaf has been grown in Northern Arrakan—pronounced by many people equal to the best imported from Turkey and Persia—whence derived it is not known, but the suggestion has been made that it was raised originally from Manila and other foreign seed. By certain manufacturers at home, it has been supposed to have been produced from the seed of Havannah or St. Domingo tobacco; and according to their verdict both as regards colour and leaf it possesses excellent qualification for cigar-making.

But, generally speaking, English opinion on Indian tobacco has all along been unfavourable. The truth of the matter is that the great bulk grown in the country is consumed by the native population, whose taste and mode of using it require a leaf possessing strength rather than delicacy of flavour and aroma, while in order to produce what Europeans look upon as good standard, the crop demands more attention than the ryot, as a rule, can spare, and especially as regards the troublesome operation of curing. This accounts for the fact of our export trade in unmanufactured tobacco, valued in 1894-95 at about 10½ lakhs, showing instead of progression a considerable decline. It is unquestionable that the quality of Indian tobacco is capable of much improvement and within the past 12 years the limited efforts made in this direction have been fairly successful, especially in Madras, both in respect of the raw product and the manufacture; but unfortunately cultivators cling to the theory that it pays them better to produce a large growth of inferior leaf, which suits the native consumer, rather than a smaller quantity of superior leaf, for which in time they might expect to realise what would be to them a fancy price. Probably in order to extend appreciably the production of tobacco suitable for the consumption of Europeans and the classes of well-to-do natives who have learned to prefer it to the compound used in the hookah, the leaf would require to be cured and prepared by European agency, the mere cultivation being left in native hands. Following this principle and with due attention paid to the processes of curing, sorting, and packing; all points of great importance in striving for commercial success India might be expected, in time, to take up the supply of a far larger share of the world's demand for tobacco than falls to her at present. Undoubtedly there are powerful rivals in the field who have already secured the markets best worth having, but what has been done elsewhere may be done, here, and India is said to be situated more favourably for tobacco-growing than those European States where foreign varieties of seed have been successfully acclimatised. With this advantage, perfect freedom from excise duties and regulations and capabilities of improvement in market value, it seems to say little for enterprise in India that not only has our export trade in the raw article fallen away, but also that the trade in the manufactured article remains practically what it was 20 years ago, *i. e.*, confined to insignificant dealings with the Maldives, the Straits Settlements, Ceylon and Arabia, &c, the total value of which in 1894-95 was R34,382. On the other hand, imports of manufactured tobacco (other than cigars), valued in 1893-94 and 1894-95 at 17½ and 11½ lakhs respectively, have about trebled in value during the above men-

tioned period. The only satisfactory feature is the rapid progress made in the export trade in cigars, which during the past 10 years has increased from 230,921 lb., valued at R1,55,892, to 593,539 lb., valued at R6,08,914 (in 1891-95), the United Kingdom being the chief market. And yet it is notable that in spite of this great increase in the Indian export of cigars, of which we hear so much in connection with Earl's Court Exhibitions and the like, our imports of foreign cigars have nevertheless increased in value during the past decade from about 2½ lakhs to 4 lakhs. The Indian cigar is not therefore sole king in his own country; and if we were to take pipe and cigarette tobacco into the reckoning also, we should find that the value of the tobacco that comes into India is far greater than that of the tobacco that goes out. Altogether then our trade in tobacco cannot be said to be in a satisfactory position. State aid has been suggested, but Government has decided against it, and probably with wisdom. Such assistance has not been found necessary with indigo or coffee, and it was withdrawn in the case of tea at a stage when that industry had made much less progress than tobacco has done.—*Pioneer*, May 16.

PLANTING AND PRODUCE.

AN OLD COMPLAINT.—We publish elsewhere a letter from "Shareholder" complaining of the exclusion of reporters from certain meetings of tea companies. Attention has been called to this matter several times in these columns, but, with few exceptions, those companies which sinned in this respect at the time we wrote, continue to follow the same course. The shareholders in these concerns for the most part accept the situation. The directors therefore having become so accustomed to these private gatherings resent the idea of publicity, feeling perhaps that the public have no concern with their business, and that in graciously declaring a dividend when there is one to declare, and saying as little about it as possible when there is not, they are doing all that is required of them. Shareholders, we know, ought to receive dividends with all humility, and they should behave with due decorum when there are none, but for all that a domestic and family reading of the Companies Acts is not in harmony with the spirit of the age. Moreover, it is in the interests of investors and the tea industry generally that publicity should be given to the proceedings at these meetings. If a company or garden has not had a good year the fact is sure to leak out if adverse comments are made, and it is better that the reason why should be known and explained at the proper time and place. If, on the other hand, there is good news to give the shareholders, why suppress the account of the proceedings when they receive it?

GOOD ADVICE.—The *American Grocer* is impartial in its advice. It encourages the drinking of Indian and Ceylon tea, and it also tends useful information on the subject of coffee. In a note which is "most sarcastic," it informs its readers that the true way to kill a coffee trade is "Keep package substitutes! Keep stale roasted coffee! Keep low grade coffee! Work everybody else's brand or blend but your own, and you will soon do very little business in coffee. On the other hand, make drinking quality the first consideration; style, the second. Have coffee fresh roasted at least every day, and, if the trade will warrant, 'fresh every hour.' Urge your trade to buy the highest grade. Grind coffee to order, but, better yet, induce customers to buy the whole bean, and to grind coffee as required. The coffee department ought to be one of the most profitable in the store. It attracts trade and serves to hold customers. There is more of pleasure for the palate in a cup of fragrant, good-bodied, well-made coffee than in anything which goes on the American breakfast-table. Good coffee covers a multitude of sins; exhilarates, gives tone to the system; fits one to enjoy life, for Bacon said: "It comforteth the heart and aideth digestion."

JAPAN AND HER TEA TRADE.—Japan will probably soon subsidise a line to the Australian ports, chiefly

with a view to the greater development of her tea trade. The first steamer of the new monthly service to Europe by the Japanese Company, Nippon Yusen Kaisha, is the "Tosa Maru," of 5,789 tons gross. The vessel was due to leave Bombay about the middle of April.

LECTURE AT THE SOCIETY OF ARTS ON TEA PLANTING IN DARJEELING.—Mr. Christison will read his paper on "Tea Planting in Darjeeling" before the Society of Arts on Thursday, the 14th instant. The chair will be taken at half-past four o'clock by the Right Hon. Sir Richard Temple, Bart., G.C.S.I., C.I.E.

"PRIVATE AND CONFIDENTIAL."

To the Editor of *The Home and Colonial Mail*.

SIR,—As a shareholder in several tea companies I protest against the policy pursued by some of these companies in endeavouring to keep their affairs dark.

I know that you have commented on this strongly, and I quite agree with your comments. Unfortunately the shareholders on some tea concerns are so weak in the knees that they submit without protest to a custom which is not only out of date in these days, but is distinctly detrimental to their interest.—I am, sir, yours, &c.,
SHAREHOLDER.

ACREAGE OF TEA COMPANIES.

To the Editor of *The Home and Colonial Mail*.

SIR,—Under the heading of "Market for Tea Shares" in your valuable paper of yesterday, I notice a paragraph stating that the Eastern Produce and Estates Tea Company is the largest single tea company in existence. Now, I beg to point out that this is incorrect, as both the North Sylhet Tea Company, Limited, and the South Sylhet Tea Company Limited have much more than 11,000 acres each under cultivation. I should feel obliged by your kindly giving this fact publicity in your next issue for the information of all interested.—I enclose my card, and remain, yours faithfully,

London, May 2, 1896.

J. HUTCHINSON.

ABOUT BANANAS.

The following account of Captain Baker, the Banana King, will be interesting to many people in the colonies:—

About twenty years ago a Yankee skipper knocking about with his schooner, called at some of the ports on the easterly side of the island. Bananas were plentifully offered him, and knowing the taste Americans were fast acquiring for the fruit, which was then scarce in their market, he began to study out a plan to convey the fruit in a sound condition to the United States. As soon as his arrangements were completed the shipment of bananas to America became one of the leading industries of the island, and is yearly growing in magnitude.

The name of this skipper is Captain Lorenzo D. Baker, of Boston, the president and tropical manager of the Boston Fruit Company. He is known as the Banana King, and resides at Bowden, a grand plantation on the south side of the island. The steamer "Bowden" was named after the captain's home. The Buckman Fruit Company, of Baltimore, is largely connected with the Boston firm.

Captain Baker's company owns the largest banana plantations in Jamaica, and controls the Wentworth coconut plantation at Port Maria. The company owns and charters twelve steamers, which run on schedule time between Jamaica and Boston, Baltimore and Philadelphia, carrying passengers and mails. In 1877 this great enterprise rolled up its sleeves and went to work to make a new Jamaica. It owns 30,000 acres of land and has about 16,000 acres leased. Nearly 1,000,000 bunches of bananas are the annual shipments, besides 5,000,000 coconuts and vast quantities of allspice, oranges, coffee, cocoa and valuable woods.

The labour performed on the Company's plantations requires over 400 coolies and as many more negroes. Six hundred mules are always in service carrying

the fruit from the plantations to the shipping points along the coast. Eight hundred head of oxen have been employed at one time preparing ground for planting bananas cultivating the fruit already in the ground.

The company has 32 plantations under cultivation. Each has an overseer, and a superintendent is over all. President Baker's office and all the administrative departments are at Port Antonio. Telephone connection is had from the main office to every plantation, by which orders are sent to what point on the coast to deliver fruit and in what quantity. An electric plant light the wharves, offices and stables of the company at Port Antonio. Another enterprise which has been a blessing in an artificial ice factory. West Indian and Commercial Advertiser.—*Fiji Times*, April 4.

HUNASGERIA TEA COMPANY, LIMITED.

DIRECTORS REPORT.

The following accounts are now presented to shareholders, viz:—Balance Sheet shewing the financial position of the Company on 31st December, 1895.—Profits and Loss Account, for crop 1895.

It will be seen from the Profits and Loss Account that the weight of Tea sold in London during the year amounted to 316,808 lb.; this included about 2,000 lb. of tea made from bought leaf. The average selling price was 6.57d per lb., and the proceeds amounted to £8,720 19s. 8d., including that sold in Ceylon.

The crop of Cardamoms and sundry produce realized £48 15s 9d.

The total receipts from sales of produce thus amounted to £8,769 15s 5d.

The total expenditure for the year in Ceylon and London was £7,148 3s 5d., so that a profit is shewn on crop 1895 of £1,621 12s 0d.

It is proposed to deal with the above Profit as follows:—

To the payment of a Dividend	
of 4% for the year	£909 2 5
To the reduction of Suspense Account	650 18 0
To be carried forward	61 11 7
	<hr/>
	£1,621 12 0

By the above appropriation the Suspense Account will be extinguished, and profits will not therefore be again subject to reduction on this account.

The crop of Tea secured is satisfactory, the yield having been 400 pounds per acre against 347 pounds in 1894.

The season was favourable, but the increased crop is in most part due to more liberal cultivation, and it is believed that a continuance of the same system will still further improve the yield.

The Tea Market during 1895 ruled low, more especially for the class of Tea grown on Hunasgeria. The average selling price of 6.57d. compares with 7.36d. obtained for the crop of the previous year.

The larger crops now being dealt with necessitate increased factory accommodation; this is now being provided, and half the cost is included in the expenditure as given above.

A small Tea nursery has also been laid down, and the cost debited to the past year's expenditure; this is to provide plants for any extension of the Tea area that may be decided upon.

The cultivated area remains as under:—

Tea	789 acres
Cocoa	30 „

819 acres

The Directors regret to announce the retirement of Mr. H. H. Potts from the Board owing to ill-health. Mr. P. C. Oswald has been selected to fill the vacancy.

Mr. Norman Stewart, a member of the Board, retires from office on this occasion, and, being eligible, offers himself for re-election.

Mr. John Sawyer, the Company's Auditor, also offers himself for re-election.—By order,

J. ALEC ROBERTS, Secretary.

29th April 1896.

THE DIMBULA VALLEY (CEYLON) TEA CO., LIMITED.

THE TRANSFER OF ELGIN AND BELGRAVIA ESTATES.

IN view of the confirmed and detailed information which the present mail brings of Sir John Mair's withdrawal from an untenable position in reference to the contract for the sale of the Elgin and Belgravia estates, the question may well be asked as to whether some change in our Island legislation is not required to prevent any such misunderstanding in the future. It is of the utmost importance that London and British capitalists generally should have no uncomfortable feeling that a bargain, and even contract, for the purchase of property, entered into in good faith in London, Manchester, or Glasgow, may be liable to repudiation in Ceylon. We think that all men of business will agree that what is good enough in respect of a sale contract for landed property in the city of London is good enough for the first of Crown Colonies; and the sooner, therefore, our local law is made to recognise the full force of such home contracts as we refer to, the better for every local enterprise which is dependent on British capital or the London market. If the law advisers of the Government are not prepared to go so far as to make English or Scotch Agreements, under the circumstances we speak of, binding legally in Ceylon, at any rate we may well ask that the value of stamps required on preliminary Agreements (according to the existing Ceylon law) should be credited when the actual transfer takes place. As our law now stands, a preliminary Agreement for the sale of landed property has to carry the same value in stamps as the Conveyance itself—so that payment has to be made twice over for stamps to ensure the contract being carried out. Now we understand that in the Straits Settlements—and Chief Justice Sir W. Bonser, who was Attorney-General and lawmaker there, will be able to advise the Government as to this—the stamps on preliminary Agreements are credited in afterwards stamping the Conveyance. There can be no question that had certain precautions (beyond the mere Agreement) not been taken in the recent Dimbula-Sylhet case, there would have been a serious and prolonged controversy, and, no doubt, an expensive "case in Court" to the great detriment of the credit of Ceylon (among other things) in the estimation of business-men in the Metropolis and other large British cities; and surely it is to the express interest of planters and merchants (European and native) as of the Colony and its Government, that any cause for misconception of this kind in the future should be removed, as we trust it may be, by order of H. E. Sir West Ridgeway at an early date.

J. F.

THE INDIAN TEA ASSOCIATION.—The annual general meeting of the Indian Tea Association was held on the 27th ultimo at the Bengal Chamber of Commerce, Mr. G. A. Ormiston, Chairman, presiding. There was a large attendance of members, and Mr. H. C. Williams and Professor Haffkine were present by invitation. Speeches of considerable interest by the tea industry were made by the Chairman, the Hon. Mr. P. Playfair, C. I. E., Mr. H. C. Begg, Mr. A. Tocher, Mr. H. C. Williams, and others, the labour question being one of the principal subjects touched upon. Professor Haffkine also gave an interesting account of the results of his inoculations against cholera.

NOTES FROM OUR LONDON LETTER.

LONDON, May 8.

CEYLON TEA COMPANIES.

With this letter there is posted to you the reports of the Scottish Ceylon Tea Company [see page 12], and of the Hunasgeria Tea Company [see page 21]. The first of these two bodies proposes a final dividend of 10 per cent, making with the interim one paid, a total of 15 per cent for the year, free of income tax. In addition to this division 7 per cent has been paid on the preference shares, but £838 is set aside for depreciation on the Buildings and Machinery item, and £852 13s' 9d remains to be carried forward. The tea crop of last year was 667,049 lb. being 7,049 lb. in excess of the estimate. The Hunasgeriya report proposes a dividend of only 4 per cent for the year, but a sum equal to about another 2½ per cent is devoted to the extinguishment of the Suspense Account. The average selling price of this Company's tea had been 6.57d per lb., and the yield per acre 400 pounds as against 347 pounds in the year previous. 789 acres are reported as under tea, and 30 only under cacao.

In the report of the recent meeting of the Eastern Produce and Estates Company you will note the satisfactory statement contained in the speech of the Chairman that since this Company was formed to take over the business of the defunct Ceylon Company it has paid off £73,000 of the £195,000 of debentures. Perhaps few of the tea companies connected with your Island have had to struggle against similar conditions of difficulty as this one has had to surmount. The division of profits was hemmed in by restrictions of a most stringent character, and there were those who at its inception deemed that it would prove impossible to succeed against these. However, this has been achieved already to a very large extent, and ere long, thanks both to good management and to some degree of good luck, the shareholders may expect to reap the full benefit of their long waiting.

INDIAN TEA COMPANIES.

Reports of several of the Indian tea companies have appeared this week, and may be contrasted with those of the Ceylon companies already sent you as to the results narrated. The Mungledye Company can only pay its dividend on its preference shares, carrying forward the small balance of £380. The Chardwar Company will pay 10 per cent dividend for the year. The Tinigri Company pays a dividend of a similar amount and carries forward £161. The Borelli Company cannot go beyond a 4 per cent dividend, but carries forward £3,003. The Southern India Estates Company is more lucky, being able to pay a dividend of 10 per cent.

Tomorrow will witness the opening of

THE INDIA AND CEYLON EXHIBITION

at Earl's Court. Before next writing it will probably be possible to record the impression of a personal visit to this. From all we outsiders hear, Ceylon is not likely to make a show adequate to her proper representation by the side of India. If this should prove to be the case, we must regret that any attempt was made to include the name of Ceylon in that given to the Show. Invitations to attend tomorrow's ceremony have been freely distributed among press representatives, and the *Ceylon Observer* will not be unrepresented at it.

PLANTING NOTES FROM HATTON.

DEAR "OBSERVER,"—Monsoon come down here on Sunday pretty well—rain 2.66, and yesterday 1.20. This brings our rain up to last year's quantity.

Those were rather interesting notes in your paper a few days ago from some old "fossil" on old Kadugannawa; but he might have given us his opinion why the old district went out so suddenly. Manoty weeding and want of brains, I fear, was the cause. Your correspondent seems to think there is still a kick in the old "oss": if so, I would not mind having a shy at something with him if he is not "kelaveno potchi," which, I fear, he is when he can go back to Mariawatte being in coffee and a "nundi" A.L.C. being a contractor on the railway to Nawalapitiya. That must have been about the time Adian was a boy, and the writer of this in "swaddling clothes."

This has been a good year for leaf, but the auld cry "No labour" has been in every planter's mouth. Now the true will change to "No work for those poor coolies."—*Cor.*

MARKET FOR TEA SHARES.

Thursday evening, May 7.

Though the official list does not, this week, show quite so many advances in quotations, the buying of nearly all the shares named in the list, as well as those not so quoted, continues on an increasing scale.

MINING LANE continues very firm, and both Indians (of which the supply continues rapidly to diminish) and Ceylons have hardened in value.

CEYLON SHARES: C. T. P. Co.—There is nothing fresh to report excepting a small transaction in the 7 per cent. Prefs. at £18.

EASTERN PRODUCE AND ESTATES.—Business in the Ordinary £5 shares of this company is a particular feature in the Ceylon share market, and a large number of shares have changed hands at 5½ ex div.; they now ask 5½.—*H. & C. Mail*, May 8.

THE AMSTERDAM MARKET.

Our Amsterdam correspondent writes on May 5th that 60 tons of Van Honten's best cocoa-butter were sold that day by auction with good competition at extremely firm rates, prices averaging 70.58c per half-kilo. Details concerning 1st week's Amsterdam cinchona-auctions show that the richest parcel of bark offered in sale was one of 11 bales crushed Ledgeriana, analysing 10.83 per cent of sulphate of quinine. It realised 40½c per half-kilo. The principal feature of the sales was the excellent demand for fine druggists' quills, for which higher rates were readily bid than have been known for a long time. (Good broken quills and root were also) well completed for ordinary and medium quality, on the other hand, was quite neglected. The Java cinchona-shipments during April have been as follows:

	1896	1895	1894	1893
Amsterdam	lb.	lb.	lb.	lb.
April	419,000	615,000	715,000	649,300
January 1 to April 30	2,420,000	2,477,000	2,388,000	2,530,000

—*Chemist and Druggist*, May 9.

THE TEA MARKET

continues to rule very firm, imports (chiefly Ceylon) being on a small scale. The Clearing House transactions, backed by cheap money, point to present prices being maintained well into the summer months. The remnants of first crop China passing out of importers' hands sell at disastrous rates, but it is a misnomer to describe these teas as fine, whereas standard quality of strength, quality, and aroma would yet command remunerative prices. Deliveries continue on the most satisfactory scale for Indian and Ceylon, but not of China. Java Tea now comes in for a fair share of attention, especially where quality is conspicuous.—*L. & C. Express*, May 8.

PLANTING IN PERAK.

From the Matang monthly report for March, printed in the *Perak Government Gazette* of May 8th we take the following:—

On the evening of the 21st I went to Kumpang Dew and went all round the Yim Sang coffee estate with Mr. Boyd, the Manager. It has been very well drained. Nothing is planted as yet, but there are some very fine nurseries of coffee plants which Mr. Boyd hopes to commence to plant out within the next fortnight.

On the 23rd, Mr. Boyd, who had come back with me on the 22nd, left for Sungei Tinggi to select a block of 640 acres of land for coffee cultivation for himself and Mr. Aylesbury.

On the 27th the Assistant Magistrate and Mr. Hamilton returned from Sungei Tinggi in the launch, bringing Mr. Boyd with them. The latter gentleman came to see me about the land which he has selected, and with which he seemed to be well pleased.

The opening of these estates at Sungei Tinggi will be a very good thing for the place and will, no doubt, give employment to many of the natives there, who are very poor.

TEA IN AUSTRALIA.

A moderate business has been done in China tea, sales being reported of 350 half-chests common at 4½d to 4¾d, a small line of fine puyong at 8½d, 150 half-chests common kooloo, 100 half-chests kooloo at 7½d, 350 quarter-chests buds at 5d to 5½d (besides a large parcel of buds) and 850 quarter-chests S.O. pekoe at 5¾d to 6½d Ceylon teas have been moderately active, sales covering over 700 packages at prices ranging from 6½d to 11d. At auction on Tuesday a catalogue of 282 half-chests and 829 quarter-chests China tea was offered, and sales were made of 282 half-chests common congou at 3¾d to 4d, and 655 quarter-chests common buds at 4½d to 7¾d. At the auction sale on Thursday Indian teas met with keen competition. Some of the better grades realised an advance, while other grades realised full late rates. The quantity offered was 2,576 chests and 571 half-chests, all of which were sold as follows:—Orange pekoe, 591 chests and 173 half-chests at 6¾d to 9½d; pekoe, 1,638 chests and 220 half-chests, at 5¾d to 10¾d; pekoe souchong, 347 chests and 169 half-chests, at 5½d to 7½d. Of Ceylon teas, 590 chests and 104 half-chests were offered, but the bidding for these was dull, and prices were slightly easier, especially on common grades and dustily broken pekoes. Sales amounted to 303 chests and 104 quarter-chests as follows:—Broken orange pekoe, 11 chests and 42 half-chests, at 9d to 11½d; broken pekoe, 183 chests and 62 half-chests, at 6½d to 9½d; pekoe, at 6½d; and pekoe souchong, at 5¾d to 6½d.—*Australasian*, May 9.

THE AMERICAN TEA CAMPAIGN.

The London correspondent of the local "Times" writing by the last mail says:—

This week I have had the opportunity in several directions of learning something about the chances of successfully pushing Ceylon and Indian teas in the American market. My conversations have included those in the Indian as well as the Ceylon tea interest. More than one gentleman who has discussed the position of our staple with Mr. Mackenzie has given me all that could be remembered, and I have myself met your delegate more than once in Northumberland Avenue just as he was going into the Metropole and elsewhere. The dwellers in the States do not seem, unfortunately, to be the tea-drinkers we Britishers are. The first-rate coffee to be procured generally in the States is as palatable as ever it was, from their infancy up, to a large portion of the cosmopolitan mixture that makes up the full total of the population of the United States. There are 10,000,000 Germans, 5,000,000 Scandinavians, Danes, and Poles,

3,000,000 Cubans, and 7,000,000 Negroes who don't drink tea; add the Red Indians and you get about half of the population non-tea-drinkers. Next we come to the green tea drinkers. There is a consumption of fifty million pounds of green tea in the States, and upon that consumption we are making no impression whatever. It stands before us a huge impenetrable wall, massive and unsurmountable. We have been more successful in the attack upon the fifteen or twenty million pounds of black tea consumed, and also upon the partly fermented teas. But it seems from what I hear, that Mr. Mackenzie leans more towards an endeavour to supply the American dealers and the American public with what they do want than by advertisements, expenditure and strong effort to make them take what they do not want. One of the grievances of the Uitlanders in the Transvaal is the quality of the dynamite they are forced to use. President Kruger has given a monopoly of the article to Dutchmen and Germans, and he grimly tells those complaining, and others whom it may concern, "Your dynamite requirements must be bent to the sort of dynamite my friends supply." Ceylon tea manufacture to obtain an outlet in America must be bent to the sort of tea the Americans require. Doubtless whilst such excellent profits are being secured from a certain manufacture, *i.e.*, of black tea, the planters of Ceylon will require some leverage before they will give time to opening up a green tea trade with America. The stimulus of necessity is not bearing heavily upon them at present. Sufficient to the day, perhaps, is the evil thereof. But if it is good enough for the Ceylon Tea Plantations Co., Limited, to look well ahead to a day that, perchance, may come when tea is down in the depths and coconut property jogs placidly along at a slow but steady pace, it ought to be good enough for the planting body to look ahead during the years of plenty and perfect itself in tea manufacture in every form that the markets of the world demand. There are a good many men here who can remember some few years spent in the endeavour to get Ceylon tea pure drunk by the masses. Examine the packed teas on the shelves and the loose tea in the canisters of the grocers of the United Kingdom today, and see how much of it is not "blended" tea. That endeavour was swimming against the tide. It was slow. Swimming with the tide is easier and quicker. I am told the difficulty of introducing Ceylon green tea would be far less than the task of getting our black teas into consumption.

THE UNCERTAIN QUALITY OF BRITISH-GROWN TEA.

The next difficulty is the objection the big buyers have to the breaks and uncertain quality of British-grown teas. You can quite understand that dealers who have been accustomed to place an order for next year's requirements, even up to 2,000 half-chests at an order, to closely follow what they are supplying to their connection, and to *get it*, view with dismay the idea of embarking in a Ceylon and Indian trade, and will not, unless forced to do so by the strongest pressure, raise a hand to taste the numberless samples of tea requisite to produce a regular and even blend.

GETTING TOO MUCH FOR THEIR MONEY.

One more trouble is the dealer's objection to pay something approaching 3d per lb. all round extra by adopting British-grown tea and yet get no better profit, for the retail price must not be altered. Unless forced by the strongest pressure he will not forsake the tea he gets the

best profit on. Naturally. And there is no blinking the fact that the old difficulty the pioneers here had to contend with, viz., the strength of the tea, at present militates considerably against the popularizing of British-grown teas. It was not until one of our Chancellors of the Exchequer, Mr. Goschen, I think it was, mentioned in his Budget speech the greater strength of British-grown tea and the loss to the Revenue by less being required for the tea-pot than China tea that people really comprehended extensively that less India or Ceylon tea would produce the same result in strength of liquor as the full quantity of China. The Americans have not got as far as this in their tea education, and there are still complaining of getting too much for money,

SHALL WE MAKE GREEN TEA?

If green tea were taken energetically in hand in Ceylon and India it is possible we jointly might displace ten millions out of the fifty millions at present consumed in the United States. That would help. Then the trade would not stop at America; there are other places that still require this class of tea, although it is dead in the British Isles. It may be said there are ten chiefs who control a large proportion of Ceylon tea estates.—Messrs. Whittall, Rutherford, Storey and others. It is to them we must look to initiate a commencement in green tea manufacture. In the field of green tea in the States there is a chance, but there seems no hope of displacing the article otherwise than as I have indicated,

SMALL BREAKS AND UNEVEN SAMPLES.

Regarding small breaks and uneven samples the Americans simply will not now buy Ceylon teas on sample, because the bulk, they have decided, is never the same as sample. Small breaks they will not touch if they can help it. Messrs. P. R. Buchanan & Co., who are shipping increased quantities, are doing what the Americans require, viz., selling from bulk. Mr. Larkin their Canadian representative, is now staying at the Metropole, London, and I hope to see him. He, I hear, will say that in Canada it is always Ceylon tea that is asked for; but what is supplied is three-fourths Indian. Why? Because there is no firm like Mr. Larkin's firm devoting itself to Ceylon tea interests. Larkin's hold mostly stocks of Indian tea, and there is no chance of buying Ceylon teas from bulk there. I have heard that a dealer in Canada stated lately he could have sold 3,000 chests more Ceylon had he had it. Why hadn't he got it. Well, "small breaks and uneven samples" stand in the way. The possible cure for this will be contained in some remarks on Indian tea below.

MR. BLECHYNDEN'S SUGGESTION.

Touching on over-production after discussing the above points, I was told that Mr. Mackenzie's conviction is that it is India, with its immense forest reserve, towards which we should turn our eyes in this connection. Unless the Ceylon Government throws open the reserve of forest in Saffragam there is, he thinks, no great surplus over our present figures to be dreaded. He thinks this will not be a year of much increase in our shipments outside the United Kingdom. In 1891 there was a jump in the figures, 1892 almost stationary, 1893 jump, 1894 almost stationary 1895 jump, 1896, he thinks, will prove like 1892 and 1894. His idea is that 105,000,000 pounds will be reached for 1896.

I learn that the Indian Tea delegate is thoroughly alive to the disadvantages under which Indian and Ceylon teas labor, and is anxious that the obstacles which at present stand in the way of

a better state of things shall be removed. The same facilities which American traders handling long lines of China and Japan teas enjoy, he is anxious shall be provided, at any rate in the teas he represents. He also has to complain of small breaks and of the impossibility of matching, without delay, any sample that may be sold out. It is the want of these facilities that is the greatest obstacle to large firms touching British India teas. Mr. Blechynden firmly believes that the enterprise and energy which have built up this great tea industry, will in time handle these obstacles and sweep them away. These large firms are accustomed to give orders on last year's samples. Each mark has its recognised standard and varies very little each season. Orders are booked upon prices quoted subject to market fluctuations, the importer taking the risk of the goods differing widely from standard. One traveller can thus book orders for hundreds of thousands of pounds. The trade thus in a great degree is in the hands of a few large firms. Disputes as to quality are by no means unknown, and many firms have retired from the business, out of heart with the wiles of the Chinaman and the Jap. But still the business is a great one and is conducted on large lines. This is impossible in Ceylon and India teas. "small breaks and uneven samples" keeping the business on a petty basis. To get over this obstacle to Indian tea being handled on great lines, I understand Mr. Blechynden is most anxious that an agency be organised in India to take the place of the packing houses of China and Japan, buying teas in Calcutta, blending and packing them to certain fixed standards, and thus opening out business upon the lines demanded. Factory blending on a small scale is useless. The confidence of the big dealers can only be secured by reliable standards and large supplies. Mr. Blechynden recommends a guarantee being provided that *the teas ordered would be forthcoming*, and is anxious that the Association should guarantee a certain sum, placed in the hands of a firm in New York to increase confidence which would be close at hand should the agency fail to carry out what it had undertaken and become liable to forfeit of the guarantee. Brands, as in Japan and China, would thus become well known, and the owners of the brands would only have to thank their own failure in matching teas to keep their brands level, if their reputation went down and claims were made. It is proposed that the I. T. Association should give a grant for meeting the first cost of the requisite plant and outfit.

A GIANTIC BLEND.

Mr. Mackenzie, I understand thinks that the limited quantity of tea put up to auction in the Colombo market would not allow of such a plan being worked in Colombo. But it is very certain that what India does Ceylon will not long be behind in doing, and if India, by imitating the packing houses of China and Japan, begins to get long lines taken and repeat orders sent, Ceylon will find a means to do the same, even if it necessitated the throwing-open of Colombo free to the world to blend and pack in. "Keep up the quality" is a phrase that has become a too well-known cry here. I question whether it is fifteen years old and whether in the old days the grocer ever had to bother himself much upon such a matter at all. It may be that the millenium is at hand, that the lion and the lamb, the strong and flavory, the poor and wishy-washy teas will lie peacefully side by side leavened up by the art of the selecting broker, and the discerning blender, into one regular and satisfactory whole in the mix-

ing machines and packing roans of Calcutta and Colombo.

MR. W. MACKENZIE AS THE SUNBURNT MAN.

The Brooklyn *Citizen*, in three columns, gives a capital account of sport and life in Ceylon and India, with illustrations, the object being all the while to deftly draw the attention of readers to the merits of our teas. The article is jointly the work of Messrs. Mackenzie and Blechynden. It is headed "Oriental Sport; the Sunburnt Man gives some Incidents of Elephant Hunts; Thrilling Charge of the Enormous Beasts." This is the sort of thing to catch the eye and make people read, especially with an enormous "King of the Jungles" taking up a good portion of the second and third columns. The Sunburnt Man" tells a lot of his experiences in shikar in Ceylon, but the main object is well held in view, and every reader having been beguiled by the heading and the illustrations into reading has absorbed a lot about British-grown tea before he has finished.—London *Cor.*, local "Times."

EASTERN PRODUCE AND ESTATES COMPANY, LIMITED.

The ninth ordinary general meeting of the shareholders of this company was held at Winchester-house, Old Broad-street, E.C., on Wednesday, April 19, Mr C. J. Lindsay Nicholson (the chairman) presiding.

The Secretary (Mr. Douglas R. Smith) having read the notice convening the meeting,

The Chairman said: Gentlemen, assuming that you will take the report, which has been in your hands for some time, as read, I will now proceed to make a few remarks upon the position of the company. I think I may say with confidence that the directors feel to-day that they come before you with a report which shows continuously improving features. We have had a year of some anxiety. Of course, naturally with all agricultural pursuits, we have had the anxiety in Ceylon of weather, and on this side we have had the anxiety which a large crop necessarily gives as to market; but I am glad to say we had had a bumper harvest in Ceylon, and at the same time, thanks to the intelligence of our superintendents, to whom you and we invariably, I am glad to say, are able to give a word of thanks, we have found a good crop, accompanied in Mincing-lane by a favourable appreciation of our marks. With a price of tea a fraction under 8d. it requires good marks. As I have often said to you from this chair, our instructions to our superintendents are, let us have quality and quantity if you like, but above all things give us quality. You, gentlemen, who take an interest, perhaps, in what the Chancellor of the Exchequer says may have been interested in the debate on the Budget by seeing what Sir Michael Hicks-Beach said as to Ceylon tea, that it appears to the Exchequer a matter of some anxiety whether Ceylon tea is not put rather on the more favoured nation clause, seeing that it is stronger than China tea, and therefore a cup of tea made out of it pays less duty than a cup of tea made out of China tea. That is an interesting compliment to our product. While on that subject, you may also have observed that he drew attention to the fact that the great speculation in gold mines during last year had caused a consumption of something like one million bottles of champagne. He added to that another curious statistic that the consumption of tea had increased by 10,000,000 lb., so it is evidently the case that for every excess bottle of champagne we may congratulate ourselves that ten pounds extra tea are consumed. Well, gentlemen, those are little matters which are somewhat interesting. We believe you are served in Ceylon by a contented and happy staff, and our experience is that we have always application from men of good position and in every way eligible for appointments in the service. I attribute a great deal of the contentment of our staff abroad to the

care and assiduity in the framing of the furlough rules, by my friend, Mr. Cameron, the managing director, and to Mr. Stacey for his exertions in Ceylon. The progress of this company, as you will notice, has been almost unprecedented in the few years we have been connected with it. It has increased ten-fold, and at the present moment I am happy to say our shares are at a premium. (Applause.) I saw in a paper the other day that this is the centenary of the occupation of Ceylon. Bombay and Madras were well known and inhabited by settlers some years before 1796. I think that in the past century Ceylon has well developed herself, and we may be very proud of the little island both in a commercial and planting sense. You will see, if you refer to the report, that the acreage of our tea is 10,347 all in good cultivation. The estimated yield for 1896 is 3,458,000 lb., against 3,276,000 lb. last year. There is no doubt that the secret of success lies in the fact that we must not go to sleep. With the increase in the production of tea there is the necessity to look out for markets, such as Russia, the colonies, and America. (Hear, hear.) India is not a competitor; she should be with Ceylon a sister, and together they should endeavour by friendly rivalry to let the established value of Eastern tea be well known. Wherever it is known we may be sure it will make a successful home. Our accounts are so clear that anyone who runs may read. On our capital we have earned £46,000; we have paid interest, £7,500; we have paid debentures £7,900; we have put to reserve £5,000; we pay in dividends £15,000; and we carry over £10,000 in round figures. Since the commencement we have paid off £73,000 of the £195,000 debentures, and we have reduced the rate of interest on the remainder from 6 to 4½ per cent., and to-day, after paying you gradually increasing dividends, we pay you 5 per cent. At the same time the board are convinced of the propriety of continuing the prudent course of speedily paying off the debentures. (Applause.) We commenced with that determination, and we have continued it. While continuing to discharge the debentures freely as circumstances will allow, we look forward with confidence, unless something unforeseen happens, to being able to give you increasing dividends. (Hear, hear.) There may be many matters on which I have not spoken and on which you may desire to ask questions. These I shall be happy to answer to the best of my ability. I beg now formally to move—"That the report of the directors, dated April 16, 1896, be received and adopted, and that a final dividend at the rate of 2½ per cent. on the capital paid up on the preferred shares, and at the rate of 3½ per cent. on the ordinary shares, for the year ending December 31, 1895, be declared and made payable on the 1st May, 1896." (Applause.)

Mr. Ralph A. Cameron (managing director): In the remarks I propose to make is seconded the resolution I shall necessarily be going over more less familiar ground, but there are a few matters which I always like to bring before you in comparing one year with another. The increase of crop in 1895 was about 500,000 lbs., or nearly 20 per cent. over that for 1894. The yield per acre on tea in bearing was 356 lbs., as against 303 lbs. the year before; although 1894 was somewhat short, still apart from that the increase is very satisfactory. The net price per lb. was rather over 3d. less than in 1894, but this is more than compensated for by the increased yield and the lower cost per lb. for production consequent on that increase. So far as we can judge, we have no reason to fear or expect any further considerable fall this year. As regards extensions, you will observe that we continue to add about 250 to 300 acres a year to our cultivated area. No doubt there is more land that could be planted, but we are obliged to regulate it to a considerable extent so as not to interfere with the labour force on our estates. I still think, however, that we might do more in this direction, and when we see our way to do it we shall no doubt take it in hand. We have about 2,000 acres of available land which I think is more or less fit for tea cultivation. Taking into account

a part of the 9,072 acres now in bearing, but not at maturity, and the continuous yearly additions to which I have referred. I think we may look forward to steadily increasing yield for many years to come. The general features of the trade are decidedly satisfactory. There has been a further considerable increase in 1895 in the quantity of tea from Ceylon exported direct or re-exported here to other countries, the amount being 20,000,000 lbs., as against 14,700,000 lbs. the year before, and there is every indication that this diversion to new markets will go on and increase. The workshops which we told you last year we were about to establish have been started, and we have reason to believe that they will develop satisfactorily. The increase in the agency business has continued to answer our expectations this year, no less than 12,000,000 lbs. of tea having been shipped by the company, including that from our own properties. I do not think there is any other point of detail that I need touch upon, but with regard to our general position I can only say that the large reduction of the debenture debt, and the favourable arrangement made in regard to the balance remaining, coupled with the increased profit earned, have fully justified the removal of some of the restrictions as to the disposal of the profits, which in the earlier stages of the company's existence were both desirable and necessary. It must not, however, be overlooked that our present sound position is largely due to the observance of those restrictions, and whilst it is now right that there should be more freedom in dealing with the profits, it is equally, as heretofore, for the interests of the shareholders, that liberal provision should be made for extinguishing the debenture debt, and providing for all contingencies by substantial additions to the reserve fund. In conclusion, I will ask you to join the board in expressing our thanks to the managers of the estates and the staff in Colombo and London for their zealous and efficient services during the past year. (Applause.)

The resolution was when put and carried unanimously,

Mr. David Reid proposed the re-election of Mr. C. J. Lindsay Nicholson and Mr. Ralph A. Cameron as directors. He said the remarkable progress of the company was more eloquent than anything he could say in support of the resolution.

Mr. Christopher B. Smith seconded the motion, which was unanimously agreed to.

Mr. Broad said there was one resolution he wished to move which he thought would commend itself to all the shareholders present. It was, "That the remuneration of the directors, other than that of the managing director, be increased by the sum of £250, dating from 1st Jan. last." Those who had been in the company as he had been from the commencement would endorse everything that had fallen from previous speakers as to the management of the company. The successful conduct of the company's affairs was due to the managers abroad and the directors here, and it gave him very great pleasure to come and move this resolution.

Mr. Wm. Gaviller, in seconding the resolution, remarked that the directors not only deserved great credit, but something more substantial for having put the company on a sound and prosperous footing.

The resolution was carried unanimously.

The Chairman returned thanks, and stated that what the directors appreciated most was that the proposer of the resolution was one who had done more for the company than perhaps the board themselves. The advice he had given them had much to do with the present success of the company. (Applause.)

On the motion of Mr. Earnshaw, seconded by Mr. Rich, Messrs. Welton, Jones, and Co. were reappointed auditors of the company for the ensuing year.

Mr. Ferguson proposed a vote of thanks to the chairman, directors, and staff of the company both at home and abroad. He said he had lately returned from Ceylon, where a great deal of interest was

taken in the company and in its steady prosperity. No company could have a better manager than Mr. Stacey, nor a better staff than those who worked under him. He fully endorsed the policy announced by the chairman and the managing director of paying off the debentures.

Mr. Welton seconded the motion, which was cordially adopted.

The Chairman briefly acknowledged the compliment, and the proceedings then terminated.—*Money Market Review.*

TOBACCO IN CEYLON.

A correspondent who has had a long practical experience of the cultivation and manufacture of tobacco in India, and who was recently in Ceylon on one of several visits he has paid to our Island, sends us the following remarks on the cultivation of the tobacco plant in Ceylon:—

Much has in recent years been said for and against tobacco cultivation in Ceylon. In 1887 and 1888 tobacco was the great topic. It was then demonstrated that the plant could be cultivated profitably, and sufficiently so, to induce a number of local men to join in a venture for this purpose. Land was purchased, buildings were erected; and everything looked bright and well for the future. Unfortunately, however, the liquidator completed the management of the Company.

It is difficult, without sufficient data to go upon, to venture an opinion as to the reason of the Company's failure to become a profitable concern, but it seems that the main cause was excessive expenditure brought about by excessive expectations that unfortunately were not realized.

Man must walk before he can run; and the fact of the Ceylon Tobacco Company's not being the success its promoters anticipated does not in any way prove that Ceylon cannot produce good leaf. On the contrary, the history of the Company and previous ventures clearly shows that good and excellent leaf has been and can be produced, and that large profits can be derived.

Some of the leaf from Ceylon has fetched as much as 3s 10d per lb.; and if the Island could do this in 1888 it can do it again in 1896. 3s 10d per lb. would give the Ceylon planter a larger profit than 4s 10d per lb. to the Sumatra planter: the expenses of the latter are quite out of comparison with similar outlays in Ceylon. It costs the Sumatra planter somewhere about 1s 6d per lb. to produce his leaf; it should not cost the Ceylon planter more than 3s.

18½s. per lb. It therefore follows that the Ceylon man can afford to be satisfied with a much smaller profit for his outturn and still make a very satisfactory return upon his money, though he may not be able to produce Sumatra leaf.

The essentials to successful planting are suitable land, climate and labour. Ceylon certainly has the first two, if not all three essentials; the question of labour in any case as far as Ceylon is concerned, is no great factor: if local labour is not obtainable, imported Indian agricultural labour is, and the difference of cooly cannot be very much more than paid in India.

The soil required is a good friable volcanic loam, the climate a moist warm temperature with reliable and regular seasons of rain and sunshine. Gentle undulating land capable of perfect drainage to enable rapid filtration through the roots is the most suitable.

Given all this, and Ceylon does give it, intelligence, commonsense and practical knowledge do the rest to make tobacco one of, if not the most profitable product in the Island.

It may take a season or two to determine the best jät of seed suitable for the country; but in any case a fair crop of whatever seed should cover its own expenses, always provided, that such are within reasonable limits and the acreage opened sufficiently large, coupled with judicious and practical management.

In a private letter our correspondent says:— "Personally I have the greatest faith in Ceylon as a tobacco-producing country; and it were a

pity if an industry of such great possibilities of tobacco were allowed to drop out of sight and mind for the want of enterprise (and Ceylon men do not lack this as a rule) and practical knowledge." In the *Planting Review* prefixed to our *Handbook* we have summarized the information available to the end of 1895 on the subject of tobacco in Ceylon. In his latest report on the Ceylon Botanical Gardens Dr. Trimen does not refer to tobacco; and the Blue Book for 1895 has not yet reached us: so that we are unable to say whether the cultivation of the plant is still advancing in Ceylon. Perhaps some correspondent can inform us on this point. There is no question that tobacco is a paying product; but it is also terribly exhaustive of the soil, which needs to be a rich one to stand the strain on it.

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed, during the week ending 9th May 1896, under the provisions of Act V of 1888.

Extract from Rhea bark.—No. 150 of 1896.—Harry Stafford Beyts, merchant and commission agent, residing at 97, Elphinstone Circle, Bombay, for an extract from *Rhea* bark.

The fees prescribed have been paid for the continuance of exclusive privilege in respect of the undermentioned inventions for the periods shown against each:—

For improvements in machinery for obtaining fibrous material from ramie and other plants.—No. 193 of 1891.—Mr. E. C. Marc's invention for improvements in machinery for obtaining fibrous material from ramie and other plants. (Specification filed 8th February 1892.)—*Indian & Eastern Engineer*, May 23.

COFFEE AND TRADING IN "OPTIONS AND FUTURES."

LORD STANLEY OF ALDERLEY rose to call the attention of the House to the alleged depreciation in the prices of wheat, cotton, wool, silver, coffee, and other agricultural products, owing to an international system of trading in "options and futures," representing fictitious or non-existing produce. He said that some 25 condemnatory resolutions had been passed in the last two years by our leading agricultural and other societies. Further, owing to the reports of the special commissions held in the United States, Germany, and Belgium, a Bill for suppressing these systems was twice read in the United States House of Representatives last December, and a similar Bill passed the same House in 1894, while a committee of the German Reichstag reported last month in favour of total prohibition of them; also in Belgium a Bill to deal with this subject had been framed. He asked her Majesty's Government why Mr. Charles W. Smith's evidence, prepared in 1893 and 1894 at the request of the Royal Commission on Agriculture on this subject, had been suppressed after having been printed, and whether it would be laid upon the table of the House; also a translation of the articles published on the same subject in the *Journal de l'Agriculture*, by M. Alfred Paisant, President of the Civil Tribunal of Versailles; and he further asked her Majesty's Government how it was that, after hundreds of failures due to these systems hardly one had been brought before the Bankruptcy Court for fear of exposing the system; and whether her Majesty's Government would appoint a Select Committee to take evidence on the subject. 5:30 The noble lord formally moved for papers on the subject.

THE EARL OF DUDLEY.—I do not think that the matter which has been brought forward by the noble lord is one which calls for any action by Parliament at the present time. It has been discussed pretty freely by many commercial bodies throughout the country, and, although it is perfectly true, as the noble lord says, that some of those commercial bodies have passed resolutions in favour

of legislative action, still, on the other hand, the Associated Chambers of Commerce, at both their last two conferences, have refused to bind themselves in any way to such an expression of opinion. Moreover, the matter has been brought forward by Mr. Smith, a gentleman who has taken a leading part in this question, before the Central Chamber of Agriculture on more than one occasion, but that chamber has not seen fit to make any representation to the Board of Agriculture. The Agricultural Commission have had before them evidence bearing on this question, and they will no doubt deal with it in their report. Under these circumstances I feel sure that your lordships will not feel inclined to adopt the suggestion of the noble lord and appoint a Select Committee to inquire into this subject. The noble lord has drawn the attention of the House to the alleged depreciation in the price of certain products owing to the system of what is called dealing in "futures" or "options." Of course, there can be no doubt that there has been a very large fall in the price of some of the products to which the noble lord has referred, but I venture to think that it is by no means proved, even after the speech of the noble lord, that that fall in price is in any way due to the system of which he complains. To say that price is governed by the laws of supply and demand is merely to use a truism, but it is, I believe, a fact that that law holds good even in the speculative market, and that the unanimous opinion of the best experts is that the price in those markets follows and does not lead the price dictated by the laws of supply and demand. In fact, they are of opinion that this system of dealing in "futures," instead of deteriorating prices, rather tends to equalize them and to counteract the fluctuations that always must exist. The noble lord refers, in his question, to coffee as one of the products the price of which has been depreciated by this particular system. My information, however, is totally at variance on that point with that of the noble lord. Although I understand that it is perfectly true that this system enters very largely into the coffee trade, and that, in fact, the coffee trade is to a great extent carried on in that way, yet coffee happens to be a product the price of which does not fluctuate and which has not depreciated of recent years. The circumstances of coffee in particular, therefore, point to a totally different conclusion from that drawn by the noble lord. But, even if the arguments of the noble lord were sound, and even if one had reason to believe that this system of gambling had depreciated prices, I very much doubt whether it would be possible to check it by legislative action. The noble lord has referred to the many attempts that have been made chiefly by Mr. Smith and others, to distinguish between purely legitimate speculation and gambling enterprise, but all those attempts to differentiate have failed, and I doubt very much whether it would be possible to draw any distinguishing line of that kind in an Act of Parliament, without running very grave risk of hampering trade and checking legitimate enterprise. The noble lord also referred to several attempts which had been made by foreign Governments in this direction, but in no single instance have those attempts been successful and no Bill drawn with this object has as yet passed into law, and I understand that only last month an anti-option Bill was thrown out of the Agricultural Committee in the House of Representatives at Washington. With regard to Mr. Smith's printed evidence, which the noble lord seems to think has been suppressed, I believe what really took place was that Mr. Smith prepared a *précis* of the evidence which he intended to give before the Agricultural Commission, and he was cross-examined upon that *précis*, and that it was not published for the very good reason that it is not usual to publish a *précis* of intended evidence. With regard to the last point referred to by the noble lord, the Government have no information that the proceedings in bankruptcy do not include as large a proportion of failures by gambling in "futures" as by any other cause, and the reason that they are not more frequently heard of is probably because few of such failures in proportion take place. The translation which the noble lord asks for does not seem to the Government to be one which can rightly be put on the table of this House.

LORD STANLEY OF ALDERLEY said he did not wish to be understood as showing any want of courtesy or respect to the noble earl who had just replied, but he did object to have an answer on a matter of agriculture by the Board of Trade.

THE MARQUIS OF SALISBURY.—On the question of the distribution of duties, I would like to point out to my noble friend that undoubtedly a question of buying and selling is a matter for the Board of Trade and not a matter of agriculture. The buying and selling of corn is not an agricultural act.

The motion was by leave withdrawn.—*London Times*, May 2.

THE ROASTING OF COFFEE.

TO THE EDITOR OF THE "STANDARD."

Sir,—With reference to the statement made by the Chancellor of the Exchequer in his recent Budget, to the effect that the annual decrease in the consumption of coffee, and its increasing disfavour with the public, arises more or less from the inability of an ordinary Englishwoman to make a decent cup thereof, it may be well to note that professional observation (and bitter personal experience), extending over half a century, has led me to the conclusion that the true cause of the relatively increased preference for tea, with its deleterious constituent, tannin, will ultimately be found to depend, not on the incompetence of the English housewife to properly make coffee, but on the over-roasting of the berry by the trade coffee roasters, with a view to impart a deep colour, and apparent, but factitious, strength to the infusion when made.

During the process an empyreumatic product is generated, which causes such highly-roasted coffee to disagree with the stomach, and renders dyspeptic persons unable to indulge in it, in consequence of the heart-burn and flatulence it produces. If the public were candidly given to understand that highly-roasted coffees, though imparting a deeper colour to the decoction or infusion, are *de facto* less strong, with a corresponding loss of the true aroma, than the lightly-roasted berry, coffee would ere long resume its place as one of the national beverages, and the public and the Exchequer be alike benefited.

I am, sir, your obedient servant,
May 1. PHYSICIAN.

THE CARBOLIC CURE FOR LEAF DISEASE.

Sir,—I notice in your issue of 9th May, in a letter from a Queensland correspondent, an account of the carbolic cure for leaf disease. This so-called remedy was started as long ago as 1881 by a Mr. Storch of Fiji and attracted some attention in Ceylon, but did not meet with all the success that was claimed for it. That there is something in it, I am inclined to believe. It would be interesting to know to what extent it has been tried in India. In theory the vapour arising from the acid is supposed to kill the spores, and prevent their germinating. I will give you my experience of it in 1893-91. The first year I experimented with an acre of coffee, lightly shaded, that had in previous years come in for a strong dose of the disease yearly. I started the process in July and charged 35 tins placed 6 trees apart, with a solution containing 10 per cent. of Calvert's No. 5 Carbolic Acid, charging them about every 10 days with a 5 per cent. solution. The tins holding about $\frac{1}{2}$ a pint each were protected from the rain by an umbrella-like cover soldered on about 2 inches above the tin. I kept this up till February and conducted this first experiment personally. During this time most other parts of the estate had leaf disease during some months of the year badly, the experimental acre alone keeping remarkably clear though not entirely so from it, but the very slight attack it did have quickly disappeared with the result that that acre gave about 15 cwt. of crop the following year. I was so pleased with the result of the experiment that the following year I tried it over 25 acres, but whether from the trees bearing heavily this year (averaging 8 cwt. per acre) or for other reason the

result was disappointing and certainly did not keep off the disease except from trees under shade. I then gave up the treatment. The cost for about 8 months including the outlay on tins was under R10 per acre.

As I stated in my letter of the 8th January, if a cert. in cure could be obtained for leaf disease, it would make coffee cultivation comparatively easy, and ensure crops without such a lavish expenditure in manure as is now necessary, and I understand it has been combated successfully in certain instances by other methods.—PLANTER OF 20 YEARS' EXPERIENCE.—*Planting Opinion*, May 23.

BROKERS AND ARBITRATION.

The recent judicial decision in the case of *Domier v. Treats* has caused much searching of heart among the members of the General Produce Brokers' Association of London. At present all drugs changing hands in Mincing Lane are bought and sold subject to certain stringent conditions framed by the Brokers' Association in the interest of its members. Theoretically, it is, of course, open to a buyer and seller to make a contract subject to any conditions upon which they may be able to agree, but in practice there is no escape from the one official contract-form. It is fair to say that, upon the whole, the system works well, except for a single, but most important clause, which refers to the settlement of disputes. Under that clause all disputes must be referred to arbitration in accordance with the rules of the Association, each party appointing an arbitrator, who must be a broker and a member of the Association. If the arbitrators disagree, they select another broker as umpire. There is an appeal from this first set of arbitrators to the committee of the Association; but in no case is it possible, under the rules to appoint as an arbitrator a non-broker, however impartial and experienced. It has hitherto been quietly assumed that this Mincing Lane Court of Arbitrators constitutes a kind of legal *Imperium in Imperio*, equal to any regular court of justice. Baron Pollock and Mr. Justice Day have somewhat rudely dispelled this delusion, and the brokers now desire to re-cast their contract-rules so as to prevent future reversals at law of their decisions. With that object in view the Association has issued the following circular-letter to its members:—

GENERAL PRODUCE BROKERS' ASSOCIATION OF LONDON.

Established 1876.

B Staircase,
Commercial Sale Rooms,
Monday, 27th April 1896.

DEAR SIRS,

It having become necessary to alter Rule VII. (the rule governing the arbitration-clause in the contracts) on the back of the Contract Forms issued by this Association, so as to conform with present requirements, on behalf of the Committee I beg to hand you proof copy, showing the alterations which are proposed, and I shall be glad if you will give the same your careful attention and perusal.

Should you have any suggestion to make, please let me have it within seven days as the Committee propose to call a General Meeting to confirm the new form.

(Signed) R. J. HOSSACK,
Secretary.

So far as we can make, out the only important alteration which it is proposed to make in the rules is to substitute words to the effect that the decision of the arbitrators "shall be irrevocable, and it, and the award to be made in pursuance thereof, shall be enforceable under the provisions of the Arbitration Act, 1889," for the present wording, "Any award . . . shall be absolutely final and binding on both parties, and this submission and such reference shall be subject to the provisions of the Arbitration Act, 1889." What the produce brokers can hope to gain by substituting a declaration of irrevocability for one of absolute finality we fail to understand. The law remains, no matter what solemnity of a severation the brokers may resort to, and the law, as was shown in the citronella oil case, is by no means favourable to the occult influences that notoriously pervade the air of Mincing Lane arbitration rooms. The proposed

substitution of tweedledum for tweedledee is only another instance of the reactionary tendencies of the Brokers' Association. For years it has been a grievance with the vast majority of the Mincing Lane drug merchants that only brokers are eligible as arbitrators. It is notorious that disputes constantly arise in which the presence of a merchant, a manufacturer, a lawyer, or an analyst upon the Arbitration Board would be of great advantage; and we hope we shall not be thought wanting in respect for an eminent fraternity if we hint that brokers are not always possessed of a reasonable elementary knowledge of the articles upon which they are called to arbitrate. Furthermore, the Mincing Lane organism is complex. There are wheels within wheels, and it is whispered that there have been cases in which disputants were merely "men of straw" the brokers whom they appointed to attribute on their behalf, *errice versa*. For these and many other reasons there is a widespread distrust of the present arbitration system, and the sooner the oligarchy that controls it opens its doors to some of the Mincing Lane "Uitlanders" who do the bulk of the business, but are now without voice in the settlement of their "undoubted grievances," the better. We are, therefore, glad to hear that the London Chamber of Commerce propose to call a meeting of members connected with the drug-trade to discuss the arbitration question, and we urge all those who desire a fairer way of settling disputes to be present at that meeting.—*Chemist and Druggist*, May 9.

ORANGES IN CALIFORNIA.

The Los Angeles *Saturday Express* of California had in a recent issue a report of a visit to, an interview with, a well-known Californian orange grower, at his orchard in Duarte. Mr. Thomson is the originator of the 'improved, or Thomson, navel orange—a fruit that is fast supplanting the old navel. It has all the good qualities of the Washington navel, the Mediterranean sweet, the St. Michael and the Malta blood. It has a delicious flavour, a thin skin, a delicate colour and the best shipping quality. The question of how this new variety was produced brought out an illustration by Mr. Thomson. Whipping out a pruning knife, he cut two buds and a branch from a tree. He cut the buds in half, united the two halves and placed them under a slit in the bark.

'There you have it,' said he. 'I took the buds from two varieties and made them grow; did the same thing with two other varieties, and they grew. Then I took the buds from these new products and did the same thing with them. The result was a combination of all the four varieties of oranges.'

'Orange trees are as peculiar as people,' said Thomson; 'they have habits and moods and dispositions the same as individuals.'

As an illustration he pointed out one tree that always bore fruit more abundantly than those right around it, though it did not differ from the others in appearance and the soil was the same. Another tree bore fruit of a richer colour than its neighbours, yet the conditions seemed no different. The orchardist told how fast the trees developed, and he pointed out trees loaded with fruit that had been budded less than two years. The branches were weighed down with the golden spheres, and the oranges were bright and clean as though polished at a dago fruit stand.

'Will there be much development in the orange in the future?' was asked.

'Just as much in the next twenty years as in the past twenty' was Thomson's reply. While he confessed he had gained some experience in his work, he freely admitted that others who came after him would add to the quality and character of the citrus fruit.

All this time Thomson picked specimens and loaded up his visitors. Everybody was weighed down with the best in the orchard. The Ohio girl, who just a month ago begged for the privilege of picking just one orange from a tree, that she might bring back least of the exploit, was asking to be relieved of her load—that is, she expressed herself as well as she could between mouthfuls of the delicious fruit.

'How much did you make last year?' the Monrovia editor asked Thomson.

'From seven acres I sold 4,000 dols. worth of fruit and prices were just half what they were any previous year.'

Last year Thomson sold grafts of his new navel at 250 dols. each, and the previous year they were in demand at 5 dols.

'Some people say my new variety is no better than the old; but why do they pay me ten times as much for the grafts if that is the case?'

Nobody tried to answer, for it was not necessary.

B. C. AFRICA: CURRENT CHAT.

It is calculated that there are 1,750,000 plants in the Cholo District alone.

Mr. Bradshaw's crop is estimated at about 20 tons parchment.

Mr. White (Cholo) has planted out 100 acres this season.

Mr. Livingstone at Magomero has planted out about 70,000 plants this season. Pride of India has been planted thirty by thirty as a shade tree.

Mr. Mitchell at Namiwawa has planted up about 60 acres. Now that his assistant—Mr. Greenshields,—has arrived, Mr. Mitchell will proceed with the opening up of his Palm Stream Estate.

Mr. Israel has about 150 acres planted out at Chipande, Chiradzlo. He has partly removed his maiden crop.

We hear that Mr. Keiller has also partly stripped off his maiden crop as he was afraid of his bushes overbearing.—*Central African Planter*, April.

DR. WATT'S REPORT ON WHITE ANTS.

(COMMUNICATED.)

If the remainder of Dr. Watt's notes on pests that infest the tea bush are of as little value as those on white ants, the tea planting community will have derived very little benefit from his visit to the tea districts, and it is high time that an expert should be appointed to be controlled by the tea industry itself alone. Your Hare Street contemporary, no doubt, holds a brief from Dr. Watt to echo his trumpet on subjects, regarding which its portly proprietor can know but little, if anything, beyond the destruction of a few office admirals! I doubt exceedingly if he ever saw a tea bush growing, except, perhaps, in the glass case in the Crystal Palace. Some time ago I ventured to say, that all those supposed scientific reports amounted to very little in the long run, beyond affixing an unpronounceable name to the particular pest enquired about, and this chapter on white ants bears out all I wrote. There are very few planters, one would think, who could not have answered the question he puts, 'Whether they will attack "living as well as dead wood"?' At any rate, there is seldom a day but evidence is put before them, and it is their own fault if they don't grasp what the eye sees. With regard to remedies, one of them, that the bushes should be pruned up the stem for a space of three or four inches, carries absurdity on its face, as every planter aims at getting a large number of stems instead of one, so that the sap may flow freely. The tendency of the indigenous tea is to run up into a tree, and in order to stop this as much as possible a bush has to be pruned in its infancy, and if the bush still persists in attempting to become a tree, the recourse is to what is known as "collar" pruning, of which a great deal more is done in Assam proper than in Cachar, Sylhet or the Doors. The reason of this is, most probably, that the indigenous variety was first favourite in planting out new gardens in Assam, many years before it became the rage in the other districts. Here then, we have a remedy recommended against all laws of nature, and without any consideration as to after results to the plantation. Many practical planters will, no doubt, have observed that if an indigenous bush has been nursed in collar pruning and has only the single stem recommended in the report, that if allowed to go on for a year or so with ordinary light pruning, strong

young shoots will of their own accord spring up from the present single stem an inch or two beyond ground level, nature clearly pointing out that the natural flow of sap was stopped in some way and the old stump or stem, unable to perform its functions, had thrown out below the surface, when the bark was soft, a young generation, strong and vigorous and able to do the appointed work. With regard to using the red paint, which he says is so effective in the Gondal State, how is this to be applied when white ants will eat their way right up the stem of bush, and there is no outward sign that any damage is done at all, the first indication being the drooping of the leaves, and a very few days after this appears, the bush will topple over and disclose the stem as nothing but a shell? I have known many experiments made to prevent this, and hitherto without doing any good. Kerosine oil has been suggested and tried, but without efficacy, though the soil all round the roots stank of the oil months afterwards. With regard to the different kinds, there is little doubt but that two distinct *jāts* (to use a Hindustani word) work, and there is no doubt that one of these is much more destructive than the other, but this is no new discovery and we are not much "forrarder" than we were. The large *tumuli*, mounds which one *jāt* raises, makes excellent material for top-dressing, when judiciously mixed with lime. As regards the question, how far stakes in a young plantation attract white ants, there was never any question in the mind of a careful planter as to this, and one of the *hookums* of such an one, always is to keep the stakes some distance away from the young plant, so that if the white ant attacked the stake it would leave the plant alone, and no careful Manager leaves the stakes in longer than can be helped, but to remove the stakes at so early a period as Dr. Watt suggests would be suicidal, for the coolie looks as keenly for the stakes to direct his hoeing or weeding, as a Babu does after his garden *dustoor*, and it would be as difficult to prevent the hoeing out of plants without stakes as to prevent the Hooghly running past Calcutta, always provided they are of course not grown to a height of a foot or eighteen inches. In planting out a garden with 6 months seedlings, it is usual to remove the stakes during the following cold weather say in November and December, and as the stakes are made of all sorts and conditions of jungle produce, according to what predominates in the estate, no opinion could possibly be given as to its being an attraction or not; on many estates bamboos are largely used and the skin of this is quite impervious to white ants for a much longer period than the stake is used in planting out. In *bleed* gardens, where there is water between the *bleeds* and consequently the white ant cannot expend its peregrinations beyond one *bleed*, its ravages are simply appalling and there seems no remedy, as it attacks everything living or dead within that bed, and the planter can simply stand and fold his hands and watch in grief and dismay the destruction of whole rows of strong, vigorous plant. —*Indian Planting Gazette*, May 16.

DRUG REPORT.

(From the *Chemist and Druggist*.)

May 7th.

COCA-LEAVES have been offering somewhat more freely; fine green Truxillo may be had at 1s 2d per lb. on the spot.

CATTLE-FISH BONE is quoted at higher rates. Several of the parcels recently offering have been taken out of the market, and the demand has been fairly good.

OIL (Essential).—Citronella oil easier at 1s 2d per lb. on the spot, perhaps less.

CEYLON VANILLA: A RECORD PRICE. It will be seen from the extract given in our commercial column that at the latest drug sales in London 19s 6d per lb. was paid for a fine reflected Ceylon vanilla, being the highest price ever paid for this variety. We should like to know where it was grown.

A FORMER CEYLON PLANTER IN CANADA.

Mr. F. W. Godsal writes to us, from South Ford Ranche, Pincher Creek, Alberta, Canada, respecting books on coffee cultivation, and adds:— "Some 15 or 16 years ago, I was coffee planting in Ceylon. I lately paid a visit to the Hawaiian Islands, and was much struck by the prospects of the coffee there. Thanks to the introduction of the ladybird bug, it has quite recovered from the blight, which covered coffee, oranges, guavas etc. I found a few old Ceylon planters there. I hope the *Observer* is flourishing: I hope much, some day, to visit Ceylon again."

THE FUTURE OF JAMAICA ORANGES.

Despite the gloomy forebodings of those who croak and cry that Jamaica has passed from the land of the present to the land of the past there are those who consider that her prosperity is just beginning, arguing that the prosperity of the past was an insipid and uncertain thing as compared with the prospects of the future. No doubt the failure of the sugar plantations to compete successfully with their rivals in northern regions has to a great extent induced this view; but Jamaica, as we have always maintained, is not a country of one achievement of one attainment or of one purpose; the resources, the possibilities of Jamaica are boundless; the fertility of the soil has never been thoroughly tested—indeed it may well be said, Jamaica is the land of the future.* And were impelled to this statement by the event which is chronicled in another column—The immigration of orange planters from Florida to Jamaica. Florida has long claimed the proud distinction of providing the American market with that fruit, but a succession of adverse seasons has been sufficient to humble the vain-glorious vaunters, who scoffed at Jamaica and put their trust in Florida. As our readers are aware planters in Florida have for some considerable time been considering the advisability of emigrating to Jamaica and when it was mooted some time ago that the project was on the tapis the wire-pullers of Florida indignantly denied the rumour, asserting that so long as a single orange could be exported from Florida, so long would Jamaica remain in the background. But it must now be apparent that these assertions were not the result of conviction but rather an expression of the paroxysm of rage which possessed the defenders of Florida at the bare thought that Jamaica might yet supplant "the garden of America" in the production of oranges. A change has come over these spouters. Planters, not to be hood-winked by the statements made regarding the impossibility of Jamaica as an orange producing country, have left Florida, and at present a large number of planters who were successful in Florida so long as a measure of success was attainable, are in Jamaica, on the outlook for plantations to raise oranges. Comment on the significance of this immigration is needless. The Jamaica orange has never been properly tested; its qualities are practically unknown to the outside public, and therefore it has been allowed to remain in the background. But now that men of experience and intelligence have arrived with the purpose of giving the orange a fair trial it may be confidently expected that the result, instead of justifying the caustic remarks of Florida's favorites, will satisfy even the anticipations of Jamaican growers, and prove once more that monopolies were never recognised by Nature. It is argued that the Jamaica orange is too sweet for the northern palate; but it must be remembered that the average Florida orange contained too much acidity until by the use of chemicals a greater degree of sweetness and a more highly flavoured orange was produced. The same means for reducing the excessive sweetness is within reach of Jamaica planters, and who dare contend that a new era in the history of Jamaica has not begun?—*Gleaner*.

* This may be said of the whole W. I., the "New" West Indies.

THE CROWN COLONIES OF THE EMPIRE.
A CHAT WITH DR. D. MORRIS, C.M.G.

BY OUR SPECIAL COMMISSIONER.

Having interviewed most of the official representatives of the self-governing Colonies, I have been on the look-out for some one who could give me authoritative information with regard to the Crown Colonies of the Empire. I met my man at the anniversary banquet of the Royal Colonial Institute on Friday evening. After an introduction to the Marquis of Lorne, who presided over the brilliant gathering, and a brief chat with Sir Frederick Young, another of the Vice-Presidents, whose name will ever be associated with this remarkably successful institution, I found myself rubbing shoulders with Dr. Morris, the Sub-Director of Kew Gardens. Congratulating him upon his healthy appearance on his return from the Bahamas, I remarked, "You are just the man I have been looking for. I know of no one who has a more intimate acquaintance with the Crown Colonies of the Empire than yourself, and I should like to have a chat with you for publication in 'The Citizen.'" The doctor smiled at the compliment, said he would be delighted to do anything in his power to bring the Crown Colonies, in whose material welfare he had ever taken the deepest interest, to the front, and fixed Monday evening, at the Savile Club in Piccadilly, for the interview.

The Savile—delightfully situated, overlooking the Green Park—is a social club patronised by leading men in the literary and scientific world. We chatted over the soup, the fish, the entrées, and the joint, and continued the conversation in the smoking room, for Dr. Morris is a veritable encyclopædia, upon all that concerns the Crown Colonies, and he gave me sufficient information about their industries, their progress and development to fill a small volume.

But I fancy I hear some of your City readers say, "And who is Dr. Morris?" And as one of the main objects of these interviews is to influence the introduction of capital into the Queen's possessions beyond the seas for the benefit of the Empire at large, it will be of interest and importance to briefly sketch the career of this genial Government official, who has done so much to promote the prosperity and foster the best interests of our tropical colonies.

A native of the Principality, Dr. Morris graduated in honours at Trinity College, Dublin, where he took his B.A. in 1876, and subsequently M.A. and D.Sc. A pupil of the late Professor Huxley, he made botany his special study, and was successful in obtaining early in life the Assistant Directorship of the Botanic Gardens in Ceylon. During his two years' residence at Colombo he made investigations into the coffee leaf disease, and in 1879, when it was decided to establish a botanical department in Jamaica, he was offered and accepted, the post of director. During his seven years' residence in that island he did much towards making known the resources and capabilities of the West Indies. At that time sugar was the great staple of Jamaica, the crop amounting to 35,000, and even 33,000, hogsheads a year of the value of something like £400,000; but he foresaw the effect of the Continental bounties on the same industry, and warned the planters not to continue "to put all their eggs in one basket." He recommended the cultivation of fruit and other "minor industries," as they were then called, with the result that of late years fruit has really been the salvation of the colony in which he spent some of the happiest years of his life. In the famous year of the "Colinderies" Dr. Morris was appointed Assistant-Director of the Royal Gardens, Kew. Since he has occupied his present position he has ever taken the warmest interest in the fortunes of our tropical colonies, and in 1891, at the request of the several local Governments, he revisited the West Indies with the object of reporting upon the botanic federation which he was successful in bringing into existence. Last December he paid a visit to the Bahamas to report upon the sisal industry. For scientific services rendered

to Her Majesty's possessions Dr. Morris in 1893 received the distinction of C.M.G. In addition to being a fellow of the Royal Colonial Institute, he is a Fellow of the Linnean Society, and a Fellow and late Treasurer of the Royal Horticultural Society. He is married to a daughter of the late Captain Aitken, J. P., President of the Manchester Geological Society, and lives in Cumberland Road, Kew.

Said Mr. Morris: "I quite agree with you that the resources and capabilities of the Crown Colonies ought to be more widely known and appreciated than they are. These Colonies constitute a most important part of the British Empire, look at their vast area."

"What is it?"

"Oh, only about four million square miles, equal to the total area of the continent of Europe—half-a-million square miles more than the whole of the United States of America, and more than the whole of Australia, New Zealand, Tasmania, Fiji, and New Guinea put together. They are scattered all over the world's surface. Of course, they are chiefly tropical, and that accounts for the large native element. The total population is about ten millions."

"And which is the largest of the Crown Colonies?"

"British Guiana, which is half the size of France. The smallest is Hong Kong—one-fifth of the Isle of Wight. Size alone, however, does not give the relative value of these colonies, for the trade of Hong Kong is of the annual value of about £3,000,000, while that of British Guiana is only about £4,000,000. By the way, the present Governor of Hong Kong, Sir William Robinson, was one of the most enterprising governors the West Indies ever had. He was at Barbados, the Windward Islands, and Trinidad, and was deservedly popular."

"And what about the trade of these Crown Colonies?"

"Well, according to Sir Montagu Ommanney, who as you know is chief of the Crown Agents here, the trade is gradually but steadily improving. The total trade in 1894 was over £112,000,000, as compared with £104,000,000 in 1884, showing an increase of over £8,000,000 in ten years. The trade of the self-governing colonies in 1894 was £190,000,000, so that it is evident that the trade of the Crown Colonies is not unimportant."

"An increase of £8,000,000 in ten years is very good, I should say."

"Yes; but at the same time the great competition in regard to the staple industries renders the further development of the Crown Colonies a matter of the most serious concern. Take sugar, for instance. See how the cane-growing industry is handicapped by beet. The Crown Colonies produce over 7,000,000 tons of sugar a year, of which only 2,000,000 tons come into the United Kingdom."

"Why?"

"Because of the increased production of beet sugar. Owing to the over-production of wheat in America and Australia it does not pay to grow wheat either in this country or on the Continent of Europe. Both Germany and France have gone more extensively in for the cultivation of beet because it gives a better return than wheat, and the consequence is that the market is over-stocked with sugar. About 1,800,000 tons were produced last year in Germany. Of this only 600,000 tons were required for home consumption, leaving 1,200,000 tons for export. The result is that there is little room for our cane sugar in the English market; in point of fact, the failure of wheat in Europe is causing indirectly the failure of sugar in the Crown Colonies. Then again, in addition to sugar, France and Germany are extending their colonial industries. Look at Madagascar. The French will develop that country and its various products will, of course, come into competition with those of our own colonies. Cocoa is already apparently going like sugar. The consumption, it is true, is increasing, but so also is the production, and at a far greater ratio. The stocks in hand are enormous, with the result that prices continue to be depressed. At the end of 1893 the amount in bond was roughly 12,000,000 lb., in 1894 21,000,000 lb., while at the end of last year it was no less than 23,000,000 lb.

What is the result? Prices are only two-thirds of what they were six years ago."

"And you think the pressure is likely to be severer than ever?"

"Yes, and that there is urgent need for systematic action."

"And what do you suggest?"

"Well, in view of the gradual shifting of the position of the old staples, attention must be directed to the development of new ones. Tea has completely taken the place of coffee in Ceylon, and the export this year is expected to reach 100,000,000 lbs. Fruit in the West Indies is worth £1,000,000 annually. In Lagos, Sir Gilbert Carter, the Governor, has had the proud privilege of developing a trade in rubber, which is the most remarkable of any now existing. It is only about fifteen months old, and yet the shipments in 1895 were of the total value of £270,000. Take mahogany, again; a few years ago only about 200,000 ft. of this timber came from West Africa. In 1893 the total receipts in Liverpool alone were 3,200,000 ft. It is true that this trade has injured the old mahogany trade of British Honduras, which has fallen away from 5,000,000 ft. to 200,000 ft.; but that colony has other resources which can be developed."

"Then your argument is——"

"That it is the duty of England to prepare the Crown Colonies for keen competition in the future by laying the foundation of sound and flourishing industries. What I would suggest is the immediate extension of the system of botanical and experimental gardens under skilled persons throughout the whole of the Crown Colonies; the organisation of efforts to promote new industries and revive old. Scientific and practical organisation should go hand-in-hand, with due regard to the requirements of the nearest markets. Then there should be a change of educational effort. Instead of fitting the natives for clerkships in stores or offices, we should seek rather to make them skilful cultivators. At present the system of education is such as to give them a distaste for manual labour and a dislike for taking up the cultivation of the soil. During my last visit to the West Indies an old native came to me and said he had educated his son in an English school, where he had developed very expensive tastes. He lived upon the money supplied him by his father, and when his father got old and infirm would not dream of taking to the land; in fact, such sons get positively ashamed of their fathers. That has been, unfortunately, the case in the West Indies; but I would mention that Sir Henry Blake has taken steps to apprentice a number of boys to the Botanical Gardens of Jamaica for the purpose of having them trained in the cultivation of economic plants, so that they might become afterwards agricultural instructors amongst the peasant proprietors in the island. That is a step in the right direction, and one which might with advantage be followed in the other islands. In many of our Crown Colonies people are entirely without knowledge with regard to the cultivation of industrial plants. They are anxious to learn, but there are in some of the Colonies no Agencies, and that is why I recommend the establishment of experimental gardens. We are, however, improving in this respect. In 1830 there were only three botanical gardens in the West Indies; now there are eleven botanical institutions—experimental and trial stations for new industries."

"Well, it is to be hoped, Dr. Morris, that your suggestions will have weight in the right quarters."

"It is clear that something will have to be done. Strange as it may seem, probably the most flourishing colony in any part of the world today is Java. There they have extensive botanical gardens and experimental or proof stations, of great value and utility, under the charge of a large staff of highly-skilled scientific men maintained by the Government of Holland. Then Germany is following the example of Holland, and doing all it can to develop tropical industries in Africa. Similarly, France is aiding also by means of differential duties and grants-in-aid."

"But Mr. Chamberlain seems to be fully alive to the situation. His circular to the Colonial Governors eliciting their views on the development and extension of British trade with the colonies ought to be productive of good."

"Mr. Chamberlain's sympathy with the colonies is well known, and his desire to develop colonial trade is regarded as most encouraging. His influence is already felt in the various colonies. He has infused new life into many of them, and what is more has induced a greater interest to be taken in the colonies in this country."

"Speaking of Mr. Chamberlain, he is, I understand, largely interested in the sisal industry of the Bahamas, from which you recently returned."

"Yes. By the way, the history of this industry is interesting. The sisal plant had been in the colony for the last 50 years, and had really become a hindrance to agriculture. People did not know what to do with it. Several Governors took the matter up. The first of these was Mr. Bailey, in 1857; then Sir William Robinson, then Sir Henry Blake, who, just as he was on the point of developing the industry, was transferred to Newfoundland. It was then taken up with great energy and enterprise by Sir Ambrose Shea, who really deserves the credit of having placed it on a commercial basis. Well there are about 12,000 acres already planted. It is estimated that this year they will export about 6,000 tons of prepared fibre. There were fears that the market had fallen so low as to render the industry unremunerative. The price of the fibre last year was £13 per ton, but to-day it is worth £17 10s., and as the fibre can be marketed for about £10, there is at the present moment a good margin of profit."

"The market, of course, is the United States?"

"Yes; which is really the natural market of the West Indies. The orange cultivation in the United States having been practically destroyed, there is now an opportunity for the Bahamas, Jamaica, and other islands in the West Indies to supply the States with tropical fruit on a larger scale than ever. Owing to the failure of the Florida crops it is expected that the trade in oranges between Jamaica and the United States alone this season will be worth £120,000. When I was in Jamaica in 1880 the fruit trade of that island only amounted to £10,000 a year, in 1886 it had grown to £400,000, and today, as I have said, it is worth probably over a million sterling. Where originally there was one steamer employed under a subsidy, there now seven steamers regularly engaged in the fruit trade, and running without any subsidy at all."

"But is it not possible to develop a trade in fruit between Jamaica and this country?"

"I think so. At any rate, the Government of Jamaica seem determined to find out whether there is or is not an opening here for tropical fruits. They intend to specially charter a steamer fitted with cool chambers to run direct from Kingston to the docks here. She will bring oranges, bananas, mangoes, and indeed all kinds of tropical fruits. The experiment, I need hardly say, will be watched with great interest."

"Well, Dr. Morris, I am very pleased to have had this chat with you. Evidently, there is money to be made out of our Crown Colonies today."

"Yes, I certainly think so. Look at Dominica. There is no other West India island so rich in natural resources. It is capable of producing all the richest treasures of the tropics, and yet it is languishing for want of the necessary capital and energy to work them. As showing what small industries can do, Bermuda is almost entirely prosperous because it grows onions and new potatoes. St. Helena sends new potatoes to the Cape. Grenada is noted for its cocoa, nutmegs, and cloves, while Montserrat is known all over the world for its lime-juice. Yes, the 'minor industries' are not to be despised. There is money in them, and, indeed, for small capitalists, the Crown Colonies offer perhaps just now better opportunities than any other part of the Empire."—*Citizen*, May 2.

THE GOVERNMENT OF BENGAL has informed the Indian Tea Association that the question of improved road communication in the Dairs is receiving the attention of Government, and that a scheme for the construction of new roads, and the efficient maintenance of existing ones, is being prepared.—*A. Mail*, May 23.

PLANTING AND PRODUCE.

THE BREWING OF TEA.—We have frequently called attention to the ignorance displayed in brewing tea and the indifference shown by the public on the subject. Judging by the concoctions served at the average restaurant and railway station bar it is surprising that tea is so popular, for it is no rash assertion to state that a large number of people who drink so-called tea have not the smallest idea what a really good cup of tea properly made is like. Owing to the rapidity with which the tea is made and served in refreshment rooms all the ordinary rules for brewing tea are set at defiance, and as a result some liquid resembling diluted snuff is taken into the system under the name of tea. It is therefore remarkable that the demand for tea has increased so much under such unfavourable conditions. An honest endeavour has been made by some refreshment room proprietors to improve the methods of tea brewing, but owing to the indifference of the public and the trouble entailed they soon fall back on the old system. The tea trade does not appear to suffer much in consequence, although who can say what the demand would be like if the delicate flavour of the tea were preserved in making the tea? Perhaps, following the example of the old lady who liked her gin when it tasted like turpentine, the palate used to stewed tea would despise anything less pungent.

WITH COFFEE IT IS DIFFERENT.—It is not so with coffee. The demand for coffee has no doubt fallen during the past, owing to the difficulty of making it on this side of the Channel. On this subject the *Grocer* points out that the serious decline in the demand for coffee has been realised by all members of the trade, and in a severe degree by those gentlemen whose dealings are mainly in this commodity. But up to the present the efforts of the deputation of merchants and others interested to induce the Chancellor of the Exchequer to remove or reduce the duty and to facilitate operations in bond have not been rewarded by any marked degree of success. On the contrary, the pessimistic dealer persists in taking an even gloomier view of the situation. It is worth while, perhaps, to ask if there be not some reason for the change in the public taste. The Chancellor of the Exchequer put it down to the inability of the ordinary Englishwoman to make a decent cup of coffee. There may also be something in the theory of a professional gentleman who writes to a daily contemporary. This gentleman's observations and "bitter personal experience," extending over half a century, have led him to the conclusion that the true cause of the relatively increased preference for tea, with its deleterious constituent tannin, will ultimately be found to depend, not on the incompetence of the English housewife in making coffee, but on the over-roasting of the berry by the trade coffee roasters, with a view to impart a deep colour and apparent, but factitious, strength to the infusion when made. During his process, he says, an empyreumatic product is generated, which causes such highly roasted coffee to disagree with the stomach, and renders dyspeptic persons unable to indulge in it, in consequence of the heartburn and flatulence it produces. He argues that if public were candidly given to understand that highly roasted coffees, though imparting a deeper colour to the decoction or infusion, are *de facto* less strong, with a corresponding loss of the true aroma, than the lightly roasted berry, coffee would ere long resume its place as one of the national beverages. The consummation is one devoutly to be wished. But the Chancellor of the Exchequer was near the just apportionment of blame when he saddled it upon the shoulders of the consumers—the people who try to "make a cup of coffee," and only succeed in spoiling one. If the public would but exercise the care and skill which are essential in making a cup of really good, fragrant coffee, the results achieved would amply repay them, and we should probably soon see a revived demand. The best way to achieve this end is to educate the public in the right method of preparing coffee for the table.—*H. and C. Mail*, May 15.

PUBLIC MEETINGS HELD IN PRIVATE.

To the Editor of the *Home and Colonial Mail*.

Sir,—The tea investing public is greatly indebted to you for calling attention to the exclusion of reporters from the meetings of some companies. It is to be hoped that the new measure now before Parliament dealing with joint stock companies provides for the admission of reporters to all shareholders' meetings.

I can instance my contention that the accounts of shareholders' meetings are inadequate from your own columns. In the report of one of the tea companies you published last week, a company which does not admit reporters, there was so much of the proceedings omitted that you might as well have contented yourself with reprinting the report of the directors.

While your report, which I presume was contributed, gives the chairman's platitudes in extenuation of poor results, and a eulogy of colleagues, some trenchant critical remarks of one or two shareholders do not appear. The observations of one speaker, as reported, convey a wrong impression, moreover, for when the speaker criticised the management on the subject of the salary and commission paid, and intimated that the holding of appointments by the managing director of a similar kind in other concerns might be detrimental to the particular company to which the speaker referred, your report left the pith and gist of the speaker's remark in doubt. Another speaker also mentioned that if he attempted any review of the direction, the difficulty would be where to begin and where to stop. He also said if he were to attempt such a task he would not compare the results with those of agricultural holdings at home, but would ask how it was that neighbouring gardens with inferior natural advantages gave a profit of £8 per acre, while the company under criticism only showed half as much. A neighbouring concern gave a profit of 5d to 6d per lb., while the other company gave but 3d to 3½d. All this seems to me fair and useful comment, and should, with other kindred observations of a critical nature, be duly reported.

If shareholders took more real interest in the welfare of the concern in which their money is invested, they would agitate for more publicity.—I am, sir,

ANOTHER SHAREHOLDER.

[Our correspondent, we fear, expects too much. When our own reporters are refused admission to meetings we have to rely upon accounts of the proceedings kindly supplied by friends who, like our correspondent, believe that publicity is beneficial to all concerned. We cannot under the circumstances complain if these reports are not as full and complete as they otherwise would be. They do not emanate from official sources, and they are intended to be impartial, and to convey a correct account of the proceedings. Even if our own reporters were admitted in each case it does not follow that we could give a report of every word said. Life is short, our space is limited, and some shareholders are very inquisitive and sometimes long-winded. We agree with our correspondent that publicity on all vital points is desirable. Were we permitted to report the proceedings of all tea companies we trust that "Another Shareholder" would have no cause for complaint that justifiable criticism is not duly chronicled.—*Ed. H. & C. M.*—*H. & C. Mail*, May 15.]

THE CITRONELLA-OIL AWARD.

Messrs. Green and French, the two brokers to whom the citronella-oil dispute was referred back by the judges, in order that they might take the question of quality into consideration, have given their award to the effect that the oil (which, it will be remembered, consisted of 55 per cent. of kerosene, 35 per cent. of citronella oil, and 10 per cent. of oil of lemon) is citronella oil, and that the buyer is bound to accept and pay for it according to contract. They tendered their award to Mr. Domeier, together with a claim for 34 guineas for fees. We understand that Mr. Domeier has refused to accept the award or to pay the fees, and also declined to

take up or to pay for the oil. He declares that he will wait until he is sued by Mr. Treatt, and then bring the case into court.—*Chemist and Druggist*, May 16.

ESSENTIAL OILS.

From the Semi-Annual Report of Schimmel & Co., (Fritzsche Brothers), Leipzig & New-York, for April 1896, we extract the following:—

CINNAMON OIL, CEYLON.—The demand for this oil almost surpassed the supply. Offers of oil of fine quality were scarce last fall; to all appearances considerable quantities were retained in Ceylon in order to cause a rise in prices; this reached 2½d per lb., last September. Quotations have never been so high since years, but have remained unchanged.

In glaring contrast to these prices stand the export figures for both bark (tubular) and chips; the total amount shipped from Ceylon (Colombo and Galle) has been:

	Bark:	Chips:
1895	2,169,527 lb.	920,136 lb.
1894	1,959,905 "	657,725 "
1893	1,995,257 "	667,113 "
1892	1,947,538 "	615,155 "

In London, the principal market for both grades, the stock of cinnamon was not larger than when prices are normal. Under such circumstances it is difficult to foretell the changes for the rates of cinnamon oil in the near future. The fact is that the demand during recent years has been unusually large, and that the quantity of cinnamon chips consumed in our distilleries amounted to about the ninth part of the total shipments during the year 1895. These figures, however, when compared with the export figures of former years, do not justify a conclusion as to the rise of values, but other factors must have exercised an influence upon the cinnamon market. From an economic stand-point the rise of prices should not cause surprise, since those of the raw material and of the oil were abnormal ones.

CITRONELLA OIL.—The prices of this oil, one of the most important ones in the soap-making industry, have increased within the last six months from 1s 3d per lb., or marks 3.20 per kilo, to 2s, or marks 4.60 per kilo. As there has been no failure in or decrease of the crops a real cause for the rise of prices cannot be well ascertained.

The only explanation can be found in the increased use of the oil, since the American and English custom of perfuming not only toilet, but also common grades of domestic and even of soft soaps with flavors containing citronella oil seems to find general favor. If this inference is a correct one, as indicated by the following figures, the present market condition of this commodity may be considered a normal and, it may be hoped, a permanent one.

Recent shipments show a considerable increase; they amounted to:—

1895.	1,182,760 pounds Engl.	a quantity never before attained
1894	938,471 "	" "
1893	668,550 "	" "

These figures are copied from the official report of the German Consulate at Colombo (*Deutsches Handels-Archiv*, March 1896, Heft 108). We notice with gratification that the figures in the statistical compilations of these reports are now stated by the pound and not any more by the ounce.

With so brisk a demand for, and so large transactions in, citronella oil sophistication has to be looked for and constant care has to be exercised in the control of this subtle oil.

The coarse sophistication of citronella oil by the admixture of petroleum or fatty oils, so common in former years, has been much lessened since the publication of our "solubility test." There can nevertheless be no doubt that the quality of the commercial citronella oils has recently experienced a retrograde tendency, as is evident from their be-

haviour with 80 per cent alcohol. According to our statement published in our Report of 1889, citronella oil should give a clear mixture with 2 to 3 parts of alcohol containing 80 per cent by volume of anhydrous alcohol; and this mixture should remain clear upon the addition of 7 to 8 parts of alcohol of the same strength. A turbidity would indicate a sophistication; upon allowing the mixture to stand in a closed vial for some time, fatty oil will settle at the bottom, while kerosene will separate at the top of the alcoholic fluid.

Not all commercial citronella oils seem to stand this simple test at present; they may render a perfectly clear solution during the first part of the test, but upon the further addition of alcohol an opalescence or a turbidity occurs without, however, giving rise to the formation of any deposit, either at the bottom or at the top of the liquid, even when left standing for 24 hours. We could not but allow on several occasions such oils to pass, because a sophistication could not be proved and better oils could not be obtained in the market.

J. C. Umney in a recently published paper (*Chem. and Drugg.* 48 [1896:] 356) also calls attention to this discrepancy between different commercial citronella oils in their department with alcohol. He is inclined to believe that a kind of gurjunbalsam oil may be used as an adulterant. For this purpose, however, the common commercial gurjun oil can hardly be used, nor can the amount of any such addition be considerable, since an experimental admixture of but 10 per cent of gurjunbalsam oil not only much impaired the solubility of the oil in alcohol, but also gave rise to the separation of drops of the balsam oil at the bottom of the liquid, after it had stood for 24 hours. Umney suggests the acetylation process for the estimation of the amount of geraniol, and that a minimum amount of 60 per cent of geraniol be required.

We have also been about since some time to apply this test to citronella oil, have, however, not yet succeeded in obtaining sufficient material to form a definite conclusion. In all such examinations and final statements too much discrimination and care cannot be exercised so as not wantonly to disturb the confidence of the market.

Just before closing this report we were called upon to certify to the quality of a suspicious citronella oil in the London market; on examination it proved to be largely adulterated with petroleum hydrocarbons (kerosene, paraffine oil). The quantity of this adulteration amounted to about 66 per cent and the sophistication seems to have been committed after the arrival of the oil in England.

LEMONGRASS OIL.—Sp. gr. 0.895. Opt. rot.—0° 8' at 16° C. The general characteristics of the Brazilian oil are identical with those of the Ceylon oil, with the exception of its solubility in alcohol; while the latter oil forms a clear solution with 2 to 3 parts of 70 per cent. alcohol, the Brazilian oil does not, even with 98 per cent. alcohol. The oil was distilled from cultivated plants. In years with a rainy summer season as much as four crops can be cut, in a dry summer only three cuts of the grass can be harvested. The oil in the plants seems to undergo considerable changes; the quicker the grass grows, the lighter is the color of the oil obtained; dried grass yields a more or less dark oil; the same is the case when the grass is exposed to cold nights during the winter. The yield from fresh grass ranges, according to the season, between 0.24 and 0.1 per cent.

GERANIOL FROM CITRONELLA OIL.—The introduction of this fine substance into perfumery advances slowly. We have applied for a patent in Germany on pure geraniol as main-body for the odor of roses and of mignonette.

The remarks in our last Report on an inferior geraniol, made from oil of citronella, which was offered in the American market have caused the disappearance of this article from the price lists of the firm in question, but "geraniol chemically pure, soluble in 12-15 parts of 50 per cent alcohol" has been put into its place. We, however, have doubts about the wisdom of quoting immediately below this article "Geraniol with Roses, see Rose Reunioi."

A PROSPEROUS CEYLON TEA COMPANY.

We need add very little to the full report, which the *Financial News* of May 14th affords, of the proceedings at the annual meeting of the Scottish Ceylon Tea Company's shareholders. This is one of the older as well as of the most prosperous of Ceylon Companies, rising one year in dividends to 18 per cent, but latterly wisely resolving to adhere to the 15 per cent which distinguishes our premier Company, while gradually forming a satisfactory reserve fund, and allowing fully for depreciation of buildings, machinery, &c. No one, we think, can read the remarks of the Chairman and of the Ceylon Manager, Mr. Kerr, without feeling that judicious management in respect of cultivation and preparation as well as in the conduct of all business detail, account for the marked success of this Company. The steady increase in the average yield of the estates is noteworthy, as also the fact that the Directors are not ambitious that this average yield should rise above 450 lb. an acre—a fact which ought to enlighten many Indian tea critics who argue that Ceylon gardens are being over-cropped, and must, within a limited time, collapse! The remarks of Mr. David Kerr in this case—and of Mr. Talbot in respect of his Company—as to the policy which guides the management of these Ceylon tea estates, should go far to dispose of such criticism. Most careful are such Managers not to force their tea-bushes,—not to over-pluck them, nor to stimulate them by artificial manures; but rather to help them to maintain their usual vigour and to do justice to the fields in every possible way indicated by sound wise systems of cultivation. The only thing we need add to the report of proceedings is an extract from the letter of a well-known Ceylon planter, read by the Chairman at the meeting, but apparently not given in the *Financial News*. It ran as follows:—"I regret I will be unable to attend the meeting of the Scottish Ceylon Tea Co., Ltd., to be held tomorrow, but as a shareholder and knowing the estates and the Ceylon Manager, Mr. David Kerr, I have much pleasure in expressing my satisfaction with the Ceylon management. In Mr. Kerr the Company has a Manager keenly alive to their interests, and I hope he may long continue to act as their Manager there. I visited Strathdon, Abergeldie and Lonach with Mr. Kerr in February last, and I can testify to their being in first-rate order, and the bushes remarkably healthy in appearance."—We heartily congratulate all connected with the Scottish Ceylon Tea Company.

J.F.

NOTES FROM OUR LONDON LETTER.

LONDON, May 15.

Among other matters that engaged the attention of the Tea Committee of your Association on Wednesday last was consideration of a letter addressed to it by your

TEA COMMISSIONER FOR AMERICA.

Nothing certain as to this letter has transpired, but it is believed that it contains some novel remarks upon the course of the tea trade in the United States. It is also rumored that Mr. Mackenzie states one great obstacle to progress to be the distinct preference of the Yankees for green teas. We remember the late Mr. Whittall remarking that he did not think any amount of expenditure in America would have a successful result for you until this preference could either be successfully combatted or provided for by a change in preparation by your planters.

He remarked to the writer that he was himself devoting much attention to making such a change on his own estates, but we have never heard whether he did this successfully. It would seem, if what is said about Mr. Mackenzie's letter may be relied upon as correct, that that gentleman has come to acknowledge the difficulty precluded to exist by the late Mr. Whittall. It is not known what the views of the Tea Committee of the London Ceylon Association may be with reference to this particular of Mr. Mackenzie's letter. At all events it is said that that body has decided to have the letter printed and circulated among the members of the Association. It has been suggested that Ceylon must undertake a missionary tea enterprise in the States to convert the popular taste from green to black tea. As yet, what has been done does not seem to have gone far in the direction of accomplishing this change.

It seems probable that the report of the abovenamed Tea Committee that was to have consideration at last Wednesday's meeting may have to be somewhat deferred in order to the dealing with the two subjects mentioned above being included. It is hardly likely, however, that progress could be made before the Annual General Meeting of the Association sufficient to warrant any delay to insure inclusion in the report. We have not yet heard if Lord Stanmore has fixed a day for that meeting.

All admit that

"MAZAWATTEE TEA"

has been a great success, inasmuch as it has obtained an enormous popularity and corresponding consumption. The more educated palates do not relish the article, and it is not much met with in the better circles of society. But the fact remains that there must be millions who do appreciate and who use it exclusively. Its sale is said to have procured large fortunes for its present proprietors, and it creates no surprise therefore that the concern is soon to be converted into a limited liability company. With the enormous amount of capital now seeking investment, a perfect rush for the shares in this may be predicted. Mazawattee tea is a fresh and striking instance of what can be achieved by persistent and bold, if somewhat unscrupulous, advertisement. Without this it may safely be said that Mazawattee tea would have remained unknown to fame.

THE TEA DUTY.

A somewhat cool proposition was made by Mr. Lloyd George, the well-known Radical member for Carnarvon, in the House of Commons this week. During the Committee on the Finance Bill this gentleman rose to move an amendment, which was, to insert after the words providing that the tea duties should be continued the words "except with respect to tea grown in any part of Her Majesty's dominions." Mr. J. H. Lewis, another Welsh member, seconded this motion and urged the desirability of encouraging Indian tea. He advocated the abolition, he said, not only in the interest of the poorer consuming classes but of an industry in the island of Ceylon, which deserved encouragement. The present condition of India, he went on to say, did not justify the House in retaining any duty which might be prejudicial to our Indian Empire. That such a measure of protection such as this should be advocated by professed Radicals has naturally given rise to astonishment, they having been always looked upon in the light of bigoted free traders. Sir Howard Vincent

must have been delighted to note such a defection from among the ranks of the strongest opponents of his persistent advocacy. But the Chancellor of the Exchequer soon disposed of the matter. His chief argument was one it was impossible to controvert. He pointed out that the adoption of the amendment would destroy the duty on tea in a year when we could not afford so large a loss to the revenue. He also alluded to the effect the abolition would have in putting an end to the payment of indirect taxation by a very large number of the population. He followed up these remarks by the very natural observation that "this was a proposal which, coming from the other side of the House, was of a very remarkable character, because it indicated the adoption by hon. gentlemen opposite of what they had hitherto denounced as a policy of protection, or at any rate, of a reactionary character." Evidently the minister was so taken by surprise that, as he said, had he known what was intended he would not have attempted to proceed with the Bill, or rather he would have postponed the consideration of the clause and taken up the succeeding clauses which were non-contentious. As the subject had now been raised, he said he would not ask the Committee to proceed with the discussion that night, but would move to report progress, which was then done. What the Cobden Club must think of this matter is not known to us. But since it has so complacently accepted the protectionist principle in Ceylon in regard to grain taxation, it may perhaps be able to swallow this new move. But undoubtedly the Government is taken aback by the circumstance, that *sub rosa*, many of its members entertain protectionist views, to which they would gladly give expression but for the fear of losing freetraders' support. Now they find the tables being turned upon them in a most unexpected manner. If this sort of thing extends, it is impossible to say what limit, if any, may be assigned to future *volte face* movements. The affair may be found to possibly colour the proposals of future Budgets.

SCOTTISH CEYLON TEA CO., LTD.

A SATISFACTORY YEAR'S WORK—STATEMENT BY THE CEYLON MANAGER.

The seventh annual ordinary meeting of the Scottish Ceylon Tea Company, Limited, was held yesterday, at the offices, 16, Philpot-lane, E.C., under the presidency of Mr. H. L. Forbes (the chairman of the company.)

Mr. J. F. Anderson (Lyal, Anderson and Co., secretaries) having read the notice convening the meeting,

The Chairman said: On this occasion, on behalf of the board of directors, I think I have very little indeed to say to you, and as we are about to declare a good dividend, I daresay you will have very little to say to us. I think we have embodied in our report all that we have to say with reference to the working of the company during last year, and I am sure you will agree with us that the report we present to you is satisfactory. It varies but little from those of former years, and I think that is a matter for congratulation. The net profits for the year amounted to £3,801, and, with the balance brought forward from the previous year (£669), we are left with a sum available for distribution of £9,471. An interim dividend at the rate of 5 per cent, free of income-tax, was paid in September last, absorbing £2,050, and dividends on the seven per cent, preference shares have also been paid, amounting to £630. It is now proposed to pay a final dividend on the ordinary shares of 10 per cent, free of income-tax, making 15 per cent for the year, which will absorb £1,101. We then propose to add £1,000 to the reserve fund, raising it to £6,000, and

to write off for depreciation on buildings and machinery £838, which is about 10 per cent of the valuation of the buildings and machinery belonging to the company, as valued by our Ceylon manager, Mr. Kerr. The total tea realised during last year exceeds the estimate by 7,049 lb., which is very satisfactory. Then, in addition to our own teas, you will note that we have made a large amount of teas for other people, which is a very paying business. We have manufactured 220,743 lb. for others. Then, as regards the result of the yield per acre, during last year the average was 433 lb., which shows a steady advance over the previous year. In 1892 the average yield per acre was 336 lb.; in 1893, 381 lb.; in 1894 407 lb.; and now, as I told you, it is 433 lb. I told you on a previous occasion that the average would probably go up to 450 lb. per acre, and I think very likely it will; but we do not think it would be desirable to look to exceeding that, for I think that is quite as much as the bush can carry. The average price realised in London was a fraction lower than in 1894; but, still, taking the prices of Ceylon tea generally, I think our company stands as well as any other in this respect. On this occasion we have again to welcome our Ceylon manager, Mr. Kerr, who will be very happy to give you any information you may care to ask of him. The acreage of the company's estates remains the same. You will be asked by and by to record your appreciation of the services of both the London and Ceylon staffs, re-elect a director, and also our auditor. The resolution I have to propose is: "That the report and accounts, as now submitted, be adopted, and that a dividend of 10 per cent, (free of income-tax) be paid on and after this date." (Applause.)

Mr. Donald Andrew seconded the motion, and congratulated the shareholders on the continued good position of the company.

Replying to Captain Grant, the Chairman said all the buildings and machinery had been revalued and reinsured. Whenever any additions were made the board was careful to have them insured. The income from the reserve fund was included in the item for interest in the profit and loss account. There was still some labour trouble in Ceylon, but things were no worse in that respect than they were last year. He thought they ought to thank the Ceylon press for the manner in which they directed attention to the question of labour supply. The securities which were purchased with the reserve fund cost the company £4,992, and they were to-day valued at rather over £5,277.

The motion was then unanimously re-carried.

Mr. R. W. Forbes proposed the re-election of Mr. Donald Andrew to his seat on the board, which was seconded by the Chairman, and carried, and, on the motion of Mr. Sanderson, seconded by Mr. Menzell, Mr. James B. Laurie was re-elected the auditor.

The Chairman moved a vote of thanks to the Ceylon and London staffs, and poked in high terms of Mr. Kerr's management. He read a letter from a shareholder of the company residing at Ceylon, and who, he said, was well-known out there, referring in warm terms of praise to the management of the estates under Mr. Kerr, and their general condition. The Chairman also alluded to the excellent management at the London office.

Mr. R. W. Forbes seconded the motion, which was carried unanimously.

Mr. David Kerr, in acknowledging the compliment on his own behalf and that of the superintendents in Ceylon, said he could confidently say that all who were working for the company in Ceylon had the interests of the company very much at heart, and were very proud to see it well to the front. They all did everything they possibly could to get the best results out of the estates, and it was very gratifying to them to find that their efforts met with approbation on this side. While in this thankful frame of mind he felt he should like to refer to two debts of gratitude which he entertained. The first was to their directors for the very kindly and thoughtful manner in which they had treated them all in Ceylon, and also for the strong support and encouragement which they had given him personally, as manager, in all the years they had been working. The second debt of gratitude was to their

worthy secretaries for the courteous way in which they conducted all the correspondence. He was proud to say that during the whole existence of the company, there had never been one hitch between the London office and the company's representatives in Ceylon, and he hoped such a state of things might long continue. (Applause). He attributed this very much to the fact that they had as their managing director a gentleman who had a thorough knowledge of planting and of planters themselves, which was a very great point indeed. Shareholders would wish to hear a few remarks from him about the estates. All he could say was in corroboration of what the managing director had already stated, and they had a tangible proof today of the high value of those estates. As regarded order and condition, they were certainly second to none in Ceylon, and he thought there were very few estates which, on the whole, came up to them. The bushes were in perfect health, the estates were free from weeds, and the general cultivation was well up to date. They had machinery which was quite up to the present time, and capable of manufacturing not only their own leaf, but also of taking in a considerable quantity of leaf beyond what they were likely to produce on their own estate. Another point of satisfaction in connection with the machinery, was the splendid motive power they had. As a rule, in their factories they were fortunate in having powerful motors—turbines mostly—driven by water, and anyone who knew anything about such machinery would understand what a boon this was in keeping down expenditure. No money had been spared in putting the estates into a condition of thorough efficiency. With regard to cultivation by manuring, their object all along had been to help the trees, and not overdrive them by putting more manure into the ground than they thought sufficient for the health of the trees. Had they put more no doubt they could have given a larger return of leaf than they had; but they had thought it unadvisable to do so. Referring to the progress that the company had made in acreage since it started seven years ago, he stated that although they had increased somewhat, he regretted they had not done so to a larger extent. He found that in 1889 they had a total acreage of 1,531 acres, which at the present moment had been increased by over 400 acres, bringing the total up to 1,933 acres. When they "topped" that and came well into thousands he should be better pleased. As regarded tea, they started with an acreage of 1,401 acres, which he was glad to say had been brought up to 1,722 acres, including the new clearing which was now being planted. Of the tea planted in the last few years, one of the clearings, amounting to 83 acres, had come into bearing this year, and the remaining young tea would come into partial bearing next year. As to the crops in 1889 they started with an average per acre of about 228 lb. They had gone on increasing until at the close of last year they had a crop of 668,000 lb. of made tea, or 433 lb. per acre, being about 7,000 lb. over the estimate. That increase, he felt sure, was not only due to manuring, but also to the new clearings coming into bearing. The average would be increased during the year on which they had now entered, and would go on improving for the next few years. (Applause.)

Mr. J. Ferguson moved:—"That a cordial vote of thanks be given to Mr. H. L. Forbes, Chairman and managing director, and to his co-directors, for their able conduct of the Company's business." He had known their Chairman from his first day in Ceylon, and his career as a hard-working, intelligent, straightforward planter—first as superintendent, and afterwards as managing proprietor, of his family's plantations—afforded an example which it would be well to keep before succeeding generations of young planters. Mr. Forbes was well-known as an ardent cricketer and golfer; but he never allowed recreation to interfere with estate duties. Then, in the dark days of coffee depression in Ceylon Mr. Forbes never lost heart; but even invested fresh capital at a time when most men were clearing out of the island. On the plantations thus formed, after being turned into tea, rose the Scottish Ceylon Company, and he need

not tell the shareholders how well its affairs had been looked after by their managing director and his colleagues, and how well they deserved this cordial vote of thanks. (Applause.)

Mr. George Todd seconded the motion, which was carried unanimously, and the proceedings then closed. —*Financial News*, May 14.

NOTES FROM THE METROPOLIS.

OUTH KENSINGTON, May 15.

I need say little here about the Society of Arts meeting on

"TEA IN DARJEELING"—

having so fully dealt with the paper, separately. But I may say that amongst 70 or 80 presents, I only saw one Ceylon man, Mr. J. Macintosh-Smith of Caledonia, Dimbula (he left early, if I am right); but there was a number of Darjiling and North India planters besides Mr. Hancock, Mr. Ernest Tye and other "tea" men. Sir Richard Temple—looking uglier than ever!—proved a genial Chairman; the paper deserved all the credit given to it, but was badly delivered, Mr. Christian being nervous and hurried. The slide illustrations were, however, very good—of the scenery, tea gardens, buildings, machinery, coolies, bazaar, railway line, &c. The full discussion will follow in the Society's journal; but I may mention that Sir Stuart Bayley—tall and grey—and Sir Chas. Elliott—shorter, broader and almost white-haired, but very alert—both spoke well and appreciatively. Mr. Christian had one Ceylon slide of tea withering and an old Darjiling planter made some fun by calling on the lecturer to disavow the starved-looking creature shown on the floor being a Darjiling cooly—he could only belong to Ceylon. (He was in reality, as I told the sceptic, only a Tamil boy and not a man; for he ought to come and see what sleek, well-formed coolies Ceylon had to show!)

THE SCOTTISH CEYLON TEA COMPANY'S

annual meeting is fully reported in the financial papers, and both the Managing Director (Mr. H. L. Forbes) and Ceylon Manager (Mr. David Kerr) met with a cordial welcome from the shareholders present, who included Messrs. Jas. Grant, Dod, Sanderson, Keith, Arbutnot, Anderson, Geo. Todd, formerly of the Royal College, Colombo. Mr. Todd retains his position in connection with the Scottish Educational Department at Whitehall, and though older-looking like all of us, is still hale and hearty, with a warm corner for Ceylon.

I was glad to learn during a visit to the office of Messrs. Gow, Wilson & Stanton that they are not at all afraid of the increased

TEA SHIPMENTS

from Ceylon, inasmuch as there is no Indian tea to compete at this time of year. They are only selling on two days in the week now. They showed me evidence of the tea making season so far being unfavourable in Northern India, *e.g.*, a card circulated in the City as follow:—

THE BRITISH ASSAM TEA COMPANY, LIMITED.

Summary of Telegram received today from Messrs. McLeod & Co., Calcutta.

Tea Manufactured to 30th ult. (1896) ..	82 Maunds.
„ „ to same period of last year (1895) ..	252 „
Decrease (in 1895) ..	170 „

Decrease on 1894 .. 209 „

D. M. STEWART, Secretary, 3, East India Avenue, E.C. London 6th May 1896.

If this continues, and the Indian tea estimate has to be cut down, Ceylon must have another prosperous year; but it is too early yet to say much.

An ex-Ceylon colonist interested in tea at home, remarking on a statement in your columns about the need of promoting the demand in Britain as well as in new markets, writes:—

"The enclosed cutting, and the last part of it, from *Overland Observer* of April 17th, page 392, hits off exactly what I have held for years, and the best way that I can think of to do this is to make a fresh crusade against our teas being sold with Indian. Little use trying to stop the sale of tea 'Indian and Ceylon.' The thing to do is to let the public know what is a pure Ceylon. All very well to peg away at new fields, but the U.K. must be our great outlet for years to come. And even in the U.K. you can have no idea how few people still know what a pure Ceylon tea is. Grocers and others won't give it them."

Messrs. Gov, Wilson & Stanton mentioned among other flourishing Ceylon Companies, the strong position taken up by the

EASTERN PRODUCE AND ESTATES CO.

whose £5 shares were now sold for £5 15s, and which was the subject of commendatory notice in *The Statist* the other day for its good management:—

A PROMISING INDUSTRIAL.—An industrial company that we consider has an excellent position, and which investors content with a comparatively low yield, in the reliance on better times in the not far off future, should give attention to the Eastern Produce and Estates Company, Limited, a tea company with estates in Ceylon. In respect of its area under cultivation it is first on the list of tea companies either in India or Ceylon. The issued share capital is £299,888, consequently it is of respectable size, and commands a free market, and there are Debentures in issue for £122,500. Only recently the Company, owing to its steady progress, was able to replace old Six per Cent Debentures, of which there were about £150,000 a few months ago, with Four-and-a-Half per Cents. The estates owned by the Company cover an area of 16,630 acres; 10,337 acres are under tea cultivation, and on 9,000 acres the plants are four years old. The yield of tea in 1895 was 3,276,000 lb., and the estimated yield for 1896 is 3,458,000 lb. Then, there is not far short of 1,000 acres under cocoa, coffee, and cardamoms, and the balance of land is uncultivated or forest grass at present.

For 1895, after covering Debenture interest, retiring £7,500 nominal of new issue of Debentures by drawings, and setting aside £5,000 addition to the reserve fund, already existent, the dividend on the Ordinary was at the rate of 5 per cent for the year, leaving the substantial balance of £10,182 to be carried forward, equal to 3½ per cent upon the Ordinary capital. The shares are quoted about 5½—¾, giving a yield of nearly 4½ per cent on the dividend actually paid for 1895; and now the area of land under tea is thoroughly established the outlook is for larger results year by year.

I was wrong, too, by the way, the other day in supposing that "the Ceylon and Oriental" was the only one with debentures at 4½ per cent. The Eastern Produce and Estates Co. is in the same happy position of having 4½ per cent debentures.

PLANTING IN PERAK.

From the annual report on the Kuala Kangsar District for 1895, published in the *Perak Government Gazette* of May 22, we quote the following extracts:—

There are now 13,107 acres in the district leased out for coffee and pepper planting. Of this area about 1,200 acres have been already opened in coffee and 60 acres in pepper,

To really open up this district as it should be both in the direction of the Bruas, on the south, Lasah, on the north and east, and Piah Lintah, on the west, at least two more European Assistants are necessary. I have every hope in seeing, in the next year or so, several more estates opened in coffee. Sir Graeme Elphinstone is desirous of selecting four more estates of 500 acres each, and I have little doubt that several more blocks will be applied for. An experiment that has been tried on Waterloo estates has answered very well. Here you will find 150 Chinese working at weeding the soil, handling the trees and picking the berries better, according to Sir Graeme, than any Tamil. These men are a very poor stamp of coolie, being those that cannot work in the mines, and are as a rule old gaol birds and pauper patients from the State hospitals. If really good men, of whom I am informed there are plenty ready and willing to come, were got down from China, it would certainly pay planters to give them equal pay with the ragamuffin set now doing such excellent work on Waterloo. Kuala Kangsar is not in a tin district; although there is tin in it, it is very pockety. I would earnestly beg the Government by everything in its power to push on planting in every form. There are acres and acres of padi land that only want levels to be taken for the natives to make the requisite *tali ayers* and *ampangs*, with slight help, in most cases, from Government; the enhanced quit-rent for which would repay the Government within three years. There are thousands of acres of land, the soil of which is quite equal to Kamuning or Waterloo estates, from the road level up to 1,200 feet, covered with splendid timber, easy of access, only waiting to be taken up. The roads are first class and with the railway at Chumor by the middle of 1896 the cartage from Kuala Kangsar itself by road will only be 22 miles, and from Kamuning and the land in its vicinity, only 10 miles. Putting down \$200 per acre as the cost of opening up the first 150, and \$80 per acre for every subsequent 100 acres, per annum, until 500 is planted up with coffee coming into full bearing within four years and yielding only five pikuls per acre at \$40 per pikul, it does not take much calculating to prove that, with average luck, after the sixth year the owner of an estate of 500 acres would be drawing a very fine income, on an outlay of £6,000.

From the Bataug Padang annual report for 1895, printed in the same paper, we extract as follows:—

One hundred and seventy-eight applications for new land in small areas, chiefly for coffee planting, were dealt with during the year.

Applications were also registered for 1,435 acres in large blocks for coffee and coconut planting.

The coffee in the district is generally looking and bearing well and I am certain that if we could only get a few planters to begin here there would be a great future before the district. Even in the short time that I have been here I have seen some magnificent land. Of course it is out of the way at present and wants opening up and if Government would undertake to make a cart-road, or even a bridle-path to begin with, provided a certain number of acres in any particular locality were taken up, I feel sure that planters would come in. If a bridle-path were made in the first instance and it was found necessary afterwards to turn it into a cart-road to deal with the traffic I see no reason why the Ceylon system of grant-in-aid roads should not be instituted. This, as far as I understand it, means that Government and the planters benefited pay half the cost of the upkeep each.

I cannot say that I am altogether in favour of giving out small areas to Malays for coffee, they will not work it properly, they allow weeds to grow up all over the land to the detriment of any neighbouring estate and if any disease appears the weakened coffee is a nursery for it, whence it spreads all over the State. Land has been given out near the railway station, which will, I hope, have the effect, when it is planted, of lessening the fever which is so prevalent in that part of the district.

TEA IN DARJILING—AND THE SCOPE FOR
PRODUCING THE FINEST TEAS IN
INDIA AND CEYLON.

The special object with which we made it our business to be present at a meeting of the Indian Section of the Society of Arts on May 14th, to hear Mr. S. W. Christison's paper on "Tea Planting in Darjiling," was to learn how far an increased production of fine teas might be anticipated in that quarter. The result was, we think, eminently satisfactory. The paper itself was a very full, instructive one, and exceedingly well-illustrated by lime-light views. But there was a great deal, of course, with no special bearing on the important question of future development. Mr. Christison, however, showed a map of the Darjiling district, with the tea gardens dotted over it; also of the adjacent district of Daling, in which only three plantations had been opened, and which he (the lecturer)—a plain, practical Scot of very long experience—pronounced unfit for tea; and thirdly of "the Dooars" at the foot of the hills, which are now being freely entered on and largely opened up, but which cannot be deemed a "fine tea district." In the course of his paper—an early copy of which is sent you for republication—Mr. Christison mentioned that the Government returns show 329 square miles in Darjiling as "grants for tea cultivation," or one-fourth of the whole district; but one-thirteenth, or $7\frac{1}{2}$ per cent, is actually bearing tea so far. In the Daling hill district (which properly may be coupled with the Dooars) only 1,200 acres have been opened in tea, so unsuitable are the soil and country generally. In Darjiling proper, there are now 180 gardens with about 55,000 acres planted and giving employment to 70,000 natives, "excluding children and other non-workers." The 1895 crop from this acreage equalled 10,771,117 lb. Among other novel experiences mentioned by the lecturer were the fact that often the steeper—extremely steep—ground grows the better tea, due to natives having frequently used the gentle slopes; and also that their sturdy hillmen capable of carrying a box of tea over 120 lb. weight up 2,000 and sometimes 3,500 feet of their climbing from garden to railway, gave in, fatigued after half-a-mile of *flat* walking! From childhood in that steep broken country, the muscles for climbing up and down alone are developed. Mr. Christison does not consider the question of manuring a pressing one in Darjiling; for, there, not more than 12 cwt. of green leaf per acre is taken from the soil annually on an average (or 336 lb. made tea per acre)—rather different from nearly 40 cwt. of leaf sometimes gathered on Mariawatte for instance. But the lecturer said very truly that the Darjiling tea crop is neither heavy nor exhausting, and nitrogen is freely returned to the soil in the rain in tropical and sub-tropical lands. All this is equally true as to crop (and rains, &c.) in the higher districts of Ceylon with their fine tea production.

Mr. Christison had a good deal to say about transport, and also on buildings and machinery—several allusions being made to Ceylon—and again on tea preparation, especially the fermentation or "oxidation" in which he evidently thinks, as in regard to preparation generally, there is room for experiments and improvement. The fine quality of Darjiling teas, he considered to depend on the soil, vigour of the bushes, variety of plant, elevation, and season or weather; but also on unremitting care in pre-

paration. He considers "the chemistry of tea,"—notwithstanding the valuable efforts of Mr. Kelway Bamber and others—to be "practically an unexplored field of investigation." He considers pure Assam or a high-class Hybrid as not suited to give the true Darjiling flavour in the tea—a blend from China and Hybrid plants has proved best at that high elevation. Mr. Christison had much to say about "labour"—a growing difficulty in Darjiling as elsewhere. He spoke in the highest way of the Nepalese as workmen; but the supply of men is falling off, owing to recruiting for Police and Government transport purposes. The wages are $5\frac{1}{2}$ to $6\frac{1}{2}$ rupees a month for men, $4\frac{1}{2}$ to 5 for women, and 3 rupees for boys, and on this—particularly with helps from extra tasks—money is saved and the coolies live with great comfort.

In the discussion that followed—three past Lient.-Governors of Bengal—Sir R. Temple (Chairman), Sir Stuart Bayley and Sir Charles Elliott—all bore testimony to the great importance of the Darjiling Tea Industry in developing the country, benefiting the natives and aiding the Government; and in respect of "labour," it was shown that, officially, great pains were taken not to interfere with the planters. But the Nepalese immigrants were naturally growing more enterprising, and found that even better wages could be got by going further into India. Above all, the officials congratulated the Darjiling employers on not being hampered by a Labour Law, and warned them not to ask for it! The course of the Assam Labour system was "the middlemen" who took care that each cooly sent there cost R100 a head, whereas the Emigration Agents for the Colonies got the same coolies to Calcutta, ready to ship at an outlay of about 15 rupees a head! The difference did not benefit the cooly or the Assam planter; but went into the pockets of the middlemen. In respect of tea extension, Sir Charles Elliott gave it as his opinion that not much could be added to the area under tea in Darjiling, although individual planters might add 50 to 100 acres now and then. It was on this point we specially wanted to get information; and so, on being called on by the Chairman during the discussion, we ventured to point out that the 55,000 acres now cultivated (giving 10 million odd lb. per annum) only represented a small proportion of the land actually in private hands; for, Mr. Christison had said the grants to gardens equalled 329 square miles or say 210,000 acres. True, Sir Charles Elliott had indicated that planters might add 50 to 100 acres to their tea gardens; but if this were done at an average by 100 (out of 180) gardens and averaging 50 acres each, we should get 5,000 acres a year. There was also the question as to whether among large forest reserves mentioned by Mr. Christison, there was not good land suited for tea which might yet be granted for gardens. In reply, Mr. Christison gave it as his opinion that the present output of Darjiling tea—10 millions—was not likely, at any rate for some years, to be materially increased. And in private conversation with him after the lecture, we gathered that "labour" was really one great difficulty in the way of extension, while, also, as a matter of fact, all the best land in the grants had already been utilised. But, Mr. Christison was equally frank in saying that there was some very fine land in the Government reserves and neighbourhood of Darjiling, which, with a little official trouble, might readily be made available for tea; and, if so, would be quickly taken up and opened. For the present, however, we

gathered that there is no prospect of Darjiling increasing its fine supply of fine teas to the London market.

Talking after the Scottish Ceylon meeting with Mr. Donald Andrew—who has had a prolonged experience in Southern India—we found he quite agreed that the area in the Nilgiris district for fine teas could not well be largely extended nor could much be looked for in the higher portions of the Wynnad, Oucherlony Valley, etc., although in the rest of these districts, no doubt, there is scope for a very considerable development of tea cultivation. Contrary, therefore, to the opinion recently expressed by Sir John Grimlinton, we have arrived at the conclusion that there is not much fear of any special increase in India of the production of *fine teas* calculated to compete with the fine high-grown teas in Ceylon, which distinguish a great part of Dimbula, Dikoya, Maskeliya, Maturata, Ramboda, Udapussellawa, New Galway, Haputale West, and the region still higher up. This is an important matter; but at the same time planters, in the region specified, quite understand that if they are to keep up the reputation and prices of their teas, special care and attention must be given to cultivation, plucking and preparation, and they must aim at “quality” rather than “quantity,” as Mr. Hancock (of the well-known Mincing Lane Broking House) well reminded us at the Society of Arts meeting. J.F.

COFFEE IN CEYLON AND AFRICA.—In the *Bombay Gazette Budget* we read:—However well coffee planters in Ceylon may have succeeded in the last year or two in overcoming the leaf-disease that so completely changed the economic conditions prevailing in the Island twenty years ago, there is no likelihood whatever of coffee taking its old place as the chief economic product. Ceylon tea has so well established itself in the European markets, and its cultivation is so free from the uncertainties attending coffee planting, that the colonists are not likely to return to the old love that played them so falsely in the past. The fragrant berry seems to have a much better chance before it in British Central Africa, where its production is increasing by leaps and bounds. The single plant which was taken out to Nyassaland a few years ago by a Scottish gardener is now the parent of many millions of trees, and it is estimated that this year no less than three hundred and twenty tons of coffee will be available for export. This estimate is contained in a report addressed to Sir H. H. Johnston by Mr. M. Master, the sub-commissioner in charge of the Blantyre district. It remains to be seen whether the industry will prove as profitable to those who have invested money and labour thereon, as was the case with the pioneers of coffee planting in Ceylon. At present, great difficulties stand in the way of the planters, foremost amongst them being the decrease in the available supply of local labour and the consequent rise in wages. The planter now has to pay no less than five shillings a month—or its equivalent—to his native “boy,” as against the two shillings a month which about a year ago was the local rate of wages in coffee plantations in Central Africa. Land, too, in the township of Blantyre has doubled or trebled in value during the past twelve months, and other economic changes are taking place which, so far as the immediate future is concerned do not augur well for the planters.

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed, during the week ending 16th May 1896, under the provisions of Act V of 1888.

AN IMPROVEMENT IN THE METHOD OF PACKING TEA.—No. 169 of 1896.—Henry Sabow, engineer, of Kurseong, in the district of Darjeeling, Bengal, for an improvement in the method of packing tea, to be called “H. Sabow’s patent vibrating tea packer.”

IMPROVEMENTS IN TEA LEAF-ROLLING MACHINES.—No. 172 of 1896.—Samuel Cleland Davidson, merchant of Sirocco Engineering Works, Belfast, Ireland, for improvements in tea leaf-rolling machines.

Specifications of the undermentioned inventions have been filed under the provisions of Act V of 1888.

IMPROVEMENTS IN OR CONNECTED WITH MACHINERY OR APPARATUS FOR DRYING TEA LEAF OR THE LIKE.—No. 108 of 1896.—William Jakson, engineer, of Thorn Grove, Mannofield, Aberdeen, North Britain, for improvements in or connected with machinery or apparatus for drying tea leaf or the like. (Filed 11th May 1896).—*Indian and Eastern Engineer*, May 30.

SHAN TEA SEED.

Whether the promising outlook that Indian tea has assumed since Easter will be sustained or not remains to be seen, but certainly there appears every prospect that for this year, at any rate, tea will maintain the profitable position it has occupied for the past two seasons. This will doubtless beget a fresh insistence on further extensions and consequently a corresponding demand for seed, and as no one in a position to plant will look at other than the best kind, there is likely to be a dearth of the favourite (so-called) Manipuri seed. True, many of the new gardens planted during the past decade have been put down with this, but, as we pointed out three years since, it by no means follows that the seed from these will produce seedlings of the same standard, for wherever thrown up plantations of the old kind of hybrids exist in the neighbourhood, hybridising must to a greater or less extent, take place, though, perhaps, for the next two or three years the deterioration may not be very apparent; still it is going on and in the natural order of things, will increase each successive season. It would be as well therefore if arrangements were made to ensure future supplies of seed as uncontaminated as possible.

Manipuri, itself, the Hukong Valley and the eastern ravines of the Naga Hills, in and around Swemi abutting on the valley of the Maglung, are capable of furnishing a large amount of pure seed, but cannot be expected to meet the whole demand, hence it would be as well if measures were taken during the rains to ascertain what quantity may be procurable from the Shan States, of which we heard so much a few weeks back. The Nagas of north-western Burma, unacquainted with the value of the tea plant, have destroyed whole tracts by their pernicious method of clearing by *burning*, or there would have been an unlimited supply derivable from the Hukong and its neighbourhood. But the Shans, though not actually cultivating tea, conserve it, though pruning pretty severely should still have no inconsiderable stocks in their valleys, and as the country is not an unhealthy one to travel in (even during the rains), there should be little difficulty in securing the whole crop. We could certainly depend upon the purity of this supply, and plantations established in Travancore, or, still better, the Andamans and Tenasserim, would furnish sufficiently isolated spots, to guard against contamination.

Much, of course, could be done to preserve from hybridisation, the recent additions to the Assam gardens if sufficient labour were available to pick off the blossom from the thrown up plantations in the autumn, or severely cut back the plants below the flowering point; but, on the whole, we incline to the opinion that the better plan would be the adoption of the isolated seed gardens we recommend.—*Indian Planters’ Gazette*, May 23.

COFFEE IN NORTH BORNEO.

Mr. Henry Walker writes to us:—I visited Mr. Edward Walker's estate in Morindu Bay on the 4th May. I was staying at Toritipan coffee estate belonging to the Borneo Coffee Company, when Mr. Walker came over to visit the manager, Mr. Schuck, and I was glad to have the opportunity of visiting a coffee estate opened by a Ceylon planter. We left Toritipan early in the morning and were accompanied to the estate landing place by the Messrs. Schuck who had supplied us with a good sailing boat (and four coolies) in which we dropped down the small creek which runs about a mile and a half to the sea, at the entrance into which stands the Toritipan village. We had a fair wind, and putting up the nipa-leaf sail we soon passed the police station at Tanjong Batu, where the contract steamer "Normanhurst" calls four times a month on her coasting trips, and by twelve o'clock we arrived at the mouth of the Menpakad river, which runs through Mr. Walker's estate. We landed at the Campong of Bajows, who are the fishermen of Borneo, and proceeded along a bridge track, and up the rising land on which the estate stands, and reached the bungalow in twenty minutes. I went down to the stream at once and found a pool in the shade of the jungle where I got a lovely bath, and then came back to breakfast. In the evening Mr. Walker took me through a part of the clearing to see the country at the back, low rolling hills with easy slopes, mostly covered with second growth, but within about a mile of the sea there is big jungle. The soil appeared to be similar to Toritipan, but not so rocky: indeed, I saw no rock except in the river. The soil is of a rich dark red or chocolate colour with a greasy feel when wet, but when dry it pulverizes and granulates in a most curious way, and, when a heavy rain comes on, it sinks into the ground at once, and there is little or no wash. A most suitable soil for coffee, as is now proved by the splendid trees at Toritipan. Mr. Walker has felled about 50 acres of small jungle and the ground is very clean, although the weeding has not yet been fairly taken in hand. A little clearing up and burning remains to be done. Holing has been commenced, ten feet apart, and the coffee nurseries are coming on nicely. Planting will probably be finished in July: indeed, a few plants are already out and look healthy. Mr. Walker finds it best to use small shingles for shade as done at Toritipan, and as the coolies can cut them at 70 cents a thousand the expense of shading is not great, especially as the shingles can be used again. So far Mr. Walker has had no trouble about getting labour. The Dusun villagers near the estate number about 500, and at Pingan Pingan, two and a half miles distant, the village contains 1,000 Dusuns who are willing to work at prices which give them about 16 cents a day. Mr. Walker tries to do everything by contract, which does away with the necessity of keeping hours to which the ordinary native objects. They work well but like to go to work and knock off at their own time. Mr. Walker tells me he expects to bring the coffee into bearing for 10 pounds sterling per acre. He pays \$2.25 per acre for felling, and for the clearing up, burning, holing and one weeding he gave out a small contract at \$5 the acre. Clearing up and burning depends on the kind of jungle; for holing the price is one cent for four holes and the weeding will be done for under one dollar per acre per month. At Toritipan the bungalow field is now weeded for 80 cents and there appears to be no reason to pay more after the weeding is well in hand. Mr. Walker's bungalow is 28' x 32', plank floor, kadjan walls and atap roof; it is well raised from the ground and later on a dining-room will be made below the present floor. The cost, so far, has been, including kitchens, under \$150. As regards food Mr. Walker tells me the chief, Serif Duya, kills cattle several times a month and always sends some meat for which Mr. Walker invariably pays. Fowls and ducks can always be bought, besides which there is already a capital poultry yard at the bungalow. I saw a good many villagers passing the bungalow on the path to the fishing village laden with vegetables, which include melons, sweet potatoes, yams, and beans. Fish is plentiful at three cents a pound. We called in at

one house and asked for water, which was presented in a glass and the woman who filled it wore a dirty jacket trimmed with a sort of lace. The house was little better than a birdcage, but as it was only intended to last for one padi crop, or at most two years, little trouble was expended on it, and the number of people living in it was astonishingly large for the space available. The people seemed well nourished and the children I saw were fat. The padi in the house was particularly good, and judging by the length of the straw I should say the crop must have been large, which one would expect from the richness of the soil.

Mr. Walker says he finds the place healthy. He has had fever, but he is looking very fit and has put on weight since last September when he came from Ceylon. Medicines are obtainable at the hospital in Kudat but at very high prices, and it is better to import supplies. Dr. Hoare of the London Borneo Tobacco Estates proposes to establish a convalescent hospital at Tanjong Batu which would serve for the estates generally, and such a scheme would doubtless be supported by this estate and by Toritipan as well as by the Lang Rom Tobacco estate.

Kudat is about fifteen miles distant across Morudu Bay, and the path to Pitas Tobacco Estate, where there is a doctor and four planters, is some ten miles (unmeasured) distant. I suppose, in Morudu Bay, and at Pitas, the number of Europeans is now about forty. Tobacco planting is, however, a close and engrossing pursuit, and except on pay days, which occur on the 1st and 16th of the month, the tobacco planter knows little cessation from work. I should mention, however, that they get a good deal of sport, as I know two who have killed over eighty deer in Morudu Bay, and one who killed many rhinoceros on the Kinabatangan. Of course, on the coffee estates Sunday is observed as a day of rest. Since he began to open here, Mr. Walker has killed eleven sambur deer and two kijangs, and along the coast there are lots of curlew. On the estate itself, and in the padi clearings round about, pigeons of several kinds are plentiful, and the Bay affords variety in boating. The path from Menpakad to Toritipan is fourteen miles long. Mr. Schuck has ridden it, but it was difficult work. As it passes through good soil for coffee. I expect to see more estates along the sides of the Bay, and the opportunities for social intercourse will then increase.

Having suffered severely from the strong winds which mark the monsoon in Ceylon, in days now long gone by, I should like to say that so far I have never seen any damage done to coffee by wind in North Borneo, nor do I think there is any part of the territory wind-blown, as is the case in Ceylon.

NOTES FROM THE METROPOLIS.

SOUTH KENSINGTON, May 8.

SIR JOHN MUIR AND DUMBULA VALLEY ESTATES.

The great news before the little Ceylon planting world in London during the past few days is that Sir John Muir, Bart.—in the matter of the Elgin and Belgravia estates transfer—has given way, as Mr. James Sinclair and his co-directors always said he would, supported by everybody on this side, who were at all cognisant with the facts of the case. No doubt, Sir John was not aware in Ceylon of all that had transpired here, and he was also, perhaps, the recipient of bad advice—at any rate, our contemporary was in stating so prominently and persistently that the sale was broken—that the transfer could not take place, and so on. You have had the answer to this before you ere now, for on Wednesday, May 6th, the Secretaries of the Sylhet Company wired to their attorney in Colombo to transfer Elgin and Belgravia on the terms agreed upon originally—so now everything must be smooth sailing. There can be no

question the Dimbula Valley Tea Company acquired those properties at a bargain, but that that should be a reason for repudiating the sale was a ridiculous idea, to say the very least. There is not an acre of poor soil on the whole group of this company—the properties are all high class and as one old Ceylon planter who owns shares put it,—“when the Dimbula Valley Company ceases to give handsome dividends, God help the Tea Enterprise in Ceylon!” In any case, the Company's first sale of tea a few days ago at over 1s average is a good augury; and clearly

MR. JAMES SINCLAIR

has every faith in it, as his not having taken a penny out of the sale of his places shows. Not only so, but I hear that his three sons are large shareholders and many personal friends besides. Mr. Sinclair's “bread and butter” must depend on the success of the Company; and if he had no other incentive than this the shareholders might rely on his leaving no stone unturned to make the Company a success.

CEYLON AND ORIENTAL ESTATES CO., LD.

The satisfactory report, which I sent you by last mail, was duly passed by the shareholders at the meeting yesterday of “The Ceylon and Oriental Estates Co., Ltd.” I was not able to be present; but a friend who was there sends me the following notes:—

“The chairman (Mr. H. C. Smith) had practically nothing to add, beyond what the report contains, except that the current year had begun well, and that the crops (tea) secured for January, February and March showed an increase over the like months in 1895 of about 25 per cent. After a few ordinary questions had been asked and answered the report and accounts were adopted; then followed the passing of the dividends, re-election of directors, and election of auditors, and the proceedings terminated with a vote of thanks to the superintendents and directors.”

TEA SHIPMENTS FROM CEYLON FOR MAY.

The heavy shipments of tea telegraphed as likely to be made from Colombo during May (10½ million lb.) may temporarily affect the market here; but the prospect for the year as a whole continues good, even in the face of the increased crops estimated for India and Ceylon.

MR. WELTON.

The gentleman who amended and seconded my proposal of thanks to the directors and officers of the Eastern Produce and Estates Co. was I find Mr. Welton, undoubtedly the well-known liquidator of the Oriental Bank, and it would be interesting if the opportunity presented itself to ask him when the long expected dividend is to be paid in which so many people are interested.

At a meeting in the city yesterday of the

IMPERIAL CEYLON TEA ESTATES CO.

—at which the decision was taken to complete the purchase of the Binoya estate—I had the pleasure of meeting Messrs. R. A. Bosanquet and G. E. Worthington, both looking very well, especially Mr. Bosanquet, who reported that he had so thoroughly recovered the use of his broken limb as to be able to ride a bicycle with comfort and advantage. I had afterwards just time to shake hands with the veteran Mr. John Tyn-dall who looked both hale and hearty and reported that that still older veteran, Mr. John Capper continued to be able to move about with ease. In the office of Messrs. Darley & Butler besides Mr. Theodore Stretch, a former merchant of Colombo, I met Mr. MacMartin and Mr. J. Mait-

land-Kirwan, and the latter is as hopeful as the promoters of the Acme Tea Chest, that his patent for tea packing boxes will yet become popular and freely used in Ceylon; it is making its way gradually in the meantime.

CEYLON TEA FOR AMERICA: COMPLAINTS AS TO QUALITY.

I was sorry to hear from more than one quarter that certain shipments of very poor Ceylon tea have been made to America, so indifferent indeed that in one case an American tea-dealer said that he felt inclined to throw it into the street rather than serve it to his customers. Whatever may be said about the custom of sending poor Ceylon teas to England or Australia, in the case of America to do so at the present time when we are trying to conquer the country for our teas is absolutely suicidal, if not wicked; and the Ceylon Planters' Association ought to offer a reward for the discovery of the slipper, who is doing his best in this way to undo the work of the Ceylon Tea Fund and discredit the colony. It is difficult enough to force on our good teas in America, but if the attempt is made to send trashy stuff across the Atlantic on account of cheapness, farewell to the hope that a striking advance can be made during the next few years. In this connection I have had confirmation of the extraordinary rates charged for advertising in the United States—far above anything known in England, and as a consequence, showing the much greater importance attached to, and the competition existing for, advertising among the commercial and trading folk over there. Mr. Mackenzie told me that the back cover of a popular magazine published in New York was let as high as £75 for one insertion of a page, advertisement. Well, now in England I do not think that half this amount is obtainable for the most popular of our periodicals. Cooper, Cooper & Co., the great tea-dealers, filled a whole page of the London *Times* the other day, equal in size, of course, to many periodical pages, but I do not suppose the cost was one-half that of the rate mentioned above.

MR. J. L. SHAND.

Mr. J. L. Shand is starting tomorrow, I hear, for Costa Rica on a mission which will occupy a couple of months, in connection with coffee-planting development, supported by a City Syndicate.

Some time ago I learned that there was a similar project in connection with the States of Colombia, for which Mr. A. H. Duncan might possibly be engaged to report on forestland, &c.: but this was a mistake, and Mr. Shand's is, I believe, the only mission.

DISADVANTAGES OF SAW SHADE.—A correspondent reminds us that shade of any kind is bad for tea, as the effect on flushing, as Bamber states, is decidedly prejudicial. The writer states that this is his own experience also both in Ceylon and South India for the last 15 years. Of course, where blight is so bad that tea won't flush at all, then the half loaf under shade is better than no bread in the open. He further states that he has found shade in tea draw a weak, spindly flush, which does not liquor well. This is of course absolutely true, but we are not aware that we ever recommended the planting of *Albizia stipulata*, or any other tree as shade for tea. What we advocate is the choice of this special tree when shelter-belts in or near tea are planted in lieu of either bluegums or grevillias. The litter, when cut down for fuel or thinning purposes, will greatly enrich the soil even without counting the beneficial effects of the root tubercles.—*Planting Opinion*, May 23.

THE HOME DUTIES ON TEA.

Evidently there is a strong party in the House of Commons that might be expected to support protectionist measures. The proposal, that while the present duty on tea should be retained against China and other foreign growths it should be annulled in the case of all British productions, is about as strong an instance of protectionist tendencies as could well be imagined. It can create no surprise that the Government refused to consider this proposition; but so long as it permits the present anomalous position here in Ceylon with regard to the inland grain taxation and the import duty on rice, so long must we regard it as content to strain at the gnat while swallowing the camel. For as regards the suggestion as to tea, its adoption would at least have favoured British subjects at the expense of the foreigner. As respects our rice and paddy taxes the injustice that exists is felt only by British subjects. But general opinion will be, we think, on the side of ministers in their refusal to consent to what was asked in the case of our staple. The planters of Ceylon and India are quite able to hold their own in the competition to which they are now exposed, without seeking for advantages which would be in opposition to the principle of Free Trade. As matters are as regards the import duties on tea, they have not only held their own, but have fairly beaten China out of the field. Whether the day may yet come that may, in the interests of British planters, demand a differential treatment in their favour, we cannot pretend to foresee. But, until it should arrive—if it ever do so—we conceive that there exists no desire to seek the advantage suggested. It is very certain, that, were once the door opened in the case of tea, there would be claims made of a similar nature for the protection of almost every other form of British production. We are by no means obstinately conservative as regards the principles of Free Trade. We cannot shut our eyes to the fact that Great Britain is severely handicapped by the refusal of foreign countries to grant reciprocity, and it is further open to argument at least as to whether some measure of protection might not be justifiably accorded in the interest of some of the agricultural industries of the mother country. But as regards tea it seems to us that we can afford to let well alone. It is very certain that, with present and prospective demands upon the Imperial revenue, the abolition of the duties upon British-grown tea must create a position of the gravest difficulty. And we agree too with the rebutting argument employed by the Minister who spoke against the proposal. The poorer classes in England are relieved altogether from any payment of direct taxation. But it is only fair that, in a degree and according to their capacity, these should contribute towards the expenditure by which they secure peace at home and protection abroad. It is only by taxation of some portion of the necessities of life consumed by such classes that this contribution can be obtained. The duty on tea—in itself not an absolute “necessary” of life—must be as little felt as any import upon these could be. If it were abolished in preference to the taxation upon other articles of import, it would probably be compulsory to tax some other article which would be more a “necessary” than tea is. We do not think the proposition made has been wisely considered. And what is more, we doubt if it has been put forward chiefly in the interest of the tea grower. There are numerous intermedi-

aries engaged in the tea trade who, we expect, would be the chief benefitters had such a proposition been adopted.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, May 14.

SEEDS (VARIOUS).—Of 33 packages Annatto-seed, none sold. For good bright Madras 5d per lb. would be accepted; West Indian was bought in at 5d per lb.

VARIOUS DRUGS.—Coca-leaves: No fine qualities were offered, although 60 bales were shown today. Brown Hnanoco were bought in at 1s 6d, and 1 bale of ordinary dull greyish leaves sold at 1s per lb. Twenty-one cses very dark broken East Indian cuttlefish-bone sold cheaply at 3d to 1½d per lb. Twenty-eight bags dark Cubebs, without stalk, were bought in at 35s per cwt.

OILS (ESSENTIAL).—Citronella oil is still declining; sales of this near at hand are said to have taken place at 1s 2d per lb., c. i. f. terms, while about eight tons in drums sold at the end of last week at 1s 3d per lb., c. i. f. London shipment, till end of September. Twelve drums Citronella oil (Schimmel's test) were bought in at 1s 4d per lb., while for 2 cases of Winter's brand 3d per oz. is asked

THE PASSING OF CINCHONIDIA.

The sudden demand during the past two weeks, which called for many thousand ounces of cinchonidia, revealed the fact, which was, without doubt, patent to close observers, that there was practically no stock on hand, and the question naturally arises, what is to be the outcome of the situation which has somewhat suddenly become manifest. There appears to be but one answer, and that is, the end of cinchonidia is at hand. It has seen its best days, and will soon be classed with the “has beens.” The salt cannot be said to have lost caste with the profession and the trade, but, on the contrary, it has doubtless steadily grown in favor ever since its usefulness was discovered, and so long as a supply was obtainable its cheapness, as compared with quinine, made a steady, although not very extensive demand for cinchonidia. The Peruvian and Ceylon barks contained it in sufficient quantities to make it worth the while of manufacturers to market it, but since the quinine makers became obliged to confine themselves to the use of the Java barks, the days of cinchonidia have been numbered. In the selection of varieties of barks for cultivation in Java, particular attention was paid to those which yielded the greatest proportion of quinine, owing to the natural preference and ready sale for it in quantities greatly in excess of any of the other alkaloids found in the cinchona barks of commerce. This preference for quinine was doubtless in great measure traceable to the fact that it was the first of the alkaloids discovered, hence appealed more strongly to the manufacturing chemist as a means of profit, providing it proved to be of therapeutic value. Its value having many years ago been satisfactorily proven, little attention was paid to its associate alkaloids until about the year 1874, when Howard & Son of London became convinced, from a series of experiments made by the English Government in India, that it possessed properties which made it almost as valuable as quinine, if not equal to it in some respects. They also learned that the first in value, of the cinchona alkaloids, was quinidia: then came quinine, cinchonidia and cinchonina, in this order. As the first-named was obtained in such small quantities, little attention was paid to it, but cinchonidia promised a profitable return on the slight expense attendant on the methods employed for isolating it and preparing it for the market. Within a very short time after the announcement of its therapeutic value, Powers & Weightman determined to begin a campaign of education with a view to making an outlet for their accumulation of stock, which had been going on for years. Like every other judicious manufacturing chemist, they had saved everything in their manufacturing processes, that might some day prove of value, with the result in this case that they had a stock of many

hundred thousand ounces. They realized that the only way to reach the desired end was through the medical profession. They, therefore, sent out travellers to call upon physicians, they published and distributed a large quantity of literature on the therapeutic value of the alkaloid, and spent thousands of dollars in postage, distributing at least 100,000 ounces, if not more, to the profession. In due season came their reward, and cinchonidia assumed its place in the ranks of the drugs of known value. With quinine selling at \$2.50 per ounce, they were very glad to dispose of cinchonidia at \$1.30 per ounce. With comparatively little use for it in Germany, the makers there were only too glad to dispose of their product to the United States, and thousands of ounces per annum were imported into this country.

In a few short years, or in 1877, quinine commenced to decline in price, owing partly to improved processes of manufacture, and naturally cinchonidia began to be affected. It had been sold at one-half the value of quinine. When it had reached twenty-five cents an ounce, the manufacturers thought it was unprofitable to them, nevertheless they continued to save it, and marketed many hundred thousand ounces at two and one-half cents per ounce in bulk. The lowest price it ever reached being, so far as we know, one and five-eighths cents per ounce.

With cheaper quinine came a decrease in the demand for cinchonidia from the profession, but a demand had sprung up from makers of patent medicines, which steadily increased and prevented an accumulation of stocks for any length of time. A certain prejudice had arisen in the minds of many persons against quinine, which presented an opportunity to many vendors of proprietary medicines that they were not slow to take advantage of, and many nostrums made their appearance as chill remedies "containing no quinine," and obtained a wide sale. It is these remedies which will be hard hit by the changed conditions, and doubtless the demand for quinine will be correspondingly increased.

Cinchonidia has to some extent been used to adulterate quinine, but probably not to the extent that is popularly supposed. The manufacturers of pills cannot be accused of using it, as each one keeps such a close watch on the products of the other as to preclude the possibility of any chances being taken. Cinchonidia pills are sold, however, being oftentimes prescribed. Indeed, some physicians prefer them, believing this alkaloid to be equal to quinine as an antiperiodic. Possibly it might have ranked with quinine in many other respects had not the impression been prevalent that a much larger dose than that of quinine was necessary in every case in order to produce the same effect. For years there has been a growing prejudice against large doses, and in favor of administering drugs in the most concentrated forms possible. Many physicians prefer cinchonidia. It has been found to produce a more perfect cinchonism hence a better lasting effect, but the large dose necessary to produce the desired effect has precluded the possibility of its extended use.

With the relegation of cinchonidia to the ranks of past favorites will go quinidia and cinchonina, for the same reason, leaving the field to quinine.—*Oil Paint and Drug Reporter*, New York, May 4.

BECHUANALAND AND ITS PLANTING POSSIBILITIES.

Mr. Prior Palmer, of Dotel Oya, Aranayaka, writes to a contemporary:—

"The best proof of whether there is anything in what Mr. Macleod says, is that when our expedition was nearly over, Government offered any of us 10,000 acres of land free for ever; provisions, rifle, and ammunition for two years, also a horse, on condition that we would be liable to be called out for service at any time. Now, to my knowledge, not one took up the grant. I saw a good deal of the country, and, with the exception of a few cases, where there

was some heavy timber, chiefly mimosa trees, there was nothing but poor sandy soil that would take 20 acres to feed a cow, and the only means of watering cattle would be by making huge dams, which are filled by means of artesian wells, worked by wind-mills. These are generally near large stores, where everything can be brought from a needle to an anchor. What rivers and streams we saw, were quite dry to the naked eye; but by scraping down a foot or so you got good water, and at long distances there were deep pools, where we used to catch large fish. As to growing coffee, I saw no land for that, and where is the rain? There winter is a hot sun in the middle of the day, with hard frost at night. I have often seen six men lying together, so as to get them six blankets to help for warmth, and in the morning their moustaches and whiskers were stiff with hoar frost.

That is a fine place for coffee! I was shewn one coffee tree near a Boer's house, and it looked very well, and had a good crop; but it was watered every day. I should think that, if Mr. Macleod happens to take any of my countrymen out to farm there, he will get a dose of mercury for his trouble; and I would strongly advise any Ceylon man to be very careful to give it a wide berth, as far as I saw of the country. There was good shooting in parts of Bechnanaland, and that is pretty well played out since I was there, I hear. One of the great things they grow there is 'water melons' which, as you know, require a very dry climate and soil."

MR. OTANI ON TEA.

The *Oriental Economist* prints an interview that a representative had with Mr. Otani, the leading tea merchant of Yokohama, on the subject of the tea industry. Tea manufacture, Mr. Otani confesses, is still very imperfect, owing to the ignorance of Japanese manufacturers of foreign taste. Manufacturers in Japan have left the firing and packing of tea to resident merchants from the very outset, until, it has come about that tea, no matter how excellent in quality, has to undergo re-firing at Yokohama or Kobe. Japanese tea before it reaches the latter ports is in a half-manufactured state. There is no question that Japanese tea must be improved in quality, and that before long. A law issued by the United States Government in 1883 against the import of deteriorated tea, was a signal to tea men in Japan that urgent step must be taken to improve the quality of their output. In that year the principal tea manufacturers and merchants of Japan held an extraordinary general meeting at Kobe to discuss the best way of lifting the industry from its low level. The result of that meeting appeared next year in the form of the Tea-Guild Regulations. In 1887, a Government notification dealing with the matter in a comprehensive form was issued. These efforts of the tea men and the Government have acted more or less beneficially in Shizuoka, where marked improvement has been achieved. Points in which improvement is now needed are as follows:—(1) Drying; (2) preserving from impregnation with smoke; (3) steaming; (4) storage; (5) adulteration of new tea with old; (6) discontinuance of the practice of picking leaves grown after the 3rd picking; (7) discontinuing the manufacture of inferior kinds of tea. Inferior teas mentioned in the 7th clause are mostly manufactured in Mino and northern Ise, and are sold for mixing with tea of a superior

quality. This mixing impairs the reputation of Japanese tea, and should be positively discontinued. Mr. Otani is not sanguine that Japanese merchants can for some time to come fire and pack teas for foreign export, seeing how much improvement is needed in the earlier stages. Nor could they hope to obtain the credit that is given to foreigners by their clients in the West, to which difficulty must be added the fact that they are very indifferent judges of Western taste.—*Japan Weekly Mail*, May 2.

EUCALYPTUS.

The uses to which eucalyptus may be applied are many, some of which are but little known. It is a genus of trees of the natural order of Myrtaceae, and nearly all are indigenous to Australia, where they are called "gum trees" or "stringy bark trees," from their gummy or resinous products. But the tree mostly favored is *eucalyptus globulus*, and is now very familiar in Europe, having been of late years extensively cultivated, especially in the Mediterranean region. But it was not introduced there until the year 1856, when seeds were sent to Paris. Now it may be met with in various parts of England, as visitors to Cornwall can testify, for it is only in such a locality that it is able to grow without shelter. This tree has a specially high reputation as a hygienic agent in damp, unhealthy and malarious situations, and has, therefore, been planted in many parts of Europe. Its value has been alternately ascribed to the antiseptic action of its camphorlike odors and to its rapid growth, which sometimes exceeds ten feet per annum, and the consequent drainage of the soil through the enormous transpiration from the leaf surfaces.

Since the year 1870, when the tree was planted in its cloisters, the Monastery of St. Paolo a la tre Fontana has become habitable throughout the year, although situated in one of the most fever-stricken districts of the Roman Campagna. This property of destroying the miasma of marshy localities might be made use of in many districts to advantage and deserves the attention of those connected therewith, as it will thrive in any situation having a mean annual temperature not below 60 degrees F., and it will not endure a temperature of less than 27 degrees F. The leaves are the part mostly used in medicine, although they are not official in the British Pharmacopoeia.

The principal constituent of the leaves is a volatile oil, which may be readily obtained by distillation with water. When used for medicinal purposes the narrow leaves should be used, which are obtained from the full-grown tree, these being more efficacious than the broader ones, which are common to the younger plants. The fresh leaves are also more active than those that are dried. When fresh, they possess a bitter, pungent, camphoraceous taste, and the oil has a similar flavor and peculiar odour, more so than the leaves. When fresh, it has a yellow color, but it becomes brown and resembles resin by exposure to air; this appearance should serve as a test when purchasing. Oils obtained from other species are largely used in perfumery and for the making of varnishes, and for such purposes the color is not so much an object. As these essential oils are of daily increasing importance, their various characteristics should be observed and noted. The features of the chief are as follows:

The oil of *E. amygdalina*, is thin, pale yellow, pungent, lemon-like odour, specific gravity 0.881 at 15 degrees (59 degrees F.), becomes resinous in air. This oil is used in medicine, disinfecting and perfumery.

E. oleosa is thin fluid, pale yellow, mild, and has a turpentine flavor, mint-like odor; specific gravity 0.911.

E. goniocalyx, pale yellow color, pungent, penetrating, disagreeable odor, very unpleasant flavor: specific gravity 0.818. *E. globulus* already noted; this is the kind more frequently used medicinally.

E. citriodora.—This kind forms a good cosmetic. *E. dumosa* is an excellent kind for oil and spirit varnishes. The exudation from the bark and leaves

of this species is often gathered by the natives from the ground beneath the trees, on which it lies like hoar frost; this is used by them as food. *E. mannifera* is also a sweet exudation from the bark and leaves, and comes into commerce as eucalyptus manna and resembles genuine manna, which is non-purgative and is sold as a sweetmeat in many parts of Southern Europe, especially in Sicily and Calabria.

There are many other kinds of eucalyptus which find their way into the market, but those named are the more important.

The properties of the leaves depend upon the volatile oil, some one or other of the alkaloids of cinchona barks, but experiments have gone to show that no such quality exists to any appreciable degree. The leaves have been largely used in the treatment of intermittent fever, especially in Australia, where they have long had a popular reputation. They have also been used as a stimulant and anti-spasmodic. The tincture and other preparations of the leaves have been found useful in bronchitis; and in the form of cigarettes the leaves have been smoked with good results, in cases of asthma, whooping cough and such like complaints. The leaves have also been used as a new method of dressing wounds in the place of lint. They are simply laid on the wounds, and it is said that their balsamic nature not only cures, but removes all unpleasant odor. An excellent disinfectant may be made from 1 to 4 ounces of oil to a bushel of deal sawdust. The oil is also useful in rheumatism, and can be employed for inhalation in bronchial and throat affection, one-half to one teaspoonful being added to half a pint of water. The bark is said to have similar properties to the leaves for many medicinal purposes. It is also useful for tanning and dyeing, and may be used for the manufacture of paper.

The timber of the eucalyptus generally is in demand, owing to its durability and the great power it possesses in resisting the attacks of insects and the influence of moisture. When first worked it is soft, but soon hardens, hence its great value. In Italy a liquor is made, and is in great request, while eucalyptus honey is said to contain the valuable characteristic of the tree.

It is, however, with the oil that we have the most to do, and care should be exercised in the purchase, as it is subject to adulteration, which is difficult to detect.

As a general characteristic it should be noted that the genuine article is either colorless or of a pale straw yellow, becoming darker on exposure, aromatic odor, a pungent, spicy taste, leaving a sensation of coldness in the mouth, neutral to litmus paper, sp. gr. averages nearly .900, and it is soluble in an equal weight of alcohol, but the oils of commerce vary somewhat as to their specific gravity, according to their botanical source; with this exception, the other characteristics may be relied upon.—*British and Colonial Druggist*.

SPRING VALLEY COFFEE CO., LD.

We call attention to the annual Report of the Directors of this good old "Coffee" Company, —one of the late Mr. John Brown's creations as a Limited Company for the leading Uva plantation some thirty-three years ago and which long had a career of great prosperity. Then came the dark days of "coffee" and the "Spring Valley," like so many "coffee" Companies, fell to a rate below par that made them like a drug in the market. But it is pleasant to find that the wave of prosperity which "tea" has brought, is bringing nearly every old Ceylon Company once more to the front. The shares of the Eastern Estates and Produce Company, those of the Uva "Coffee" Company, and now those of the Spring Valley "Coffee" Company are all considerably above par, and the report in the present case shows that the last mentioned not only earned a 5 per cent dividend last year but carries forward £2,595 (or the equivalent of nearly 2 per cent) to enable tea planting exten-

sions to be carried out. The Company has now 1,361 acres under tea, and 538 acres still under coffee, besides 354 under fuel, forest patana, and waste. Mr. Alfred Brown has succeeded his father as the efficient Managing Director, Mr. Norman Stewart (one of Mr. John Brown's original partners in Glenalpine) being still on the board; and besides Mr. Leon Famin, we have now Mr. P. C. Oswald, so well-known and esteemed in Ceylon as Banker, but now of Messrs. Oswald and Nevett, London, merchants. Mr. J. Alee Roberts has long been the trusted Secretary of this Company and that of "Uva" and both have entered on a new era of prosperity—long may it continue. J. F.

THE OUVAH COFFEE COMPANY.

We also publish today the report of the directors of this Company which shows an excess of coffee secured over the estimate, and an average sale of 93/5 per cwt. against 99/8. The tea yield was slightly below the estimate, but it fetched 9/08d per lb. against 8/66d in 1894. Cocoa, however, sold at 48/9 against 60/4 for the preceding year. Net profits are returned as £11,068. A final dividend of 5 per cent is recommended, making 8 per cent for the year. Two sums of £1,000 each are to be written off cost of estate purchased and of the Badulla Tea Factory.

VARIOUS PLANTING NOTES.

THE CITRONELLA CASE.—We understand that the citronella-oil arbitration-case, which has been referred back by the Queen's Bench division to the two drug-brokers under, circumstances already reported, will be reconsidered by those gentlemen on Tuesday morning next.—*Chemist and Druggist*, May 9.

THE CULTIVATION OF COTTON IN EGYPT.—M. de Vilmorin, the well-known French seedsman, who has been travelling in Egypt the last two winters, has submitted a very interesting report on the cultivation of cotton in that country to the French Société Nationale d'Agriculture. The regular cultivation of it does not date beyond the first half of this century, and a great impulse was given to it by Mehemet Ali when the various inland canals were cut to regulate and equalise the annual overflow of the Nile. In order to show his colleagues how rapidly the growth of cotton had increased, M. de Vilmorin included in his report a table showing that the quantities exported to Liverpool had risen from 15,000 bales (of about 6½ cwt each) to 79,000 bales in 1850, to 109,000 in 1860, to 220,000 in 1870, and to 240,000 in 1880. The cotton crop is, M. de Vilmorin adds, of an average annual value of about 10,000,000l, and it extends over an area of more than 1,000,000 acres, with a tendency to extend each year. Nearly all the cotton grown in Egypt is cultivated as an annual plant, being sown in March and gathered in from September to December. M. de Vilmorin goes on to point out that careful studies as to the best methods of cultivation, the most desirable varieties to grow, and the most effectual means of destroying the enemies of the cotton plant are being conducted, and that the more enlightened growers are beginning to use plenty of artificial manure. The Egyptian cottons are, in M. de Vilmorin's opinion, merchandise *sui generis*, without any precise equivalent in the world, and likely to be in great request among the manufacturers of cotton goods. He points out, by way of conclusion, that although the development of cotton cultivation in Central Asia may deprive Egypt of a portion of its trade with Russia, there is little chance of the Turkestan cotton competing with that of Egypt in the markets of Western Europe.—*O. Mail*.

DR. TRIMEN'S RECENT REPORT.—A Bombay contemporary speaks in terms of praise of the annual report of the "Botanical Gardens under the Government of Ceylon" as dealing with questions of prime importance to the mercantile community of the island. Reference is then made to the figures dealing with the tea and coffee crops for the year.

CINNAMON.—The demand for cinnamon, says the *Home and Colonial Mail*, has ontstripped the supply within the last four months, and the position of the article is a healthy one with price 1d to 2d per lb. higher than they were in May, 1895. Cinnamon chips are likewise proportionately dearer, in spite of enlarged receipts and accumulating stocks.

LIGHTNING AND TREES.—Investigations made by Dr. Carl Müller, and reported in *Himmel und Erde*, show that lightning prefers to strike certain kinds of trees. Under the direction of the Lippe-Deimold Department of Forestry, statistics were gathered showing that in eleven years lightning struck fifty-six oaks, three or four pines, twenty firs, but not a single beech tree, although seven-tenths of the trees were beech. It would seem, then, that one is safer in a storm under a beech tree than under any other kind.

"BANANA FLOUR has been lately adopted in the manufacture of yeast. From its richness in starch and good flavour it is to be particularly suitable for such a purpose. The yeast is of a good colour, and has the requisite properties for keeping well." So writes a trade paper on this wholesome product. With regard to the banana being rich in starch, this is an error. As a matter of fact its freedom from starch renders it the most wholesome, easily digested, and nutritious fruit grown. Banana flour forms a splendid food product, and cannot be praised too highly.—*The Fruit Grower*, May 13.

NILGIRI PLANTERS AND THE LADYBIRD BEETLE.—At a meeting of the Nilgiri Planters' Association held on the 16th inst., at Ootacamund, it was decided to ask Government for assistance in procuring the lady-bird beetle from Australia or the Sandwich Islands, in which latter place it has been found very effective in destroying the scale bug on plantations. Mr. H. O. Newport, a member of the Lower Pulneys Association, laid a paper on the subject before the Nilgiri Planters' Association, and Mr. Stanes gave a very interesting account from personal experience of the good effected by these beetles in the Sandwich Islands.

SWAMP LAND FOR LIBERIAN.—The, to outsiders apparently inevitable collapse of the Klang boom in Selangor has brought some curious facts to notice in the local papers. One is, as far as we can understand, that even 20 or 30 feet bogs will in time form excellent plantations for Liberian coffee. Messrs. Christie and Forsythe are bitterly blamed by the local planters for throwing up their land when they learned it was practically useless to think of planting it up until the place had been thoroughly drained, but how many years this latter operation would take no one could tell them. Mr. Carey, one of the Selangor spokesmen and Honorary Secretary to the local P.A., says, in other words, the whole fiasco is due to the wretched conceit of Ceylon planters pretending to know the true value of Klang land better than even the resident planters. It may be also deplorable ignorance on our part, but we cannot for the life of us understand what else Messrs. Christie and Forsythe could well have done. The usual custom for plantors in districts outside Selangor is, we understand, to avoid wasting even ten years, if possible, before beginning to plant out in fresh forest land. *Autres pays, autres mœurs.*—*Planting Opinion*, May 23.

TEA IN CHINA.—The *Foochow Echo* says:—It is estimated that the value of the funds sent up-country for the purchase of the new season's tea is twenty lakhs of dollars. Included in this estimate is the value of the opium, lead, and piece-goods taken up by the teamen. The total is about the same as last year. We believe that the teamen have gone away well advised as to prospects, and with the depressing accounts of markets in London, Anstralia, North America, and Canada it certainly behoves them to be cautious about the prices they pay. They must be prepared for a lower scale to rule here, for assuredly foreign buyers cannot afford to run the risk of repeating their purchases at last season's rates.

THE WILD ORANGE AS A SUBSTITUTE FOR COFFEE.—It has been discovered that the fruit of the wild orange that grows on the Island of Beniuon has the aroma of the coffee berry. At it costs less to raise the wild orange than regular coffee, naturally the planters are substituting the former for the latter, and the Government even has ordered that a great part of the highlands on the island be reserved for the cultivation of the new bogus coffee. One bright gleam on the coffee horizon is in the fact that the new berry will be so cheap that it will, if its culture succeeds, drive out chicory, and as an adulterant it is said to be much less vile than that staple coffee cheapener.—*Fruit Grower*, May 13.

A VALUABLE PALM, SO-CALLED.—It is stated on the authority of *Modern Society*, that Miss Helen Gould, the gentle maiden-millionaire, who takes a great pride in her conservatories, "has just committed a little piece of personal extravagance in the purchase of a very rare palm, for which she paid the sum of £7,000. This palm is a magnificent specimen of "*Ravanala madagascariensis*!" (*Ravanala madagascariensis*), "and stands a little over 32 feet high, while it is nearly 100 years old." This species will be known to some under the name of *Urania speciosa*. It may not be generally known that the French term this palm "the travellers' tree," probably on account of the water which is stored up in the large cup-like sheaths of the leaf-stalks, and with which travellers are said to allay their thirst. The leaves are of gigantic size, somewhat like those of *Musa Ensete*, but arranged in two rows on opposite sides of the arboreal stem. [The plant is nearer to *Musa* than to palms. Ed.]—*Gardeners' Chronicle*, May, 9th.

GOVERNMENT CINCHONA PLANTATIONS.—In the U.P.A. papers published in this issue will be found the answer of Government to the Association's letter of September last regarding the contemplated extensions of the Government Cinchona Estates. Sir Arthur Havelock has not been fortunately advised in his treatment of the question. Putting Sir M. E. Grant Duff's promises on one side, it is surely the height of absurdity to maintain that because an industry is languishing, therefore it should receive no help. It is just because cinchona cultivation is in a bad way that it would be extremely grateful for help of the kind advocated. The price of the quinine now sold to the public allows of Government paying a substantial, though reasonable, rate to private growers, which would do a vast deal to keep them from abandoning their estates altogether. There is more than sufficient cinchona under cultivation in Travancore, Wynaad, and the Nilgiris to provide all bark required for many years to come, but without full and accurate statistics, it is of course hopeless to get Government to believe this. We should advise the U.P.A. to first obtain the necessary information as to the Government requirements for the next few years, and the amount that could be supplied by private plantations, before making another protest.—*Planting Opinion*, May 23.

BITTER ORANGES.—The naturalist Galesio was the first to trace the history of the orange, and the result of his careful researches he published in 1811 at Paris. According to this author the Arabs penetrating further into the interior of India than any foreign

nation had done before, discovered the orange family flourishing there, and held in high esteem by the natives. From this point the Arabs conveyed the sweet orange into Persia and Syria, and the bitter orange, now called the Seville, found its way into Arabia, Egypt, the North of Africa and Spain. From these points the orange travelled into other countries, notably China, and in this latter empire it so flourished and spread, that by-and-by it came to be a fiction, believed in by Europeans, that the orange was indigenous to China. Galesio shows, however that the so-called 'China Orange' is by no means a spontaneous production of that country, and his statement is further corroborated by the absence of any mention of this fruit in the exceedingly minute and circumstantial account given by Marco Polo of the productions of China. The sweet orange which the Arabs carried to Spain spread thence into Portugal, Sicily, St. Michael, the Mediterranean Islands, and the West Indies. In each and all of these various places has the difference in climate and soil produced varieties and changes in the characteristics of the original common stock. On the banks of the Rio Cedeno, in the midst of a great forest. Humboldt, to his amazement, came upon a broad belt of wild orange-trees laden with large, sweet, and most delicious fruit. "Surely, these must then be indigenous to the soil," he thought; but subsequent inquiry led to the discovery that these grand old trees had once formed a portion of extensive groves planted by the Indians from seeds obtained from their early Spanish visitors and conquerors. And to this same source does Florida owe her beautiful groves; only there, whether by the accident of soil or seed, the wild fruit is sour, not sweet. I am indebted for the above information to *Florida Fruits*, published in Louisville, U.S.A. W. Roupell, Harvey, Lodge, Roupell, Park, S.W.—*Gardeners' Chronicle*, May 9th.

THE GOVERNMENT OF SOUTH INDIA AND CINCHONA PLANTING:—The Indian mail has brought us to day a copy of a Government Order, in reply to a letter from the United Planters' Association of Southern India in September, 1895, submitting a resolution in which it was represented that the Government should obtain its bark from private owners instead of re-planting the existing plantations or purchasing new estates. It was incidentally stated that a promise that such a course should be followed was given by Sir M. E. Grant Duff. The order proceeds:—The Government has not been informed to what oral or written communication of Sir Monntstuart the Association refers, but presumes that reference is made to his reply to the Address presented in January 1882 by the members of the Nilgiri Planting and Mining Association. If this presumption is correct, the Government is unable to find in Sir Monntstuart Duff's utterance any distinct pledge or promise of the nature indicated by the Association. In any case, the Association over looks the fact that circumstances have materially altered since 1882. The Cinchona industry has languished for a considerable period and so far as the Government is aware no large areas have been planted up of late years by private owners. On the other hand it has been decided in the interest of the general population that Government should itself take active steps to secure the production of quinine at a cost sufficiently low to admit of its being widely disseminated in a suitable form amongst the poorer classes throughout the Presidency, and more especially in malarious tracts. Such dissemination would be impracticable if the Government merely purchased cinchona bark from private owners or bought quinine in the open market. In these circumstances, His Excellency in Council does not consider that the United Planters' Association has any reasonable ground for complaint and is able to accede to the request which it makes.

TRINIDAD ROYAL BOTANIC GARDENS.—The Bulletin of Miscellaneous Information for April has the following contents:—Water-Cress, Artichokes, Roses (Extract), Sisal Hemp, Notes on Manuring (Extract), Introduction of *Lodoicea Sechellarum*, Robbery and Murder, Circular Notes: No. 30—Sguar Cane Seeds, Water Measures and Rainfall (Extract), Jamaica Drift Fruit, Gordon's Coffee Machines, Chrysanthemums, Natural History Notes: No. 25—Corbeau in Error, No. 26—New Coccids, No. 27—Snake Bites (Extract), "Tabasheer."

INDIA AND CEYLON'S TEA CAMPAIGN.—The *Bombay Gazette*, referring to the prospect of Ceylon's losing India's help in lighting a common cause in America in consequence of the difficulty of finding the funds necessary for keeping a Commissioner in America, says that surely the best way of meeting that difficulty will be for the India and Ceylon Association to amalgamate as was proposed from Calcutta in the first instance.

INSECT ENEMIES OF TEA AND COFFEE.—We have received from the Indian Government No. 6 of Vol. III of "Indian Museum Notes," containing Miscellaneous Notes from the Entomological Section, by E. C. Cotes, Deputy Superintendent, Indian Museum. Figures are given of various insects of economic importance in India, among them being two enemies of coffee, *Sericea pruinosa*, Burm., and *Agrotis segetum*, Schiff.; a troublesome pest on cinchona and coffee bushes in Ceylon, *Cremastogaster dohrni*, Meyr.; and the green bug (*Lecanium viride*, Green) of Mr. E. E. Green.

COFFEE IN BRITISH NORTH BORNEO.—In sending us the interesting letter which appears in another column Mr. Henry Walker writes in a private note:—

I may honestly say that the difficulty I had experienced in advising young men to come here is passing away. We are proving at Taritipan that labour can be obtained locally, and Edward Walker is proving it here, and I feel that I can now conscientiously advise people to come here. Good soil, good coffee, good food, and good health with a fair chance of profit is what can be obtained; and I shall be glad to give information about our territory to anyone who is inclined to come here. I intend to make a short trip to the Native States, and then leave for Europe.

We are glad to hear of the brighter prospects of "New Ceylon."

RUBBER CULTIVATION IN CEYLON.—The *India Rubber World* of May 10, in quoting the letter addressed to us some months ago by Mr. C. Purcell Taylor, says:—The following communication in the *Tropical Agriculturist* (Colombo) may possibly serve to throw some light upon the slow progress made in rubber-culture generally. It will be remembered that Mr. Clements R. Markham, who was so largely instrumental in introducing rubber-culture into India, in an article contributed some time ago to the *India Rubber World*, mentioned more than once the "official apathy and indifference" shown toward the plantations even after they had been started, he evidently feeling that under more favorable management the Indian rubber experiment would have resulted more satisfactorily.

TEA IN MANCHESTER.—A London correspondent writes to us (*Manchester Guardian*, 2nd May):—"The position of the tea trade is deserving of notice at the present moment. Indian and Ceylon descriptions continue in request, as shown by the returns of duty payments, while the re-exports also continue on a satisfactory scale. The duty payments on Indian for the first ten months of the present season were on 101,076,652 lb., as compared with 91,333,861 lb., during the corresponding period of 1894-5, and on Ceylon tea 63,559,900 lb., as against 58,533,795 lb. As regards the re-exports from June 1st 1895, to March 31st, the total of Indian was 3,221,183 lb. and Ceylon 6,150,797 lb., or an increase of 224,286 lb. and

1,629,978 lb. respectively. Heavy sales have taken place this week and with the absence of supplies and a good demand the lots were cleared off rapidly under keen competition. The better qualities of Ceylon are scarce, and the lower qualities were bought at a further advance of $\frac{1}{4}$ d to $\frac{1}{2}$ d per pound above the prices obtained last week; while the rise in Indian teas is $\frac{1}{2}$ d to 1d per pound. There is every appearance of values being well maintained."

COCOA AND COFFEE.—For some years past successive Chancellors of the Exchequer have told us that the demand for cocoa is increasing, and that tea is driving coffee out of the market. Yet in face of a growing demand cocoa has cheapened, while the relatively high price of coffee is maintained, notwithstanding the decreased consumption. How is this to be accounted for? Our Consul at Quayaquil, Ecuador, supplies a partial explanation. Cocoa, he writes, has cheapened materially during the last few years owing to its extensive cultivation, and likewise to the fact that, although the demand has increased, it has not increased proportionately to the supply. The maximum selling price in 1892 was £5 5s per cwt, and the minimum in 1895 was only £2 18s. On the other hand, fair prices have ruled for coffee, and the consequence has been that "new plantations may be said to spring daily into existence." There is a good deal of mystery about the maintenance of the price of coffee in spite of a decreased demand and an increased output. We can only suppose that in the case of this commodity gold has depreciated considerably, and is still depreciating.—*Newcastle Chronicle*, May 8.

THE SILKWORM SUPERSEDED.—We notice that arrangements have been concluded for establishing a factory near Manchester at a cost of £30,000 for the manufacture of artificial silk fibre from wood pulp according to a process invented by Count Hilaire de Chardonnet and which has been in operation for two or three years at Besançon. Already, we read, dress fabrics made of wood silk are being sold in London as French novelties of the season, though their appearance differs from that of old-fashioned silks so little that ladies, it seems, have been buying them, and even shopkeepers selling them, without realising that they are artificial imitations, or that they could trace their lineage to the carpenter's shop instead of to the cocoon. The wood pulp is taken in the condition already familiar to the paper-maker. The silk-maker treats his share of the pulp with a mixture of nitric and sulphuric acids. The acids are squeezed out by hydraulic presses, and the condensed pulp cleansed in vats of water. Then it is treated with alcohol and ether. The practical effect is to convert the whole mass into something resembling a thick gum, which is then conducted into cylinders from which it is forced by pneumatic pressure into pipes from the sides of which project a great number of small glass tubes the apertures of which are so fine that a human hair could not be passed through them. These tubes are the Besançon silkworms, and it is from their fine orifices that the gum is pressed out in the shape of delicate filaments which have all the characteristics of silk. Eight to twelve such filaments are spun together to make a silk thread. When this has been produced it is woven like any other silk. Before it goes to the loom it passes through some processes that gives it an extraordinary degree of lustre. It will take dye even more readily than natural silk. "Now," says the *Times*, "that industrial ingenuity has shown that the silkworm can be supplanted by any sort of timber, there is a good prospect of distributing a good deal of this money among our own workers instead of sending it abroad."

Correspondence.

To the Editor.

ADVERTIZING CEYLON TEA IN AMERICA.

Kandy, 16th May 1896.

SIR,—From a large quantity of American advertisements of Ceylon tea which have arrived this week I forward one or two. You will notice that trade customs as well as orthography in Buffalo, N. Y. vary from those of Colombo!!

The advertisements of 'Salada' tea appear in every paper in North America in various forms, and the three large firms originally enlisted by Mr. Maekenzie continue their efforts. As he says, "their work has been the lever which enabled us to bring the American houses in."

Mr. Lipton is also bringing his energy and capital to bear in the U. S. A. Meanwhile, other countries are not being neglected; Mr. Rogivue has been placed in funds, in reply to his application for a special purpose; and a beginning has been made in Norway.—I am, &c.,

A. W. S. SACKVILLE.

(Exact Copy.)

John Ledger, Buffalo N.Y., April 2d, 1896.

B. Fischer & Co.

Dear Sirs,—I have paid C. D. Petrie in full for last shipment. Now on this other 4 chests I have ordered—try and do as well as you can on all of them—of cora the 2 chests of gren tea—I have conceidrebel trubbl with it on account of sor much fine dust in it. My customers don't detect it when I mix with black but when they get it clear—that is the time they com for me—I am a cash man and aught to have preference over long time men—Now some of your New York houses has sent me some verey fine samples of tea—withch proves out better than any I have got from you—and they garentee to duplicate there samples by the chest—but I do not want to change with you, if you will do as well—my partner has drawn out from mc and I will have to run it on my own account. I am giving a pound of tea with everey ton of coal I sell, 2 pounds on every livery that gos out, if they use tho horse well and not brak the buggy they got tho tea and if used hard get out be put if the Police Station and fined this is my sceam and I think it will work well when I get thrugh with the stock I haye on hand—I think it will want considerabel tea—my tea is all high price and I am mixer with yours. Send me good samples this time. Of coars I know nothing about tea but I may know or my pocket may know before I get through—but that will not be you funeral—that will be my look out, do what is right with me—and no more of my partner—tea I will have or he was my partner but is not now.—Yours respectfully,

CAPT. JOHN LEDGER.

THE KOLA IN AFRICA.

London, April 28.

SIR,—I think it will interest some of your readers to know that in certain parts of Africa the Kola grows with considerable luxuriance, but in place of the variety (which yields the bean) which divides into two equal parts, or, in other words, has only one division across the fruit, the variety found growing in this district and especially the Portuguese possessions, divides up into 5 or 6 divisions when the bean is bruised or when it is dried. This variety of Kola yields a sweet powder, and it is not appreciated by the natives in anything like the proportion of the Kola with the "equal divisions." So much is this the case, that the Europeans now settling in Portuguese Africa find that they are obliged to get seed of the true Kola (*Sterculia Acuminata*) and take it down to their estates. It is their intention to destroy all trees that they cau

find of the Kola not yielding the true variety. The Kola that breaks up when dried into several sections has been sent to the London market, and after being held in stock as dried Kola Nut for some length of time, has been sold at ruinous prices. This very much militates against the market price of Kola, because people are careless in stating the different sorts of varieties.

By this explanation I want to make it quite clear, that there are also other varieties of Kola which are much worse even than these sweet Kolas, which are known under the name of the "bitter kola" and have been fully described in my No. 8 "New Commercial Plants & Drugs."—Yours truly,

THO. CHRISTY.

SILK IN CEYLON.

DEAR SIR,—With reference to my letter of 13th inst., perhaps the following notes, pending publication of a small pamphlet which I hope to complete shortly, will be of interest to intending cultivators.

The castor-oil silkworm is easily reared, as the worms are of a hardy nature and spin their cocoons within a month. The eggs laid by the moths hatch out in a week or twelve days: the period depends on the temperature in which they are kept. The young worms should be fed at first on the smallest and most succulent leaves of the castor-oil plant, freshly gathered, and on larger and more mature leaves as they grow older. In 3 or 4 days they stop feeding and change their skins for the first time (this is called 'moulting'), and during these periods they should never be disturbed.

The worms as they continue to grow 'moult' 4 times, and after the 4th moult their appetite increases at an astonishing rate, so that the leaves must be given to them very frequently during the day, and enough given them late in the evening for food during the night. At the end of 18 days, or less, they will be ready to spin their cocoons, and should be put into inverted baskets. The cocoons are finished in 3 or 4 days, and the moths emerge within a week and, after pairing, lay their eggs, each female laying from 100 to 200.

The temperature in which my worms are being reared ranges between 80 and 90 degrees: the hotter the climate the more rapidly will the brood be completed.

Lizards, bats, birds, rats and spiders have to be guarded against, and for this reason the worms must be kept indoors, but they should have as much fresh air as possible and be kept clean, the withered leaves and stalks and *excreta* being removed from the tats daily.

This silkworm should be a decided success at any elevation below Nawalapitiya: in fact wherever the castor oil plant grows rapidly: it comes up as a weed in most kurakkan chenas.

I shall be glad to send you fuller details later on: in the meantime any information will be gladly given to intending sericulturists.—Yours faithfully,

B.

P.S.—Early application for cocoons or eggs is necessary, as the moths emerge and eggs hatch so quickly, and the worms cannot easily be sent by post.

PLANTING IN SUMATRA: LIBERIAN COFFEE; RUBBER AS SHADE; CUSCUS.

Soengei Karei Estate, Lobo Pekam, Sumatra,

May 7, 1896.

DEAR SIR,—Some few months ago, a correspondent in your columns recommended a certain rubber tree as shade for Liberian coffee. I have mislaid the paper, and should be obliged if you would tell me the *species* of rubber, and where I could get the seed.

Cuscus Tats.—Can any of your correspondents inform me where I can get these delicious aromatic tats for hanging round a verandah, and the probable cost of a tat say 9ft. by 10ft.?

The planting of Liberian coffee is going briskly ahead here; and during the last few weeks many hundreds of thousands of plants have been put out in this district (Serdang), while our old Ceylon friend Mr. Inch is going big licks in Deli.

There can be no doubt Serdang will hold its own in prices. A few months ago one estate sent a shipment to Singapore, which was so highly thought of, that it fetched one dollar per picul above the day's market rate. Another estate recently shipped to Havre a parcel which created such a *furor* that it was sold at \$61 per picul. "Such Liberian coffee had never been seen before," it was said.—Yours faithfully,
W. TURING MACKENZIE.

[The rubber referred to by "W. T. M." in his letter of Oct. 25, 1895, as suitable for shade for Liberian coffee, was the *Castilloa* variety. We believe that cuscus tats can be purchased in Colombo, or they can be procured from India, where they are largely used in the hot season.—ED. T.A.]

COCONUT CULTIVATION.

DEAR SIR,—“Young Planter” is I see exercised by what “they say”—that “grubs, worms and insects” bred in the cattle-manure applied to lagging coconut plants will destroy them. He may make his mind perfectly easy on the subject and go on with his manuring operations, as the only insect known to destroy coconut trees in Ceylon is the red beetle, and it is not bred in manure heaps. As to the age beyond which it is not safe to transplant coconut plants, he will find on page 6 of the book he has quoted, that in Jaffna a plantation was opened with plants 3 years in the nursery. I myself have put out as supplies, plants 3 and 4 years old. The nursery for these was made in a well drained swamp, the plants were taken up with a large ball of earth and placed in coconut leaf baskets to prevent the ball breaking up, and transported to their destination in carts. The advantages of putting out plants of this age as supplies are many and obvious. The veteran planter and authority on coconut cultivation Mr. Wright could say that he put out plants older than 3 and 4 years old and that they grew successfully.

Now as to the method of applying manure. Experience has satisfied me that it is more economical and effective to spread manure round the tree at some distance from the stem and dig it in, than to pack it in a trench cut round the tree. By the one system the manure is mixed up with the soil and becomes available to a large number of root points; by the other, the manure is in a mass and the ground occupied by it in a short while becomes a dense network of rootlets. The system of applying manure in a small area immediately round the stem of a tree is peculiarly native and cannot be too strongly condemned.

Agriculturists must understand that trees take up nutriment by the points of their roots or rather rootlets. By increasing the area in which manure is applied, we increase the root surface and the number of points that feed on the manure. This is of paramount importance in the case of products with a limited lease of life, as it involves the greatest benefit to the greatest number in the shortest time. But it is not of such importance in the case of perennials, as the feeding on the manure wherever applied becomes a matter of time, and the only question involved is one of good or bad husbandry. If you increase the area manured, you increase the area dug up and cultivated and permanently benefited, you increase the number and vigor of the roots, and as a consequence the vigor of the tree, and the last though not the least consideration is that you prevent the rootlets getting matted round the tree, which has such a pernicious after-effect on it. A matter of allied importance is the fineness of the particles of manure.

In my last communication, I dwelt on the importance of salt in coconut cultivation, and was a great deal disappointed that the subject was not pressed on the attention of Government editorially. I have been a consistent advocate of the use of salt in coconut cultivation for a long while, and was the means of its being pressed on the attention of Government directly. On that occasion the Government as a reply inquired what the probable quantity of salt was that was likely to be used in coconut cultivation, before it could decide the question as to its issue for this purpose at wholesale rates. The question was puerile, and the Government must have known as much when putting it. Who could say the probable present consumption of salt for the purpose of experiment, or the probable development of its use once it had passed that stage?

In my agitation for the issue of salt for agricultural purposes I was supported by Mr. Hoole of the School of Agriculture, whom I must take this opportunity of congratulating on his success at Bombay in Veterinary Surgery. He supported me with a few modern authorities on its use. I have since come across the authority of Johnson, who says:—“A mixture of salt and lime was recommended as a manure by the German chemist, Glauber, more than two centuries since. The mixture was most fit for dunging trees, and to be used instead of common beasts' dung.” It is also described as “the cheapest of all mixtures for the enrichment of poor and barren soil.” As here, so in England, “the considerable duties so long imposed on it, naturally prevented any extensive use of this fertilizer.” The Essex farmers are said to steep seed-wheat in water mixed with salt and of sufficient gravity to float an egg and then roll the salted seed in lime, both to prevent smut and to increase the vigour of the resulting plants. Mr. Hollingshead wrote in 1800: “Lime prepared for manure should be slacked with salt water, lime so slacked will have a double effect.” In 1804, of twenty-five manures used experimentally for potatoes, lime and salt was found superior to nineteen others.

The history of the use of salt as a manure is traced to biblical time. “If the salt has lost its savour, it is neither fit for the land nor fit for the dunghill.” An explanation is given of the puzzling expression of salt losing its savour. “There is found in Syria a peculiar kind of fossil or rock-salt, which in progress of time, by exposure to the air, loses almost entirely its taste, except in the very centre of the lumps.” “Cato 150 B. C. commends it for cattle, hay, straw, &c., as does Virgil. The early German farmers knew of its value for sheep. In 1570 Conrad Herebadius commends it as a certain prevention of murrain or rot.” Salt promotes the decomposition of animal and vegetable matter. 2. It destroys vermin and weeds which are converted into manure. 3. It is a plant food. 4. It is a stimulant. 5. It renders the soil more capable of absorbing the moisture of the atmosphere, of great importance in dry situations or seasons. The result of various experiments with salt in combination with other manure is given and uniformly points to better results.

“Now I come to treat of the mother of all manures, namely, salt. Take six bushels of salt, six bushels of lime and six bushels of dry ashes, mix them together, this is sufficient for an English acre.” “Take 32 bushels of lime and slack it with sea water, this quantity is sufficient for an acre of ground, and may be thrown over the land with a shovel or made into compost with forty loads of moss or earth. Its component parts are muriate and sulphate of lime, mineral alkali in an uncombined state, also muriate and carbonate of soda. There is one instance in which it was tried in comparison with 72 cart loads of soaper's waste and dung; and although this was an extraordinary dressing, yet that with the salt and lime manure was fully above the average of the field.”

We are advised to make a mixture of 2 of limo and one of salt and cover up the heap with sods for 2 or 3 months. The muriate of lime formed by the decomposition of the mixture is said to be one of the most moisture-loving substances known, and as such, it is said when applied to the land to help vegetation to overcome drought.—Yours &c. B.

THE DIMBULA VALLEY COMPANY'S ESTATES PURCHASES.

High Wycombe, May 8.

DEAR SIR,—I have noticed that the Ceylon papers have expressed somewhat free criticisms upon the "Dimbula Valley" Company's estates purchases, even down to the remarkable action of the Chairman of S. Sylhet Company, in retarding the completion of that Company, to sell Elgin and Belgravia on the terms agreed upon. For the information of the public, I may say that the sale is now completed upon the terms originally determined, and that the "Dimbula Valley" Company is in possession of all the estates contracted for when the Company was brought out. These are all exceptionally good and promising, and I believe the first sale resulted in a 1s average for Lippakelly tea. With good management and care, and with the high average price their produce obtains in the market, they possess a margin between cost of production and sale price, probably higher than any other large Tea Estates Company holding property in Ceylon.

WM. FORBES LAURIE.

THE WILD SILKS OF CEYLON.

Kandy, May 22.

DEAR SIR,—Considering how largely the uses of Tusser silk has extended of recent years, it is to be regretted that nothing has been done to develop the industry in this article in Ceylon. It is probably due in a great measure to the ignorance of the natives generally of the habits of the insects, the Sinhalese in this respect presenting a remarkable contrast to the natives in many parts of India.

There, in some districts the cocoons are regularly gathered from the jungle trees each season: in others the people have partially domesticated the worms, and their method of cultivation is briefly this. As soon as the eggs are hatched, the young worms are placed in little baskets of leaves and carried to such trees as they naturally feed on. The rearers camp at the edge of the jungle, and boys are employed to scare away birds. The rent of a silk 'field' in some districts is R3 for each full-grown man employed, and 3 men, on an average, take up and look after 10 acres. There are 2 broods, or more, in a year, according to the climate: the worms spin in about six weeks after they are hatched.

I am not sufficiently acquainted with the low-country to say whether we have in Ceylon any large tracts of jungle land where the Tusser is to be found in very large quantities: many of our Foresters should be able to afford information on this point. The insect is widely distributed at all elevations below 3,500 feet, but in the more populous districts chena and patena fires destroy large numbers of the worms and cocoons.

In the dyeing of Tusser silk, the varying shades of drab and brown have been found to present serious difficulties. The natives in India collect the cocoons from, or grow them on different species of trees, and by this system silk of uniform colour and quality cannot be produced. I believe it is possible, by feeding the worms on certain trees with which I propose to experiment, to obtain a silk not only of improved texture, but of a lighter colour, a point of special importance, and I shall be very glad to receive cocoons from anyone disposed to assist me in this way. Cocoons should be sent with a small branch of the tree on which they are found, and whenever pos-

sible the native name of the tree should be given. The trees on which the cocoons are most commonly met with are the kahata or 'patana oak,' the weralu, cashew, and cinnamon; but they may be found occasionally on many others. Pierced cocoons, from which the moths have emerged, will be of use for comparison, if sent with the leaves. The moth lays its eggs on the under side of the leaf. The worms are bright green, covered with tubercles, and grow to a length of 5 inches or more.

To show what can be done by careful management of silkworms, I am sending you specimens of cocoons of the castor-oil worm bred in Assam and a cocoon of the same species bred here.—Yours truly,
B.

COFFEE IN SUMATRA: A CORRECTION.— BAMBOO DOGCARTS.

O. K. Sumatra, May 23.

SIR,—I was in error in my last when I stated that the \$61 p. picul coffee was sold in Havre. I have just been told by the vendor that it was sold privately in Switzerland.

Can any of your correspondents give me the name of the firm or firms in India who make a remarkably light dogcart, with male-bamboo shafts, and a net underneath, suitable to hold "sâman" of any description?

I saw such a one in Singapore some years ago, but cannot find the name of the maker. I should be grateful for information through your column. The cart I allude to is an ideal planter's buggy, and runs light as the wind.

W. TURING MACKENZIE.

TICKS IN CATTLE.

June 13.

DEAR SIR,—*Lic* ticks in cattle.—I have always found a double handful of common salt dissolved in a bottle of coconut oil—well rubbed in—to free cattle from ticks. I have not tried phenyle, but feel sure it would answer well, as it does in the case of most kinds of vermin.—Yours truly,
F. W. GRAY.

A COFFEE CLEANING PATENT.—In the *Illustrated Official Journal* there is the following:—24,079. December 11, 1894. COFFEE. Lake, H. H., 45, Southampton Buildings, Middlesex. (Fraser, D. B.; 234, Central Park West, New York.) *Cleaning and sorting grain*, such as coffee, is carried out by feeding the coffee from a hopper on to the top sieve of a series of sieves mounted in a reciprocating frame actuated by cams on the shaft. The sieves are arranged across the frame in inclined planes alternating in the direction of their inclination and having a guide tray under each, so that whatever passes through one sieve is delivered to the top of the next. The shute leads away any refuse which does not pass through the first sieve, and shutes carry off whatever fails to pass through each particular sieve. The sorted coffee beans are received from these shutes, whilst any husks or light bodies are drawn upwards through the channels and deposited in the bins by the action of the exhaust fan. There are shutters for regulating the draught produced by the fan in each channel. The frame carrying the sieves is supported by elastic pieces and also is provided with rubber balls mounted on levers which are caused to strike the sieves whenever the rods strike the stops.

PLANTING AND PRODUCE.

THE ROYAL HORTICULTURAL SOCIETY AND TEA PLANTING.—The Royal Horticultural Society claims to have played a leading part in the establishment of the tea planting industry in India. In 1842 Mr. Fortune went out on a mission to China, and while there, observed and reported on the growth and cultivation of tea. He subsequently visited India with a view to the introduction of the plant into that country. The East India Company took great interest in the matter, and experiments were made which laid the foundation of the present industry of tea-growing in India and Ceylon. The Royal Horticultural Society was originally due to a suggestion from Mr. John Wedgewood, whose father's name is immortalised by the celebrated Wedgewood ware. In 1809 a royal charter was granted to it by George III., and since that time it has existed as a corporate body. A year later than this it commenced the issue of that series of "Transactions" which has made it famous among the learned and scientific societies of Europe. The cost of their publication exceeded £30,000. It has also established experimental gardens for testing the value of new and possibly valuable plants. At the same time it also commenced that system of the importation of foreign plants which has conferred such inestimable benefits upon this country.

THE NEW SEASON'S CHINA TEAS.—The season for China teas "opens," we are told, "more auspiciously" this year "than for some time past." Certainly the tea trade of China, so far as this market is concerned, has been in a very bad way for so long that anything auspicious connected with it will be very welcome to Chinese growers and importers, and will not seriously distress Indian and Ceylon planters. The reason given for the brighter outlook, according to the *Grocer*, is owing mainly to the fact that the first crop of Monings is likely to fall 9,000,000lb short of that of 1895. What is worse for buyers to know is that the quality is said to be "weathered," if not irretrievably spoiled, by excessive rains. And these two circumstances of a heavy deficiency in the supply, together with an inferiority of outturn, are calculated to stir up a better feeling for the article amongst a large section of the trade, though at the moment symptoms of a revival of demand are only faintly visible. But it is early enough yet for the dealers and others to arouse themselves to speedier action in the matter of buying, seeing that shipments from Hankow to this port will not commence directly, and even when they do, it will probably be another month or six weeks before the new black leaf arrives here, as the Ping Suey with the first entire cargo in 1895 did not pass Woosung until after June 2nd, and was not in Thames water until July 9th following. As usual, relatively high prices were paid for the earlier arrivals, but their novelty soon wore off, and not long afterwards importers, as well as the wholesale dealers, burned with large stocks of unsold teas, were seen pressing them on the market unreservedly for sale, at a reduction of several pence per pound from the original prime cost. Thus it is quotations have been brought down to so low a point as they are now.

THE RUSSIAN DEMAND.—The low figures asked for these teas appear more strikingly evident, according to the authority we have quoted, when comparison is made with the enhanced prices at present current for the commoner grades of India and Ceylon descriptions, through the diminution of supplies and lack of any certain prospect of the former cheapness returning until the amount of useful tea available is more abundant generally. The truth of this statement, says our contemporary, will soon be discovered by the Russian buyers at Hankow, if they muster there in great force as is their wont on the opening of the new season for China teas. As Ningehows are their favourite kinds when purchasing for their home wants, it is not unlikely that they may have to pay much higher rates for what they require in the ensuing months—perhaps 1d to 6d per lb. above the rates at which similar qualities of old season's teas have been re-

cently obtained in our market. If so, the position of the article will be greatly strengthened in the near future, and some stimulus will be thus imparted to a business which, once flourishing, has for a long while past been seriously on the wane. In 1895 the direct shipments of tea from Hankow to London were equal to only 3,283,440 lb., against 6,876,180lb. in the preceding year, 8,918,960lb. in 1893, and 9,971,840lb. in 1892—showing a rapid and progressive decrease; whilst those to Russia, on the contrary, rose from 15,423,700lb. in 1892 to 20,504,470lb. in the following year, to 22,233,620lb. in 1894, and to the swollen amount of 26,642,730lb. last season. The *Grocer* thinks that it is too much to expect a complete reversal of this movement in China tea, whereby a larger proportion would be diverted to the English market for distribution, but it expresses the hope that the decadence in this important branch of the trade will henceforth be arrested.

A LARGE TEA BUSINESS.—The latest conversion to the joint-stock company form, is the Mazawattee Tea Company, limited (Densham and Sons and the Mazawattee Ceylon Tea Company), which has been formed with a capital of £550,000, divided into 40,000 5 per cent. cumulative preference shares of £5 each, and 350,000 ordinary shares of £1 each, for the purpose of acquiring, carrying on, and developing the business of the Mazawattee Ceylon Tea Company and the business of Densham and Sons, wholesale tea dealers, now carried on by Messrs. Edward Densham, Alfred Densham, Benjamin Densham, and John Lane Densham, who are the vendors to this company. The price to be paid by the company for the businesses, leases plant, fixtures, book debts trade marks, &c., has been fixed at £460,000, with an option to the company of taking certain assets and chattels at £90,000, which option has been exercised, making the total amount to be paid £550,000, which is payable as to £188,331 by the allotment of 13,333 fully paid-up preference shares of £5 each, and 116,666 fully paid-up ordinary shares of £1 each, and the balance in cash. Applications are now invited for 26,667 preference and 233,334 ordinary shares.

TRY TURKEY.—It was announced last week from Constantinople that the British Ambassador took tea with the Sultan. Unless this was a mere conventional phrase, meaning that the Sultan partook of coffee in the afternoon, it indicates that Western customs are finding favour in Constantinople, and that there is a prospect of a new market on the shores of the Bosphorus for the cup that cheers and the leaf that grows in India and Ceylon.

THE CONSUMPTION OF TEA AND THE DUTY QUESTION—In a memorandum just issued explaining in detail some of the figures which the Chancellor of the Exchequer used in his recent Budget speech there are some interesting figures about tea. In the year 1885-6, the produce of tea duty, at 6d per pound, was £4,187,000. In 1890-1 the duty was reduced to 4d per pound, with an estimated loss to revenue of £1,072,000. If, therefore, in 1895-6 the consumption of tea had been the same as it was ten years before the revenue the duty would have been £3,115,000. The actual produce was £3,745,000, and the difference between the two sums is taken as representing the elasticity of duty in the decennial period. It appears from another table that, prior to the reduction of the duty, the consumption of tea per head of population had increased. In 1875-6, with the duty at 6d per pound, the consumption per head of population had been 4.51 lb. In 1885-6, with the same duty, it had risen to 4.65 lb. In 1895-6, with duty reduced to 4d, it rose to 5.74 per head. We are not, however, to assume that it has been the reduction of duty alone that has served to stimulate consumption. More considerable, and probably more effective, has been the reduction in the import price of tea. In 1875-6 the import price was 16.73d per pound, in 1885-6 it was 12.14d, and in 1895-6 it had come down further to 8.65d. So, too, with sugar. The consumption per head of population has increased from 60.78lb in 1875-6 to 89.16lb in 1895-6, while the import price per pound has gone down from 2.37d to 1.24d.

TOBACCO AND THE DUTY.—In the memorandum referred to the returns on tobacco show more clearly the effect of an increase or decrease in duty. In 1875-6 the duty on tobacco was 3s 14-5d per pound, the revenue from it was £7,745,000, and the consumption per head of population 1-47lb. In 1885-6 the duty was 3s 6d per pound, the revenue from it was £9,299,000, but the consumption per head had fallen to 1-44 lb. In 1895-6 the duty was 3s 2d per pound the revenue from it at this lower rate was £10,745,000, and the consumption per head 1-69 lb.

COFFEE PLANTING IN MEXICO.—Mexico bids fair to occupy a prominent position as a coffee-producing country. The fall in silver and the reduction in the price of labour and of land have furnished conditions favourable to the development of the new industry. A useful report on the coffee plantations of Mexico has been prepared by Mr. Francis Stronge, Secretary of the British Legation and issued by the Foreign Office. Mr. Stronge tells us that 250 acres of suitable land can be had for £300, and that whilst the cost of cultivating the plantation during the first five years is £30 per acre, the yield amounts to £59 per acre. The coffee plant reaches its full power of production in its fifth year, and in the sixth and subsequent years the expenses of working amount to £11 17s per acre, and the receipts to £27 6s. The advice given to intending settlers is that in purchasing and estate they should negotiate with a trustworthy foreign agency, and that they should spend some time in the country before making the purchase, with the view of acquiring some knowledge of the coffee-planting business. A capital of £1,500 is said to be amply sufficient for the requirements of any ordinary planter.

THE BAHAMA SISAL INDUSTRY.—Dr. Morris, assistant director of the Royal Gardens, Kew, has prepared for the Colonial Office an interesting report on the sisal industry in the Bahamas, which has assumed such large proportions of late. The actual area planted in the islands is about 25,000 acres, and it is estimated that the yield will shortly reach about six thousand tons. Last month good fair sisal sold in London for £17 10s per ton. Dr. Morris estimates that even if the lowest price ever obtained—viz., £13 per ton—be accepted, the margin for profit will amount to £4 10s per acre, the yield of which varies from one-half to three-quarters of a ton.—*H and C. Mail*, May 22.

SIZE OF THE BREAKS OF CEYLON TEA.

There is some talk in the market of raising the limit for public sale sampling to the same figures as prevails in Indian tea—nearly, 20 chests, 30 half-chests and 50 boxes. Buyers have felt the strain severely of late in having to taste so many samples, and they complain also of the extra expense of sampling and sending out a number of small breaks instead of one large one. It is to be hoped that the Ceylon tea planters will fall into line with their Indian confrères as soon as possible. Justice cannot be done to so many samples in the busy season, and the seller invariably suffers if the buyer has not been able to satisfy himself thoroughly as to the top value of what he is bidding for. Something might be done to meet the legitimate wishes of buyers if planters were to curtail the number of grades into which they sorted their produce. The tendency of the tea trade being so much in the direction of large blending businesses, there is not now the necessity for more than three sorts, and planters would save themselves expense and trouble, and in the long run get as good a return if they were to endeavour to work in the direction now indicated.—*H & C. Mail*, May 22.

THE DIMBULA VALLEY TEA COMPANY.

It may be said that all is well that ends well, and the dispute between the Directors of this Company and Sir John Muir having been closed, it is not needful to go into it at any length.

But some very curious information has transpired as to the difference in the law of England and Ceylon and also of England and Scotland bearing on the sale of estate (Belgravia and Elgin) property in this case. When Sir John Muir disputed the sale and the Directors had to take the best available legal advice, it turned out that the Agreement undoubtedly entered into with the Sylhet Company at home was,—

- (1) Not binding in law in Ceylon.
- (2) Was binding in England, but the estates being in Ceylon no action could be raised in an English Court; or if damages were claimed as they might be up to £25,000, and obtained, no specific recovery could take place against any one here! and
- (3) The Agreement with homologation (that is the subsequent proceedings of making part payment of price and sending out Power of Attorney to transfer) was binding under the law of Scotland.

This last fact no doubt influenced Sir John Muir in withdrawing opposition to the transfer of the Sylhet Company estates; but surely the anomalous condition of affairs revealed by the above in reference to the law affecting Agreements for Sale of Landed Property within the same Empire should lead to some reform. At any rate, our Government must see to it that a legal Agreement entered into and duly stamped in London—the centre of capital, trade, and business generally,—should be made valid in Ceylon. For, undoubtedly, had there been a continuance of the dispute, and a law suit had resulted in the Dimbula Valley case, a great shock would have been given to the reputation if not credit of Ceylon, in metropolitan business circles. We trust, therefore, to see some amendment of the present system shortly carried.

THE CITRONELLA-OIL DISPUTE.

We understand that Messrs. Domeier & Co. have been approached this week by Mr. W. W. Green (Brookes and Green), who was one of the arbitrators in the Citronella-oil case, on the subject of the dispute between themselves and Mr. R. C. Treatt. Mr. Green, on behalf of Mr. Treatt, suggested settlement of the questions at issue, and Messrs. Domeier & Co. have agreed to close the matter upon Mr. Treatt paying the entire costs of the arbitration and analyses and the legal expenses, taking back the adulterated citronella oil, and replacing it by guaranteed pure oil. These conditions having been agreed to, no further law proceedings will be taken.—*Chemist and Druggist*, May 23.

VARIOUS PLANTING NOTES.

THE PRODUCTION OF COFFEE AND TEA IN BRITISH DEPENDENCIES.—The *Home & Colonial Mail* in noticing the communication which we reproduced on Saturday says:—Mr. J. Ferguson of Ceylon, who is always eager to keep our statesmen and the public generally well informed as to the facts in connection with the planting industries of British dependencies, writes a letter to the *Times* to correct some current misapprehension about Ceylon coffee production and price.

MAURITIUS TEA.—We have received some samples of Mauritius tea, which we submitted to an expert, who informs us that the curing is not quite satisfactory, but that, allowing for the improvement which it is perfectly possible to make in that direction, there would seem to be no doubt that a regular market for this production could be found in London, the quality of the leaf, strength, and aroma being good, the principal defect being in firing. To suit English taste these teas would have to be blended with other teas; but we understand they are at present mostly consumed in the island itself in the form in which we saw and tested them.—*The Sugar Cane*.

NOTES FROM METROPOLIS.

HERTFORD, May 22.

MR. WM. MACKENZIE

is not idle about our tea in America, though on this side at present. He has frequent interviews with houses on this side who are exporting tea to the States and is only now waiting for the co-operation of India, and perhaps to meet Mr. Blechynden in London, before starting again for New York. A remittance of £3,000 from Ceylon has come to hand. Here is a specimen of the latest advertisement inserted by our Commissioner in the American Press:—

INDIAN AND CEYLON TEAS.

The Chancellor of the Exchequer, in presenting the Budget to the British House of Commons on Thursday, said:

"A great feature had been in the increase of the revenue from tobacco, wine and tea, the latter having steadily driven coffee out of the market, * * * and the popular taste for rum was greatly lessening. Tea had yielded £120,000 over the estimate, implying an increased consumption of 10,000,000 pounds of that commodity. There was a large and welcome transfer of the tea trade from China to INDIA and CEYLON."

The increase in the consumption of these teas in America during 1895 was at even a greater ratio, being equivalent to an advance of 72 per cent over that of 1894,

Imports in 1894	5,379,542
Imports in 1895	9,283,144

The three estates purchased (or to be purchased) by the

CONSOLIDATED ESTATES COMPANY

of Ceylon from Messrs. Arnboth & Co., are Knutsford, £5,000; Rutland, £15,600; and Warriagalla, £14,400—total £35,000; and fresh debentures and shares are to be issued to cover the amount.—Another extract from yesterday's *Pall Mall*, of tea interest, runs:—

MAZAWATTEE TEA COMPANY: FULL DETAILS OF THE COMING USE.

We are able to state that the capital of the Mazawattee Tea Company which is on the point of being offered to the public, will be £550,000 in 40,000 five per cent cumulative preference shares of five pounds each and 350,000 ordinary shares of one pound each. The prospectus will state that in addition to the tea trade the vendors also carry on a large business as wholesale coffee dealers, that they supply some of their customers with printed matter from their own printing plant, and that it is believed that, besides meeting their own requirements, they will be able to carry on an export and general trade in tea-packing lead. The new company takes over the stock-in-trade valued at £71,418, cash at bankers, bills receivable and book debts, less liabilities, at £71,771, and leases, plant, fixtures and effects at £24,322. The total purchase price for the whole business will be £550,000, of which one-third will be taken in preference and ordinary shares, to be retained for at least twelve months, and not to be sold for five years without the consent of the directors. A statement of profits certified by Messrs. Whinney, Smith, and Whinney will appear in the prospectus, showing that they amounted to £11,050 in 1893, £44,229 in 1894, and £52,118 in 1895. The business is being converted for family reasons, and in order to enable customers, the trade, and the staff to obtain a direct interest.

GREEN VS. BLACK TEAS IN AMERICA.

Until Mr. Mackenzie's letter is available for reference, we cannot know the degree at which he estimates the difficulties that the preference shown for green teas in America offer to his full success on our behalf. From what our London Correspondent has been able to learn as to this, however, it seems natural to conclude that he

does not regard these lightly. Whether he has been able to offer any practical suggestion for overcoming them we are at present unaware. We conclude from the fact that the Tea Committee of our London Association had determined to print his letter for circulation among its members, that that body deems Mr. Mackenzie's communication on the subject to be of an important character. In the meantime our readers may well be reminded that this is by no means the first occasion on which this cause of hindrance has been brought under notice. Some three or four years back the matter was so strongly represented, that some of our estate proprietors prepared a considerable quantity of green tea and sent it home. This first shipment met with such a ready sale, that the preparation of this tea was undertaken by others in the colony. It was soon made evident, however, that this further supply was in excess of demand, the shipments made remaining for a long time unsold. But no sooner had the stock become slowly exhausted than fresh demands were made for it for America, which, of course, the London trade was not then in a position to supply. We discussed the situation at the time, coming to the conclusion that the demand for green tea was too fluctuating and uncertain for it to be worth the while of our planters to undertake its manufacture after any regular fashion or to any considerable amount. The late Mr. James Whittall, as our London Correspondent has reminded us, was very strong in his views as to our attacking the American market with this description of tea, and he had a large quantity prepared upon his own estates. But we have never heard that the result his doing so inclined him to persevere in that course. We shall be curious to hear if Mr. Mackenzie recommends that it should be continued by our planters. Two alternatives, it would seem, must then be before us. Either we must await such a change in taste as has now come about in England, or we must endeavour to meet that yet prevalent among the people of the United States. As to these alternatives Mr. Mackenzie will no doubt advise us wisely. The local experience he has now obtained in America must render him the fittest person to decide our future course for us.

THE EADELLA ESTATES CO., LD.

The following is a fuller report of the ordinary general meeting of shareholders in the Eadella Estates Co., Ltd., held at Kandy on Saturday, June 13, than we were able to give in our issue of that day:—

Present:—Messrs. W. D. Gibbon in the chair, F. M. Laurie, E. S. Fox, H. S. Rix, Gordon Pyper, Edward Kynaston, and there were also represented Messrs. Wm. Forbes Laurie and Buxton Laurie.

After the usual formalities the Directors' Report for the past season was presented.

The CHAIRMAN said that he thought the report, which the Directors now submitted to the shareholders, was pretty well exhaustive, and that they had entered fully into all that had been done; and though they had met them with a proposal for a slightly less dividend than that of last year, he would like them to consider that this Company's season ending in April put the results on a different footing to those companies which had closed their season on 31st December last, as we had to include some 4 months of poor prices and high exchange. The teas had netted about 8 cents less than in the previous years. He

would certainly like to see them getting higher prices, but still they should not lose sight of the circumstances he had mentioned. The Company was in a good position. The preliminary expenditure had been written off in 3 instead of 5 years as originally contemplated, and they had also carried forward a good sum. He desired specially to accentuate the fact of the new clearings being so good, and the shareholders ought to bear in mind that they have now an additional area of 102 acres of Liberian coffee and cacao, planted also with coconuts, and that not in the used-up soil of a resuscitated coffee estate, but as their visiting agent could affirm some of the very finest soil in the district.

Mr. FOX said that the clearings of cacao and Liberian were most satisfactory, and the soil exceptionally fine and all that could be desired. He mentioned the fine coconut plants also. Alluding to the very fine crops of Liberian coffee that were originally yielded from the older and much poorer soil in the portions of "Liberia" that adjoin the railway line, he remarked that much more could be expected from the new fields of rich soil than was got from the older and poor land which cannot be compared for a moment to the clearings, though they had yielded handsomely in former years as regards quantity, when unfortunately the real value of Liberian had not been recognised and prices were very low compared to present values.

Mr. GORDON PYPER asked regarding the shade on the new clearings, and whether it was detrimental to Liberian coffee, and an interesting discussion arose as to the methods of topping Liberian, and general working and labour and the season of tea pruning; and after suggesting, that consideration should be given to the opening of 30 or 40 acres more land next year, Mr. Pyper proposed the adoption of the Directors' report and accounts, and, seconded by Mr. H. S. RIX, it was carried.

DIVIDEND.—It was moved that 6 per cent be now paid making the complement of 11 per cent for the year.

DIRECTORS.—Messrs. Fox and F. M. Laurie were proposed to be re-elected by Mr. PYPER, seconded by Mr. RIX.

AUDITOR.—Mr. John Guthrie's re-election was moved from the CHAIR and carried.

SUPERINTENDENT.—Mr. E. S. FOX considered that Mr. Kynaston's efforts and management of estates merited the thanks of the shareholders; and this being seconded by Mr. LAURIE, the resolution conveying the same was carried.

With a vote of thanks to the chair the meeting terminated.

ANOTHER NEW TEA COMPANY.

THE PENRHOS ESTATE COMPANY, LIMITED.

The last new tea estate company is the Penrhos Estate Company, which is to be formed to purchase the Penrhos and Hentleys and Dehanaike estates in Ambagamuwa. Penrhos and Hentleys belong to Mr. W. B. Kingsbury, and the whole group is to be formed into one Company. The purchase amount is said to be about £11,000, and Messrs. Lee, Hedges & Co. are the agents. A contemporary is told that the capital is already subscribed more than twice over.

MADRAS CINCHONA PLANTATIONS.

The *Fort St. George Gazette* recently contained an announcement of the appointment of Mr. W. M. Standen as Director of the Government Cinchona Plantations in Madras, and that of Mr. D.

Hooper as Government Botanist, subject to the approval of the Secretary of State. The Government of India has, on the recommendation of the Government of Madras, sanctioned Mr. Standen's appointment on a salary of R450, rising to R750 with free quarters. Mr. Standen, as a cinchona planter of experience, is considered the best person to conduct the working of the plantation and its produce. He will be given one year's time to qualify in the processes involving the manufacture of cinchona products, when he will be placed in charge of the quinine factory.—*Pioneer*, June 10.

INDIAN INSECTS OF ECONOMIC IMPORTANCE.

Number 6. Vol. III. of the Indian Museum *Notes* contains a very large number of figures prepared from time to time in the Entomological Section of the Indian Museum in illustration of insects of economic importance in India. Most of the species concerned have already been more or less completely discussed in the pages of previous issues of these interesting pamphlets, and in publishing these figures the Trustees do so, merely with a view to facilitate their identification, and they have thereby rendered the public a great service. The illustrations are very well executed by native artists, to whom due acknowledgment is given for their services, while the writer of the *Notes* does not forget to express his thanks for the great assistance rendered by Colonel J. Waterhouse and Messrs. Dean and Ross. Among the illustrations which have the greatest interest for those in this Presidency we find one of the Buprestid *Psiloptera fastuosa*, referred to in previous *Notes* in connection with injury to teak trees. It resembles the jumping beetles, that description which if placed on their backs will recover their proper position by a series of jumps, sometimes leaping two or three inches into the air. The Hesperid *Gangara thyrsis* is notable as a defoliator of young coconut palms in Malabar. The caterpillar of these species *Alope vicini*, a sort of woolly bear, occurs throughout India, and is a general defoliator. Another illustration shows that *Aceridium aeruginosum*, referred to in various places in the *Notes* in connection with so-called "locust-invasions" in this Presidency, taken from specimens received from Madras. We are told that considerable individual variation is exhibited in the arrangement of the wing markings, even in specimens forwarded together from the same locality. In the absence of colouring, we are unable to say whether these are the same species of locusts that invaded the Island several years ago, but they look rather like them. The ones we refer to, attacked the croton bushes at the further end of the Island, near the Buckingham canal, and were notable for their beautiful colouring, in which a bright blue was conspicuous. But we find an illustration of another locust, the palaeartic, which may be the one we refer to. Specimens of the latter were sent to the Indian Museum in connection both with the Madras locust invasion of 1878 and also with more localised injury to standing crops in Gan-jam in 1890. The variety appears to be a far less serious enemy to standing crops in India than such species as *Aceridium peregrinum* and *Aceridium succinctum*. Of coffee pests there are several illustrations, including one of an ant, which also attacks cinchona bushes, in Ceylon, and is known as *Cremastogaster dohmi*, a very long name for a very little insect; the imago of the cosmopolitan species *Agrotis segetum*, which attacks young coffee plants; the scale insect, *Lecanium viride*, with a plate illustrating its life history. Among other interesting figures is that of an Asilid fly which mimics the bee *Trigona vidua* so closely in size and colouration as to be almost indistinguishable when upon the wing, in spite of its great structural diversity. The Asilid figured was taken in the act of devouring the bee. The last illustration which we can refer to, shows the remains of a beam of wood, from the neighbourhood of

Calcutta, which had been attacked by white ants. The supports left by the ants to bear the weight of the earth and rubbish that lay above the beam, consist mostly of a knob in the centre strengthened by a little of the surrounding wood-tissue, exhibiting the wonderful wisdom of the termite in his depredations.—*M. Mail*, June 3.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, May 21.

CAFFEINE.—Unaltered in price, at from 18s to 19 per lb., according to quality. There has been a good deal of dissatisfaction lately among wholesale druggists and shippers at the practice of caffeine-manufacturers to book one-cwt. orders at the minimum price and to allow the quantity to be taken out as required. This practice is said to be spoiling the wholesale trade, and it has been arranged to make a combined representation to the manufacturers asking them not to sell below the list prices and to insist upon the entire contract being taken up at once.

ESSENTIA OILS.—It is expected that the quotations for Croton oil will shortly be further advanced, on account of the extreme scarcity of croton-seed. Clove oil remains quite neglected; the demand has fallen off considerably lately.

VANILLA is extremely firmly held, and according to the importers, there is every prospect that prices may still advance by several shillings for fine qualities.

SPICES.—White pepper is very flat with sales at auction of middling. Penang at 3d, brown Ceylon at 3½d, and fine ditto at 4½d per lb. For June-August delivery 3½d per lb. has been paid privately.

MR. E. M. HAY'S VISIT TO AUSTRALIA.

A FLOWER AND FRUIT EXPERIMENT IN CEYLON.

Mr. E. M. Hay of Goorook-oya, we are glad to learn, has returned from a visit to New Zealand greatly benefited in health from his visit to the Britain of the south. Auckland, Mr. Hay confided to an *Observer* representative, was his headquarters, and at the famous Rotorua Springs, a district, the climate of which has for him many charms, he has laid in a store of health and strength. In Australia, he doubtless, would have had an enjoyable time but for an attack of fever. All the same, Mr. Hay has not been idle in the course of his travels, and as a result he is about to make an experiment in orange and lemon culture, a subject with which he is *au fait* and an enthusiast to boot. In the steamer "Orient," by which he came from Australia, Mr. Hay has brought several cases of orange and lemon grafts. Despite the long sea voyage, the grafts are in excellent heart and appear full of vitality. The orange and lemon plants with which he is to experiment, grown at Sydney, originally came from Florida, and they are the results of high and very careful cultivation. The orange contains a very limited number of seeds, has a very thin skin, and is of exquisite flavour. The lemons are of the very finest grown in Florida. Mr. Hay intends to send some of the grafts to the Royal Botanic Gardens at Peradeniya and with the others he is to experiment on his estate of Denmark, Ulapane. The elevation of the estate is about 1,700 feet, and it is well suited for the cultivation of oranges, though he does not think that lemons will grow so well on it. Mr. Hay proposes to graft the oranges on to pumelo trees of which there are a good many on the place, and he may, by way of experiment, probably send some of them to an estate in Uva, the premier fruit district of Ceylon. The method of planting, Mr. Hay explained, was pretty much like that employed with coffee. Holes were cut and the plant set up in good,

soil. In Australia, he remarked incidentally they did not take very much trouble in the matter of planting though they were very particular with regard to securing efficient draining. A most important thing he said in orange growing was to see that the land was thoroughly drained. There was nothing more impatient of wet feet or stagnant water than the orange. Mr. Hay has also imported a quantity of prize chrysanthemums. While at Auckland he was very much struck with the appearance of the chrysanthemums. Some of them were of the most exquisite colours, and in several instances a single bloom measured quite 8 inches across. The prices asked for such were very stiff, but he succeeded in getting cuttings as well as a few choice dahlia blooms. Mr. Hay considers that the chrysanthemum, if properly looked after, would do very well in Ceylon, and if they do not thrive in Ulapane or Nawalapitiya, he purposes sending them to Nuwara Eliya. Reverting to the subject of New Zealand, Mr. Hay expresses unqualified admiration for the timber of that country—twenty or thirty of the woods being most beautiful.

THE CITRONELLA OIL DISPUTE.

As some of the parties connected with this (now happily settled) dispute have endeavoured to throw doubt upon the correctness of our announcement of last week relating to the terms upon which the incident was closed, we may state that Messrs. Domeier & Co. confirm the accuracy of our statement in every respect, and that they have shown us the memorandum, dated May 20, and signed "Wm. W. Green," in which Mr. Green confirms the terms of settlement verbally agreed upon between himself, on behalf of Mr. Treatt, and Mr. Domeier, earlier on the same day. This document states that Mr. Treatt agrees to give to Messrs. Domeier & Co. "approved commercial citronella oil of direct import from Ceylon" against two of the contracts in dispute, while, with regard to the third, Mr. Treatt agrees to refund the money and take back the oil. Mr. R. C. Treatt further undertakes to pay the arbitrators' fees and the analysts' fees, and it is agreed between the parties that "no other questions are to be raised."

But, although the Domeier-Treatt case has thus been settled, we understand that more is likely to be heard with regard to yet another parcel of citronella oil, purchased from Mr. Treatt by the London representatives of one of the largest German essential-oil firms.—*Chemist and Druggist*, May 30.

"CAMPHOR-SEEDS."

At today's auctions 5 1-cwt. bags described as "seeds," imported from Rangoon, were offered for sale. In appearance the drug very much resembled decorticated cardamoms, but it was distinguished from the seed of *Elettaria cardamomum* by its strong camphoraceous odour and taste. The older druggists recognised the article (which has not been seen on the open market for many years) as "camphor-seed" at one time a regular article of trade. The seeds are those of *Amomum cardamomum*, Willd., the "round cardamom" formerly not unfamiliar on our market, and are closely allied to the official cardamom in medicinal properties. In the south of Europe, in fact, we believe that they are (or were when available in trade) often used as a substitute for the true cardamom. The habitat of the parent plant is Sumatra, Java, and the other Malaysian islands, which accounts for the importation of the parcel via Rangoon instead of from Ceylon or Southern India. The fruit has sometimes been imported in the cluster form in which it grows, and which has earned for it the French name of "*Amome en grappes*."—*Chemist and Druggist*, May 30.

INDIAN TEA ASSOCIATION.

GENERAL COMMITTEE'S REPORT.

The following are extracts from the Report of the General Committee of the Indian Tea Association for the year ending 29th February 1896:—

INDIAN TEA IN AMERICA.

Mr. Blechynden has continued to carry on his campaign in the United States, in the interests of Indian tea, with unabated vigour during the year, and has been working lately in conjunction with Mr. Mackenzie, the Commissioner from Ceylon. Mr. Blechynden has displayed great versatility and resource in the schemes he has adopted for bringing Indian tea before the American public, and at a meeting of the General Committee of the Association in London, held on the 17th of March last, a resolution was passed, expressing their appreciation of the valuable services he had rendered to the tea industry. Reference was made at considerable length in the last report to the details of his plan of operations, which consisted mainly in giving demonstrations in both large and small stores in New York, Brooklyn, and Chicago, assisted by his staff of five Native servants who proved a considerable source of attraction. During the past year he has however, been working on somewhat different lines, and has dispensed with the services of the Natives, who appeared to be no longer required, after a certain stage in his operations had been reached, although they were extremely useful in drawing attention to his enterprise in the first instance. Mr. Blechynden has furnished from time to time interesting reports of his proceedings, which have been communicated to the newspapers for the information of all those interested in the extension of the Indian tea trade. He is now engaged in calling the attention of the American public, in conjunction with Mr. Mackenzie, to Indian and Ceylon teas by means of advertisements, paragraphs in newspapers, lectures, demonstrations, and by supplying tea as a beverage in places of public resort. He has also—and this is, perhaps, one of the most important branches of the work at present—arranged to co-operate with private firms and others engaged in selling British-grown teas, by granting them subsidies for advertisement on such firms undertaking to spend an equal amount in advertising Indian and Ceylon teas. The London Committee have found by experience that they have been able to obtain a much larger field for advertising and making known the good qualities of Indian tea by working in conjunction with Ceylon, and have good reason to hope that the vigorous efforts, which have been made by the representatives of both countries, are now beginning to bear fruit.

Statistics recently published by Messrs. Gow, Wilson and Stanton show very clearly the result of the efforts which have been made to obtain a footing in the markets of America. There has been a steady increase in the consumption of British grown tea in the United States and Canada during the last six years, and the advance in consumption which has taken place in 1895, the figures for which are 9,283,144 lb. as compared with 5,379,542 lb. for 1894 furnishes, in the opinion of the Committee, striking evidence of the success of the vigorous exertions made by both the Indian and Ceylon Associations to push the trade, and should act as a powerful incentive to still greater efforts, when it is remembered that the American markets annually consume over 100,000,000 lb. of tea.

In their last annual report the General Committee recorded their opinion that a slow but steady increase in the imports of Indian tea into America was taking place, and the figures which are referred to above show that their forecast was fully justified.

The American and Foreign Tea Committee of the Indian Tea Association, London, who have the control and direction of Mr. Blechynden's work in the United States, recently published an interim report, in which they expressed the opinion, that having regard to the very large extensions which are coming into bearing both in India and Ceylon, it would be a grave error to leave at present entirely unaided the extension of

consumption in the United States, and stated that it was essential that there should be a levy for the season 1896 on the same basis as in the last year. On the above report being presented to the General Committee in London, on the 17th March last, a resolution was unanimously passed in favour of making an effort to carry on for at least another year the work of pushing Indian tea in America, and a further levy on the same terms as in 1895 was decided upon for this purpose. The General Committee here are fully in accord with the views of the London Committee on this matter, and they have accordingly issued an appeal for support not only on the grounds of the success achieved in exploiting the American markets, but also in view of the vital necessity which exists for finding new outlets for the annually increasing crops of Indian tea. The estimate of the Indian tea crop for 1896 amounts to over 144 million lb., or nearly 9 million lb. over the actual outturn of the crop of 1895, and this, of itself is a proof of the necessity for opening up new markets wherever possible. In response to the Committee's Circular of 20th July, 1895, the sum of £92,545 was contributed. This represented a production of nearly 80 million lb. of tea, and included liberal contribution from the two Planters' Associations in Travancore, which have all along taken great interest in the American campaign. The General Committee trust that in view of the increasing necessity for finding outlets for tea, a much larger sum will be raised during the present year. If the ratio of increase of consumption of British-grown tea in America can be maintained for a year or two more, the trade will probably be in a position to take care of itself, without the aid of special efforts, such as the present, and the Association will then be able to turn their attention to the opening up of new markets in Russia, South Africa, and other parts of the world.

MITIGATION AND PREVENTION OF INSECT BLIGHTS.

This important matter formed the subject of a somewhat lengthy paragraph in the last report closing with a reference to the deputation of Dr. Geo. Watt, C.I.E., Reporter on Economic Products to the Government of India, to Assam, to make special enquiries as to the value of the *Adhatoda lasicca* plant as an insecticide, and also to prosecute any further investigations on points lying within his sphere of work, which might be suggested to him, and might be of service to the tea industry. Dr. Watt remained in Assam some three months, the time allotted to him by Government, and his report, which is shortly expected, will no doubt, prove of the greatest interest to all connected with tea, although it is to be regretted that he was not able to devote more time to his investigations while in Assam, and the Government have not since seen their way to allow him to return.

EXEMPTION OF TEA MACHINERY FROM DUTY.

In consequence of representations received from members of the Association, the General Committee addressed the Committee of the Bengal Chambers of Commerce on the 26th March 1895, with papers in support of a representation the Committee of the Chamber were making to Government in favour of exempting all machinery used in connection with the manufacture of tea from duty, and were subsequently favoured with a copy of the letter addressed to the Board of Revenue by the Secretary of the Chamber on the subject. The result of the Chamber's action was, that orders were issued by the Government of India, exempting all tea machinery from duty, and the General Committee tendered their best thanks to the Committee of the Chamber for the part they had taken in bringing about this desirable result.

MANUFACTURE OF THEINE FROM REFUSE INDIAN TEA LEAVES.

The Committee have had some interesting official papers placed at their disposal by the Government of India, containing correspondence between Messrs. Thomas Christy & Co., London, and Her Majesty's Board of Customs on this subject, and they are

printed in the Appendix for general information. Messrs. Thomas Christy & Co., will no doubt have conferred a great benefit on the tea industry and also on the general public, if they had solved the problem of converting refuse tea into a useful and beneficial drug. In October last the Committee received from Messrs. Thomas Christy & Co., through the Indian Tea Association, London, a couple of sample boxes of Theinc tablets especially recommended in cases of fatigue and headache which it was thought, would meet with a large demand among the natives of India. The quantity sent was too small to experiment upon, but it is understood that Messrs. Christy & Co. are taking steps to have these tablets widely disseminated among tea estates in different parts of India.

INDIAN TEA IN PERSIA.

In September last the attention of the General Committee was drawn to an article in the "Home and Colonial Mail" of 16th August on the subject of tea in Persia, commenting on the report for 1894-95 on the trade of Khorassan by H. B. M. Vice-Consul Mr. Ringler Thomson. The Consul stated in his report that there was no doubt a very large quantity of cheap bad tea come from the Indian markets, and that brought to Meshed was of the vilest description, and probably damaged stuff; which had been subjected to firing a second time. The Committee were of opinion that this was a statement which should not remain unchallenged, and required careful investigation in the interests of the Indian tea trade, and they accordingly addressed the Vice-Consul at Meshed, asking by what route the tea arrived in the country, and how it was packed, and a request was also made for samples if they could be supplied, in order to enable the Committee to trace its origin. Mr. Thomson replied on the 2nd of October, forwarding four samples of tea with his letter in support of his previous official statement. Three of these on being valued were found to be absolutely worthless, the value of the fourth being estimated at not more than 7 annas per lb., although selling in Persia at Re. 1-40, this being the only one of the four samples sent, which was fit for consumption. The Committee have been using their best efforts to discover where and by whom this worthless tea is shipped to Persia. It is quite clear it does not come from Calcutta, and they have received a letter from a leading firm of brokers here stating that although a very considerable quantity of sound high-class tea had been shipped from this market to Persia, for some seasons past, they desired to place on record their statement as brokers for the largest buyers for the Persian market, that so far as they knew, no unsound tea had ever been shipped from this port. A reference in the letter from the British Vice-Consul at Meshed to Kangra led the Committee to place themselves in communication with the Kangra Valley Planters' Association, who supplied them with some interesting information as to the mode of manufacture and adulteration resorted to by Native planters in that district, and it appeared likely that this tea was sent to Bombay for shipment to Persia together with inferior and adulterated tea from other districts with possibly a good admixture of low-class China tea. The Committee have since been in correspondence with the Secretary of the Chamber of Commerce, Bombay, who has very kindly done all in his power to assist in the investigation; but so far as the enquiries have gone, has not been able to find any trace of shipment of such tea having been made from Bombay, though he is hoping to collect further information. The matter, although an extremely important one to the tea industry, in view of Persia becoming an important outlet for Indian tea, is admittedly a very difficult one to deal with. The exports of Indian tea from Bombay to ports in the Persian Gulf amount now to about 2,000,000 lb. annually.

THEFTS OF TEA IN TRANSIT.

In October last attention began to be directed to the serious loss caused by the frequent shortages found on opening tea chests in London, evidently the result of the chests being tampered with and

pilfered somewhere in the course of transit. The General Committee immediately took action in the matter by asking for the co-operation of members in trying to localize the thefts and bring the offenders to justice. They also issued a circular letter to different firms of brokers, enquiring whether they had discovered any shortages of tea sold by auction in Calcutta, and asked what precautions they took against thefts being committed when tea was in their godowns. The Tea Traders' Association were also addressed with a request for any help they could give in investigating the matter. The general opinion was that the chests were tampered with somewhere in the port before shipment. The Committee then placed themselves in communication with Sir John Lambert, the Commissioner of Police, who immediately took active measures to discover and suppress the thefts if they were being committed within the limits of the port. As a result of the energy and vigilance of Mr. Superintendent Hogg, an important arrest of the manjees and dandees of two cargo boats was made on the 17th of December, the issue of which was that seven boatmen were sentenced to six months' imprisonment and one receiver to one year's imprisonment. Superintendent Hogg and his staff followed up this successful beginning very vigorously, and between the 17th of December and the 15th of January, twenty-three persons were arrested by the River Police in connection with nine cases of theft, of whom eighteen were convicted. The Committee showed their appreciation of the good work done by the police by placing at the disposal of the Commissioners the sum of R500 for distribution as rewards. Sir John Lambert has called special attention to the temptations to dishonest boatmen owing to absence of proper safeguards on the part of shippers while their tea is lying in lighters on the river, and he has suggested that no cargo boat should be sent off without a responsible sircar or peon in charge. The manjees and their crews who ply in this port are very nearly allied to the criminal classes, and consequently reasonable supervision by owners and agents is imperative. Sir John Lambert stated that all that could be done by the police force would be done, but it was impossible for a small body of police, who have to perform multifarious duties, to exercise complete control over the movements of dishonest boatmen, or to prevent their tampering on board their boats with goods entrusted to them. The Committee are glad to state that owing to the vigorous action of the police a stop has apparently been put to thefts on the river, but they fear that a considerable amount of robbery takes place on the way down from the gardens, and the detailed statements they have received from different members show that a very large quantity of tea has been pilfered from time to time. Some important papers in connection with this matter will be found printed in the Appendix.

FINANCES.

The total planted area represented by the Association during the year has been 265,138 acres against 243,278 acres, a fairly satisfactory, but still not in the opinion of the Committee, a sufficient increase, considering that the total area under cultivation in Assam, Cachar, Darjiling, the Duars, the Terai, Chittagong and Chota Nagpur is at the present moment 389,107 acres, and they trust at no distant date to see the whole of the tea industry of Northern India represented by the Association. The year's subscriptions at the rate of one anna per acre amount of R16,571-2-0, and the Committee have realized this year a further sum of R240-3-2 from the sale of Mr. Bamber's text-book on the "Chemistry and Agriculture of Tea" for which there is still a demand. The Revenue Account published shows a surplus of R3,947-11-3, and from the balance sheet it will be seen that the Committee had a balance in hand on the 29th of February, 1896, of R14,842-1-0. The Committee remitted to the London Association on account of the expenses of the London Office the sum of £200, the equivalent of which R3,498-13-9 is debited to Revenue Account, and has been provided

out of ordinary income. The balance of ordinary income over ordinary expenditure is generally about R4,000; but in the year which is now commencing, the General Committee will be called upon to meet an additional monthly expenditure of R200 as the Committee of Bengal Chamber of Commerce have suggested that, in view of the increased work connected with the Association, the monthly contribution to the funds of the Chamber should be raised from R400 to R600. The General Committee realizing that the work of the Association has largely developed in late years, in several directions have decided to recommend at the annual meeting that the request of the Committee of the Chamber should be complied with, and trust the recommendation will receive the support of members generally.

ANNUAL GENERAL MEETING.

Proceedings of the fifteenth annual general meeting of members of the Association, held at the Bengal Chamber of Commerce, on the 27th of May, 1896.

The Chairman said:—The report fully treats with labour and markets for our tea, but without labour we cannot get the produce, and yet it seems beyond reason that with the teeming million of people we should find any difficulty in securing labour. Markets also are not without difficulties, as it is easy to take a horse to the water, but it is quite another matter to make him drink, although a little coaxing might be resorted to, and this is being done.

The first estimate of the Indian crop issued in the middle of April anticipated an outturn of 144 million lb., but the unfavourable weather prevailing in some districts at the beginning of the season made this estimate drawn up some time previous, to be considered a full one, and it cannot be said from the general information received to date that the situation has in any way improved, but you can understand the difficulty in gauging the future when there are so many causes—climatic and otherwise—to contend with, which may materially affect the crop before it is gathered.

Out of the 144 millions, 16 millions are estimated for shipment to the Colonies and other ports and for local consumption, leaving 128 million lb. for Great Britain.

Ceylon has been annually showing considerable expansion in exports, and it is expected that they will reach over 100 million lbs. this year of which 15 millions will likely be taken by the Colonies and other foreign countries, but the eventual results will much depend on the weather.

The annual increasing production from India and Ceylon has caused some uneasiness, but with the increased consumption at home, and improving demand from other countries as well as the displacement of China and Japan teas, we have no reason to view the near future with alarm, on the contrary, the present statistical position points to the season's supply not being in excess of requirements.

I noticed from a Hong-Kong Circular the other day that the total exports of tea from all China for the past season was 140 million lbs. or 5½ millions more than in 1894-95.

It is indeed worthy of note to place these three countries' figures side by side and compare—

In 1875	China imported into U.K.	122	millions
„ 1895	„ „	31½	„
„ 1875	India & Ceylon	23½	„
„ 1895	„ „	190½	„

thus showing the rapid strides British-grown tea has made in 20 years.

The Budget shows a surplus of over six millions, and the outcry is that sufficient consideration has not been paid to the "breakfast table." As tea takes a very prominent position in that daily meal, doubtless the industry which we are representing, before long will claim some attention from the Chancellor of the Exchequer, and he may see his way to making a further reduction of duty on tea.

The statistics available go to show that America imported during 1894, 102, against 98 million pounds in 1895, of which India and Ceylon contributed over nine millions last year, being an increase of four

millions over 1894, the remainder being China and Japan. This will show the field we have yet to conquer in that direction, but a beginning has been made, and the efforts of the Associations with their able representative, Mr. Blechynden, will doubtless show greater results at the end of the current season. Americans do not appear to take very kindly to tea, judging from the fact that during 15 years the consumption only increased some 30 million lb., and now it is put down at 1.34 in pounds per head of population. So that there is in addition to the ousting of China and Japan, a great field for us to induce the Americans to transfer their fancy from iced drinks to the cup that cheers.

There is no saying also to what extent the ladies of America will go in the use of tea to supplant tobacco, because I have seen notice taken of the rage for cigarettes made of tea, and we hope the "weed" will grow largely in favour although we would not like them to jeopardise their constitutions in so doing.

That there is a wide opening for Indian tea in America and Canada is quite evident, and it appears that Indian in time will not only oust out a large influx of China and Japan manufacture into that country, but will also bring our teas into favour with those who now use beer or coffee at almost every meal. The taste of the American tea drinkers has been educated to green teas, and it will therefore take time to divert their liking to ours, but success is bound to attend our energetic efforts. Gardens have tried over and over again to make green teas, but abandoned them chiefly on account of the high cost of manufacturing, but this important matter deserves every consideration.

It is therefore incumbent on me to emphasize the grave error we would make, if we were to allow the position we have gained to relax in the slightest degree, in trying to win this promising market, which is so important to retain, in face of the large area of tea coming into bearing, during the next few years. Let those who have not yet made up their minds to contribute towards the American Fund, hesitate no longer to contribute their share of what is justly due by all with no exception. The appeal of the London and Calcutta Committees, it is therefore hoped, will receive that hearty support it so justly deserves.

We cannot, however, be expected to carry every market before us without opposition, and this recalls to my memory a recent article which I read bearing on adulterated teas being imported into America. It went on to say that the plan adopted to restrict or prevent the duty of inferior teas into America has so far proved futile, and stated that this refers particularly to the "bogus" teas which are not grown but manufactured from spurious leaves, tea dust, and colouring material. The mixture is made to look quite handsome to the inexperienced eye, and its sale returns good profits to unprincipled retailers. A chromo thrown in with every purchase makes the ignorant consumer apparently satisfied. There is no question about the legitimate trade being injured, and Mr. Bunn proposes to regain lost ground by needed legislation. Certain suggestions have been made by this gentleman which, it is acknowledged, would be a vast improvement over the present system, but the House of Representatives appear indifferent. It would therefore be well for the tea trade to agitate the necessary reforms in admitting tea into America, and it is to be hoped that a matter so detrimental to our interests, will claim the earnest attention of all concerned in the welfare of our industry.

It is said by some that tea causes many local diseases, and you sometimes see articles running in this strain, but much, I am afraid, is due to the manner in which it is infused or rather "stewed" and, the adoption of "Chinese rubbish," which it is often termed, in place of using our pure Indian tea manufactured entirely by machinery and not by hand as in China. It is to be hoped that consumers will soon learn to infuse tea for three to four minutes only, with fresh boiling water, and to bear in mind that Indian possesses more body and finer flavour and at less relative cost to the consumer than China.

There are other markets which have still to be captured and they are deserving of the earliest attention.

South Africa seems a likely market for our teas, and with an ever-increasing population it is to be hoped that our manufacture will soon find its way in large quantities to that market. It is said that the people there drink inferior China and Natal teas when they can get it, and we should lose no time in entering that market with vigour. There is a large mining population in Johannesburg, and there are other rapidly growing places, and as the miner prefers tea to liquor, which is excessively dear, in all reasonable likelihood, he would take to tea, if he can get it good, and will no doubt pay well for it.

The Negro population of New Orleans, Alabama and other places in the States buy largely, but the coloured people living in the south, although not of the same liking, should not be forgotten, while Russia, consuming 70 million pounds of tea, and Persia should claim a large share of our attention, where our teas are gaining favour as against China.

We do not appear to make much headway in the Colonies in competition with China and Ceylon, the proportions being put down at six millions Indian, nine millions Ceylon and 11 millions China, making the consumption per head of about 7 lb., as against the United Kingdom of 5½ to 5½ lb.

The India, Burma and Ceylon Exhibition was opened at Earl's Court on the 9th instant and it is reported that the Indian exhibits exceed those of last year three times over. We all realize the importance of having our manufacture brought prominently before the British public, and influential visitors to London and the Exhibition, who it may be expected will take back to their own countries, not only a liking themselves for a real good cup of tea, but initiate its use among their friends and in turn the thousands.

It is not too late to send samples, as it is most desirable to make a creditable appearance alongside of Ceylon, and no doubt the cleanly method of manufacturing by machinery and other demonstrations will be shown, as it is well that people should know that no foreign colouring substances are used, and that our teas are manipulated entirely by machinery.

We are much indebted to Dr. Watt for his valuable hints on tea blights, and we trust that Government will see their way to allowing him to prosecute his researches in the districts for a few months, and thus enable him to further investigate the terrible pest of the tea bush and thereby assist in suggesting certain remedies whereby its ravages may be allayed.

In regard to the appointment of a Scientific Officer for the tea districts for a term of years it seems reasonable to expect, and it may be said to be beyond doubt, that such a specialist would be invaluable to the industry at large, as he would be able to thoroughly investigate the many points which must arise in the chemistry of the tea plant and the cultivation and manufacture of it. Much has yet to be learnt on the subject of proper cultivation of the plant, and remedy for blights and the investigations would contemplate certain inquiries into the physiology and chemistry of the tea plant, the manufacture of tea, and especially the eradication or treatment of diseases, pests and blights. It is hardly to be expected that an officer can efficiently investigate all these points, but an expert in chemistry would be able to make such observations and collections in both botany and entomology as to ensure assistance from the Economic Department of Government, and we have every reason to believe that Government would render valuable assistance in this and other ways.

It is estimated that to secure a really good man £1,500 per month would have to be offered and guaranteed for five years, and the question now arises in what way the necessary funds would be best raised. Mr. Buckingham suggests a voluntary subscription of one anna per acre under cultivation, and this probably would be the best means of securing the necessary funds, but the Committee are anxious to have the views of all interested in such an important matter, and proprietors, agents and managers will be circularized to obtain their opinions.

The Committee have to express regret that, owing to the non-receipt of one of the statements of account, they are unable to place the accounts of the American Market Fund before this meeting, but they will be issued as soon as the necessary information is received which has been written for.

The Hon. P. Playfair, C. I. E., said:—The expansion of markets is a feature full of encouragement in the future prospects of Indian tea. The results anticipated by the Association when it decided to make an effort to introduce Indian tea to the American consumer appear likely to be fulfilled. Much credit is due to Mr. Blechynden, and the resource and energy he has displayed are both instructive and commendable.

You have alluded, Sir to remarks made by the chancellor of the Exchequer on the introduction of the Budget, and you may have observed that he congratulated those who desire to promote trade within the limits of the Empire, that the trade in tea was being rapidly transferred from China to India and Ceylon; and that the duty with an increased consumption of 10 million lbs. had risen to £3,745,000. To produce this, Indian and Ceylon teas were taxed to the extent of £3,200,000, or Rs. 5½ crores, and of this amount Indian teas contributed about Rs. 3¼ crores, or I might add in passing, Rs. 2½ crores more than is the estimated income in the Indian Budget for the current year from import duties on cotton goods, over which so much indignation has been expressed at Home. It is a noticeable fact that although tea is one of the few products of India that finds a market from its intrinsic merit, *i. e.*, superior quality, consumption is very dependent upon price. Deliveries decrease with a rise in values, and *vice versa*, and I believe the free breakfast table is a future fiscal achievement in which India and Ceylon, as the suppliers of 85 per cent. of the tea consumed in the United Kingdom, is much interested. This is a matter to which I think this Association should not be indifferent.—*Englishman*, June 2.

TICK IN CATTLE

[The following information may be of help to "R. W." who wrote us recently on this subject.—ED. T. A.]

Dr. M. Francis, veterinarian to the Texas Experiment Farm, has been investigating the methods of destroying ticks in cattle, and has communicated his results to the *Texas Farm and Ranch* of March 14. After several unsuccessful attempts to destroy the pest by various means, the dipping process has been adopted at Texas with very gratifying results.

A large vat of 5,000-gallons capacity is used, and the cattle are forced to swim through it. Various carbolic and arsenical sheep-dips were employed as solutions in the vat, but the results were not satisfactory; either the cattle had to be kept in the dips for too long a time in order to kill all the ticks or they were irritated by the solutions. This led Dr. Francis to try the effect of oil. It is well known that grease or oil of almost any kind is fatal to insects, lice &c. and known facts as to the life history and structure of ticks gave presumptive evidence that oil might be successfully substituted for the various commercial dips which had been employed. A layer, from three-quarters to one inch in thickness, of crude cotton seed oil on the water in the vat, was first used, the cattle being forced to swim through the vat so that when they emerged they were covered perfectly with oil. This had no apparent effect on the cattle, but was found to be exceedingly fatal to the tick, and was very much superior to any other treatment tried. Dips of different natures were experimented with, but none as yet used have given such satisfactory results as the cotton-seed-oil. Kerosene emulsion was found to have no practical value; crude petroleum irritates the skin, and emulsifies with

water; resin oil is useless for the purpose; corrosive sublimate is too dangerous, and is not very fatal to ticks even in solution 1 to 250 of water; and tobacco sheep-dips have no practical value. Dr Francis is at present studying the effects of other oils the most promising being West Virginia black, a mineral oil.—*Chemist and Druggist*, May 23.

SERENDIB TEA ESTATES COMPANY, LTD., CEYLON.

The mail has brought us a copy of the prospectus of this Company formed with a capital of £150,000 in 30,000 shares of £5 each (whereof 18,000 are 6 per cent cumulative preference shares preferred as to capital as well as to dividend), and 12,000 are ordinary shares), for the purpose of acquiring five estates in the districts of Pusseflawa, Ramboda and Badulla, aggregating a total area of 1,898 acres, of which about 942 are in tea, and the balance is described as chena, forest, and grass land, a large portion of which is available for tea planting. The officials are:—Directors.—William Stephenson Bennett, Director of the New Dimbula Co., Ltd., Tower House, Chalvey Park, Slough, who will join the board after allotment; Herbert Wilford Brett, Halliford-on-Thames; John Londonn Shand (Messrs. Shand, Haldane & Co.), 24, Rood Lane, E.C.; Patrick Gordon Spence, (Messrs. Spence, Wallis & Co.), Chairman Dnckwari Tea Plantation Company, Ltd., 17, Philpot Lane, E.C. Bankers.—Chartered Bank of India, Australia and China, Hatton Court, Threadneedle Street, E.C. Brokers.—Messrs. Roger Mortimer & Co., 57, Old Broad Street, E.C., and the Stock Exchange. Solicitor.—H. B. Wade, 8, Old Jewry, E.C. Secretary and Offices.—H. Wallis, 71, Philpot Lane, E.C. The following are particulars of the estates, showing the acreage under tea and in reserve:—

	Tea in full bearing.	4 years old.	3 year old and under.	Fuel and Timber.	Chena, Patna, &c.	Total Acreage.
"Riverside" ..	268	3	19	12	88	390
"Glenloch" ..	135	—	40½	58	82½	316
"Karagastalawa" ..	120	—	—	72	200	392
"Wewesse" and "Debedde" ..	245	50	61	120	324	800
	768	53	120½	262	694½	1898

In the present issue provision is made for a working capital of £7,000, which in the opinion of the Directors is ample, as the estates taken over are all going concerns. The production for the current year of these estates, is estimated at 330,000 lb. of tea from 821 acres in full bearing, the profit upon which calculated at only 3d per lb. is equal to £4,125, which is ample to provide for the preference dividend upon the capital allocated, and leave a good return upon the paid-up ordinary share capital involved in the purchase, and as the balance of say 121 acres now in young tea comes into full bearing, the production should be increased to at least 375,000 lb. of tea, and larger profits be in consequence realized.

DEAFNESS.

An essay describing a really gennine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free. Artificial Ear-drums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN; LONDON.

The Vendor Company will pay all expenses up to the first allotment of shares except those incidental to the registration of the Company, and have fixed the purchase price (which includes their profit) at £56,000, payable as to £30,000 in cash, £13,000 in fully paid-up preference shares, or partly in cash and partly in preference shares at the option of the directors, and £13,000, in fully paid-up ordinary shares.

CEYLON TEA COMPANY, LIMITED.

At the Fifth Ordinary General Meeting of shareholders in the Ceylon Tea Company, Limited, held at Kandy on Monday, the 15th June 1896, there were present Messrs. W. D. Gibbon, J. Munton, A. Philip, Mr. A. E. Wright by his attorney W. D. Gibbon. Mr. Gibbon held a proxy from Mr. A. M. Forbes, Mr. Munton held a proxy from Mr. Harry Whitham, and Mr. Philip held proxies from the following shareholders:—Capt. E. de Frisch, Messrs. James Westland, A. E. Holsinger, J. H. Renton, J. C. S. Armstrong C. J. Pattenson, F. T. Hawke, Reginald Collinson, H. V. Masfield, Edward Hamlin, R. Bartrum, C. A. Kalenberg, J. A. Spence, P. Japheth, Wm. A. Wijesekera, W. Hasman, A. J. B. Unwin, J. H. Cobban Lea, Sinnattamby Wellupille, and R. Burke, Mrs. E. A. Carey.

The Annexed Report was adopted and Messrs. W. D. Gibbon and C. S. Armstrong were elected Directors, while Mr. J. Guthrie was reappointed auditor.

REPORT OF THE DIRECTORS.

The Directors submit to the Shareholders the Fifth Annual Report together with the usual statements of accounts.

The Directors have steadily kept in view the advertising of pure Ceylon Tea, and their endeavours have met with a satisfactory response in this respect, orders having been received and repeated from Home and the Continent as well as the Colonies. A list is appended at the foot of this report.

The gross sales of Tea show an increase on the previous year, and the quality has been much appreciated by visitors to Ceylon and others.

In continuation of the policy initiated by the present Directors to reduce liabilities incurred in advertising and introducing Ceylon Tea on the Continent and in America, the Board has decided to write off a portion of the amount. The working of the Company for the past year may be considered satisfactory, and under ordinary circumstances a dividend has been earned.

While, however, the comparatively large amount of Capital—R3,654,74—remains locked up in the New Oriental Bank Corporation, Limited, in Liquidation none can be paid for the present.

MEMO. OF PLACES TO WHICH CEYLON TEA HAS BEEN SENT IN 1895-96.

- Australia.—Adelaide, Albany, Melbourne, Sydney.
- Austria.—Fume Gratz.
- Aden.—Aden.
- China.—Hongkong, Shanghai, Tientsin.
- Egypt.—Port Said, Suez, Cairo.
- France.—Castres, Giron es
- Great Britain.—Bristol, Brighton, Bonchurch, Berkeley, Beverley, Buzzard, Colchester, Covan, Canterbury, Cowes, Chatham, Croyden, Dloore, Dublin, Dulwich, Dnnmore, Donegal, Dnnedin, Edinburgh, Erlington, Glasgow, Halifax, Havant, Inverkip, Ipswich, Kingston, Letterkenney, Kel, Liverpool, London, Leicester Loughborough, Leeds, Lettes, Lurgan, Leighton, Mulo haum, Maynalty, Macclesfield, Man Nottingham, Praigton, Plymouth, Ridsrove, Southampton, Srewsbury, Spilsby, South Sea, Tillicoultry, Western Supermare, Wellingboro, Alloa, Aberdeen, Abbotsbury, Basingstake, Cork, Cheltenham, Dumbarton, Devon.

port, Forfar, Lydd, Maerhip, Northback, Penzance, Preston, Teddington, Whittesford, Winchfield, Weymouth, Wolverhampton.

Germany.—Insel-Leipzig, Reigen, Weimar.
Hungary.—Buda-Pesth.
Holland.—Amsterdam.
India.—Calcutta, Rawal Pindi, Umballa, Karachi.
Japan.—Yokohama.
Mauritius.—Mauritius.
Singapore.—Singapore.
United States of America.—Detroit.

Note.—A. Tea is delivered at any port in the world, and B. At any address in Great Britain, freight, duty and all charges paid, either before shipment or on delivery at destination. Rates on application.

The quality of the teas is always maintained regardless of cost, the X Blend Tea being a Blend of the choicest Ceylon Teas obtainable.

Remittance by P. O. Order or Bank Draft, which should accompany Order, to be made payable to the Ceylon Tea Company, Limited.

OUVAH AND SPRING VALLEY COMPANIES.

The annual meetings took place at the London office of the Companies on 27th May, Mr. Alfred Brown presiding, supported by his brother Directors, including Mr. Oswald, while some half-dozen City shareholders made up the meeting—the only old Ceylon resident besides, I noticed, being Mr. Geo. Smyttan Duff, the former respected Manager of the old Oriental Bank, whom I was glad to see looking exceedingly well considering his years.

I sent you the Spring Valley Report last mail—that of the Ouvah Company may have reached you also, but in case not, I send it now. [Duly received and published.—ED. C.O.] The fact emphasized by the Chairman most in both cases, was the better price paid for their teas last year than in 1894; the good yield of crop and the first-class factories provided. In the case of SPRING VALLEY, a good coffee crop had helped in 1895; but this was not to be repeated in 1896—when the crop would be poor, and although tea was increasing, yet with the area of young tea to keep up and that to be planted—150 acres in '96 and '97, till 1,650 acres in all were reached—the Chairman could not say how the dividend for the present year might be, though the prospects thereafter should be good. He considered the Company should stop planting at 1,650 acres, or at any rate add to this slowly if at all. The purchase of Kotagodde estate had been a good one, strengthening the Company, and he congratulated the shareholders on the increased value of their property as a whole—shares which were at £2 not long ago, being now at £6.

A SHAREHOLDER wanted to know, in the case of Kotagoda, how the purchase money (£6,300) was provided.

ANOTHER SHAREHOLDER—if the 5 per cent dividend would be kept up for 1896.

A THIRD SHAREHOLDER—how much of the area in tea on Spring Valley was on old coffee land, and how much, if any, on virgin land.

SMOKERS SHOULD USE CALVERT'S DENTO-PHENOLENE, A FRAGRANT LIQUID DENTIFRICE AND MOUTH-WASH.

Editor of *Health* says:—"The most effective preparation for ridding the mouth of the aroma of tobacco, and leaving a pleasant taste."
Sold in 1s. 6d., 2s. 6d., and 1 lb. 7s. 6d. bottles,
by Chemists, & c.

F. C. CALVERT & CO., MANCHESTER.

The CHAIRMAN replied that the Directors were inclined, if approved by shareholders, to pay for Kotagodde out of profits taking £1,000 a year or so. Next, that it was impossible at present to say how the dividend might be—much would depend in the coffee prospects for '97; for if the Directors felt assured that a good sum was to come in for coffee next year, they might feel more justified in recommending a good dividend for 1896.—As to area planted, most of Spring Valley tea was on coffee land, very little on patna or scrub, and there was this to remember that the worst coffee on the estate was first superseded by tea, so that there was further reason to expect better crops from the younger tea.

The Reports of both Companies were duly carried.

The CHAIRMAN in proposing that Mr. Oswald take the place permanently of Mr. Potts as Director, spoke in high terms of the aid he had already rendered, and of the large stake in the Companies' shares he represented.—The election was duly carried.

In moving a vote of thanks to the Chairman, Directors and officers of the Company, Mr. J. FERGUSON congratulated the shareholders on securing one so well-qualified to succeed the late Mr. Brown as Chairman, and on adding to the Board a gentleman with the business capacity and Ceylon experience possessed by Mr. Oswald, whom he knew to be highly esteemed; while in their Secretary, and Ceylon Managers they had all good men and true.—Carried with applause, Mr. Brown and Mr. Oswald duly returning thanks.

A NEW PATENT ROLL-BREAKER.

Apparatus for breaking up balls of rolled tea, giving the leaves a final roll, and separating the finer and coarse portions while freely exposed to the air. The leaves are fed by a hopper between a fixed corrugated plate and a rotary corrugated disc which is driven by a shaft adjustably mounted in a footstep bearing. The leaves fall from the edge of the disc upon a screen, which is oscillated by a cam on the shaft, and the larger leaves fall from the end of the seive, while smaller ones pass through it. The upper plate may be fitted with a steam jacket, when it is desired to heat the leaves under treatment, and it may be hinged at one side in order to give access to the corrugated surfaces. A modified form of the apparatus is described in which the discs are arranged vertically.—*Illustrated Official Journal (Patents)*. May 20.

COORG: A NEW TEA DISTRICT.—There is no end to the faith that is held in tea. The latest district to point out the desirability of opening out in tea is Coorg, where the Western Ghats are considered peculiarly favorable. The rainfall is certainly ample enough and the forest land good and abundant. Certainly West Coorg is a district to prospect for men who are still sanguine of tea paying for the next twenty years or so. We believe we are correct in stating that the two failures in experimental tea cultivation—both in or very near Mercara—were due to the extreme shortness of yield owing to the rainfall at this station not being sufficiently distributed, coupled with the wretched "grass" land chosen for the sites. Further west, down the ghaut, conditions are far more favorable. The only drawback is the fact that during the S.W. monsoon no produce can be shipped from the Coast. Were, however, the contemplated pier at Tillocherry constructed, as it undoubtedly should be, this objection would be removed.—*Planting Opinion*, June 20.

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce).

Colombo, June 23rd, 1896.

EXCHANGE ON LONDON: CLOSING RATES, *Bank Selling Rates*:—On demand 1/2¹/₂ to 5-32; 4 months' sight 1/2 5-32 to 3-16; 6 months' sight 1/2 3-16 to 7-32. *Bank Buying Rates*:—Credits 3 months' sight 1/2 9-32 to 5-16; 6 months' sight 1/2 5-16 to 11-32. THE
AGRICULTURAL MAGAZINE,
COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for July:—

Vol. VIII.]

JULY, 1896.

[No. 1.

OURSELVES.

THE present issue opens the VIIIth volume of our Magazine, the first number of which was issued at the beginning of July 1889, from which date the Agricultural Magazine has continued to appear monthly before the public without intermission. Since then also changes both as regards the quantity and quality of the contents have taken place, and we trust that such changes have always been improvements. The interests which the conductors of the Journal have at heart are embodied in the announcement which usually accompanies the advertisement of the Magazine, viz., "the development of Eastern Agriculture; the introduction of improved methods of culture, seeds, plants, implements of husbandry and dairy apparatus; while we also make it a point to record information of local interest, referring to crops and stock."

Indeed, we have even gone further and treated of other subjects in our endeavour to make the Magazine as interesting and entertaining as well as useful to our readers. We take this opportunity of thanking our contributors and subscribers for their help in maintaining the Magazine, and the Press for its patronage.

SEASON REPORTS.

WESTERN PROVINCE.—Yala cultivation nearly completed. Fruit and vegetables plentiful, except in the Negombo district where it is reported to be scarce.

CENTRAL PROVINCE.—Maha harvesting nearly over and Yala cultivation proceeding. Supply of vegetables good. *Stock*.—Foot and mouth disease prevailing in Walapane.

NORTHERN PROVINCE.—Paddy lands being manured and ploughed, outturn of dry grain not satisfactory for want of rain. Tobacco crop harvested and a failure in quality reported. *Stock*.—Cattle plagues reported in Vavonia and Mullaitivu districts.

SOUTHERN PROVINCE.—Maha crops reaped and thrashed in Hambantota district, yala cultivation proceeding. Vegetables and fruits abundant. There is scarcity in East Giruwa Pattu, where the usual food supply has failed, villagers eking out an existence on jak fruit.

EASTERN PROVINCE.—Paddy fair, but is likely to be damaged by blight. Vegetable products getting rare for want of rain.

NORTH-WESTERN PROVINCE.—*Puttalam*. Yala cultivation has been retarded owing to want of rain. Fine grain crops too have failed. *Chilaw*.—Yala sowing has failed in some places for want of rain.

NORTH-CENTRAL PROVINCE.—Maha crops reaped, yala cultivation proceeding. *Stock*.—Cattle plague still prevailing.

UVA.—Paddy crops thriving and prospects good. Fruits and vegetables scarce. *Stock*.—Foot and mouth disease prevalent among cattle in Gampola.

SABARAGAMUWA.—Yala cultivation in progress, prospects generally good. *Stock*.—Cattle plague

and foot and mouth disease reported from Kegalle district.

N.-W. PROVINCE.—*Kurunegala District.* Paddy—ploughing and sowing. Want of rain retarding operations in Wannu Hatpattu, and this cause is interfering with crop prospects in many places. *Stock.*—Health fair, except in Katugampola and Dambadeni, where cases of murrain are reported.

Greatest amount of rainfall in any 24 hours on the 13th June, 3·22 inches.

Recorded by M. W. K. BANDARA.

OCCASIONAL NOTES.

In our next issue an interesting paper by Mr. G. W. Sturgess, Colonial Veterinary Surgeon will be commenced; the articles on Fruit Culture by M. Zanetti, and on Forest Law by the Law Lecturer in the Forestry School will be continued; while we also hope to publish a communication from Professor Wallace.

We would draw special attention to "Facts and Figures *re* Coconut Cultivation," containing interesting and reliable information on the subject of coconuts and the products of the palm generally. When we published the letter of "Cocopalmit" we anticipated that there would be some discussion over his contribution, and if our correspondent's estimates were rather wide, he will have done good service to the cause of coconut cultivation if his letter leads to the question of estimates in connection therewith being fully threshed out, by calling forth more valuable, because more accurate, information with reference to coconut planting, which is beginning to be looked up—to judge from the present tendency in planting affairs—as our safest and most stable agricultural enterprise.

The uncertain weather which characterised the advent of the S.W. Monsoon rather interfered with calculations for the pruning of the grape vines at the School of Agriculture, as it no doubt also put out the calculations of most

persons engaged in agricultural pursuits. After mature consideration, however, M. Zanetti decided on doing the pruning on the 31st April, on which date the vineyard was operated on, and the whole area pruned within half a day with the help of some of the students, to whom the work has proved a valuable lesson.

M. Zanetti's contribution on pruning will, we anticipate, be much appreciated by many, who for want of a proper knowledge of the principles which guide this important process—the value of which is practically unknown to the native cultivator—have carried on their fruit culture at a great disadvantage. We trust M. Zanetti will continue to favour us with further contributions with reference to what is a much neglected industry in Ceylon, and about which, from his long practical experience with cultivation of fruit trees, our correspondent is ably qualified to write.

Mr. D. Chinniah, a successful student of the School of Agriculture, has been awarded the Ceylon Government Scholarship for the study of veterinary science in India, and left for Bombay, to join the Veterinary College there on the 20th May. Mr. Chinniah showed special aptitude for veterinary work, and we shall expect, as we hope, that he will go through his course of veterinary studies with much credit. The policy of Government in training up natives to the veterinary profession, so as to reach the masses in Ceylon through their own countrymen, is a most commendable one.

A correspondent desires to be informed whether there is any known and reliable method of judging of the age of trees, "such as ordinary timber trees or coconut trees." He refers to the method of fixing the age of trees in England by the annual rings in the wood of the stem, and asks if this is a reliable way, and whether there are any analogous indications of age in forest-trees in the East. The question is one which is for the Forester to deal with, and rather than reply to our correspondent ourselves, we would bespeak the aid of some one versed in the Science of Forestry, and therefore more qualified than ourselves to supply the information asked for.

We have been applied to for some definite information regarding the quantity of milk required to make a pound of butter. We hope to be able to deal fully with the subject in our next issue.

FACTS AND FIGURES *RE* COCONUT CULTIVATION.

A correspondent writes to us with reference to "Cocopalmit's" facts and figures regarding coconut cultivation: "I note on pages 111 and 112 of your current number, figures concerning the weight of coconut products. The information is not valuable, because it only deals in outside estimates, and the range quoted is almost ridiculously great. If your informant will quote average yields and weights, his figures will be of value to us." Our correspondent who states that he himself has collected much valuable information on the same subject from time to time, refers us to pages 44-46 of Sessional Paper XII. 1895. This official document is the second report of the Commissioners

(Messrs. Allanson Bailey, W. E. Davidson, A. C. Kingsford, and H. V. Lushington) appointed by the Governor to report on the proposal to extend the railway into the Kelani Valley. Among the Appendices we find much useful information on the subject of coconuts. We quote as follows: "As regards the yield a table is inserted here collating the leading authorities in Ceylon on this point. From it may be deduced the fact that the scientifically cultivated estates in Siyane Korale would yield not less than an average of 40 nuts per tree or 3,000 nuts per acre." There are some no doubt who will object to the authorities mentioned in the annexed table being called "leading authorities" when the names of such well-known planters as Messrs. Wright, Jardine, de Mell, Schrader &c. are left out; but the value of the figures is by no means diminished on that account. The information which follows is culled both from the Sessional Paper referred to, and also from the notes of the correspondent who was kind enough to draw our attention to the official publication.

8. Meedeniya R. M.'s estimate for three Korales ...
Mr. F. Beven's estimate:—
(a) Average for well cultivated properties ...
(b) All round average for the whole Island ...

The following notes compiled from various sources and specially checked by Mr. F. Beven, of Franklands, Veyangoda, give full particulars as to the weight of the various products:—

(1) Oil.—40 nuts yield 1 gall. of oil, value R1 to R1.25.

500 ,, or 12½ ,, = 1 cwt. value R15 to R16.50.

One acre at 3,000 nuts given 6 cwt. oil, value R99.

Note.—The number of nuts per gall. of oil varies in different districts from 30 to 45. Mr. Beven quotes 36 nuts as a fair average.

(2) Poonac.—The oil ought to be ⅔ of the original weight; poonac ⅓. If an acre yields 6 cwt. oil, it ought to yield also 3 cwt. poonac.

Poonac varies immensely in price according to its quality. Perhaps R2.50 per cwt. is a fair price. Thus an acre which yields 6 cwt. of oil for R99 and 3 cwt. poonac at R2.50, gives a gross return of R106.50 exclusive of the value of husks.

(3) Copra is sold by the candy or param which = 5 cwt. or 560 lb. It is generally reckoned that 1000 nuts yield a candy of copra. (It varies from 900 in the Chilaw district to as much as 1500 elsewhere). The usual calculation is that 2 nuts = 1 lb. copra. A fairly good estate with a yield of 300 nuts per acre would give 15 cwt. of copra, or at R46 per candy, a gross return per acre of R138.

(4) Coconuts.—A green coconut with husk on weighs 4 lb.; if dried it weighs 2½ to 3 lb.; if dried and husked 2 lb. The yield by weight of an estate gives 3000 nuts per acre is over 2½ tons. Mr. H. L. Daniel, who is said to be the first coconut planter who kept statistical records of the yield of coconut properties gives the following:—

Estimates:

Coconuts:	Nuts per tree.
Chilaw district	60, 70, 80
Negombo "	50, 60
Maha-oia "	50, 60
Siyane Korale East	35
Hewagam, Salpiti and Rayigam	
Korale	25 to 30

[N.B.—Good cultivation will yield even in Hewagam Korale 45 to 50.]

Copra:

- 900 nuts for a candy is the best result.
- 1000 " " " is a high return.
- 1200 " " " is a fair average.
- 1500 " " " is the result with heavy bearing trees.

Nuts yield in chekku mills ⅔ oil to ⅓ poonac. Theoretically, coconut trees are planted 25' x 25', or 75 trees to the acre, but 70 is a high average. Native gardens may be more thickly planted, but the yield is more than correspondingly less. A fair average for old estates is 60 trees. New estates, without vacancies average 70 trees.

The average weight of copra of an average acre in Siyane Korale would be not less than 7½ cwt.

THE PRESERVING OF FRUIT.

(Continued.)

Fruit preserved in the manner already described will keep for years. In cans the fruit will keep in almost any position and regardless of temperature, but in glass jars the case is somewhat different. Light promotes chemical action, and hence fruit in glass jars must either be stored in a cool underground room, or a cheap substitute and safe receptacle may be easily made by sinking a common box, of sufficient size in some out of the way corner under the house. Absence of light and a uniform, if not very low, temperature will keep all canned goods safe. To be sure, however, the glass jars should be wrapped with paper to exclude the light.

There is another way of preserving fruit which might be referred to in closing this paper, viz., by drying. The practice of preserving fruit by drying in the sun is very old. Of late in America, and to some extent in Europe, this primitive practice has given place to canning and the better method of drying; but even yet in parts of Europe and the East the sun drying of fruits is a common employment. Figs, dates, raisins, currants and prunes are to a very large extent dried by this original method. Not long ago in Australia apples, peaches, pears &c., were pared and dried on house-tops or upon elevated platforms on crates or racks. In thus drying apples, for instance, the fruits were pared, cored and quartered and then placed on tables and drying boards tilted up so as to get the greatest sun exposure. Often the fruits were strung on strings, and hung on festoons near the ceiling over the kitchen fire—a practice not to be commended for obvious reasons. Later on, fruits came to be dried over stoves variously designed. A common but really efficient form of these primitive driers is thus described by an American writer: "It was composed of three things, viz., a hogsh-head, a tin box and a small stove. The hogsh-head stood on end and half a door sawed out of the side to admit the stove; a hole 18 inches square was sawed in the head of the hogsh-head to let the heat of the stove up, and a six or seven foot box, having the lower end knocked out, stood on end in the top of the hogsh-head, and was carefully fitted over the hole in the head of the hogsh-head. The heat ascended from the stove through the top of the hogsh-head and on through the box. A pipe hole was made in the hogsh-head opposite the door to let the smoke out, so that none ascended through the box. The lid of the box was fitted with hinges, and cleats or supports were put in on which to rest the open shelves or crates which held the fruit. The stove was heated by wood or coal. Some such simple contrivance as the above might be made by any one capable of using a saw and hammer, and enable him to dispose of fruit when available in a convenient and palatable form.

Practically all fruits are suitable for canning, and more, may be preserved by drying, and a large variety of vegetables, such as potatoes, pumpkins, tomatoes, carrots, beans, peas, Indian corn, &c. Fruits that are generally peeled before cooking must be pared before evaporating, and all must be sufficiently divided to make rapid and thorough drying possible. The point to be arrived at in evaporating is to secure thorough and not too rapid drying. If too great or too dry heat is employed the fruit is partly cooked, or else evaporated so rapidly that the fruit cells are ruptured and a flavourless insipid article is the result. The temperature of the air nearest the source of heat must not be above 200° F., but for drying the more delicate fruits and vegetables this temperature is somewhat too high. To modify the influence of heated dry air it is the practice to introduce into the evaporator shallow vessels filled with water, placing them where the heat is greatest and driest, near the stove or other heater employed.

PRUNING.

[I send you a few notes on pruning, which I shall be very thankful if you will publish, my object being to try and remove some prejudices against the operation and acquaint fruit growers with some of the mistakes made by them in their system of fruit growing in the Island. A little personal experience following upon the lessons of illustrious authors on agricultural science, such as Boussingault, Liebig, Ville, Wagner and others has aided me in this attempt, so that if your readers find my notes of any value at all, let them render their thanks to those high authorities and be thankful only to them.]

The pruning of fruit trees is the most important part of fruit culture when we want to obtain a proper and well-matured crop. I have seen very little done in this line in Ceylon by a few amateur growers, and nothing at all by the natives who, on the contrary, dare not cut a single sucker off a tree fearing they might injure it. Plenty of wood, little fruit, and that sour, are the results of this treatment. If oranges are cultivated properly, there is nothing in this island to prevent the trees giving us fruit as good as is obtained in other countries. I am not blaming the poor villager for leaving his fruit trees to grow wild, and so lose the chance that nature, assisted by a little care and labor, offers him. If he does not know any better, is he to be left in his ignorance for ever? And is it not the duty of somebody to begin to show him his errors, and so encourage him towards earning an honest and remunerative livelihood, and thus render his life more useful and happier than it is today?

I will not say that by pruning old trees we will obtain at once good fruit (as no grafting has ever been attempted but all trees grown from seedlings, generation after generation, a good fruit cannot easily be obtained) but by taking one of these trees thoroughly in hand and letting it undergo rational pruning, the improvement in crop and quality must follow. By suppressing a useless branch the sap which went to support it will go to the benefit of those remaining, and their buds being well nourished will soon bring forth the healthy shoot which in time will carry blossom and fruit.

I consider the very last days of drought the best time for pruning here; at this period there being practically a cessation of growth, the plant will be saved from the shock of heavy pruning.

The tree must be trained from the very first to a single stem, and preference always given to the healthiest and straightest. This attention paid to a young tree will make it grow fast and vigorously, and there will be no harm in allowing it its own way till it reaches its third year of existence, when we will have to prune it so as to give it a uniform appearance. The vigour of a tree depends mostly on the equal distribution of sap to all its branches. If a branch does not receive a full and regular flow of sap, it becomes weak and bears but poor fruit which will never attain proper maturity. It is hence necessary if we want to secure for our trees both symmetrical form and vigorous health to prune so as to maintain an equally distributed flow of sap through all primary branches. The way to bring about this equalized flow consists in cutting little or nothing off the weak branch but shortening the strong branch

to the height of the weak, taking care to cut short at laterals.

The durability and vigour of a tree depends a good deal on the relation of the branch system to the root system—the growth above ground to the growth below ground. This is why in transplanting any sort of tree we must cut its branches proportionally to the roots, the same as when a tree is affected by root disease or when very old.

The sap is always inclined to run from the roots to the branches as vertically as possible, so that it is found to be more copious in vertical than in lateral branches, and this is the reason why long vertical branches should be shortened to the height of the rest.

It would break the heart of a native to see about ten feet of a fine long branch ruthlessly cut off while endeavouring to emulate the neighbouring coconut tree (not seldom too neighbourly). In view of the native's prejudice to pruning I might give this advice: when a branch of an orange tree is too vigorous in growth, and therefore little productive of fruit, in order to stop its growth, it can be arched or bent. Again, a bent and feeble branch can be rendered vigorous if straightened. The sap in a short-cut branch, or in one that has been bent, will bring forth healthier buds than it would if the branch when cut is still fairly long or is left straight. This fact is easy of comprehension—the sap having to nourish a few buds only will be more abundant and the few buds will bring forth shoots much stronger than those produced by fifty or sixty.

We should never prune for fruit only, but try and prepare our wood for the next year also. Practice only will teach the pruner to distinguish between a branch carrying shoots with buds for fruit, and another for wood, the principal rule to follow being that the same shoot which has given us fruit this year will not do so next year unless a secondary one is formed during the fruiting season.

If a tree has been exhausted by a heavy crop it is advisable to prune it very short for two years, not for fruit but for wood. By this means it will obtain a sufficient quantity of new wood to revive the circulation of sap and so re-establish the needed equilibrium for the production of fruit. The sap being always inclined to ascend to the extremities of the branches will develop the upper buds with greater vigour than those in the middle or at the bottom. This should always be taken note of when we are pruning young trees and want to obtain elongation of the other branches. In cutting a long branch short, the cut should always be made about half an inch above the healthiest bud or shoot.

There is a good deal to be said yet, but I do not wish to take up too much of your valuable space at once, and will leave it for another issue whenever space should be available.

C. ZANETTI.

HOUSEHOLD HINTS.

PEANUTS FOR CONSUMPTION.—Dr. Brewer in the *Journal of Hygiene* has a new idea concerning food for consumptives. His treatment consists in inhaling the fumes of vinegar and eating of

peanuts or groundnuts. He gives his patients as many peanuts as they can eat without injuring their digestive organs. Two young ladies who had been the rounds of the doctors and had taken cod liver oil and tonics till they were nearly dead, were put on his treatment and recovered. Concerning these cases Dr. Brewer says: I now recommend feeding (do not laugh) peanuts. One would think this a very indigestible diet, but they craved them, and it has always been my policy to find out what my patients desire to eat, and unless it is too unreasonable I humor them. Both young women have become quite plump, and after a year's inhalation have ceased coughing and I pronounced them well. The peanut was long known as an excellent fat producer, and much more agreeable than cod liver oil. While not all can digest peanuts, a great many even with feeble digestion eat them without discomfort. It beats the Koch lymph and it is the most satisfactory treatment I have ever tried for these diseases.

Science to-day tells us that we may live under the most beautiful conditions; we may feast on bread, meat, eggs, rice, cocoa, oatmeal and such like foods for a short time, but unless we take fruits or fresh vegetables—fruits being the best—we shall get listless, with leaden face, etc., until we die in a few months at the longest; and it follows that if we would keep ourselves and our children with clear skin, bright intellects, good digestion, rich-colored healthy blood and strength for work, we must regularly take fruit and vegetables, and look upon them as actually more necessary for the support of good health than any other article of diet.

To clean black cashmeres and merinos, first well brush and remove all dust, wash very quickly in warm water in which soap has been lathered. A good quantity of ammonia should be put into the water; there should be as little rubbing as possible; the rinsing should be done in blue water, containing a handful of salt. Soap should never be rubbed on.

To destroy insects and vermin dissolve 2 lb. of alum in three quarts of water; let it remain till the alum is dissolved, then with a brush apply boiling hot to every joint and crevice in the place where bugs, earwigs or other insects infest; brush all the joints and crevices of bedsteads; keep it boiling whilst using; a strong boiling-hot tea of cayenne, used with a brush, is also a capital remedy.

Cut flowers will keep fresh if a small pinch of saltpetre is put in the water. The ends of the stems should be cut off a little every day to keep open the absorbing pores.

Paint can be removed from glass by rubbing it with hot strong vinegar. Stains on hands can be removed by acetic acid or salts of lemon, and ink-marks will soon yield to pumicestone.

SAND TARTS.—A cup of sugar, half a cup of butter, a cup and a half of flour and an egg. Roll out thin. Cut in rounds. Spread the top with the white of an egg, sprinkle with cinnamon and sugar. Bake in a quick oven.

A good complexion never goes with a bad diet. Strong coffee, hot bread and butter, heated grease, highly spiced soups, meats or game, hot drinks, alcoholic liquors, fat meats, are all damaging to its beauty.

Salt preserves the teeth, keeping them white; the gums healthy, and the breath sweet. Put some in an iron shovel, place it over the fire and when quite hot pour into a thin bag. Apply to any part affected with neuralgia or intense pain.

To remove mildew from linen: First of all, take some soap and rub it well into the linen, then scrape some chalk very finely and rub that in also, lay the linen on the grass, and as it dries wet it again. This done twice or thrice should remove the mildew stains. Another way is to mix soft soap and powdered starch with half the quantity of salt and juice of a lemon. Lay this mixture on with a brush, and let the linen lie out on the grass for a few nights and the stains will disappear.

Paint stains may be eradicated from white or coloured cotton or woollen goods by rubbing with oil of turpentine, or benzine, followed by soapsuds. For stains of paint on silk, apply benzine or ether, but avoid hard rubbing. Equal parts of ammonia and turpentine well mixed, and the spots saturated with it, is also an excellent way of taking out paint stains. Wherever possible afterwards wash the mark with soap and water.

Dissolve a teaspoonful of alum in a quart of water. When cold, stir in as much flour as will give it the consistency of thick cream, being particular to beat up all the lumps; stir in as much powdered resin as will lie on a sixpence, and throw in half-a-dozen cloves to give it a pleasant odour. Have on the fire a teacup of boiling water, and pour the flour mixture into it, stirring well at the time. In a very few minutes it will be of the consistency of mush; let it cool; lay on a cover and put in a cool place. When needed for use take out a portion and soften it with warm water. Paste thus made will last 12 months. It is better than gum, as it does not gloss the paper and can be written on.

THE NUTRITIVE PROCESS IN PLANTS.

Prof. J. Reynolds Green, D.Sc., F.R.S.

(Continued.)

We find specially occurring in the cell, when it is at the height of its activity, representatives of two great classes of bodies, carbohydrates and proteids, the former consisting only of carbon, hydrogen, and oxygen; the latter containing nitrogen as well, with sulphur and possibly phosphorus. The former seem to be found independently; in the construction of the latter possibly carbohydrates are involved.

The absorption of carbon-dioxide by the cells of the leaf during sunlight is associated at once with the coincident liberation of oxygen. The amount of the latter given off is the same in quantity as that of the former taken in. The

first application of the energy of absorbed light is thus to the decomposition of the carbon dioxide. It is considered that this splitting up of the latter very intractable body is responsible for half the oxygen evolved, carbon monoxide and oxygen being formed according to the equation

Side by side with this decomposition there is the splitting up of some of the water in the cell thus:

The two molecules of oxygen are given off and the two residues, the carbonic monoxide and the hydrogen combine to produce a body known as formaldehyde, &c. Further complex processes supervene, the formaldehyde being very speedily replaced by a sugar.

At this stage we have reached a material which is directly serviceable as a food-stuff both to animal and vegetable protoplasm. Whatever be the form of sugar thus formed—whether cane sugar as now appears probable, or some other kind—we have the construction, from simple inorganic substances, carbon dioxide and water, by a series of very intricate chemical processes, carried out by the protoplasm under the conditions above noted, of such complex organic material as will serve for the nourishment of the plant.

Similarly we may trace with more or less success the formation of proteid material. It takes place probably in the same cells under the same influences, though from different materials, and by very different steps. Chlorophyll does not seem to be directly necessary for the process, but most likely carbohydrate matter takes a part in the construction, possibly being combined with peculiar nitrogenous crystalline bodies known as amides, which are in their turn constructed from the simpler compounds of nitrogen taken in from the soil. Chlorophyll is thus concerned, though indirectly, in the production of proteids in the green plant.

Both sugar and proteid material are available for the nutrition of the cells in which they are formed, and if constructive ability is not very great, as when light is dull or temperature low, probably they are at once used up. But it is different when the plant is well illuminated; then construction is active, and a large quantity of both classes of material is made, far indeed beyond immediate requirements. The form of the leaf and the peculiarity of behaviour both of stem and leaf, go to show that construction beyond such requirements is distinctly advantageous. The substances of the leaf is very small in comparison with its surface; its cells are so arranged as to secure the greatest possible amount of light; and its position is definitely taken up so as to place its upper surface at right angles to the incident rays.

The first sign of this excess of activity over consumption is to be found in the appearance of small grains of starch in the cells of the leaves. It is important to note that the stable body, starch is not the form of carbohydrate on which protoplasm can feed. Whenever starch is to be used for nutritive purposes, whether by animal or by plant, it has to undergo a conversion into sugar. The starch thus appearing in the leaf is then the first indication of the process of storage of reserve materials. True it does not persist long in the leaf. Formed during the day, it is removed

during the night, and stored again elsewhere. We may wonder, perhaps, that the plant should turn its carbohydrates into starch for such a short space of time; possibly the excess of sugar tends to render the protoplasm incapable of discharging its functions, and so the surplus is withdrawn from the active life of the cell, being laid down in insoluble form. Its deposition in quantity can readily be seen by a very simple experiment. If a leaf be taken from a tree during the hours of bright sunshine, killed and bleached by warming in strong alcohol, and then immersed in an alcoholic solution of iodine, it turns a deep blue colour wherever the light has had access to it, owing to the formation of the blue iodide of starch.

The disappearance of starch during darkness can be similarly demonstrated, another similar leaf being selected from the same plant, and gathered in the early morning, or after a period of imprisonment in a dark room. The iodine treatment does not then colour the leaf blue, indicating the absence, or rather removal, of the starch which the first experiment has shown to be present in the leaves during and after immediately their illumination.

The starch is manufactured at the expense of the sugar, as we have seen. It is in the form of grains of definite shape, which are built up by the chloroplastid, and occupy a definite place in relation to the latter. The shape it takes being that of a very small granule, its position is in the interior of the chloroplastid. Often two or three are formed inside the same plastid. They can be detected by a high power of the microscope, after bleaching the leaf and staining it with iodine.

They never attain a large size, and never have the complex structure which starch grains attain in reservoirs which retain them for a long time, such as the cells of the potato tuber.

The formation of the starch granule in the interior of plastid is due, then, not to the chlorophyll but to the protoplasm of the chlorophyll grain. The latter converts the sugar which has been formed into starch, by a process closely resembling, if not identical with, true secretion such as we find taking place in an animal's gland.

GENERAL ITEMS.

The Colonial Veterinary Surgeon of Cape Colony replies to a correspondent who asks where the gall-bladder of the horse is situated, that the horse, like the ostrich and some antelopes, has not got one. The idea that a horse's gall-bladder is somewhere in the region of his head arises from the fact that it is not to be found about the liver, and also that when a horse is dying from the pulmonary form of horse-sickness a quantity of a pale yellow-looking fluid, resembling frothy beer, flows freely from his nostrils, the origin of which many people attribute to the gall-bladder having burst in his head.

A successful remedy against red spider is to syringe the trees thoroughly with sulphur and soapy water. This is to be left on for about four days and then syringed off with clear water.

The Sydney *Stock and Station* says that the Chief Inspector, Mr. Gordon. "has under consi-

deration the matter of constructing dips at certain points in the proclaimed southern line of quarantine. These dips will be constructed on the American principle and will be 10 ft. deep and cemented. The cattle will be driven into them through a narrow lane and will come out into a cement-floored draining yard, where the dip will drain back off the beast into the tank.

"With reference to the dip to be used in the troughs, Mr. Gordon states that only two have been found to be efficacious and then only at great strength. Common sulphate of iron has been found very efficacious, however, at a strength of about half-a-pound to the gallon of water. If the ticks which this solution does not actually kill drop any eggs after the immersion the eggs are found to be infertile.

"Mr. D. Miller has been successfully treating the bullocks in his paddock that were infested with ticks. The cattle, eighteen in number, were dressed with a preparation consisting of eight gallons of tallow, five gallons of oil, half gallon of Stockholm tar, and half gallon of paraffine. These ingredients were mixed and heated to boiling point, and the mixture was applied while warm. The cattle were put through a crush; the liquid being applied with tar brushes and two brooms. There were a number of interested people present, including Mr. A. Brook, stock inspector. The solution proved most deadly to the insects, as several of them were taken from the cattle and a drop poured on them, and in all cases they did not live three minutes afterwards. After the cattle had been thoroughly saturated they were turned back into the paddock, and on examination four days later were found to be perfectly free from ticks."

A correspondent of the *Australasian* writes:—"On stations and farms in many parts of the colonies and more particularly in the hot back country it is difficult to keep cream sweet or to make good butter, where it is required for home use in small quantities through the summer. Being confronted with this difficulty many years ago it occurred to me that the method so common of keeping water cool in canvas water-bags by hanging them in a draught, and securing the cooling effect of rapid evaporation, might be applied to cream and to the making of butter. After some experiments I found that by taking a piece of common sheeting calico, putting it over a bucket and pouring the cream into it each morning, then taking up the ends and tying a string round it and hanging under a verandah, the cream is kept cool and sweet, and after hanging so for twenty-four hours it can be taken out, and by stirring a few minutes with a spoon it may be converted into the best butter. The cream does not pass through the calico, but the water does, and produces the same cooling effect as is produced by the canvas water-bags so commonly used; and as in the course of 24 hours nearly all the water which the cream contains is filtered out, with some of the buttermilk, there is never any difficulty about getting the butter, and the flavour is perfect. One of the principal advantages is that even a pound of cream can be kept, and easily converted into butter without any labour and with no failures. I have had this method in use now for a great many years, where only a few cows are milked for home use, and as

I think it may prove a boon to many of your readers in the warm parts of all the colonies I send it for your columns. It may be capable of application on a larger scale, but I have only used it with small quantities of cream. The principle is so easily understood by anyone who has used the canvas water-bag (and who has not), that there is not much likelihood of mistakes being made."

Referring to the above method of preserving cream, the *Agricultural Journal* of the Cape observes that it is on much the same principle as that for making so-called "fairy butter," which is done by tying up cream in a cloth and burying it in the ground. Though this way of butter-making was an Old World trick, yet a few years ago a patent was taken out in America, and it was proposed to adopt the plan on a large scale.

A potash manure largely used in agricultural districts is seaweed. In a fresh condition this manure may be described as containing about 3 per cent. of potash, and about half that amount of nitrogen, with a fraction of a per cent. of phosphates. Its manurial action and value are generally reckoned as similar to that of farmyard manure; but this is perhaps hardly correct. It, however, is a valuable manure.—*Australasian*.

It had been admitted for a long time past that the researches and conclusions of Lawes, Gilbert, and Pugh into the nitro-collecting habit of leguminous plants were fully borne out by experience, but it remained for the German scientists to show that the bacteria affecting the nodules on the roots of clovers, peas, &c., may with beneficial results be introduced into a field of leguminous plants where they are comparatively deficient. It is something like adding yeast to liquor—the fermentation is promoted. In any field where legumes have not been grown for some years it may be presumed that the bacteria

are not very abundant, but this defect may be remedied by sprinkling the field with some soil taken from a field where legumes have recently been grown, and the result will be that a large quantity of nitrogenous matter will be produced by the roots of the plants grown—or, rather, by the bacteria which are associated with the roots of the plants. In some cases, the farmers have sown some kind of leguminous plant along with a cereal crop, and then sprinkled the field with about a ton to the acre of soil taken from a field in which a leguminous crop had been grown. The result showed that the field was very much richer in nitrogen than before, and crops requiring nitrogen, and sown afterwards, were much benefited. Indian farmers grow Black Medick (*Medicago lupulina*) amongst their wheat crops, and it is said they never have occasion to apply nitrogenous manures to their fields. It is also said that the Medick does not depreciate the yield of wheat. These are matters that are worthy of further enquiry.—*Melbourne Leader*.

The mystery of nitrification is now so well known that any farmer can understand it. Plants thrive on nitrogenous food but apparently have no power to take it either from the air or the soil. Here the nitrogen-bacteria get in their work. These microbes, like atomic sponges, take in the nitrogen from the soil and the air, and transform it into nitric acid, in which form the plant can consume it. A soil may be destitute of nitrogen and need both that and the microbes, or it may lack only the microbes, in which case a supply of them renders the field immediately fertile. Stable manure has little nitrogen but swarms with the germs of microbes. Add to a field where clover seed won't "catch," a light dressing of soil from a plot where clover thrives to perfection, and a catch of clover seed is almost sure to result. Why? Because the soil added is full of the germs or microbes that enable the young clover plant to avail itself of the nitrogen in ground or air.—*American Agriculturist*.

[No. 2.]

GINGER.

BY J. CH. SAWER, F.L.S.

THIS very widely-used aromatic is furnished by the roots of the *Zingiber officinale* (Roscoe), an Indian herbaceous plant, with creeping jointed, woody root-stocks, from which are sent up every year stems surrounded by sheathing leaves arranged in two ranks. Its cone-shaped spikes of flowers are thrown up from the root-stock. The plant is largely cultivated both in the East and the West Indies; also in Africa (Sierra Leone) and in Queensland (Australia). The so-called Chinese and Siamese gingers are identical, but both of them are the produce of another plant, viz. the *Alpinia Galanga* (Willd). Yet, considering the wide distribution of *Zingiber officinale*, it is quite possible that the true ginger may also be cultivated in some parts of China.

The quality and commercial value of the dried rhizome from different localities varies considerably, being influenced very much by the method of cultivation, collection, and preparation.

Ginger is largely produced in all the warm and moist parts of India, up to an elevation of 4000 to 5000 feet. The best pieces of the previous year's harvest are selected and sheltered in a corner of an outhouse; the heap is then covered over with cow-dung to keep the roots from drying up. The land is prepared by ploughing it up two or three times, and then dividing off into beds, with a little raised edge round each bed, care being taken to make openings to allow superfluous water to run off; for if water stands on the crop the roots will rot. Pieces of the roots one or two inches long are then buried three or four inches deep in the soil at intervals of nine inches, and the field is next covered over with the leaves of trees, which keep the soil moist; over the leaves is spread to a depth of half an inch; when rains, the water, impregnated with manure, filters readily through the leaves to the

roots. Artificial irrigation is not employed during the rainy season, but after that period it is necessary. During the first three months of the dry season the field is weeded three times. At the end of that time the plants will be about two feet high, having eight fibrous tubers to each shoot; these are dug out and buried in another place for a month. They are then taken up, and if intended for use as "green ginger," are simply exposed to the sun for one day. If intended for dry ginger, the fresh roots are put into a basket, which is suspended by a rope, and two men, one on each side, pull it to and fro between them by a rope attached, and thus shake the roots in the basket; this process is carried on for two hours each day for three or four days. After this the roots are dried in the sun for eight days, and again shaken in the basket. A two days' further drying completes the process.

In Jamaica (where the finest ginger is produced) it has been ascertained that the soil which yields the very highest quality known in the market is the deep, black soil of the virgin forest; but to grow ginger under this condition involves the destruction of large areas of forest. Magnificent trees six feet in diameter may be seen in some districts lying rotting on the ground, while the ginger cultivators have gone further to the centre of the island. The plan adopted for clearing a forest is for a cultivator to invite a few of his friends to a "cutting-match"; he provides food, etc., and the laborious work of felling trees is carried on merrily, and without much expense. Afterwards fire is applied, and the place is burnt over. This burning is considered very important; probably because the resulting deposit of the mineral matters or ash returns to the soil those inorganic constituents which had been abstracted therefrom by the trees. Besides undoubtedly, the fire also sweetens the ground, corrects sourness, and, moreover, it destroys insect pests. Some cultivators will grow ginger only in freshly-cleared woodlands, and the next year they move on to a new clearing; but although they get in this way very fine ginger, it is at the expense of forest land. Albert Town was not so long ago a centre

for the cultivation, but it seems that growers have already got as far as fourteen miles further inland. Although ginger is an exhausting crop, and growers have been advised not to plant it on the same ground two consecutive years, it can be and is grown in many places year after on the same ground, but in this case it runs wild—or, as it is called “ratoons.” The “plant ginger” (the produce of planting) is of better quality than the ratoons, which, become inferior in each succeeding year. When the ground is too poor to grow white ginger, then the inferior blue variety can be grown.

As regards the application of manure, there is a prejudice against it in the West Indies, some growers maintaining that it breeds worms, and that there is a difficulty in getting it in any quantity. It is probable that those who have not succeeded with manure have used it improperly by applying it fresh or not sufficiently mixed with soil. As to obtaining it in quantity, oxample should be taken from the Chinese labourer, who preserves every particle of matter that can in any way be utilized as manure—not only cattle manure, but decaying matter of any kind, night-soil, etc.; even soapy water left after washing is very useful. To imitate the formation of forest soil, a pit might be filled with alternate layers of bush and manure; everything in the nature of manure or decaying matter should be thrown in, and a layer of soil directly over the manure would be useful. The pit ought to be lined with clay, to prevent the very valuable part of the liquid of the manure from escaping, and a cover of some kind should be placed over the pit to keep out rain. Such a compost, when quite decayed, would be found very useful for re-fertilizing the soil.

In some part of Jamaica a soil of well-drained clayey loam is selected. The method of planting out is the same as in India (above described). The small pieces of root are set in March or April. The flowers appear in September. When the stalks wither in the following January or February, it is time to dig up the roots. At this period these are fibrous and fit for drying; but if required for preserving in syrup, or candying, they should be dug up before the period, whilst they are still succulent. The mature rhizomes for drying are separately picked, washed, and scraped; they are then dried in the sun and the open air. Occasionally, owing to a very wet season, the people cannot dry the ginger in the sun; it then mildews, and the badly cured ginger sometimes found in the market is more frequently the result of this cause than of want of care in curing it.

Dried ginger is called by the dealers “races” or “hands.” It is in flattish, jointed, branched or lobed, palmate pieces, which rarely exceed four inches in length. The Barbadoes, Bengal, and African gingers are covered by a dry, shrivelled epidermis commonly called the “coat”; hence these sorts are usually said to be “coated” or “unscraped,” whereas the Jamaica ginger and some of the sorts brought from Malabar and Bengal have been deprived of their epidermis, and are, therefore, called “uncoated” or “scraped.” The external colour varies in different sorts of pale or bright yellow to dark or brown; the palest sort is the fine Jamaica, and this realizes the highest price. Cochin ginger resembles it, but is of a pale brownish tint externally. According to some authorities, the chalky-white appearance of the so-called “bleached ginger” is produced by submitting the root to the action of the fumes of burning sulphur or by washing it in a solution of chloride of lime; but it is also likely that this appearance results sometimes from a simple application of chalk or plaster of Paris.

The interior of the dried root varies like the exterior in colour; the best is that which cuts pale but bright. The consistence of ginger, as ascertained by cutting, varies from soft to hard, or, as it is termed in trade, “flirty,” the soft being preferred.

The Chinese ginger (above referred to as *alpinia galanga*) is cultivated in nearly all parts of the province of Kwang-tung. The districts of Nan-hai, which belongs to the city of Canton, produces greater quantities and a better quality than other neighbouring districts. The independent tribe of the

Misotsu, in the mountains at the north-western border of the same province are also said to produce large quantities of ginger. In the district of Hsin-hsing, about thirty miles south of the city of Chao-ching, on the Western River, three-tenths of the flat land and seven-tenths of the cultivated soil in the hills are planted with ginger. A distinction is made between the flat land ginger (called in the Canton dialect *Ten-Keung*), which is generally soft and tender, and mountain ginger (*Shan-Keung*), which is brittle and very pungent. This is generally used for home consumption; the Chinese pickle it in vinegar. The expensive *Ten-Keung*—syrup ginger—is almost exclusively consumed by foreigners or exported.

The marked difference between the Chinese preserved ginger and that from the West Indies has been carefully investigated at Kew, with the result that they are now considered to be produced from the West Indies has been carefully investigated at Kew, with the result that they are now considered to be produce from distinct plants, as above explained.

The plant furnishing “Siamese ginger” is reared in a desultory manner in almost every village, but so little care is bestowed upon the culture and drying that it markets at a very low price in the local bazaars. The best quality is procurable from the bazaars frequented by hill tribes.

The yield of essential oil from various dry gingers ranges from 1.9 to 2.7 per cent. The oil is yellow in colour. Its odour is intensely that of the root—the oil of Jamaica root being the most fragrant—but no variety yields an oil possessing the pungent burning taste of ginger; this taste is due to *gingerol*, the active principle of the root, and exists to the extent of from 0.6 to 1.45 per cent. It can be eliminated in the form of a viscid fluid of a pale straw colour, entirely devoid of odour, and of an extremely pungent and slightly bitter taste. It is very soluble in alcohol, even when highly diluted.

The total imports of ginger into the United Kingdom during 1894 were as follow:—

	cwt.
From India, the Straits, and Ceylon	.. 57,922
„ British West Indies	.. 6,848
„ Hongkong and other British Possession	.. 1,360
„ Sierra Leone	.. 14,933
„ Various foreign countries	.. 4,401
	<hr/>
	85,464

Powdered Ginger is sometimes adulterated with rice flour, but this is readily detected by the microscope. A more serious adulterant has lately come into use namely the addition of from 10 to 30 per cent of exhausted ginger, which is practically valueless. This can only be detected by a careful chemical examination.—*Planter's Gazette*.

COFFEE PLANTING IN BRITISH CENTRAL AFRICA.

A despatch has been received at the Foreign Office from Sir H. H. Johnston, Her Majesty's Commissioner and Consul-General in British Central Africa' with regard to coffee planting in these parts.

Sir H. H. Johnston states that coffee flourishes in almost any part of the British Central Africa Protectorate. At one time it was thought that its cultivation must be confined to the highlands above 2,000 ft in altitude, but it has since been found that coffee grows equally well in quite low-lying parts. The Liberian coffee, of course, actually grows better in the tropical plains, but as this kind does not fetch such high prices as the Mocha variety, which is the kind chiefly planted in British Central Africa, it rather the facilities for growing the last-named variety which must be taken first into consideration. It is not that the Mocha coffee will grow quite as well in the plains not many feet above the level of the sea as it will in the hills, but it may be stated positively that it grows as well at an altitude of 900 ft. above the sea as at 3,000 ft. Above 3,500 ft. the coffee is liable to be nipped by frost in the cool season.

Throughout British Central Africa the soil is nearly every-where very fertile—too fertile in some places—as it is absolutely virgin soil, and this excessive richness is doubtless the cause of much of the malarial fever which prevails. Not only is the soil rich, but it is everywhere well watered by perennial streams which render irrigation during the dry season practicable.

The average rainfall in British Central Africa is 50 ins. per annum, but in most of the districts it is about 45. The least rainfall in many district is probably 36 ins. The highest rainfall is in parts of the Mlauge district, where it attains in some years over 100 inches. The rain falls principally in the months of December, January, February, March, and April. There are heavy rains at the latter end of November, and occasional showers in May and June. It often occurs also that rain falls in the hills during August. In the hill-country—and most of British Central Africa may be described as such—it may be said that

no month passes without a shower of rain. Nevertheless, it should be broadly stated that five months of the year are very wet and seven months of the year are very dry. This want of a more general distribution of the rainfall is not such a favourable feature as would be the more regularly distributed rain which occurs in Ceylon.

The climate in most parts of the Protectorate is agreeable, but it cannot be described as healthy. Neither can it be described as very unhealthy. The chief condition of health is comfort. Europeans who make themselves thoroughly comfortable and do not expose themselves too much to the sun, and who lead a thoroughly temperate life, seldom have occasion to complain of their health. Almost the only disease which causes any anxiety is malarial fever. There is very little dysentery, and it is of a mild type. Dysentery is hardly ever met with except in the plains. The climate is on the whole beneficial to persons of a consumptive or asthmatic tendency—very beneficial in fact to the latter, who often maintain better health in British Central Africa than in other parts of the world.

The whole of the Protectorate is now absolutely safe for European settlers, the entirety of it being under the direct control of the Administration. The natives are very well disposed towards the Europeans. There is a native population of about 1,200,000, but this is rapidly increasing by immigration from the countries outside the Protectorate into the more settled districts. Labour is very cheap and fairly abundant. It is the great cheapness of labour, however, which the principal attraction that British Central Africa can offer to coffee planters, and which atones for its inferiority of climate and rainfall as compared to Ceylon. Adult labourers receive wages to the extent of about 3s. a month. At some periods of the year food is given in addition, making the cost of adult labour about 4s. 6d. a month. The labour of women and children is paid for at lesser rates.

The price of land ranges at present from 5s. down to 2s. 6d. an acre, but, owing to the considerable demand for estates, it is possible this up-set price may increase. Land in Blantyre or in the vicinity of that township fetches rather high prices—from 100l. to 120l. an acre. Except within the settled and civilised shire districts, the price of land is hardly likely to exceed 2s. 6d. an acre for some time to come. As regards the sale of Government land, however, no estates exceeding 4,000 acres in one spot are permitted to be sold, and, as a rule, 1,000 to 2,000 acres is the area chosen. About one-eighth of the land in the Protectorate belongs to the British South Africa Company, the African Lakes Corporation, and some 200 European settlers. About three-eighths of the land is permanently secured to the natives, and about half of the total land area of the Protectorate is now at the disposal of the Government, though, with a view to native expansion, it is intended to alienate more than about a quarter of the total land area.

Although the bulk of the settlers are of British nationality, there are other nationalities represented, viz. Dutch, Austrians, Germans, French, and Italians. The nationalities are given in the order of their majority as regards number of representatives.

A constantly extending transport service is now carried on throughout the Protectorate by the African Lake Corporation, Messrs. Sharrer, Zambesi Traffic Company, the African International Flotilla Company, and the Oceana Company. At present the cost of transporting goods from British Central Africa to London may be roughly estimated at an average of 15l. a ton—ranging from 20l. a ton from the north end of Lake Nyasa to 4l. a ton from the Lower Shiré. From the Shiré province, which is the most settled district, the average cost of transport is perhaps 10l. or 11l. a ton (7l. from Blantyre). The cost of transport from England to British Central Africa is about 11l. a ton more than the figures given, the difference arising from the greater facilities for sending goods down stream compared to the hauling of them up stream.—*Board of Trade Journal*, May 1896.

PURE COFFEE.

The paper that was lately read at the Chamber of Commerce on the subject of agriculture took a view of how oppressed this department is by rates and taxes. The medical profession decided that if milk could be obtained in a pure form it was extremely valuable as a food, and, further that its consumption would be very largely increased. All this has taken place, and even now the analytical chemist is continually on the watch to attack either the farmer for sending milk of too poor a quality to market, or else the retailer because his milk is not up to the standard.

Lately, at the Annual Meeting of the Chemical Trade Section of the Chamber of Commerce, I put it to some of the analytical chemists who belong to our branch whether they were not now pretty well satisfied with the quality of the milk; they admitted they were. I then asked them another question, viz., were they not aware that, at the present time, if they went into almost any hotel, restaurant, coffee-house, and many private houses, they could not obtain pure coffee, and that at many railway stations the beverage called "coffee" was nothing but an adulterated mixture? They admitted this to be the case, but said they had not been instructed by the Government to proceed against this vile system of the adulteration of coffee.

I took the opportunity of explaining to the Committee that the adulteration consisted of beans, bad dried fruit ground up, and as a fact the very best and richest coffees yielding the best flavours were all sold at a high price to people who used them, because they would flavour the largest amount of adulterating matter.

After the deputation waited upon the Chancellor of the Exchequer, at the end of February, to appeal against the duty on coffee, I wrote to the Chancellor of the Exchequer telling him that I entirely agreed with some of the members of the deputation, that the reason of the falling off in revenue from coffee was attributable to the filthy adulterating matter that was employed when people required and purchased ground coffee.

I am glad to say that the Chancellor of the Exchequer took the same view that I did upon the matter, and agreed with some of the members of the deputation that waited upon him; and it was pointed out that the department responsible for allowing this adulteration, and, in fact, robbery of the Exercise, is conducted by Sir Michael Hicks Beach. If these facts are admitted, we may conclude that the poor English farmer, who has delivered to the hotel or restaurant pure milk, has been most unfairly treated by the Government authorities, for he has been forced to abide by most stringent conditions; and now he finds that the vendor of "coffee," so called, may sell and admixture in a shop, and other vendors may sell any adulterated article under the name of "coffee" direct to the public.

The coffee dealers in Mincing-lane, who have an immense stake in this business, subscribed together and formed a committee, and they gave pure coffee to certain people as long as they would agree to sell it to anyone who asked for a cup of coffee at their establishment, and there are very few establishments left now where the sale of this pure coffee has been continued.

Would it not be fairer to trade in general if the Government administered justice in this branch? because I maintain that, now we have such excellent quality of milk, good coffee would be greatly appreciated, and very soon coffee drinkers would be able to discriminate between the different sorts of coffees that were supplied to them.

While discussing this question from an English point of view, I should like to further remark that in France, now, it is most difficult to get a cup of pure coffee; so much so is this the case, that if you ask at a good restaurant for a cup of their best coffee after breakfast or after dinner, they charge you an extra price for it.

In Germany the so-called "coffee" which is supplied contains really less of the pure berry than it does in either England or France, and immense quantities of figs and dates are sold to adulterate the

coffee—in fact, I am informed that the adulterating material is present in a larger proportion than the pure coffee. Yet in both France and Germany it is most important that the trade of their colonies should be fostered! In conclusion I would like to remark that so many people ask for coffee, and if they only had pure coffee given to them, the demand for genuine coffee would be so great that it would cause a rise in the market price, and at once tend to improve the revenues of our dependencies.

THOS. CHRISTY.

THE APPLE-TAINTED TEA QUESTION

LONDON, July 3rd.

The Tea and Produce Committee mention Monday afternoon to discuss the apple-tainted tea matter. There were present Messrs. Rutherford, Chairman, W. Martin Leake, Dickson, Cameron, Stanton, C. Scott, G. White, A. L. Hutchison, Brooke, Thompson, J. Hamilton, (who is now no longer with Messrs. S. Rucker & Co., but has an office in the same building), Corbert, who was made a partner in Messrs. Whittall & Co., just before Mr. Whittall's death and who has no Ceylon experience whatever), and Keith (of Messrs. Arbuthnot, Latham & Co., the largest importers of Ceylon tea on this side). It appears the position Messrs. Anderson, Anderson & Co., have taken up is one that does not leave much hope that they will accede to the demands of the twenty-one firms claiming about one thousand pounds (£1,000 sterling), although I am told that the market loss is a good deal more than that sum. There is precedent to back the demands of the claimants, for the Orient Line allowed a certain amount upon a small shipment of tea which was affected by oranges taken in at Malta. There seems to be a good deal of difference, however, between the taint produced by oranges versus apples. It was said that the oranges flavoured tea found considerable favor amongst buyers, and actually fetched 1d. or 2d. per lb. more than it was expected to realise under ordinary circumstances. That term "orange pekoe" is still a delusion and a snare to many a tea retailer and consumer. It was only this week I was asked for a tea "flavoured with orange blossoms." Possibly it was for a wedding! To see what the ordinary tea man would say if asked for such an article I went into one of the large city retailers and asked for it. It was promptly produced a China pekoe "made with orange flowers, and whence the term orange pekoe was derived;" the man said. The price was 3s. per lb. But, however favourable may be the sales of orange flavoured pekoe and other grades, there is not much doubt that the smell of a ripe strong apple is not a desirable addition to your staple. If it is necessary, as it is I hear, to charter special steamers from Jamaica to carry bananas, it seems advisable that those engaged in the apple-carrying trade from Australia should go and do likewise. Rum and sugar as an instance, has always to be kept entirely separate from coffee, except when a certain well-known Ceylon merchant sent them all off together during the "diggins" time to Australia and scored the best deal there he ever did in his life. The season for the Australian apples covers a period of about two and a half months, and unless some special arrangements are made by the Orient and P. & O. people they will find themselves particularly short of freights from Colombo in the future during that time. I have heard it stated here, and on good authority, that any tea that comes home in an apple ship is under a disadvantage whether it is tainted or no. Certain people make it their business to ferret this information out and take advantage of it to lower the price by reports that the tea is tainted. We all know these methods on the Stock Exchange. Why should the tea market be free from such modern highwaymen? Short of freights these liners will be, and their troubles will not cease at the apple season point. Several chiefs here have wired out instructions to Colombo not to ship tea at all by either line without a guarantee

That guarantee has, I am informed, been refused, and the business is passing into other hands. And certainly unless these lines put the whole matter on a more satisfactory footing than it at present is, these firms will adhere to their decision and doubtless others will follow. The Indian bill of landing for tea is worded differently to those in use from Colombo. A clause is stamped on that hides, turmeric, and several other evil-smelling articles will not be carried on the same deck as tea. But not one of those articles enumerated on the Indian bill of landing is in the same street with apples, especially if they are a little more ripe than they are usually carried. The Tea and Produce Committee decided that the Chairman and Messrs. Cameron, Dickson, and Keith be formed into a sub-committee to reply to Messrs. Anderson Anderson & Co.'s letter, and to draw up a tea clause to be stamped on all tea bills of landing similar to that in use on tea from Calcutta. That clause they will endeavour to get the Shipping Companies here to agree to, and if they succeed the tea per "Cuzco" and "Austral" will not have been spoilt in vain, although even such a clause will not dispose of the reports which are put about, and it is also the opinion of many here that the bad results from apple taint are not to be got rid of by carriage on a separate deck.

SMALL BREAKS.

For the past eight years the question of small breaks has been forced upon the attention of brokers and others here, and the Tea and Produce Committee has from time to time discussed the matter. The big men, who will not even look at anything below a certain size of break, leaving the smaller fish to the smaller fry, have objected to being kept idly chewing their quills, whilst smallest lots are being sold. The Brokers' Association has approached the Tea and Produce Committee to increase the Ceylon limits to 18 chests, 24 half-chests and 40 boxes. This will doubtless be carried through, and anything under these limits will be relegated to the small lot sale. Of course, the object really is to induce the planter to increase the size of his breaks, the enormous quantity of different teas to be gone through being a great tax. Even one half-chest of dust sent separately must be liquored and valued, and there are a great number of little "dabs" in the Ceylon sales that are perhaps unavoidable, but none the less difficult to deal with. Various days and times have been suggested for the small lot sale. Wednesday has been spoken of as a good day. It has been said that Thursday might be devoted to it, or that the "minor canons" might be disposed of at 2 o'clock on Tuesday, at the same time the "big guns" are buying in the big sale. If the result of the above increase of limit is that the small lot sale becomes more important, perhaps the division of the sale of tea that the abortive Thursday's sale was to effect will be better carried out by the sale of the "gros" lots, and the little "dabs" in separate rooms. The Ceylon Planter whose shipments are small is better off than the Indian Planter, the limit for the teas of the latter being 20 chests, 30 half-chests, and 50 boxes. As Ceylon properties become more and more absorbed into limited Companies, however, the small lots will perhaps show a tendency to become fewer and fewer. But there is no doubt there are plenty of buyers here who took as carefully after the small breaks as the big men do after the large, and it would be instructive if some one who knows all the buyers would inform the Tea and Produce Committee how many of the usual bidders are unrepresented at the small break sale. Very few, I fancy, although possibly the bidding is done by a less important representative of the firm than at the big sale.—*Local "Times."*

FLORIDA CAMPHOR.—The Florida camphor-forest is looking up. We mentioned sometime ago that many camphor trees had been planted there. Now it is reported that a small quantity of an excellent quality of camphor has already been made, and a sample lot has been sent to Washington for analysis. Experiments will be undertaken to ascertain which reduces the more camphor, the trunk or leaves of the tree.—*Chemist and Druggist*, June 27.

THE MIGRATIONS OF THE TOBACCO PLANT, THE FARNESIAN CASSIA, AND THE LOMBARDY POPLAR.

I would solicit a brief space to record in the *Journal of the Society of Arts* some criticisms I have received from a scientist of the highest authority, in correction of statements made by me in the course of my remarks on Mr. Tripp's recent paper on "The Tobacco Industry of India and the Far East."

1. My correspondent writes:—"It is by no means certain that the Old World owes the Farnesian Acacia to the New. It appears to be indigenous to Australia, and not impossible to Asia."

I was aware that the *Acacia Farnesiana* had been identified by Fraas with the "white Acacia" of Theophrastus, and the "Acacia in Cappadocia," &c., of Dioscorides; but I know of no solid ground for this identification; while, on the other hand, it is described as a native Chilian plant by Molina, in the 16th century, from which date it is gradually traced through a succession of writers eastward, in Italy, the Morea and Greek Islands, in the gardens of Egypt and Arabia, and in Western India. From Buenos Ayres, it was carried by Europeans into Louisiana, and as far north as Charleston, and again by Europeans it was carried from America westward to Tahiti and the Philippines, to Timor and Java, and apparently to Burma and the Coromandel coast of India. It has now overspread all India. Everywhere its name seems to be derived from its exquisite "aroma," and as the Greek writers do not refer to this, its overwhelming characteristic, I accepted it as a plant of exclusively American origin, and one of the most delightful gifts of the old world to the new. It is first botanically described by Hyacinthus Ambrosinus A.D. 1605 72.

2. My correspondent writes:—"The 'Lombardy Poplar' is only a fastigiat variety of our *Populus nigra*, and is certainly not American." And again:—"The 'Lombardy Poplar' is European, but the 'Black Italian' is American."

I am not entitled to gainsay this dictum, but I reasoned thus. The Greeks and Romans knew only the three following poplars—

Populus alba, Linn.: the cherois [*i.e.*, "of Acheron"] of Iliad xiii. 389 and xvi. 482, the "lenke" of Theophrastus and others, and the "populus alba" of Pliny xvi. 35 (23);

P. nigra, Linn.: the "aigeiros" of Iliad iv. 482, Odyssey ix. 141 and x. 510, and of Theophrastus, and Hippocrates, and the "populus nigra" of Pliny, *loco cit.*

P. tremula, Linn.: the "aigeiros makednos" of Odyssey vii. 106, and "populus Lybica" of Pliny in *loco cit.*

These three *P. canescens* being regarded as a variety of *P. alba*, and *P. græca* of *P. tremula* would seem to be the only poplars truly indigenous to Europe; the rest being nearly all American species. But to-day there is to be seen everywhere throughout Europe the pyramidal "Lombardy Poplar," *populus fastigiata*, said to be a variety, but if so a powerfully differentiated variety of *P. nigra*. Some regard it as a native of Central Asia others of North America, *i.e.*, of Carolina and the valley of the Mississippi. It is the *P. italica-carolinensis* of Brugsdorf; and inasmuch as it was not introduced into Lombardy, between Milan and Pavia, before the 17th century, nor into France and Great Britain before the 18th century I concluded that it came into Europe rather from the Mississippi than from Persia. Had this "Kensple" poplar been a native of anterior Asia it seems to me that Homer would certainly have known of it, and given it a discriminating epithet, "pyramidikos" or the like.

3. My correspondent writes:—"There are only two tobaccos used, the pink flowered *Nicotiana Tabacum*, and the yellow *N. rustica*. I doubt if the latter is much grown, except in the Levant, for cigarettes. I do not believe it furnishes Brazilian, German and Hungarian tobacco. You perpetuate a very old error about Persian or Shirzaz tobacco.

N. persica is not a variety, but a species. It is the same as *N. alata* and white flowered. It does not yield tobacco. The blunder is due to Lindley; and Shirzaz tobacco is only the ordinary *N. tabacum*."

I relied on Lindley and Pereira, but on referring to the "Kew Bulletin," No. 5^o, for April, 1891, for having overlooked which until to-day I am most blameworthy, I find that Mr. Thiselton Dyer has there conclusively demonstrated my critic's contention on this point. I erred through writing "in a castle (of indolence)—cock-sure."

GEORGE BINDWOOD.

—*Journal of the Society of Arts.*

THE PROSPECTS OF THE CINCHONA AND QUININE MARKETS.

It is not a little remarkable that one of the most valuable and best-known drugs, namely, quinine and one of the most valuable and best-known flavouring agents, namely, vanilla, should quite recently have been occupying a considerable amount of commercial attention; the first in consequence of the opening of a new quinine factory in London, and the second in consequence of the extraordinary advance in the price of vanilla, which has been going on for some time. In reference to the first, the *Chemist and Druggist* makes some remarks on the commercial prospects of the company, and on the cinchona-bark produce generally. In the first place, it expresses an opinion that the establishment of a new factory is not likely to have any serious effect upon the market position of the drug, though the entire output of the factory for November was said to have been sold before the month was half through. "The chief point of interest in the situation," it is said, "is that the new factory is the only one in Europe not bound by the 'agreement,' 'convention,' or 'understanding' which has existed for more than a year among the older makers, and has given a healthy tone to the quinine markets." It is further pointed out that the product of the new company is an unknown brand, and that it will take some time to convince the average consumer, especially a British one, who is proverbially loth to leave his time-honoured sources of supply, that the article has all the excellence of the old brands. The possibility of the new makers underselling their rivals is also discussed, and should the older makers declare war upon the new comers, it is considered possible that we may return again to the price-cutting days of 1892, when quinine was purchaseable below 10d. per oz. "The new factory starts at a time when the older manufacturers were believed to be contemplating an all-round advance in their quotations early in the coming year. From the quinine-maker's point of view, the market has been mending for some time, notwithstanding the fact that there has been no improvement worth speaking of in the second-hand quotations, and that the maker's prices have remained unaltered for months. The second-hand stock of quinine in London has been reduced to manageable proportions; the cinchona-bark supply in this country is too small to place any serious impediment in the way of a rise, and at least one of the large German quinine work has been deliberately kept closed all through the summer months. Only the Java producers remain hopelessly disunited. Their exports of cinchona-bark in October reached the enormous total of over 1,200,000 lb. (1,100,000 Amsterdam lb.), and in their present disorganised condition they are almost at the mercy of the quinine makers so far as the price of their produce is concerned. At the present time, the quinine manufacturers pay for the quinine in the bark only about one-fourth of the price at which they quote their finished product, and if only the second-hand stock of quinine were smaller than it is they would not be at all badly off. The facts here stated show to what lengths and variations the traffic in cinchona bark has extended in the space of time within the memory of many, when the bark was drawn from its native South American forests, and when the manufactured article, quinine, was sold at a guinea an ounce.—*Journal of the Society of Arts.*

E DIMBULA VALLEY (CEYLON) TEA
COMPANY, LD.

STATUTORY MEETING.

The Statutory Meeting of this Company drew quite a number of shareholders together at the Company's Office (Messrs. Rowe & White), 16 Philpot Lane, E.C. Mr. James Sinclair occupied the chair and was supported by his co-Director's Messrs. Rowe, Forbes Laurie, Macdonald, and T. C. Owen and the Solicitor to the Company, Mr. Templeton (of Messrs. Templeton and Cox). Among shareholders present were:—Messrs. Donald Andrew, Leslie, Sanderson, E. T. Delmege, F. D. Mitchell, J. R. Grant, Russell D. Reid, G. E. Worthington, &c. The notice of the meeting having been read, the Chairman explained the position of the Company, and though it was understood this meeting was not one for press reports; yet no harm can occur from letting Ceylon readers understand what passed. It was mentioned that a telegram had come to hand just before the meeting, from Colombo, announcing that all was clear now for the transfer of the estates and that so soon as this was effected, a further and general meeting of shareholders should be called together. Meantime, Mr. Sinclair referred to the highclass and valuable properties owned by the Company and noticing certain press criticisms he would say it was not correct that he was taking a large amount of cash out of the estates—in fact his own interests and those of his family were bound up with the Company on which they would be dependent for their salt, and if this Company did not pay, and long continue to pay good dividends to its shareholders, then all he could say was "God help Ceylon tea plantation owners." (Hear, hear.)

It was then intimated that any questions might be asked and a SHAREHOLDER said that he had come to the meeting prepared to make certain remarks; but after what he had heard, he would not make them.

Mr. F. D. MITCHELL wished to get information on a number of points—(1) as to the application to the Stock Exchange for a quotation and whether the Agreement with the Vendor as well as the Articles of Association had been formally submitted to the Committee. The SOLICITOR gave assurance this had been done and certain alterations were suggested, which had received attention and they expected approval from the Stock Exchange-Committee shortly.—The Mousa Ella mortgage was then discussed and the arrangement entered into about it which was done under legal advice. It transposed also that while the prices of Elgin (£20,000) and Belgravia (£15,500) equalled £35,500; those of Bearvelland Mousa Ella amounted to £55,000.—The Lawsuit about a right to water-course on Mousa Ella would be prosecuted on behalf of the Company. MR. WORTHINGTON following Mr. Mitchell referred to the Mousa Ella transfer as to whether it secured a clear title from the Vendor and it came out that the Colombo Solicitors had given their opinion that the title was a good one. Some discussion followed as to whether the Vendor, rather than the Company, should not bear the risk of any future action and after some discussion with the Solicitor, MR. J. FERGUSON said that all in the room who knew the Messrs. de Saram of Colombo would place great confidence in their opinion; while he wished to know whether, as a matter of fact, there had been any notice or suggestion of an action.—None whatever was the response. The Solicitors would be happy to give any further information to shareholders at

their offices and the whole could be discussed at next meeting.

A SHAREHOLDER wished to have some information about crops.

The CHAIRMAN stated that the first sale of Lippakelle realized 1s 1½d and the next 11¾d; while part of an Elgin shipment averaged 8½d, but part was withdrawn, owing to Ceylon teas having been unfavourably affected—the market at last sales disorganised—through a large shipment of Ceylon teas in coming over getting tainted to some extent by contiguity with a cargo of apples. Such was the report. He felt no doubt that stand-out prices would be secured for all the teas from the Company's estates.

The meeting closed, with the understanding that the next would be called together as early as possible.

SPRING VALLEY COFFEE COMPANY,
LIMITED.

REPORT.—To be presented to the Thirty-first Ordinary General Meeting of the Company to be held at No. 5, Dowgate Hill, London, on Wednesday, the 27th day of May, 1896, at 1 o'clock p.m.

The following Annual Accounts are now presented to Shareholders, viz:—Profit and Loss Account for Crop 1894-5. Balance Sheet made up to 31st March, 1896.

Crop 1894-5.—In last year's Report Shareholders were informed that the coffee crop of the above season was estimated at 1,400 cwt., and it will be seen that the actual weight sold amounted to 1,658 cwt. 0 qr. 3 lb. exclusive of clean and refuse coffee sold in Ceylon. This crop realised £7,890 9s 9d, the average selling price in London being 91s 10d, as compared with 98s 5d per cwt. obtained for crop 1893-4.

The yield of tea amounted to 219,180 lb., the estimate in last Report being 215,000 lb., and this, together with 55,160 lb., bought from neighbouring estates and manufactured at Spring Valley, sold for £10,685 8s 1d., or an average of 9'34d. per lb., the average selling price last year being 9'15d. per lb.

Sales of Cinchona Bark realized £43.

The total proceeds from the sale of produce amounted to £18,618 17s. 10d., and deducting from this £12,056 12s. 5d., the total expenditure in Ceylon and London, there remains a profit of £6,562 5s. 5d. on the year's working.

To this has been added the sum of £32 11s. 9d. brought forward from last year, making a total of £6,594 17s. 2d. at the credit of profit and loss.

On the 7th November last an interim dividend of 2 per cent. was paid on the capital of the Company, and the Directors recommend that a further dividend of 3 per cent. be now declared, making 5 per cent. for the year, and leaving £2,594 17s 2d. to be carried forward to next account.

The Directors cannot recommend a larger distribution of profits, as they consider it advisable to carry forward a sufficient sum to ensure the rapid extension of our tea area.

The comparatively large crop of coffee secured last year appears to have greatly weakened the coffee trees, and, though everything is being done to retain the coffee area, it is feared that much of it will have to be planted with tea this year. In any case the crop will be a very small one.

Tea continues to do well, and during 1895-6 it is expected that a crop of 280,000 lbs. made tea will be secured. During the past year the quality of our tea has been well maintained. It will be seen that the crop realized 9'34d. against 9'15d. for the 1893-4 crop.

The acquisition of Kotagodde Estate sanctioned at the Extraordinary Meetings held last year has been duly completed, and the Directors are well pleased with the purchase.

The area under Tea is as follows :—

TEA.			
Over 5 years old	741 acres.		
Planted Nov./Dec.	1892	53	..
"	1893	243	..
"	1894	179	..
"	1895	115	..
Area under Tea	1,361	..	
Area under Coffee	538	..	
Area under Fuel	57	..	
Forest Patna and Waste	297	..	
Total Area	2,253	acres.	

The Directors regret to announce the retirement of Mr. H. H. Potts from the Board, owing to ill-health. Mr. P. C. Oswald has been selected to fill the vacancy. Mr. Oswald retires on this occasion, and, being eligible, offers himself for re-election.

J. ALEC ROBERTS, *Secretary*.

18th May, 1896.

OUVAH COFFEE COMPANY, LIMITED

REPORT.—To be presented to the Thirty-third Ordinary General Meeting of the Company, to be held at No. 5, Dowgate Hill, London, on Wednesday, the 27th day of May 1896, at 12-30 o'clock p.m.

The following Annual Accounts are now presented to Shareholders, viz.:—Profit and Loss Accounts for Crop 1894-5, Balance-sheet made up to 31st March 1896.

Crop 1894-5.—In the Directors' last Report the Coffee Crop of the above season was estimated at about 1,000 cwt., and it will be seen that the actual weight sold in London amounted to 1,208 cwt. 2 qrs. 14 lbs.

The proceeds amounted to £5,646 14s. 10d., giving an average of 93s. 5d. per cwt., against an average of 99s. 8d. obtained for the previous crop. Coffee sold in Ceylon realized £149 8s. 1d.

The crop of Tea was estimated at 575,000 lb., and the actual weight sold from the Company's own estates was 564,000 lbs. Besides this, 349,483 lbs. of Tea manufactured from leaf bought from neighbouring estates were sold.

The value of all tea sold was £34,587 6s 11d, or an average of 9.08d per lb. as compared with 8.66d for the previous season.

Cocoa, weighing 270 cwt. 0 qrs. 3 lb. realized £657 19s 7d, the average selling price being 48s 9d per cwt, against 60s 4d for the former year's crop.

It will thus be seen that the total value of all produce sold amounted to £41,090 12s 7d.

The total Expenditure for the year in Ceylon and London amounted to £30,022 11s 9d, and deducting this from the value of the Produce, a profit is shewn on the season's working of £11,068 0s 10d. To this has to be added the sum of £83 0s 11d brought forward from last year, giving a total of £11,151 1s 9d at the credit of Profit and Loss Account.

An Interim dividend of 3 per cent on the capital of the Company was paid on the 7th November last, which absorbed £3,000 of the above-named sum, and the Directors now recommend that £5,000 be applied to the payment of a further dividend of 5 per cent, making 8 per cent for the year, and that the balance of £3,151 1s 9d be dealt with as follows :—

To write off the balance of the cost of Ledgerwatte	£1,000	0	0
To be credited towards Cost of Badulla Tea Factory	1,000	0	0
To be carried forward to next Account	1,151	1	9
	£3,151	1	9

The result shewn above cannot but be satisfactory

Owing to unfavourable weather during the part of the season the Tea Crop did not quit up to estimate. The satisfactory yield of made tea per acre was, however, obtained, a price shews an improvement compared with the previous year.

The whole area under tea is reported to first-rate order, and it is hoped that by the present year we shall have 2,000 acres that cultivation. Every care is being taken to the most suitable land at our disposal for plant and to put in only the very best seed.

The four factories belonging to the Company in full operation, and heavy outlay on this may be considered to be at an end. As further of our tea come into bearing, increased work space and additions to our machinery will be required, but no large expenditure will be incurred in any one year.

It is exceedingly difficult to estimate what Coffee will be secured this year. Black bug and other pests have been very virulent, and the yield will in any case be small.

The estimated Tea Crop is 606,000 lb., and is gathered and present prices are maintained. The result of the 1895-96 working should be satisfactory.

The area now under Tea is as follows :—

TEA.			
Over 5 years old	1,271	acres.	
Planted November/December	1891	10	..
"	1892	..	
"	1893	15	..
"	1894	11	..
"	1895	14	..
Area under Tea	1,881	..	
Area under Coffee	600	..	
Area under Fuel	31	..	
Forest Patna and Waste	488	..	
Total Area	3,000	acres.	

The Directors regret to announce the retirement of Mr. H. H. Potts from the Board owing to ill-health. Mr. P. C. Oswald has been selected to fill the vacancy.

Mr. N. Stewart, a Member of the Board, on this occasion, and, being eligible, offers himself for re-election.

Messrs. Deloitte, Dever, Griffiths, & Co., Auditors, also offer themselves for re-election.

18th May, 1896. By order, J. ALEC ROBERTS, *Secretary*.

COFFEE NOTES.

It is estimated that the coffee crop of Liberia in 1891 in the Mexican state of Oaxaca alone to be 50,000 piculs this year, against 30,000 piculs last year.

The state legislature of Espirito Santo is discussing the plan adopted in the agreement signed in Rio de Janeiro by the representatives of four coffee States to increase the consumption of coffee.

Francisco Schmidt, a planter residing near Pretoria, has sent two coffee trees to Germany for the purpose of figuring at an exhibition in that city. Each tree together with the earth at its roots is packed in a frame in which it is packed is said to weigh 100 lbs.

According to a recent official statement the coffee crop in 1891 in the Mexican state of Oaxaca alone to be 50,000 piculs. In 1889 the exports of coffee from Mexico amounted to 9,233,091 kilogrammes, and in 1893 had increased to 11,514,919 kilogrammes. plantations are being constantly created.

Messrs. W. H. Crossman & Co., of New York, estimate that the Brazil coffee crop of 1896 will be about 10,000,000 bags, of which about 55 per cent. of the coffee production of the world other countries for some years past have been an average of 4,839,041 bags per annum. If this average the total supply for 1896 will be 13,839,000 bags. The consumption is calculated to be 11,250,000, bags, from which it appears that

CONSOLIDATED ESTATES CO. LTD.,
(OF CEYLON).

An extraordinary general meeting of this Company was held at the London Offices of the General Managers, Messrs. Arbuthnot, Latham & Co. on 27th May, to consider and approve of an agreement issued to shareholders by the above firm from which the following are extracts:—

An agreement dated the 14th day of May, 1896, which has been entered into with ourselves as General Managers, for the purchase from us of the Knutsford Estate of 205 acres in the Kalutara district, the Rutland Estate of 582 acres in the Hewaheta district, and the Wariagalla Estate of 1,261 acres in the Nilambe district of Ceylon. These three estates are in our opinion conveniently situated for the business of the Company, and in anticipation of the Company consenting to the purchase, we have actually purchased and paid for the Knutsford Estate, and we have had the same transferred into the name of the Company, and we have entered into arrangements to purchase the other two on the 1st July next.

Full particulars regarding the prices we are paying for the three estates are given in the agreement, the amounts being approximately as follows:—

Knutsford	..	£ 5,000	} Total ..	£35,000
Rutland	..	£15,600		
Wariagalla	..	£14,400		

We accordingly propose to resell to the Company for the above amount (£35,000), or such less sum as will cover our actual disbursements, with interest thereon, and we propose to charge a commission—as our remuneration for negotiating the purchase and other matter connected therewith—of 2½ per cent on £20,600, being the purchase money of the first two estates. We do not propose to make any charge of commission in respect of the Wariagalla Estate, inasmuch as we are to receive a commission of 2½ per cent from the Vendors.

With reference to the Wariagalla Estate, we beg to call our attention to the fact that a member of our firm, Mr. Herbert R. Arbuthnot, is interested in the sale to the Company, he being one of the executors and one of the Residuary Legatees of the late Mr. George Arbuthnot, his father, who owned an undivided three-fourth share of the Estate.

It is proposed that the Company should issue, for the purpose of putting itself in funds to pay for the property, £10,000 in 6 per cent. Debentures at 5 per cent premium; £13,000 in 8 per cent Preferred Shares at 10 per cent premium; and £13,000 in Ordinary Shares at par, and that these issues should be offered to the Shareholders. Should the Shareholders not take the whole, we will ourselves take or place the balance not taken by the Shareholders, but in such case the premium on the Debentures payable by us would be 3 per cent. and the premium on the Preferred Shares would be 5 per cent. The Ordinary Shares we will in such case take at par.

It is estimated that the par value of the above will cover the cost of the three estates and expenses of transfer, as well as our commission, and that there will be a small surplus, which we propose to place, together with the premium, to the credit of the "Factory and Extension Account" to provide for the opening up of the Company's Estates and for factories and machinery as may be found necessary or desirable from time to time.

The Debentures now offered will bear interest from 1st July, 1896. They rank in all respects *pari passu* with the Company's outstanding Debentures, except that their final due date is 1st July, 1931. They can be redeemed earlier by annual drawings on and after 1st January, 1898, and whenever redeemed are payable at 103.

The Shares now offered will not participate in the profits of the Company in respect of the current year

partner, but no Agreement has yet been formally entered into authorising him, as a member of our firm, to act as one of the General Managers of the Company. A draft Agreement whereby this is to be done has been prepared, and will be submitted for consideration at the General Meeting, with the view of its being approved and sealed.

Mr. ARBUTHNOT, head of the firm, supported by his partners and co-Directors, presided and made an admirable Chairman. Several city men represented the shareholders with the addition of Mr. Arthur Davidson, formerly of Wariagalla, now of Dorsetshire, who his Ceylon friends will be glad to know is well and vigorous, albeit the whitening effect of years is apparent.

The CHAIRMAN explained the circumstances under which the three estates were to be added to the Company: how Messrs. E. S. Grigson and Ballardie had given careful reports and valuations above the prices to be paid; how Knutsford with its 209 acres of tea could be economically worked with one of the Company's places adjacent in the Kalutara district and was a bargain at £5,000; how Rutland (582 acres—446 in tea, grevilleas 51, patana, &c. 99, costing £15,600) was the splendid estate of Mr. C. S. Armstrong who was loath to sell and was valued at £16,100; how Wariagalla (to cost £14,400) had for long been owned by Mr. Geo. Arbuthnot and Mr. A. Davidson and was also not too dear with its 1,261 acres in all; 429 in tea, 70 coconuts, 40 cacao, and rest patana, scrub, &c.

About the prospects of the Company, the Chairman had a good account to give: the crops of tea being in every case likely to be in excess of estimates, while the temporary rise in exchange had not affected them much.

The Resolutions were duly seconded and unanimously carried and also thanks to the chair, mention being made of the good bargains made for the Company in the three estates purchased.—The Visiting Agent's reports on the three estates referred to were laid on the table by the Secretary Mr. Keith, formerly of Coimbatore.—The Chairman referred to their Colombo agents Messrs. Geo. Stewart & Co. fully approving.

PRESERVATION OF COCONUT TREES AT THE STRAITS.—The *British North Borneo Herald* of June 1st says:—Regarding the preservation of coconut trees, the Assistant Superintendents of Forests, Singapore, in his report for 1895 say:—The inspector, with the assistance of one notice-server and one climber, has been employed alternate months in Penang and Province Wellesley. One thousand four hundred and twenty five notices have been served on persons having on their premises trees, stumps, or rubbish—suitable breeding places for the beetle; and as the result, 3,608 dead trees, 3,856 stumps, and 209 heaps of rubbish have been destroyed. Seventy-nine persons were prosecuted for non-compliance with the notices served on them, and fines inflicted amounting to 170 dollars. Apropos of this it may be well to state that the beetle plague appears to be practically unknown in B. Borneo. Two species, a very large weevil, and a sort of *elephas*, have been brought to the Museum as found in coconut trees. But curiously enough no work obtainable appears to mention the actual scientific name or names of the pest. Perhaps the Curator of the Singapore and Perak Museums

THE OUVAH SPRING VALLEY, AND
HUNASGIRIYA COMPANIES.

The circle of Limited Companies indissolubly connected with the name of the late Mr. John Brown were among the earliest started in connection with the Coffee Enterprise of Ceylon. They were also for many years among the most prosperous, and redounded greatly to the credit of the Colony. "Glenalpine" estate—long identified with the names of Stewart, Brown and Macintyre—recognised as one of the best opened, cultivated and equipped plantations in the island, formed the nucleus of the "Ouvah Coffee Co." Spring Valley took its name from the magnificent plantation of the same name selected and first opened by Sir Wm. Reid on what was about the finest area of forest soil even in Uva, and was purchased by Mr. John Brown from Mr. Bannatyne of Glasgow on behalf of the Company. The Hunasgiriya Company connected with the well-known property North of Kandy was of more recent formation; but all three Companies suffered with the decline and fall of our staple, until their shares so long held above par, at last became almost unsaleable. How great the change now! For, although the shares of the Spring Valley and Hunasgiriya Companies have not yet fully recovered; yet they are in request and offer good prospects, while those of the parent Company are already much above par. The good done by tea is clearly indicated in this experience; for, although, coffee has continued to some extent to bridge over a time of difficulty; yet now and in the future it is on our new staple that the hopes of Directors and shareholders, are built. The late worthy and ingenious Managing Director saw as well as any one, what was coming, and he lived long enough to make sure there would be a resuscitation of his old Companies, although we could have wished, he had lived on to see the full fruition. Still more to the credit of the late Mr. John Brown, was the energy and invention he displayed in the "tea" era as in the early "coffee" days in setting to work to devise better means of preparation; and in "Brown's Desiccator" and "Roller" we have tea (as well as coconut) drying and tea rolling machines, high in favour with the planting community.

These thoughts are suggested by the annual meetings of the Companies in London, briefly reported in our last issue. It was made a proper matter of congratulation by the only Ceylon resident present that as Managing Director in succession to his father, the Companies were able to have one so well-equipped for the post as Mr. Alfred Brown, while the Board was strengthened by another esteemed business-man of Ceylon experience in Mr. P. C. Oswald. For the careful management which has always distinguished the Companies, much is due to the able clear-headed Secretary, Mr. J. A. Roberts; while what the Ouvah and Spring Valley Companies are doing in "tea" under the local direction of the Messrs. Rettie, is well shown by the fact that the average price realised for the teas in 1895 is in considerable excess of that got for 1894. All this promises well for the future; and we may hope with the present Chairman that the day is not far distant when like those of "Ouvah," the shares of the sister Companies will be quoted at, or above par. We heartily congratulate all concerned on the results already sustained.

J.F.

MR. ROGIVUE'S WORK IN RUSSIA.

From Mr. A. Philip, Secretary of the "Thirty Committee," we have received the following copy of a letter received from Mr. Rogivue regarding his work in Russia:—

Moscow, May 8 20, 1896.

A. Philip, Esq., Secretary to the Thirty Committee,
Kandy.

Dear Sir,—I now beg to confirm my telegram of 27th April (o.s.) and to acknowledge receipt of your reply, also to thank you for your favour of 25th April advising me of the resolution passed upon the reading of my report.

I am very much gratified by the favourable opinion expressed by the Thirty Committee, and hope, by making a wise use of the money granted, to do all that they could wish to further the interests of those they represent and trust that now I have made the start and got over the first difficulties, Ceylon tea will meet with a more rapidly increasing demand in Russia in answer to my continued efforts. With regard to details of expenditure under the £1,000 grant, all the accounts for expenses incurred up to the end of March have now come in and if it were not that Mr. Rogivue is kept so busy at Nijni Novgorod you should have all particulars by this time, but as soon as all is arranged there you shall have the detailed amounts.

Mr. Rogivue is at present occupied at Nijni looking after the arrangements for advertising Ceylon tea at the forthcoming Exhibition and Fair, where he has obtained an excellent position for the erection of a "Pavilion" not inside the Exhibition, where he found it absolutely forbidden except for Russian produce, but immediately outside the principal entrance. As the ground obtained forms the entrance to the large central garden of the biggest hotel in Nijni and is on the main road, the building had to be made up to a certain standard which together with carrying out my previous schemes for advertising Ceylon tea there, in an adequate manner, necessitated the additional outlay for which I wired for sanction on 27th April. As this Exhibition is generally expected to be such a gigantic affair and will be visited by such immense numbers of people from all parts of Russia, it seemed good policy in the interests of Ceylon to make the most of this excellent opportunity for bringing Ceylon tea prominently before the Russian public, and I telegraphed to you accordingly. I may mention briefly that among other things, arrangements have been made to supply Ceylon tea in various hotels during the time of the Exhibition and to place placards in the rooms and windows (one hotel which contains 800 rooms will have an advertisement of Ceylon Tea in each room.) I have also secured large spaces for advertisements both inside and outside of the electric trains which are to run all round the inside of the Exhibition, when all is completed, photographs (where possible) and full particulars shall be sent to you.

To the Thirty Committee I must tender my sincere thanks for their prompt and favourable reply to my request. The additional outlay sanctioned will enable me to carry out a scheme which will represent Ceylon Tea in a thoroughly worthy manner at this exhibition.

Thanking you also as secretary for the trouble you must have taken in the matter,—I remain, dear sir,
yours faithfully,

p.p. M. ROGIVUE.

(Signed) HUGH C. DOWLING.

NATAL TEA SEASON, 1895-96.

The following has been contributed to the *Star*:—The present tea season in Natal will probably close on or about the last week in June. The one before, 1894-95, ended on the 22nd of the same month, the seasons lasting from about the first week of Sept. to the third week of June, or ten months out of the 12. The picking goes on the whole time with but few stoppages, of which, however, there ought not to be any at all. The remaining two months

of the year are devoted to general outdoor work, such as pruning, deephoeing, manuring, draining, &c. The principal tea district of Natal is, of course, that on the north coast, about six miles from Stanger. The nearest railway station is Verulam, about 30 to 40 miles away, but the line will probably pass through Stanger to the Zululand frontier on the River Tugela within three years from date, a result greatly desired by the Victoria County planters—tea and sugar. On the South Coast there are also two tea estates, Barrow Green and Ifafa, both good properties. These, too, will soon be connected by rail with Durban. At present there is not a single working tea estate in Natal on the line. The total outturn of tea for the whole Colony was estimated last September at 960,000 lb. for the present season, or about 100,000 lb. more than season before. The crop, however, will probably not reach over 700,000 lb., on account of the great fire last December, which totally destroyed the Kearsney Estate Central Factory. This estate, which manufactures not only its own leaf, but buys and manufactures the leaf of eleven small out-gardens, under the circumstances is not expected to reach its estimate of 560,000 lb. as it was given out that 100,000 lb. of tea alone were destroyed in the fire. If they have succeeded in making 300,000 lb. more at Kearsney only, they will have done remarkably well. Space does not allow of detail, but the conclusion come to is that by deducting at least 260,000 lb. (including 100,000 lb. destroyed) from the Kearsney estimate, and therefore the same amount from the total estimate for the Colony, the result will be 700,000 lb. total out-turn of tea for Natal season 1895-96. Besides the drought, locusts have been a source of loss and vexation of spirit to the tea-planters. Fortunately, locusts do not touch tea, at least not the young tender shoots used for picking, though they have been known to nibble at the older and coarser leaves. It is a good thing that there is so much else eatable that strikes their fancy more in Natal, as, if they did take a liking to the tea-leaf in general, then good-by to the industry as long as locusts were about. The danger exists, nevertheless. It is to be hoped that no fire, or drought, or hailstorm, or other evil will interfere with the welfare of the very promising tea industry of Natal during the coming season 1896-7, and that the planters will reap fully the benefit from their labour, especially the smaller ones, who without capital, have worked hard and pluckily for some years, and certainly deserve all the success they can get. With favourable weather, such as the Stanger district was blessed with in 1894-5, and on ill luck or accident, the turn-out of the whole of Natal should easily top the very respectable figure of one million pounds of tea for season 1896-7. Let us hope then that increased quantity with improved quality will be the result next June year.—*Natal Mercury*, May 15.

INDIAN PATENTS.

Specifications of the undermentioned inventions have been filed under the provisions of Act V of 1888.

Improvements in the trays or carriers of apparatus for exposing tea, coffee, &c., to the drying or other action of air, vapour or gases.—No. 66 of 1896.—Samuel Cleland Davidson, merchant, of Sirocco Engineering works, Belfast, Ireland for improvements in the trays or carriers of apparatus for exposing tea, coffee, &c., cocoa, grain and other substances to the drying or other action of air, vapour or gases. (Filed 22nd May 1896.—*Indian and Eastern Engineer*, June 13.

THE PRODUCTION OF COFFEE AND TEA IN BRITISH DEPENDENCIES.

TO THE EDITOR OF THE TIMES.

Sir,—There is a great deal of misapprehension current in reference to our old Ceylon staple, coffee, its production and price—which, with your permission, I should like to correct. The other day Lord Stanley of Alderly, addressing the House of Lords,

included "coffee" in his list of products suffering from depreciation of price, although for the past eight years at least coffee has been pre-eminently the tropical product which, contrary to the theory of bimetallicists, has not only maintained but increased its gold value in the markets of the world. Thus, in 1889 the lowest and highest quotations for middling plantation coffee in London were 91s to 102s, and they have not since fallen below that figure, while for 1895 the range was 100s to 107s, and there is little difference this year. This is due to the fact that production has not kept pace with the demand for the Continent of Europe and North America; and yet here again a curious misapprehension prevails as to there being an immediate risk of the over-production of coffee as of tea. Thus, at the recent reading of a paper before the Royal Colonial Institute on "The Development of Tropical Africa," by Sir George Baden-Powell, in the discussion that followed, Dr. Morris, of Kew, stated that "in the regular cultivation of coffee, cacao, cotton, kola, and fruit, West Africa has a great future before it." And in describing the coffee industry in the Nyasa hill country (British Central Africa) I made the remark:—"The chief staple, coffee, is one of which there is no fear of over-production at present." Nevertheless, the chairman (Sir R. W. Herbert) in summing up and referring to tropical products, said:—"It is desirable as far as possible to seek for new staples rather than to crowd the markets with ordinary produce like tea and coffee, which seem in danger of being over produced."

Sir Robert Herbert is correct as regards tea, but he has overlooked the great falling off in the production of coffee within British dependencies during the past 16 years. This has been mainly due to the terrible effects of a fungus enemy on the coffee of Ceylon, a great part of Southern India (and even of Java). Without going into details, let me venture to give approximate and contrasting estimates of coffee exports from British dependencies:—

	Maximum annual export 16 to 18 years ago. Cwt.	Estimate for 1896. Cwt.
Ceylon	1,100,000	50,000
South India ..	450,000	240,000
West Indies ..	150,000*	80,000
Straits and North Borneo	—	30,000
	1,700,000	400,000

This indicates a woful deficiency, and I see no prospect of more than a very limited increase for many years in the above dependencies. I am free to confess that at the same time Brazil has maintained and even increased its large production of coffee; but this has been counterbalanced by the notable falling off in the crops of Java and Netherlands India generally; and were it not that American and European capitalists have been developing coffee plantations in Mexico and Central America (Guatemala, Costa Rica, &c.), the consuming markets would have been barely supplied. The continued high price has, indeed, encouraged Ceylon tea planters to invest surplus capital in a new coffee district in East Java; while I am aware that City capitalist are looking to foreign States in South and Central America for coffee investments.

Surely, then, experiments in coffee cultivation may well be encouraged in the British divisions of Africa (as well as in the Malayan Peninsula, North Borneo, &c.), and more especially in British Central Africa under Sir Herbert Johnston's enlightened administration. The first limited company for coffee cultivation in Nyasaland was formed a year ago in Ceylon by planters and merchants, whose manager, now

* The West Indies attained their maximum early in this century, Dr. Morris telling me that Jamaica alone exported 260,000 cwt. of coffee in 1805, while other islands—Barbados, Antigua, Dominica, Montserrat, St. Kitt's, and the Virgin Islands—made up as much more, or, say, from 500,000 cwt. to 600,000 cwt., at the maximum about 90 years ago.

hard at work opening up a plantation, gives an encouraging report of his prospects in labour supply, crop, &c.

It will be a long time, however, before such enterprise, or any other enterprise at present within British territory, can seriously affect the coffee market; and I see no early prospect, in any other quarter, of an over-production of coffee. The case is rather different with tea, in view of the large areas planted and still being opened in India and Ceylon. The export of tea from India has steadily risen, year by year, from 2½ million pounds in 1861-62, until the estimate for 1896-97 is 141 million pounds. In the case of Ceylon we began with 23lb. export (23 years ago) in 1873, and for 1896 the official estimate of total export is 102 million pounds.—I am, sir, yours truly,

J. FERGUSON, of the *Ceylon Observer* and
Tropical Agriculturist.

UNFORTUNATE FLORIDA.

It is only after a visit to Florida that one appreciates the disastrous effects of the freeze of last year. It is the constantly-recurring topic among residents. It left behind it ruin, misery, and blasted hopes. Many persons had invested the savings of a lifetime, all the money they could borrow or scrape together in groves and plantations of one kind or another. Some had even mortgaged the growing crop to tide them over, expecting to find themselves on the road to fortune when it was harvested. Then the labor, expenditures and efforts of years were literally wiped out in a night by the cold wave which killed off the growing things and left the land as unproductive as it was before cultivation began. It was a blow from which many settlers cannot recover, to say nothing of the pecuniary loss to the State at large. The extent of it has not really been measured yet, for it is possible that time may show that the injured orange and coconut groves and other plantations must all be planted over again, and the process of cultivation begun again from the start, a matter involving years of toil and expenditure. People in Florida talk hopefully of the prospects, but there are many estates for sale and many settlers are eager to sell at any price that would enable them to set North again. A shrewd, hard-headed Vermont farmer came, through a complicated real estate trade, into possession of a plantation in the orange belt upon which the owner had spent \$6,000. He offers the property at \$1,000, and says privately that he would gladly accept \$500 cash for it. He even regrets the cost of the coat of paint which he put upon the house to make it more attractive to possible purchasers. Property, of course, will rise in value in time; but this farmer's experience is said to be a fair illustration of the condition of real estate in Florida.—*New York Sun*.

THE LONDON CINNAMON SALES.

The last mail from London has brought fairly cheering accounts of the quarterly sale of cinnamon, which should have been held on the last Monday in May, but which came off on the 1st June as the 25th May was included among the Whitsuntide holidays. The sale was in most respects a satisfactory one. The quantity offered was not unusually large, but, like the offerings at the previous sale in February, was a fair average quantity. In all, 1,743 bales were put up for competition, being a little less than the quantity

offered in February, when 1,792 bales were catalogued, and the better part found purchasers. The quantity, however, was in excess of that offered at the corresponding sale last year, when only 1,065 bales were down in the catalogues and the whole found purchasers. But from the table of exports one might have expected even a larger quantity yet, as the current year shows far heavier exports than the four preceding ones—perhaps than any previous year. Of the 1,743 bales offered, more than two-thirds, viz. 1,292, were disposed of under the hammer. The competition left little to be desired; for although the fine qualities sold at a decline of half a penny to one penny, the bulk which consisted of ordinary cinnamon, commanded fair competition and even advanced to a slight extent. Thus, whereas, at the February sales, A S G P (Golna Pokuna) fetched up to 1s 5d per lb., at the sales on the 1st inst., this well-known mark did not command a higher price for its firsts than 1s 4d. The next highest prices realized were for spice from W.S. and K. from the well-known F. S. Kadirane group; and these fetched up to 13d; but the ordinary cinnamon advanced a penny.

In commenting on the February sales, we drew attention to the fair competition which "unworked" cinnamon commanded. Even a couple of years ago such cinnamon would scarcely be looked at, because it had failed to pay the exorbitant charges imposed by the dock companies for the wholly needless operation—at least as regards the well-known marks—of having every single bale cut open and restoring after the removal of broken quills. As in the February sales, so at the last, a very considerable quantity of "unworked" found buyers. Among the most prominent were the C. H. de S. (de Soysa) marks, which sold according to the grades, from 8½d to 10½d. It is not a small advantage that unworked cinnamon is now fairly competed for; but there is special ground for satisfaction in the keener competition which ordinary cinnamon commands. We interpret this as evidence that new uses have been found for our spice through which the disadvantages under which cinnamon so long laboured, of overproduction, are being overcome. Another hopeful future is that broken quills and clippings fetched as high as 9½d a lb.—an advance of about 50 per cent. over usual prices. Altogether therefore the sales must be regarded as satisfactory, and promising well for Estate Proprietors. The following is the Report on the last sale from one of the leading firms in the spice trade:—

London, 2nd June, 1896.

CINNAMON.—At the quarterly sales held yesterday, 1,743 bales Ceylon were offered, against 1,792 bales in the February auctions, and 1,063 bales at this period last year. There was a steady demand, and 1,292 bales were cleared under the hammer; ordinary and medium quill realising full to occasionally dearer rate, while fine quality sold rather irregularly, but mostly at ½d to 1d per lb. decline on the prices ruling in February. About 400 bales worked sold; firsts sold, good to fine from 11d to 1s 1d; seconds, good to fine 10d to 1s 2d; thirds, 10d to 1s 1d, and fourths, 8½d to 10d per lb. The unworked quill—about 900 bales—brought, firsts, 10d to 11d; seconds, 9d to 10½d; thirds, 9d to 9½d, and fourths, 8d to 8½d per lb. Chips sold at 3d and clippings up to 9½d per lb.

The London Warehouse Stock is 3,173 bales against

in 1895	1894	1893
Bales.	Bales.	Bales.
3,306	3,218	and 3,699

The next auctions are fixed for the 31st August.

HANTANE, OLD AND NEW.

The district of Hantane, though not the oldest, largest, nor most important of planting districts, must always have a peculiar interest attached to it. It contains the beautiful capital of the Central Province, and every estate has its history and associations more or less interesting to all old Ceylon men. Apart from this it is one of the healthiest of localities, and what is more was on the whole ever a paying district in coffee as it promises to be in tea. Things are not always what they seem, and Hantane is better than it looks, which is more than we can say of most places or some men. Looking up from Kandy the cursory observer, seeing the sparsely covered ridges, would not be prepared to hear that the returns per acre have ever been fully equal to those of the more sheltered upland valleys. Yet such is the case, while the proximity to Kandy adds a certain value to all the landed property in the vicinity. Even supposing there was no tea there are other strings which one could stretch—if need be—for a livelihood.

Walking down the Windmill brae of Aberdeen one day with a well-known proprietor whose estates lay within easy access of the mountain capital, I observed him lifting his hat to a poor old woman who was chopping up firewood for sale. "Who's your lady friend?" I asked. "Don't know," was the reply, "but we are both in the same line of business"! It was during the dark days of coffee when this means of tiding over the bad time suggested itself, and brought him in a few hundreds a year. And there are many other items which could here be turned to account though not necessary to enumerate while tea is tea.

It would be difficult perhaps to find another estate in the Island that has given better returns in its day than old Hantane itself. Opened in 1838 by Messrs. Atchison and Jefferson it was the first systematically cultivated and clean weeded of coffee estates, and for many years this estate well repaid all the care bestowed upon it. The collapse of coffee came upon the just and unjust, but even then Hantane was not worked at a loss, while now again its prospects are of the very brightest.

After the retirement of good old Jamie Martin from the management of this estate in 1858, a strange series of disasters befel its superintendents—one was supposed to have been poisoned, another was certainly shot dead, while a third went stark mad. Since then matters seem to have got into a smooth groove again, and tea is doing very well.

A better known estate was perhaps Odewelle adjoining. This fine property may be said to have been the Lippekelle of old, realizing in 1845 the record price of the day (£15,000),—a fact which led to the mad rush and ultimate collapse No. 1. When first we passed through Odewelle, good old 'Know best'—really then at his best—was superintendent glorying in his fine herd of cattle—all of which he knew by hip and horn, and all knew and loved him. A hospitable host was Willie, and many a good Willie waucht did the thirsty traveller enjoy at his bungalow. After him came a Willie of a different jât, but the estate went on prospering and giving good returns till Collapse No. 2 of the early 80s. In tea Odewelle has not yet quite come up to the position it held in coffee. Tea takes time to accommodate itself to the best of old coffee land, but it promises well.

Let us now once more pass through the gap to Kitoolmoola where first we met that typical

planter of the middle ages A. C. Mortimer, the trusted and eminently trustworthy manager for Sir John Cheape. Kitoolmoola and Gallaha were model estates carefully cultivated and gave splendid returns to the lucky proprietor at home; but alas the days of even careful A. C. Mortimer drew to an end. He stayed the year too long on the much loved totum, and died at Southampton while *en route* for the dear auld hame. He was succeeded, however, by a most capable man, whose hard and shaggy head contained, and still contains I am glad to say, brains enough to accomplish anything he cared to undertake. Under his management the properties continued to improve till sold to the present proprietors. The tea here is now giving most satisfactory returns, and the splendidly equipped and well managed factory on Gallaha is one of the sights of the island.

Pain would I push further down to where I first called upon T. Gray, now of Bunyan fame, or round the corner to Nilambe where the far-seeing "eye-glass" received me so well, and on to Warriagalle where the hospitable Henderson reigned, or down where I was wont to spend the evenings with the most congenial of Davidsons; but this must suffice for today. And we must now return northward passing over the ridge from Odewelle into Hopewell, of which it used to be remarked in 34 Craven St. that it formed "the most comfortable of accounts"—always on the right side. It now belongs to Mr. S. Agar, its former superintendent, but as yet only a small portion has been planted in tea. Mount Pleasant, adjoining, still belongs to the old owner, and though the best portions are still to plant tea is doing remarkably well. It will however take a long time to come up to the splendid returns of old coffee days, when £8,000 sterling was netted from 400 acres! And be it remembered had the rupee been then at 1s 2d the profits would have been nearer £14,000 per annum. Tea has indeed a big margin to make up before it beats the old king.

I shall now only notice, on the way down to Peradeniya, the quondam and favourite abode of clever, capable, Sandy Brown, Bellevue, as he delighted to call it, but now known by the less appropriate name of Augusta. Would that Sandy was here today to witness the change! The neighbourhood presents few more satisfactory transformations than this. As a coffee estate it was one of the very poorest and least remunerative in the district, its quartz ridges eating up all the manure that Kandy or Getambe could supply, with the result of only a few additional leaves. Now see it closely clothed in luxuriant tea of the best jât, while that grandest of exotics, the Grevillea, adds yearly to the improving soil. Truly tea is a hardy though eccentric plant, often growing best where least expected and sometimes—as we will see in my next—refusing to take root in the richest soil.

Yes: I could wish Sandy had lived to share in the prosperity of this now very profitable property. I have always thought his fate one of the saddest in Ceylon. Worried and bled by relatives at home, distrusted by his old friends in Ceylon, many of whom he had helped to make—he passed away neglected, crushed, and starved, when, as usual, the friends came forward, and gave him a stone.—*Cor.*

CULTIVATION OF RHEA.—The Government of India, it is stated, is likely to take steps to investigate the cultivation of the rhea plant. An enormous demand for the fibre has sprung up in England. By a new process of manufacture, excellent fabrics can be woven from rhea and the industry seems to have a great future before it.

THE RUBBER SITUATION IN MADAGASCAR.

Madagascar as a source of India-rubber is destined no doubt to become largely more important. The exports of rubber from that island have fluctuated from year to year, sometimes declining so far as to induce fears of the early extinction of the yield, which were strengthened by reports of the destructive methods of the rubber-gatherers. But again the output has increased, while each successive traveler returning from Madagascar has thrown new light upon the extent of the rubber forests. Some facts of interest in this connection have been supplied to The India Rubber World by Mr. John L. Waller, some time United States consul at Tamatave, who has lately returned to America after his release from a French military prison, his troubles having grown primarily out of a concession to him of valuable rubber lands by the Malagasy government without consultation with the French authorities.

This large island is covered, for the greater part, by virgin forests throughout which, so far as foreigners have made their way, India-rubber vines and trees abound. By the way, most authorities have attributed the Madagascar rubber to vines of the genus *rubra* (similar to if not identical with the *Landolphia* vines of continental Africa), but, according to Mr. Waller, a more important source of rubber is a large tree which he has not been able to identify botanically. This tree often grows to a diameter of twelve to eighteen inches and in such numbers as to make the ground seem almost bare after the reckless rubber gatherers have gone over a strip of forest with their axes. A peculiarity of the tree which Mr. Waller reports to have seen personally is that the roots are not killed by the felling of the trunks, but that new shoots invariably spring up, becoming large enough in a few years to yield rubber. Thus the extinction of the supply is provided against by nature, which is not true of the Pará rubbers or the *Landolphia* climbers. The tree likewise grows readily from the seed.

The usual practice of the native rubber-gatherers is to proceed to the forest in gangs, armed with axes for felling trees and galvanized iron buckets for catching the sap. The fallen trunks are chopped or sawn into lengths of three or four feet and supported over the buckets until all the rubber sap has drained from the bark. Mr. Waller reports having seen two quarts or more of sap yielded by a single stick of wood. Coagulation is effected by stirring a few drops of acid into a bucketful of sap and allowing it to stand in the sun for several hours. There is as yet practically no proprietorship in the lands, and the rubber-gatherers have been free to wander at will in the forests. But the governor of the province in which Mr. Waller's concession is located has orders from Antananarivo to prohibit trespassing upon it after the limits shall have been surveyed, and the next step will be to put an end to the destruction of the trees.

The concession covers 144,000 acres of forest lands, to be located in the best rubber district in Madagascar, which is in the southeastern portion, including the old French station, Fort Dauphin. This has been the chief place for working rubber on the island, and, as it is distant from any consulate, and, as the English and French traders are secretive about the extent of their business, doubtless not a little rubber has been exported to which no record ever reached the various consuls stationed at Tamatave. Rubber near the coast began to be scarce several years ago, but the natives asserted that more was to be found farther inland, and now the seat of the industry has been removed to a district about three days distant from Fort Dauphin. Twenty-two dollars are paid there for a hundred-weight of rubber. Fort Dauphin has been styled a halfway house between Europe and the Orient, and it is now a port of call for the Castle mail Packets Co., Limited, and another line of steamers. There are from two to four ships and sometimes more per month in the harbour. The

climatic conditions at this point are good, the lands are fertile, the cost of living is low, and a consideration which induced the Hovas to grant this concession was that it might lead to immigration from Mauritius and elsewhere and the development of various industries at Fort Dauphin.

It is the belief of the *concessionaire* that the district would be well fitted for colonization by Afro-Americans, who would find there better advantages for trading than they enjoy in the United States. The Hovas are an educated race, and foreigners from several countries have made fortunes in trading with them. Mr. Waller will attempt to find means in this country for developing his concession, the status of which, he claims, has not been changed by his troubles with the French authorities. In what light it will be viewed by the latter, however, remains to be seen. He believes that a field exists for a much wider direct trade between the United States and Madagascar. While the foreign traders have been mainly English and French, the American house of Ropes, Emmerton & Co., of Salem, Mass., long and had a successful career at Tamatave, retiring from the trade during the troubles growing out of the late French war. The house of George Ropes, of Boston, entering the trade later, is now established at Tamatave, Vatromandry, Antananarivo (the capital of the island), and Finanarosa. A large business is done in the selling of American cotton goods to the natives.

The British and American imports of Madagascar rubber, which presumably include almost the entire output of the island, have been of late years as follows:—

UNITED STATES.		GREAT BRITAIN.	
	Pounds.		Pounds.
1891-92	.. 174,919	1890	.. 624,848
1892-93	.. 275,331	1891	.. 729,232
1893-94	.. 265,411	1892	.. 996,240
1894-95	.. 31,003	1893	.. 1,040,920
		1894	.. 984,816

There must also be taken into account the British imports of rubber from Mauritius which are mainly derived from Madagascar, and which amounted in 1894 to 163,336 pounds. Altogether, the official figures available point to an average annual output of Madagascar rubber in recent years of 1,162,000 pounds. If it be true that the supply is practically unlimited, the ever-growing commercial spirit of the age, the increasing means of transportation, and the utilitarian spirit which must inevitably stop the waste of trees, will without doubt combine in largely and permanently increasing the yield.

Madagascar rubber is classed in the markets as "pink" and "black," the former being the more valuable. When asked whether one kind was probably yielded by trees, and the other by vines, Mr. Waller replied that he could not say.—*India Rubber World*, May 10.

THE CLIMATE OF MID-AFRICA.

Mr. Scott-Elliot, in his account of his journeys in Mid-Africa, says of the Ruwenzori range that the highest peaks are almost perpetually hidden from view by mist, which in the morning covers the lower slopes, and appears to rise at the rate of about 1,000ft an hour. The upper limit of forest is given at 9,000ft, bamboos at 11,000ft, whilst heather reaches 15,500ft, at which snow begins. The climate is divided into four zones of altitude—the coconut or oil-palm zone below 3,000ft, the coffee zone between this and 5,000ft, the colony zone from 5,000ft to 7,000ft, and the cloud belt above 7,000ft. The Ruwenzori region is stated to be a more promising coffee and tea region than even the Shire highlands. For colonies the Masai uplands and the Stevenson Road plateau are the most recommended.—*H. and C. Mail*, June 12.

TEA PLANTING IN DARJEELING.

PAPER TO BE READ BEFORE THE INDIAN SECTION
OF THE SOCIETY OF ARTS ON THURSDAY,
MAY 14TH, 1896.

BY GEO. W. CHRISTISON.

My first duty—which is a pleasing one—is to thank the committee of the Indian Section of the Society of Arts, for having done me the honour of inviting me to read a practical paper on tea. As the history, progress, commercial aspects, and complete statistics of the industry have been exhaustively dealt with by others, I shall best employ the time allotted to me this afternoon by giving a brief outline of the culture and manufacture of tea in Darjeeling, with some suggestions on a few points of vital importance, referring to that district in particular and the industry generally, drawn from my own observation and experience.

The annexation of Darjeeling (strictly British Sikkim, and British Bhutan, exclusive of the Dooars) is but a comparatively recent chapter in the history of the extension of British rule in the East. Until 1815, when the country was brought into notice by the Goorkhas invading the territory of the Raja of Sikkim, that district was practically a *terra incognita*. This led the East India Company in 1816, at the close of our war with Nepal, to espouse the cause of the Raja, and enter into a friendly treaty which constituted Sikkim an independent state under British protection. In 1835, 138 miles of Sikkim were ceded to the East India Company for a sanitarium for Bengal, in lieu of which an annual allowance of £300 was granted. In 1850, after the Sikkim war, some more hill territory and also the Terai were added, the subsidy, however, at the same time being enhanced very materially. And in 1865 the hill district of Daling was annexed from Bhutan as the outcome of the expedition of 1864, and the war with that state just then terminated.

The district is mainly situated on the lower and outer ranges of the Himalayan mountains, but as stated, includes the Terai which is an unhealthy level sub-montane tract of forest, or what was up till 30 years ago almost uninterrupted forest. It is bounded on the east by Bhutan, west by Nepal, north by independent Sikkim with Tibet beyond, and on the south-east and south by the Dooars tea district and Purneah in Bihar, and extends from about 26deg. 30' to 27deg. 13' N. latitude. Though in area it hardly exceeds that of a second-rate English county, it ranges in elevation from about 350 feet to altitudes of over 12,000 feet above sea level. The town, or as it is called the "station" of Darjeeling, which is the administrative headquarters of the district, as well as the health resort for the Government and residents of Bengal, is charmingly situated on a ridge at an elevation of 7,167 feet, commanding a magnificent view of the "snowy range" (about 40 miles distant and rising to over 28,000 feet), and to the north of Calcutta 379 miles by rail, but somewhat less in a direct line. Any attempt to describe the magnificent and sublime scenery is, fortunately, outside my province, as it is altogether beyond my powers. It is impossible for me in words to convey even any adequate idea of the steepness and irregular configuration of this mountain territory to those who have not visited it, though this feature must not be lost sight of in our consideration of the main subject of this paper. The mountains do not rise by any series of inclined planes or uniform undulations to their summits. The main trend of the ranges is towards the "snows"—generally from south to north—and of the torrents and rivers in the opposite direction from the snows towards the plains, but there are also side branches of importance running east and west (one of those, the Little Rangheet river, actually flowing north-east, and the adjacent mountain ranges ascending south-west), and many minor spurs and streams are in the very opposite direction to the main ones. On this account, the interior of the hill district generally presents a somewhat confused labyrinth of ridges and valleys. A con-

siderable proportion of the hill area is so precipitous as to grow nothing but scrub or an occasional tree in the crevices of the rocks, and much is unfit for tea or cultivation of any description; but the soil on the gentler and some of even extremely steep slopes is good and of surprising depth, considering the situation. As a rule, the best soil on the hills is found from 2,500 to 5,000 feet; that below 3,000 feet is generally dry, and the tea thereon more subject to blights. Elevations over 5,500 feet are rather cold for tea—certainly for its rapid growth—though it is to be found thriving and doing fairly well from 6,000 to even 7,000 feet. Owing to the extreme steepness and irregularity of the ground, the roads have to be laid off in zigzags of greater or less length, when, as is the rule, an ascent or descent has to be made, or in sharp curves where contouring more levelly round ridges and into the indentations. This renders the length of roads from place to place out of all proportion to—not unfrequently over twice, and occasionally almost three times as great as—the distance as the crow flies. The district government roads are, as a rule, at gradients of 1 in 9 to 1 in 7, and are from 10 to 7 feet wide.

As stated, owing to the zig-zag and winding nature of the roads, and the wide intervening spaces of forest and jungle, the length of the roads is very great, in proportion to the cultivable and rateable area, especially as the Forest Department does not pay road or public works' cess, and the vast tracts of native cultivation nothing directly and next to nothing indirectly. In my time, the local railway was also exempted. For these reasons, as well as on account of the district being a frontier one, containing a military station and sanitarium, it has special claims for "grants-in-aid" towards its roads and bridges, in regard to which, it must be admitted, Government has, on the whole, been liberal, sometimes especially so. Yet I hold that, in justice, as well as viewed as a fair and legitimate matter of account between the Government departments, a great landlord like the Forest Department of India, claiming a large clear revenue annually, ought to be charged both land revenue and road cess. Incalculably valuable as this department undoubtedly is to India, profit should not be its chief aim; and such a step would cause the department all the more adequately to realise its immense responsibilities in holding such vast territories.

But, in addition to locomotion and soil, this rapid and great variation in elevation affects the climate, health, and working capabilities of the inhabitants, native and European, vegetation, humidity, and, to some extent, the quality of the tea, to which allusion may be made hereafter.

The rainfall varies greatly throughout the district. At the "station" the average is about 120 inches, and on the tea-gardens (at lower elevations) it ranges from 75 to 135 inches and even over annually. The defect for tea in regard to rainfall is that it is not sufficiently distributed—the dry season being too long, but worst of all too little rain falls in spring and too much during three to four months from June to September, when it is too frequently accompanied by dense mists, often obscuring the sun for a week, sometimes more, at a stretch. There are also not unfrequently sudden heavy downpours which have been known to amount to ten inches and more in a single night. These downpours as well as considerably heavier annual rainfalls than have been named are more characteristic of the outer ranges. The mean temperature of the "station" of Darjeeling is only a couple of degrees above that of London, but that of the tea gardens is of course much higher. In the Terai and confined valleys under 2,000 feet on the hills it is quite tropical and often stifling. At elevations of 4,500 feet the temperature seldom exceeds 85°, the mean maximum about 80°, and at elevations of 3,000 feet it occasionally turns 90°, with a mean maximum of about 85° in the shade during the hot months. The mean maximum in the shade in winter is about 60° at 4,500 feet, and 67° at 3,000 feet. The difference between the mean maximum and the mean minimum varies from 15° to 20° and more in winter than summer, and at high than low

elevations. As registers have been kept since 1866 for the company I served in Darjeeling for thirty years, and for the last eight or ten years at no less than eleven stations, at various elevations from 1,400 to 6,300 feet, the statements in the appendix are given to avoid further details here.

The latest complete Government returns that I have been able to obtain give the entire area of the Darjeeling district as 1,234 square miles, about equal to that of the county of Stafford. The old hill territory, containing the well-known tea gardens, is put at 477 square miles, the Terai at 271, and the Daling-hill district at 485 square miles. Of the whole, 438 square miles were returned in the possession of the Forest Department, 397 miles as held by native cultivators for cereal crops inalienable for tea as far as the hills is concerned, 70 miles had been allotted to the Government Cinchona Department, and 329 square miles as grants for tea cultivation. It will, therefore, appear that but one-fourth of the whole has been allotted for tea, and that certainly not more than one-thirteenth or about seven and a-half per cent of the entire district is actually bearing tea at the present time. From information kindly furnished by the India Office I find the area of the district is now stated to be 1,164 square miles, and the difference may be due to the portion marked off and include in the Dooars district some years ago. I am also of opinion that for tea, transfer of some of the land returned as above for native cultivation may have taken place in the Terai. Yet if this be so, the proportion of the tea grants would not be greater than stated. Seeing the Census of India Report, published in 1893, gives 212 square miles as the area held for tea estates, I cannot be charged with any desire to understate the proportion allotted for tea. Hardly any land on the hills suitable and available for tea remains unplanted.

The more recently acquired district of Daling may be taken as about equal in extent to that of the entire original Darjeeling hill territory, and generally comprises much gentler slopes. Of this 250 square miles are returned as made over to the Forest Department, 30 as retained by Government for cinchona, and 141 consisting of beautiful slopes, most desirable as a place of residence for Europeans, and as suitable a district for European colonisation as can be found anywhere in the East, has been reserved by Government for natives, and is now largely in the possession of Nepalis who are aliens, and a smaller proportion of aborigines and semiaborigines. About 65 square miles of this subdivision was reserved for tea, but so unsuitable was it that, notwithstanding the eagerness for tea grants, especially in the hills, only about eight or nine square miles had been taken up when I left India in 1893, and hardly more than about 1,200 acres altogether have been opened out. These new gardens adjoin the Dooars, and may be said to belong to that district rather than to Darjeeling.

The late Dr. Archibald Campbell, who was an active and enthusiastic member of the Indian Section of this Society, was the first resident Government official at Darjeeling, and did much for the district in its early years. He was removed from the residency at Nepal to be superintendent of Darjeeling in 1840, and in 1841-42 he made the first trial of growing tea in the district. He continued his experiments, and in 1847 had the plants raised, reported on by a gentleman from Assam, which fully confirmed him, in the opinion that tea could be grown successfully on the hills. Seed was distributed by Government to several residents most likely to do justice to it, and experimental plots of a few acres were planted out in different localities, about 1856; and in 1857—or it may have been a year earlier as asserted by some—the first tea garden, on an extended scale or commercial footing, was started at Alloobaree by Major Samler. In the Terai, though experimental plots were planted earlier, the first garden (now known as Chumpta, near Kaprail) was opened out by Mr. James White, one of Darjeeling's pioneer planters, than a most energetic man, who had previously planted, in the course of two seasons, very

successfully, Singel, near Kurseing, still one of the largest, if not the very largest, of our single hill gardens. Darjeeling has since grown gradually in importance as a tea-producing district and in other respects. At present there are about 180 tea gardens in the district, extending to about 55,000 acres under plant, giving employment to not less than 70,000 natives, excluding children and other non workers.

According to the last census returns, the rapidly-increasing population of the district was 94,712 in 1872, and 223,314 in 1891. Of the latter, 88,021 were stated to be residents who were actually born in Nepal. This being so, the Nepali population of Darjeeling who have immigrated at one time or another or been born in the district, can hardly be less than 160,000.

Tea is certainly the staple, if it may not claim to be the only, Darjeeling industry, and to say the least, has done much for the district. The 1895 crop amounted to 10,771,117 lb. of which most went home, contributing considerably to the exchequer, benefiting trade in many directions, and supplying nearly all the return traffic to the local railway, at highly remunerative rates, considering it is conveyed downhill mainly by gravitation. Very little produce of any kind is exported, or even supplied to the district, from the native holdings.

In regard to my main subject, the first point requiring attention naturally should be the selection of a site for a garden. This is a matter of vital importance, and calls for the exercise of much judgment and experience, and often exhaustive labour in exploiting. The soil may be looked upon as the constitution, so to speak, of a garden upon which its prosperity and staying power mainly depend, and its selection, especially as the subsoil, to a great depth, is of importance with a deep-rooted plant like tea, involves no light responsibility. Besides a wholesome water supply, forest, water-power, and, in the plains, immunity from flooding should all if possible, be secured. But as this can no longer concern Darjeeling hills, it need not here be dwelt upon at length. Though I have been concerned with the opening-out of gardens of considerable extent on Darjeeling hills, I have never had the responsibility of the selection of the grants for them, but have merely had to endeavour to make the most of the ground at my disposal. The original Darjeeling gardens were, as a rule, selected and opened out in a creditable manner, considering the experience of the time. During the mania of 1863-64 extensions were pushed on upon risky and unsuitable soil, beyond the labour and experience available, the land was very imperfectly prepared and planted; there were difficulties about seed; seedlings had often to be carried long distances, necessarily resulting in failure and consequent abandonment for a time. A proportion of the land then abandoned has gradually been re-opened successfully under more favourable conditions. If a grant of land has still to be selected on the hills, the most important consideration would doubtless be to secure a soil that would yield quality, and varying in elevation from 3,500 to 5,000 feet. All aspects grow tea almost equally well; and though the southern and south-eastern are drier and more difficult to plant successfully, they are, upon the whole, preferable when opened out. The northern aspects require less care and less skill, and are not risky for vacancies, but have comparatively more in their favour at low, dry altitudes than high. Though gentle slopes are undoubtedly preferable, they have generally, on that very account, been much more under native cultivation; and, contrary to the expectations of many, the steeper—often extremely steep—ground grows the better teabushes. It should here be noted, in regard to these hill-sides, that it is very difficult to get tea to thrive upon the sites of homesteads, and that for many years these parts generally remain bald, comparatively bare looking, and an eyesore upon an otherwise successful garden. But I can bear testimony to the fact that such patches, after having been trenched to an unusual depth, kept fallow, and sulphured annually for three years, have afterwards been planted quite successfully the tea bushes flourishing and keeping pace with the body of the garden

from the outset. Further, all land long under native cultivation should be allowed to lapse into jungle, or, as it were, lie fallow for three or more years, and, of course, the longer the better before planting.

The first operation in tea planting is the clearance of the land; it may be from forest, but often upon partially cleared and cultivated or grazing land. In the case of forest toon and a few other very valuable trees, the drip and shade of which are least injurious, should be marked for preservation at considerable intervals. The felling of trees is a work the Nepali is expert at, and delights in, his bump of destruction being highly developed. The trees are sometimes prepared so that the fall of one carries others over with it, and so on continuously down the slope like nine-pins, with a crash that resounds through the solitude of the hill sides like muffled thunder. After the storage of useful timber, the next step is the burning, over which there is considerable excitement. This is carried through as soon as the clearance has been duly prepared and become sufficiently dry, advantage being taken of a safe and suitable wind. A great number of coolies have to be in attendance to guard the fire from spreading to property beyond. In addition to wood and other growth there is often numerous bamboos upon the clearance which, when being burnt, crackle and give forth reports resembling the roll of musketry, while the figures of the natives flitting athwart the raging flames, and by times being taxed to their utmost to keep the "burn" within safe bounds, renders the scene a lively one, though not always free from anxiety to those responsible. The burning stumps and heavier bamboos often smoulder for days.

After the fire has died out the ground ought to be trenched and thoroughly cultivated to the depth of 18 inches throughout the gentler slopes, but effectively though carefully and to a lesser depth on the steeper slopes, and in accordance with the degree of steepness—extracting stones and all roots of trees, bamboos, jungle and weeds at whatever cost. On such steep and irregular ground much judgment and ingenuity have to be exercised in order to direct the surface drainage into safe channels to prevent "wash." All except the gentler slopes ought to be carefully terraced. These terraces should not be formed too elaborately, with a deep well behind, and built up sharp angular edges in front or containing two rows of bushes along side as they sometimes do, but merely so as to modify the slopes no more than necessary for the stability of the soil and prevention of wash. This is more simply accomplished if attended to at the proper time and place than it would appear to be. A shallower formation of terrace will interfere less with the capilarity and natural circulation in the soil than the more elaborate. The deeper and more acute angular terraces greatly intensify the defects of the Darjeeling climate. The terraces should also be aligned as far as practicable to direct the surface drainage into safe channels. It stands to reason that the wash should be diverted near its source, and as it begins to accumulate. Paradoxical though it may seem it is not generally the steepest parts that suffer most, but the gentlest slopes even where they assume almost the form of a plateau. This arises from the surrounding slopes having acted as a filter, so to speak, concentrating a rush of water upon such after sudden downpours. The object of surface drainage is to check this accumulation, and the drains should be laid off with a gentle run. The excessively steep portions should be laid off in "spot" terraces, formed in the most advantageous places, to contain one or more plants. The laying off of the estate roads so as to traverse all parts of the gardens, without involving waste of locomotive power, is important, and their alignment should also be such as to aid in the safe drainage—the reverse being easy. This somewhat difficult task, with the skill and experience available in the early times, was not so invariably successful in attaining the perfection and easy uniform gradients as desirable. The prevailing gradients of garden roads, except where the slopes or rounding ridges, are from 1 in 7 to 1 in 5, with

5 or 6 feet; but paths are to be found not more than 1 foot wide, and so steep as to ascend or descend 1 in 3. A sure-footed pony—which the Bhooteah ponies generally are—is indispensable; and passing across precipices with a sheer drop of hundreds of feet upon such roads is trying to the nerves of most unaccustomed to mountain travelling. As has been remarked, the length of road is great in proportion to area. By careful survey, I have ascertained that on a garden of 500 acres, benefiting by the service of a district road zigzagging through its entire length for $4\frac{1}{2}$ miles from top to bottom, the inadequate system of estate roads measured 18 miles, leaving fields of tea very arduous to reach from any of the roads. The Ceylon "road tracer," a simple and inexpensive, but admirable, instrument, is a most valuable aid, to the inexperienced especially, for the alignment of roads, but, in my experience, even more so in the laying off of terraces. Roads generally, like terraces, should have the outward, not inward, slope, but may also have a drain along the inner or hill side when required. The removal of stones, as referred to, might possibly be carried to excess in rare instances, but of this the risk is not great. I have often had this done to an enormous extent, and with an unflinching corresponding advantage on extensions. The stones may be disposed of for buildings, or in forming embankments, culverts, and fords for roads. Besides, when a road passes through good land the rich soil may be removed and spread upon the poorer parts of the garden, and replaced with stones. The remainder of the stones can be built up in heaps upon spots of convenient waste land. The cultivated area has to be lined and "staked" off for planting, and no little ingenuity and care are required to get the points for the plants arranged in perfectly straight lines up and down a steep, irregular hill side, "over hill and dale," and, at the same time, getting them to fall into contouring lines along the terraces, without loss of space or overcrowding. Opinion has always varied, and from time vacillated, as to the distance the bushes should be planted apart, and though there is a guiding principle in regard to this, it may not be well to dogmatise. For the hills, I would venture to recommend 5 feet by 4 feet, $4\frac{1}{2}$ by $4\frac{1}{2}$, and at the closest $4\frac{1}{2}$ feet by 4 feet on the base, but for the Terai greater distance, especially between the rows, to admit of ploughing or horse-hoeing if found necessary.

There are two modes of planting, the one from nurseries by transplanting, the other by putting down the seed germinated or fresh *in situ*, or, as it is termed, "at stake." Each has its own advocates and advantages, but in the climate of Darjeeling the former is preferable; besides, two paramount advantages may be claimed for it anywhere—namely, five or six months more are available for the thorough preparation of the ground, and it admits of the perfect selection of the most vigorous seedlings of the best and of uniform variety. Moreover, from my own observation, I have often been disposed to doubt whether the quality of the produce is not improved by the transplanting. This may not be so, but I have been at a loss otherwise to account for the different quality of tea in adjoining gardens on similar soil, and under varying management. This is a matter I would recommend to practical men, as worthy of being determined by systematic experiment. If the transplanting is to be adopted, an extensive and elaborate system of nurseries is essential. For nurseries, the most advanced garden cultivation, constant care and attention is indispensable—watering in most instances, and shading in hot-exposed situations being needful. The nurseries should be numerous, and practical, in or near all parts of the proposed extensions, for economy in the carriage of the seedlings. The seed beds must be thoroughly freed from stones, and the seed should be sown rather wide apart especially when machine planting is to be adopted. Though 4 inches by 4 inches may seem too close, judging from what is generally written, that in practice will be found to work out satisfactorily, the early and first seasons's operations thinning out, and giving space for the young plants that remain.

The seedling are generally removed from the nurseries at the age of from six to eight months. They should be transplanted with balls of their own earth attached to their roots, and this can be accomplished to great perfection by Jaben's patent transplanter, an ingenious Cachar invention, simple in operation, handy, costing a mere trifle. All risky dry aspects should be planted by this means, and also during the most seasonable and favourable season and weather. Most northern aspects, unless during unfavourable weather or towards the close of the season, may be planted very successfully by hand with a lighter quantity and less perfect ball of earth attached, at a saving of labour. By this method the seedlings receive no check to their growth, while those put out in the old ordinary defective way, without earth attached, with difficulty exist during the ensuing dry season at the best five months in duration—some years, even eight months, from October to May inclusive. With land thoroughly prepared and planted out as referred to, though much more costly the first year, this will be more than compensated for in the saving upon the cultivation in subsequent years; while, it may be safely asserted, that as good growth has been obtained in three years in this way as was common during five years under the ordinary method.

It must readily be perceived that the judicious cultivation of such excessively steep ground must be a matter of vital importance. The utmost foresight, ingenuity, and care are necessary to prevent the soil from being carried downhill, not so much in the process of hoeing itself, as by the action of the heavy rainfall, especially the sudden down-pours early in the rainy season. Forking is much less dangerous for injuring the roots of the tea, and is much safer for hill cultivation than hoeing with the country *kodalie*. Moreover, the straight digging fork admits of the labourer standing upon the unturned ground, and turning or tossing the soil up hill; while in hoeing he reverses the process, by trampling the ground he has just cultivated, and dragging the soil down the declivity. Cultivation by means of the straight digging fork was first advocated and experimented with in Darjeeling by the late Mr. John Stalkart. Forking was resorted to on a large scale by me 23 years ago, and is now pretty general, the hoe (*kodalie*) being only used in the preparation of extensions, road-making, and the like. It is, however, decidedly, more costly than hoeing, which is a consideration, when labour is scarce, and many hundreds of acres are entirely under spade industry, so to speak. The deepest and most important cultivation of the year is the cold-weather digging. This is but too commonly done, by turning the ground up rough, and leaving the whole in large clods. Such a process is highly objectionable, in a climate like Darjeeling, with a long, trying, dry season, and too subject to droughts in spring. It is, of course, quite different in Britain, where the soil exposed in a similar way is pulverised by the action of forest, and there is in general an excess, rather than otherwise, of moisture in winter. But this rough cultivation aggravates the defects of the Darjeeling climate, and intensifies the drought; while the clods, by the scorching action of the sun, get dried and baked like so many bricks especially in the southern and dry aspects. In all countries subject to droughts, especially in the tropics and sub-tropics, a thorough cultivation and pulverisation of the soil throughout, but especially at the surface, in autumn and the dry season, is by far the best for attracting and retaining moisture and obtaining healthy crop growth. Thorough cultivation admits of ample aeration of the soil. This is a subject which I have given much thought and attention to for 30 years. Shortly after I went to Darjeeling, I experimented with rough and thorough cultivation, on equal plots alongside, noting the result as to benefit derived from dew and retention of moisture, and can entertain no doubt as to the immenso advantage of the latter system over the former. While making my farewell tours through the district in the spring of 1893, field after field, in different localities, came under my observation, lying exposed to the scorching

sun in clods, in some instances almost half the size of a man's body, and I could not but sympathise with the proprietors. For the second and succeeding cultivation at the close of spring and the early part of the tea season, hand weeding is the most suitable and stimulating culture of all; and as an accompaniment the weeds or grass can readily be disposed of in layers or bands across the slopes, and (drainage having been attended to as referred to) check the "wash" in a wonderfully effectual way, even where there are no terraces. Hand-weeding may be carried on most advantageously, especially where extensions have been thoroughly prepared. In the rains, when hand-weeding has become impracticable and a turf has formed, the soil may be forked over less deeply and left rough, there being no longer fear of drought, and less from "wash." After an extra wet time, or on unsafe parts during the rains, nothing more should be attempted than close sickling, supplemented by hand-weeding, of spots around the collar of the roots of the plant.

The great difficulty attending the perfect cultivation of a tea garden during the rains is, the crop must be gathered at the same time, and there is often pressure to get the leaf off at the most perfect stage. The time, nature, and amount of cultivation has, therefore, but too often to be regulated by the labour available for it. Forking ought to be avoided in excessively wet times, and done in favourable weather, but for the reason just stated, it is impossible always to choose the best time, unless the labour force be unusually strong—stronger perhaps than might prove profitable where coolies must be retained all the year round, as is the rule, and cannot be engaged for a pressure of work, and their services be dispensed with when it is completed. Extensions and building upon an old garden are also liable to retard garden operations, and add to a manager's difficulties and anxieties. Unfortunately, the real question is not to know what ought to be done in regard to cultivation, but too frequently what is practicable with the available labour. What has, in many instances, become a most vital matter on the hills, is how best to rectify the results of reckless or defective cultivation on old gardens during the past. This is sufficient to tax to the uttermost the skill and resource of the most ingenious, and in some parts, not to speak of impaired cropping capabilities, so grave has the evil become that the only effective remedy would be to carry back the soil from the valleys and hollows where it has in process of time been wasted. Terracing an old garden originally lined up and down hill, and often laid out in hedges without any such object in view, has its drawbacks. The plants that fall in the backs of the terraces get their roots bared too much and injured, and those in the edges are unduly buried.

Ploughing is impracticable anywhere on the Darjeeling hills, but in the plains districts might with advantage be restored to, and I daresay has been for the preparation of extensions, but whether steam ploughing has been resorted to or not, I cannot say. About 25 years ago I tested light ploughs by Ransome and of native pattern on a mature garden in the Terai, but the work was not fine or the result satisfactory. For the plough the distance between the rows would require to be wide, but in spite of this the lateral roots of the tea get damaged, and the cleaning close to the stems must be done by hand. The injury to the roots should to some extent be obviated by trenching all over as recommended on opening out, but ploughing on a planted garden is never likely to prove so advantageous as hand labour when procurable at moderate cost.

The manuring of the tea plant is for many reasons difficult, but fortunately the matter is not yet a pressing one generally, the tea crop being neither heavy nor exhaustive, and more nitrogen is undoubtedly returned in the rain than in more temperate climates. The average crop of green leaves taken from the soil annually does not exceed 12 cwt. per acre (say half-a-pound per bush) which is very trifling compared with the weight of agricultural crops in this country exclusive of the portions thereof returned to the soil. Some attendant drawbacks to tea

manuring are want of an adequate supply, costliness of transit, liability to evaporation and waste, and tea being a deep-rooted plant the difficulty of applying the manure so as not to increase the growth of the weeds rather than leaf in the first instance. It has not been proved even how manure may affect quality, which is an important consideration and must depend upon the nature of the manure used. By all means let every available manure, solid and liquid, be preserved from waste through exposure—the danger of which is very great in a tropical climate—and be applied to the best possible advantage. But of all that is practicable in this line, I attach most importance to “green manuring” by means of turning into and burying in the soil in autumn the greatest possible amount of fresh and decaying growth. Let this work be pushed forward with the utmost vigour with all available labour. Nothing else in the way of manuring I know of can give so good a return. Top-dressing with leaf mould or other rich mould is also of immense benefit, and even when soil of only the poorest quality is procurable a thick dressing with that on thin dry parts has shown markedly good results. Manuring, and more so top-dressing, is comparatively unavailing—simply outlay and labour in vain—unless the application be a liberal one—three to five inches deep in the case of the latter according to quality of mould.

Transport by means of wheeled vehicles, in the ordinary sense of the term, is quite impracticable on any Darjeeling hill road, except the main military one, where cart traffic has been superseded by the wonderful Darjeeling Himalayan Railway, and on one or two other pieces in or near the station. There are no lakes or navigable rivers as in Kashmir, and previous to the torrents being permanently bridged ferries even were not practicable except at one or two points in or near the Terai and they were always attended with some danger.

All carriages including that of ordinary building materials, fuel, provisions, is performed upon men's backs, and journeys are performed by pony, on foot, or, in the case of ladies, children, and invalids, in chairs or a form of hammock called a “Dandy,” suspended on poles and carried by coolies. Heavy loads, such as boilers, tea, lead, and sometimes lighter packages, are conveyed from the nearest station to the gardens by trucks or trolleys mounted on low broadrimmed wheels. The bringing down of a 20 or even 10 horse-power boiler of several tons weight is one of those little incidents that break the monotony of garden labour. Some skilful steering is needed in turning the acute corners of the zigzags, and in guiding the passage safely over many precipitous parts of those steep, narrow mountain paths. As many as 100 of the strongest men may be employed with a truck so freighted, chiefly strung upon ropes—some pulling before and others behind as occasion requires, the latter to prevent the truck getting beyond control by acquiring too much down hill velocity; others using crowbars, planks, or other appliances as need arises. In Assam and other plains districts of India and Ceylon, elephants are employed for the dragging of boilers, presenting scenes hardly if at all less picturesque.

In regard to buildings, time will not admit of my entering into detail. In the past the planter has been his own architect and clerk of works, planning, estimating for, and vigilantly superintending every operation from the sawing of the timber in the forest, the making and burning of the bricks, to the completion and full equipment of the edifice. The more modern and doubtless the most extensive buildings are in the plains districts of India and Ceylon, where extensions on an enlarged scale have been more recent; there in addition to the most modern mechanical appliances electric lighting has been introduced. In Darjeeling there has not been the same scope, the buildings had generally to be designed to suit the sites after costly excavation on the steep hill sides, and in the case of amalgamation of factories, for instance, ingenuity had to be exercised in the erection of a main central building to connect two others at different elevations,

the ground floor of the one being near, but not on the identical level with the first floor of the other. The whole had to be designed for convenience, to deal with increased crops, and meet modern requirements. The managers' bungalows are generally charmingly situated, little being required, in the shape of landscape gardening, to make the surroundings altogether beautiful. These buildings, with their white-washed walls and shining roofs, studded over the hill-sides surrounded by the green tea gardens, present to the traveller at all points a striking and pleasant feature of the landscape. Many of the dwellings of the garden labourers are substantially built with brick walls, corrugated iron roofs at the higher, and thatch for coolness at the lower elevations, and verandahs in front. The floors are well raised, and space, convenience, comfort, and sanitation are provided up to and in most instances in advance of the tastes and wishes of the occupants. Few of them would tolerate fire-places, or the exit of the smoke by chimneys in the walls; but on account of warmth, or other reasons best known to themselves, prefer it finding its way from the centre of the floor through the ventilators in the roof, as in Scotland, within my own recollection, and I daresay in other civilised countries. Many darken or block up entirely the windows provided for them. However the modern coolie dwellings are a very great improvement upon the huts once universal, and in most cases all is being done for the coolies' comfort that is practicable or, at present wise. In the centre of the village there is generally a level plot reserved, though difficult to obtain, as a recreation-ground.

The view now presented includes a group of buildings comprising sub-manager's bungalow, factory with coolie lines in the background, to all of which pure water is conveyed from a stream on the opposite spur of the mountain two miles distant, by means of galvanised iron pipes passing through a deep ravine, where there is a pressure of 1,175 feet head of water at the lowest point. The company to which this small estate belongs has water laid on in pipes to all their coolie lines, where needful, factories and bungalows, having in operation for this purpose, as near as may be, seven miles of galvanised pipes of various bores, fed from filtering beds and fountain head tanks, and discharged into numerous large cisterns, from which and from “standpipes” convenient to all, including the coolies, are constantly supplied. Besides, this company has a supply of fire-hose fitted to discharge water with force at the highest point of the factories, and, in one case, at least out of three, with pressure sufficient to eject it over the roof of a three and a half storey house, the hose meanwhile being held in the hand on the ground. And, to convey some idea of the extent corrugated iron is in use on tea gardens, I may mention that the company referred to, though by no means the largest in the district, has in all imported 4½ acres to that material for roofing its own buildings.

The operations of tea manufacture are now performed by machinery in all factories of any importance. Steam is the commonest motor, but water-power (mainly by turbine) is also in use. In the case of the Tukvar Company, the turbine is situated in a ravine about two-thirds of a mile from and 1,500 feet below the level of the factory, the power being transmitted to the machinery there by means of wire rope, travelling upon pulleys supported on standards placed at suitable distances apart. The district owes the conception and accomplishment of this bold and arduous undertaking to the ingenious, indefatigable, and praiseworthy efforts of the late Mr. Thomas B. Curtis, of Tukvar, a well-known and most able tea planter. On another hill garden electricity has for some time been employed, the turbine and generating apparatus being similarly placed beside the torrent far below and distant from the factory and machinery to be driven. For this laudable pioneer object lesson in regard to the motor, which I believe to be specially suited and destined to be the power of the future for Darjeeling, we are much indebted to the late, much-lamented Mr. Wm. Lloyd, who has besides rendered many public services to the district in the promotion of her mar-

vellous little railway, botanic garden, public park, Municipal affairs, volunteering, local banking, and the like, fully appreciated by few, and which never have been adequately acknowledged. Through his enterprise Darjeeling has been for 30 years conspicuous as the only tea district as such as far as I am aware, possessing a European bank.

To return to the field operations, a few remarks are called for concerning the pruning, which has to be attended to as early as the young plants betray a tendency to run up too much and assume the habit of a tree rather than retain the form of a bush, in the case of vigorous seedlings at as early an age as two years, and even younger where individual specimens show exceptional growth; that is, if the planter believes, as I do, in training the bushes when young, but opinion used to vary on this point as on much else connected with the industry. After the plants have attained three years of age they are all pruned according to their form and condition annually. The object of the operation is to get rid of the knotted unproductive wood, thin out slightly to admit air and light, leaving the young vigorous leaf-producing branches and shoots, to train the bushes to width—to give flushing surface, the leaf being gathered mainly from the top—and to keep them at a height convenient for the coolies to pluck the leaf from. Great caution is necessary in regard to heavy cutting in Darjeeling. The pruning is a work requiring a great deal of labour annually, and as many untrained coolies have to be employed, it demands close and constant supervision. The pruning season, as a rule, lasts from the end November till the beginning of March, but the more that is done from Christmas till early in February, the better.

Need I say, that tea is not made from the old, matured, or even hardening leaf, but only from the unopened bud and the young and most succulent leaves at the point of the growing shoots. In early times three, sometimes four, if not occasionally even more leaves were gathered, but more recently quality has become more and more the aim annually; and now it is the common practice to take only two leaves and the bud, but in some instances plucking is so select as only to embrace one leaf. The bud yields the finest tea of all, *i.e.*, the "golden tip" or "silver tip," the top leaf forming the next quality "orange pekoe," or when large "pekoo," and the second or lower leaf generally yielding pekoe, but "pekoo-souchong" when the leaf is large. Commonly the first shoots of the new growth of the season bearing, four, five, or six leaves go to make up what is termed the "first flush." The two top leaves of this, or in some instances only one leaf with the bud are plucked—that is cut off with the incipient tender stalk between the finger and thumb—for tea; the remaining leaves and stalk being too far developed for quality and necessary for the health of the bush, and the giving out of subsequent "flushes" are left. After the first flush, less fresh growth requires to be left, and after three or four months of discriminate, sparing cropping, the bushes having become sufficiently made up and fortified for the season, all the fresh growth that will make tea of prime quality may be gathered without risk of injury to the plants. The pluckers have to go round the gardens at intervals of from five to eight days, extended from nine to eleven days towards the close of the season, according to elevation. It is the pluckers' duty to avoid gathering too coarse leaves or unripe shoots, to miss no good, suitable leaf, and prevent the heating in the baskets of all that has been gathered. In plucking, much discrimination as well as dexterity is necessary, and though perfection may not always be attainable with many hundreds, including often a proportion of untrained pluckers, employed, the operations over the scattered fields on those steep rugged hill sides requires all the more unremitting attention and arduous supervision to obtain the most satisfactory results practicable. It is well when the leaf can be delivered at the factory twice during the day, but this is not always advantageous when the

range of elevation is great. On plain gardens this is comparatively easy, light runways being occasionally in use for the purpose. The cropping season generally lasts from the end of March till the middle of November. The crop varieties from eight to fifteen cwt. of green leaf per acre annually, which yields barely one-fourth its weight, say from 200 lb. to rarely so much in the present day as 400 lb. of prepared tea per acre.

The first operation at the factory is the weighing of the leaf. Here it is necessary finally to examine the quality and condition of the leaf brought in from the field. The pluckers are occasionally paid extra for what is gathered in excess of the allotted task, and if a shrewd inspection of the contents of the baskets were not made, in addition to leaves of inferior quality, a stone or other foreign substance might occasionally be concealed among the leaf to increase its weight. The leaf should be delivered green and fresh, but it is often wet, in fact this may be said to be its normal condition in the rains.

Thence the leaf is conveyed to the withering rooms or sheds which are fitted up with tiers of broad shelves of wire mesh, Hessian cloth, or bamboo netting, at heights and distance convenient for handling the leaf. The leaf should be spread out thinly, and the more extended the surface provided the better, up to say eight superficial feet per lb. of leaf. It is most desirable to have a free current of air to pass over and through the spread leaf, and to cause the air propellers known as "Black-man" fans, or others of similar description, are extensively used. Natural air is most desirable, but when the leaf is wet, the weather misty, and the atmosphere saturated with moisture, as is often the case, air slightly heated, and as far as practicable dried artificially, has to be applied instead, and it is under such conditions that the fans do much to facilitate and quicken, and prevent loss and injury to quality from unduly protracted operations, especially in the case of high-class hybrid leaf. The function of the fans should be to distribute the dry hot air and give ventilation over a wide area. The withering process is a very important one, it should not be done too quickly, and the great aim with it is to obtain fragrance, to avoid heating or discolouration of the leaf. By it the leaf should be brought into a flaccid state. This prevents its breaking up in rolling. Withered leaf to the feel resembles that of a fine kid glove. The process generally lasts from eight to ten hours in all. Wet leaf should be the more slowly withered, but ought not to occupy more than fourteen hours unless the weather be very unfavorable, and artificial heat be not restored to. The leaf leaves the withering stage of manufacture limp and flaccid, still green, but of slightly duller hue, and ought to be fragrant.

The next process is rolling, which is performed by machinery. There are several rolling machines by different patentees, each having their own advocates. The best known and most generally used are the Jackson machines, especially the "Rapid," which performs the work of about 70 men and does it to great perfection. By an ingenious arrangement of cranks, &c., an eccentric motion with elastic pressure (resembling that of the old hand rolling) is produced between a table and a box above which usually contains as much as 300 lb. of withered leaf at a time. This upper plate or rolling box is generally of metal lined with wool, but also of granite or marble for greater coolness. The lower rolling surface or table is usually of wood, but is sometimes granite or marble faced. This machine is beautiful though simple in movement, and as a roller as near perfection as can well be conceived. The leaf is usually rolled for from 25 to 35 minutes according to quality of leaf and the views of the manager, then sifted on wire mesh sieves to separate the fine from the coarser which at the same time acrates it and breaks up the balls. The fine and coarser leaf are after this rolled again separately for from 10 to 15, and from 25 to 35 minutes according to quality, and under such pressure as desirable for each. Machines are also

designed and supplied specially for sifting, disentangling the balls, and aerating the rolled leaf. The withered leaf is fed into the hopper of the roller from the loft above by means of a canvas shoot, and the rolled leaf is discharged through a trap underneath into a trolley which conveys it to and from the sifter, and finally to the fermenting room. It must here be noted that the leaf on leaving the rolling machine has had its cellular tissues broken, has received a twist or "roll," and is a wet pulpy mass but still green.

Now follows the "oxidation," commonly termed "fermentation," without exception the most important process of manufacture. The rolled leaf having been sifted as referred to admits of the fine and coarser being oxidised separately, thus securing a greater uniformity of result. The fermenting room should be in the most shaded situation, and might in fact be partially—in some instances entirely—underground in the hills. The leaf is spread upon tables, or it may be on tiers, of ledged shelves resembling shallow empty bunks in a passenger steamer but at convenient height, in layers 3 to 4½ inches in thickness according to the temperature of the day and other conditions. Every means should be used to keep the leaf cool. It is kept covered with wet cloths, and surrounded by screens kept wet by constant syringing. The floors and surroundings are also syringed with water. I am unable to say how far refrigerating apparatus might be adopted in the fermenting rooms with good results. This has been thought of by a Darjeeling manager, long a fellow-worker with me. I am, however, enabled to testify as to the best quality having been obtained at the coldest season, and when the oxidation occupied an unusually long time. The great secret is to be able to check the "oxidation," or incipient fermentation at exactly the right stage, as quality will be unfavourably affected by under doing it or over doing it. The time occupied varies generally from 3½ to 5 hours, but 5 or even 6 hours towards the close of the season and at high elevations is nothing unusual. A great test of the result is when a bright salmon colour resembling that of a new penny is obtained in the mass. It is important here to observe that the leaf entered upon the "oxidation" process, green and wet, but leaves it for the next, which is drying, a bright salmon-colour and slightly less moist.

In former times the leaf at this stage underwent a process called "panning," which for many years has been entirely dispensed with. In this the leaf was turned over and tossed about in highly-heated iron pans by the operators' hands, aided by a forked stick. This was the most trying process of all for the "teamen," and unless it had some advantages in regard to the keeping or other properties of the tea—and it would seem impossible for any one positively to assert that it had not—it is well it has been abandoned, as it was a dirty, troublesome, risky process, calling for the consumption of no little fuel. After the panning (which occupied the position of the sifting referred to) the leaf received a second and final rolling.

There are several tea-drying machines. The best known are those patented by Jackson and by Davidson. But each machine finds its own ardent advocates among producers and their managers. Jackson's "paragons," his latest inventions in this line, are like some of his others automatic in their action, and, as their name indicates, work to very considerable perfection. By these machines the leaf is passed through a chamber filled—by means of a fan—with a current of air heated to a temperature of 240 deg. to 250 deg. (reduced to, say 200 deg. for finishing), on a travelling endless web of perforated zinc sheets or "flappers," which convey the leaf backwards and forwards through the drying chamber, turning it over at either end, in all, seven times through its entire journey. The wet leaf is fed in at the top, and there is a continuous discharge of the dried tea at one of the lower ends of the machine. Davidson's dryers are worked by means of wire mesh tray drawers, containing the leaf, which are pulled out to have the

leaf turned over, and are pushed back again into the heated chamber, and this process repeated by hand, to meet requirements and the views of the manufacturer, his "down-draft sirocco" being worked with the "up-draft sirocco" with a fan. The mode of desiccation just superseded by machines, and which has all but disappeared, was that over charcoal fires in brick-work furnaces, with wire mesh trays worked by hand. The original method of drying, as practised by the Chinese, and for years in India, was still more primitive. It was by bamboo mesh trays, placed on the top of light wicker-work cylinders of the same material, encircling small charcoal fires placed in holes in the floor. These cylinders stood about three feet high, and were narrower in the middle than at top or bottom, resembling in shape some wooden egg-cups of the olden time. The leaf goes into the dryers a salmon colour, but in the process of drying it changes colour, and is discharged from the machine (or other process) dry, crisp, and black, and its twist has become more perfect and wiry; in fact, it is now practically the tea of commerce; "unassorted," only requiring to be sifted into "classes."

The classification of the tea is performed by machines, by means of wire mesh of different gauges, receiving the unassorted tea above, and discharging it as "broken pekoe," "orange pekoe," and "pekoe-souchong" from shoots into their respective compartments below, in which boxes or other receptacles may be placed to receive the different classes. The long reciprocating sieves, though cumbersome, have no other fault I know of, and are simplicity itself, consisting merely of a succession of webs of the required mesh placed end to end, discharging the various classes into receptacles placed underneath, the large leaf being dropped over the end.

From some of the classes thus obtained, especially the lower grades, a few coarse leaves, stalks, or stray foreign substances may have to be picked out—the operation being impracticable by machinery. But a few bright, tidy Nepali girls soon give those light finishing touches, which hardly amount to handling in any degree. For this the tea is placed upon bamboo trays by an expert jerk, of which the contents are turned over from time to time for examination, and the required sorting out very deftly performed with delicate pliers, simply formed of two slim springy splints of bamboo ingeniously joined together.

The final process is packing. To do this daily as the tea is made has but little to recommend it, but if it were otherwise, it is not always practicable. The insuperable objection to this arrangement however is, that one day's manufacture, even when the same in appearance, differs unaccountably in quality and character from that of another, and the contents of one chest, must, as a rule, be different from that of another in the same break, entailing bulking at home with its consequent damage to the tea, and extra expense. All tea, I hold, ought to be bulked at the factories, where alone the operations can be performed to perfection. For this purpose each class, on being assorted as just referred to, should be put away in a separate "bin" daily, and retained there till thirty, forty, sixty, or more chestfuls, according to the size of the factory, accumulate. These bins, of course, must be in a dry situation, zinc lined, with closely-fitting hatches above and doors below, and perfectly airtight all over. The bins should also be all carefully cleaned and dried for the reception of the tea to be poured in through the hatches. It may be accepted as an axiom that well-cured tea, perfectly stored, will improve by keeping, and the larger the quantity the greater the improvement. Poured in and kept as referred to, the tea will not only get well mixed, but one day's make will get blended with the others, without which no bulking can be complete. For factory bulking uniformity of tares is imperative. To secure this the chests must be made from evenly sawn, clean, and perfectly seasoned boards; and to more perfectly equalise the tares,

the chests should all be carefully classified by weight, those of (say) 23 lb. being laid aside for the "broken pekoe," those of 22½ lb. for "orange pekoe," those of 22 lb. for "pekoe," 21½ for "pekoe souchong," and so on. Providing the sawing has been done with reasonable uniformity, by this means and the interchange of lids, the tares will be found practically even. But, at any rate, this difficulty can surely be surmounted by the use of machine made boxes, patent "vencer" or metal chests, or some similar device. When sufficient tea has been collected in the bins to complete "breaks" of the desired size, it is drawn from the lower doors, of which it may be found advantageous to have more than one or even two to a bin. This alone goes far to mix the whole. The tea is then slowly dried at a comparatively low temperature to ward off the slightest trace of moisture, thoroughly mixed in a large heap in a dry apartment, on a canvas sheet on a clean and perfect floor, to complete the bulking. It is then packed hot in the lead-lined cases. The packing can now be done by the "Davidson-McGuire patent packer," which ingeniously imparts a rapid, short vibratory motion to the chest being filled, obviating trampling, unequal pressure, breakage, and discoloration. This machine is coming into use on the gardens, and the sooner it is also universally adopted in the London warehouses the better, not only for the above reasons, but to compass the only missing link in the entire circle of machine manufacture. This machine claims to pack so as "to preserve the even grade of the perfectly bulked tea," through-out its passage to market, which would be an immenso boon to the industry. It may be an aid, however; when packing by machine—as it certainly was without—to place a thin scale inside the box (better one at either end), graduated to, say, eight, or some other convenient number of equal, parts of its depth to be filled, so that exactly the proportion of the weight to be packed shall occupy the corresponding space, neither more nor less, and thus secure a uniform compression of the tea throughout. This will prevent the tea having to be crunched up or pressed too much to get the required contents all into the box at the finish, or, on the other hand, having it too loose, in the case of too much pressure having been applied and the tea caused to occupy too little space at the early stage of filling. As soon as the chest has received its exact quantity, the top of the lead lining is closely soldered down, hermetically sealing the contents. Finally the chests are marked with stencil plates, and secured by hooping or otherwise for the perils of a trying journey by land, which, as regards strain upon the boxes, do not even end at the port of export.

Darjeeling tea is all carried by the hardy hill-men up the steep mountain roads to the nearest railway station on the way to market. It is no unusual day's work for a coolie to carry a tea chest weighing 110 to 130 lb. a distance of five or six miles, making at the same time an ascent of from 2,500 to 3,500 feet, in short vertical elevation. There can be no deception about a task like that, and we cannot but have an admiration for the powers of endurance of those who perform such a feat. Of course, these people are trained to load carrying and mountain climbing from their very infancy, and hence the peculiar set of muscles required for it are fully developed, if not actually called into existence at the cost of others, so much so, that walking on the level, after a few miles, becomes positively painful to them. In the prosecution of their own trade, or on domestic affairs, they frequently undertake, long, arduous journeys over ridges and along and across hot valleys, varying many thousands of feet in elevation, occupying many days on end, carrying heavy loads of from 150 lb. to 200 lb., and over and in addition their own food and bedding, most cheerfully lighting a fire, cooking and eating their scanty meal, and going to sleep by the wayside. There is a story still current of a Bhootchah in old times having carried a grand piano up the hill to Darjeeling, a distance of 50 miles forward, and involving a rise of over 7,000 feet in elevation by the old road. These hill tribes

are a hardy people capable of performing marvellous journeys without partaking of food, or on the most meagre fare. They have no surplus flesh about them. In this they have at least the advantage of the majority of Europeans.

Green tea has never been manufactured in Darjeeling beyond an experiment. The process is less varied than that just described for black, but here I cannot speak from experience. Mr. Fortune, who travelled in China from 1848 to 1851, was the first to place beyond doubt that both kinds of tea are made from the same shrub. The Indian planters were not, I believe, successful in producing tea of so deep or uniform a green as the Chinese, because they did not resort to artificial colouring with Prussian blue, gypsum, &c.

Brick tea claims to be mentioned. It is largely used in Tibet and the adjacent countries, on the direct route to which Darjeeling is situated, but the trade has so far been exclusively with China. The possibilities of trade in this direction have never altogether been lost sight of. A few bricks have occasionally been prepared by way of experiment. At present all that can possibly be done is to ascertain the requirements of the market, as by our recent treaty with China British grown tea cannot be imported into Tibet before 1st May, 1899, and then "at a rate of duty not exceeding that at which Chinese tea is imported into England."

Much might be said on the all important subject of quality. In Darjeeling that depends mainly (1) upon soil, on (2) the vigour of the bushes, (3) variety of plant, (4) elevation, and last though perhaps not least (5) the season (and mysteriously so often), the weather. Apart from these natural advantages or disadvantages as the case may be, much is due to skill and unremitting vigilance and care throughout all the operations; and an ample supply of machinery factory accommodation and equipment, to enable any rush of leaf to be coped with advantageously. As explained cultivation must tell in the long run, but for immediate results fine plucking is the main point, to secure which an ample supply of labour is indispensable. Indeed, I have always believed that half the battle is outside the factory entirely. It is quite easy I admit to make bad tea out of good leaf, but it is on the other hand beyond the power of the most skilled to obtain quality from coarse badly-conditioned leaf. The spring teas are now inferior to what they could be, because the plucking is then for the benefit of the bushes not for quality. Better teas could very easily be made at the outset, as had often been done, at the cost of the bushes, and though not of the quantity in the same year certainly at the expense of the quality of the after flushes. Contrary to general belief, I am fully convinced that the maximum crop the bushes can safely yield, is quite compatible with the best quality. This is merely a question of labour.

From the illustrations already shown, it must be evident that one of the great advantages of British grown tea is the cleanliness of its preparation compared with the unsavoury methods of hand and feet manipulation still common in China, and not pleasant to think of considering the climate and the habits of Oriental labourers. The contrasts, as described and illustrated by Mr. Fortune, furnish matter for a separate paper.

The important subject of the chemistry of tea I am not able to deal with, even though time permitted. In spite of the able and valuable efforts of Mr. Kelway Bamber and others, I fear practice has as yet benefited little, and this remains practically an unexplored field of investigation.

Some of the earliest Darjeeling gardens were planted in part with a good variety of hybrid, which still influences the quality of their produce. Afterwards, for a time, there seemed a reaction in favour of the China plant, but for the last 15 years extensions generally have been with hybrid. It would not be well to plant pure Assam or a high class hybrid solely, as that would fail to yield the true Darjeeling flavour. The Assam indigenous has also a tendency to become deciduous on the hills, if not upon the choicest sites. A blend from China and hybrid plants is, I believe, best of all, and I

may say that all Darjeeling gardens, famous for quality, have this. I have experimented with small fields of Assam and Manipuri indigenous, and have always recommended extensions with hybrid of variety to suit the different elevations and other conditions, and would do so still, because in addition to other advantages, leaf is gathered from such more economically. There are, however, many slightly different shades of variety of the China plant. During the struggling days of tea, 30 years ago, it used to strike me that much alone would have been gained by planting only a careful selection of the best strains, capable of still further improvement by cultivation; and I am fully convinced that—especially on high elevations—the best varieties of the now too-much-despised China plant, or a hybrid nearly allied to it, will yield tea of the choicest quality. In Darjeeling plants grown from high-class hybrid, or pure indigenous seed, in course of years revert towards—or, more correctly, assimilate—the China type; and further plants which, when young, appeared perfectly uniform in variety, size, and shade of leaf, as they get older become mixed and unequal in those respects. This, as well as the fact that tea has never been found indigenous anywhere in China, would go to show that India is the original home of the tea plant; that there is but one variety, the Indian; and that the comparatively dwarfed growth and diminished leaves of the China variety are due to the unfavourable conditions of soil, climate, and treatment for centuries.

It is unnecessary to state that a tea garden is not repeated and re-planted annually; on the contrary, a tea estate is an investment from which a proprietor, after the expenditure of much capital, has to wait long and patiently for any return from its working. Even under a combination of favourable conditions one would be sanguine to expect tea to be self-supporting within six years on the hills, or from four on the Terai. But there are many contingencies, such as scarcity of labour, sickness, unfavourable weather, pests, and last, though not east, depressed markets, to upset what would seem the most moderate and reasonable expectations. Any one opening out a new garden gradually—which, in most circumstances, is the only way to do so efficiently—might certainly be considered over sanguine if he calculated upon a clear profit on its working within seven years on the hills or five in the plains there is, however, his set-off that with judicious and skillful treatment, the same bushes, with partial renewals, where vacancies arise, should go on yielding full crops for a period to which it would be difficult to assign any limit—possibly not less than 100 years on good soil on the higher elevations on the Darjeeling hills. With injudicious cultivation and treatment, and upon poor, dry soil, it is, of course, different. It is, therefore, difficult in deed for proprietors and auditors to determine what to write off annually for the ageing and depreciation of the bushes. But investors in well-equipped concerns have, in these days of general agricultural depression, landed security of really the very safest class, from the fact of the tea harvest being spread over eight months annually. This secures the crop against the vicissitudes of seasons, in the form of a month or even two of adverse weather at any stage, which is certainly not the case in this country where the whole crop comes to maturity or ripens in a few days or even weeks.

On the hills labour may be said to be solely Nepalese, and in the Terai, Nepalese and Nagpuris. It is "free," that it is, not subject to the regulation of any special legislative enactment. The Nepalis immigrate freely, and very many are born and bred on the tea gardens. They belong to the same race as the Goorkha soldier, the flower of our brave Indian army, are a capable, cheerful people, of whom much can be made. Those bred on high elevations are stronger and more capable than those reared at low, hot elevations, but the former generally prefer to remain in similar zones to those they have been bred in. No class can perform so much work at low as at high

elevations. The rates of wages in Darjeeling, as in all the large tea districts, is high compared with that elsewhere in India, except in connection with European enterprises. But in addition to money wages, houses, fuel, water, medical attendance and medicine, and a covering for protection from the rain when at work or on a journey are provided at the expense of the garden, and most of the coolies keep goats, fowls, pigs, and the head men even have one or more cows, and occasionally a pony. In some instances land is also allowed for cultivation, which has always attractions, but this, as a rule, benefits but little the labourer for whom it is intended, and is carried out at a cost to the concern in land occupied and impoverished, and destruction of forest that would seem rarely realised or even thought of. Though the wages may not seem high, generally 5 rupees 8 annas to 6 rupees 8 annas a month for men, 4 rupees 8 annas to 5 rupees for women and strong boys, and 3 rupees for children, for the reasons just mentioned—necessaries being cheap, and several members of the same household working; those coolies who work full time or nearly—which very many will not do—contrive to save a considerable proportion of their earnings. At market and on holidays the garden labourers dress brightly, and their savings are conspicuous in the form of strings of rupees or other coins around their necks, and the costly gold and silver ornaments worn. Native assistants, contractors, overseers, artisans, engine-drivers, machine attendants, teamen, and petty gangers earn very high wages for the East, and the coolie class have often the opportunity of adding to their monthly wages by extra tasks performed—contracts, works undertaken, and the like. Within the last 25 years much has been done for the coolies' comfort and welfare, and as their tastes expand more will be done. From a somewhat intimate knowledge of both classes I, without hesitation, assert that, considering the nature of the work and climate, those coolies in their own sphere are at least as comfortable as the agricultural labourer at home was thirty years ago, and certainly more contented than he is now. The natives have many excellent opportunities of improving their position on tea gardens they otherwise could not possibly have had. As an instance, one Nepali from infancy known to me, whose father was a garden coolie on the ordinary pay, and who himself worked as a boy at 3 rupees for a time, and is self-educated in English, was gradually, but most deservedly, promoted, till for years he has been in receipt of 110 rupees a month, and in addition bonuses on the profits as a reward for valuable services rendered, amounting to from one-third to three-fifths of his salary annually. Numberless other instances could be given of the betterment of natives on tea gardens, to which there is no parallel in native farming or other pursuits. No one could be 30 years in Darjeeling without becoming strongly attached to the place, but I also parted from the natives with no little regret. And this much I feel in justice bound to say, that whatever little I may have been enabled to achieve in the way of modern tea extensions, under some considerable natural disadvantages, was in no small measure due to the loyal aid I have had from natives, and that among the more intelligent of those who worked with me for long periods of years I have found some absolutely truthful and honest, and not only competent but as conscientious and diligent workers as could be wished.

In regard to tea nothing is of greater importance than labour. In this respect Darjeeling is comparatively fortunate, though many gardens—especially those at low elevations or without special attractions to offer—are as a rule short of requirements not only for high but fair cultivation during the manufacturing season. One serious drawback, however, is the small and steadily diminishing proportion of men coolies upon the gardens. In the case of one concern employing not less than 1,400 coolies daily the proportion of men has fallen within the last twenty years (not to go further back) from 42.5 per cent, to 17.5 per cent last year. This I have ascertained from the records,

but before leaving Darjeeling, in 1893, I was assured by several managers, on whose authority I could fully rely, that the men upon their gardens did not average more than 5 to 10 per cent of the labour force. This may be due in some slight measure—but only to an inappreciable extent—to the growing wants of the station and the spread of education. The evil, now most serious, may be put down as entirely chargeable to the Government recruiting at Darjeeling for military police, and in the past for various military expeditions, public works, and other departments, and for the native army. I do not charge the Government officials with willingly doing this great injustice, because on the contrary, I feel perfectly assured they would be delighted to benefit the industry and district, as, I am glad to acknowledge, we have often had proof. But yet the recruiting is not put an end to, notwithstanding the repeated appeals of local representatives of the industry. This is doubtless due to the change of governors, and the administrative head of the district only holding his appointment for two years. It simply arises in this way—the men are wanted at short notice and must be got, but all the same the injustice is very great. The gardens have collected their coolies at considerable outlay, and are relying upon them for efficient working. Of those who leave on military service, many never return, and most who do are broken in health, so the injury inflicted is permanent, as statistics prove. The system is most unjust: it inflicts heavy loss on proprietors, and untold annoyance to managers, and has the worst possible effect on the coolie morally. The remedy is very simple. Let Government lay its plans sufficiently ahead; decline to enter tain garden labour under any pretence; make advances and recruit from Nepal, as the planters do, or from the plains of India or their own native colonies at Kalimpong and elsewhere in the district, which, as stated, is much more than twice the area of the tea grants, and which must be pronounced a great failure in every way if unable to meet such a demand. I hear that Government have recently proposed to restrict recruiting in the Darjeeling district. But this is not sufficient now that the evil has become so acute, the gardens having been so depleted of men. The recruiting at markets or other centres frequented by, and the entertaining of garden coolies obtained directly or indirectly should I submit, be entirely discontinued and put an end to by Government. I most respectfully but earnestly appeal to the executive of the Society of Arts to use their influence with those in power to aid the Darjeeling tea industry in this matter.

Another important subject, that can only be briefly mentioned, is forests. Their conservation, in the majority of cases, has been too little attended to, and proprietors must soon discover, if they have not already done so, that they have, to their own irreparable disadvantage, been playing into the hands of the Government Forest Department, the fuel-economising boiler inventor, and the electric engineer.

Neither can blights be dealt with. These are sure in time to follow large tracts of cultivation of whatever kind, and those concerned must make the best of the situation. "Red spider" commenced its ravages in the district in 1876. It was first most severe in what seemed a special zone of its own—the dry, hot valley of the little Rungheet river; now it is pretty general in the Terai and all over the hills. Nowhere has the pest been entirely eradicated, but a very effectual remedy is sulphur, which on many soils act as a manure. The "mosquito blight" though noticeable 25 years ago, was nowhere severe till about eleven years ago. It has long done serious damage in the Terai and Mahanuddy Valley, and seems to have increased in severity in other parts of the hills during the last few years. Owing to this pest being winged and migratory, and its attacks worst when quality should be at its best, it is less amenable to any application than red spider; but so far as my experience goes, injures the health of the bush less. Numerous other pests are known, but none of them are, as a rule, really very hurtful. "Green fly" does not injure the constitution of the plants, improves quality, and plants, improves quality,

and proves helpful rather than otherwise. And there is this consolation, that pests on the whole, if they do not become more serious than they have yet been, may not be looked upon as altogether an unmitigated evil in these days of threatened over-production, from extensions recently and now being made, as well as in view of the cropping potentialities of the present bearing areas.

The Terai was opened out with inordinately sanguine expectations of proving much more remunerative than the hills; and at present I cannot but believe it has become unduly depreciated in public estimation. This is the rule with tea. The greatest drawback is undoubtedly its unhealthiness. In this respect there has been less improvement than might have been expected from the clearances. As has been remarked, it has also suffered severely from blights. The soil is generally good, though not equal to the best of the Dooars, with which, however, it compares much less favourably in regard to spring rainfall. The Terai has suffered from its labour having been attracted to the Dooars, and when attacked by blights, and requiring all the more liberal cultivation, I cannot but think that for some years before 1893 (when I last visited it) the short-sighted policy has been but too often that of restriction and starvation. If this continues, the gardens cannot fail to fall more and more into the hands of native managers and owners. Under an improved water supply and sanitation this district should become more salubrious, and, with liberal and suitable cultivation, and efficient, but economical management, the Terai should yet compete, not unsuccessfully, with most other districts.

Interesting though it be, the subject of a tea planter's life, duties, qualifications—which are multifarious—and prospects cannot be entered upon here. One observation I may be permitted to make. On tea gardens all Europeans, in relation to age and social standing, have the welfare, happiness, and comfort of numerous fellow-creatures in their hands, to an extent unparalleled in this country. Hence their responsibility and influence are proportionately great. Those, therefore, who are unswervingly just in their dealings with, and have a kindly fellow-feeling for, the natives—a knowledge, not only of their language, but of the little idiosyncracies of mind and thought, and are most considerate in regard to their customs and habits—will best discharge their duty to a subject-race, and cannot fail to prove most successful planters. Very much depends, of course, upon the European staff. Their lives, as a rule, are retired and solitary, often wanting in plain comforts. Their duties are exhaustive, and frequently depressing, and, when faithfully discharged, they should meet with the support, encouragement and sympathy of the proprietors and directors.

What has, more than anything, enabled the industry to cope with the greatly diminished sterling price of tea during the last twenty years has been the introduction of labour-saving machinery and the fall in exchange.

The most encouraging outlook for the future of the British-grown tea industry is that 38,428,157 lb. were taken by markets outside the United Kingdom during 1895, being an increase of 9,000,000 over 1891, as against 19,300,000 in 1893, and nearly three times as much as that of 1890, which was 13,400,000 lb. There is, therefore, every reason to hope that under energetic and well-directed efforts to develop them the foreign markets will absorb—or go very far to absorb—the greatly increased crops to be expected from the large extensions recently made, and still being made. The expected shortfall of imports from China for 1896 is also encouraging.

But the fact must not be overlooked, that not for nearly twenty years have we found the consumption of Chinese tea increase and that of Indian fall off in the same year, as has been the case during 1895. Though there are some, directly in touch with the consumer, who assert that there is a reaction setting in favour of Chinese tea, I believe the slight relapse is quite satisfactorily explained otherwise, and may be ascribed to medium Indian teas having been comparatively dear for a few months early in the

APPENDIX I.

AREA OF BRITISH-GROWN TEA, ACCORDING TO GOVERNMENT RETURNS FOR 1894.

India—	Acres.
Assam	154,284
Cachar	59,586
Sylhet	54,926
Darjeeling.. .. .	*70,038
Julpaiguri (Dooars)	*43,133

* These figures show increases from 1893 and previous years that seem much too great for Darjeeling and too little for Julpaiguri.

year. Still the public taste in tea cannot, more than in anything else, be entirely exempt from the law of the pendulum. We are apt enough to console ourselves that the home market has been won. Be it so, we have got to hold it. It therefore behoves all concerned to see well to the weak points in our methods, and leave nothing undue that is needful to insure the supremacy of British grown in the public estimation at home and abroad.

One matter I feel in duty called upon to allude to in this connection. I refer to the handling of our tea in the London warehouses. This is perhaps not the place for free criticism or full discussion. I shall not, therefore, enlarge upon the cruel manner in which the lids of the chests are removed, and the lead linings opened; or the exposure of the tea for a greater time than it ought to be in bulking; the condition in which the linings are replaced, especially those which have accidentally been in contact with a nail; the refilling under the heel of the dock labourer; and, worst of all, the boxes being left unsoldered till they reach the consumer in the country, or it may be America. I have every sympathy with the warehouses in regard to the pressure upon them through the work being crowded into so short a time. But no one can say the teas are treated as they ought to be. No natural atmosphere is absolutely dry, and that of London is often very damp, and tea is extremely absorbent of moisture of any taint in the air. The papers carefully placed under the diminished and tattered lead linings are necessary to prevent the contents from pouring out in transit, but is altogether inadequate for the exclusion of moisture from a substance so attractive of moisture and so volatile of its aroma as tea. The tea cannot fail greatly to deteriorate under the treatment the Indian produce generally undergoes. The system also of dealing with the fractions of pounds in weighing the gross and tares, tolling in both directions against the producer, is manifestly unfair. The difficulty of interfering with long-established trade customs must be admitted, and I am saying nothing here against the 1 lb. draft, which is a known quantity, and surely ought alone to be a liberal trade allowance. Though the loss in taring may be averaged and allowed for over large operations by the buyer, it must partake of the nature of a lottery, and is most unsatisfactory and objectionable to the producer, especially the smaller of them, who feel it keenly to be an injustice. Though the Customs by general order provide for tea being weighed net, which would mitigate the hardship, and as far as I can see, also overcome the difficulty of uneven tares, strange to say the concessions remains a dead letter. The remedy for the evils complained of seem simple:—(1) Bulk at the factories, with tares equalised for each break; (2) repack dry at once, with the packing machine, the small proportion of chests it would then be compulsory to open on this side, repairing the linings with lead, resoldering or otherwise hermetically sealing the contents as may obviate the use of fires it need be; and (3) weigh gross and net (not the tares) under the general order referred to, amended if necessary to meet all reasonable requirements. It is satisfactory that at least one warehouse (St. Olave's) have fitted up packing machines to supersede the trampling process, and this laudable arrangement merits recognition and encouragement by importers.

In this great metropolis it might be expected that the methods of dealing with such an important article of food would be intelligent, cleanly, and even scientific. The prevailing practice is but too much the reverse of all this. The usages, to put it mildly, are antiquated and unworthy of a great industry. It is indeed amazing that they been tolerated so long. They are productive of most serious loss to the producer and consumer as well as to the national exchequer; must be an annoyance to the brokers and dealers, and disadvantageous to even the warehouses in the long run. More than this, they are grievously fettering and handicapping the British tea industry. The time is certainly ripe for combined action to secure the urgently needed reforms, which if delayed cannot fail, sooner or latter, to injure this great distributing tea centre.

APPENDIX III.

FRENCH COLONIES.

THE SUGAR INDUSTRIES.

RAINFALL ON THE LEBONG TEA COMPANY'S ESTATES,

A circular letter on the position of the French Colonies has lately been addressed to the French Government and the members of both Chambers, and is drawn up and signed by Mons. E. Souques, President of the Syndicate of Sugar Manufacturers, and delegate of Guadeloupe; Mons. F. Bougenot, a landed proprietor and manufacturer of Martinique; and Mons. Micard, President of the Administrative Council of the Pointe-Simon Sugar Association of Martinique. The letter has appeared in full in the *Journal des Fabricants de Sucre*, and, although interesting and well reasoned out, is too long for reproduction. The following table sums up the results of working in Guadeloupe, during five years, and is given by the writers in justification of the statement that the position of the industry has been declining during the last two years. With some notably exceptions, such, for instance, as Queensland, Java, Louisiana, the Hawaiian Islands, and natal, the same might be said more or less of nearly every cane-sugar producing country, and the reasons are too well known to need especial mention, and it is to be feared that even the elaborate *expose* now before us will not soften the hearts of the French Legislature to the extent of inducing them to grant the relief asked for viz., the *détaxe de distance* referred to in our issue for October, 1895, page 506.

DARJEELING, FOR 21 YEARS, (1872 TO 1892.)

Resumé of the Average Working of the 17 Largest Factories in Guadeloupe, 1889 to 1893.

Average of cane supplied:—		Tons.
By the estates belonging to the factories	288,987	
By planters interested in factories	73,656	
By independent planters	31,347	
By small cultivators	41,788	
Average total production of cane		435,778
Average cost price of cane per ton		20.79 fr.
Average cost of manufacture per ton		14.30
Deduct for the spirit (tafia)		2.00
Cost per ton of cane		33.09
Cost per 100 kilos of sugar, yield 9.69 per cent.		31.15
Export duty		1.50
Sundry expenses, freight, loading, &c.		7.42
Cost per 100 kilos., delivered in France..		43.07
Deduct the average <i>détaxe</i> for the last 5 years		6.78
Average cost per 100 kilos		36.29
Interest and sinking fund on borrowed capital are not reckoned in the above, but may be taken as about 3 fr. per 100 kilos produced		3.00

RESULTS OF 1893, 1894, AND 1895.

	1893.	1894.	1895.
Production	41,158 Tons.	43,732 Tons.	30,000 Tons.

In 1894, in consequence of the low prices, the crop fetched 14,659,778fr., against 19,993,626fr. in 1893, being a reduction of 27 per cent. In 1895, the amount was 7,500,000fr., a reduction of 62 per cent on 1893.

Some paragraphs, however, headed "Impossibilité d'une substitution de cultures." will have special interest for our West Indian friends, and we, therefore, supply a translation of them, remarking that the picture is painted in the darkest colours, this being of course the cue of the writers. Perhaps a little less of calling on Hercules, and a little more of putting the shoulder to the wheel, as is being done in our own similarly situated colonies, would commend itself more to the British mind.

APPENDIX IV

RAINFALL AT TUKVAR, LEBONG, TEA COMPANY, DARJEELING, ELEVATION 4,500 FEET, FOR THE FIVE WETTEST AND FIVE DRIEST DRY SEASONS DURING THE 27 YEARS FROM 1866 TO 1892.

"IMPOSSIBILITY OF REPLACING SUGAR BY OTHER PRODUCTS.—Now, what do they say to these unfortunate planters? Change your products; grow coffee, cacao, vanilla. Abandon 120,000,000 francs worth of industrial plant and material. Root up your canes.

They forget that it is not in the height of a crisis that such advice can be given to a country crushed under the effects of a series of bad years, and the high interest charged on the capital borrowed for their industrial plant and machinery. They forget that the only establishment which makes advances on mortgage charges 10 per cent interest, and that at the present moment it is of no use dreaming of finding cheaper money for the colonies, while the taxation of the planters is excessive in proportion to their production.

They forget that in the case of coffee five years, and in that of cacao eight years, must elapse before they begin to give a return, and that from 5 to 7,000 francs per hectare (£80 to £112 per acre), inclusive of the interest on the capital during the respective periods, must be expended on either of them.

And they overlook the fact that in the colonies the soil is not everywhere adapted for the cultivation of these products. Numerous experiments have been made, even at a height of 250 metres, which have demonstrated the impossibility of success in many of the districts in which it was thought that they might have been cultivated, not to speak of the diseases which destroyed the greater part of the former coffee and cacao estates, and the cyclones which periodically ravage these countries.

The substitution of coffee or cacao for cane cannot be effected except in those parts of the island bordering on the mountains.

It will be seen, then, that in the case of by far the larger proportion of the land it is almost a material and financial impossibility to effect the transformation in cultivation which is recommended to the planters, but it should be added that if the colonies were in a position to grow coffee and cacao instead of sugar, the home budget would have to sacrifice a larger amount than that now demanded from it for sugar, and there would be no possibility of employing all the hands now occupied in cultivation and manufacture, not to mention the decrease in the tonnage employed in the trade with the mother country."—*Sugar Cane*.

BUGS AND THEIR ECONOMIC DESTRUCTION.

Singular as it may seem in face of the fact that the fumigation of fruit trees with hydrocyanic acid gas has been long and successfully before the fruit growing public, there are, however, a number of firms now in the field recommending other devices and materials for overcoming scale insects on fruit and tree. The arguments advanced by these traveling dispensaries of "cure all" remedies are at times suggestive of humor, were it not for the fact that they do succeed in palming off their goods to innocent purchasers. Again, it has come to us that a cheap cyanide of potassium has been offered with the assurance that it "is just as good as the 98 or 99 per cent pure." Like the effects in using inferior Paris green for spraying apple and pear trees for codlin moth, growers of citrus fruits using this cheap grade of cyanide will experience similar unsatisfactory results. You cannot wear a number seven shoe on a number nine foot; neither can you expect maximum results in any endeavor when using inferior materials. Verily, the best is always the cheapest.

The importance of using the gas remedy or fumigating for scale insects is forcibly brought to mind in the failure to introduce effective parasitical insects to feed on the red and black scale affecting citrus trees. After four years trial the ladybug business has proved abortive, unsatisfactory and detrimental to the fruit business in so far as it applies to these two scales. Fumigation is now the recognized remedy for these pests of the orange and lemon and

is preferred to all other methods—indeed, it is no exaggeration to say that it is the only means affording absolute relief. But its uses are in some respects more important in the eradication of these insects on young nursery trees. When fumigated under the direction of experts, trees so treated are practically free from pests, and hence the planters can feel reasonably certain of clean orchards in after years. Viewed purely from a commercial point of view the use of hydrocyanic acid gas on citrus fruit trees subject to injurious insects is a money making proposition. Sealy fruit is at best a drug on the market and always brings a low price. Washing is often practiced to render such fruit marketable. In cases where it is resorted to the fruit is thereby more or less injured; besides, it costs more to clean it than it would to have fumigated the trees and thereby freed them and the fruit from scale insects.

During the period following its successful introduction some difficulty was experienced in securing cyanide of uniform strength and purity to generate a reliable gas. This invariably resulted in either damaging the fruit and tree by either too strong an application, or it was of insufficient strength to kill the insects. In either case the fruit growers sustained a loss. This difficulty, however, is removed by the introduction into this market of the celebrated and reliable cyanide manufactured by the Roessler & Hasslacher Chemical Company of New York City. This is guaranteed to be 98 to 99 per cent and is sold at a lower rate than any other make of the same quality. In view of these facts the fruit growers should avoid the cheaper grades at any price. The matter of reliability is not alone in that the percentages of the lower grades contain foreign substances that absolutely interfere with the cyanide of potassium they really do contain (no matter for what purpose used) in developing hydrocyanic acid gas. The question of price will at once be obvious by dividing the price of the lower grade by its supposed percentage and multiply the result by 98 (the percentage of the chemically pure) the price equivalent in chemically pure for the lower grade is found.

The history of insect life is too minute to be entertained in a short skit dealing principally with its destruction. There are a few salient points, however, that should be considered as having a direct bearing upon the destruction of scale insects. Nearly all, or at least the great majority of insects, are hatched from eggs in the form maggots, caterpillars or grubs usually designated as larva. To fight injurious insects, successfully the best results are to be gained by destroying them in the first stages of their existence. Especially is this true of all scale insects, as before they become "settled" on limb and fruit and commence their "sucking" career and become encrusted with an impenetrable shell they are easily killed. It is right here where hydrocyanic acid gas fumigation by means of tents covering the trees proves its great efficiency. Its poisonous and destructive properties when discharged envelope the *whole* tree. Each and every part, the upper and underside of the foliage, every twig, limb and each individual fruit is enveloped in its deadly fumes and every bit of insect life is killed. Nothing could be more thoroughly, more destructive and farther reaching in its effects. Fumigation should therefore be practiced in every orchard in which there is any trace of infection, to the end that the coming season may witness a great reduction in the enemies of our fruit trees. The proverb says that "cleanliness is next to godliness," and as applied to trees and plants it can be said that "cleanliness is the price of success" in fruit culture. Avoid a scale infested or diseased tree or plant as you would a pestilence, and profitable production of fruit, and vigorous growth of plant or tree will be your reward.

Too little attention has been given to the eradication and suppression of injurious insects by orchardists in the past. The result has been that the warfare against them has become as essential a feature of successful fruit culture as cultivation fertilizing and pruning. The man who neglects it invariably has an inferior crop of inferior fruit, and as a consequence finds that "fruit farming does not pay."

With the advent of keener competition and larger yields, the time is close at hand when only gilt-edge fruit will sell at all—and this cannot be produced in scale infected orchards.—*Rural Californian*.

THE CITRONELLA OIL SPECULATION.

It seldom happens that an entire trade is deceived on the position of an article. As a rule, a speculation cannot be under way very long before some one in the trade discovers the nature of the movement, and is guided accordingly in making his purchases. In the case of citronella oil, however, one of the cleverest manipulations recorded in any article in recent years was started a little over a year ago and carried to a successful conclusion, without the character of the movement having been discovered until manipulators had accomplished their purpose if the real character of the moment is now understood, the entire trade was deceived as to the real position of the article. The decline in price which commenced a few weeks ago not only excited comment, but on investigation brought to light a story which will be read with interest at this particular time. For several years previous to the Spring of 1895 citronella oil had ruled at a trifle over twenty cents per pound in large lots, and the consumption in this country had more than doubled from 1893 to 1895. The latter part of April, last year, the market commenced to advance, the price at that time being twenty-two and one-half cents per pound in large lots. It moved gradually upward until some dealers have paid as high as fifty cents per pound in January of this year for January-March or January-July shipment from Ceylon, sellers' option. At first excessive rains and later drought were given as reasons for the short crop which was reported, and light stocks were said to exist in Ceylon, London, New York and in other important markets. Undoubtedly the stock here was light, unusually large imports having gone into consumption. But it now appears that the advance was really "worked" by a London house with a Ceylon connection. This concern began buying oil at twenty-two and one-half cents per pound, and continued buying as the price advanced, reports being circulated at the proper time to account for the sudden change in the situation. They purchased the entire Ceylon stock, and so manipulated the market that the impression speedily gained currency that there had been a short crop, hence that there was a scarcity in the primary market. To keep up the delusion bids were made here by the above mentioned concern at intervals for lots to be exported to London, where the supply was said to be insufficient for the demand. When the price had been advanced to thirty-two cents the speculators quietly sold the large consumers in this country and presumably in England, without the knowledge of the dealers, some of whom, as already stated, continued to buy oil until it reached fifty cents. In their eagerness to obtain a quantity sufficient for what they considered their requirements, some even bought back contracts at twenty-nine cents, paying for them more than forty cents. In course of time, when consumers failed to make their usual purchases, it began to dawn on the mind of the trade that something more than the business depression was responsible for the stagnation which had prevailed for so long a time. The discovery was made by the dealers that they had been cleverly hoodwinked, but it was too late to enable them to recoup themselves. The market had already commenced to decline, owing to few offers from Ceylon of unlimited quantities and at low prices. Within two weeks prime oil, standing a well-known test, has been sold in London for steamer shipment from Ceylon, early delivery, at twenty-seven cents, cost, insurance and freight. Other sales are reported in the London market at thirty cents, steamer shipment until the end of June, and at twenty-nine cents steamer shipment until the end of August. Since these sales were made the market has stiffened considerably, the latest sales reported by cable Friday having been at thirty-three cents, cost, insurance and freight, for shipment from Ceylon.

Opinions differ as to the situation today. By some dealers it is thought the position of oil warranted an upward movement, although perhaps not to the full extent which the manipulators forced, while still others are of the opinion that an attempt is being made to again work the market. If the latter conclusion be the correct one, it is hardly probable that the dealers will be readily included in a second scheme of this character.—*Oil, Paint and Drug Reporter*, May 18.

THE BOOM IN RUBBER.

The boom in rubber goes on merrily. The price of best Para has gone up within the past few weeks from about 2s 9d to 3s 9d per lb., and it is thought by the trade that 4s or so may be reached. Owing to the limited sources of supply, the article, of course, easily lends itself to the manipulation of speculators and cornerers. But neither speculation nor demand for tyres is altogether answerable for the present high quotation. It seems that, owing to the recent dry season in the Brazils, traders have not been able to get their rubber down from the upper reaches of the Amazon, though this state of affairs may be remedied any day, when it is believed prices will give away.—*Home and Colonial Mail*, June 5.

AGRICULTURE.

COCONUT CULTIVATION.

It was but recently I enjoyed the advantage of reading in the "Agricultural Magazine" the article on the nitrogen question and of meeting and conversing with the gentleman whose observations on the influence of the sensitive plant on coconut cultivation are referred to. The problem of utilizing for agricultural purposes the vast stores of free nitrogen in the atmosphere had exercised the minds of agricultural chemists for a long while, as also the well-known fact that soil in which legumes and in particular clover was grown was found richer in nitrogen after than before these crops were grown. The researches of Hellriegel pointed to wart-like excrescences on the roots of these plants in which were bacilli which worked this all-important change. The benefit of this discovery to the European agriculturist was not great, for without being able to account for it, observation and experience taught him that clover as a rotation crop improved his land and gave him better crops. To us who grow perennials, the discovery of other plants as well, with these root tubercles which from analogy we infer are capable of converting the free nitrogen of the atmosphere into combined nitrogen for the use of vegetation, is of great practical value. But there is one thing which must be decided beyond doubt, that the bacilli in the tubercles on the roots of plants other than legumes perform the same functions as the bacilli found in the roots of legumes. So far, I do not think this has been done. Cultivated products are observed to thrive or grow better than otherwise, in the neighbourhood of certain plants or trees. The roots of these are examined and tubercles are discovered on them; the conclusion is that the bacilli in these tubercles perform the same function as those found on the roots of legumes.

It is interesting and profitable to know that the sensitive and other plants which grow wild on our lands as weeds have these tubercles on their roots. But has not the question yet to be decided that these plants exert a beneficial influence on the soil? That coconut trees thrive where the soil on which they grow is covered with the sensitive plant, is to my mind no conclusive proof that the improved appearance of the tree is due to the presence of this weed. The opposite conclusion is equally sound, that the presence of this weed is due to good soil. This weed is always found to grow on roadsides, which receiving the wash of the road

with animal deposits and crushed gneiss and gravel have necessarily rich soil. On an estate I had charge of, there was a rank growth of this weed on a flat at the foot of a hill which received much wash. Cinnamon grew luxuriantly here. Is the conclusion sound that the luxuriant growth of the cinnamon was due to the presence of this weed? One thing is beyond question, that this weed deposits large quantities of leaves, easily decayed, which improves the soil.

I must not be understood to state that the sensitive plant does not improve the soil or that the improved appearance of coconut trees where this weed covers the ground, is not due to it. All that I say is that proof of this is wanted. I was told by the same observer an experienced gentleman who discovered that the sensitive plant improves the soil, that the "pilla" performs the same functions. Previously I had not known this shrub by name, but observed that it grew round manred coconut trees chiefly. Here again there is the possibility that where coconut trees thrive when this shrub covered the ground, the cause could be attributed as reasonably to good soil as to the growth of "pilla." I am no botanist, but the examination of the flower of this shrub showed a resemblance to the flower of the pea tribe. So that this, equally with the different varieties of "thora" which have similar shaped flowers, must be a legume, must have tubercular growth on the roots infected with nitrogen-assimilating bacilli, and must improve the soil it grows on. Anyone with observation will have remarked that wherever stiff soils have been manred by the tethering of cattle, a luxuriant crop of the different varieties of "thora" springs up. So that if it be the case that the soil in which these shrubs grow is improved, it is equally true that good soil is necessary for their growth. I examined the roots of the shrubs I have mentioned, but my inexperienced eye failed to detect the presence of tubercles.

If heaps of rubbish are burnt on sandy soils, the little organic matter they contain is burnt off and they are impoverished. This is testified to by the absence of all vegetation on such portions. If rubbish be burnt on heavy soils, increased porosity follows and of necessity increased fertility. This is evidenced by a rank growth of weeds chiefly the "balanakuta." I think it may be safely accepted as a rule that the presence in luxuriance of the different varieties of "thora" and of "balanakuta" on a soil is indicative of its fertility.

To revert to the sensitive plant. I do not think that even if it be established beyond all doubt that its growth improves the soil, many land owners will be fonder, even amongst the ordinary natives, who will foster its growth. It is a very troublesome weed and very difficult of extermination. If it be mamotied up and burnt, a more luxuriant growth follows. The great drawback with it is that it is so thorny. The periodical cutting down suggested in the "Agricultural Magazine" cannot be carried out but with shod feet. Picking and gathering of nuts on coconut plantations will become well nigh impossible. People can be found to grow "pilla," "thora" and other similar shrubs, but I do not think many people can be induced to grow the sensitive weed to improve lands. One way of keeping down this troublesome weed is with goats, but then of course the benefits of its growth will not be the same as when it is mowed down or dug into the ground. If any kind friend will send me a packet of the seeds of this weed, I will give it a test which I think will be conclusive, by growing it on a poor, sandy soil where the condition of the trees is not good.

B.

TEA IN DEHRA DUN.

The general aspect of the Dun, from the fact that it is overlooked from one of our favourite sanitarium, the road to which passes through it, must be well known to a large number of Anglo-Indians. The narrow, hazy, hot-looking strip stretching away far below Mussoorie, East and West, with the dark little Siwalik hills fencing it; in and then the misty expanse out and beyond. Within this tract—like to a variegated river-bed—

have found a place and being nearly a score of tea plantations; and after many vicissitudes and change of hands, here they appear now to be fairly establishing their roots; they are living and doing more—in some notable instances they are fairly flourishing.

The Dun is one of the cradles of tea industry; and may from that evoke some interest; albeit it has always been—as it now is—quite a minor tea district.

It may be hazarded—the prediction—that it always will remain so; as will be, we think, seen further on.

And yet at first sight the newcomer; even if an experienced hand in tea, might not understand why this should be. For, coming at some seasons of the year certainly, everything would seem to him very much like anywhere else in the tea districts—would seem very much indeed at the first view like Assam. Fine stretches of tea would he see—beautifully grown large bushes, of China jāt though they be. And all things would be very familiar: the Himalayas on the one hand although somewhat barer would still be the friends and brothers of the high hills so well-known elsewhere: likewise the littletree topped range away on the other side. He would see the rice—the *dhan* (the same old name) growing in the *khets* just in the *pothars*: he would meet his well-known clumps of bamboos, although less abundantly; and if he came at the right time would hear the old familiar bird with its re-iterated injunction to 'make more pekoe'!

Nor would he find much difference inside the tea buildings. Everything pretty much the same; except that more *pukka* work, *i.e.*, masonry, would meet the eye, both within and without and not quite so much the land of cane and bamboos: and he would recognise acquaintances of the latest date in the way of tea machinery. And the planter he would find very comfortably honed. 'Not much of the jungle here,' would probably be his expression.

Were he to come round when leaf plucking and tea making are in full swing it would appear just tea 'all over'; and were it in the bright and lovely cold weather, he would probably term the Dun 'simply glorious'!

Yet were our experienced friend to see the district in the heart of the high hot weather, he would, if there had been previous drought, have an increase to his experience: and might wonder if the dried and 'burnt' patches of plant would ever be green and vigorous again. On the whole, however, he could see that the bushes stood the alien conditions remarkably well; and were mostly green and healthy, though there were no flush.

A growing feature is the increasing abundance of shade. The shisham tree is a great favourite. The tea seems to like it and to do well—certainly to increase in thick bulk—wherever, near it as under it; and the shisham is fine-wooded tree—one of the most valuable.

Well, to come to the tea itself—the manufactured article infused. That would not meet with eulogy. It's but poor stuff, the Dun tea. Otherwise there would be fortunes to be made in the place; as labour is abundant and cheap; and the yield is very good, going up to 700 lb. per acre.

And why is the tea so poor there?

Well, in one word, 'climate.' The tea is poor; and it is likely to remain so. It has neither strength nor has it flavour, as these characteristics are understood by professional judges.

And yet it can be every vice tea to use, or fairly good certainly; especially if kept to season. A cup of good Dun tea is very nice. But its comparative inferiority often excites astonishment and incredulity in strangers. However, there it is; and that after many years' working; after the introduction of the best appliances; and with planters here who have worked in the districts where first class tea is made. A man who had been all over Assam told the writer up in these parts that the Dun was ten degrees too cold. But Kangra is probably colder; and also the tea localities about Darjiling. However, as compared with Assam the Dun seems not 'aromatic' enough. Assam is a richer, milder, moister climate; and one might well expect more

from the sap and the quickly grown parts of a plant there. In Ceylon it must be much the same. Before Indian tea had grown to its present great dimensions as a mercantile commodity—in the days when it was comparatively small; and when Ceylon tea was unknown—the Dun tea, black and green, sold very well. The black tea brought twenty years ago three times its present price. And green tea was a new thing in its day. It used to fetch high prices in Calcutta and London, for the finer kinds, certainly; while all classes of it used to sell well at the factory to Native dealers, for the Central Asian market. It was sold usually without any picking whatever—filled into the dealers' own bags; and as much would be got for low-class variety, so given them, rough and loose, as would be obtained for the best kind of black tea now-a-days in the Calcutta market, packed in good lead-lined cases, and sent there at the grower's expense, of course. This is correct. Yes! for 'Hyson skin,' unpacked, from five to six annas a pound would be given; and a Dun Orange Pekoe will not bring more now in Calcutta. In those time Dun Orange Pekoe would have brought its rupee a pound in Calcutta.

Considering that the Dun has always had, speaking generally, but, on the whole, we think correctly, a full and a free supply of labour; and that its prices used once to be very good, the disadvantage of climate might reasonably not have been held as a disqualification, although admitted as a drawback.

But the days of high prices have passed. The green tea market both of Central Asia and of England ceased long ago (well for philanthropic reason that in England, anyhow, it did; as the article was too intensely acrid to be possibly beneficial); and as to black, one might wonder if the Dun *did* ever stand on an eminence, so poor has been its place for long.

But the tea does go into use, nevertheless—all of it: and lately it has been well inquired for, and taken; from the Bombay side—a new quarter.

In the next paper I propose to treat of the position and prospects of Dehra Dun as a tea district—*Englishman, Cor.*

INDIAN FORESTS AND TANNIN EXTRACTS.

Our Indian Forests already yield a handsome income to the State, but no one knows better than the officers who work them that their full wealth is far from being developed. Mr. Ribbentrop, Inspector-General, has just issued to all Conservators a short letter covering an interesting paper by Mr. Fernandez on the preparation of tannin extracts, an industry which he recently studied during a visit to Europe. It appears that the export of myrabolans from India has hitherto only been limited by the supply and that an extraordinary development of the trade in entch in Burma has taken place. Though entch is very expensive it is, we are told, largely used as a tanning substance, its colour being extracted to fit it for this purpose. Experiments to obtain other extracts of an equal or approximate value from sal and assiana barks have not been successful, and so great is the trade demand that spurious substances are put on the Burma market. Mr. Ribbentrop remarks: "At the same time we know that tannin is largely contained in the fruits, leaves, bark and wood of many of our Indian trees and bushes, and that a forest industry of great potential value is only waiting for rational development." But the cost of freight comes in, as the raw material can only be exported in the compact shape of galls and fruits. Even in this form the tannic properties deteriorate, and it has become clear that if the trade is to assume its proper dimensions extract of tannin must be prepared in the forests themselves. Six years ago Dr.

Watt recommended that experiments should be made in this direction, but no practical methods of carrying the suggestion into effect were made. This is the case as put by the Inspector-General, and he asks Conservators and the officers under them to take up the matter, and thus open out a new industry and new source of forest revenue. Mr. Fernandez' paper is of course, somewhat technical in character, but he shows that it is possible to utilise the enormous quantities of bark and wood which at present go to waste in our Indian forests and to convert them into tannin extracts for export to Europe, and even for use in this country. He describes the various methods in vogue on the Continent and gives the palm to that known as "Villon's process." This is explained in detail, with a drawing of the necessary apparatus, which could be made of wood, bamboos and stout cotton drill, if metal and wire gauze were not available. He adds that as no chemicals are required and as the entire process is within the comprehension of the lowest intelligence, the method is specially adapted for employment in our forests, however remote. It has the further advantage that it would admirably suit entch manufacture. Mr. Fernandez sees a great opening for private enterprise if the Forest Department lead the way with experiments, and he holds that one of the functions of the Dehra School should be to analyse for tannin the bark and wood of all the likely species of Indian trees. His memorandum is one of great value, and copies of it might well be circulated to all our Chambers of Commerce. There is a fortune apparently for anyone who takes up the practical suggestions he has made for the manufacture in India of tannic extracts.—*Pioneer*, June 21.

THE AMSTERDAM MARKET.

Our Amsterdam correspondent writes on June 2nd:—The shipments of cinchona-bark from Java in the month ending May 31st, as declared by cablegram, prove to have been fairly heavy. The following are the figures for the past four years:—

	1896	1895	1894	1893
	Amster- dam.	Amster- dam.	Amster- dam.	Amster- dam.
	lb.	lb.	lb.	lb.
Month of May	763,000	402,700	400,000	711,000
January 1-May 31	3,260,000	2,879,700	3,288,000	3,241,000
The bark to be offered on June 11th amounts to 517,229 kilos, containing a total equivalent of 25,617 kilos sulphate of quinine, or an average of 5.05 per cent.— <i>Chemist and Druggist</i> , June 6.				

THE MADRAS GOVERNMENT CINCHONA PLANTATIONS.—Planting Opinion of June 20th says:—

We are glad to note that Mr. W. M. Standen's appointment as Director of the Madras Cinchona Plantations has been finally gazetted. Our readers will remember our prediction to that effect some months ago. Mr. D. Hooper has been appointed as Government Botanist, a post which, unluckily, is only a temporary one, otherwise much real benefit might have been derived by the Planting Industry during Mr. Hooper's tenure of office. His well-known sympathy with all lines of practical agricultural research, and his unquestioned attainments as a Chemical Analyst, fitted him pre-eminently for his post. The so-called experimental gardens at Burliar and Galdar will, we trust, be worked with some little show of trying to attain the objects for which they were started. But as long as they remain under the direct control of the Superintendent of the Botanical Gardens, we much fear that his multifarious duties of keeping up a good show of flowers and maintaining the grass plots round Government House in a healthy green condition will effectually prevent any serious work in these gardens.

DR. TRIMEN'S WORK IN CEYLON
AND LOCAL CRITICISM.

On the eve of the final departure of the Director of the Botanic Gardens, it may seem a little unkind and invidious to enter on a controversy as to the merit and usefulness of his administrative, economic, and scientific services to the community. But to compare Dr. Trimen's work with that of Mr. Hart of Trinidad—useful officer as the latter is in his own sphere—as was recently done by a planting correspondent of the *Observer*, is simply absurd. Take Dr. Trimen's latest work: "THE FLORA OF CEYLON" in three volumes—why, it is impossible to overestimate the value of this work for practical, educational, and scientific purposes in the Colony. For thirty years, we had been accustomed to listen to, and read, the late Mr. A. M. Ferguson's earnest desire that such a work should be prepared for the benefit of all who took an intelligent interest in the vegetation of the island. Dr. Thwaites's great work on Ceylon plants might well be complained of by any "practical planter" as above his head—being essentially a scientific botanist's book. But Dr. Trimen, while taking care to serve the purposes of science, and to be as full and correct as any reasonable botanist could desire, has added a series of most useful economic notes which simply make his work a treasure-house to the ordinary intelligent readers,—to all in fact who wish to know what can be said about each of our plants (useful and ornamental) and especially about the timber trees and economic products of the island. That the highly accomplished and worthy Director should have persisted in this important undertaking to the sacrifice of his health, if not of all that makes life worth living, speaks highly for his conscientious devotion to duty and deserves the grateful acknowledgment, not only of the Government, but of every right-thinking man in the community. So much for the most important single work, perhaps, which has marked Dr. Trimen's Administration. But we are equally clear that never before in the history of the island has more attention been given in our Botanic Gardens to every question bearing on the economic as well as scientific side of planting, and tropical agriculture generally, than during the past fifteen years. We speak of that we do know; for as editor both of daily and monthly issues, we have continuously been made the medium of requests for information, of puzzling questions, of plants forwarded for identification by planters—not to speak of our own many editorial queries—and we have never failed to receive the most prompt and satisfactory attention from Dr. Trimen.

But we are prepared to meet the planting criticism referred to at closer quarters; for, in reality, it must have been written with entire forgetfulness of the policy which has guided both the official and planting world in India, and Ceylon, for many years back. The critic is perhaps unaware that in recommending the Government Gardens, or any portion of them, to be devoted for the growth for *market* purposes of cacao or any other product, for which planting attention is given, he is contravening the principle, so stoutly fought for in India even in the present day, of non-interference by Government with private enterprise. Merchants and planters in India, for instance, have protested on this ground against even the Government Cinchona

Gardens—although nearly all the bark is now manufactured on the spot into alkaloids for distribution under official auspices, and little or none sent into the open market. The Ceylon authorities long ago learned the lesson not to interfere with private enterprise in any planting direction: and we feel sure that the vast majority of our planters, as of intelligent natives, desire the same policy continued, by which while all new products are carefully tried and cultivated and a stock of seed or plants maintained for sale and distribution of new and certain old products or plants, no attempt is made to rival the tea, collee, cacao, cinchona, rubber, &c. planter, even in a small way by establishing a permanent garden of any one of such products.

We can only smile at the idea of bringing the West Indies into comparison in such a connection. The West Indian planters—as Messrs. Arthur Sinclair and H. Ross told us long ago—are many years behind those of Ceylon. Dr. Morris bewailed to us not long ago that there was not even one enterprising, intelligent editor in the West, to stir up and lead the planters in respect of new staples and industries; and very few planters who would take the trouble to try or plant anything new. No wonder, therefore, though Mr. Hart, and other superintendents of gardens have had to turn to work as planters and tropical editors in a small way. But how different the case in Ceylon: is there a new product mentioned in our *Tropical Agriculturist*, or the local daily press, or the Peradeniya annual report, that is not at once indented for, planted and tried in several districts in Ceylon? Be it kola, coca, rubber in new species, cacao in fresh varieties,—are there not planters ever ready to save the Government officials, whether at Peradeniya or Hakgala, from doing more than give them a lead with all the information and instructions available, in order to find the fullest and amplest trials given and that too in the most practical fashion? As to the Trinidad monthly or quarterly bulletins being offered as an example worthy of copying at Peradeniya or Hakgala, we not only protest as editors and publishers in the name of common-sense and private enterprise; but we take it as unkind (only it was from want of thought) on the part of the planting correspondent, to offer such criticism or suggestions, forgetful of how completely the *Tropical Agriculturist* covers the ground. This monthly periodical has been *officially* recognised not only in Ceylon and India, but by many of the West Indian Governments, in New South Wales, Fiji, South Africa &c., and is carefully filed by the Agricultural Department at Washington, United States. Dr. Trimen, and his subordinate officers, especially Mr. Nock, have ever been among our readiest supporters in supplying information and suggestions for the improvement of this almost unique tropical periodical which is so widely distributed and generally prized not only by planters but by garden and scientific authorities. We feel sure that, on reflection, the planting critic of Many will see that the points of complaint he puts forward against the administration of our Royal Botanic Gardens are, in reality, pointless—and indeed, tend rather, to justify the soundness of the policy pursued; while we are absolutely clear that no more valuable Reports—both from an economic and scientific point of view—reach us from any Botanic or Government Gardens the wide world over, than those that bear the imprint of Peradeniya.

INDIAN AND CEYLON TEA.

Messrs. Thompson's Annual Review,

38, Mincing Lane, June, 1896.

The completion of the year ending 31st May brings an opportunity for reviewing the characteristic features of the season, and summing up its results.

For the kindred industries of India and Ceylon, the year has been one of expansion. Production has continued to increase; consumption at home has been larger than ever before; and trade with other countries has made a marked advance,

To growers the season has brought substantial, though not uniform, remuneration—not, indeed, to the full extent of last year taking the actual sale price of the product as the measure of success, but so considerable in comparison with the general earning-power of capital as to make this Industry conspicuous by contrast with others, and to enhance the value of all good properties.

For individual producers, however, and specially for managers abroad, interest centres upon the result of their own year's work; and those who have been less successful than others will desire to know the reason. To find it we must look back to its position as it was a year ago, and trace the unseen influences affecting the market and causing fluctuations in value—in doing so we may find some light thrown upon the future.

At that time a fine and rather short crop had been closed at prices, if not inflated, yet so high as to check consumption and let in cheaper kinds from China and Java—leaving all holders of stock with dear tea, and inconvenienced by the loss entailed by the process of pushing it into use. Then came from abroad estimates of heavy crops, not indeed destined to be realized—as they rarely are—but put forth with sufficient authority to make buyers anxious. With the arrival of the new Indian teas came a foreshadow of a poor crop, with signs that planters, influenced by high rates for common tea were plucking coarse. The heavy supplies received in the Autumn, and exaggerated reports circulated about shipments, deepened impressions already formed, when values in London moved in the directions they usually take if crops are large and not of good quality—and remained there.

A few who had foreseen this state of things, and were in a position to do it, made the best tea possible—to their great advantage, as it proved. Others relied upon a large yield and a low cost; they, as a rule, have done well; while some who took a middle course, and had neither a fine crop nor a sensational yield to help them, have only done moderately.

Such, in broad outline, is the history of a season offering many points of contrast to that of 1894, but resembling that of 1893 in the higher price of fine tea; the lower price of common; great and growing consumption, and a wider demand for our teas from abroad.

That this is a sound position for the Industry, as a whole, is not open to question—though it does not suit all equally well; for it will encourage the production of the good tea required for home use, and will facilitate trade with Asia, Australia, and America which for the present turn upon the teas used there being procurable at low rates.

Writing a year ago about this foreign trade, upon which so much will depend a few years hence, we said "The development will be seen when there is plenty to spare from the home market, and quotations are not maintained at a level which checks it"—events have proved this to be true; lower rates have been followed by a great expansion of trade with other market; which must be taken as a partial set off for the disadvantage of low prices to those who produce an inferior class of tea.

Were it not for evidence of the gradually widening world's demand for Indian and Ceylon tea, many producers—and especially those who are contemplating further extensions—would need seriously to weigh these questions—1. Has the limit to

which cost can be reduced been reached? 2. Is there *any* limit to the possible fall in value of common tea?

The influence of foreign orders upon the Calcutta and Colombo markets has been considerable; it has often made values there, for the sorts taken, independent prices ruling here. This has not been sufficiently recognized by those who send, or by some who execute, orders from London:—for the future it will be necessary to be more circumspect, and to adjust buying prices to those current in the place of destination, remembering that if operations in the limited markets of India are attempted on the scale of China business in olden days the result will be disappointing.

Another result of orders from new markets has been to accentuate the preferential value of leafy as compared with broken teas, for broken are not saleable abroad, and here fewer buyers seem to bid for them every year, bringing their value below that of leafy tea. One reason for the disfavour in which small broken teas are held is to be found in the tendency of business to pass into the hands of those selling "blended" tea who habitually give the preference to whole leaf.

The development of this branch of trade continues to make progress, and it is an element of importance in the market—for the Blenders are teaching the retail distributor to do without holding stock, and their system saves both themselves and their customers the loss on tea that has depreciated by keeping, and on remnants of old stock, which has always been such a drawback. The shrinkage of old stocks in grocers' shops cannot be measured, but it must be considerable, and combined with the comparatively light stocks now held in bond it has strengthened the position, and accounts for the fact—exceptional in produce markets—that, apart from the slack time in the summer, wholesale buyers are always operating, and are ready to do so heavily at favourable opportunities.

The buying-power is, indeed, stronger now than it has ever been, partly, perhaps, because by force of circumstances the tea-trade has become closely allied with the provision-dealing trade of the country; partly from the strength that comes with the increased capital attracted by Joint-Stock enterprise; partly from the greater *usefulness* of capital in the hands of strong Co-operative combinations inter-acting on a cash basis. This is a matter of no little importance; for it is impossible to avoid placing excessive supplies upon the market at certain times; to absorb them, wholesale buyers with ample means and the will to use them are required.

The ideal policy for an Indian producer is to offer an equal quantity of his brand at regular intervals from August to April, giving the market a rest in the summer and buyers a chance of turning over their stocks. By degrees this is being followed, but it cannot be worked symmetrically or by all and Calcutta-bought teas cannot generally be handled on these lines.

Importers of Ceylon Tea have from the outset seen the wisdom of regular sales at the rate of importation, arrivals being sold, as a rule, within three weeks, and the first step taken to pass them quickly into use. The result is seen in a large trade worked upon a small stock, and the desired increase of consumption attained.

Much interest attaches to the progress of the Ceylon Industry, and it is being closely watched by competitors elsewhere for signs of the deterioration that some were led to expect; but upon the whole we consider that the average *quality* of Ceylon Tea is being maintained: its average *value* has declined somewhat, it is true; but other growths have been subject to this and the fall this year is due to the policy of those who have found it profitable to make heavy crops instead of smaller and finer ones:—they have brought to market tea of lower grade than used to be or need be made, and in doing so have widened the margin between the value of common and fine. Should they revert to making lighter crops, the average *value* would quickly rise, but it does not follow that a larger *profit* would be secured.

Will this movement in prices, common to India and Ceylon alike, be further accentuated in the future? It will depend upon the amount and the quality of the coming crops:—should they fall short of the world's requirement, we may see it reversed; but if ample, producers should be prepared for low rates for all inferior kinds.

As regards the home trade, we anticipate a growing appreciation for the fine-flavoured varieties, whether grown in Assam or on the hills of Darjeeling and Ceylon; and for this reason—the competition to sell “cheap” tea seems to be wearing itself out; the public has had enough of the “shilling canister,” and the vendors find they do no good by selling it; consequently, their aim is now to make trade by selling good tea at a reasonable price. This will probably determine the course of the market such time as a short supply, or a specially fine crop, lifts the value of the lower grades.

Respecting the prospect of receiving more fine tea from India, a high authority in Calcutta writes to us, “In late years the policy throughout Cachar and Sylhet has been to plant on flat lands; this means quantity not quality. The larger proportion of extensions in recent years has been made in these districts and in the Dooars, the most fertile land and prolific jâts being selected. It is, then, apparent that the proportion of land calculated to produce fine tea diminishes as we progress; and we are of opinion that the gardens in Assam and Darjeeling which can produce fine quality are in a strong and possibly improving position.” As in Darjeeling, so too, we believe in the districts of Ceylon which give the finer qualities, the land remaining available for plantations is limited to a small area. There remain Travancore and the new territories being opened in the South Wynaad; both of these districts seem capable of producing fairly good crops at a comparatively low cost, but they have not yet proved their capacity to yield tea equal to the finer grows of India or Ceylon.

WM. JAS. & HY. THOMPSON.

CAMPHOR.

Camphor is not the exclusive product of any one natural order, genus, or species; but what is more remarkable, of closely allied species of camphor-yielding genera—one species possesses the secretion, while no trace of it is found in another. Although several kinds of camphor are articles of commerce, little, if any, reaches this country, save that obtained from *Cinnamomum camphora* (*Camphora officinarum*), a member of the laurel family, and of the same genus as the tree whose bark furnishes the spice called cinnamon. Like many other natural products of which scientific research has multiplied the applications, camphor is becoming dearer and scarcer, and the question has arisen, How is the supply to be maintained equal to the demand? The bulk of the camphor imported into Europe comes from Japan and Formosa, and comparatively little from China. This is the product of *Cinnamomum camphora*, and Dr. E. Grasmann has published* an interesting account of this tree, both from a scientific and commercial standpoint. He has rather overweighted his article with second-hand information respecting laurels generally and those of Japan in particular, which, as might be expected, is inaccurate in some details. Disregarding these, we find much that is interesting concerning the camphor-tree itself, which is one of the noblest objects in the forests of eastern sub-tropical Asia. It attains gigantic dimensions, surpassing all other trees of the Japanese forests, at least in girth of trunk if not in total height. Dr. Grasmann gives the recorded dimensions of various notable trees, but what is more to the point, he also gives measurements made by himself. A tree in the neighbourhood of the town of Miyazaki, Oyodomura, measured in

1891, was 14.80 metres in circumference at 1.30 m from the ground, or 4.48 m. in diameter, and it was 35 m. high. There is an illustration of this giant reproduced from a photograph. Concerning the distribution of the camphor-tree in Japan, the author states that it grows naturally in Kinshin up to about 34 deg. lat., and scattered in favourable situations some 2 deg. farther north, the extreme limit being 36 deg. 24'. It is abundant in the island of Formosa, and also occurs in the Tsusima and Luchu groups. On the mainland of China, according to Dr. Grasmann, it inhabits the coast region from Cochin-China to the mouth of the Yangtze-kiang, and it may be added that it is now known to extend westwards at least as far as Ichang in the central province of Hupeh. From Dr. A. Henry's notes accompanying his specimens in the Kew Herbarium, it appears that the wood is in great request, but no camphor is extracted; and Consul Playfair reported the same from Pakhoi, Kwangtung, in 1883. Indeed the camphor industry would seem to be at present very limited in China, although the tree is common and widely spread. The little that is exported is mostly from the province of Fokien, but the amount is increasing in the same measure as the production is decreasing in Japan. In the latter country something has been done to maintain the supply, but Dr. Grasmann holds that the present rate of planting is wholly inadequate. He urges the importance of increasing the plantation to the greatest possible extent, inasmuch as every part of the tree is useful, from the roots to the young shoots and leaves. Even the fruit is employed in the preparation of tallow. In Formosa camphor distilling has been carried on in the most recklessly extravagant manner imaginable. It is suggested that Japanese rule in the island may put a stop to such disastrous waste.

With regard to the increasing price of camphor, it has been stated in various publications that this is due to its being used in the manufacture of smokeless powder. In reply to inquiries on this point, Sir Frederick Abel wrote to the Director of Kew in November last as follows:—

“Any increase of demand, involving a rise in the price of camphor, is not due to its application as a constituent of smokeless powder. That material was used in the earliest days of the manufacture of a successful smokeless powder for artillery and small arms; but its employment was soon demonstrated to be attended with serious practical disadvantages, and its application for the purpose can therefore not be said to have been other than experimental, and of no great importance, even at that time, as affecting the market value of camphor. This substance has, however, been used extensively for many years past, and no doubt in continually-increasing quantities, for the conversion of collodion cotton into the material known as celluloid, which is applied to the manufacture of imitation ivory, tortoise-shell, horn, and a great variety of purposes.”

As Dr. Grasmann observes, the greatest enemy of the camphor-tree is man, and in Japan large trees are eventually killed through the felonious nocturnal grubbing of their roots. Some birds are fond of the fruit and seed, and the caterpillar of *Papilio serpydon* feeds on the leaves; but, except to young plants, they cause comparatively little damage. Apart from the wanton destruction of trees, the probability of the supply of camphor being maintained is seriously diminished by the fact that the tree grows but slowly in its early years. At the same time it colonises freely, and is now naturalised in several countries, notably in Madagascar, where, according to Dr. Meller, in a note accompanying a specimen in the Kew Herbarium, it was abundant as long ago as 1862, and much used for building purposes.

Next in point of importance in producing camphor is *Dryobalanops aromatica*, a tree belonging to the Dipterocarpeæ, and inhabiting Borneo and Sumatra. The formula of ordinary camphor is $C_{10}H_{16}O$; of Borneo camphor, $C_{10}H_{18}O$; and the latter can be artificially prepared from the former. Borneo camphor is deposited in clefts and hollows of the wood, and has simply to be taken out; but it is comparatively rare, and exceedingly dear bring-

* “Der Kampferbaum. Mittheilungen der deutschen Gesellschaft für Natur- und Völkerkunde Ostasiens in Tokio,” vi. pp. 277-315, with illustrations. 1895.

ing eighty times more, according to Grasmann, than ordinary camphor. Nearly the whole production is imported into China, where it is esteemed beyond the ordinary camphor, and used as incense.

Blumea balsamifera (Compositae), a shrubby plant exceedingly common in tropical Asia, yields a kind of camphor by distillation. Hainan is the principal seat of the industry, but the crude article is refined at Canton, whence there is an annual export of about 10,000 pounds. No doubt this source of camphor could be much more extensively utilised.

Members of various other natural orders, notably the Labiatae, yield essential oils of the same composition, and having the same properties, as camphor. Menthol is an example. W. B. H.

—*Nature*, June 4.

THE SIZE OF THE BREAKS OF CEYLON TEA.

The following memorial has been drawn up and signed by fully forty of the largest buyers in the tea market:—

To the BROKERS' ASSOCIATION.

GENTLEMEN,—We, the undersigned, buyers in the Ceylon tea market, beg to call the attention of your committee to the urgent necessity of taking steps to increase the size of the sampling breaks for public sale to at least the same limit as now prevails for Indian tea on the following grounds:

I. The increasing difficulty, if not impossibility, of accurately valuing so many samples for one day's sale.

II. The saving of time to be effected in the auction room, which would be invaluable to all concerned, and would admit of buyers being able to have their purchases sampled and sent out on the same evening.

III. The extra expense and labour involved in sampling so many small lots after purchase, and in furnishing samples of them all to our agents.

We desire also to take this opportunity of expressing an opinion that the number of grades into which Ceylon tea is sorted might advantageously be curtailed, more especially as regards the produce of the smaller gardens. We also think that the smaller gardens might be advised not to dispatch their produce more frequently than once a fortnight instead of weekly. And we also deprecate the practice adopted by some, even of the larger gardens, of offering duplicate invoices on the same day.

Begging the favour of your early consideration of the foregoing suggestions.—We are, &c.

[Here follow signatures.]

Our readers will remember that we foreshadowed some such action before the holidays, and the above is the outcome of the rumours then current. It is to be hoped that due consideration will be given to the arguments adduced, as with quantities on sale such as last Tuesday, when 27,462 packages were offered in 916 lots, there seems to be urgent need for some alteration in the direction indicated if the trade is to be got through in any sort of reasonable time. In the old days of China tea one sample frequently represented 300 chests, sometimes 600 chests, and whilst it is not suggested that Ceylon planters should all at once adopt a similar limit, there is no reason why the present average should not be largely increased.—*H. and C. Mail*, June 12.

COFFEE IN MEXICO.

Our Legation at Mexico have sent home a special report upon the cultivation of coffee in Mexico, prepared by Mr. Francis Stronge, in which he points out in detail the advantages and difficulties attending the profitable employment of capital on a limited scale in the country. In purchasing an estate in Mexico a new comer should, as a rule, have recourse to a reliable foreign agency. Direct negotiations with the owners of the soil are often extremely tedious, and they should not be undertaken by anyone who does not possess a thorough knowledge of the country. Care must, of course, be taken to obtain a good title to the land

purchased, and in most cases this can now be done without much difficulty or expense. In some districts the Indian villagers lay claim to certain rights over adjoining lands, and however unfounded such claims may be, they are sometimes a source of great annoyance to the foreign planter. It will almost always be found, however, that these difficulties may be overcome by a little tact and liberality. The intending planter will generally do well to spend some little time in the country before making a purchase, and should, if possible, acquire some practical knowledge of his business at an existing plantation. He will be apt to think that by waiting he is letting slip many a golden opportunity; but such opportunities will probably recur later, and the experience he will have gained will save him much loss and disappointment. A considerable number of small foreign capitalists in Mexico would probably admit that for a year or two after their arrival experience was their only profit, and that it had been gained at a needlessly high price.—*Financial Post*, 9th June.

THE ISLAND'S SOURCES OF SUPPLY OF TEA BOXES.

There being short supplies of tea shooks and consequently higher prices, our contemporary has been gathering information on the subject, which is stated as follows:—

Our representative first waited upon probably

THE LARGEST IMPORTER,

who, owing to his direct connection, has heard from a large Japanese house the causes of the present condition of affairs. This gentleman kindly informed us that he understood that the shortage of supply was owing to the demands of the Japan Government for this particular Momi timber for putting up huts in Formosa. At this time of year also—lasting from July to December—there were the important requirements of Calcutta, while he also believed by this time the trees in Japan most easily available had been cut down, and now the exporters had possibly to go further inland and greater distances from river banks for the timber. These various causes had combined to seriously diminish the supply, and send up the cost 20 per cent. There was still a small demand here for cedar wood—which might be the original *Cryptomeria Japonica*, he was not sure. That wood was dearer than Momi, which was not a botanical name, and did not mean "pine," although a Japan pine supplied the wood. The difficulty to meet requirements—or at any rate the higher prices—would last, the speaker thought, until next December, after which, for six months, the Indian demand would cease. As to whether prices had reached the point at which European supplies—particularly Swedish and Austrian—could be imported the difficulty had always been the position of exchange, and there was not more prospect of a 1s. 1d. exchange now than in previous years.

THE LARGEST SINGLE CONSUMERS

were next interviewed. Last year when there was an anticipated rise in price they had imported from Europe; but had not taken steps to do so this year not caring for the business. Owing to the scarcity of boxes, however, they had commenced to refuse outside orders, confining themselves to the supply of their own estates, and those for whom they were recognised agents. Former customers had written urgently for supplies, as some of their tea was having to be stored in the absence of boxes; but these could not be sent. It was not anticipated that there would be much actual loss of tea, because it would keep in the factories alright for a long time; but inconvenience was being caused in some quarters.

A LARGE AGENCY FIRM.

who are their own importers, not being sellers to others, could only say that although they were paying more in Japan, they were not handicapped in supplies; and a further consignment for them was actually on its way to Ceylon.

ANOTHER IMPORTING FIRM'S EXPERIENCES

were that just now it was of little use to send forward orders, the European house in Japan with whom they dealt having so writing, at the same time appending the following explanation:—"The (Japanese) Government have taken all the available cut supply for Formosa." This firm had not made arrangements for the importation of shooks from Sweden, but they understood another firm had placed large orders for Austrian pinewood chests. Regarding locally made tea chests orders had been placed with the Udagama Tea and Timber Company at Galle, but their output was limited to about 400 chests a day. They were cheap, but the wood, of course, was not so good.

AN IMPORTER FROM EUROPE.

Our representative finally waited upon the importer of Austrian pinewood, who at present is the only importer of shooks from Europe. He stated that he had placed immediate orders for 20,000 chests, and he had booked a number of orders for delivery during the remainder of the year. He had not imported since 1893, until he sent home telegraphic orders three weeks ago. The non-resinous pinewood shooks which he was selling were also of even tare, and this question was a very important one. Locally made boxes did not ensure even tare by any means, and even Momi boxes were sometimes defective from this point of view. Uneven tare meant loss to the planter, and gave dissatisfaction to the London importer.

TEA IN JAVA.

From a pamphlet entitled "Cultures in Nederlandsch Oost-Indië," compiled from the Dutch Colonial Report for 1895, and issued by the *Indische Mercur*, we translate the following regarding tea in Java:—

ESTATES ENTIRELY DEPENDENT ON CONTRACTS WITH THE NATIVES.

The tea plantations opened by the natives on their own lands, in the vicinity of some of the tea plantations established on emphyteutic lands in the Preanger Regencies, namely in the districts of Tjitjoeroeg and Djampang Tengah in the Soekaboemi division, which according to the previous report at the end of 1893 covered a collective area of 430 bouws,* are gradually becoming of more importance to them, since in 1894 299 bouws more or less were in bearing, against 168 bouws in 1893. In 1894 in the case of four emphyteutic plantations the gathered wet leaf was bought at 3½ to 5 cents per ½ kg.,† namely, on Parakansalak, Tendjo-Aijoe, Siudangsari and Pasir Telaga Warna the produce of respectively 120, 89, 74 and 6 bouws. In this manner the plantations referred to obtained respectively 179,032, 73,708, 72,625 and 5,250, or in all 330,615 kg. of tea, whilst in 1893 under the outturn of the three first named plantations was included under the category of tea thus bought 186,709 kg. of tea, obtained from the aforesaid 168 bouws. When one considers that the gardens are laid out on lands which are unsuitable for *sawahs*,‡ and that with good management they will yield crops for at least 25 years, the profits from rice cultivation in the Soekaboemi division, which every year requires so much labour, cannot by far be compared with the results already obtained by the natives from their tea cultivation; it is therefore considered very probable that in the near future in the Preanger Regencies the voluntary planting of tea by the natives will gain in importance. It is calculated that a bouw of planted tea yields the owner a gross return of about f75 per annum.

In the Limbangan division of the district mentioned the preparation of tea finds a place—solely for the inland market—on the native plantations of Tjigiang, Pasir Tjitjoeroeg and Tjigedog, which consist respectively of 1½, 2½ and 4 bouws of land

* The *bouw* (Malay *bahu*) = about 1¼ acre.—Ed. C.O.

† The half-kilogram = 1.102 lb.—Ed. C.O.

‡ Irrigated rice-fields.—Ed. C.O.

possessed individually by inheritance. In 1891 there were prepared on these plantations 2,657 kg. of tea, against 2,501 kg. in 1893, which product was sold in the bazaars by hawkers at a fixed price of f0.40 per kg.

LANDS GRANTED BY THE GOVERNMENT IN EMPHYTEUSIS OR ON LEASE.

If, out of the 96 emphyteutic plantations, where at the end of 1894 cinchona plants were still found, 67 were in the Preanger Regencies alone, that district, so far as tea plantations are concerned, aspired even higher to the front rank, since 47 of the 50 plantations where tea cultivation is carried on on emphyteutic lands were found there. The crop from the newly opened plantations of Assam tea in the higher lying Preanger Regencies go on increasing; this increase counterbalances the decline in the production of Java tea in the lower lying regions, where the plants of Java tea are becoming more and more replaced by Liberian coffee trees. In consequence of this the tea crop of 1894 remained almost stationary. The crop amounted in 1892 to 3,794,932 kg. from 34 plantations, in 1893 to 3,405,042 kg. from 35 plantations, in 1894 to 3,421,013 kg. from 32 plantations. As regards the extent of emphyteutic lands planted with tea, so far as relates to 7 plantations (all in the Preanger Regencies) no figures are available (none also for 1893). The remaining 43 had at the end of 1894 10,263 bouws of tea plants, the total at the end of 1893, for 40 plantations, being 9,907 bouws. In these totals the Preanger Regencies residency shared at the end of 1894 (for 40 plantations) to the extent of 9,130 bouws, and at the end of 1893 (for 37 plantations) to the extent of 8,798 bouws. Some of the last-mentioned 40 and 37 plantations consisted at the time of only small fields (½ to 10 bouws).

LANDS GRANTED IN POSSESSION TO PRIVATE PERSONS

The tea production of the lands granted in possession to private persons amounted in 1894 to 675,850 kg. (for Tjikandi-Oedik in Bantam with 93 bouws of tea, Tjikoj in the abovementioned division of Tangerang, where 125 bouws more or less are planted with tea, and 18 lands in Buitenzorg with about 3,700 bouws of tea gardens).

On single Buitenzorg lands steps were being taken to replace the tea plants by Liberian coffee.

INDIAN TEA ASSOCIATION.

From the Abstract of Proceedings of a Meeting of the General Committee held in Calcutta on 29th May we extract the following:—

With reference to the Chapter on "White Ants" written by Dr. George Watt, c.r.e., for his Report of his investigations in Assam with proof copies of which he had favoured the Association, letters had been received by Messrs. Shaw, Wallace & Co., from Mr. John Alston, Superintendent of the Assam Frontier Tea Co., Ltd., and by Messrs. Finlay, Muir & Co., from Mr. James Hall, South Sylhet Tea Co., Ltd. It was decided to pass these letters on to Dr. Watt for his information.

Mr. Wallace suggested that the question of appointing a Scientific Officer for the Tea Districts should be referred to the various Boards of Directors of tea companies in London before the Committee arrived at any decision here, and it was decided that the correspondence and papers on the matter should be summarised and sent to the Secretary, Indian Tea Association, London, for this purpose.

Considered letters of 17th and 21st April, and 1st and 8th May, with enclosures, from the Secretary, Indian Tea Association, London, all more or less in connection with the American Market Fund.

Letter of 1st May, enclosed copy of an important letter from Mr. Blechynden, dated 20th April, making suggestions in detail with the view of bringing the trade in Indian tea in America on to the same lines as followed for China and Japan teas. Mr. Blechynden pointed out, that the trade in China and Japan teas was based mainly on the samples of the previous year, each mark having its recognised standard, and that large orders were booked months ahead on prices quoted, subject to market fluctuations, the importer taking only ordinary commercial risks. Mr. Blechynden's proposals, stated

briefly, were to organise in India an Agency which would take the place of the packing houses in China and Japan, and he suggested the formation of a trading company or syndicate which would undertake to buy teas in Calcutta and to blend and pack them, to certain fixed standards, shipping them against orders from America, the main points to be aimed at being the minimum of cost and thorough efficiency. The difficulty of matching any particular sample of tea which had attracted the popular taste was one of the chief difficulties in pushing the trade in Indian tea in the United States, and in order to get over this Mr. Blechynden suggested forming a number of standards of different commercial grades and of the style and liquor found by experience to suit the American markets. Such standards would cover practically all the kinds required and range in prices from the lowest to the highest grades, and a sufficient number of teas should be used in each blend to admit of their being followed whether the same gardens or district teas were available in the next season or not. In this way he considered it possible that large firms, who are not at present handling Indian tea, could go into the trade and sell large quantities.

These proposals had been considered at a meeting of the American and Foreign Tea Committee, held in London on the 5th May, but after due consideration the Committee came with regret to the conclusion that the scheme submitted was beyond their scope to deal with, but they concurred in the view expressed by Mr. Blechynden in a later letter that some effect might possibly be given to his proposals by private enterprise.

After careful consideration, both in circulation, and in the course of discussion, the General Committee arrived at the conclusion that Mr. Blechynden's proposals were not practicable, the main obstacle for carrying them out in this country being the unsuitability of the climate for blending purposes. The Committee, however, suggested that arrangements might be made for blending Indian teas on a large scale in America, which might meet the difficulty, and this was to be passed on to the London Committee. The General Committee noted the views with which Mr. Mackenzie had favoured the American and Foreign Tea Committee in London as detailed in Mr. Tye's letter of 8th May.

In his letter of 21st April, Mr. Tye called attention to the prejudicial effect on the trade of the North-West frontier of the unwise fiscal policy of the Amir of Afghanistan and the consequent falling off in the exports of Indian tea as shown in the official statement of the trade of British India for 1894-95, and stated that the London Committee were of opinion that a representation should be made to the Government of India on the subject, with a view to a removal of the restrictions referred to. The Committee having given very careful consideration to the matter were of opinion, looking at the very full and clear statement given by the Director-General of Statistics to the Government of India in his "Review of the Trade of India for 1894-95" in connection with the decline of the trans frontier trade, that a representation to the Government of India would not be of much practical benefit, at any rate with regard to the transit trade which appeared to have been practically destroyed by Russian policy and fiscal arrangements. It had been decided, however, as a preliminary step to address Mr. J. E. O'Connor, C.I.E., Director-General of Statistics, asking him for particulars of the duties and charges levied by the Amir on different classes of goods imported into Afghanistan from India, and on receipt of this information the Committee would then decide what further action should be taken.

TEA-CULTURE IN RUSSIA.—Reports from Batoum, on the Black Sea, state that on March 15th a large number of Japanese labourers arrived there with 300 cases of young tea-plants and 200 cases of other Japanese plants. They proceeded to the Government lands at Tchavka, near Batoum, where experiments in the cultivation of tea and other economic products are to be started.—*Chemist and Druggist*, June 6.

NOTHING LIKE RUBBER.

We recently referred to the approaching scarcity of india-rubber, in view of the increasing demand for the article, particularly by the cycle and kindred industries; and we opined that a fortune awaited the man who would invent a substitute for rubber. Whereupon it was pointed out by a correspondent that there is already one substitute on the market, under the title of New Rubber. Since then a rubber trade expert has been talking to us. While admitting the use of the substitute referred to, he maintains that there is nothing like rubber. In other words, the substitute may be used as an admixture, and, indeed, commonly is, to the proportion of, perhaps, twenty-five per cent in, for instance, waterproofing and similar processes; but it is, by itself, of too greasy a nature, and lacks the requisite consistency, to serve for vehicle tyres, and the like. However, as an admixture, and as an adjunct to the ordinary india-rubber of commerce, the expert admitted that the substitute was valuable. And he went on to dilate upon the growing demands upon the present supply of india-rubber, especially when vulcanized. Not only are combs, pipe stems, and numerous other articles being made, in increasing quantities, from rubber which has been vulcanized—or, so to speak, annealed—but even nuts and bolts. The latter are being found particularly useful for rivetting drain pipes and similar work, as, unlike iron, vulcanized rubber will not corrode. And as to the proximate supply of india-rubber. Well, the expert admitted that there was a danger of demand exceeding production. No doubt there were immense forests of rubber trees, but then thousands of the latter had been destroyed by immature tapping through the cupidity of natives and traders. But would not systematic planting of new trees retrieve the position? "Ah!" responded the rubber man, "if we could only get people to be so philanthropic as to have an eye for posterity. Why, it takes a century to bring a caoutchouc, or 'syringe' tree, to maturity!" So it would seem that if the supply is to keep pace with the growing demand for india-rubber, more attention must be given to the opening up of new forests, while all immature tapping of trees must be tabooed.—*Pall Mall Gazette*.

TEA PLUCKING MACHINES.

Though much may be anticipated from the opening of the Assam Railway, in the way of reducing rates of labor by promoting free immigration, there is no doubt that planters must look to improved machinery in the future as the mainstay of the enterprise. Certainly, when glancing back at the history of the industry there is much cause for congratulation, but still it must be considered that substitution of steam, or other motor in lieu of hand power, has not been sufficiently attained nor will be until some means are devised of substituting mechanical contrivances for leaf plucking. There has, we think, been ample time for one or other of the three inventions, spoken of so highly last year, for their merits to have been submitted to the public, but for months past we have heard nothing of them. If either has been successful there is no necessity for the designers to hide their light under a bushel while, at the same time, no ultimate good can be derived from concealing the fact of failure. The man who can place on the market a really effective machine for gathering leaf is certain of a competency, if not fortune, and the different tea concerns, both private and companies, might be canvassed on the subject of subscribing to a handsome reward for the successful inventor. We do not assume that first efforts will be successful, for every day witnesses some improvements in all mechanics, but even could a reaper be made that would do half the work, a great step would be gained in economising labor in what is now the most expensive branch of manufacture. While confessing ourselves unable to offer any practical suggestion in adopting plucking machinery for use on unterraced tea-chas, we think that on the gentle undulation afforded by terracing and on level gardens, the

solution of the problem lies more in the careful training of the bushes in pruning so as to ensure as far as possible a uniform surface, but to arrive at this desideratum would entail the employment of trained intelligent men, and garden coolies can hardly be said to come under such a denomination. However, once a tolerably level surface was obtained, it seems to us that a modification of the common grain reaper could be brought into play, and though a good deal of course leaf would be cut off, for the fine shoots would most probably bend before and slip through the teeth of the reaper rendering it necessary to cut low down to the more rigid stem, sifting, after a few minutes rolling would remove the greater portion of this. The difficulty lies in dealing with the sides and centres of the bush for table pruning (as it used to be called) has its drawbacks which increase as the season progresses, and by the end of July or thereabouts it would probably be found necessary to resort to the knife to thin out interlacing stems. The nut no doubt is a hard one to crack, and as few planters have time, or possess the necessary aptitude for experimenting with intricate mechanics, it would be better to offer the reward we suggest, taking care that our requirements are brought to the notice of machinists in all civilised countries. Though not without hopes that India or Ceylon may secure the honor of introducing an efficient plucker, it is more than probable that America or some of our semi-tropical colonies may be first in the field with one, for though tea-planting is now being attempted in various parts of the world, the high rates ruling for labor outside India, preclude the possibility of successful competition with us; unless the cost of out-turn can be brought down to our standard. This can only be accomplished by the aid of machinery and necessity being the mother of invention, the ingenuity of the colonists will compel them to pay the closest attention to the subject. This was the case in America some sixty years since, the paucity and consequent high price of hand labor eventually giving us all those admirable inventions that have tended so greatly to lessen the cost of production of the necessaries and luxuries of life. It would matter but little to the Indian planter whence the machine came, for he would eventually obtain it, and as there must still remain the necessity for employment of hand labor to a considerable extent on all tea-plantations, we should still remain masters of the position on account of cheap labor. It is certainly too Utopian to reckon upon dispensing with the coolie altogether.—*Indian Planters' Gazette*, June 20.

THE UNITED PLANTERS' COMPANY OF CEYLON, LIMITED.

The Directors now present to the Shareholders their Fifth Annual Report, with the accompanying Accounts to the 31st December, 1895, and are glad to be able to show continued satisfactory progress, the yield again showing a slight increase and prices having been well maintained.

During the year 163 acres of land have been planted in Tea, and are reported upon satisfactorily.

The accounts now presented show a Balance of profit of £7,670 Os. 10d., after paying an interim dividend at the rate of 5 per cent per annum, all current expenses and upkeep of machinery and buildings, and after writing £2,000 off the Factories and Machinery account, £1,560 off the new clearings account, and making further provision for the Superintendents' fund.

The Directors now propose to add £2,000 to Reserve Account, bringing the amount of that account up to £7,000, to pay a final dividend of 3½ per cent, free of income tax, making, 6 per cent for the year, and to carry forward a balance of £791 Os. 10d.

The Directors have again to express their satisfaction with the hearty co-operation received from the Superintendents in the management of the estates.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, June 11.

CINCHONA.—The monthly cinchona auctions were held on Tuesday, when a fair quantity of bark was offered. A moderately animated tone prevailed throughout the sale, and, with scarcely an exception, the bulk offered was sold at firm rates, higher prices in some instances being paid for Druggists' varieties, notably West African bark. The unit average 3d per lb.

The eight catalogues comprised 2,411 packages, which were divided as follows:—

	Packages.	Packages.
East Indian cinchona	1,465	of which 1,358 were sold
Ceylon cinchona	532	„ 510 „
African cinchona	212	„ 212 „
South American cinchona	7	„ 7 „
Java cinchona	195	„ 195 „
	2,411	„ 2,282 „

The following figures represent the approximate quantities of bark purchased by the principal buyers:—

	Lbs.
Agents for the Anerbach factory	123,784
Agents for the Brunswick Quinine-works	116,706
Agents for the Mannheim and Amsterdam works	111,075
Agents for the Frankfort and Stuttgart works	49,397
Agents for the American and Italian works	36,255
Messrs. Howards & Sons	33,465
Agents for the Paris works	22,730
Agents for the Imperial Quinine Company	4,800
Various buyers	42,437
Total quantity sold	540,649
Bought in or withdrawn	28,140

Total quantity of bark offered 568,789

Ceylon and East Indian barks realised, according to quality, from 1d to 3½d per lb. for Ledger, 1½d to 3½d for Officialis, 3d to 2d for Hybrids, and 1d to 2½d for Succirubra. For Java Ledger 2½d to 2¾d was paid, and for Hybrid from 4½ to 4¾d per lb. African succirubra quills realised 2d to 3d per lb. At today's drug-sales 20 serons of Guayaquil Loxa sold readily at from 7½d to 10d per lb. for fair, partly bright, partly broken, mossy quill, and from 4d down to 1d for ordinary dull quality. Of 131 packages cultivated Bolivian-Calisaya 6l, in quill, fair, but damaged, realised from 2½d to 3d per lb. Three packages South American red bark were bought in at 3s 6d per lb. The exports of cinchona from Puerto Cabello (Venezuela) in 1895 were 14,005 kilos. In 1894 they were 2,265 kilos.

CROTON-SEED is again dearer, and imports of good quality would no doubt realise high rates. At auction 8 packages (about 7 cwt.) of rather dark mixed Ceylon seed brought 66s per cwt. The last price paid at auction on May 2nd for a better-looking parcel was 65s.

KINO.—A new shipment of about 300 lb. of East African kino, upon which we have recently commented has been received. No definite price is stated, but it is said that the holders are not disposed to sacrifice it. The offerings of auction included 2 packages of dark astringent East Indian gum, one of which was bought in at 10s per lb., and three packages of a bright red and woody mixed gum from Bombay, for which no price was mentioned.

KOLA-NUTS are being pressed for sale owing to heavy arrivals. Fair bright West African are offering privately at 3½d to 4d per lb. while for fresh kolas very low figures are mentioned. At auction 29 bags of dried nuts were bought in at 6½d to 9d per lb., and 20 baskets of fresh at 6d per lb.

VANILLA.—At today's auctions the demand was only moderate, and holders accepted a general decline of 1s to 2s per lb. Fine *Mamritius*, slightly crystallised, 6 to 8½ inches, realised from 28s to 33s; fresh plump, 4½ to 8 inc.es, 21s 6d to 27s 6d; 8 to 8½ inches, 31s; ordinary pale to common from 18s 6d to 28s 6d per lb. Good Fiji vanilla realised 1 s per lb.

VARIOUS DRUGS.—Good qualities of Cuttle-fish bone are scarce, and are firmly held. At auction 19 packages of low to ordinary dark mixed quality from Bombay sold readily at 3d to 2½d per lb. Twenty-seven bales Coca leaves, Huancoco character were bought in at from 1s 2d to 1s 2d per lb., and 20 bags Cocculus Indicus at 8s per lb. Five cases dark-brown Patchouly leaves from Penang sold at 31 pe lb.

ANNATTO.—Good bright seed is now in very large supply, but difficult of sale. About 60 packages East Indian were offered today, but only 8 sold, at 5d per lb. for fine bright, and 1½d for ordinary damaged. A parcel of West Indian annatto-paste, imported via New York, was also offered. It consisted of 10 cases, and was bought in at 2s per lb.

THE CEYLON ESTATES INVESTMENT ASSOCIATION, LIMITED.

REPORT

to the twelfth Ordinary General Meeting, held in Glasgow on the 16th June:—

The Directors have pleasure in submitting herewith the accounts for the year ending 31st March, 1896.

The Directors are pleased to be able to again show a satisfactory result of the year's working.

The balance at the credit of Profit and Loss account, including £481 18s 10d brought forward from last year, is

£1,708 11 10

The Directors propose that this should be applied.—In

payment of a dividend of 12½ per cent free of Income Tax

£3,875 0 0

In writing down Tea Machinery and Factories

300 0 0

4,175 0 0

and that the balance of

£533 11 10

be carried forward to next year.

The directors who retire at this time in conformity with the Articles of Association are Mr. Robert King and the Reverend Peter Grant, D.D. They are eligible and offer themselves for re-election.

The Auditor, Mr. Alexander Moore, C.A., also retires, but is eligible to be re-appointed.

INDIAN PATENTS.

Specification of the undermentioned inventions have been filed under the provisions of Act V. of 1888.

IMPROVEMENTS IN OR CONNECTED WITH WEBS, TRAYS FLAPS OR CARRIERS FOR CARRYING TEA LEAF IN DRYING MACHINES.—No. 143 of 1896.—William Jackson, engineer of Thorogrove, Mannofield, Aberdeen, North Britain, for improvements in or connected with webs, trays, flaps or carriers for carrying tealeaf or other substances in drying machines. (Filed 8th June 1896.)—*Eastern Engineer*, June 27.

COCONUT OIL.

BY DR. HIRSCH.

There appears to be a good deal of irregularity in the classification of the various qualities of this important raw material for the manufacture of toilet soaps, and it would perhaps be better to replace the names at present in general use, viz., Cochin, Ceylon and coprah oil, by the terms "white," "prime," and "yellow," since "coprah" only means the material from which the oil is obtained, and the others (which may be called territorial designations) are somewhat misleading, it being possible to obtain "Ceylon" oil of first-class quality, or "Cochin" oil that is merely "prime."

The white or first-quality oil is used in the manufacture of white soaps, and must, equally with the latter, contain no coloring matter—a prohibition which particularly applies to gray, yellow or blue shades. The very soft bloom of the fine almond soaps is due to the complete emulsion produced by the incorporation of the oil with the colorless soda lye. For this reason the coconut oil should contain no free fatty acids, or, at any rate, not more than 1 per cent at the outside. The oil should exhibit the characteristic pure nutty taste and odor of its class.

For colored soaps, either filled or unfilled, the "prime" oil is used, a small proportion of coloring matter being therefore allowable in the oil and in "white" soaps made therefrom, but this should be very slight as compared with that contained in "colored" soaps. As a rule, the soaps from this grade are not required to exhibit the same bloom and transparency as the almond soaps. The presence of over 4 per cent. of free fatty acids produces lumpiness when the oil and lye are stirred up together, on account of the extra rapid reaction of the free acid with the alkali, and the mass easily becomes thick, the finished soap showing flakes due to the

irregular distribution of the fat, alkali, color or scent. When filled soaps are in question the free fatty acids should not exceed 3 per cent., or the work will be attended with difficulty. In odour the oil is not expected to be so fine as the "white" quality, but must on no account be disagreeable or irritating.

The chief use of the yellow oil is in the manufacture of filled soaps by the warm process, especially those yielding upward of 250 per cent. Its color may be deep compared with the finer qualities, but not to such an extent as to discolor the soaps. Free fatty acids are no detriment, good results being often obtained where as much as 12 or 11 per cent. is present. The odor may be slightly rancid, but not so as to make the soap disagreeable.

The barrels for packing coconut oils must be perfectly clean, those having previously contained fusel oil or inferior spirits requiring to be steamed until the characteristic smell has disappeared. On account of the solubility of palm oil in coconut oil, and the consequent coloration thereby imparted to the latter and the soaps prepared from it, every trace of the palm oil should be removed from barrels having previously served to contain the same, before they can be used for coconut oil. Tar barrels must on no account be used, and the cleaning of casks by burning out is to be deprecated (unless all carbonized spots therein are subsequently scraped clean) on account of the contamination of the oil by particles of carbon, which ultimately make the soap look gray.

The estimation of the free fatty acids may be effected in the following manner: One hundred c.c. of pure alcohol (95 to 96 per cent.) are placed in a 250 c.c. flask, and a few drops of alcoholic phenolphthalein solution added thereto. To this mixture normal soda lye is added, one drop at a time, until a decided rose coloration is produced, a little more than one drop being needed to neutralize the carbon dioxide absorbed from the air by the alcohol. The liquid is then heated to a boiling, and ten c.c. of melted coconut oil are added from a pipette (which must be rinsed out afterward with alcohol twice). The oil dissolves completely (or nearly so), and may be titrated with normal soda until the initial rose-coloration reappears. One c.c. of the soda corresponds to 2.2 per cent. of free fatty acid.

There is another grade of coconut oil known as "imported" oil, which is said to be superior to the "white" quality, but the author has not had any opportunity of testing it. As with other imported oils, the buyer is supposed to accept what is tendered, without any guarantee as to color, purity or any other characteristic, and the weight is reckoned on the basis of 11 per cent. tare—which, however, is usually a few points higher.—*Der Seifenfabrikant*.—*Oil Paint and Drug Reporter*, June 8.

A POISONOUS ORCHID.—A comparatively common orchid, the *Cypripedium spectabile*, one of the oldest of cultivated species, has been discovered by Mr. D. E. MacDougal, according to the *Revue Scientifique*, to possess decided poisonous properties. "These properties," says the *Revue*, "are localised in the leaves and stems; they manifest themselves by a special cutaneous irritation in those who are so imprudent as to handle the orchid in question. This irritation recalls that which appears in persons who have handled *Rhus* [poison ivy]. The substance that causes the effects consists of an oily matter secreted by the glandular hairs. This matter is found, as in the Chinese primrose, deposited between the cellular wall and the cuticle of the terminal cellule of the hair; it is set free by the rupture of the cuticle. This poisonous substance seems to perform the function of protecting the reproductive portion of the plant, for the virulence of the poison and the quantity secreted increase as the plant develops and attains a maximum during the formation of the seeds."

TEA PLANTING IN DARJEELING.

(Continued from page 100.)

DISCUSSION.

The Chairman said they had heard about as good a paper as could possibly be given on this important subject, a paper abounding not only in very accurate description and practical knowledge, but also illustrated in a very elaborate manner. The important part of the address—apart from the labour question—lay, not so much in the preparation of the ground for the tea plants as in the preparation of the tea. Of course, all that had been said as to forests, buildings, and the like, was very interesting, but that one could imagine; and, no doubt, in these respects their rivals in China could show quite as good a case as India. He ventured to suggest to the British public that the real hope was in the preparation of the tea. In that respect they had the advantage, and that was the reason why they were rapidly gaining ground over China. Many could, no doubt, remember when the tea industry in India was in a very low state; but now, owing to the adoption of scientific processes, that condition of things had been considerably altered. It was the possession of superior machinery which had given India the advantage over China. He should be glad to know the exact number of acres under cultivation in the Darjeeling district, and what quantity was still available for the purpose. It had been said that tea planting was almost the only industry in Darjeeling; but he could recollect the time when the cultivation of cinchona was an important industry.

Sir Stuart Colvin Bayley, K.C.S.I., thought they owed a debt of gratitude to Mr. Christison for his very interesting and instructive paper. The paper dealt with the tea-planting industry, as a whole, in Darjeeling, and there was much in it, particularly in the technical portions, as to which tea planters whose experience had been in other provinces would have something to say. He had hoped to hear from the reader of the paper a little more upon the subject of labour—for instance, tea method of recruitment, the average duration of contract—that was to say, whether the labourers who come from a distance stayed any time in one garden; whether they took an annual holiday to visit their homes; or whether they stayed there for years? No one could have told us better about the Nepali labourer than Mr. Christison, for no one knew them better or did more for them. Perhaps there were many who had attended the annual gathering at Tukvar, which was organised by Mr. Christison, and to which many coloured crowds of cheerful, well-looking labourers from all the neighbouring gardens used to flock for the contest in athletic games and other amusements promoted by their guide, philosopher, and friend, Mr. Christison. The Nepalese labourer had probably more intelligence and industry than those of any other part of India; and among the advantages which the Darjeeling tea planters had over their neighbours in Assam—and there were many—was the fact that they drew their labourers from the neighbouring country. There was a grievance even in regard to those labourers—that they were taken away from the work in the tea gardens and recruited for military police in other parts of India. This question was just beginning to crop up when he was in India. He fancied it had become more burning; but as he knew nothing of its recent developments, he would leave others to say what there was to be said about it. His advice to the Darjeeling tea planters would be that, whatever pressure they might put upon the Government to get their grievances redressed, they should not fall into the snare of asking for a labour law. If they did, they would no doubt find their labour protected against Government or other competition, but they would find the price which they would have to pay a very heavy one. The great advantage which the Darjeeling and the Dooars gardens enjoyed over their Eastern rivals was the fact that they had no labour law. In Assam there was no indigenous labour to speak of, in Upper Assam none at all. If the

tea industry was to live labourers had to be imported at very great expense from Bengal. But having gone to this expense the planters required, in the fierce competition that existed, to be protected from desertion and from the allurements of other employers of labour. Hence the contracts were maintained by severe communal penalties, but if the law did this on one side it did a great deal also on the other. It took under its protection the general well-being of the labourer, his wages, his food, his clothing, his housing, his sanitary arrangements, his medical attendance, &c. These were looked after by means of inspection and minute regulation, two methods which inevitable as they were for the purpose, tended no less inevitably to a considerable amount of friction. A worse result was that the labourer when thus hedged in was such a valuable asset that the planter was willing to give a very large price in Upper Assam, over a hundred rupees for each. But the difference between this sum and the actual cost of conveying the labourers to the district was so great as to leave a very large margin, and inevitably there was a fierce struggle set up for this margin. "Where the carcase is there are the eagles gathered together," a whole hord of middlemen, contractors and their agents, licensed recruiters, unlicensed recruiters, garden sirdars, and what not, all connected for the *corpus vile* which was to yield this profit, and systematic recourse to fraudulent recruiting and even to kidnapping, became common, sufficiently common to be felt as a discredit to the administration, and one not easily to be put down. This point had received very great attention from his successor (Sir Charles Elliott); and one of the last of his public acts had been to appoint a committee, which, representing all interests, would try to regulate and co-ordinate the various conflicting and antagonistic systems by which labour for the eastern gardens was collected, recruited, and sent up. Any arrangement by which these conflicting and ill-regulated interest could be brought into a decent system, under responsible management, so that they would work not antagonistically, but for the benefit of the tea planters, would be an advantage not only to the planter but to the labourer and to the public. He should be glad to hear about the genesis of the committee and what its results were likely to be.

Sir Charles Elliott, K.C.S.I., said the information given by the reader of the paper was not only interesting to those present, but would add a good deal to the interest taken throughout England by those who were concerned in the tea industry—not only with regard to the cultivation of the land and the preparation of the tea, but in the very important question of the way in which the tea was treated when it came to London. In reply to the Chairman's inquiry as to how far the extension of the Darjeeling district was possible for tea cultivation, he might say that there was not much more room for extension. Almost all the land capable of being planted with tea had been taken up. The only extension possible, with a few exceptions, especially in the Daling district, where the area reserved for tea had not all been taken up, was the gradual slow extension which went on from year to year within the areas of the different plantations whenever labour was available for clearing and planting an additional 25 or 50 acres. But there was an enormous area capable of tea cultivation in the Dooars. The land in that district was much more suitable for tea cultivation, as it produced a vastly larger crop, the result being that the influx of capital necessarily went into the Dooars instead of into the Darjeeling district. The Chairman had also referred to cinchona, and he might say that the Government plantation near Darjeeling was the source of the quinine supply from Upper India, but the price of bark had fallen so low that the cultivation of cinchona had been abandoned in all the gardens. He wished to express his strong agreement in what had been said by Mr. Christison as to the relations between the tea planters and the population of the district, and the great utility the tea planters were in the administration of the country.

He, as well as his predecessors, had always set a high value on the assistance given by the tea planters to the administration in various forms. They were the backbone of the British Government in that district; and were the chief members of the District Board, corresponding to the county councils in England, through whom were carried out the making and repairs of roads, the establishment of schools, the improvement of sanitation—in fact, every description of work. The question of labour was a difficult one in Darjeeling, though it was not nearly so difficult there as in other parts of India. Reference had been made in the paper to the depletion of tea gardens through competition by the Government in recruiting labour for military purposes in Burma and Bengal. This recruiting had been complained of by the tea planters as drawing upon their supply of labour. But the Government had taken the greatest possible pains to prevent any such grievance arising. A transport officer had been appointed at Darjeeling with a depot there, and he had strict injunctions to see that none of the recruiters went to the tea gardens or took anyone employed there. The recruits were kept at the depot for some considerable time; so that any planter who had suspicion that his labourers had been carried off might go to the depot and see the recruits, and in case he identified any of his coolies the authorities would not retain them. He had heard the same story about the want of male labourers on some of the gardens, but well-managed gardens in a favourable situation did not suffer in this way. The two Tankvar gardens, including the one over which Mr. Christison presided, were instances of what could be done by good management. They did not recruit labour; they bred more labour than they could employ. The labourers lived upon these estates permanently; children grew up there and multiplied to such an extent that one of the chief difficulties was to find employment in the gardens for the children bred on the estates. In other gardens which were not so near civilisation, and perhaps not so well managed, the difficulty of finding labour was no doubt greater. The grievance was not, as might be supposed, that Government recruited coolies employed upon the gardens, but that Government went into the same market as the tea planters, and employed men whom the planters might have employed. The immigration from Nepal referred to by Mr. Christison was employed in three different ways—part went on to the gardens as they were extended, the greatest part went on to the land, especially in independent Sikkim, where agricultural extension had been very large; and a small portion was recruited by the Government for military and transport service. All that could be done was to try and arrange that the competition should not be an unfair one. The Government required very severe work from the men it recruited for the military police and for transport work. They were sent long distances, and to unhealthy districts; on the other hand, they were seldom required for a long period, whereas tea planters employed them for life. As the men had to undergo great privations while in the employ of the Government they received a larger wage than they got from the tea planter, and do doubt to the more adventurous spirits a higher wage with a short period of service was more attractive in spite of the distance and risk to life. On the other hand, the wages earned on the tea gardens were certainly large, and thrifty and diligent families were able to save a considerable sum. His own belief was that all had been done which could be done to secure fairness in the tea planter's interest. He need not say that if any well-considered complaint were made, and some grievances established, there would be the greatest readiness on the part of the Government to listen to the complaint and to remove the grievance. With regard to the wider question, which had been touched on by Sir Stenart Bayley, he might mention that the Commission which had been sitting to discuss this particular question, and the remedy to be applied, had suggested that the work of recruiting labourers for tea gardens in Assam should be concentrated into a single hand. The great evil which had arisen with regard to the

competition of labourers had arisen from the immense number of different persons who were competing against each other—deceiving each other, stealing each others coolies, kidnapping women and children, or enticing them by false pretences, and even using force and wrongful confinement so that they constantly figured in the police courts. A great contrast was presented by colonial emigration, which was conducted by well-paid agents established in Calcutta, who recruit from 10,000 to 15,000 men and women every year for the colonies. These recruits were brought down to Calcutta and embarked at Calcutta at 15 rupees per head. An exactly similar class were brought down from the same parts of the country, and taken to Assam, but instead of costing 15 rupees they cost the tea planter 150 rupees. And the tea industry had to pay annually a fine of 50 lakhs of rupees on the 50,000 to 60,000 people who immigrate into Assam. This large sum, or most of it, went into the hands of the middlemen. The only remedy which could be suggested was to sweep the middleman away; and he trusted this would be the result of the commission that was now sitting to report upon the subject.

Mr. Shillington said that, having been a tea-taster in Mincing-lane for the last 30 years, he should like to refer to one point to which Mr. Christison had alluded, namely, that of bulking. It had been suggested that the dock companies did not act fairly in the matter. He wished to say that, although the treatment that tea received at the docks was rather rough, still it was a necessity that every parcel should be turned out and packed again. It was said the remedy was to bulk the tea at the gardens, but, unless they could have perfectly even quality, it was hopeless to rely on this. With regard to the question of tarcs, it had been said that in India they could not get wood which did not dry upon its way home. But the difficulty had been avoided in China, where they sawed their wood five years before it was wanted. The Indian tea industry was getting to be a large affair; and it was a terrible thing to tasters to have to deal with such a large number of samples. He recollected the time when one sample of Chinese tea would represent 600 chests; in India a sample represented an average of 28 chests, the consequence being that the tea tasters had to taste some 50,000 samples each year. He suggested that in future the number of packages in each break should be increased to 100 chests at least.

Mr. Ernest Tyo said the paper was a most able one, and he had no doubt it would give great pleasure to many when it appeared in the columns of the *Journal*. The most important question referred to in the discussion was the labour question; but as this had been so exhaustively dealt with by previous speakers, there was little left for him to say. He hoped that upon some future occasion this question would be dealt with by itself in a paper.

Mr. George Williamson said he could not agree with everything that had been said upon the labour question. Great progress had been made in the cultivation of tea in India, as was apparent from the fact that an enormous quantity was now exported, while in 1818 (the year he entered the field) the export amounted to only 250,000 lbs. There were large areas still suitable for tea cultivation in India, but in his opinion the widening of the field of consumption was a more important factor in the problem of the future prosperity of the industry than increasing the area of production. He was very pleased to see Ceylon take the lead as an educational agency, but to his mind the Ceylon tea had not the grit or body of Indian tea.

Mr. John Ferguson said that they (in Ceylon) acknowledged that the Darjeeling district produced the very finest tea, and were anxious to know what increase might be looked for in Northern or Southern India of finest teas. He thought the reader of the paper had not quite made clear whether the 10,000,000 lb. of tea now produced in Darjeeling from the 56,000 acres were all of the fine tea which sold at the highest price, and whether this acreage could be added to materially. Mr. Christi-

son had stated that the grants of land in private hands equalled 329 square miles, and he should like to know what further portion of this could be used for tea cultivation. In Ceylon, and in the Nilgiris, the area available for fine teas was limited.

Dr. J. A. Voelcker thought the gist of the paper was to be found in the concluding remarks. What they wanted to know was what had brought Indian tea to the front greatly to the exclusion of that from China? It had been suggested that this was in a great measure owing to the advance of knowledge of scientific processes and the use of improved machinery. This might be true with regard to machinery, but upon the other point he ventured to differ. His belief was that from beginning to end both the cultivation and the manufacture of tea were carried out more by "rule of thumb" than according to any scientific method. There appeared to be a want of thorough knowledge of what actually did take place in the different processes. He felt that the question for the future was not so much whether here or there one could produce a fine quality of tea, or whether the area of cultivation could be extended, but it was how large a number would in future be able to produce the finest quality and in a scientific manner. There appeared to be an absence of knowledge upon points of cultivation, for example, as to what manure should be used and what should be avoided in order to produce the best tea. With regard to the manufacture, though there might be excellent machinery, there was very little known of the processes which were denoted by the use of such chemical terms as "oxidation" and "fermentation." These terms were used in a loose way without any clear idea of what they meant. Until more was known on such points that progress would not be made which was necessary to keep English industries in India to the front. In Germany, the Government encouraged greatly the development of industries and the spread of knowledge concerning them, but little was done in this direction either in England or in India. Not very long ago a Tea Planters' Association in Assam decided to call in the aid of science to their industry, and engaged the services of a chemist from England. But he was only given a year and a half in which to find out all about tea cultivation and tea manufacture, and soon afterwards the association said they had no more funds, and his services were dispensed with. It was not in such a way at this that scientific investigation should be carried out, and what was really needed was a patient working out of all the details, aliko of cultivation and of manufacture, until the whole was put upon a thoroughly scientific and practical basis.

Mr. Christison, in reply, said he could not contribute much to the vital question of labour for Assam, but he fully appreciated Sir Stuart Bayley's advice to those districts which had no labour Act to do without one. He frankly acknowledged, and felt thankful for it, that her labour advantages were among the strong points in favour of the Darjeeling district, and though the grievance referred to did exist, they really had no labour question to compare with that of Assam. Upon that wide and perplexing subject he would not venture. If, however, he might be permitted one remark, it would be, let Assam concerns recruit through a common agency, and avoid undue competition with each other; and he would implore all districts to believe that what was for the common weal in this matter was for the best interests of individual concerns in the long run. Therefore, let all pay their coolies fairly, but at stated accepted rates with other conditions for their locality, and avoid stealing a march upon each other, or entertaining, much less enticing away, a neighbour's labour under any temptation or pretence whatever. The question of Darjeeling labour he considered of too local a nature to be dealt with more fully than it had been in his paper. Still, it was a wide and very intricate, as well as a most important, question, sufficiently studied by but few, and would alone require a series of papers to deal with it in all its phases. There were some Nepalis who had been employed for 20 and 30 years

in the gardens with which he was long connected. Many lived and died upon the tea gardens, but they were not a long-lived people more than Europeans on Darjeeling gardens, he grieved to say. Though, as he had said, coolies were not really under contracts to the gardens, and were free to leave at least at the close of any season, the majority—especially women—settled down for years. There was a considerable proportion—greater or less on different gardens—more or less shifting, who came in from Nepal (a few also from Sikkin and the Government farms) and returned thither in a year or two, or were induced within shorter time to leave—and these were chiefly men—for Government service as stated, contract work, and a few from the hills (more from the Terai) for the Dooars and even more remote tea districts. It was not unusual for coolies, but more particularly headmen, to take leave to visit Nepal, returning to their duties on the gardens, and many visited their homes to recruit coolies at the same time. He hoped Sir Charles Elliott would pardon his differing from him in regard to some minor details. He was the more reluctant to do so knowing Sir Charles Elliott's great ability, and that there never was a more conscientious and painstaking Governor, or one more desirous to be fair to every industry and enterprise. He had said, with reference to Darjeeling, that Government recruited in the same market as the tea planter did, but he (Mr. Christison) begged most respectfully to submit that that was just what was not done. The planter recruited his labour, at some expense and risk, from Nepal; Government within the districts in the bazaars and markets frequented by the garden coolies. He had suggested that Government ought to recruit for the military police and expeditions direct from Nepal, as was done now for the Goorkha Regiments, as he presumed under treaty with that State, or, failing that, elsewhere in India, or from the vast native Government colonies within the district. He was fully satisfied of the anxiety of the Lieutenant-Governors and the districts officials not to take garden labour, and to return any that had been taken; but it was difficult for them to obtain accurate information on all points, and recruiters, and especially petty recruiters, had their own reputation for zeal to maintain. He could give many instances of how the well-intentioned rules for the return of coolies were frustrated, by coolies being returned at the depôt at Darjeeling, merely to rejoin the recruits a station or two down the railway line and the like, only fully understood by those possessing a perfect knowledge of these adventurous hill-tribes. The experience of the two concerns mentioned by Sir Charles Elliott really proved the depletion of men referred to. In one instance the proportion of men fell from 42.6 per cent. to 17½ per cent., and in the other so straightened was the Tukvar Co. for men coolies, that it was actually forced to increase their wages by twenty per cent. He was in accord with the views expressed by Dr. Voelcker, as to there being as yet little known of the chemistry of tea manufacture. For instance, what was really known as to the action of light in withering? or the chemical changes that took place in the various stages of the so-called "oxidation" and other processes described? It was regrettable that Mr. Bamber's services were not continued. That gentleman displayed much industry, and no ordinary powers of observation, and accomplished a great deal in a short time. Mr. Bamber had only time to visit two out of the many Indian tea districts. Still, he made a valuable and most comprehensive contribution to the literature of tea, which, as far as he was aware, was the standard work on the chemistry of manufacture, if not of the entire subject at the present time. It was difficult often to get science and practice to go hand in hand. The Indian Tea Association, aided by Government, ought, as recommended by Dr. Voelcker, to employ a competent agriculturist as chemist to continue the investigations in conjunction with practical planters, and not for one or two years only, but for 20 years. In reply to Mr. Ferguson, the proportions of the Darjeeling tea crop from the hills was a little short of eight millions, and the majority of that

was of true Darjeeling flavour. As stated in his paper he (Mr. Christison) agreed with Sir Charles Elliott that Darjeeling might be looked upon as a closed district for tea, there being practically but little more land available. He had no hesitation in saying that the land allotted for tea grants in the Daling district was, taken all in all, the most precipitous and barren of any hill land he had seen. Of course in the district there was land of gentle slopes, which afforded scope for as much tea as was on the original hill district, and in this original hill district there was also much land suitable for tea likewise in the possession of the natives. Could this have been thrown open for tea it would have been applied for on account of the more healthy situation, even more eagerly than the Dooars, but it was not desirable nor would it be fair to grant land there for tea now that it had been settled upon natives, besides the land had been tortured, impoverished, and bared of forest, and would require to be allowed to lie fallow for many years before it would be suitable for growing tea.—*Journal of the Society of Arts.*

NOTES FROM THE METROPOLIS.

CRITICISM ON TEA COMPANIES

is not likely to stand in the way of new proposals. The big one of the week has been Sir John Muir's union of the North and South Sylhet with

THE CONSOLIDATED TEA AND LANDS COMPANY with a capital of £2,000,000. I quote from the prospectus as follows:—

THE CONSOLIDATED TEA AND LANDS CO., LTD.

Capital, £2,000,000, divided into 100,000 five per cent cumulative 1st preference shares of £10 each; 40,000 seven per cent cumulative 2nd preference shares of £10 each; 60,000 ordinary shares of £10 each.

Present Issue—100,000 five per cent cumulative 1st preference shares of £10 each; 40,000 seven per cent cumulative 2nd preference share of £10 each; 40,000 ordinary shares of £10 each.

DIRECTORS.

Sir John Muir, Bart., of Deanston, and of Messrs. James Finlay & Co., 22 West Nile Street, Glasgow, and 34 Leadenhall Street, London, and of Messrs. Finlay, Muir, & Co., Calcutta and Colombo.—Chairman.

Field-Marshal the Right Honourable Lord Roberts, of Kandahar and Waterford, G.C.B., G.C.S.I., G.C.I.E., V.C., D.C.L., LL.D., &c., Royal Hospital, Dublin.

Sir Robert Drummond Moncreiffe, Bart., of Moncreiffe, Bridge of Earn, Perthshire.

P. R. Buchanan, Esq., of Messrs. P. R. Buchanan & Co., 45 Leadenhall Street, London.

William Allan Coats, Esq., Director of Messrs. J. & P. Coats, Limited, Thread Manufacturers, Paisley.

A. B. Murray, Esq., 33 Renfield Street, Glasgow; and Roschank, Patrick.

A. M. Brown, Esq., of Messrs. James Finlay & Co., 22 West Nile Street, Glasgow.

William Walker, Esq., of Messrs. James Finlay & Co., 22 West Nile Street, Glasgow.

Robert Scott, Esq., of Messrs. Morgan & Scott, 12 Paternoster Buildings, London.

This Company is formed to take over as going concerns, and to amalgamate, the estates in India and Ceylon particularized in the statement accompanying this prospectus, and known as The Estates of the North Sylhet Tea Company, Limited, The Estates of the South Sylhet Tea Company, Limited, in which are included the Estates of the North Travancore Land Planting and Agricultural Society, Limited.

These Companies have, since their formation in 1882, been worked under the same proprietary, as private Companies, and they are now amalgamated, and formed into a Public Company with a view of securing a quotation on the London and Glasgow Stock Exchanges.

The estates comprise an area estimated at 180,000 acres of land, situated in Assam, Sylhet, the Dooars, Darjeeling, the North Travancore Hills, and Ceylon, of which, on 30th November, 1895, there were planted

21,310 acres with tea in bearing, and 5,439 acres with young tea, coffee, cocoa, and coconuts. Since that date 1,371 acres have been cleared and are in course of planting, so that the whole area at present under cultivation is 31,120 acres.

As will be seen about 150,000 acres are still uncultivated. This land has been very carefully selected, and a large proportion of it is pronounced by the Superintendents and the Managers of the Companies to be as fine land for the cultivation of tea, coffee and cocoa as can be found in India and Ceylon. The large tract of land estimated to contain 90,000 acres in the North Travancore Hills, of which about 60,000 are computed to be at an elevation of 4,000 to 6,500 feet, is an exceptionally attractive feature. This land is generally very rich, and capable of yielding large crops of tea or coffee of the highest quality, and its acquisition renders the prospects of the Company unusually promising, as either by the formation of subsidiary companies, or by opening up the land on the Company's own account, large profits should be secured therefrom. It is the Directors' intention to put a considerable area under coffee, the cultivation of this product having proved successful and remunerative in Southern India. The unplanted lands in Ceylon about 8,000 acres, and in Assam about 11,000 acres, will be rapidly developed and brought under cultivation.

All the estates are well equipped in every respect, having a staff of 127 experienced managers and assistants, an excellent labour force of about 31,000 labourers, an ample supply of good machinery, fine roads and tramways, and substantial brick factories, bungalows, godowns, good wells, &c.

Compared with other good dividend-paying Indian Tea Companies the record of the North and South Sylhet Tea Companies, Limited, is one of the highest. From 1882 to 1886 inclusive, while the plants were young and yielding little or no leaf, no profits were made from the newly-planted gardens, but out of the profits of the seasons 1887 and 1888 the Companies paid to their Shareholders compound interest at the rate of 5 per cent. per annum, for the whole period of about five years, during which the estates were practically non-productive, besides placing £16,000 to reserve account for depreciation. For the past seven years—from 1889 to 1896—sufficient profits have been earned to pay an average dividend of 10 per cent. per annum on the capital paid up, and to put aside £21,000 to reserve account for depreciation.

The crop, which in 1888 was 5,678,379 lb., had increased in 1895 to 9,583,734 lb. of tea. The estimated crop for the current season is 10,070,000 lb. of tea, and the present planted area as it matures is expected to give an annual yield of 11,000,000 lb. of tea. This large increase of crop should reduce the average cost of production per pound.

Although a large area of the cultivated land was either too young to yield crop or only in partial bearing, the average profits for the last four years amounted £93,976, as will be seen from the Auditor's certificate set forth below, or sufficient to pay a dividend of 5 per cent. on the Cumulative 1st Preference Shares; 7 per cent. on the Cumulative 2nd Preference Shares in the new Company; and to leave a balance available for the payment of a substantial dividend on the amounts paid up on the Ordinary Shares. As the young estates come into bearing the amounts available for dividends on the Ordinary Shares should be materially increased.

The properties are taken over as from 30th November, 1895. The Vendors will receive interest at the rate of 5 per cent. per annum upon their purchase-money from that date until the same is paid. The accounts will be closed on 30th November in each year.

Messrs. Finlay, Muir, and Co., of Calcutta, who have managed the Estates since their formation, have agreed to continue to hold the Managing Agency in India and Ceylon, in which Island they have a branch firm, and they have undertaken; during their tenure of the Agency, to hold shares to the nominal value of £200,000 in the Company, which will include Ordinary Shares to the nominal value of at least £100,000.

Sir John Muir, the Chairman of both the Vendor Companies, has also agreed to act as Chairman of the Company for at least five years, and to give the Company his active support.

The cost price of the Estates in the books of the North and South Sylhet Tea Companies, Limited, on 30th November, 1895, was £1,446,342. The purchase price has been fixed by the Vendors, who are the promoters of the Company, at £1,450,000 for the planted Estates, and £150,000 for the uncultivated land—in all, £1,600,000.

The Company will repay to the Vendors all advances made by them on account of the current season; and will also take over, at a price to be fixed between them, all stores purchased by the Vendors for future use and in hand, as at 30th November, 1895.

The balance of this issue, together with the £200,000 yet to be issued, will, it is intended, be expended (subject to the payment of the preliminary expenses) upon the development of the land and of the young Estates.

The legal expenses, brokerage, and other charges attending the issue of the Prospectus and allotment, will be paid by the Company.

SCHEDULE REFERRED TO IN THE ACCOMPANYING PROSPECTUS.

THE SYLHET ESTATES consist of the Deanston, Balisera, Rajghat, Amrail, Jagcherra, Goombira Dukiugole, Sagurnal, Holicherra-Degaicherra, Baitakhal, Lullecherra, Lalakhal and Jafflong Divisions, comprising an area of 50,707 acres as follows:—

	Acres.
Tea in bearing	14,456
„ Non-bearing	916
Cleared and in course of Planting	315
Uncultivated	35,020
	50,707

THE ASSAM ESTATES consist of the Hattigor Powai, Sagmootea and Borpau Divisions, comprising an area of 14,059 acres, as follows:—

	Acres.
Tea in bearing	1,192
„ Non-bearing	771
Cleared and in course of Planting	975
Uncultivated	11,382
	14,320

THE DOOARS ESTATES consist of the Runganuttee, D.M-Dim, Nakhati, Bytagool and Nowera Nuddy Divisions, having a total area of 10,899 acres as follows:—

	Acres.
Tea in bearing	4,542
„ Non-bearing	31
Cleared and in course of Planting	20
Uncultivated	6,303
	10,899

THE DARJEELING PROPERTIES consist of the Bloomfield and Orange Valley Estates, with an area of 1,007 acres as follows:—

	Acres.
Tea in bearing	650
Uncultivated	357
	1,007

THE CEYLON ESTATES consist of the Warwick, Gonakellic-Mandara-Newera, Hopewell, Meddekande, Halgolle-Weweltalawa, Halwatura, Delwita and Katungastota Divisions, and comprise 14,000 acres of land, as follows:—

	Acres.
Tea in bearing	470
„ Non-bearing	2,014
Cleared and in course of Planting	1,306
Coffee, Cocoa, and Coconuts non-bearing..	1,075
Cleared and in course of Planting	739
Uncultivated	8,375
	14,000

THE NORTH TRAVANCORE ESTATES AND LAND consist of an estimated area of about 90,000 acres as follows:—

Tea in bearing	Nil.
	Acres.
„ Non-bearing	405
Cleared and in course of Planting	1,000
Coffee Non-bearing	194
Cleared and in course of Planting	25
Uncultivated	88,376
	90,000

About 99,555 acres of land are freehold, subject, in the case of the North Travancore Property, to a small tax, and estimated area of 74,539 acres are held under ordinary Government Leases, and the balance 6,839 acres is private leasehold land.

Although the areas and other particulars above mentioned are believed to be correct, or approximately correct, the Vendors are not to be held as guaranteeing their correctness.

Glasgow, June 1896.

I hear that apart from the fact of the old shareholders taking the greater part, there is likely to be no hesitation in the part of the general public in offering for more than is available.

The same is likely to be true of Mr. C. E. Strachan's Company—

‘ THE GALLAHA CEYLON TEA ESTATES AND AGENCY COMPANY LIMITED’

—which is likely to come out very shortly with a capital of £165,000, and all that may be offered to the public are likely to be applied for several times over. The Company are to have 2,397 acres of tea including what is planted this year, 107 acres cardamoms, 276 acres planted for fuel, 2,094 acres forest, patana, etc. After paying working expenses, interest on Debentures and Preference shares, it is estimated there ought to be 7½ rising to 10 per cent for the ordinary shareholders,—perhaps more as there will be 762 acres young tea coming on. Such, I believe, are some of the anticipations.

SHARES OF EXISTING COMPANIES.

Notwithstanding the eagerness about such new Companies as the above, there can be no doubt of some slackness in respect of the shares of existing Companies, mainly due to the large number of shares offering from Ceylon, showing that caution must be used in the Colony with reference to locking up capital. Nevertheless, there is great confidence felt in Ceylon and its tea enterprise—a recent visitor speaks of all “as in a most flourishing and prosperous condition and men were commencing to talk of £130 an acre as the value of good tea.”

This, I submit, is too sanguine, and it can scarcely be wise to go above the price recently paid in Dimbula and its neighbourhood.

THE RAGALLA TEA ESTATES, LIMITED, is to declare an *ad interim* dividend on 1st July of 4 per cent.

NOTES FROM OUR LONDON LETTERS.

(From Our Own Correspondent.)

LONDON, June 19.

The last letter sent you gave copies of correspondence dealing with the proposed re-construction of the capital of the

ORIENTAL ESTATES COMPANY.

We were not then in possession of information enabling us to offer any comment upon the subject of these letters, but the Chairman's speech at an extraordinary general meeting of the Oriental Estates Company held this week enables us now to do this. The object of this

meeting was to consider resolutions for re-arranging the capital account with the view of bringing it into close correspondence with the present value of the assets. Mr. Quintin Hogg presided on the occasion of this meeting. He said he thought some scheme of re-construction would be desirable, because, if the assets were not sufficient to meet the liabilities they must either reduce the value at which those assets stood in the Company's books or accumulate a cash reserve to balance the deficiency and as a set-off against depreciation on the estates. He preferred, he said, a live and negotiable security in place of the present preference shares. In fact the ordinary shareholders could prevent any money being paid to the preference shareholders as long as their assets did not represent the value at which they stood in the books. He estimated the annual income from their estates at £20,000. If the meeting adopted the scheme proposed, £10,000 of this would be taken for debenture interest, and £5,000 would be required for the payment on new preference shares. Of the balance, £2,500 would go to reserve, and of the other £2,500 one-third would go to the preference and two-thirds to the ordinary shareholders. The board were inclined to favour this scheme as a fair basis of negotiation, and they were in duty bound to submit it to the shareholders. Mr. Welton, the official liquidator of the late New Oriental Bank, and in that capacity, of course, largely concerned with this proposal condemned the scheme as so unfair that he did not believe any judge would sanction it if it were opposed. Some of the shareholders moved and seconded the appointment of a committee to investigate the affairs of the Company and to protect the interest of the preference shareholders. Mr. Slaughter, who had framed the proposal remarked as to this that he and his friends held 60,000 preference shares, and it was their object to increase the value of these. Another shareholder stated that at present their ordinary shares represented no value and were held by a syndicate. The idea at the back of the scheme, he said, was to increase the value of these. The final course adopted was the appointment of four gentlemen to confer with the directors on the scheme, to negotiate with the ordinary shareholders, and report to a subsequent meeting. To us outsiders the condition of things existing with respect to this company is exceedingly difficult of comprehension. If things be as stated, the position of the company is not favourable, and one is inclined to wonder how it was that the late large sale of the company's debentures resulted so well. And if this sale was made with the facts mentioned kept back from the public, that transaction should seem to have been made under false pretences. Surely the public would not have purchased these debentures had it been aware, for instance, that the valuation of the assets in the company's books was a fictitious value! That is the first point that must strike the uninitiated. Then why should Mr. Welton have so strongly condemned the proposal to right this difference? It seems to us that the ordinary shareholders may be threatening to refuse payment of the interest on the preference shares on the ground that that difference exists. If so, those who lately purchased debentures ought to have a voice in the matter. But we don't pretend to wholly understand either the scheme propounded or the intentions or desires of those who oppose it. Only one thing seems certain, and that is that no appeal should be made to

public investors so long as the value of the assets in the books is not correspondent with their *actual* value. It is to be feared that the position is not a satisfactory one, and that the revelations made at this meeting may act injuriously on the credit of Ceylon tea companies generally. For the general public will be no more able to discriminate as to the bearing those revelations have than we are ourselves able to do.

MEXICO AS AN OIL PRODUCING COUNTRY.

According to the last available statistics, Mexico produced the following quantities and values of oil seeds in 1891:

	Hecto-liters.	Value.
Sesamum ..	17,263	\$37,000
Earthnut ..	70,510	110,000
Chia ..	721	5,500
Coquito ..	9,862	26,500
Cocunut ..	346,500	1,165,000
Castor ..	18,740	22,000
Linseed ..	15,578	45,000
Rapeseed ..	77,711	132,500

The Indian sesamum, called in Spanish *ajonjolí* or *aljonjolí*, is sown in February or March, and is reaped in April or May, and in Mexico it yields 500 per cent. Notwithstanding this, and although there is no lack of proper soil for it, the amount grown is comparatively small. This is owing to the want of field labour and the small local demand. The difficulty of transportation to the seaboard has caused the idea of shipping it to be abandoned, although it would find a ready market in Europe. In the producing districts it can be bought at from \$2.75 to \$3.50 the charge of 138 kilos, but the heavy cost of mule transport to the nearest railway station, and the fact that the market is cornered, makes the price at Mexico City about \$8.50 for the same quantity. The sesamum is treated nowadays by hot processes, and yields 45 per cent its weight of oil, and the oil cake is a good food for cows in milk. The sesamum oil, with a liberal admixture of olive oil, produced in the environs of the city, is used almost exclusively for alimentary purposes. The mixture is called *aceite de comer* (eating oil), and sells retail at about a shilling the liter. Under the names of rose oil and green oil it is also used in pharmacy to colour ointments and in making the empirical medicines of the country.

Rapeseed grows on the central plateau, and costs in Mexico City from \$1 to \$5 the charge. It yields about 35 to 40 per cent of its oil, and many oil manufacturers in the country use the oilcakes as fuel for their engines.

Flax up to now has hardly been cultivated in Mexico for the sake of the seed, although many trials have been made to grow it for textile uses in the neighbourhood of one or two of the larger towns. Linseed, therefore, comes from a restricted area, and costs about \$3.50 the load at Mexico City. The European oil could be imported into the country but for the duty on it.

The culture of the olive was forbidden in colonial days, Spain wishing to preserve the monopoly of the supply of olive oil. Moreover, the climate of Mexico does not seem to agree perfectly with the olive, which prefers the dry soils of temperate climes and exposure to the sea breezes. It is cultivated only in a few villages near the capital. The fruit is small, disagreeable in taste and very bitter, but the oil is good, with not too pronounced a flavor.

The castor oil plant grows in abundance all over the country, and in the warmest soils it reaches twenty feet in height and looks like a tree. About 60 per cent. of oil could be extracted, but with the primitive methods in use the actual yield is 35 to 40 per cent. A few small factories are installed in the producing districts, but they do their work badly and relatively expensively, the cleaning of the seed

being done by hand. The oil is used for soap making and for lighting purposes. As for the medicinal article, it is still imported from Europe. The expense and difficulties of transport have always been in the way of attempts to export the seed, but it is asserted that a German firm at Vera Cruz has begun to send regular shipments of it to Hamburg. The load in Mexico City is worth \$8.50.

Cotton grows well all over Mexico, and especially well in certain parts; but the want of field labour has restricted its culture, and it is chiefly grown as textile material. For the last five or six years cottonseed oil has been imported from Texas for soap making. The Mexican producers cannot compete with the price of this product, and have lost the sale of the article to the soap makers. The Government tried to help them by raising the duty on cottonseed oil, and since this increase came into force on Jan. 31 last two important oil factories have started at Torreón.

The chia is cultivated on the central plateau. Its seed resembles that of the colza, and the oil extracted from it is used as a substitute for linseed oil. It is very siccative, and could be used for art painting.

The cacahonantzín is the name of a tree of which the seed gives 30 per cent of excellent oil. It is suitable for the manufacture of the finest soaps, but it seems to be very little used.

The chicalote is a thorny plant like a cardoon, which spreads so rapidly that it is a veritable agricultural scourge. Nevertheless, its seed gives from 25 to 30 per cent. of a limpid oil, which is said to be one of the best possible for paint. The Indians of Uruapan use it for their famous paintings on wood and on calabashes, which resist boiling water, and are as fresh after twenty years as on the first day.

The mammey (American mammetree) has a nut which yields 40 per cent of fine oil suitable for perfumery and soap making. The work of extraction, however, is rendered dangerous by the amount of prussic acid it contains, and, for want of a market, the oil is hardly produced.

The earthnut, called here cacahuate, produces from 30 to 50 per cent. of an oil which is used for the hair and for making fine soaps. In general the nut is only cultivated for eating in Mexico, and for other purposes is imported.

The coquito de aceite, or small oil coco, is the almond of a Sylvester pine which grows in abundance in several States. It is found in groves on the banks of some of the rivers, but the crop has been a good deal neglected so far, although the nut gives 65 per cent of an oil in high esteem for lubricating machinery and for soaps. A few factories extracting this oil are in the country, but the greater part of the nut crop is sent to San Francisco. The oil-cake is used as fuel.

The coconut is used only as a table delicacy, and fetches a relatively high price. It grows in abundance in several States, but the Mexicans do not yet seem to have hit on the idea of utilizing it for its oil. In Mexico City there are seven oil factories, the most important of which can treat thirty charges or loads a day. All of these factories use steam, and one or two of them have hydraulic presses and modern appliances. The capital engaged in the business may be put down at \$300,000, and gives a return of from 30 to 40 per cent. The seeds treated here as a general rule are sesamum, rape, linseed and castor. Small quantities of coquitos, mamneys and olives are also sometimes treated. The industry of oil seeds may possibly have a great future before it, not because of local trade, which is of necessity restricted, but in view of the export business. Unfortunately, fate is against any great immediate growth of the industry; there is a want of field labor, a difficulty of transportation, and a heavy charge for freight to be overcome. The ships calling at Mexican ports cannot expect a full cargo, and, consequently, double their prices, or, in preference, pick their return cargo at Buenos Ayres or in Brazil.—French Consular Report.—*Oil, Paint and Drug Reporter*, June 1.

CEYLON AND INDIAN TEA IN AMERICA.

The following is an extract from a letter, dated New York, 19th May, 1896, from Mr. R. Blechynden:—

Since the date of my last Report Mr. Mackenzie, the Ceylon Commissioner, has paid another visit to this country, leaving during the first week in April. During his stay he confirmed and extended the arrangements made during his previous visit, for the joint demonstration and advertisement of India and Ceylon teas. A considerable sum has been expended by Ceylon in advertising in magazines and journals. For some issues these advertisements were for Ceylon teas alone, but Mr. Mackenzie recognising that Ceylon was getting the full benefit of all work of every kind we did, met us in a fair and liberal spirit, and thenceforth the advertisements have been for Ceylon and Indian teas. I have sent specimens of the advertisements as they appeared for Ceylon tea alone and for Ceylon and Indian teas. The space taken by Mr. Mackenzie in the magazines was doubled on his return to the States, and is still for the teas of both countries. I will enclose specimens of the advertisement as it now appears in 23 different journals and magazines circulating throughout States; many of these are admittedly the best mediums for advertising of their kind existing. Some efforts have been made by the Advertising Agents to have notices of "machine-made tea" inserted in these journals, and in a few instances with success. Most of the magazines are however, not of a character to be able to introduce such "write ups," having no columns set apart for general notes.

In addition to the magazine advertising arranged for by Mr. Mackenzie, the columns of the regular daily press have been extensively used, and also certain commercial journals. Copies of the advertisements have been sent to you as they came out. In the commercial journals the publication of certain facts not creditable to China and Japan teas was first taken hold of, and the language used by the importers of these teas themselves condemning them in their efforts to impose an import duty on teas, were quoted and the advantages of Ceylon and Indian teas set forth. These advertisements were also used at first in the daily press. When the figures showing the remarkable increase in the use of our teas were published by Messrs. Gow, Wilson and Stanton, great use was made by us of them. More recently the remarks of the Chancellor of the Exchequer relative to the increased use of tea in Britain and his reference to India and Ceylon teas were made the text of the advertisements. These advertisements have been published in New York, Philadelphia, and Boston, in the dailies, and the New York commercial papers have a wide circulation in the States and Canada. In addition to these papers Mr. Mackenzie has had regular advertisements (whole page) in the leading grocers' paper in Canada.

The system agreed upon was to use the New York evening papers every week, and as for financial reasons it was impossible to take sufficient space to set forth what we had to say in any striking manner as an ordinary advertisement, we struck upon the plan of using rhyme with a small wood cut, trusting to the novelty of the method to attract attention. Specimens of these have been sent to you as they appeared. These rhymes are parodies upon popular airs, and sing the virtues of India and Ceylon teas. The types selected, the cuts used, and the form in which they appear make these advertisements "stand out" as they can be seen at a glance at the page on which they appear. Among advertisers we are given a good deal of credit for these advertisements and technical Advertisers' paper "The Newspaper Maker" commends them. I have also heard from several private sources that although they have been appearing for only a few weeks the advertisements are well known. The plan is to change the parody each week, and to keep the head line, and the cuts the same as a means of drawing attention to the article and identifying it as on the same subject. I am assured that scores of people who do not ordinarily read advertising matter read and "hum" the lines we publish.

A large number of leaflets with cuts, printed on "faced" or "coated" paper in two colours, were ordered by Mr. Mackenzie during his previous stay here. These were to be for Ceylon tea alone, but as we had agreed that all work would be more advantageous if done for the teas of both countries the requisite changes were made, and the leaflet appeared in the form of which I send specimens. Some 350,000 of these have been distributed through the different firms we have given grants to, and also through other channels, some through jobbers and from them to grocers, and others to grocers direct. The large number of applications we have received for copies made us determine to get out a fresh edition, which is now in the Press, and we have added this figures of the importations of tea into America. This edition will be one of 200,000, and will be divided into batches of varying sizes, and on each batch the name of the firm through whom they will be distributed will appear. We find this a better plan than giving out plain copies, as the people who use them for distribution stamp their own names on them with rubber stamps, &c. and do not make as neat a job as we can have done by the printer. It is immaterial to us that individual firms benefit by this, as we are saved the immense (really prohibitory) cost of distributing them ourselves, and we are saying the same thing through numerous different mouth-pieces.

I may mention here that a large number of leaflets on Ceylon tea, printed in London, were brought over here by Mr. Mackenzie on the previous occasion, and these, too, have been sent out through the same channels.

The matter of giving subsidies to certain firms on reasonable conditions has been the subject of separate letters, and as our relations with the firms in question are confidential, I will not do more than make this general reference to the subject here. I believe that the firms in question are loyally adhering to the points agreed upon, and are not shirking the responsibilities they undertook. One of the objects aimed at has certainly been gained, and that is our teas are being distributed not only in the large cities, but in many towns and villages as well, and we can hope, therefore, to get much of the advantage, which we would otherwise lose, out of the general advertising we are doing.

During February, arrangements were completed to introduce the system of giving away tea between the acts at other theatres, and finally we had the following theatres all at work at the same time:—Casino, Garrick, Herald, Square, Star, all in New York, and the Amphion, and Park theatres in Brooklyn. I have explained the plan in previous reports, and have only to say that while the cool weather lasted they were an excellent form of making the tea known and popular. The theatres are all closing now, and we have at the present time but two places in work, the Casino and the Garrick. I am only keeping these up on the present lines until I know more definitely what the plans are for the future, as I think that iced tea might be used with advantage, but do not wish to undertake new plans at present.

At the 100th performance of the "Lady Slavey" at the Casino, we arranged that the souvenir given away on that occasion should be a silvered tea caddy of a very neat pattern, having a suitable inscription on one side, and the words "India, Ceylon tea" on the top. These were filled with tea, and nine hundred were given away to the ladies attending that evening. By the urgent representation of the manager, I agreed to share the cost of an additional 100 caddies, for distribution among the other theatrical managers, Press representatives, &c. The souvenir is said to be the best ever given away in a theatre in New York. The arrangement, made was that the cost of the caddies should be shared between the management and ourselves, we paying for the tea used. The management undertook to do all the puffing requisite, and gave out that the tea cost \$10 per pound, and other stuff of that nature. The advertisement was a good one, not only because each recipient of the caddy is sure to remember the tea, but because the country papers all over the country must have had paras, re-

garding it, which we cannot trace. I will send sample of the caddies in duplicate as usual with all I send.

During one week we tried an advertising scheme, very clever in itself, but expensive. In the "Lady Slavey" there is a scene in which the American millionaire, the leading man character, is being entertained by a rich country grocer. The scene is laid in the Grocer's house, Snipe Manor, and he draws attention to some portraits on the wall. The American remarks that he supposes they are those of ancestors. The reply is "No, those of best customers," and at the same time, while both the audience and the people on the stage are looking at the portraits, they are brightly lighted up by means of a strong stereopticon, or some similar arrangement, and one reads, "Pure Ceylon and India tea." The effect lasted only a short time, and as we could not make terms for the American to make some suitable remarks about the tea, we left off after a couple of weeks' trial.

I have given several lectures at schools, &c., and recently gave one before the Women's Press Club, New York, at Carnegie Hall. Although the Meeting did not happen to be well attended this was the best one I have had from an advertising point of view, as it was mentioned by a number of papers (as usual it is difficult to trace them), and the report in one of them alone would, if measured and paid for at the usual rate, cost nearly \$240, (*viz.*, 166 lines the aggregate measure, at \$1.50 a line). In this case the lady reporter of the paper in question—*The Recorder*—happened to be there, and agreed to use notes of the lecture if I could send them in time, the lecture being on Saturday. I wrote them and sent them off at once, and she used them bodily, no doubt glad to get so much copy done without trouble. Still the advantage is ours.

I was not permitted to lecture at the Professional Women's League, as no man has the privilege of appearing there. Mrs. Tipton accordingly got up the lecture, which she has heard me give very often now, and was, I have no doubt, a very efficient substitute. At any rate, the notices we got from that lecture would, if measured up and paid for, cost two or three hundred dollars.—*M. Mail*, July 3.

THE AMSTERDAM CINCHONA MARKET.

Our Amsterdam correspondent, writing on Friday last, observes that the Java cinchona-auctions on June 11th were chiefly remarkable for the fact that for rich manufacturing barks (which were in good supply) prices were paid altogether exceeding the regular unit figure. The auctions included 1,150 kilos. of bark analysing from 8 to 9d per cent of sulphate of quinine, and 1,010 kilos. analysing from 10 to 11 per cent. The richest parcel at auction was one of 10 bales crushed ledger-bark from the Gumboeng plantation, which fetched 37½c per ½ kilo., equal to a unit of 3.40c, whereas the average unit for fair-quality barks was only 2.90c. Our correspondent adds that there must have been some special reason why these barks realised such high rates. Pharmaceutical barks of fine quality also fetched high prices, medium and ordinary grades were neglected, and mostly bought in. The bark stock in Amsterdam is now very light.—*Chemist and Druggist*, June 20.

THE PUMELO IN ENGLAND: THE IGNORANCE OF KEW GARDENS.—The *Fruit-Grower* of July 1 says:—

Another astounding statement comes from Kew Gardens which will probably become a standing joke in fruit trade circles. Mr. Morris writes us: "I have been asked more than once lately whether there is no fruit yet unknown to most English palates which might be introduced into this country, and form a pleasant article of food," and then he goes on to refer to the pumelow, or pomelo, as it is spelt in the trade, or shaddock, as being such a one. Considering the shaddock has been imported for years, and that in spite of the futile attempts that have been made to popularise it with buyers, it is amusing to find anyone writing so late in the day, and from Kew too, in such a strain. The shaddock, if it is a rival of any other fruit, is a rival of the lemon, and as the public prefer the latter to the former, there is not much likelihood of it ever becoming "a pleasant article of food" in this country.

BOTANIC GARDENS, GRENADA.

From the annual report for 1895, by W. E. Broadway, Curator, we make the following extracts:—

GENERAL REMARKS.

1. The Garden was founded in 1886 (Annual Report for 1891) during the administration of Sir Walter Sendall, K.C.M.G., then Governor of the Island, and since its existence has made on the whole considerable progress. If remarks from disinterested persons are worthy of notice, similar ones to the following are not uncommon—"a crab hole a few years ago, a respectable garden at the present time."

Though one becomes accustomed to the rapid growth of plants in tropical countries, yet it is often hard to realize that plants and trees could assume such proportions in the short space of time since their first being planted, and trees which were at first intended for shade purposes have had to be thinned out as they cramped one another, Eucalyptus, Samans, Ficus, and various Palms, have many of them grown into large trees.

From the main entrance one cannot but notice the healthy *Oreodoxa* palms on each side, which form a very pretty avenue. Passing the nurserie on the left, one continues along a straight road until the notice board to the office is reached.

From the office one gets a fine view of St. George's shiiping in the Carenage, the wharf, Government buildings, the Fort and its flagstaff. From the second entrance to the gardens, one walks up an avenue of small palms and a selection of different varieties of Crotons. This, again, leads on to the coffee plantation on the right and to the orchard on the left.

INSECT PESTS.

2. Two large *Cassia florida* trees have been done away with, as every plant growing under their shade, or near them, have been continually covered by a soot-like substance. On examination, the cassia leaves proved to be the abode of numberless scale insects which we take to be the source of all the mischief. Specimens of these have been sent to Mr. F. W. Ulrich, F.E.S. of Trinidad, for determination, with other kinds of plant pests.

Another plant for a like attack is the Governor Plum. Trees of this, which form both a screen and wind brake in front of the office, are covered with a black coating. On the under side of the leaf several scale insects resembling the cassia one alluded to above may be observed. Scale insects, mealy bugs, and black stinging ants are a scourge to the Garden, each and all exist in unlimited numbers.

Grubs in fruit on the other hand are unknown, and caterpillars scarce, owing probably to the quantity of birds and lizards in the Garden.

A Ceylon tree (a species of *Cinnamomum*) has during the past eighteen months been a disfigurement to the Garden, due to its dirty black appearance. It stands in a prominent section near the rose beds, and its proximity to other plants affects those nearest to it with the same blight. We are trying to remedy this by removing the old soil from the surface, four feet from the base of the tree trunk outwards, and to a depth of a few inches, and by digging a trench around the outer extremity. Manure and rotted vegetable refuse replaces the old soil removed, and it is to be hoped this may in time have the desired effect in ridding the tree of its unnatural coating by inducing a more vigorous root growth.

In the determination of the *Coccida*, we beg to thank Mr. Ulrich for ready assistance already given in this direction.

PROFESSOR J. B. HARRISON'S VISIT.

3. The services of Professor Harrison, the Government Analyst of British Guiana, having been obtained by the Government, he visited the colony during the month of January for the purpose of selecting sample soils from different districts of the colony, and in so doing to enable by reporting on them to advise planters as to the deficiencies in their soils and the best manures to apply to them. As Curator of the Botanic Garden, the Government permitted me to accompany the Professor throughout his tour of Grenada and Carriacou, which gave

me a splendid opportunity of meeting planters and proprietors and to note the agricultural position of the colony. As there has been no fitting opportunity hitherto, I make use of my present report to thank the following gentlemen for their kind hospitality and cordiality shown me when undertaking the tour in question:—

Mr. George Whitefield Smith, Bell Vue; Mr. A. J. Best, Carriere; Mr. G. Seton Browne, Dunfermline; Mr. F. Harford, L'Esterre; Hon. William H. Lascelles, Annandale; Mr. R. J. Graves, Minorca; Hon. F. Gurney, Mount Felix; Mr. Wm. Copland, Tafton Hall, (since dead I am sorry to say); Mr. G. DeFreitas; Corinth; Hon. D. S. DeFreitas, Dougaldston; Dr. Latour, Gouyave; Mr. Henry LaMothe, Grand Bacolet; Hon. James Paterson, Carriacou.

When visiting Carriacou the Hon. James Paterson most kindly went to the trouble of showing us over so much of the island as we could see during the hours at our disposal. Professor Harrison's report has recently appeared in the Official Gazette, January 13th, 1896. He remarks on the Botanic Garden:—"This soil is deficient in phosphates, potash, and available lime. Its retension power for water is low, I would recommend that the soil ought to be dressed with "mild" lime, i.e., slake lime exposed to dry air until it has ceased to be Caustic, in quantities of about $\frac{1}{2}$ ton to the acre. It requires the addition of large quantities of farm yard or pen manure. Its deficiency in potash will be best met by the use of Ohlendorff's early cane manure or similar preparations."

FORESTRY.

4. The rapidity with which Grenada is being denuded of its forest trees has assumed alarming proportions.

A circular referring directly to this subject was published by the Hon. Edward Drayton when administering the Government of the colony last June.

The Governor, Sir Charles Bruce, K.C.M.G., is giving this subject serious attention and in the near future we hope to have plants prepared for the replanting of forest trees in a systematic manner. In December we planted on the Morne Rouge estate, which has recently been escheated to the Government, sixty small teak plants which may be regarded as the beginning to the forestry scheme.

The valley at the back of the dwelling house at Morne Rouge ought to prove suitable as an orange cultivation, as suggested by the Governor, the soil appearing fertile judging from the vegetables ("provisions"), bananas, and plantains reaped from it, and also on account of its being screened from high winds. The estate of Morne Rouge is accessible from town by either sea or land, and distant only some two miles.

Subsequent to the teak planting at Morne Rouge, the Spout Lands have undergone a partial cleaning, and logwood planted there. Eventually, the whole of these lands will be planted out in logwood. The Spout Lands are under the control of the Curator of the Botanic Garden.

CARRIACOU.

6. Six hundred Liberian Coffee Plants have been given to Mr. J. McNeilly on the Dumfries Estate for trial purposes in the Island of Carriacou.

At present the main products of that Island appear to be cotton, ground nuts, and ground provisions (vegetables)

It is also used for rearing sheep, cattle, and horses, for sale. Should this venture prove a success and coffee and cacao become established at Carriacou, it will be of immense advantage to the island, and Mr. McNeilly will be deserving of the thanks and gratitude of the Carriacou residents.

The Hon. J. Paterson, of Carriacou, is making efforts in a similar way. During the dry weather Carriacou looks as though a fire had swept over it, the grass becomes parched or dries up altogether owing in a great measure to the hills having been denuded of their tree growths, and as fast as saplings spring up, the continued destruction of these for fuel. In trying to establish permanent cultivations of coffee and cacao in a place like Carriacou, it would appear most essential to have ready before-

hand sufficient temporary shade, until the young trees get well rooted and have grown large enough to form their own shade by the extension of their branches in close contact with each other.

For this purpose, bananas and plantains might be thickly planted together the preceding season, so that there would be an abundance of shade for the young coffee and cacao when they are ready for their permanent places, and thereby protected for the dry season.

When the primary shade is established the young plants—the larger the better—should be planted out at the beginning of the planting season, so that every advantage be taken of favourable weather and the chances of failure reduced to the lowest possible degree.

The Government are willing to encourage the introduction of cacao and coffee into Carriacou and would allot plants for this purpose gratuitously, providing that the initial expenses of freight and packing be borne by those desirous of making the experiment, and also that suitable shade plants had been established the previous season. Forking the ground before planting is recommended, and during the dry season, independent of shade plants, the chances of success would possibly be greater if the ground was thickly covered on the surface by trash formed of dried fig leaves cut into convenient lengths: stable manure, if available, would be better still, or in fact any kind of partially decayed rubbish laid on the surface would be better than none. The reason for applying a covering or coating on the surface of the soil between and round the plants is to prevent the soil from becoming too dry. This process keeps the soil "cool" under normal circumstances. By loosening the ground during the growing season, and covering the soil over as advised during the dry season, it would be nothing extraordinary to expect success with coffee and cacao at Carriacou. Unfortunately. Parasol Ants exist there, though absent from Grenada.

Appearances suggest that pine apple cultivation would succeed at Carriacou. These might be grown in large quantities for export.

MINOR AGRICULTURAL PRODUCTS.

7. By direction of the Government, a report was written by the Curator on the Minor Agricultural Products of Grenada, for the Government of British Guiana, during the month of August. In connection with this matter, I beg to thank the Hon. James Paterson, Hon. D. S. De Freitas, and Mr. George Whitfield Smith for ready and willing assistance in replying to questions I addressed to them on the subject.

PLANT SALES.

8. We have this year only realized about half as much in cash as what we did the year previous, the sales amounting to fifty pounds (£50). But we have on the other hand more than trebled in value exchanges to that of 1893, for while in the latter year a sum of thirty four pounds sixteen shillings and eleven pence (£34. 16. 11.) stood to the credit of exchanges, we this year can show for a similar purpose one hundred and fifteen pounds ten shillings and five pence (£115. 10. 5).

Charges for coffee, cacao, kola, and nutmeg plants have been reduced by consent of the Government, and this, considered in conjunction with the general depression existing, accounts in no small degree for the smaller sale of plants. To show that plants are not grown on any principle of remuneration at the Garden, it might be necessary only to mention that coffee and cacao, irrespective of size, are disposed of at the rate of forty cents (18) per hundred plants—if in boxes, eight cents (4d.) extra. Boxes are only sold at cost price. Making money is not so much the object in view by selling plants, etc., at the Garden, as by increasing the distribution of good qualities of agricultural and horticultural plants, by exchange.

PROPOSED AGRICULTURAL SCHOOL.

11. This scheme initiated by the Governor has fallen through, for the present at all events, for want of support and encouragement. It was His Excellency's wish to attach boys to the Botanic Garden

where they might be taught practical subjects in relation to agriculture and horticulture, which could not fail to be of benefit to them as future planters or small peasant proprietors. It was proposed to pay them at the rate of seven pence (7d.) per day.

UNCARIA CAMBIER.

13. The Director of the Royal Gardens, Kew, has sent us on different occasions seeds of this tanning plant, but up to the present time we have not succeeded in getting a single seed to germinate, although we have tried it under different conditions, as well as following out the Kew circular instructions as to how to grow it from seeds. It is however, on record that seeds germinated once in this Garden, but died off when only an inch or two in height. It would be interesting to learn of the successful fruiting of the Dominica and Trinidad plants which were reported to be doing well sometime ago. The chances are, if these fruited, plants could be raised, as the seeds would then be obtained and sown immediately with the farther advantage of being acclimatized.

COFFEE.

14. The Arabian and Liberian have continued to do well. From the Arabian trees which were grown from seeds of the true Blue Mountain coffee of Jamaica that were received direct from the colony in the first instance, an excellent crop of cherries was picked during the latter part of the year, and the seeds sown for propagating purposes.

This is another year's proof that the Arabian varieties do well at or near sea level in Grenada. Upon the Waltham Estate in the parish of St. John's, one of the properties of the Hon. Macaulay Browne, it is reported upon good authority that it does there remarkably well, although close to the sea. Some of the Liberian at the end of the year had cherries upon them which were advancing to the stage of maturity. These are now but slightly shaded with young saman trees, and banana plants. It is evident from observations made at the Garden, very little shade indeed is required for coffee plants that have attained the age of three or four years.

Were it not for the dry season, shade could be entirely dispensed with. Shade trees often harbour insect pests which attack the coffee, and from the frequent dropping of branches injury is also done to the coffee trees by breaking and splitting off the living branches. A vigorous growing coffee tree bearing large very dark green leaves, and a crop of large cherries in the Liberian coffee plantation, answers well, in my opinion, to the description given in "New Commercial Plants and Drugs," No. 7, Christy, London, 1884, for the Maragogipe Coffee of Brazil. The seeds will be sown when ready, so that we may be enabled at a later date to offer plants for distribution to planters. The three *Coffea stenophylla* plants are at a standstill. A fourth kind of coffee growing at the Garden was presented to us during the year by Mr. John McPhail, St. John's, under the name of "Mennda." Mr. McPhail obtain this variety from the Trinidad Gardens during Mr. Prestoc's time.

A Coffee Commission composed of the Hon. D. S. De Freitas (chairman), Mr. A. Ross, Mr. G. E. St. George, Mr. H. LaMothe, Mr. G. Whitfield Smith, with Mr. Septimus Wells as Secretary, was instituted by the Governor during the year, in the interests of agriculture. Sittings were held in each of the parishes to collect information from planters, and their deliberations are to appear, it is understood, in a voluminous report early in the ensuing year. Without anticipating the Commissioners' report, it is worthy of notice that persons have become aroused over the coffee question, and, in consequence, the supply of young plants has fallen short of the demands. We are making strenuous efforts at the Garden in preparing ourselves to meet a reasonable demand for plants when next planting season comes round.

SICILY LEMON.

15. At the request of His Excellency the Governor, seeds and plants of this commercial lemon were procured with the view of propagating it in quantity. None of the seeds germinated.

Of the small plants received we have a dozen now growing, but at a very slow rate. The order for seeds has been repeated, and it is hoped that when received better results will be obtained.

PINE APPLE.

16. A small patch of land at the base of Richmond Hill has been planted with pine apple suckers. During the past year the fruit obtained from the usual pine section were small in size, inferior in flavour, and on the whole, very disappointing. As the section taken up by pine culture is considerable and runs into a few thousand plants, much time and labour are absorbed in their cultivation and maintaining in anything like cleanly order. The only reason of failure which suggests itself is that the ground had become "worn out" and requires a change of cultivation.

There are always numbers of willing purchasers during the pine season, some taking as many as a barrelful at a time. There is evidently an opening for private enterprise in this direction and would give satisfactory returns. In the cultivation of pines, sandy well drained soil is considered necessary for the development of good size and well flavoured fruit, providing desirable sorts of suckers have in the first instance been procured. We can supply these at certain times of the year in limited quantities.

BANANAS AND PLANTAINS.

17. Mr. Jenman, of the Botanical Department, Demerara, sent us, last May, suckers of amed bananas and plantains. These together with additional plantain suckers of the "giant" kind obtained in the colony, have been planted to enable us subsequently to have suckers available for distribution.

We have experienced difficulty in procuring even a dozen or two of the giant plantain suckers locally. In Grenada there are two sorts of plantain the "giant" and "common." Good sized bunches of plantains sell in St. George's for as high as two shillings and sixpence (2/6) the bunch as cut from the plant. Mr. Jenman writes me in reference to the plantains grown in Demerara:—

"Here, where they are grown on a large scale, often several hundreds of acres in a continuous stretch, the farmers say, without thieving or disease, it would pay them to sell medium size bunches for twelve cents (6d) on the fields."

"AGAVE RIGIDA SISALANA."

18. Towards the latter part of the year, large asparagus looking heads began to appear above the leaves, showing that their flowering period had arrived. No machine with all the desired requirements having been brought to our notice, a trial was made at decorticating the sisal hemp leaves by hand labour, on the principle adopted in the Bahamas by the peasantry there. The results of our experiment were not encouraging.

GARCINIA MANGOSTANA.

19. A small plant brought from the Trinidad Botanic Garden, in July 1894, has made such slow progress since it was planted that it is now scarcely any bigger than what it was at that time. Yet it looks healthy. It is a fact well known to people on this side of the West Indies, how notoriously stubborn young plants of the mangosteen are to grow at all. Our plant is placed on the section which is chiefly reserved for nutmegs. We should be gratified to any correspondent who would be generous enough to add a young Dorian plant to our collection.

PASSIFLORA SP.

20. The seeds of this passion-flower came from Mr. J. C. Lewis, Trinidad, and were sown when received. From them we have procured a few plants which are now under trial. A memorandum which accompanied the seeds stated it came from Brazil, and from its fruit a good preserve is made. So far the plants have not flowered.

NIPA FRUTICANS.

21. On November 20th we planted at the Grand Etang, thirteen plants on either side of the jetty, and close to the margin of the lake. This palm is a native of tropical Asia and Australia where it abounds

in the estuaries of rivers. Its leaves are used by the people of those parts for roofing their houses. These plants were raised from seeds received from Mr. Jenman, of Demerara, and had out-grown the space allotted them in the Garden tanks. Two remain in the permanent collection, one of which flowered for the first time this year. A saline element is considered a necessity to the Nipa in its natural home, yet it has flowered well in the aquatic tanks which are supplied with fresh water from one of the St. George's reservoirs. Their growth has been rapid and vigorous. It will be interesting to note how these plants thrive at the Grand Etang, where the water of the lake is very fresh and is situated amidst the highest mountains and most central part of the island, with an almost cold atmosphere.

BERTHOLLETTIA EXCELSA.

22. Plants of the Brazil Nut have made no progress. These came from the Trinidad Gardens in July 1894.

PALM CULTIVATION.

There are innumerable sites on our tea plantations at present unutilised, such as in and around the coolie lines and factory buildings, sides of roads and tanks, etc., where palms might with advantage be put down. The *Phoenix dactylifera* or date palm, some dozen or so of which were successfully grown at Cocobela in Hylakandy in the later sixties, succeeded well. If any of our planters would care to essay the cultivation of this plant, it would be advisable to go to the expense of obtaining the seed from Rio Janeiro, Pernambuco or other semi-tropical South American port, as the trees of these places frequently yield 3,000 fruits in one bunch. As a general rule the date palm lasts for twenty years, commencing to yield in the fourth, if grown for the fruit alone and not tapped; though responding to cultivation and generous manuring it will flourish pretty well if left to itself, merely guarded from cattle and goats by the usual bamboo fascine, until the crown is high enough to be beyond the reach of these animals. Much may be done in the way of care and attention to improve the *dactylifera* indigenous to Lower Bengal, but fresh stock would be preferable. The date palm is not likely to thrive, or, rather, mature its fruit, within the influence of the rain belt so that the drier localities only should be selected for its propagation, and there is ample land and to spare in South Sylhet, Cachar, and other place in Assam, where the date would prove no mean addition to the income of the factory, besides affording an inducement to the labour force to remain on the place.

The areca palm, commonly called the beetle nut tree, is too well-known to need any detailed description, and is so familiar that its gracefulness excites but little admiration except among new comers. The areca can be raised even on the banks of garden roads, for the shade given is so infinitesimal, that it would but affect the tea out-turn in a very slight degree, and this "arrow shot from Heaven," as Sir J. D. Hooker once described it, would add greatly to the appearance of the factory. The best nuts for planting are to be had at Shella, Terriah Ghat, Lakat and as far as Jaintiapur on the north side of Sylhet, as they are all grown on the limestone formation and are free from the canker worm which effects the palms grown away from the hills. An acre would contain in round numbers 1,600 plants, the usual income from which is reckoned at 4 annas each, so that the areca is worth attention from a commercial standpoint. The fibrous envelope can be removed by passing the fruit, after being well dried in the sun, between wooden rollers studded with nails, after the pattern of the country cotton gins. If estate owners who care to take up palm cultivation on an extensive scale, will go to the expense of importing economic palms from other countries, there are many, the cultivation of which would pay handsomely. The sago, which is abundant in the jungles, is hardly worth attention for Assam, nor any part of India, can compete with the West Indies in this and similar starches, high as is the price of labour there. *Elais guineensis* and *E.*

melanuca furnish the celebrated African palm oil, the ripe fruit being crushed and boiled, the oil skimmed and strained. Coconuts we may pass over, for though the palm will grow, the fruit seldom attains maturity when removed far inland; the heart wood is, however, of value, so that if land is available a few hundred nuts may be put down in out-of-the-way places. A kind of wax oozes from the lower surface of the leaves of the *Copernicia cerifera*, also from the trunk and between the leaves of *Cerogylon andicola*. The fruits of *Caryota saguacus* when soaked in lime water lose their acidity and can then be made into a very palatable preserve. *Arca orolacea* is the Indian cabbage palm, the buds being steamed (not boiled), forming a pleasant substitute for the vegetable whence it derives its name. This plant is indigenous along the hills overlooking the Sylhet plains and may readily be distinguished in the jungle by the silvery appearance of the underside of the leaf. *Borassus flabelliformis* gives the handsome Palmyra wood. *Cognilla* nuts much in request among wood turners, are the produce of *Attalea funifera* and vegetable ivory is yielded by the *Phytalephas macrocarpa*. *Calamus draco* is a plant from which dragons blood is obtained. Space will not admit of our going *seriatim* through the whole list of palms, so we have contented ourselves with indicating those suitable for cultivation in Assam, and of the greatest commercial importance, giving the botanical names, so that importers of exotics in England may know what is required. The majority, however, of these palms are obtainable within the country, some indigenous in the unjhumed jungles, others are probably to be had from one or other of the botanical gardens. If the Agricultural Department was kept up to the collar, an economic plantation, similar to those which all civilised Governments possess, would be established, from which plants and seeds could be distributed much to the benefit of all agriculturists in the country, ultimately enhancing the revenue.—*Indian Planters' Gazette*, June 27.

CULTIVATION OF CACAO IN MEXICO.

An interesting report has been issued by the Foreign-office on the cultivation of cacao, vanilla, india-rubber, indigo, and bananas, in Mexico, all of these crops flourishing in the warmer lands of the republic. Mr. (now Sir Henry Nevill) Dering, Her Majesty's Minister at Mexico, who supplies this report—which is based on articles published from time to time by the Mexican Information Bureau—states that he has been induced to forward it as he is of opinion that the information respecting the cost of cultivation, the district in which each crop may be advantageously raised, as well as a statement of the pecuniary results to be obtained with proper care, may be valuable to many persons with small capital—say £1,000 to £2,000—who may be desirous of investing the same in a country offering exceptional advantages. He also adds that the necessary dwelling-houses, or simple ranche, for personal occupation on a plot of ground purchased for the growth of any of the above crops, may be set up at an expense considerably less than the cost of an ordinary labourer's cottage in England. The cacao tree is a native of Mexico, and, long before the conquest, the Aztecs and other ancient Mexican tribes used the fruit as one of their alimentary beverages. They prepared a drink called "chocolatl" by mixing the seeds, after having crushed them together, with fine corn meal, vanilla ("tlilxochitl") and a species of spice called "mecaxochitl," and those who drank it were a picture of health. All nations subjugated under the Aztec Eagle had to bring among other valuables a certain number of bags of cacao to the palace in the great Tenochtitla as an annual tribute to the Emperor. It was so highly prized amongst the ancient natives that in trade it was utilised as currency among the lower classes. The varieties cultivated were the "quanhehuatl," "mecacahuatl," "zochiecuahuatl," and "tlacacahuatl." The bean of the last one was very small, analogous to the kind found at present at Soconusco, Chiapas. The tree is

found growing wild and in cultivation in the States of Colima, Michoacan, Guerrero, Oaxaca, Chiapas, Tabasco, and central and southern Vera Cruz, where the elevation is from 100 to 1,200 feet above sea level, but Chiapas and Tabasco are noted as being its home, the climate and soil there being more particularly adapted to its culture and development than any other portion of the globe. The species of cacao tree most cultivated in Mexico are—Cacao or *Theobroma ovalifolia* *T. bicolor*, *T. angustifolia*. There are other kinds known, generally found growing wild, which come under the head of the Guazumao or guacima, *Guazuma polybotrya* being the principal species. A warm, moist climate, having a mean temperature between 76° and 77° Fahrenheit is necessary for the cultivation of cacao if large crops are expected, but when the soil is suitable the tree will grow and yield fair returns on a moderately dry or well drained place. The best elevation is from 300 to 500 feet, and in sheltered situations near the seashore good crops are to be obtained, but the tree will not thrive if exposed to the direct influence of the sea breeze. Cacao will not bear much exposure, hence sheltered lands and valleys should be selected, and on the Gulf side of Chiapas, Tabasco, and Vera Cruz northern and eastern aspects should be avoided. Cacao plants are obtained from the seed, which germinates readily and quickly, and the seed, when sown, is covered with vegetable mould or loose loam mixed with horse manure, and over that banana leaves. The bed is sprinkled every day for 12 or 15 days when seedlings appear. Then the banana leaves are removed, and sheds made of palm leaves and sticks so fixed that they can be raised as the seedling grows, should be placed over the nursery as shade and shelter. A year after sowing, seedlings are about 20 inches high, and ready for transplanting. Returns from a cacao plantation cannot be expected until five years from transplanting. At two years old the tree, on rich soil, stands 5 or 6 feet high; when 7 or 8 feet high it begins to bear, but it is not in full bearing until it is between 10 and 12 feet high. The average yield of dry cacao from each tree varies very much; the limits may be said to be from 1½ to 8 lb. per tree. Some trees in the plantation of "La Carolina," district of Macuspana, in Tabasco produce 220 pods and plantations in Alvarez, Colima, and in Apalzinghan, Michoacan yield on an average 5 lb. to the tree. The pods having been gathered, are placed in heaps under the trees; they are then taken to a place, called quebradero, where they may be broken at once or left for a day. The kernels or nibs are then taken out of the pods which either opened with a machete, or a knife made from a wood called Jahmate. As the seeds are extracted from the pods, the former are thrown into wooden troughs called "tollas," half filled with water, to wash them, and the beans are then carried away to the cocoa house for the sweating or fermentation process. When the beans have been properly sweated, they are dried ready for shipment, and this drying process is complete as soon as they produce a crackling sensation when pressed between the thumb and forefinger or when the parchment (outer skin) breaks off easily. As to cost and expense, generally, cacao planters in Chiapas and Tabasco make contracts, paying 90 to 100 dollars (Mexican dollar may be taken as equivalent to 2s 2d.) per 1,000 trees, to be delivered in a state of production in four years, the plantation to be in good condition and with proper shade. The contractor keeps the products and first crop of the plantation. If the planter has his own labourers, he pays them from five to eight dollars per month and rations, then the cost will be from 70 to 80 dollars per 1,000 trees. When the labour is not done by contract but by "jornales" or tasks, the cost for six years per hectare (2.47 acres) is 191 dollars for 750 trees. The expense of collecting, drying, and sacking the seed is from three to five dollars per cargo of 60 lb. Thus 750 trees will produce the planter 75 cargoes (4,500 lb.), the price of which is from 20 to 22 dollars per cargo at the plantation. Deducting the cost of curing, he will have a net annual profit of more than 1,225 dollars, besides the produce obtained from side crops.—*Journal of the Society of Arts*, June 19,

MR. ROGIVUE'S WORK IN RUSSIA.

From Mr. A. Philip, Secretary of the Thirty Committee, we have received the following copy of a letter received from Mr. Rogivue regarding his work in Russia:—

Moscow, May 31st/June 12th, 1896.

A. Philip, Esq., Secretary to the Thirty Committee, Kandy.

Dear Sir,—Confirming my last respects of the 8/20 May and acknowledging receipt of your valued favour dated 15th May, I now beg to hand you enclosed account of expenditure under the grant of £1,000 stg. voted on the 20th July 1895.

From my statement you will see that the total amount I have expended is considerably more than the £1,000 granted to me, but the results I think justify this, for not only do I notice an increase in my sales and a general extension of the business all over Russia, but also that the export from Colombo to Russia direct from 1st January to 20th April, 1896, is more than double what it was for the corresponding period of 1895, the "Times of Ceylon" giving the following figures in its list of export distribution 1895-96.

1st January, 20th April	1896	1895
Tea to Russia	159,597 lb.	70,528 lb.

Again the figures quoted in the tea report of Messrs. Gow Wilson and Stanton for 13th March, 1896 show how largely the re-export of Ceylon tea from the United Kingdom to foreign markets is increasing, special mention being made about Russia and attention drawn to the fact that the bulk of the tea shipped to Germany is for Russia. The numerous and frequent advertisements in the newspapers of every part of this Empire have been a great success as evidenced by the many new enquiries I have received about Ceylon tea from all quarters of Russia. By means of numerous free samples and by giving bonuses over and above the usual trade discounts and supplying tea in the first instance frequently at cost price I have induced many new people to give Ceylon tea a fair trial which generally means a continuation in its use, so I think it would be by all means advisable to continue the above methods for another year.

NIJNI EXHIBITION.—As I wrote to you in a previous letter I was not permitted to build a pavilion within the Exhibition grounds, but have arranged to have on two of the cars of the electric tramway which runs right round the inside of the exhibition, a large advertisement (8ft by 2ft) setting forth the advantage of Ceylon Tea, the latter words being in very large letters and the most prominent feature also, inside all the cars. I am having my placards fixed as well as in all the rooms of the largest hotel of (and nearest to) the exhibition, on the grounds of which between two wings of the building and forming the main entrance to the hotel, on the high road close to the principal gate of the exhibition, two pavilions will be erected in the Hindoo style (each 15 feet square) joined by a large arch 36 feet span by 6 feet bearing the words "Ceylon Tea" prominently painted thereon in huge letters, the whole being nicely decorated and lighted outside by three large electric arc lamps and inside by incandescent. One of these pavilions will be for the sale and distribution of tea in packets, the other for the testing and free distribution of tea in cup.

These Pavilions for the building of which I have made a contract with a competent architect, are to be finished by the 15th June (Russian style and though the exhibition was officially opened on 28th May (Russian) it is so far from completion that it will not be ready until about 20th June and no large attendance is expected before that date. During the time of the exhibition I am having a special announcement published in 5 Moscow and 2 Nijni papers, inviting people to come and try the famous Ceylon tea at the Ceylon Tea Pavilion at Nijni.

I am also having new brochures and leaflets printed specially for the occasion. I experienced great difficulties in obtaining a position to erect a

building on and could get no assistance, but rather the contrary from the authorities of the exhibition and town.

Finally I obtained the present place by private arrangement with this hotel "Frantzia."

I will keep you informed as to how matters progress at the exhibition, and all that concerns Ceylon tea in Russia.—I am, dear sir, yours faithfully,
(Sgd.) M. ROGIVUE.

TEA COMPANIES AND SHARES.

On the one hand, we hear nothing but good of the condition of Ceylon tea plantations and the prospects of the enterprise; and yet, on the other, we find an unusual and decided depression in the Ceylon tea share market. Possibly, this may be partly due to the comparatively large receipts of tea and a consequent weakening in price; but the more direct and immediate cause is, undoubtedly, the report of depression in the Colombo market and the transfer of a considerable number of tea company shares thence to London to be disposed of. So far, again, as this check is due to action on the part of Colombo bankers to check speculation, it must be regarded with favour rather than censure, by all prudent colonists and *bona fide* investors. The danger of a crisis arising through banks making advances on the security of tea scrip, such advances being used to buy up further shares in new companies, was a very real one; and a cessation of the practice—if, as we hear such has prevailed and has now been stopped,—has not come a day too soon. There can be little doubt that, after a temporary check, the share market will recover itself and become stronger than ever probably, in view of the sounder basis on which the business will then rest. There is nothing to indicate a permanent fall in prices, or other than a good crop season in Ceylon, with the usual dividends and in proportion to these, it cannot be said that the value of shares rose too high. But it is well that individual capitalists or investors should understand that the less bowed money is introduced into the purchase of tea or any other shares the better.

The fact that there is no abatement of public confidence in the Metropolis, in tea cultivation in Ceylon and India, as an investment, is shown by the favour extended to new companies, even though they appear at a time when the share market is said to be depressed. Sir John Muir's gigantic company—being mainly a consolidation of two existing companies—may be said to be somewhat exceptional; but though criticised a little sharply in one or two City papers, the demand for shares among even hard-headed men of business, on the chance of getting some of the surplus portion, is specially keen. But still more to the point, is the fact that Messrs. Chas. Strachan & Co.'s Gallaha Company should be in so much favour that all the capital available for the public is, practically, over-subscribed before the prospectus has appeared. True, the ordinary shares in this company are retained by Mr. Strachan in his own hands—only debentures and preference shares being made available. But, all the same, confidence in the Ceylon tea enterprise must be indicated by the facts above stated, and by the encouraging offers we have heard made of late to individual proprietors with plantations for sale.

A good deal of the criticism extended to Sir John Muir's company must be deemed personal and indeed puerile. Of this type is a paragraph in the editorial columns of the *Daily Chronicle*, condemnatory of Field Marshal Lord Roberts lending his name to a tea company directorate, forgetful of the fact that Lord Roberts had long

been connected with the Sylhet Companies and that a lifetime spent in India might well give even a military man a warm interest in, and special acquaintance with, the working of tea cultivation companies. But in this direction the *City Leader* excels in a leader now sent you,—entitled ‘A ‘Swagger’ Prospectus”—the theme of Lord Roberts being again prominent, as well as some childish remarks on the title of the company. Far more businesslike is the analysis offered by the *Financial News* in an editorial (also forwarded) on “Indian Tea Companies” with the “Consolidated” and some other companies for the main theme; but dwelling generally on tea investments deserving more attention than they have hitherto received—in, we suppose, the regions of high finances. This is due to the absence of public quotations for the large majority of companies. Out of 75 of these undertakings known to our contemporary, only 13 are quoted in the official list; but a study of many more shows they offer very desirable investments. *Fairplay* of the 18th instant is also very favourable to the big company as may be seen from the following:—

The *Consolidated Tea and Land Company* is about the strongest thing in the shape of Companies that has come out for some time. The total capital, as will be seen from the advertisement, is £2,000,000. The board of directors is exceptionally strong, with Sir John Muir, Bart., at the head, and comprising some of the best known names in the commercial world. The Company is formed to take over, as going concerns, a number of tea estates in India and Ceylon, and is sure to be regarded as a safe and good investment.

But it is more interesting to read what the *Erchequer* of yesterday's date has to say on the tea trade and on tea-growers in a brief editorial:—

So much attention has lately been given by the investing public to the Indian and Ceylon tea trade that the review of the year up to May 31 will arouse interest. The various firms that issue these reviews evidently prepare them with care; and while they are perhaps a little technical and difficult to understand on the part of the mere investor, it must be admitted that, so long as the information is given, it is all that can be fairly expected. For India and Ceylon the twelve months show expansion, the production continues to increase, the consumption at home was larger than ever, and trade with other countries marks a substantial advance. To tea-growers the season brought substantial remuneration, said to be “so considerable in comparison with the general earning power of capital as to make this industry conspicuous when contrasted with others.” The history of the season offers many points of contrast to that of 1894, but resembles the season of 1893 in the higher price of fine tea and the lower price of common, a great and growing consumption, and a wider demand for the teas from abroad. The influence of foreign orders upon the Calcutta and Colombo markets has been considerable, and for the future it is pointed out that it will be necessary to be more circumspect about fixing buying prices in this country in face of the growing competition among Indian producers. Importers of Ceylon teas, which have lately been attracting some notice, have seen the wisdom of regular sales at the date of importation, arrivals being sold, as a rule, within three weeks, the result being that a large trade is worked upon a small stock, and the desired increase of consumption attained. There is quite an active market now in Indian and Ceylon tea shares; and it is evident, from the condition of the industry, that this is likely to go on expanding.

There is no indication here of depression even in the share market, and, indeed, the check in the case of the Ceylon portion may be regarded as merely temporary and due to a cause—the application of principles of sound financing in Colombo—which is likely to place the market on a sounder basis than ever before. J.F.

THE GALAHA CEYLON TEA ESTATES AND AGENCY COMPANY, LIMITED.

Share Capital, divided into 6,000 Cumulative Six per cent preference shares of £10 each	£60,000
5,000 Ordinary Shares of £10 each	50,000
	<hr/>
	£110,000
Debenture Capital 550 Five per cent Mortgage Debentures of £100 each	55,000
	<hr/>
	£165,000

The debentures have been subscribed for privately, the ordinary shares are reserved for allotment to the vendor in part payment of the purchase-money, and applications are invited for the 6000 cumulative six per cent preference shares of £10 each at par, payable as follows:—

On application	10 0 per share.
On allotment	2 10 0 ”
On 1st Aug. 1896	7 0 0 ”

£10 0 0 per share fully

paid up.

The preference shares confer the right to a fixed cumulative preferential dividend at the rate of six per cent per annum and the right to repayment of capital in preference to all other shares.

Directors.—Charles E. Strachan, Esq., Colombo, and 6 Balfour Place, Mayfair W. (Chairman); M. P. Evans, Esq., 17, Airlie Gardens, Kensington, W.; William Harwood, Esq., 29, Palace Gate Kensington, W.; W. L. Strachan, Esq., Kelvin, Ceylon and 35a, South Street, Mayfair, W.

Solicitors.—Messrs. Harwood & Stephenson, 31, Lombard Street, E.C.; Messrs. F. J. & R. F. De Saram, Colombo, Ceylon.

Bankers.—The National Bank of Scotland, Limited, 37, Nicholas Lane, E.C., Head Office in Edinburgh, and Branches in Scotland; the National Bank of India, Limited, Colombo.

Brokers.—Messrs. W. I. Carr, Sons & Todd, 2, Royal Exchange Buildings, E.C.

Auditor.—A. N. Frewer, Esq., A.C.A., 34, Nicholas Lane, E.C.

Secretary (*pro tem.*) and Officers.—P. E. Hervey, Esq., 39, Lime Street, E.C.

This Company has been formed for the purpose of acquiring, carrying on, and developing—

1. The group of Freehold Tea Estates, Galaha, Goorokelle, Goddawella, Kirrewana, Kitoolmoola, Dunally, Monsakelle and New Maddegama, and East West, and North Vedhettes, situate in the Nilambe and adjacent districts of Ceylon, containing 4,871 acres, of which 2,397 acres are now under tea, and 107 acres are under cardamoms.

2. The freehold property, with the Central Tea Factory thereon, known as the Galaha Factory, situate on the Government Cart Road, 10 miles from Peradeniya Station, on the main line of railway to Colombo.

3. The freehold property in Colombo, containing nearly 3 acres, known as the Union Mills, consisting of coffee mills, Cinchona presses, warehouses with ample accommodation for storing tea prior to shipment, manager's bungalow and offices.

4. The general and agency business of Messrs Charles Strachan & Co. in Colombo, now carried on by Mr. Charles E. Strachan, the Vendor.

The estate comprise approximately—

1,635 acres tea in full and partial bearing, upwards of three years old.

516 acres tea, one to three years old.

246 acres tea in course of planting.

107 acres cardamoms.

276 acres cleared and forested for fuel purposes.

2094 acres forest patna, &c., of which a large portion is considered available for tea cultivation.

In the season 1894-95 the crop was 549,357 lb. tea, which was sold for 7.02d per lb. net. The crop of season 1895-96 is estimated at 757,000 lb. of tea, of which already 613,920 lb. have been received in London, and of this quantity 510,540 lb. have been sold at a net average of 7.23d per lb.

The estimate of cardamoms for the latter season was 16,500 lb., of which 7260 lb have been sold at a net average of 1s 11½d per lb.

The whole of the leaf is manufactured at the Galaha Factory, which is most conveniently situated almost in the centre of the estates.

The vendor's estimates of crop from the estates for the present season, from 1st July, 1896, to 30th June, 1897, are as follows, viz:—

880,000 lb. tea at 7d net	£25,655 13 4
20,500 lb. cardamoms at 1s 6d net ..	1,537 10 0
	<hr/>
	£27,201 3 4

The profits on the Galaha Factory and Colombo business during that period are estimated by the Vendor as follows:—

Galaha Factory	967 5 5
Colombo Mill and business ..	1,036 5 7
	<hr/>
	£29,257 14 4

The working expenditure for the same period is estimated by the Vendor at

15,711 11 11

Taking the year's profit on this basis at	£13,546 2 5
After paying interest on Mortgage Debentures £55,000 at 5 per cent ..	£2,750 0 0
And a Dividend of 6 per cent on 6,000 six per cent Cumulative Preference Shares	3,600 0 0
	<hr/>
	6,350 0 0

There should remain a balance for the first year available for the Reserve Fund and the Dividend on the Ordinary Shares of £7196 2 5

The Directors anticipate a considerable yearly increase of profits, not only from the Tea Estates themselves, by reason of the larger yield per acre from the Tea now in bearing, and from the 762 acres of young Tea coming into bearing during the next three years, but also from the consequent extension of the business in Colombo.

The Estates are well equipped with substantial Bungalows and Buildings, and with permanent Coolie Lines. The Galaha Factory, erected at a cost of about £13,000, is a substantial stone building, fitted with all necessary modern machinery for Tea manufacture, and will be capable of turning out 2,000,000 lb. of made Tea per annum, when the extensions now in course of construction are complete. The purchase includes all the Live and Dead Stock, Machinery, Tools, Furniture, and Fixtures on the Estates, and the Machinery and Office Furniture in Colombo, but the Company will take over at a valuation all stores purchased by the Vendor for future use and in hand on the 1st July, 1896.

A Tramway of 2¼ miles in length has recently been constructed at the cost of £4375, to bring the leaf to the Factory, resulting in a considerable saving of labour and expense.

The Coolie labour force on the Estates is ample.

Messrs. M. P. EVANS & Co. have hitherto acted as Consignees and Agents of the Estates in London, and have agreed to continue to do so, and the businesses in Ceylon will be carried on without interruption by the present staff.

Mr. CHARLES E. STRACHAN, the Vendor, who has managed these Estates and business for many years, has agreed to act as Managing Director for a term of five years, without any remuneration beyond the ordinary Director's fees.

The price to be paid by the Company for the purchase of the estates, properties and businesses, free from incumbrances, has been fixed by the Vendor at £155,000, payable as to £50,000 by the allotment of 6000 Ordinary Shares, and the balance in cash. Taking the prices of the Galaha Factory at the above sum of £13,000, and of the Colombo Mills and Agency business at only £12,000, and the price of the uncultivated and reforested land at £5 per acre, the price per acre of the land under Tea and Cardamoms is under £47 5s per acre.

The Vendor will discharge all outgoing and liabilities belonging to season 1895-96, in respect of the Estates, Mills, and business up to the 1st July, 1896, from which date the Company will take possession, and be entitled to the profits, but the Company will repay the Vendor all advances made by him before that date, on account of the season 1896-97.

The Vendor will pay all the expenses of and incidental to the formation and registration of the Company up to the first general allotment.

The Directors propose to appropriate £10,000, the proceeds of 1,000 Preference Shares of the present issue, for working Capital and the further development of the estates.

The following Contracts have been entered into, viz:—

A Contract dated 27 June, 1896, between Charles Edward Strachan and this Company, being the Contract for the acquisition by the Company of the above-mentioned properties, and a Contract dated 27th June, 1896, between this Company and Matthew Pennefather Evans, William Dann, and John Pennefather Evans, trading as M. P. Evans & Co., being the Contract under which the latter are to act as Consignees and Agents of the estates in London.

The current contracts entered into by the vendor in the ordinary course of business, and, as to the debentures, may, however, constitute contracts under Section 38 of the Companies Act of 1876, and applicants for shares must be deemed to have waived further specification of any such contracts.

Nothing has been or will be paid in respect of promotion or underwriting.

It is intended to apply to the Committee of the London Stock Exchange for an official quotation of the Preference Shares.

Copies of the memorandum and articles of Association and contracts can be inspected at the offices of the Solicitors to the Company.

Applications for Preference Shares should be made on the form accompanying the Prospectus and be sent to the Company's Bankers with the amount payable on application. If no Allotment is made the deposit will be returned in full, and where the number of shares allotted is less than the number applied for, the balance will be applied towards the payment on allotment.

Prospectuses with Forms of Application for the Preference Shares can be obtained at the Offices of the Company, or from its Bankers, Brokers or Solicitors. 27th June, 1896.

METROPOLITAN NOTES.

LONDON, June 26.

I omitted in my last to refer to one significant remark made by Mr Quinton Hogg as Chairman of the

ORIENTAL ESTATES CO.,

and which I do not think has been recorded in any of the reports. It was when he referred to his own experience as a sugar plantation proprietor both in British Guiana—a gold currency colony—and in Mauritius with its Indian rupee currency; and to the immense advantage which the use of silver in payment of labour, etc., gave to the latter over Guiana with its gold payments. The Committee appointed to confer with the Directors was to have its first joint sitting on Monday last; and I have no doubt by this time a thoroughly good understanding has been effected: for, it became perfectly clear at the meeting that the Chairman and his fellow directors had acted with the utmost good faith, however strongly "preference" shareholders might object to the course pursued.

TEA, TEA SHARES, AND TEA COMPANIES

have been a good deal before the press and the public during the past week, mainly owing to Sir John Muir's big Company affording the text for a good many articles, some of them rather far-fetched. It was interesting to learn from Mr. C. E. Strachan, during a brief chat, that all the capital required for his

"GALLAHA COMPANY"

from the public is already over-subscribed—mainly by personal and business friends—before the prospectus has been issued. Mr. Strachan is full of confidence in the future of our tea enterprise; and he has, of course, a very large interest, not only through the Company about to be floated, but in the Ragalla Company, with its high rich plantation, and in valuable tea properties in the Agrapatana, Bogawantalawa, etc. Mr. Strachan, who much enjoyed his recent winter visit to the colony, is looking very well and may go out again during the coming winter. The "tea" acreage in the Gallaha prospectus, I may mention, is valued so moderately as £42 per acre. The Company will hold the Colombo business (with Mr. Hathorn as Manager) and this will probably be much extended.

My letter on

"COFFEE," ETC.

in the London *Times* has been attracting a good deal of attention, mainly through a reprint circulated among Ceylon men and merchants at home. One planting colonist writes:—

"I am much obliged for the reprint of your extremely interesting letter to the *Times* which had escaped my notice. I have felt for some time that coffee is the thing to go in for now, and am myself taking up land in the Selangor District with a view of having another try at the good old staple. I am hoping to go out to Ceylon and the Straits towards the end of this year to have a look round."

It is evident from recent experience that one has to be careful to discriminate among the States and soils of the Malayan peninsula, so far as "coffee" is concerned; but I do trust that some investors—Sir Graeme Elphinstone, for instance—may reap the fruit of their enterprise. On the other hand, the Shré Highlands in British Central Africa may yet prove the coming Eldorado for coffee; we shall hear more of it shortly, no doubt, when Sir Herbert Johnston arrives home.

MR. THOS. CHRISTY AND THE OVERPRODUCTION OF COFFEE AND INDIAN TEA.

I have also received the following suggestive and interesting letter from Mr. Thos. Christy of Lime Street:—

London, E.C., June 19, 1896.

DEAR SIR,—In your letter to the *Times* of June 1st, you speak of the question of over-production of coffee. The price of coffee appear to be ruled very much by Brazil for quantity and Java for quality. In my opinion, in the future the great coffee-producing country will be Africa, and the reason I think so is this: there are so many indigenous varieties found growing wild in Africa, and crops which would surpass the imagination of those who had seen it, points to the fact that that land is suitable of coffee-growing.

In the same copy of the *Times* was a leaderette on Indian affairs, and speaking about the labour that India can furnish for making railways, I am quite convinced that it will not only be a question of the Indian assisting to make the railways and doing them thoroughly well, and at a low price; but I shall be very much surprised if the Indian once leaves Africa. There is a class of Indians, if I may be allowed to use such a name, who have thoroughly studied in Europe, and also in the schools of India, and some of whom, I believe, you have in Ceylon; these men, in many cases, they are excellent telegraph clerks, excellent post office clerks, who thoroughly understand the routine according to the English system; they are accustomed to hot weather and, from the information I have obtained, are thoroughly reliable. Although we may be sending English ladies out to India as doctors, there is a large number of native gentlemen who have qualified in this country who would be very suitable to send to Africa, especially to the Soudan, and it will not be long

before the attention of merchants in Bombay and Calcutta and also in Ceylon will be turned to the splendid districts which England is reconquering in Africa. It is well-known that the English have no wish to fight; they are merely endeavouring to establish peaceable occupation for the Egyptian and also for their Indian subjects who are now commencing to trade with Africa; so much so is this the case that produce is being sent from the east coast of Africa to Bombay, where it is transhipped to England. Once the Indian leaves the rule of India he will feel that he will have the full protection of the British Government in Egypt and in a very short time you will be able to chronicle the fact of the introduction of Indian houses along the east coast of Africa. Already some of the East Indians are going to France to study French; some are also settling in Germany to thoroughly gain the language and the customs of Germany and German trade, with the object of settling in German colonies. They know that they can purchase goods; they know also what the natives require and will very quickly learn the native languages and dialects. Although entirely agreeing with the writer in the *Times* of the 1st June in regard to the labour, still we must not ignore the upper classes in India who have qualified to assist the English in developing our colonies and possessions, especially in hot climates.—I remain, yours truly.

THOS. CHRISTY.

That my correspondence is widespread and varied may be judged from the following from the editor of the *Friend*:—

DEAR SIR,—I was glad to meet you at the breakfast meeting of the Aborigines Protection Society at Cannon St. Hotel, but had no opportunity to ask you a question on which I want information. Friends want to establish an Industrial Christian Mission on Pemba and we think the best way of helping the coloured people when Mr. Curzon abolishes the legal status of slavery will be to purchase an estate on Pemba and run it with freedmen. This will require a competent business man at the head of it to run it, and we have no such man at present; but I want to know how *copra* is prepared in Ceylon for the Marseilles market. Can you kindly tell me where I can get the information that would practically guide us in placing *copra* from Pemba in best condition for the market? I understand that at present Ceylon does this the best, and that you have studied the subject. Kindly excuse me for thus troubling you.—Yours very truly,

HENRY STANLEY NEWMAN.

A copy of our "All about Coconuts" gave Mr. Newman, I trust, all the information he required.

HORNIMAN'S TEA COMPANY.

Talking of Sir Graeme Elphinstone reminds me that I learned from Mr. Horniman, M.P. the other day, that neither "Logie" nor Mr. Powell Jones now holds seats on the Directorate of his great Tea Selling and Distributing Company. Competition in this business must be very keen owing to the multiplication of agencies; and yet I was surprised to learn the other day that a well-known City Firm could allow a grocer-agent in a West of England town as much profit as fourpence a pound off a good tea supplied by them and which was being freely sold and appreciated at the said watering place.—Mr. Horniman evidently thinks it very important a good hold should be got of the American and Russian tea markets to meet the further production of tea. I forget if I told you in a previous letter of a surprising fact learned through a young English lady's letter from

BERLIN,

namely, that she has never seen so much tea drunk as in German families there: as in Australia, the rule seems to be to have tea at every meal. I recently heard of the death at 93 in England of one who had been a great tea drinker all his life—a good evidence of its use!

The question as to whether the pristine

QUALITY OF CEYLON TEA

grown on virgin soil can be maintained is again on the *tapis*. A well-known V. A. of wide experience now at home, is of opinion, such a quality can with proper care and attention be kept up; but he is opposed by the actual experience of several proprietors of first-class properties—notably in Bogawantalawa—who declare that, with no possible falling-off in attention, their teas of the 3rd to 6th years have never been equalled in flavour since, though a good average has been maintained.

NATAL TEA INDUSTRY.

A GREAT FUTURE.

IF PROPERLY WORKED.

Mr. G. W. Drummond, at present at Johannesburg, writes to the *Diggers' News*: The following remarks on the tea industry of Natal may be of some interest to many in Johannesburg who are engaged in the trade, and also to others who may like to know how this particular industry is progressing in the Garden Colony at present. Compared with India, and even with Ceylon, tea growing in Natal may fairly be said to be only in its infancy. The industry dates practically from 1882. Since then, however, it has made great bounds, and particularly so from 1891. There are barely 3,000 acres under plant in the whole Colony—quite small—equal only to the extent of many single estates in British India. Still, there is not a doubt but that the industry has a bright future in South Africa. The bulk, the very great bulk, of the yearly out-turn is consumed in Natal itself. Fields further ahead to the south and inland are yet practically untouched, and it now undoubtedly rests with the planters themselves to make prompt use or not of their present golden opportunity. For Johannesburg, for instance, which is a splendid opening for Natal tea, the growers of Natal are even now, rather late in the field. They do not appear to have tackled the subject properly, so far. Certainly they had difficulties to contend with in not being directly connected by rail until lately; but more could have been done. Another mistake they make, too, is misnaming their teas. Natal golden pekoe, for instance, though a very excellent tea, is not a pekoe (or leafy tea) at all. The same with their flowery pekoe, which is simply a broken pekoe. Teas here are bought for price or by their name, and naturally a grocer or the public accustomed to China and Indian teas looks for something leafy in pekoes of any kind. It would be a very good thing if more tasting before purchase was done in Johannesburg, such as obtains in England. There, every little village grocer will get samples from different houses first, and then buy his tea according to quality. How much Natal tea is consumed in Cape Colony or the Free State? No quantity worth mentioning. But the trade only requires adequate and intelligent pushing to find markets there. Planters must be prepared to spend money if they wish to open up the interior. Indian and Ceylon teas are getting very firmly established in all parts of South Africa, and so are cheap China teas. If Natal wants to compete with the two former, her most dangerous rivals, she must meet them more on the level. She must pick finer. Natal planters say they cannot, couldn't pay, labour too expensive, and so on; but the real fact is, they have never seriously tried. It would have been better for them if, with an estimate of 200,000 lb., they had been content with 150,000 lb. better quality; and in the long run quantity before quality will not do, and will not pay. This has been proved in India over and over again. More friendly competition, too, among the Natal planters would be good for the industry. There are only five estates, altogether which use machinery to make their own teas (*i.e.*, counting the Sprowston estate one with Kearsney), out of which only two are in any large way, and these two, instead of working hand in hand for the

benefit of the industry, are perpetually cutting each other's throats by jealous rivalry, for which one is not a whit less to blame than the other. If the industry had received more substantial aid from the Government of Natal at its very commencement, such as the Ceylon planters got, it would probably have been three or four times as large by now, and it would have undoubtedly been so much the better for the Colony. The cost of coolie labour now-a-days is too expensive altogether. But this is a subject which cannot be gone into here. The "whys" and "wherefores" would take too long. It would be another good thing for the industry if some of the leading growers would take a trip to, say, Ceylon, and see how they do things there. It is almost quite safe to say that, at present, not a single man engaged in tea planting in Natal has more than the mere local knowledge of his business—no outside experience—and it certainly is to his credit that he has done so well so far. The real tea districts of Natal lies within six miles of Stanger, amid exceedingly pretty scenery and commands a fine view of the sea. As regards the total output of tea from the Colony for the current season, the result will be below that of last year. In December, 1895, the large central factory at Kearsney was totally destroyed by fire, the with it, at the same time, 100,000lb. tea. Now and estimate for Kearsney alone was 560,000lb., and for the whole Colony 960,000lb., so that it can be seen that the bulk of Natal tea is made at the Kearsney central factory. This estate buys the leaf of 11 small gardens (belonging to separate interests), and manufactures it into tea along with its own leaf. It cannot, after the fire, in which the machinery was lost also, make more than 300,000lb. for the season 1895-96, so that the total crop of Natal tea this season will probably not reach over 700,000lb., or something over 100,000lb. less than last year. Next month, June, will see the close of the present season. Outdoor work will then be the order of the day until September comes round. As Kearsney has got to work again, partially, and will probably be ready for the new season, the output of the colony for 1896-7 ought easily to exceed 1,000,000lb of tea. That would be a gratifying result, and all the friends of Natal will be glad to see the Garden Colony going ahead successfully.

A "SWAGGER" PROSPECTUS.

We cannot congratulate the promoters of the Consolidated Tea and Lands Company, Limited, on the felicity of the title they have selected. What does it mean? Are they going to sell consolidated tea in one department, and deal in land in the other? Or are they going to sell a blend of tea and land with calm disregard of the Adulteration Act? Neither, we understand is the actual object—which is described in the prospectus as follows:—"To take over as going concerns and to amalgamate the estates in India and Ceylon. . . . known as the estates of the North Sylhet Tea Company, Limited, and the South Sylhet Tea Company, Limited. . . . These companies have since their formation in 1882 when worked under the same proprietary as private Companies, and they are now amalgamated and formed into a public company with a view of securing a quotation on the London and Glasgow Stock Exchanges." This is a very frank admission which does credit to the pretentious board of directors who are going to assume the management of the amalgamated undertakings. It is, however, to be regretted that the same spirit of candour was not extended to giving a statement of the amount of capital of the companies to be acquired. It seems to be a respectable enough promotion, and possibly it may not be intended to let outsiders have much of the capital—all events until the coveted Stock Exchange quotations are obtained.

What strikes us most in the prospectus is the appearance on it, as a director, of Lord Roberts, the Commander-in-Chief of the Forces in Ireland. We beg his lordship's pardon. We ought to have said of;—

Field-Marshal the Right Honourable Lord Roberts of Kandahar and Waterford, G.C.B.; G.C.S.I.; G.C.I.E.; V.C.; D.C.L.; L.L.D.; etc.; Royal Hospital, Dublin.

It is a pity that Lord Roberts had not a few more initials to append to his name and chief title. We were under the impression that it was not good form for a fully-pay officer occupying such a distinguished position to let his name appear as a director of a public company. There is, perhaps, no special reason why he should not, provided that the official duties are not thereby prejudiced any more than that he should devote his leisure time to the management of his private affairs at Kandahar, Waterford, Sylhet, The Royal Hospital, Dublin, or elsewhere. Still, it does strike us as strange, in view of the stringent regulations of Government departments in analogous matters to find Lord Roberts' name in this connection and with his official address. We have not forgotten the outcry there was when a Lord Mayor of London allowed his name to appear on a prospectus and with his official description appended. And surely it is more appropriate for the Lord Mayor of the greatest financial centre in the world to be a director of a public company than for a General, even if he be also a Doctor of Laws and an "etc."

Should there be any warlike operations against the properties of the Consolidated Tea and Lands Company the services of Lord Roberts will be invaluable. In the absence of these we presume that on the other directors will fall, the bulk of the work of conducting the business. By the way, they express their intention of putting a considerable area of the land to be acquired "under coffee" which suggests to us that it would have been a happy idea to call the company the tea, coffee and Land Corporation, Limited. Undoubtedly all concerned with the company are of high business standing from the directors downwards. The firm of Finlay Muir and Company of Calcutta who have managed the business since its formation have agreed to continue to do so, though the period of the agreement is not stated, and during its tenure to hold shares to the round value of £200,000, of which at least one-half shall be in Ordinary shares. What chiefly perplexes us about this prospectus is whether it is really intended as an invitation to the public or not. The reference to the object of obtaining Stock Exchange quotations, the short time allowed for the offer of capital, and the general family-party appearance of the document, suggest that the public offer is more or less *pro forma*; though, perhaps, some of the ordinary capital—the proceeds of which are to be devoted to the purchase and development of land, and is to be called up over a period of five years—may be given to outsiders.—*City Leader*, June 20.

INDIAN TEA COMPANIES.

The appearance of the Consolidated Tea and Lands Company brings into prominence once more a class of investment which scarcely receives the attention it deserves. Taken all round, Indian tea companies show results with which shareholders have no reason to be dissatisfied, and their success is evidenced by the number of new companies registered in London during recent years. It is a little surprising, therefore, that out of a list of 75 of these undertakings which we have before us only 13 are quoted in the Official List, while the prices of the remainder, being unknown to the tape, can only be discovered by special inquiries. A partial explanation is to be found, no doubt, in the fact that the capital of many of these companies was privately subscribed, and that the proprietors have been content to hold their shares as an investment, without caring for the advantages of public quotations. It is obvious, however, in cases where realisation is necessary, that a free market ensures not only the finding of a purchaser, but also the certainty of obtaining a fair price, and it is apparently with the object of securing a quotation on the London and Glasgow Stock Exchanges that the North and South Sylhet Tea Companies are being converted and amalgamated into

the Consolidated Tea and Lands Company. At first sight the capital of the new company appears rather large, since, as far as can be ascertained, the paid-up capital of the two amalgamating concerns is only £462,000, while the purchase price to be now paid is £1,600,000! We imagine, however, that there must be loans of a large amount in addition, because the prospectus states that the cost price of the estates stands in the companies' books at £1,416,000. While it is not our purpose to discuss the merits of the new undertaking, it may be of interest to take the North and South Sylhet Companies as a starting point, and how to show the rapid progress which has been made, especially as they are even now by far the largest producers of Indian tea.

Their estates cover an area of 170,000 acres in Assam, Sylhet, the Dooars, Darjeeling, and North Travancore Hills, besides about 10,000 acres in Ceylon. On November 30, 1895, there were 21,310 acres with tea in bearing and 5,439 acres planted with young tea, coffee, and cocoa; while since then another 4,371 acres have been cleared and are in course of planting; so that the whole area under cultivation is now 31,120 acres. How greatly in excess these figures are of the acreage of any other limited company will be evident when we mention that next in order comes the Assam Company, which has about 10,000 acres under cultivation, while the Land Mortgage Bank of India has 8,000 acres, the Jokai (Assam) Company 7,300 acres, and the Dooars Tea Company 6,120 acres. After these we drop to 5,000 acres on the Jorehaut property and then we find a number of companies such as the Assam Frontier, Chargola, Lungla, Singlo, and Brahmapootra, where the cultivated area varies from 3,000 to 4,000 acres. As regards production, the combined North and South Sylhet Companies raised 9,583,734 lb. in 1895, against 5,673,379 lb. in 1888, and the 1896 crop is estimated at 10,070,000 lb. of tea. Bearing in mind that they have 150,000 acres of land still uncultivated, of which 90,000 acres are in the North Travancore Hills, from which exceptionally good results are expected, there cannot be two opinions of the great possibilities that lie before the amalgamated undertaking. At present the largest crops for 1895, of the other companies that have so far been actually reported are 3,108,671 lb. on the Jokai (Assam) estates and 3,017,000 lb. on the Dooars property. These amounts will probably be exceeded by the Assam Company, where the crop is estimated at about 3,300,000 lb., and then there is a drop to 2,400,000 lb. on the Assam Frontier Company's estates, and an estimated outturn of 2,143,000 lb. by the Brahmapootra Company.

We need hardly say that the amount of the crop is not necessarily an indication of a company's prosperity, nor of the desirability of its shares as an investment. The relation which the outturn bears to the acreage under cultivation must be considered, as also the quality of the leaf, and, above all, there is the important question of capitalisation. For instance the Brahmapootra yield of 2,143,000 lb. from 3,390 acres is better than 2,423,000 lb. from 4,085 acres on the Assam Frontier property; while, as the capital of the former is only £114,500 in £5 shares, against the £339,000 (including debentures) of the latter, there is clearly much larger scope for dividends on Brahmapootra shares. In fact, the average dividend on these shares for the six years from 1889 to 1894 inclusive, has been 17½ per cent., against 6 per cent. on the Ordinary shares of the Assam Frontier Company. For 1895 the final dividend has not yet been declared by the Brahmapootra Company; but the interim dividend was 8 per cent., as in the previous year, and there seems every likelihood of the total distribution coming to 20 per cent., as in 1894. The directors of the Assam Frontier Company have already declared 6 per cent., for the past year, which we may observe, is just double what the Ordinary shares received in 1891. Among the other companies that have announced their dividends may be mentioned the British Indian Tea Company with 5 per cent., as against 6 per cent. a year ago, Darjeeling 5½ per cent.

Dooars 12½ per cent., Jhanzio 10 per cent., Jokai (Assam) 10 per cent., Moabund 15 per cent., Noakacharec 5 per cent., all of which are the same as in 1894; while the Doom Dooma dividend of 10 per cent. is 1½ per cent. less, and the Lebong and Majuli distributions of 13 per cent. and 5 per cent. are 2 per cent. smaller in each case. The two Sylhet companies have paid an average dividend of 10 per cent. for the last seven years, and for the same period the average dividend on Doom Dooma shares has been over 11½ per cent., on Dooars 11 per cent., Jhauzie 9½ per cent., and on Jokai 10 per cent. The shares of the last-named company are quoted at £18 for the £10 share; so that they yield £5 11s per cent., which is not a bad return for a sound undertaking which has paid 10 per cent. every year since 1885, and has a reserve of £43,808. The yield on Dooars shares at the current price of 20 is just 6½ per cent., and this company also has a satisfactory reserve of £40,000. At 18½ Doom Dooma returns £5 8s per cent., and, on the basis of last year, Jorehaut and Assam shares can be bought to pay 6½ per cent., both the two latter having also substantial reserve funds, while the Lungla and Singlo Companies, which have only recently been established, can be purchased on still more advantageous terms. There are many other companies with equally good prospects—we have merely taken at haphazard a few of those which are best known over here—but we have said enough to show readers who have time to study the position of Indian tea companies that they may be able to find not a few desirable investments among them.—*Financial News*, June 20.

THE PRINCIPAL DISEASES OF CITROUS FRUITS.

We have been favoured with a copy of Bulletin No 8 from the U. S. Department of Agriculture, which contains a very interesting treatise on the principal diseases of citrus fruits in Florida, beautifully illustrated with coloured plates showing the various blights and their effects, such as "Die-back" or *Evanthema*, "Scale," *Ferrucosis*, "Foot-rot," "Sooty mould" &c: the last following the mealy wing or white fly, *Aleyrodes citri*, from all of which it appears that frost is by no means the only enemy Florida has to fight.

The writers would seem to make a mistake in supposing that the "die-back" is peculiar to Florida or that it is "not known in any other part of the world." In Ceylon we are not strangers to the "die-back" disease on orange trees with all its accompanying characteristics,—first the unusually large foliage, followed by the dead tips, the scaly eruptions which seems invariably present, the sickly yellow colour of fruit and reddish-brown stains thereon. The results are disastrous enough to the fruit-bearing capabilities of the trees; but inasmuch as we, in Ceylon, place very little commercial value upon our orange its enemies have received less of our attention. There are however a few grains of comfort in these admirably written pages which will commend themselves to all interested in the culture of this most refreshingly wholesome and delicious of fruits. Not content—like too many scientific men—with elaborately and minutely describing the life-history of the enemies of the citrus family, they carefully trace the causes, suggest preventive measures, and in plain terms prescribe effectual treatment. It is, we believe, generally felt that scientists are rather too apt—like Dr. Watt on white-ants—to treat us to learned and laboured dissertations on the life of such enemies of the husbandman as if there was any doubt about their existence! omitting altogether what we stand most in need of, viz., some suggestions as to their effectual and speedy destruction. A man half poisoned with strychnine cares little to be told to what ancient family *nux vomica* belongs. It's an antidote he wants. Life is short, and few farmers or planters in this work-a-day world have time to follow the philosopher in all his leisurely researches. They may be learned, they may be interesting, and still the practical result be nil. In this respect the

writers—Messrs. Swingle and Webber—on vegetable physiology in the United States Department of Agriculture show an excellent example. The information is brief and to the point, they diagnose the diseases of trees as a doctor does that of a patient, and prescribe accordingly.

We need only quote one sample. The treatment of "die-back"—after concisely stating the causes and various symptoms—is thus recommended:—"When die-back is due to excessive use of highly nitrogenous organic fertilizers, an effective remedy consists in simply ceasing to cultivate. In fertilizing omit entirely all highly nitrogenous organic manures but use about the normal quantity of potash and phosphoric acid. As the tree recovers a small amount of nitrogen should be given, preferably in the form of nitrate of soda or sulphate of ammonia, until the tree is brought up to its normal condition. If the disease is produced by the close proximity of privies, chicken houses, &c. removing these will usually result in the recovery of the affected trees. When the malady is caused by planting on die-back lands treatments vary according to the character of the soil. Thorough drainage will usually be found an effective remedy without any other treatment. If the soil is underlaid with hard pan, muleh-ing the trees with pine straw-oak leaves or something of this nature will allow the feeding roots to develop near the surface and usually bring about a cure. The latter has been found effective in many instances. Similar instructions are given with regard to "foot rot," "melanose" and "scoty mold." In the case of each disease discussed we have not only preventive measures suggested but the most practical means of combating it when it does appear.

The orange industry in Florida and the West Indian islands is of prime importance. In Florida alone no less than \$50,000,000 has been invested in the business, while fully 20,000 people are dependent upon it for support. Here in Ceylon it has hitherto been of little commercial value. Growers complain that there is no real market for such produce, notwithstanding the number of calling ships and the eagerness with which passengers appreciate good fruit. The dubashes somehow contrive to supply such rubbish that a very bad impression is given of the capabilities of our fruitful isle.

VARIOUS PLANTING NOTES.

THE PRICE OF WYNAAD TEA continues to rule high, says a Madras contemporary. The latest sale, 27 half-chests from the Kananbyle estate in the Cherambady District, realised an average of 10½d, being on an average about 2d above Ceylon marks sold that week. We have still to learn what is the annual yield per acre of these young tea clearings, but if it is anything like the amount anticipated, the success of the Wynnaad as a tea country will be assured. But then we shall probably be told it is too wet for tea—a planter cannot wither properly with 18 inches of rain a day, an argument that would have all the merits of those adduced to prove the district was too malarious for the cultivation.

THE PREPARATION OF CHINA TEA: ANOTHER COMMISSION TO INDIA PROPOSED.—In the *North-China Herald* of June 12 is printed the following note from the June number of the *Messenger* :—

Tea Culture.—The Board of Revenue has been addressed by a eunuch Lieu and by Chen, a senior secretary, on the importance of sending a commission to India to examine the methods of preparing tea for the European market there in use. They also propose the establishment of a technical school of instruction in tea manipulation. Workmen would here be informed what to aim at and what to avoid. It is to be hoped that China will soon become fully awake to the need of close attention to tea culture. We do not expect that the proposals will be acted upon, seeing that the outcome of the former commission appears to have been *nil*.

Correspondence.

To the Editor.

MANURE FOR JAK TREES.

Carambogam Estate, Pallai, N.P., June 17.

DEAR SIR,—Could you kindly find out for me through your valuable paper a good manure for jak trees.—Yours truly,
H. J. M. T.

CEYLON TEA IN CANADA.

25, Front St. East, Toronto, June 22.

DEAR SIR,—In your issue of May 16th, you publish, amongst the interesting list of contents, "Ten Thousand Pounds of Tea for Canada," and in your news column, page 491, are the particulars of this export, as a portion of the cargo shipped per steamship "City of Agra," namely "For Montreal, Tea, 10,669 lb." We presume, since you gave prominence to this fact by the headlines above quoted, that it was intended that your readers interested in the export of Ceylon Tea should read with gratification, that such a large amount as 10,000 lb. has been exported on one steamer to Canada direct; but surely instances of several times this quantity being shipped to Canada direct are taking place with almost every opportunity, of vessels leaving for London.

In proof of this, we shall draw your attention to the figures published in a circular issued by Messrs. Gow, Wilson & Stanton, of London, dated February 21st, in which they report "Re-exports of Ceylon Tea, United Kingdom to Canada, 1,113,165 lb. for 1895; as against 613,817 lb. for 1892, and Transshipments United Kingdom to Canada as 255,408 lb. for 1895, as against 13,330 lb. for 1892."

The direct exports Ceylon to North America are given as 714,958 lb. in 1895, as against 204,891 lb. in 1892, and as Canada takes a considerable portion (about half) of such direct exports to North America, and as Canada is now more than ever importing its supply of Ceylon Teas direct from Ceylon, and as the business, under judicious advertising, is rapidly increasing, as the figures above quoted indicate,—it must be so, that large quantities of tea are being shipped every week from Ceylon to Canada.

We ourselves are constantly receiving direct from Ceylon, in much larger quantities, and it would be interesting to know, if you have the means of looking up, the quantity of Ceylon Tea shipped direct to Toronto on through bills of lading. Having taken a very active part in the development of the sale of Ceylon Tea in Canada, we are naturally desirous that people in your country who take any interest in this matter should not arrive at the wrong conclusion that 10,000 tea exported to Canada can be looked upon as an item of interest, when, as a matter of fact, we should think, from the figures above quoted, and from our knowledge of the trend of business in Ceylon teas, that a low estimate of the present direct exports to Canada would be at the rate of half a million pounds per year, because it must be borne in mind that the 255,000 pounds quoted as transshipments United Kingdom to Canada are to all intents and purposes, and as a matter of fact, direct purchases in Ceylon, for Canada account; teas being shipped to London, to be trans-shipped there to destination in Canada.—Yours respectfully,
SALADA CEYLON TEA COMPANY,
P. C. LARKIN & Co.

NATAL TEA.

London, E.C. June 25.

SIR,—My old friend Mr. Peter France who has done so much towards the advancement of South Africa has been moved from Port Elizabeth to the Cape Town office of the African R. Mail Steamship Company. He sends me a cutting from the

S. African Telegraph respecting Natal tea. I have tested this tea and it contains a good amount of theine or caffeine, showing it is far better to drink than the mixtures that used to be shipped from Hamburg to South Africa.—Yours truly,
THOS. CHRISTY.

[The cutting appears on page 126 —ED. T.A.]

THE FASTENING OF TEA CHESTS.

26 Mincing Lane, London, June 26.

SIR,—I think it will interest you to learn that I have now perfected a nail or clamp for securing lids to tea chests so that the lids can be lifted off without damage to the package and thus leave it a usable and saleable article for repacking or otherwise. As at present the packages from Ceylon are very little used, after inspection it is always necessary to open them for the brokers, and sometimes they are again opened for sampling whilst a large proportion are exported with landed teas in them to foreign markets, thus it is an evident advantage to make the opening and closing of the tea packages as simple as practicable. My chests are made of inodorous white wood, dovetailed, grooved and tongued, are rather lighter than the momi packages and about the same price. I am making occasional shipments to Ceylon and India, and find that the trade buys readily, as the grocer here has a sale for a package which can easily be converted into a flour bin, or other useful and domestic furniture, while he finds the iron and hard wood packages are only in his way.—
Yours truly,
ED. AMES.

THE PRICE OF CINNAMON.

Magdalene House, Negombo, June 26.

DEAR SIR,—In your paper of 24th instant writing about the last cinnamon sales, you say:—"A.S. G.P. (Golna Pokuna) at the sale on the 1st instant, did not command a higher price for its firsts than 1s 4d." *Quite correct.* "The next highest prices realized were for spice from W.S. and K. from the well-known F.S. Kadirane group, and these fetched up to 13d."

This, I beg to point out, is not correct, as my 1st quality cinnamon, under two different marks, was also so'd at 13d and more, one small lot of Hora Hena Estate being sold even at 14d, and these too, in the same catalogue of the brokers Messrs. James Cook & Co. in which the sales of "Golna Pokuna," W.S. and K. appear.—Yours faithfully,

J. DE S. RAJAPAKSE.

FRUIT PACKING.

DEAR SIR,—I see that it has been discovered by a California fruit-grower that when fruit is packed in powdered borax it resists decay for months. I should wish to know, if this system of packing has been tried by anyone, and if it has been really successful.—Yours truly,
GARDENER.

EXTENT OF CINNAMON GARDENS IN CEYLON.

DEAR SIR,—Amongst the "General Gatherings" (a most interesting column) in the *Weekly Budget* it is stated:—"The cinnamon gardens of Ceylon are said to have an area of 12,000 acres." But I always thought that it was a great deal more. Who can give the correct extent?—Yours truly,
CINNAMON PLANTER.

[According to the Ceylon Blue Book for 1894 (the latest published) the area under cinnamon is 39,816 acres; but this is only approximate.—ED. T.J.]

PURE CEYLON TEA.

Billiter House, London, July 1.

DEAR SIR,—“How to secure pure Ceylon Tea being sold in England” is the text of “a gentleman interested in the Home tea trade” whose incubrations are given, if not in full, at all events in sufficient length, in the *Overland Observer*, under date May 21 of this year.

The first thing that strikes one is, that though “England” is the country to be converted from a belief in “delicious Mazawattee” and Lipton’s “best tea in the world for 1/7” and such like blends of “Far Cathay” with Lanka’s sole, Scotland is the division to be first operated upon, and Glasgow the first city in which the proposed experiment is to be tested by some lusty youths, presumably in hilts as they will have to mount many stairs, and will need all the freedom of limb possible to overcome the much climbing to be encountered in the four months’ siege of the denizens of St. Mnngo.

The next thing that occurs is, if “pure Ceylon” in the City of Lipton, the great producer of the article, has to be sought for with such care and forebodings that salvation for England cannot be expected from these, why not try the great cosmopolitan Metropolis, and perhaps a virtuous few might be found amongst the adulterating many of the modern Sodom, who, if separated from the wicked, by the imprimatur of the Ceylon Association of London, might eventually so commend the pure article as to leaven the whole lump, more or less—but rather less it is to be feared.

It is only to be expected that Ceylon Tea, like all other articles in great demand, and capable of adulteration, will be adulterated, and nothing that can be suggested outside a stringent penal act of Parliament, will prevent Ceylon Tea being used to fortify and work off cheap Chinias, and other tea rubbish of many lands.

Old planters and others interested in the genuine article being sold in its purity may speculate as much as they like on measures to prevent adulteration, and palming off spurious and inferior mixtures in place of pure Ceylon teas, but the best prevention is for the dealers in only the real leaf of the Spicy Isle to combine and advertise themselves as under the guarantee of the Ceylon Association of London to sell only the teas imported direct from Ceylon.

Whatever might be done in Glasgow under the direction of the “gentleman interested in the home tea trade” by the use of a map and the services of a dozen kilted lads, spurred on to storm the many winding stairs by the quickening strains of Scotia’s martial pipes, it is certain that other and milder means must be found for the conversion of the brutal Saxon to take his tea, as it is hoped he takes his beer pure and unadulterated.

If the correspondent of the *Observer* believes earnestly in his plan of campaign I feel sure the Planters’ Association would be only too glad to see him put it in operation—of course at his own expense—and surely one largely interested in the home trade and perhaps in Glasgow as well—can hardly expect the Planters’ Association to do more than give him their best wishes and a blessing into the bargain.

Much of the Indian tea may be all that the “gentleman interested in the home trade” says it is, but we have only his word for it that the sale of “Ceylon” is being injured by the blending that may be going on with “Indian.” So long as it is blended with Indian only, there is probably no damage done,

but the contrary, for if much of the Indian tea can be put on the retail market only after being fortified by Ceylon tea, it is a testimonial to the latter, and a guarantee that its virtue will be rewarded by a constant demand from its great neighbour for the further support of the increasing millions that will be sent from it to the world’s great market in London.

When we consider the annual increase in the consumption of tea, that Ceylon will probably never go much beyond the hundred millions, and that China is going down as India is going up, why should we, as suggested, initiate a crusade against the Indian with which we are now, to our mutual advantage, in America, running in double harness, and should be doing the same in Russia, and other countries yet to be conquered?

The last thing I should hope the Planters’ Association of Ceylon, or Chamber of Commerce of Colombo, will do, will be to countenance anything to disparage Indian teas: they may not be as good as Ceylon, but that does not affect the latter, so long as it finds a market. If the Indian is not so good, so much the better for Ceylon, and why therefore go out of our way to proclaim what—if it is a truth—will show itself soon enough for Ceylon, and much too soon for India.

It may be true that Ceylon had a great share in onsting China, but she could not have done it, however good the quality, without India, neither can the balance left of the production of the celestials be wiped out without India. Together have they conquered, and only together can they advance to greater victories.

China is not dead yet, nor Li-Hung Chang either, and we cannot tell what effort may be made in the immediate future to resuscitate the production and trade in tea from the Flowery Land. Before going to war with India let us first drive out what remains of China, and, when that is done, we shall in all probability find there will be less cry of adulteration, and less need of measures to prevent what can only be a blending of varying qualities of the same leaf, similarly prepared in the two countries.
—Yours faithfully,
JOHN TYNDALL.

MR JOHN FERGUSON, of the *Ceylon Observer and Tropical Agriculturist*, has an interesting article in the *Times* of June 1st on the subject of “The Production of Tea and Coffee in British Dependencies.” Few men know as much on this subject as Mr. Ferguson, and we regret that want of space forbids us from quoting at length from his letter. He points out, among other things, that the export of tea from India has steadily risen, year by year, from 2½ million pounds in 1861-62, until the estimate for 1896-97 is 144 million pounds. In Ceylon the export of tea 23 years ago was 23 lb. only, while for 1896 the official estimate of the total export is 102 million pounds. Verily tea has done much for Ceylon’s lovely Isle.—*Colonies and India*, June 6.

COFFEE IN B. C. AFRICA.—Says the *Central African Planter* for June:—

We have at last been favoured with the statistics of last season’s export of coffee and it is gratifying to find that the figures completely bear out the estimate published in these pages some nine months ago, viz. 150 tons. The actual quantity exported was 146 tons exactly double the export of the previous year. In addition to the actual quantity exported we have to consider the amount obtained in this country for home consumption and the amount used as seed. As 1 cwt. is by no means a large amount for seed purposes and as the number of separate plantations exceeds 100 the amount used for seed alone would be considerably in excess of 5 tons that it is certain that the actual crop exceeded 150 tons. Taking the usual calculation of £100 per ton the report shows a gross value of £41,600, the most of which goes to the benefit of this country. It however represents only a small fraction of the amount annually expended by planters in this country as of course most of the recent clearings do not come into bearing till 1897. It is to be hoped that the forecast for this year’s out-put, viz., 300 tons will be abundantly verified and thus continue the geometrical progression of the last five years.

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Eardrums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN; LONDON.

VARIOUS PLANTING NOTES.

ORCHIDS AND ANTS.—It has been observed, says *Public Opinion*, that orchids derive some benefit from the numerous ants which overrun them in the tropics, but the precise nature of the service has remained a mystery. According to a naturalist of the Botanic Gardens in Trinidad, the ants appear to foster the growth of a fungus on the roots of the orchid, and this fungus acts as an additional source of nourishment to the plant. Certain South American ants are known to cultivate fungi for their own use, and these may unconsciously sow the seed of the fungi in crawling over the roots of the orchid. Quite recently, we may add, a variety of these fungus farming ants was found in the neighbourhood of Washington, United States.

THE PLANTING INDUSTRY IN COORG.—In the course of an editorial on this subject the *Madras Mail* says:—The little Province of Coorg may be likened in many ways to the Colony of Ceylon. Not only are its interests identified with the planting industry, but the planters are themselves most enterprising; and nowhere else in Southern India is there such a large continuous area of European cultivation as in South Coorg, where it is possible for a man to ride for more than twenty miles with coffee on either hand. In Ceylon of course nowadays the cultivation is almost all tea. It is no wonder that Mr. Lee Warner wrote strongly in favour of Local Self-Government in Coorg. There is so much wisdom in this recommendation that we trust it will not be lost sight of. Coffee has been doing remarkably well in Coorg during the past few years, and it is largely to this fact that there has been such a great expansion in revenue. This surplus revenue at the end of 1894-95 was the largest ever collected in the Province viz., R3,53,496-9 5, and the total revenue the highest, viz., R9,62,935-9-7. The increase in revenue from coffee is 21-21 per cent., partly due to the vigilance of the Land Record Department. These figures are in themselves an eloquent appeal for a more generous mode of administration. What are chiefly needed are new roads, increased allotments to the P.W.D., an Assistant Superintendent of Police, and railway extension, or, omitting the policeman, the urgent wants of the Province are confined to one thing—improved communications. It has been remarked that it seems “as if the interests of the Indian Government are so vast and varied that it is unable to give the same attention to European interests that is given by smaller and more self-centred Governments, such as that of Ceylon.” In the little Province of Coorg, at any rate, it might reasonably be expected to be otherwise, for there is no mistaking the great benefits which European enterprise has conferred, or which it might still further confer, if only it were given a reasonable chance of development. It must, however, be observed that though the coffee industry in Coorg has been built up by European enterprise, at this time there are not a few Coorg gentlemen engaged in it, and it is a source of wealth to the whole population.

CLOSETS, Urinals, Night Commodes, Stables, Kennels, &c. should be lightly dredged (after cleansing) with CALVERT'S 15 per cent. CARBOLIC POWDER, to destroy bad odours and to kill or keep away insects.—The most effective preparation.—In $\frac{1}{2}$ lb., 1 lb. and 2 lb. dredgers, at 6d., 1s., & 1s. 6d. each, from Chemists and Stores.
F. C. CALVERT & Co., Manchester.

INDIAN TEA SALES.

(From *William Moran & Co.'s Market Report*.)

CALCUTTA, July 12th, 1895.

TEA.—Since our last, auctions on the 9th and 16th instants, have comprised 32,395 packages, of which 31,961 were sold. The quality offered has shown some improvement, especially on Assam growths: Darjeelings, however, are still wanting in flavour. Prices for the common grades have been a shade easier, but for other descriptions the market has been fairly steady.

Total quantity of Tea passed through Calcutta from 1st April to 18th July.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, July 9th.

CUBERS.—Quite neglected and easier. A parcel of fair quality was cleared some time ago at 32s 6d per cwt., and since then importers have been asking from 37s 6d to 40s for fine shifted Singapore. At that price, however, they have found it impossible to make progress. At today's auctions 31 packages fair brown berries, not stalky, from Bombay were bought in at 35s, a bid of 32s being refused. Another lot of 65 bags very small and dusty ordinary berries from Singapore sold without reserve, at from 19s 6d, rising to 22nd for sound, and 20s 6d for damaged quality.

CUTTLE-FISH.—A parcel of fair pale, slightly discoloured, mixed medium to bold quality sold cheaply at from 2½d to 3½d per lb. Another lot of 50 bags broken cuttle-fish bone from Penang was bought in.

OILS (Essential).—Lemongrass oil quiet, at 2½d per oz. on the spot, and 1 15-16d. per oz. c. i. f. At auction 27 cases Coch'n oil were bought in at 2½d per oz. Citronella oil is tending easier still: on the spot the quotation is 1s 6d per lb. in drums, and 1s 4d per lb. in tins; for arrival it is 1s 2d per lb. c. i. f. in drums.

VARIOUS DRUGS.—A parcel was bought in at 1s 1d per lb. today. 100 bags *Cocculus indicus* were bought in at 8s 6d per cwt. Of Coca-leaves, a large supply of 150 bales recently arrived was shown. Good Huanoco were bought in at 1s 1d per lb.; for good Truxillo character at from 7d to 1s per lb.

TEA SEED CARRYING COFFEE LEAF DISEASE!—The *Central African Planter* for May has the following alarmist note:—

We are informed by a Mlanje correspondent that the Nyasaland Coffee Company, Ltd., is importing tea-seed from Ceylon and it is stated that a permit has been obtained allowing the seed to enter B.C.A. at Chiromo. From what our correspondent says it is probable that, by this time, the consignment has already passed Chiromo. The Mlanje planters—Messrs. Moir, Bradshaw, Brown, Simpson, C x and Austen have, with commendable promptitude, already protested to H. M. Commissioner against the importation and we sincerely hope that C. M. Commissioner will rigidly enforce the present Regulations for preventing the introduction of Coffee-leaf disease into B. A. C. Ceylon already has the notoriety of introducing leaf-disease into Fiji and German East Africa but it is to be hoped that our connection with the spicy Isle will not result in settling the dreaded fungus amongst us. If such a catastrophe is to be averted we will have to be doubly cautious in all importations from Ceylon the more so in the case of tea-seed as Coffee and tea are grown in the closest proximity there. We should think this is a question for the Chamber of Agriculture and Commerce to notice and it would be gratifying to hear that the standing Committee are moving in the matter. We are fain to hope that the importation has not reached the stage our correspondent suggests because were it so it would be a grave breach of faith on the part of the Administration towards the planting Community.

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce).
Colombo, Aug. 4th, 1896.

EXCHANGE ON LONDON: CLOSING RATES, Bank Selling Rates:—On demand 1/2 7-32; 4 months' sight 1/2 1/4; 6 months' sight 1/2 9-32.

THE AGRICULTURAL MAGAZINE, COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for August:—

Vol. VIII.]

AUGUST, 1896.

[No. 2.

SEASON NOTES FOR JUNE.

WESTERN PROVINCE.—A fairly good *yala* paddy harvest is expected; in some places crops have been slightly damaged by floods. The supply of fruit and vegetables reported good except in the Negombo district where they are scarce.

CENTRAL PROVINCE.—Paddy fields are being ploughed for maha sowing. Vegetables reported deficient in Nuwara Eliya.

NORTHERN PROVINCE.—Paddy lands are being manured and ploughed. There is a fall in the price of tobacco compared with last year. *Stock.* Cattle plague still prevailing in some parts of the Mullaitivu district.

SOUTHERN PROVINCE.—The area under paddy crop in the Galle district smaller than in the corresponding season last year. Condition of crop satisfactory. Fruit and vegetables plentiful, but jak and breadfruit are scarce. In Giruwa pattu of the Hambantota district, paddy sown on irrigated land promises well, but that on unirrigated land, though fair at present, will require rain. The food supply of the pattu at present is reported to be somewhat scanty.

NORTHERN PROVINCE.—Paddy harvest has commenced and is fair except in certain tracts of the Batticaloa district reported to be damaged by blight. Tobacco prices at Trincomalee reported to be better than last year.

NORTH-WESTERN PROVINCE *Puttalam District.*—Crop prospects fair except in the Puttalam Pattu, where nothing has been done for want of timely rain; prospects of fine grain crops moderate. Chilaw district *yala* crops are thriving.

NORTH-CENTRAL PROVINCE.—Paddy Crops being reaped in certain places and at others in various stages of growth. Giugelly crop been also being reaped. *Stock.*—Cattle plague still prevailing.

UVA.—Paddy in various stages, crops reported good. Fruit and vegetables scarce throughout the district. *Stock.*—Cattle plague in Wiyaluwa.

THE INSPECTION OF MEAT.

BY G. W. STURGESS, M.R.C.V.S., &c., Government
Veterinary Surgeon.

1.

From the close relationship existing between the diseases of human beings and animals—and from the fact that certain diseases can undoubtedly be communicated to man from animals—the question of the proper supervision of the animals intended for slaughter, and the thorough inspection of the flesh after death becomes of paramount importance. This can only be effectually carried out by killing the animals in public abattoirs or slaughter-houses. Here the animals can be inspected before slaughter, and the meat afterwards, before being passed over to the butchers and sold to the public.

With the private slaughter-house system it is practically impossible to carry this out however vigilant the inspector may be, as the animals are often slaughtered, cut up, and removed under cover of darkness.

PRIVATE SLAUGHTER-HOUSES.

Before granting a license to private persons to slaughter, the following rules should influence the decision of the sanitary authorities upon each application for a license, as regards the site and structure of the premises to be erected:—

1.—The site selected should not be within 100 feet of any dwelling-house, and should admit of free ventilation by direct communication with the external air.

2.—The places reserved for the confinement of the cattle should not be within 100 feet of a dwelling house.

3.—The slaughter-house should not be below the surface of any adjoining ground.

4.—No room or loft should be constructed over a slaughter-house.

5.—A good water supply must be provided.

6.—The slaughter-house should be well paved with asphalt or concrete, and laid with a proper slope or channel towards the drain, which should be properly trapped and covered with a grating, the bars of which should not be more than $\frac{3}{4}$ ths of an inch apart.

7.—Provision for the effectual drainage of the slaughter-house should be made.

8.—No water-closet, privy, or cesspool should be constructed with the slaughter-house, neither should there be any direct communication between the slaughter-house and any stable, water-closet, privy or cesspool.

9.—Every lair for cattle in communication with the slaughter-house should be properly paved, drained and ventilated.

Distinguishing Characteristics of Flesh.

THE FLESH OF THE OX.

When freshly killed it should always be of a slightly florid hue on section, and of a firm and somewhat elastic consistency. It is moist when first cut, but rapidly dries on exposure, the colour at the same time brightens a little, consequently a fresh section should always be made each time it is examined.

To the hand the cut section should afford no evidence of soapyness or adhesiveness, neither should it be very cold or clammy. In beef there

is no odour of any importance when healthy, the causes of odours we shall notice by and by. In certain parts of the body the flesh presents what is known as a "marbled" appearance, that is due to the presence of fat, intermingled with the muscular tissue.

The carcase should set firmly, and become fairly dry in a few hours after death. This applies more to temperate countries where the meat is kept several days; in the tropics for obvious reasons it is necessary to consume the flesh very soon after death.

In animals a few months old the flesh is pale and tender; as age advances it becomes darker, firmer, and has a greater tendency to dry.

Healthy fat should be of a pale yellow colour and moderately firm. It is sometimes quite white or may be of a deep yellow tinge depending largely upon the food. It is usually very pale in cattle that have been fed upon corn and hay and generally very firm, also it is sometimes white in young bulls and American cattle.

YELLOWNESS.

The fat of some breeds of cattle is naturally yellow, particularly Jersey cattle. If the colour is exaggerated it is due to rich feeding on oilcakes or to jaundice. If due to jaundice the flesh will also be dark and soapy.

Distinguishing Characteristics of the Flesh of Various Animals.

Only a brief glance can be given to this part of the subject, as various technicalities are unavoidable and only capable of being applied when examining whole carcases, and which would be unintelligible to non-professional readers.

THE BULL.

The neck is thick and well developed and comparatively short. The fat on the breast-bone is coarse, hard, and in large quantities. The arms are well developed, and the tissues generally are coarse. There is a slight odour sometimes in very old bulls.

THE COW.

The udder if present marks the carcase of the cow; it is generally removed, but the line of section is nearly always distinct; the surrounding fat is thin and in small quantities. The bones of the pelvis are finer, but the diameter of the pelvic cavity is greater than either the bull or bullock.

THE SHEEP.

Mutton is much paler than beef and not so firm in consistence. The fat is in all cases firmer and whiter in colour, and it is distributed widely over the body. The bones are the same shape as of the larger ruminant but smaller in size. Mutton has a slight peculiar odour.

The flesh of the lamb is very pale and tender, that of the ram is red in colour, almost as red as beef, and it has often a pronounced disagreeable odour.

THE PIG.

The flesh is paler and less firm than that of the ox, especially in young pigs; it sometimes becomes dark in old pigs, especially boars. The fat is more lardy and softer than that of any other animal. The skin is a distinguishing feature, and there is always a peculiar odour, especially marked in the boar which is considerably modified by castration a few months before slaughter.

THE GOAT.

Goat's flesh more closely resembles that of the sheep; it is usually darker, dryer and firmer in consistency. The fat is rather scarce, and there is always a distinguishing odour.

(To be continued.)

IMPORTANT LOCAL DECISION *RE*
ADULTERATED MILK.

The following reports are taken over from the *Ceylon Observer* :—

A CASE OF ADULTERATED MILK.—The case instituted by Color-Sergt. Arnold Hill, against a Sinhalese milk vendor, for selling adulterated milk containing 72 per cent. water, was taken up for hearing before the Police Court yesterday afternoon. Amongst the witnesses examined in the prosecution was Col. Tidy of the Lancashire Regiment. The further hearing was postponed till Monday next, when the Public Analyst, Dr. H. M. Fernando, will be examined for the prosecution.

The further hearing of the case instituted by Col.-Sergt. Hill against his milkman, for supplying adulterated milk, was taken up this afternoon before the Police Court. Dr. H. M. Fernando, the public analyst, on being examined stated that he analysed a bottle of milk sent to him by Col. Tidy on the 27th June last. The bottle contained 70 per cent of milk and 30 per cent of water. This milk was not injurious to health. It did not contain added sugar or other foreign matter. In cross-examination he stated that pure milk contained 87 per cent of watery matter, and other parts consisted of saccharine, nitrogenous, and inorganic substance. The complainant on being recalled stated that he paid the milkman the value of this milk at the end of the month, long after he was aware that the milk was adulterated. The Magistrate found that no criminal charge could be framed against the accused, as the milk was not injurious to health, and as the value of the milk had been paid long after the complainant became aware that the milk was adulterated. The accused was then acquitted and discharged.

OCCASIONAL NOTES.

We would draw attention to another letter on the subject of Coconuts by the well-known agricultural correspondent "B," and regret that it reached us too late for insertion in our last issue.

We note with pleasure that it has been decided to hold an Agri-Horticultural Show at Nuwara Eliya next year, and that a similar project is talked of in connection with the town of Matale. The more the better, say we. Why not a Show in Colombo also?

H.E. the Governor paid a visit to the School of Agriculture on the 15th July, and inspected the various branches of the institution.

A nice crop of fruit is just now maturing in the vineyard attached to the School of Agriculture. The present month will complete the first year of the experiment in Viticulture, which has been an

important one for the colony. We learn that three gentlemen (Messrs. J. H. Barber, H. L. Daniel, and R. Pieris) are cultivating improved varieties of grapes on the "Extensive System." With better conditions as regards soil-moisture than obtain at the School of Agriculture premises, we shall expect to hear of good results.

The present issue contains the first part of Mr. Sturgess's contribution on "The Inspection of Meat," which, when complete, should form an instructive paper.

A new interest has sprung up in Apiculture and Sericulture, and a few enterprising spirits are working at these interesting if not very remunerative industries. We note that special prizes are offered for exhibits in illustrating both bee-keeping and silk-worm rearing at the forthcoming Agri-Horticultural Show, and trust that by that time the experiments referred to will have shown that the natives could profitably work at these home industries.

We have received a copy of "The Life of Ehelapola" by Mr. T. B. Pohath Kehelpannala, late a student of the Colombo School of Agriculture. The pamphlet forms an interesting character sketch of a striking personage who flourished in the last days of the Kandyan dynasty.

FOREST LAWS OF OF CEYLON.—II.

The next Ordinance which principally affected the Forest Laws of Ceylon was the Ordinance No. 6 of 1878, which was necessitated owing to decisions of the Supreme Court, which had shown that the law as it existed in 1878 was quite inadequate for the protection of timber trees grown in Crown forests. There were two processes by which Crown forests had been denuded of the best part of their valuable timber. The one was the illicit felling of timber for the purposes of sale and removal; the other was the illicit cultivation of Crown forests for the purpose of temporary crop, during the process of which cultivation valuable trees were burnt and destroyed. Illicit felling for the purpose of sale or removal was punishable under the existing law; but the Supreme Court held that where the timber was destroyed as part of the process of cultivating land, such destruction was not punishable under the then existing Timber Ordinance No. 24 of 1848. [P.C., Anuradhapura 8,830. Ram. (1877) 23; P.C., Kegalla, 41,512. Ram. (1877) 69.] Consequently it became necessary in order to protect Crown forests, to make provision that the unlawful destruction of timber should be punishable for whatever purpose it might have been destroyed. The principal object of the Ordinance No. 8 of 1878 was the enactment of such a provision. Besides the object just mentioned there were one or two important alterations in the law. One was that the definite expression "valuable timber" be no longer used, the precise trees to which the Ordinance applied being specified in the Schedule. Another important alteration made the law applicable to the destruction of saplings as well as timber trees. This Ordinance also limited the punishment by fine and imprisonment for offences against the Ordinance.

A period of seven years elapsed when the Ordinance No. 10 of 1885 was passed, the principal Ordinance under which our forests are regulated. It is intituled "An Ordinance relating to Forests and Waste Lands and to the felling and transport of timber." This Ordinance is based chiefly on the Burmah Forest Act. An expert from the Indian Forest Department was sent out to Ceylon—a Mr. Vincent—who after spending several months in examining the Forests of Ceylon made a very exhaustive report upon the subject. The result of that report was the Ordinance No. 10 of 1885.

The Ordinance comprises a vast number of details, some relating to the whole Island, and some relating in different ways to different parts of the Island. In order that the question may be properly dealt with, the Ordinance provides that the special circumstances should be dealt with by means of rules to be made to suit the varying circumstances of each district.

(To be continued.)

THE QUANTITY OF MILK REQUIRED TO MAKE A LB. OF BUTTER.

Mr. Huxton in his article on Dairy Husbandry in the Agricultural Cyclopædia refers to the churning of 100 gallons of milk from Fifeshire cows in mid-summer and obtaining $27\frac{1}{2}$ lb. of butter, which is at the low rate of 1 lb. butter to every 29 pints of milk. Mr. Aiton who has written on the Dairy Husbandry of Ayrshire reports the milk of Ayrshire cows as ordinarily yielding 1 lb. of butter to 20 pints milk. The following are other instances: Mr. Telfer's ordinary yield from Ayrshire cows was 1 lb. for $20\frac{1}{2}$ pints, when the milk was richest it gave 1 lb. per 18 pints, and when poorest 1 lb. per 24 pints.

Mr. Williams, Cork Co., in one of the most fully detailed accounts that exists of dairy experience stated that from well-fed and well-bred Irish cows he got 1 lb. butter from $22\frac{1}{2}$ pints of milk in summer, and 1 lb. from $19\frac{1}{2}$ pints in the winter, for the whole year he got 1 lb. from $21\frac{1}{2}$ pints.

The late Mr. Horsfall of Barly Hall near Otley found he got 1 lb. from 21 to $18\frac{2}{3}$ pints milk. The average yield of Mr. T. Scott's English dairies, quoted some years ago before the Royal Agricultural Society, was at the rate of 1 lb. butter to nearly 25 pints. These differences in the butter yield are of course traceable to original differences in the quality of the milk, due to differences of breed and of individual character; on differences of the period after calving and the age of the animals; and on differences of feeding.

Prof. Long referring to this matter writes: "We have of late been startled by extraordinary records of butter produce from America, where Jersey cows have been cultivated and stimulated to an almost incredible productiveness. . . . We fear agricultural maxima have little influence on agricultural averages; and while we do not refuse our belief to even the marvellous stories told of Eurotas and other extraordinary American Jerseys, we fear them in ordinary experience of the larger breeds of dairy cows in this country, 1 lb. of butter from 20 to 21 pints of milk (about $2\frac{1}{2}$ gallons) is more nearly the average.

In his interesting paper on Milk and Milk Products in India, Mr. James Mollison, Superintendent of Farms in the Bombay Presidency, states as the

result of his observations at the Poona Farm during the years 1891-93, that with cows $13\frac{3}{4}$ pints and with buffaloes $8\frac{3}{4}$ pints of milk were required respectively for producing one pound of butter. These results were no doubt obtained with the use of the cream separator.

The following tables are taken from a report by the Director of the Bombay Agricultural Departments on the dairy experiments which were conducted in that Presidency. The experiments were initiated by Mr. Howman of the London Dairy Supply Company, and show the results in butter production (1) by the native method of butter-making and (2) by the use of the cream separator:—

Mr. Mollison's average of $13\frac{3}{4}$ pints per lb. of butter is a high one, but it must be remembered that the milk came from cattle well fed and housed, and treated according to the most approved methods of dairy management. It would hardly be fair to take this as the average for an Indian cattle. The cows kept on the Poona farm are also well selected animals of the best milking breeds, such as Sind, Gir, and Aden. In the article on Milk and Milk Products by Mr. Mollison—the first part of which appears in this issue—will be found a comparative analyses of the milk of the Indian cow, the English cow, and the buffalo, which show in the percentages of fat how it is that while the average quantity of cows' milk required for 1 lb. of butter is in England about 20 pints, in India it is about 14, and the quantity of buffalo milk is about 9 pints.

NOTES FROM WESTERN INDIA.

The land available for cultivation in and near the city of Bombay is very limited, but the little that is available is made very good use of. A small field or garden in the vicinity of the city is looked upon as a very paying concern, for the produce finds a ready market. The crops grown in this neighbourhood are paddy, Indian corn, pulses, vegetables such as knolkhol, radish, turnips and bringals, fruits such as mangoes, oranges and custard apples, and fodder crops including lucerne and ramnah grass.

The paddy cultivated is very little, as the staple food is wheat which is grown at higher altitudes far away in the interior. Wherever paddy is grown, it is always first sown in nurseries and then planted out when the seedlings are about three or four weeks old.

Indian corn is sown on dry lands early in June, so that the plants may grow during the rains and the cobs mature in fairly dry weather. The cobs are gathered before the seeds are fully ripe and are eaten roasted or boiled, some of the best plants being allowed to run to seed.

The rotation of crops practised here is worthy of notice. In a field of maize, for instance, and leguminous crop such as beans or gram is first grown, and after it is gathered, the land is tilled and manured, and then the maize is sown which, in turn, is followed by a leaf crop. Then the round begins again with the leguminous crop, and the land is not allowed to lie fallow except for a few weeks just before the maize is sown. In this way while the fertility of the land is preserved, the greatest possible profit is obtained from it. The maize crop which succeeds the bean or gram is also benefited by the nitrogenous matter left in the soil by the latter.

Allied to rotation of crops is the system of growing mixed crops by which is meant raising crops of two or more kinds simultaneously on the same land. The Indian ryot fully recognizes the benefit of this method of culture and makes up for the deficiency in manuring by adopting it. At the Poona Farm I noticed that Mr. Mollison had given his sanction to this method by growing a mixed crop of bajiri and dhal in a few plots. The dhal was planted in lines 4 feet apart, and 3 rows of bajiri sown one foot apart were grown between every two rows of dhal. The special benefit of growing a papilionaceous plant such as dhal side by side with a cereal will be manifest to every one who is aware of the fact that the former class of plants can assimilate the free nitrogen of the air by means of bacteroids contained in the tubercles attached to their roots.

Cattle and horse droppings are used as manure in the form of dry cakes or "bratties" which are often spread on the land and burnt before the rains, the ashes being ploughed in soon after the burning. This practice, although it has the advantage of destroying the grubs and maggots which breed in the dung, has the serious drawback of being attended with the loss of the organic portion, especially the nitrogenous part which the farmer can ill afford to lose.

Bratties are often used as fuel, and where this is the case the ashes from the kitchen ought to form a valuable manure as it contains the potash, phosphates, and certain nitrates and other mineral ingredients of the dung.

Wool refuse is a favourite manure especially for maize.

India can boast of a greater variety of native agricultural implements than Ceylon. The ryots carry on cultivation on an extensive scale, especially on dry land. With them necessity has been the mother of invention as regards their implements. They cannot afford to loiter over about with unsuitable tools when they have vast tracts of land to be operated upon in a short space of time, and by the mere handful of labourers at their disposal. Driven to their wits' end by the force of circumstances they have invented a

variety of implements specially suited for different operations. While some of these bespeak a rather high degree of inventive skill and ingenuity, others are of a primitive kind. I shall only select a few of these for consideration here.

The Indian plough is very like the native plough used in Ceylon, but the share is thicker and stronger and goes a little deeper.

As an example of the implements of the primitive type may be mentioned the huge log of wood drawn by bullocks and used as a sort of harrow or clod-crusher and leveller after dry-ploughing.

Others, however, are of an improved or better type such as the bullock rake, bullock hoe and the seed drill. The bullock rake and the bullock hoe as their names imply are drawn by bullocks. The former is used like an ordinary spiked harrow, and the latter is used for weeding between rows of plants when they are sufficiently wide apart to admit of the bullocks walking between them without trampling the plants.

The seed-drill called *pamal* or *thiffen* by the ryots is a really useful implement and is well worth introducing into Ceylon. It is said that it answers almost as well as the English seed drill. Its price is only about five rupees.

But since of late a cheap and very convenient sowing box or machine has been invented in England, which it would be more advantageous to introduce to Ceylon. Sowing is so irregularly done in our Island at present, and so large a quantity of seed is wasted, that a cheap but efficient seed drill or sowing machine is a great desideratum and would prove a great boon.

E. T. HOOLE.

SERICULTURE.

It must be admitted that we have very few industries in the Island which are capable of giving employment to the native agriculturist and especially to the members of his family during the time they have little work in the paddy-fields. The Sinhalese cultivator is frequently accused of apathy and gross laziness, but the average tiller of the soil cannot be expected to possess the knowledge and resources necessary for experiments in connection with new industries with a view to their adoption. No one will, however deny, that when he is instructed in the details of an industry that is likely to bring him an income and will not interfere either with the cultivation of his field or with his liberty as a proprietor, he is not only ready to adopt them, but is capable of carrying on the work with success. Under these circumstances it surely behoves those who have the welfare of the country at heart to experiment in connection with and popularise such industries as will give employment to and draw forth the latent energies and capacity of a large number of the rural population. The improvement of the villager's condition cannot be effected by the introduction of any industries which require large capital and which will necessarily involve factory work and cool labour. These will benefit the larger capitalists but the material and moral welfare of the agricultural masses can only be improved by providing them with work that will not necessitate the sacri-

fice of either their independence or the neglect of their holdings, however insignificant these may be. They must be encouraged to depend on themselves and work for themselves and not to work for others to the neglect of their land; and they must not be encouraged to congregate in manufacturing centres, where with busy surroundings, keen competition and undesirable associations they begin to feel discontented, a condition which generally leads to much trouble. Under these circumstances the importance of home industries cannot be over-valued. Sericulture or the rearing of silkworms may prove to be one of the industries adapted to the peculiar circumstance of the villagers. We say "may," because there are industries which though they appear likely to be suitable, will eventually be found to contain some element which makes it impossible for the people to carry it on with success. This point can only be satisfactorily settled by one or more experiments, and there is no reason why such trials should not be undertaken in Ceylon.

Broadly speaking there are two kinds of silkworms, the domesticated or the mulberry silkworm, and the wild or the uncultivated silkworm. The domesticated silkworm feeds only on the leaves of the mulberry tree and hence for its rearing the cultivation of the mulberry plant is necessary to give the insects a proper supply of food. The mulberry grows well even in the lowcountry here, but it is doubtful whether it would thrive well when grown on a large scale. Hence, in any experiment in sericulture it might be as well to first find out what amount of success can be obtained with the wild silkworms.

We find in Ceylon a few species of moths that produce cocoons of a more or less coarse texture, but so far none of these have been found to be of much practical use. In India, out of a large number of species of wild silkworms, three have come to prominent notice as being more or less successful producers of cocoons. These, as will be seen, are likely to prove successful in Ceylon, especially as the leaves on which they feed, or on which they could be fed, are derived from plants and trees that we commonly meet with in the Island. The three important varieties of wild silks are known as the Tusser, the Muga and the Eri Silke.

It may be mentioned here in passing that the life of a silk-producing moth has four stages. The egg, otherwise called the "seed" by silk raisers is the first stage. An ounce of eggs will contain from 30 to 50 thousand. A single female moth produces from three to five hundred eggs on an average.

The second stage is that of the larva or the worm. The worm goes through generally about four stages of moults, or it may be said in its growth to cast its skin at four periods. The first moult generally takes place in five to six days, the second four to five days from the first, the third and the fourth each about four to five days; after the final moulting the worm turns into the chrysalis stage in about nine days. As a matter of course these periods vary greatly according to climate and species, but the above will furnish some an idea of the life history of the insect. Before each moult the worm generally fasts for a day or two, but in the interval it eats voraciously, and especially during the last period of its existence, and hence a silk raiser must be prepared to supply the necessary food to the insects at these stages. The spinning of the

cocoon usually occupies from three to five days, and finally the insect turns into the chrysalis. During the chrysalis stage there is a suspension of animation. The chrysalis bursts in from two to three weeks and the moth emerges. The last stage is that of the moth. The male moth has broader antennae or feelers and is more active than the female. Some hours after emerging out of the cocoon the female moth begins to deposit its eggs. The life of a moth usually extend to four or five days, but frequently to a fortnight or even longer.

(To be continued.)

HOMCO MANURE.

We have been favoured with samples of this manure prepared by the Hull Oil Manufacturing Co., Ltd. The two samples sent us are guaranteed to contain $6\frac{3}{4}$ to 7% ammonia, for which the present quotation is £3 5s. per ton in double bags f.o.b. London, for either the rough or finely-ground quality. To quote from the booklet which accompanied the samples: Homco is a vegetable manure meal manufactured from rape and other oil seeds by a patent process whereby the oil is thoroughly extracted leaving a soluble meal rich in ammonia. It is manufactured in three qualities, containing $5\frac{3}{4}$ %, $6\frac{1}{2}$ % and $7\frac{1}{2}$ % of ammonia respectively; these percentages being always guaranteed. Among other advantages, it is claimed that it does not force the growth of plants to an undue and harmful extent, that it opens and lightens stiff lands and increases the retentive properties of sandy soils for manures and water, while at the same time it is not washed out by rain. As rape seed is one of its ingredients, it is said to be a preventive against wire worm and possibly of other ground pests. The analyses given of the manure have been made by Dr. Bernard Dyer, who remarks on one of the samples: "This is an excellent rape meal for manurial purposes. It is exceptionally rich in nitrogen (equal to over $7\frac{1}{2}$ % of ammonia) and has the manurial advantage of having had nearly all its oil extracted, so that it will the more readily decompose in the soil."

MILK AND MILK PRODUCTS.

(By MR. JAMES MOLLISON, Superintendent, Government Farms, Bombay.)

The milk of neat cattle varies considerably in composition. Certain breeds yield richer milk than others. Excepting Channel Island cattle, all milk breeds of Europe yield milk which is poor in quality than the average of Indian cows. The average yield of selected Indian cows is much less than that of good specimens of any imported milk breed. Choice specimens of Jersey or Guernsey cows yield 30 lb. or more per day of rich milk, whilst Holstein and Shorthorn cows have each a record of over 70 lb. per day, though in quality the milk is poor. The yield of Indian cows surely exceeds 20 to 25 lb. per day.* Twelve to 16 lb.

* In reckoning quantity from weight of milk, the weight of one imperial quart (40 oz.) is taken as $2\frac{1}{2}$ lb., thus 20 lb., 25 lb. and 16 lb. will respectively correspond with 8, 10 and $6\frac{2}{3}$ quarts or again with $12\frac{1}{3}$, $15\frac{1}{3}$ and $9\frac{1}{3}$ Ceylon bottles of 26 oz. respectively.—ED. A.M.

more nearly, however, approximate to the average of good cows in full profit. Buffaloes on an average give considerably more than cows in India, and their milk is also richer. Under skilful management there is no reason why the milk breeds in India should not be very much improved. It is quite within the bounds of possibility to breed up Indian buffaloes to become one of the best butter-producing breeds in the world. The best results respectively from a buffalo and a cow during the years 1891-93 on the Poona Government Farm are tabulated below:—

	Number of days in milk.	Total yield of milk.	Number of days dry.	Value of milk at current market rates.
Buffalo...	459	6,669 lb.	127	R417
Cow ..	471	5,024 ,,	44	335

N.B.—Giving 1 lb. butter for 11 lb. and 17 lb. milk respectively for buffalo and cow.

The comparative richness of milk may be gauged by the following analyses:—

		Average composition of milk.		
		Indian cow.	Indian buffalo.	English cow.
Solids.	Water	86.13	82.05	87.20
	Butterfat	4.80	7.98	3.70
	Casein & Albumen	3.03	4.00	4.00
	Milk Sugar	5.34	5.18	4.40
	Ash	.70	.79	.70

(To be continued.)

Correspondence.

(To the Editor, "Agricultural Magazine.")

30th June, 1896.

DEAR SIR,—How frightfully behind the times I am. I have only just read the letter of "Cocopalmit" dated the 18th March! It is cheering to find my old friend as assiduous an agriculturist as he is of Tamil Literature.

He writes enquiring whether a statement which appears in pp. 72-73 of "All About the Coconut Palm" which he quotes at length is true. My experience confirms it. If he will call over to see me I will shew him the hollow cylindrical tree, the tree with the whole stem less a small portion of it destroyed, the barkless tree and the tree with almost the whole bole devoid of roots, growing and bearing well. The writer of the letter he quotes from says that as coconut trees have no bark (is this so, and what is the outer covering of the stem which peels off in disease?) planters cannot force them into bearing by ringing the bark. To force a barren or badly bearing tree into fruitfulness, burn rubbish round the stem. The bark will in time peel off and the tree will be exceedingly fruitful. Another "dodge" is to set fire to the top of a coconut tree, the result is the same.

I wish very much to see the plantation with 40 trees to the acre which causes amusement to neighbours and yields from 200 to 800 nuts per tree per annum. The amusement and the field must both be very gratifying to its proprietor. In answer to my friend's concluding query, I must honestly confess myself a sceptic.

That individual trees bear at the rate of 200 to 300 (not 800) one can believe; but to be asked to believe that the trees of a whole plantation bear at this rate is an over-draft on one's credulity.

Now as to the number of branches on a full-bearing coconut tree. Some authorities in "All About the Coconut Palm" say the tree throws at a spathe once a month, others every fortnight. There are certainly more than 12 bunches on a heavily-bearing tree, and they correspond with the branches from 24 to 36, but how is it that at every bi-monthly picking two bunches from each tree is the rule and three the exception? If a twelve-month elapses between the bursting of the flower spathe and the picking of the ripe fruit, a tree must either have 12 bunches or nuts must ripen in 6 months! "Cocopalmit" says the plantation he writes of bears 36 bunches per tree. Do the trees yield six bunches at each bi-monthly picking?—Truly yours

B.

GENERAL ITEMS.

Tape-worm in calves is a common and troublesome experience with stock-owners. Veterinary Surgeon D. Hutcheon of the Cape referring to it says:—"There are several medicines which destroy or expel tape-worms. Turpentine, a tablespoonful mixed with a teacupful of raw linseed oil. Powdered sulphate of copper, 40 grains (half a teaspoonful) mixed with ten ounces or a breakfast-cupful of water. Cooper's powder, one teaspoonful, flowers of sulphur seven teaspoonfuls, mix thoroughly and give a teaspoonful of the mixture. The liquid extract of male fern, a teaspoonful, mixed in a little oil. These doses are for calves about 3 months old; older calves may get a little more, and younger ones a little less. The dose should be given in an empty stomach after a 12 hours' fast at least, and a longer fast is better if the calves are not too weak.

A correspondent of the *Cultivator and Country Gentleman* advises anyone having a cow with the habit of holding up her milk to give a sufficient quantity of grain usually fed to keep her busy for the time required to milk.

A cow suffering from inflamed udder should be milked *thoroughly* three or four times per day; under no circumstances should the udder be full and distended any length of time. For an inflamed and swollen udder foment frequently with hot water and apply vaseline or lard. Another remedy, highly recommended, is a mixture of sufficient cow's milk with as much salt as will make a thin paste; this should be used to anoint the udder four or five times per day.

There is now on view, at Bombay, a poultry farm—started apparently with the object of popularizing a certain make of incubators—in which some 6,000 eggs are being hatched.

The fodder grass cultivated last year at the Seebpore Experimental Farm were *sorghum*, *reana*, and guinea grass. *Sorghum* and *reana* have been grown for many years on the Farm, and found to yield a profitable outturn. Last year *sorghum* was grown on a small area (15 cottahs), and the yield of grass in two cuttings amounted to 16,893 lb. per acre. *Reana* was raised on 10½ cottahs of land; it yielded three cuttings, the outturn

amounting to 19,621 lb. per acre. An area of 12½ cottahs was newly planted during the year with guinea grass. The crop shows a vigorous growth, and promises to yield a heavy outturn for several years. The whole of the fodder raised on the Farm was fed to farm cattle.

Mr. John Hughes, the well-known analytical chemist, referring to his tour in Ceylon, says:— I was very much astonished at the small value apparently attached to the use of burnt lime from coral or from some of the numerous local deposits of magnesium lime stone, which very frequently occur in irregular masses interspersed among the prevailing granitic formations of the Island. At home the value of lime upon all arable soils is so fully recognised by practical agriculturists, that it would be unnecessary to enter at any length into a discussion of its merits Lime is a necessary constituent of all permanently fertile soils, for it is a requisite element of the ashes of plants. It assists in rendering both the organic and inorganic portions of soils available as plant food. On all flat land rich in organic vegetable remains, lime will be found especially valuable for improving the physical as well as chemical condition of the soil."

Dr. Watt writing about tea-blight refers to the part played by white ants in spoiling the tea plant. He believes that no tree is absolutely proof against this destructive pest, and that it is certain that if it does not attack trees while they are living, it often does as soon as they are dead. Excessive pruning, as a common cause of the white ant pest, is dwelt upon with proper emphasis.

A late member of the Indian Civil Service writing on the Salt monopoly says:—"The masses consume far too little salt owing to its dearness, and give none to their cattle; hence, most doctors agree, the great liability to zymotic and other diseases among men, and to murrain among cattle Salt is the basis of most important chemical manufactures, which cannot be carried on in the Empire under the present system with success."

It is proposed to confer additional powers on District Boards in Bengal, the necessary expenditure of enforcing which is to be drawn from the Road Cess. These Boards will thus be empowered to establish and maintain Veterinary Dispensaries for the reception and treatment of horses, cattle and other animals, to appoint and pay qualified persons to prevent and treat diseases of horses, cattle and other animals and to provide for the improvement of the breed of horses, cattle, &c. The *Indian Agriculturist* of May last is not greatly in favour of the new measures proposed, believing that the amount of good that will be ensured will be disproportionate to the expenditure incurred.

We hear of Ramie fibre being largely cultivated in Java for export to Singapore, and that European merchants are said to favour its extension by freely giving advances to growers, several of whom have also been provided with working capital.

Veterinary Captain Pease of India has discovered the fact that the death of cattle due to eating Jowari (*Sorghum vulgare*) at certain seasons, especially during droughts when the plants become stunted, is due to large deposits of crystalline nitrate of potash found in the stalks.

COLOMBO, SEPTEMBER 1ST, 1896.

[No. 3.

REPORT ON THE CULTIVATION OF COFFEE IN MEXICO.

(By Mr F. Stronge, Secretary of Legation.)

INTRODUCTORY.—The cultivation of coffee in Mexico dates from the commencement of the present century, and it has long been known that many districts in various parts of the country are probably as well suited to the growth of the plant as any in

the world. The unsettled state of the Republic, however, retarded progress in this as in many other respects, and it is only of late years that the capabilities of the country as a coffee producer have attracted the attention which they undoubtedly deserve.

The almost total failure of the coffee plantations in Ceylon and all Eastern countries, and the recent bad coffee harvests in Brazil, together with the fall in silver and the consequent reduction in the price of land and labour in this country have encouraged planting in Mexico, and the profits which have already been obtained seem to justify a further extension of the industry. Under these circumstances, and in view of the fact that before long a considerable amount of British and American capital will probably be invested in coffee plantations in Mexico, some information on the subject which has been obtained from good sources may perhaps prove of interest.

A considerable area in various States in Mexico is suited to the growth of coffee, but as many conditions are required to ensure its profitable cultivation, great care should be taken in selecting the site of the proposed plantation.

PRE-REQUISITES FOR SUCCESS.—The following are the principal points to which attention should be paid:—1. Soil; 2. Climate; 3. Communications; 4. Labour.

1. *Soil.*—The coffee plant can be cultivated on various descriptions of soil, but it thrives best on light, porous loam of considerable depth, which has not before been brought under cultivation. Clay land should generally be avoided as unsuitable.

In Mexico the best land is generally covered with virgin forest, and clearing it is the first operation the planter has to undertake. A rolling surface is to be preferred as it affords greater facilities for drainage, but very steep slopes are not as a rule to be recommended.

2. *Climate.*—The best temperature is one varying between 65° and 85° Fahr., which can be obtained in nearly all of the States in the Mexican Tierra Caliente. Frost kills the plant, and the fierce rays of the tropical sun if untempered by abundant moisture are almost equally injurious. Most authorities on the subject agree that coffee thrives best where the rainfall is at least 100 inches per annum, and where it is pretty evenly distributed throughout the year. It should be noted, however, that coffee has been and is cultivated with some success in districts (such as Cordova, in the State of Vera Cruz) where the rainfall is far less. Immunity, or at least protection, from high winds is very desirable. An eastern exposure is to be preferred where the weather is generally cloudy, and a western in a sunny climate. Some writers attach great importance to the height of the plantation above the sea, and assign limits of altitude for the choice of a site. It has, however, been shown by experience that suitable climatic conditions are to be found at a wide range of elevation, and that coffee of the highest quality can be grown almost at the sea level.* In selecting a site for a plantation too much attention cannot be paid to soil and climate, and it has always been found to be good policy to give even a comparatively high price for land where these were thoroughly satisfactory.

3. Facilities of communication are also of great importance. Railways have been much developed of late years, and their extension is being carried on rapidly. Still, some districts which would otherwise be very suitable for coffee planting will probably for some time to come be too inaccessible to be recommended.

* Notably in Liberia

As freight is generally cheaper by water than by land, a navigable river in the neighbourhood of the plantation is to be preferred even to a railway. In many parts of the country roads can scarcely be said to exist, and the necessity for railway or water communication to within a moderate distance of the plantation is even greater than it would be in more advanced countries. It must also be borne in mind that the cultivation of coffee is almost always combined with that of other crops, some of which are very bulky and cannot easily be disposed of without facilities of transport.

4. It is very desirable to settle in a district where labour is easily obtained, and although some authorities maintain that imported labourers are more easily controlled, the expense of introducing them is considerable, and many practical difficulties have to be overcome.

WAGES.—The wages paid vary in different districts, but the average rate for the whole country was officially estimated in 1892 at 37c. Mexican currency (or 9½d.) per diem. Since that date prices have certainly risen and the daily wage is now generally placed at about 50c. (1s. 1d.). Both employers and employed frequently prefer piecework to a daily wage, particularly for such work as clearing land before planting the coffee.

LABOUR.—The Mexican labourer requires careful handling if the most is to be made of him. A rich soil and a tropical climate supply nearly all his requirements, with little effort on his part, and he will not easily submit to harsh or unfair treatment from his employer.

Many planters find it advantageous to give their labourers small allotments, which they can cultivate themselves, in addition to their wages. They maintain that the labourers themselves appreciate this system, and that where it is in force they become more disposed to remain working on the same estate.

In some districts the Labour Question is the planter's chief difficulty. The coffee plants must be kept clean, and the berries must be picked at the proper time. These operations cannot be postponed, and it is useless to undertake coffee cultivation without a sufficient supply of hands.

THE PLANTATION.—As the best coffee lands are almost invariably covered with forest or jungle, the planter's first task is to clear this away. The brushwood is cut out with the "machete," a species of cutlass; and the heavy timber is afterwards felled with an axe. Such timber as can be used on the estate or can be disposed of is then removed, and the remainder is afterwards fired. On most plantations in Mexico it is usual to preserve the large trees for shade; but in districts where the best climatic conditions exist this is unnecessary. Much shade is in itself detrimental to the fullgrown coffee plant, and localities where it is required owing to great sun heat and lack of proper moisture should be avoided.*

* Although there can be little doubt that where the climate is most suited to the growth of the coffee plant shade is unnecessary and even injurious, the practice of having most of the larger trees of the natural forest as shade for the coffee trees is so general in Mexico that it cannot be passed by without fuller notice. Many persons possessing considerable experience of coffee planting in Mexico will even be found to maintain that shade is absolutely essential, and it is quite possible that in the districts with which they are best acquainted such may be the case. On the other hand, in countries where coffee has been extensively cultivated for a longer time than in Mexico, the plant certainly succeeds better without shade. Further experiment is perhaps required before a definite conclusion can be arrived at as regards this country, but it will scarcely be denied by the most enthusiastic supporter of the Mexican system that the tendency has been to make the shade too thick. The truth seems to be that coffee can be cultivated profitably in districts which are not naturally suited for it, and that in some of these shade is really necessary

NURSERIES.*—When the clearing of the land is commenced, a suitable spot is selected for sowing the coffee-bean, in order to establish a nursery, to be made use of in the following year. Trees required for the first planting are generally purchased from existing coffee plantations. The spot selected for the nursery should be thoroughly cleared of trees, should be easily irrigated, and of average fertility. In Mexico it is usual to leave some of the trees as shade, but in other places it has been found that the drip is injurious to the young plants, and that it is far better to arrange a shade of cut brushwood. Long ridges are formed with a width of from 4 to 6 feet, with walks between, in order that the workmen may later on reach the plants when it is necessary to clean them. In forming the ridges the earth should be well broken with hoes to a depth of at least 6 inches, the stones picked out, and the surface smoothed down. The ground is then ready for the coffeebean. The beans are dispulped and allowed to foment, so as to admit of the saccharine matter being washed off. When this is done the beans that float on the top of the water are taken away as being unsuitable, and those which sink to the bottom are placed to dry for one day in the sun, and for two additional days in the shade. They are then ready to be sown.

The sowers make small furrows in the earth with a pointed staff across the ridges, at a distance of 5 inches apart, and 2½ inches deep. Another labourer follows, placing the coffee-beans in the furrows 4 inches apart, until the ridge is finished. The beans are then lightly covered with well-sifted earth, without been pressed down, and are afterwards watered with a sprinkler. Subsequently the ground is watered every two or three days, and in from forty to sixty days the plant begins to grow. Care must afterwards be taken to keep the ridges free from weeds, and in about eight months the plant is ready for transplanting.

Slightly different methods are sometimes adopted, and sometimes the young plants found growing underneath the coffee trees are planted direct in the plantations, but this system is no longer considered a good one, and has been generally abandoned.

The time for sowing varies in different States, and in some of them sowing is carried on at all times of the year. It is desirable, however, to time the sowing of the seed in the nurseries in such a way that the plants may be from 8 to 9 inches high in the planting season. It may be noted that in Mexico the plants are often kept much longer in the nurseries, but this plan has not been found to answer in other countries, where the scientific study of coffee cultivation is much more general than is the case here.

In transplanting the trees to their final destination, the labourers should be given a base line, from which a rope should be stretched at right-angles, with marks at the required distances, say 6 feet apart. An acre of ground holds about 950 trees, planted 6 feet apart, with 7 feet between the rows. This opening is very generally adopted, though some planters in this country prefer to plant at greater distances. Special care should be taken in planting the trees that the tap root is not twisted or bent. Nipping off the tender portion, if done in the right way, does not materially affect the growth of the tree, and obviates the danger of its being turned up, which in a year or two kills the plant. The other precautions to be taken in planting do not require special mention, as they are such as would commend themselves to anyone having even a slight knowledge of arboriculture. The best time for planting is the early part of the rainy season.

to protect the plant from the excessive heat of the sun. Owners of land in comparatively hot and dry districts may find it necessary to shade their plants with forest trees or, in extreme cases, even with bananas, but such localities should be avoided by persons who have a free hand in the selection of a site for their plantation.

* The following description is mainly taken from a work by Mr. Taylor.

IRRIGATION AND MANURING.—Irrigation and also manuring are sometimes resorted to in Mexico, but if a suitable site has been selected, neither will be necessary on a new plantation. It may be added that the practice of manuring the nursery ground is not a good one, as it unfits the young plants for their ultimate destination.

CLEANING.—It is very necessary that the young trees should be kept clear of weeds, a matter to which in Mexico insufficient attention is generally paid. Weeding should be carried out every month, and though it is an expensive operation, the cost of the labour will be amply repaid by the yield of coffee. Hand weeding is to be preferred as being both cheaper and more effectual.

TOPPING AND PRUNING.—In Mexico, where empiric methods have hitherto largely prevailed, there is some divergence of opinion on this subject. In other coffee-growing countries, however, no doubt is entertained that the plant should be topped at from 3 to 5 feet from the ground, the object being to confine the sap, so that not only primary branches but secondaries and tertiaries may also bear their crop from 9 inches from the ground upwards. On rich soils the trees may be allowed to grow taller than on poor lands. Topping should be done with a knife, and only on the matured wood, otherwise the wound will bleed and the tree will be ruined. The trees are generally pruned between the second and third year, after the crop has been gathered. The operation is repeated in subsequent years, and the plant is kept as far as possible in the shape of a low symmetrical bush, without straggling or unproductive branches. On badly managed plantations, and particularly where the shade is too thick, the plants become drawn up, poorly furnished, and comparatively unproductive.

HARVESTING.—The coffee berry ripens at different seasons in different places, but in most localities the principal picking takes place in the late autumn, and in the winter. The berries are picked off as soon as they become bright red in colour, and either the same evening or the following day the pulp is removed by means of a machine called a pulper.*

The berries fall from the machine into a receptacle of stone or wood, in which they remain from 12 to 24 hours. They are then passed into a lower receptacle, into which water is poured, and are stamped or trampled upon until the sticky glutinous substance disappears. The beans which float on the top, being of inferior quality, are collected and dried separately, and the remainder are spread out in the yards or on mats to dry. This requires 4 or 5 days' exposure to the sun. The parchment-like skin is loosened by rubbing the berries between the palms of the hands. The coffee when dried is stored in granaries, and afterwards beaten, winnowed, sorted, and packed for export. All these operations, though somewhat complicated to describe, are really of a very simple character, and the whole art of treating the coffee after it is gathered, though requiring some care and attention, may be acquired with very slight experience. Machinery, which is comparatively inexpensive, is gradually taking the place of hand labour, and is, no doubt, more economical, particularly on large plantations, but the older methods are still very generally employed. It has been estimated that a complete set of machinery for a large plantation would cost from 600*l.* to 1,100*l.* On small plantations, however, a hand pulper costing some 12*l.*, or rather more, will probably be found sufficient machinery with which to commence operations, more being added as occasion requires.

AMOUNT OF CAPITAL REQUIRED AND PRICE OF LAND.—The intending planter will find a capital of 1,500*l.* amply sufficient for his requirements. It is far better to begin planting on a comparatively small scale, and to gain thorough experience of the country and the business before embarking on an unnecessarily large undertaking. Some 250 acres is as much as a beginner should attempt to deal with, and even

of this only 200 acres should be planted with coffee, the remaining 50 acres being left under timber, or applied to other purposes.

Good lands for planting can be obtained at from 18*s.* to 1*l.* 10*s.* per acre, and sometimes even cheaper. If then we take the mean between these two prices, 250 acres would cost 300*l.*, and the planter with 1,500*l.* capital would still have 1,200*l.* in hand with which to meet initial expenses and to maintain himself until his plantation came into full bearing. At first sight this sum will appear unnecessarily large, but in a country where credit is not easily obtained, and where the interest on borrowed money is very high, it is well to hold a reserve of capital as an insurance against unforeseen accidents. The failure of a large number of foreigners in this country may be attributed to neglect of this precaution.

COST AND PROFIT.—This is a subject on which there exists an extraordinary diversity of opinion, and many estimates, though quite honestly put forward, are, in fact, far too favourable. Calculations based (as is frequently the case) on the ascertained produce of a single plant are especially misleading, for, however favourable the conditions may be, the different plants vary both in the quantity and quality of their yield, and some are altogether unproductive. Perhaps the best plan is to take the average cost of cultivating an acre, and then to give an estimate of the value of the crop for the first 5 years. The following figure will be found to be pretty near the mark, but if anything they show a smaller return than may be expected if all the conditions are favourable:—

COST OF CULTIVATION PER ACRE DURING FIRST FIVE YEARS.

	Amount.		
	£	s.	d.
Clearing land	1	4 0
Staking and digging holes for 1,000 trees	0	14 0
Purchase of 1,000 young coffee trees..	0	10	0
Planting 1,000 trees	0	6 0
Replacing loss of coffee trees	0	3 0
Monthly cleaning for five years	6	0 0
Cost of harvesting 2,600 lb. of coffee including freight, taxes, &c., at 8 Mexican cents per lb..	..	21	10 8
Total	30	7 8

PRODUCE AND RECEIPTS PER ACRE.

	Amount.		
	£	s.	d.
First year	Nil.	0
Second year, 200 lb., sold at 21 Mexican cents	4	11 0
Third year, 400 lb.	9	2 0
Fourth year, 800 lb.	18	4 0
Fifth year, 1,200 lb.	27	6 0
Total	59	3 0

In making these calculations it has been assumed that a good site has been chosen, and that the land and its produce have been properly treated. On the other hand, the price obtained for the bean—a matter which is not entirely in the planter's control—has been estimated at a low figure. It may be mentioned, however, that scientific cultivation of the plant and careful treatment of the bean after picking will often raise the value of the produce by improving its quality as much as 25 per cent.

The cost of making the nursery and the necessary roads or tracks has not been included in the above estimate, but these expenses are not heavy, and appear altogether inconsiderable when calculated per acre. Moreover, as this work is of a permanent character, it may fairly be charged to capital account. The same may be said of buildings, tools, &c., the cost of which has been estimated as low as 50*l.* for a moderate-sized plantation. It seems unlikely,

* Small native cultivators do not, as a rule, use a pulper. They first dry the berry and then tread out the grain from the dry husks with the feet.

however, that anyone accustomed to live either in Europe or the United States would be satisfied with so low a standard of comfort as is implied by these figures. The cost of the house must, of course, largely depend on the habits and inclinations of the planter, but if he be a person of moderate requirements some 100% to 200% should cover his expenditure on this head.

In treating of the expense of starting a plantation it should be mentioned that the cultivation of other crops is frequently combined with that of coffee. For instance, maize may be advantageously planted between the rows of coffee plants on newly cleared land. The shade is most beneficial to the trees at this stage of their growth, and the profit on the crop may be reckoned at about 25 per cent. on the cost of clearing the land.

In its fifth year of growth the coffee plant attains its full power of production, and the estimated yield for that year may be accounted the normal crop. By that time, too, the initial expenses in connection with that part of the plantation will naturally have ceased. The account for the sixth year should, therefore, stand approximately as follows:—

EXPENSES PER ACRE IN SIXTH AND SUBSEQUENT YEARS.		Amount.
		£ s. d.
Clearing or weeding	1 4 0
Pruning, &c.	0 5 0
Harvesting, &c., 1,200 lb. coffee	10 8 0
Total ..		11 17 0

RECEIPTS PER ACRE IN SIXTH AND SUBSEQUENT YEARS.

		Amount.
		£. s. d.
1,200 lb. coffee at 21 Mexican cents	27 6 0

It will be seen that these figures would admit of liberal allowances for interest on capital and for personal expenditure, and would still leave a substantial balance in the planter's favour.

GENERAL REMARKS.—In purchasing an estate in Mexico, a new comer should as a rule have recourse to a reliable foreign agency. Direct negotiations with the owners of the soil are often extremely tedious, and they should not be undertaken by any one who does not possess a thorough knowledge of the country. Care must of course be taken to obtain a good title to the land purchased, and in most cases this can now be done without much difficulty or expense. In some districts the Indian villagers lay claim to certain rights over adjoining lands, and however unfounded such claims may be, they are sometimes a source of great irritation and consequent annoyance to the foreign planter. It will almost always be found, however, that these difficulties may be overcome by a little tact and liberality.

A foreigner buying real estate should, if he desire to preserve his nationality, take the proper legal steps to do so.

The intending planter will generally do well to spend some little time in the country before making a purchase, and should if possible acquire some practical knowledge of his business at an existing plantation. He will be apt to think that by waiting he is letting slip many a golden opportunity, but such opportunities will probably recur later, and the experience he will have gained will save him much loss and disappointment. A considerable number of small foreign capitalists in this country would probably admit that for a year or two after their arrival, experience was their only profit, and that it had been gained at a needlessly high price.

In order that this report may be comprehensible to English readers all values have been given in sterling, calculated at 26d. to the Mexican dollar. Mexico, however, uses the silver standard, and though the silver price of labour, &c., has not altered very much the equivalent price in gold has fallen considerably of late years and remains an ever-varying quantity. It is obviously to the advantage of the

English capitalist settling in Mexico that the price of silver should remain low as compared with gold; first, he receives more silver dollars in exchange for his sterling capital, and secondly, whilst most of his outgoings are in the cheaper currency, any produce exported is ultimately paid for at gold rates.

In conclusion it may be mentioned that there is probably no country in the world where the settler must more exclusively depend for success on his own energy and ability, and that it is far more difficult than in eastern countries to secure the proper conduct of a business without the constant supervision of the person directly interested in it. Moreover different problems have to be faced in different parts of the country, and in some localities coffee cultivation has scarcely yet passed the experimental stage. It is impossible to make exact calculations of the profits of an undertaking under such conditions.

The total exports of coffee from Mexico for the past 5 years are stated in the Mexican official returns to have been as follows:—

Year.	Quantity.
	Kilos.
1890-91	14,656,777
1891-92	11,058,279
1892-93	14,514,949
1893-94	18,866,590
1894-95	16,512,648

The principal coffee-producing States are Vera Cruz and Oaxaca to which may be added Michoacan. Colima coffee is also well-known in the market though the quantity produced there is much smaller than in even the last of the above-named States.

Mexican coffee is exported almost exclusively to the United States.

The price of coffee in the United States in the fiscal year 1893-94 ranged from 16 to 18½ c. gold (8d to 9½d) per 1 lb. for Rio standard (vide United States Return of Commerce and Navigation). Mexican coffee always commanded a somewhat higher price.

sweet Oranges unless they are the results of hybridisation with some other species or variety. The evidence, however, is somewhat conflicting. The experiments of Galesio, published in 1811, seem to show conclusively that the belief that they produce bitter fruit, which Mr. Dod suggests is quite generally held by gardeners, is erroneous. In his *Traite du Citrus*, Galesio says, "I have during a long series of years sown pips of sweet Oranges, taken sometimes from the natural tree and sometimes from Oranges grafted on bitter Orange trees or Lemon trees. The result has always been trees bearing sweet fruit, and the same has been observed for more than sixty years by all gardeners of Finale. There is no instance of a bitter Orange tree from seed of sweet Oranges, nor of a sweet Orange from the seed of bitter Oranges. . . . In 1709, the Orange trees of Finale, having been killed by frost, the practice of raising sweet Orange trees from seed was introduced, and every one of these plants produced the sweet-juiced fruit."

Maefadyen's statement regarding the experience in Jamaica is, however, in opposition to Galesio. Maefadyen says, "It is a well-established fact familiar to everyone who has been any length of time in this island, that the seed of the sweet Orange very frequently grows up into a tree bearing the bitter fruit, numerous well-attested instances of which have come to my own knowledge. I am not aware, however, that the seed of the bitter Orange has ever grown up into the sweet-fruited variety." Duchassaing says that in Guadeloupe the sweet Oranges often yield bitter fruit, while according to Dr. Erust, at Caracas they sometimes yield sour but not bitter fruit. Brandis, who is considered one of the highest authorities on this subject, relates that at Khasia, in India, so far as he can verify the fact, the extensive plantation of sweet Oranges are from the seed.

It is difficult to harmonise these conflicting statements. The very extensive experience of Orange growers in Florida, California, and Louisiana entirely corroborates Galesio's statement. In Florida for many years the policy has been extensively followed of growing trees from seeds of sweet Oranges, and in all cases known to the writer, sweet Oranges, usually of a very fair quality, have been produced. Indeed, the fruit of the sweet seedling Orange tree in Florida is of superior quality to the fruit commonly imported into the United States, and is well-known in the markets of New York, Philadelphia, &c. Probably one-fourth of the Florida Orange groves, which in the season of 1894-95 yielded over one billion Oranges, are sweet seedling trees. It is so thoroughly understood that seeds from sweet fruit produce sweet Oranges of a fair quality, that no grower has any hesitation to rear extensive groves from sweet seed trees. Since the severe freezes of the winter of 1894-95, which killed to the ground almost all of the trees in the State, many groves which were originally budded on sweet stock are being re-grown by allowing sprouts, which have been thrown up by the sweet seedling stock, to grow into trees without budding. This illustrates how well it is known by Florida growers that sweet seedling Orange trees produce good sweet fruit. In Louisiana and California sweet seedling trees have also been grown to considerable extent, and always, so far as I can learn, with the same results that from seeds of sweet Oranges sweet fruit is produced.

Mr. William Fawcett, director of the Jamaica public gardens, states that, "The evidence goes to show that Maefadyen's experience was exceptional in finding that the seeds of the sweet Orange sometimes produced trees with bitter fruit. . . . The danger in planting seedlings of the sweet Orange appears to be small."* Mr. Syme also says,† "The popular opinion in Jamaica that the majority of the seeds of a sweet Orange will produce sour Orange plants is not quite well founded, though there need be little surprise felt if a goodly proportion of the trees are productive of sour fruits. It may be safely asserted that there are few good sweet Orange trees in this island (Jamaica)

THE REPRODUCTION OF THE ORANGE FROM SEED.

In your issue of April 25, 1896 (p. 527), I notice Mr. C. Wolley Dod suggests that it is generally believed by gardeners that Orange trees raised from the seed of a sweet Orange produce bitter fruit unless grafted on to the sweet Orange tree. As I am somewhat familiar with Orange-growing in Florida, having spent several years here in studying the industry, it may not be out of place for me to give some notes regarding this.

SWEET ORANGE (CITRUS AURANTIUM).

The seed from the fruit of the sweet Orange, I think, we may safely conclude, invariably produces

* *Bull. Bot. Department of Jamaica*, No. 4, Nov., 1887.

† *Bull. Bot. Department of Jamaica*, No. 42, April, 1893.

so isolated from inferior varieties, sour-fruited Shaddock, Grape-fruit, Citron, Lemon, or Lime trees as to be beyond the influence of the fecundating pollen of the latter. It is inferentially chiefly to this influence, rather than to an inherent tendency in the tissue, that many seedlings, raised from sweet Orange seed, exhibit what may be termed degenerate or unmarketable fruits."

In the Reports from the Consuls of the United States on fruit culture in their several districts, in answer to a circular from the Department of State, sweet Oranges are reported to be grown wholly or largely from seeds in the following places: Morocco, Guerrero (Mexico), Ecuador, Jamaica, Guadeloupe, Porto Rico, Syria, Sidon, Philippine Islands, Naples, Azores Islands, Spain, &c.*

Far the greater portion of the evidence, it will be seen from the above discussion, supports the belief that seeds from sweet Oranges commonly produce sweet fruits. When bitter or sour fruits result from planting sweet Orange seed, it is probable that other seeds have been accidentally mixed with them or that they are the results of accidental hybridisation. Sweet Oranges are almost invariably grown near sour Oranges, Lemons, Limes, Pomelos, &c., and it is not greatly to be wondered at that from seeds formed under such conditions a hybrid occasionally arises. Both Fawcett and Syme think this is what misled Macfadyen. Stubbs and Morgan † also mention this as one of the main causes of the variation in the quantity of seedling Oranges. That perfectly fertile seeds may be obtained by hybridising the different species of Citrus I have incidentally proven in the course of pollination experiments which I have been conducting under the direction of the U.S. Department of Agriculture. The following instances may be cited—

Parson Navel Orange (a local variety of the common sweet Orange, *Citrus aurantium*), which is commonly seedless, crossed with pollen from the acid Lime (*Citrus limetta*), produce three full seeds, which were planted, and gave four seedlings, two embryos of one seed developing.

St. Michael Blood Orange (*Citrus aurantium*), crossed with pollen of Grape-fruit or Pomelo (*Citrus decumana*) formed fifteen well-developed seeds, which were planted, and gave twenty-two seedlings. If seeds thus artificially hybridised are fertile, there is no reason to doubt that seeds accidentally hybridised may be fertile.

In each of the above cases the number of seedlings resulting is in excess of the number of seeds planted. This introduces an interesting feature into experiments of nature. It is a well-known fact that most species of citrous fruits produce several embryos, some seeds producing as many as twenty-five; only from one to three of these, however, commonly develop. Crüger, Schacht, Hofmeister, Strasburger and others have carefully studied this interesting polyembryonic development; and it appears, so far as we yet know, that only one of the embryos in each seed is formed by the act of fecundation, the others being what are termed adventive embryos, developing from the side of the embryo sac. It is thus probable that only the sexually-developed embryo will be influenced by the hybridisation. As two to three embryos frequently develop from a seed, even in cases of hybridisation some of the seedlings, those from adventive embryos, will probably produce true to the parent bearing the fruit.

While seedlings of the sweet Orange produce sweet fruit similar to those produced by the parent, there is yet much variation in the fruit from such seedlings. Commonly it can hardly be distinguished from the parent, but many are of much inferior quality, and occasionally one producing fruit superior to that of the parent tree may be found. This uncertainty in the quality of the fruit is what renders budding or grafting desirable in this industry as in others. There is, however, by no means so great a difference between the fruit of the common seedling and that

of the best budded varieties as occurs in certain other fruits, such as the Pear and Apple. If sweet seedlings are to be grown, the seed should be taken from selected seedling trees, known to produce good fruit, which are isolated from trees of other varieties and species. By such selection one would avoid the probability of obtaining seeds affected by crossing or hybridising with other varieties, and may be quite sure that the trees from such seeds will produce good fruit.

The various improved varieties of the sweet Orange, such as the Hart's Late (Tardive), Jaffa, Majorca Ruby, &c., cannot be depended upon to produce true through the seed. The policy of budding the trees to selected varieties cannot be too strongly recommended.

BITTER OR SOUR ORANGE (*CITRUS BIGARADIA*.)

Whether the bitter or sour Orange be classed specifically with the sweet Orange, or is considered as a distinct species, the fact remains that the varieties in cultivation are totally distinct in foliage, fruits and character of branching, from the sweet Orange, and that both are reproduced true through the seed. The seed of sour Oranges invariably produce sour fruit of the same general character. It is true the fruit of seedlings vary slightly in shape, size, taste, thickness of rind, &c., as in the case of sweet Oranges, but they are nevertheless distinctly sour Oranges. Galesio says, "The sour Orange produces many seeds which always reproduce sour Oranges."

The sour Orange was introduced into Florida very early, probably by the Spanish, and escaping from cultivation, spread over the central and southern portions of the State. When comparatively recently—about 1870—interest was awakened here in the Orange industry, extensive wild sour Orange groves were found in many places. One of these, at Citra, Florida, contained some 500 acres. These wild groves have mostly been cut off and budded, so that now but few of the original trees can be found. I have examined a number of these old original trees, and have always found them to produce comparatively the same fruit. The fruit from these old wild trees, furthermore, does not noticeably differ so far as I have been able to determine, from the fruit of numerous cultivated sour Orange seedlings, one or two of which are found in almost every grove in the State. As these seedlings scattered through the groves of the State are unquestionably descendants from seeds of the wild sour Oranges found here, the identity of the fruit is significant in this connection. I have made some enquiry of pioneer Orange growers who cut off and budded many of the wild sour Orange trees, and have been unable to learn of any marked difference having been observed in the character of the fruit on different wild trees. Orange growers here invariably feel sure of obtaining sour Oranges when sour Orange-seed is planted. *Herbert J. Webber, Special Agent, United States Department of Agriculture, Subtropical Laboratory, Eustis, Florida.—Gardeners' Chronicle.*

FERTILIZERS FOR SPECIAL CROPS.

We are frequently asked to recommend fertilizers for particular crops, and in doing so advise for one a fertilizer rich in phosphates, for another a fertilizer rich in potash, and for another one rich in nitrogen. Our friends frequently tell us that they find a difficulty in getting the special ingredient they need for the particular crop in the ordinary brands of fertilizers on the market, and especially is this so in the matter of potash. To secure the quantity of potash needed, they have to buy much more phosphato than the crop requires. As a rule this is so. The average fertilizer does not contain usually more than from six to ten per cent. of potash. Often, in order to get 100 pounds of potash to the acre, it will be necessary to buy nearly a ton and a half of superphosphate, which will contain something near 250 pounds of available phosphoric acid, which is about 200 pounds more than most crops need, and will cost from \$11 to \$16. The same amount of potash as is contained in this ton and a half can be had by purchasing 200 pounds of muriate of potash, at a cost of from \$4 to \$5. If a soil is deficient in potash, or if the crop to be raised needs a large amount, the cheapest and best way to supply the need is to buy muriate of potash or kainit. Grasses, clover, corn, and vegetables of all kinds need potash. —*Southern Planter.*

PUBLIC COMPANIES AND THEIR REPORTS.

We recently listened to a discussion relative to the respective merits of the reports issued by the tea companies connected with Ceylon. This discussion assumed the form mainly of argument for and against the directors issuing such reports either giving or withholding the fullest information. Each course found its supporters: one side holding the view that it was not desirable to make the reports exhaustive of information for the reason that the outside public became possessed of knowledge that the shareholders alone could claim, and that the last could obtain fuller detail when they desired it on application at the offices of the companies. Those who did not coincide with this view urged that the affairs of companies should be to a very large extent public property. They argued that the general public, as investors in shares, were quite as much entitled to know the conditions under which they might purchase as were the actual holders of those who desired to sell them. We must say that we agree in the last-stated opinion. All companies are from their very nature public, not private affairs. Directly a registered company claiming limited liability submits either to public quotation or makes appeal by circular or by advertisement to general investors, it can no longer, in our opinion claim to keep back any material facts from public knowledge. Let us consider in this connection the position of any person who may be desirous of purchasing shares in a company. He sees in the lists published daily the quotation of such shares. What has he to guide his judgment as to whether that quotation is or is not to be justified? He can only rely upon the judgment of others who have been willing to pay the price quoted. In fact, he has to rely entirely and solely upon the public confidence as expressed by the published quotations. But he must certainly be entitled to such information as might enable him to form his own independent judgment; and this—not already being a shareholder and unable to claim detailed information at headquarters—he can only obtain from the directors' reports. He therefore naturally, if exercising due caution before investing, turns to these. Now these reports as issued are of strongly divergent character. Some directors, as we think rightly and wisely, issue reports affording the fullest possible detail. Others, on the contrary, seem to seek to make them as bare of information as they possibly can do. They aim, as it seems to us, not at brevity only, but at making them as bald and colourless as is possible. Surely the latter course cannot be fair towards the public interests concerned. And we hold even a stronger view than this. We say that directors cannot be justified in their adoption of such reticence as to the affairs they direct. There is given to them a very great, and, in some respects, a dangerous privilege. They may incur indebtedness to any amount they may see fit, while they are relieved as to responsibility for it beyond a certain limitation, that of their available capital as represented by individual investment. Surely the exercise of this privilege demands a *quid pro quo* for the public who may trust them; who may, on the faith of the directors holding nothing back, supply them on credit with goods or cash. It is not therefore the shareholders alone that should receive full confidence. Other interests outside of that body demand it, but these have not the power of examining into details. When, therefore, we see a report that evidently aims at withholding that full confidence, we feel our

pursestrings tighten as regards the company issuing it. It is not for the directors to urge that full revelations might affect the value of their shares. They claim and possess a privilege which can only be due to them so long as everyone is enlightened as to their position. Limited companies can in no sense be private. Publicity is the condition of their being.

MORE CEYLON TEA COMPANIES:

GREAT SUCCESS IN THE FLOATING OF THE GALLAHA ESTATES AND AGENCY CO.

The financial papers by this mail announce the registration of the "Midland (Ceylon) Tea Plantations Co., Ltd.," with a capital of £60,000 to acquire and work the well-known properties of Gneiss Rock and Strathellie; but this will be regarded as old news in Ceylon as it was in "the Lane," on being referred to. The Company is evidently a private one chiefly, and the provision of the full amount of capital required a foregone conclusion before registration.

More important, with reference to the credit of the Colony, is the very successful way in which "The Gallaha Ceylon Tea Estates and Agency Co., Limited," with a capital of £165,000, has been floated. True, the vendor Mr. Charles Strachan, reserved to himself the whole of the *Ordinary* shares (£50,000) as part of the purchase money—a fact which must have given special confidence to applicants for the Mortgage Debentures and Preference Shares. But, in reality, no applications for debentures were required, the whole (£55,000) having been subscribed for privately—indeed many times over, we believe—before the issue of the prospectus, although the interest was placed at 5 per cent. All, therefore, that was offered to the public, with less than two days allowed for application, were the £60,000 of six per cent preference shares; and considering the circumstances, it is perhaps not surprising, though very satisfactory, that the amount required was at once subscribed fourfold. This, certainly, betokens full confidence in our Tea Enterprise and the continued prosperity of Ceylon. It will have been noted from the prospectus that the area under tea and cardamoms has been priced at the comparatively moderate rate of £47 5s per acre; and with so extensive and well-equipped a Factory as that on Gallaha and the Colombo business, centrally situated, under a Manager so well-known for his experience and sound judgment, a prosperous career for the Company may well be anticipated.

Both the Midland and Gallaha Tea Companies have our best wishes for their success.

J.F.

CACAO IN MEXICO.

In the interesting report by Sir Henry Dering on the "Cultivation of Cacao in Mexico," reproduced in the *Journal of the Society of Arts* for June 19, p. 659 it is stated "The species of cacao tree most cultivated in Mexico are—Cacao, or *Theobroma ovalifolia*, *T. bicolor*, *T. angustifolia*. There are other kinds known, generally found growing wild, which come under the head of the *Guazuma* or *guacimas*, *Guazuma polypotrya* being the principal species." The latter part of this extract puzzled us a good deal, and we addressed a letter on the subject to the Foreign-office, and asked for specimens. These having arrived we found that they belonged entirely to *Theobroma bicolor*, and had no relation whatever

to the genus *Guazuma*, as stated in the report. The point is, that there are no other kinds of cacao growing wild which come under *Guazuma polybotrya*, or any species allied to it. As information of this kind ultimately finds its way into text-books, and becomes incorporated into the literature of cacao, the Director thought it desirable to draw your attention to it, in order that the readers of the *Journal* may be placed in possession of the further facts recently obtained from Mexico.

D. MORRIS, Assistant Director.

THE YATIYANTOTA AND WE OYA TEA COMPANIES.

PROPOSED AMALGAMATION.

At present negotiations are in progress for the amalgamation of the two well-known Ceylon Tea Companies—the Yatiyantota and We Oya. The subject is under the consideration of the Directors of the respective Companies, and in due course any scheme of amalgamation which may be approved by them will be submitted to the shareholders. Of course, until this is done, nothing can be decided, but we learn, that it is proposed that the amalgamation should take place as from 1st January next, which is the end of the financial year of both the Companies concerned.

THE APPLE-TAINTED TEA QUESTION.

The London correspondent of our contemporary says:—

The Tea and Produce Committee of the Ceylon Association in London will meet on Monday next to go into the matter of the claims for tea tainted by apples that I recently made mention of, and to consider a letter from Messrs. Anderson Anderson & Co. Already warning has been sent to Ceylon to avoid ships laden with the pippins we so greatly appreciate here, and the attitude that Messrs. Anderson Anderson & Co., take up make this the more advisable. I hear they state that it is a mistake to think that the tea entered for wharves was delivered from the ship over-side direct into barges. They say it was landed and lay for a time in the shed with the rest. That exactly the same precautions were taken by the "Cuzco" and the "Austral" to protect the tea from damage as have been taken always both before and since the complained of cargo. And they claim that except in the case of the two above-named ships no suggestion of damage has been made. They say that on every occasion up to now the tea and apples have been stowed in special holds with watertight bulks between them. They make the admission that one of the passengers per the "Austral" sent to the ship with her baggage a box containing about a dozen apples. This was placed in one of the holds with the rest of the passenger's baggage, not being recognised as containing apples. They say it is impossible for a dozen apples to have tainted several thousand packages of tea. But if one passenger sent a dozen apples which were not recognised, might not fifty passengers have wished to bring home as presents more or less of the fruit and their cases also have been passed into the passengers' baggage hold? But whether one or fifty passengers had fruit on board Messrs. Anderson Anderson & Co., consider that having regard to the terms of their bill of lading the ship would not be liable. The matter is, of course, in the hands of their lawyers, and it remains to be seen what stand they will take when the matter has been handled by the Tea and Produce Committee.

IMPROVED CEYLON TEA.

[FROM AN OCCASIONAL CHICAGO CORRESPONDENT.]

We have been favored with something entirely new and different in the tea line. While it is a Ceylon tea, it is so entirely unlike all other Ceylon teas that no comparison should be made. Lovers of good teas are indebted to Messrs. Franklin MacVeagh & Co., Chicago, for this article. The way they became possessed of it was in the following manner:

For years they realized that Ceylon grew a very grand tea, and beginning with the close of the World's Fair they commenced corresponding with leading growers of teas in the island of Ceylon, with the aim of getting them to prepare or cure a tea that would be suitable to the American trade.

In the past, Ceylon's trade had been from the British Isles and Australia. These countries use five times the quantity of tea per person that is used by the American people—in fact, these countries use tea the same as we use coffee, and their aim has always been to get a tea to take the place of coffee; consequently, they prepare a fermented tea, and the greater the fermentation the better they like it, as it makes a tea very heavy and malty; but this very taste, we found, was disliked by all American tea-drinkers. We are very partial to a light, flavory, delicate tea.

Samples were sent to Ceylon of the very higher grade of Formosa Oolongs, China, Greens and Japans, to show what kinds of teas were liked in America. This was back in the fall of 1894. The Ceylon factors commenced and made a great many experiments, but not until two years afterwards were they able to cure a tea that had all the fine aroma left in it, and did not possess that malty, bitter taste that goes with a tea prepared for the English market. To get the beautiful bouquet that this tea has, it must be grown in the mountain district, as a high altitude is absolutely necessary to grow this kind of a tea.

There is something very different in this tea from all other teas. Some people, the first time they drink it, do not like it on account of its being so unlike the tea they have been using for years; but the second time they drink it they do not dislike it, but the third time is the charm. It has a delicious bouquet and mellowness that no other tea possesses, and after it is drunk a few times, one becomes a lover of it in a greater degree than of any tea that has ever been before the public.

It is a wonderfully economical tea also, as not over one-half the usual quantity is necessary; if you use a teaspoonful to a cup of other teas only use a half tea spoonful of this tea.

To briefly summarize: This wonderful tea is grown and specially prepared for the American trade. It is the only unfermented Ceylon tea on the market. It steeps a beautiful bright-colored liquor, and has great fragrance. It is not malty and bitter, as all Ceylon and India teas are. BRUNO.

[We publish the above as a matter of trade news. Many believe that the tea of the future is to come from Ceylon and India. We have tested the above tea and find it of fine flavor, light liquor and nearly free from the pronounced sweetish taste characteristic of most of the Ceylon and India tea. It is claimed, and upon a sound basis, that frequent use of these teas will overcome that prejudice which first comes to the user of Ceylon and India tea, and that the user will become wedded to it and never go back to his old favorite. We are not yet a convert from the use of fancy Formosa, but we know others that are. Investigators can probably secure a sample of the tea described by "Bruno," by addressing Franklin MacVeagh & Co., Chicago, and mentioning this article.—ED.]—*American Grocer*, June 10.

"THE AGRICULTURAL LEDGER."—From the Government of India we have received Nos. 18 and 20 of 1895 and Nos. 5, 6 and 7 of 1896 of this valuable publication. No. 5 of 1896 contains a reprint of Mr. David Hooper's note on camphor leaf oil (which we printed some time ago), and an introduction by the editor, Dr. George Watt, which we give elsewhere.

THE HANKOW TEA SEASON

"Wet weather has seriously affected the first crop teas, as regards both quality and quantity."

CHESTNUT.

From distant Hankow goes the groan
That the first crop is damaged by rain:
So well may the poor chaasze moan,
As grows dimmer his castle in Spain,
As he traverses Yangtze's fair vale
A voice that is small, still and low
Gently whispers "No longer bewail:
Solve the question of weather or no"—

Then into his tea room he dives,
Infuses his musters with care,
And hopefully, manfully strives
To discover the pekoe that's there—
In vain for the flavour of old
He searches, but finds it's no go:
An aroma of graveyard and mould
Leaves no question of weather or no—

Yet he makes the tea strong in the cup,
Free from dust, and well twisted the leaf,
The discovery quite bucks him up
As he throws off a sigh of relief—
His orders, he finds, "bid him pause;"
Distinctly they say "Sure and slow;"
Yet in them is no saving clause
On the question of weather or no.

But the ice now once broken, he goes
Imbued with the spirit of fun,
Overboard his clear orders he throws,
And settles a daisy Keemun.
Then follow some tarry Lylings,
And Onans of a quality low:
He smiles as he gleefully sings
Regardless of weather or no.

Then he ships a nice frowsy Ningchow,
And some slightly Oopacky Oopacks,
Follows suit with a rosy Hohow,
Which consignees' pockets may tax:
He works just a bit with the view
That the dearer lots back he may throw,
So that when his inspecting is through
He's prepared to face weather or no.

Furious and fast is the race,
The speed's far too hot to last long,
The export goes creeping apace
And still he is going it strong.
The oof bird which lays eggs of gold,
We are killing as fast as we know,
Our shipments are bound to be sold,
In spite of the weather or no.

But in London the *stuff* is received
By our friends with a look of despair;
"How could you thus us have deceived
With cables and promises fair?
Your teas the Trade scarce deign to taste,
But despite your loud, jubilant crow,
We shall quit them with leporine haste,
And whether you like it or no!"
—*N. C. Herald*, June 26.

INDIAN PATENTS.

Whereas the inventors of the undermentioned inventions have respectively failed to pay the prescribed fees, it is notified that the exclusive privilege of making, selling, and using the said inventions in British India and of authorising others so to do has ceased:—

IMPROVEMENTS IN AND CONNECTED WITH THE PROCESS OF EXTRACTING COCOA.—No. 343 of 1891.—Messrs. E. O. Moser & Co.'s invention for improvements in and connected with the process of extracting cocoa or rendering it soluble for the preparation of soluble cocoa or the manufacture of cocoa powder, chocolate and the like preparations. (Specification filed 31st March 1892.)—*Indian and Eastern Engineer*, July 18.

ANNUAL REPORT OF THE ROYAL BOTANIC GARDEN, CALCUTTA, FOR THE YEAR 1895-96.

No. 16G, dated Royal Botanic Garden, Sibpur, the 12th May 1896.

From—Brigade-Surgeon-Lieutenant-Colonel George King, M.B., LL.D., F.L.S., F.R.S., C.I.E., Superintendent, Royal Botanic Garden, Calcutta,

To—The Secretary to the Government of Bengal, Financial Department.

I have the honour herewith to submit the 109th Annual Report of the Royal Botanic Garden, Calcutta.

The weather of the official year 1895-96, was remarkable for the great dryness of the months from October to March. Not only did the rainy season end prematurely, but the showers which are not unusual about the beginning of January entirely failed this year, and there was not a single storm from the north-west. The result of this excessive dryness on the plants growing out of doors has been disastrous. In spite of all efforts in the way of artificial watering, many small plants have died; and many trees, even of large size, will be disfigured by the loss of branches which have withered. The excessive dryness of the air during the few weeks when the majority of the orchids came into bloom had the double effect of reducing the size of these beautiful flowers, and of hastening their withering. The flowering-trees out of doors were also stimulated into putting out unusually large numbers of blossoms of smaller size than usual. The solitary benefit derived from the drought was that the water in the Garden lakes fell so low that it was possible, by cutting some of them off from the supply of water lifted from the river by the steam-pump, to run them quite dry, and thus to obtain from their beds a quantity of earth which will be of great use in raising the levels of numerous roads which are much in want of being heightened. Chief amongst such roads is the avenue leading from the river entrance to the Banyan tree. This, which is more than a third of a mile long, is one of the most prominent in the Garden. Towards the middle of it the level sinks, so that the roadway is below the surrounding ground. This depression not only produces an unpleasing effect, but it forms a cup in which water freely collects during the rains. By means of the earth recovered from the lakes near the road, I hope, during the year now entered upon, greatly to improve this avenue, as well as the ground on each side of it. During the year the Dyer and Falconer Avenues had their levels raised and were repaired, the soling bricks and burnt-brick metal required for the purpose having as usual been made within the Garden. With the relaying of the two avenues just mentioned, the eastern half of the Garden has now been well supplied with good roads. Much, however, still remains to be done in the western half. The Banyan avenue will probably be taken in hand during the current year, but it will not be possible to do more. The Roxburgh Avenue which is in very bad condition during the greater part of its length; the Thomson Avenue, which is almost unfit for wheeled traffic; and various shorter roads will have to lie over for future occasions when special grants of money can be spared. During the cold weather the new road running from the Shalimar Point to the garden was opened for traffic by the Public Works Department; and, with its opening, people coming to the Garden by land began to enter it by a gate which was previously but little used. Anticipating this change, I had for some years back been improving the Garden in the neighbourhood of that gate. During the current year the final touches were put upon that part of the Garden, and it is now one of the prettiest spots within its boundaries. The gate itself is however rather mean and small, and a larger one ought to be provided as soon as funds permit. A year or two ago the platform on which Kyd's Monument stands was paved with marble, Sir Charles Elliott having made a special grant of money for the purpose. Last year, by a similar grant, marble steps to the platform were provided in supersession of the former cemented ones. No buildings were erected in the Garden during the year. I had hoped to have been able to build a new plant-house in the Nursery, but funds were not sufficient. Such a house ought to be put in hand as soon as possible. A glass-roofed house for the display of ferns is still also one of the desiderata of the Garden. Few ferns thrive well in the grass-roofed conservatories which have proved so perfectly suitable for orchids, palms, and other plants,

In consequence of there not being a glazed conservatory, the public never see the Garden fern collection, which has to be kept in nursery houses near the Curator's quarters. Towards the end of the official year much was done towards thinning the large area planted with trees to the south-west of the great Banyan. During the year an interesting addition to the Garden trees was made in the shape of a rooted cutting of the sacred *Bo* tree of the temple at Budha Gaya, under a predecessor of which Sakra Muni, the founder of the Buddhistic faith, lived and taught. This interesting historic and religious relic was presented by Mr. G. A. Grierson, PH.D., lately Magistrate of Howrah. It has been planted on an island in the large lake near the big Banyan, from which, when it grows up, it will be well seen, and at the same time it will not be easily accessible.

2. ECONOMIC PLANTS.—At the request of the Reporter on Economic Products to the Government of India, patches of two species of *Sida* were cultivated in the Garden, with the view of testing the value of their fibres for weaving and cordage. The crops grown on these patches were made over to the officer just mentioned. At his request also quantities of young plants of *Adhatoda Vasica* were prepared in the nurseries for issue to tea-planters, a decoction of the leaves of this plant having a popular reputation as a powerful insecticide. A few experiments were made in the nurseries by the Curator, Mr. R. L. Proudlock, with the view of testing the merits of this decoction. The results, however, were of a somewhat doubtful nature. The demands for *rheca* plants were less numerous than in former years, and the distribution during the year was proportionately small. Many hundreds of fruit and timber trees were issued to public officers in all parts of the Province. The Director of Land Records and Agriculture, having been for some time desirous of obtaining a botanical report on the various races of wheat grown in Bengal, and being unable to supply adequate materials for a study of the subject, it was suggested that a portion of the Sibpur Experimental Farm should be devoted during the cold weather of 1895-96 to raising wheat from samples of seed supplied from the various wheat-growing districts. This suggestion was acceded to by Mr. Macpherson, and Dr. Prain has during the cold season made observations on the samples of wheat grown in the plot of ground thus placed at his disposal. His report on the races grown, and on their relationship to the names they bear in the different districts, will be in the hands of the Director of Land Records and Agriculture at an early date.

2. HERBARIUM.—Work in the Herbarium was carried on with vigour; and during the year 17,403 specimens were received, while 11,093 carefully-named specimens of Indian plants were issued to various scientific institutions all over the world. The chief donors to the Herbarium were the Director of the Royal Garden, Kew, who contributed 1,974 specimens, and the Keeper of the Botanical Department of the Natural History Museum, London, who transmitted 1,129 duplicate specimens not required by that institution. From Dr. Engler, Conservator of the Royal Herbarium, Berlin, were received 512 specimens, and from the authorities of the Botanical Museum of the University of Vienna 1,000. Dr. Hans Schinz, Director of the Botanic Garden at Zurich, contributed 558; and the veteran Baron Von Mieller, Government Botanist in Melbourne, augmented his former munificent donations by 106 specimens during the past year. From American botanists large contributions were received; the Smithsonian Institution at Washington having sent 1,134 specimens, while Messrs. Pringle contributed 431 Mexican specimens, Mr. Heller 344, and Mr. Nash (of Columbia College, New York) 703 specimens. The Government of the Straits Settlements contributed 850 specimens, collected chiefly in Malacca; and Mr. E. H. Man, to whom for many previous years the Herbarium has been greatly beholden, sent 257 from the Andaman Islands. Among officers of the Indian Forest Department who made presentations, there have to be mentioned Mr. J. Syke, Gamble,

an old and valued contributor, who last year sent 456 specimens from Delhra Dun; Mr. W. A. Talbot, who sent 29 from Canara; Mr. R. L. Heinig, who sent 8 from the Sundarbans; and Mr. J. H. Luce, who sent 180 from the extreme North-West Himalaya. From Mr. J. A. Gammie, of the Government Cinchona Plantation, 172 specimens were received; while his son, Mr. G. A. Gammie, having made a tour in the Sundarbans with the Forest Officer of that Division, brought back 509 specimens jointly collected by Mr. Heinig and himself. To the Director of the Botanical Survey of Northern India (Mr. J. P. Duthie) the Herbarium is indebted for 669 specimens contributed during the year; while the late Mr. M. A. Lawson, Director of the Botanical Survey of Madras, sent 300 species from Travancore; and Mr. Marshall Woodrow, Director of the Bombay Botanical Survey, sent 34 species collected in the Deccan. A large number of specimens numbering 3,068) were brought in by native collectors working under the supervision of Mr. R. Pantling, of the Cinchona Plantation; while 578 were got from Abdul Kholil, a native collector working in the Shan Hills. The chief recipients of the named plants issued from the Herbarium during the year were the Director of the Herbarium at Kew; the Keeper of the Botanical Department at the British Museum; the Directors of the University Herbaria at Edinburgh, Aberdeen, Cambridge, Berlin, Zurich, Florence, Vienna, Utrecht, Leiden, Upsala, and Melbourne; the Directors of the Botanic Gardens at Buitenzorg (in Java), Singapore, Peradeniya (Ceylon); M. C. De Candolle, Geneva; the Director of the Museum of the Jardin des Plantes, Paris; the Committee of the Smithsonian Institution, Washington; the Directors of the Botanical Survey of Northern India and of the Government Museum at Perak, of the College of Science, Poona, and of the Museum at Madras. Full lists of both receipts and issues will be found in Appendices V and VI of this report.

4. Botanical publications.—During the year the first part of the fifth volume of the *Annals of the Garden* was published. This part is occupied by detailed descriptions and figures of a hundred species of new and little known Indian orchids by the illustrious and veteran botanist, Sir Joseph D. Hooker. Sir Joseph has been engaged, as Government are aware, for the past five and twenty years on the preparation of a *Flora of British India*. In the course of his elaboration of the family of *Orchidaceae* for that monumental work, he had at his disposal the whole of the materials of the Calcutta Herbarium, including the coloured drawings made by the Garden artists. These drawings, which have been accumulating since nearly the beginning of the century, were found by Sir Joseph so useful that he recommended the publication of a selection of them, and generously undertook to supply the descriptions himself. The result is his *Century of Indian Orchids*, which forms the first part of the fifth volume of our *Annals*. Towards the end of the year there was also published the first part of the sixth volume of these *Annals*. This part is occupied by an account of a very important research in vegetable physiology by Dr. D. D. Cunningham, Professor of Physiology in the Medical College, Calcutta. Dr. Cunningham devoted much of his leisure time during a period of several years to making observations of, and experiments connected with, the phenomena popularly known as *sleep* and *sensitivity* in plants. The results of these researches go to prove that the great majority, if not all, of the transient spontaneous movements of the higher vegetable organisms are dependent on purely physical processes. The memoir is a most exhaustive one and is illustrated by drawings from Dr. Cunningham's own pencil. In the same part of the *Annals* is also included an account, by the same author, of a destructive vegetable blight. Dr. Prain, Curator of the Herbarium, contributed the following papers to various scientific journals:—*On Milula, a new genus of Labiaceae from the Eastern Himalaya* (in *Scientific Memoirs by Medical Officers of the Army of India*); *An account of the genus Argemone* (in the *Journal of Botany*); *A Revision of the genus Chelidonium* (in the

Bulletin de l'Herbier Boissier); *Le genre Microtoena* (in the *Bulletin de la Société Botanique de France*); *Noricie Indica*, IX and X. some additional *Papaveraceæ* and some additional *Fumariaceæ* (in the *Journal of the Asiatic Society of Bengal*); as well as some minor teratological and morphological communications to the same Society. Finally, in the *Journal of the Asiatic Society of Bengal*, I published the eighth portion of my *Materials for a Flora of the Malay Peninsula*; and in the same journal appeared descriptions of thirty-three new species of Sikkim orchids, by Mr. R. Pantling, of the Cinchona Plantation, and myself.

5. LIBRARY.—A few books were added to the library, both by purchase and in exchange for copies of the *Garden Annals*.

6. INTERCHANGE OF PLANTS AND SEEDS.—Full details of the issues and receipts of these will be found in Appendices, I, II, III, and IV; the total issues having been 30,898 plants and 2,384 packets of seeds, and the receipts 14,342 plants and 1,177 packets of seeds. Amongst the collections of living plants received during the year the most interesting, from a botanical point of view, was that made in Assam by Dr. G. Watt, C.I.E., during a tour which he made in that province in connection with his researches into tea blights. Dr. Watt's collection consisted of no less than 1,215 plants, many of them of much interest.

7. *Lloyd Botanic Garden, Darjeeling*.—This Garden was worked during the whole year by the Curator, Mr. W. A. Kennedy, who, besides his duties in the Garden, has charge of the Shrubbery grounds and of the trees planted in various parts of the station. During the year Mr. Kennedy carried out various improvements on the roads and conservatories within the Garden. A very remarkable plant was added to the Darjeeling garden during the year, namely, a gigantic specimen of the beautiful Australian fern, *Todea barbara*. This plant was the personal gift of the distinguished botanist, Baron Ferdinand Von Müller, K.C.M.G., F.R.S., who for many years has been the highest authority on the botany of the Australian Colonies. Baron Von Müller has in past times presented many valuable plants to the Calcutta Garden, but this, his latest gift, outrivals all his previous contributions. The *Todea* which now adorns the Darjeeling Garden was removed by the Baron, at his own expense, from a lonely valley far distant from his residence in Melbourne. It weighs upwards of half a ton, and ought, when it has had sufficient time to explain its leaves, to form a magnificent object.

8. The budget allotments of funds, both for the Calcutta and Darjeeling Gardens, were spent in full. The proceeds of the sale of surplus plants and seeds, amounting to Rs. 1,107-1-6 for the Calcutta Garden and to Rs. 1,014-8 for the Darjeeling Garden, were paid into the Government treasuries as usual.

9. Dr. Prain (who had been on furlough to Europe) returned to duty in June, and since then he has been in charge of the Herbarium. On 1st July Dr. Prain was appointed Professor of Botany in the Calcutta Medical College in place of myself, Government having allowed me to retire from that appointment. During Dr. Prain's absence the Herbarium work was carried on by Mr. G. A. Gammie (of the Cinchona Plantation), who on Dr. Prain's return reverted to his own appointment at Mungpoo. For the first eleven months of the year Mr. R. L. Proudlock held the appointment of Curator of the Calcutta Garden. Towards the end of January he was transferred to the Curatorship of the Government Garden at Ootacamund, and his place here was filled by Mr. Lane (the Assistant Curator), who returned during the year from Allahabad, where he had held an acting appointment. Mr. Lane's place on the staff of this Garden was in turn filled by Mr. Davies, who had previously been a probationer under the new scheme for providing a corps of gardeners for India. Mr. Proudlock's advancement to the Ootacamund Garden thus gave the means of giving well-merited promotion to Messrs. Lane and Davies, whose work during the year has been very satisfactory. The offices both of the Botanic Garden and of the Cinchona

Plantation have, during the year, been in charge of Babu Gopal Chandra Datta, who has worked with his usual assiduity.

10. The usual appendices (six in number) which accompany this report give full details as to the distribution of plants, seeds, and Herbarium specimens.

SEED FROM ARABICA-LIBERIAN GRAFTS.

Some few years ago a considerable amount of interest was taken in the subject of grafting the delicate but valuable Arabica on to the robust stock of the hardier Liberian. From an account of some interesting and possibly very valuable experiments in this direction carried out on a plantation in Coorg, we learn the cherries gathered from the grafted plants show marked differences to the ordinary Arabica. They are large, heavy, with a thin covering of skin and pulp, the very desirable result of enlarging the bean and reducing its covering being the first decided score for the grafts. Some of this seed has been planted, and the habits of these are being watched with care. The results will be extremely interesting to learn. The theory of grafting, as far as we understand it, does not, it is true, promise very much, early and heavy cropping being the general results of the practice, with the added constitutional strength of the usually hardier stock. Usually the scion in this case the Arabica, would be true to the plant from which it was taken; but the above instance is a decided exception. If the seedlings follow in the same footsteps, there is no telling what discoveries may yet be in store for us. Some experiments in Arab liberian hybrids are also being carried on by the same enterprising gentleman. By the way, how is it that we have heard nothing of late of Mr. Brooke-Mockett's Mysore hybrids the accounts of which created such a stir a short two years ago?—*Planting Opinion*, July 18.

A GOOD CUP OF COFFEE.

The cultivated coffee tree or shrub, writes Anna G. Murray, in the *Topeka Capitol*, is an evergreen growing from four to five feet high; its jasmine-like flowers forming in clusters at the root of shiny leaves, give forth a delicious odor. The fruit, like a purple cherry, consists of a sweetish pulp and two seeds, that lie in this pulp, face to face. The crop averages one pound of beans to each tree, though in the prolific West Indies and Brazil, where shrubs can be forced to bloom eight months in the year, three crops is not unusual. Coffee is not native to Central America or the Indies, the first plants having been brought to Martinique in 1720, from a layer originally imported from Mocha, and propagated by the *Jardin des Plantes* of Paris. It is native to Abyssinia and Ethiopia, where leaves as well as the bean have been used from time unknown. It has never been cultivated to any extent in North America, though there is an indigenous tree, dubbed "Kentucky coffee tree," because the seeds were formerly much used by Kentuckians instead of the imported coffee. A recent experiment in Iowa with Rio grains has proved, however, that it is possible to raise an excellent grade of the genus in the United States.

A German physician was the first to land coffee as a beverage to the people of Europe, in 1573, and it is to another German traveler that Europe owes the original coffee plants transplanted from the East. The first cargo of coffee was landed in 1809. Coffee delights in a moist atmosphere, and in dry climates profuse irrigation is necessary to the plant. After picking, the ripe cherries are soaked in cisterns, then dried by sun flooding floors specially adapted to the purpose.

The dried pulp is then separated from the seeds by a process of sifting, shovelled into sacks and conveyed to the coast towns, where it is roasted and shipped. The universal use of coffee owes itself to the public coffee houses, the first in Europe being that of Constantinople in 1551. In Turkey coffee is so much a necessity that refusal to supply it

constitutes a cause for divorce. Writing in 1624 Francis Bacon says: "They have in Turkey a drink called coffee and this drink comforteth the brain and heart and helpeth digestion." Still London did not have a public coffee house until 1652 and Paris 1672. Immediately coffee houses arose in every European city. According to Macauley, writing in the early years of this century: "Coffee houses were the chief organs through which public opinion vented itself and every man of the upper or middle classes went daily to his coffee house to learn the news and discuss it." About the same time Sydney Smith was also proclaiming "If you want to improve your understanding, drink coffee." The fact remains that coffee is better prepared, as well as copiously used instead of other stimulants in continental cities than in Great Britain. In 1809 an extensive cultivation of the coffee plant was begun in England under the advocacy of Bishop Compton. Another Englishman, George Bird, was the pioneer coffee planter in Ceylon (1820).

Because of its stimulative properties the use of coffee is prohibited generally in fevers. It is an excellent disinfectant. Place a couple of red-hot coals on a fire shovel, then sprinkle two or three spoonfuls of coffee over them and the aroma will not only sweeten the room, but prevent the spread of disease. In the French colonies, where coffee is greatly used, gout is said to be unknown. Arctic explorers, men accompanying caravans, as well as soldiers, claim they can endure more fatigue under the stimulus of coffee than fermented liquors.

Unfortunately, there are coffee drunkards just as there are kerosene, paraffine, castor oil and cod-liver oil drunkards. Coffee was forbidden as a drink by the Koran. Intemperate creatures have been known to drink from fifteen to twenty-five cups of coffee per day. Not unnaturally tapering off has occasioned much the same mental and physical derangement as the alcohol habit. Recently a Nebraska woman had an acute attack of delirium tremens, when forced to forego her accustomed twenty cups per day.

The adulterants of coffee are ground wheat, rye, dandelion root and chicory. Perhaps because it has been deemed harmless and deepens the color, the use of chicory has been legalized. There is another substitute, called Swedish coffee, but we do not find much of it in this country. The French favor the essence of coffee. In Sumatra natives use the coffee leaves the same as we use tea leaves. Coffee is a most economical food, for it will support life on a less additional quantity of solid food than would otherwise be required.

It has been computed that each person in the United States consumes in the year nine and one-half pounds of coffee.

To make a good cup of coffee is not so simple as it reads. A mixture of two kinds of beans—two-thirds Java and one-third Mocha—produces most satisfying results. Apropos, only a small quantity of Mocha finds its way past Constantinople. Miss Parlow claims the best coffee comes from Guatemala.

Beans should be freshly roasted when feasible. At least, heat the beans before grinding and do not grind too fine. Do not be afraid—use a full cup of beans to a quart of water. Mix the egg well with the dry coffee and above all be sure that the coffee is clean.—*Interstate Grocer.*

"ACME" TEA CHESTS.

In these days when a scarcity of momi tea chests threatens to become a serious evil, the advantages of the "Acme" steel chests, made in three sizes by the Acme Package Co., Ltd., of Glasgow, have been brought to our notice. That these chests are coming into favour is evidenced not only by the testimonials in their favour, but by the fact that 1,750,000 lb. of the Indian season's tea of 1894 was carried in Acme chests. Chests for 10,000,000 lb. of 1895 season's tea have been supplied, and the orders which are

now being placed indicate that the quantity in 1896 will be three times as much. It is claimed for the Acme chests that they show an advantage over wooden chests of from 1s 4d to 3s 5d per 100 lb. of tea. Messrs. Finlay, Muir & Co., who are the agents for Ceylon, have a supply in stock; and, to meet a growing demand, a large quantity has been indented for.

CEYLON PATENTS.

The following Grants of Exclusive Privilege have been granted under the inventions Ordinance during the half-year ended June 30, 1896:—

No. 484.—To Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, merchant, for improvements in apparatus for packing tea or other substances into chests, boxes, or other receptacles.—January 24, 1896.

No. 486.—To Edwin Rice Wiggin, of Lindula, and John Grieve, of Hatton, for improvements in machinery for rolling tea leaf.—January 24, 1896.

No. 491.—To Oilliam Jackson, of Thorngrove, Mannofield, Aberdeen, North Britain, engineer, for improvements in apparatus for rolling tea leaf and the like.—February 23, 1896.

No. 489.—To Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, merchant, for improvements in multitubular air-heating apparatus.—February 28, 1896.

No. 495.—Jules Lemichel, of 52, Rue Lourmel, Paris, in the Republic of France, engineer, for improvements in or connected with apparatus for raising liquids.—March 12, 1896.

No. 497.—To William Jackson, of Thorngrove, Mannofield, Aberdeen, North Britain, engineer, for improvements in apparatus for subjecting materials to the action of hot air, more especially intended for use in drying tea leaves and other produce only in so far as the action of an iron bar for spreading the tea leaves on their descent from the upper to the lower tray is concerned.—April 23, 1896.

No. 494.—To Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, merchant, for improvements in apparatus for limping or withering tea leaf or for drying vegetable or other substances. May 16, 1896.

No. 490.—To Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, merchant, for improvements in stoves or apparatus for heating air.—May 16, 1896.

No. 502.—To Taylor Burrows, of 88, Upper Kennington lane, London, England, engineer, and Horace St. John Kelly Donisthorpe, of 73, West Cromwell road, London, England, gentleman, for improvements in apparatus for removing the fleshy or pulpy or non-fibrous material from leaves, stems, or plants to extract the fibre therefrom.—June 16, 1896.

No. 506.—To John Melville Boustead, merchant, Cololmo, Ceylon, for an improved apparatus for desiccating.—June 30, 1896.

No. 498.—To Robert Jamieson Browne, electrical engineer, at present electrician to the British India Steam Navigation Company, Limited, of 16, Strand road, Calcutta, in the Province of Bengal, East India, for punkah pulling or causing any such similar oscillating motion.—June 30, 1896.

THE GERMANS BECOMING A NATION OF TEA DRINKERS.—The *Chemist and Druggist* of June 13 says:—

There are signs that the Germans will gradually abandon their old habit of taking coffee, and become a nation of tea-drinkers. Tea is already the fashionable refreshment of the upper classes, and is gradually obtaining favour in more plebeian circles. This is partly due to the deterioration in the quality of coffee and partly to the increase of coffee substitutes such as "malt-coffee," consisting of slightly malted and lightly roasted barley, sometimes sweetened, and retailing at twopenno a pound. Few articles, it would seem, have a better future in Germany than tea.

CEYLON TEA COMPANIES.—UNDER
CRITICISM.

"CEYLON Tea Companies" is the title of an article in the July issue of the *Investors' Review*, (see below) which has of late sprung to the front rank of independent financial and critical authorities in the Metropolis, through energy, keen intelligence, and the fearlessness of its editor, Mr. A. J. Wilson—himself a hard-headed Aberdonian. Apart from the general article—supplying useful statistical information and discriminating criticism as well as practical suggestions—we have, under "Company Notes," separate treatment of the affairs of no fewer than four of our leading plantation Companies in "The New Dimbula," "The Ceylon and Oriental Estates," "The Ceylon Land and Produce," and "The Eastern Produce and Estates." We copy elsewhere all that is said under these headings as well as the main article, save the four years' table of export and distribution of Ceylon tea to different countries already familiar to our readers. It is of special interest to see what a trained, first-class metropolitan critic has to say about our tea industry from the financial point of view, and of the position of certain leading, if not representative, company-constituents in that industry. Remembering that the *Investors' Review* and its editor are "nothing if not critical"—"that 'tis his vocation" to pick holes,—that directors, managers and shareholders coming under its or his ken may be assured in the words of Burns,—

"If there's a hole in a' your coats
I rede, ye tent it!"

—it is satisfactory to find that on the whole the critic is fairly well-pleased, and offers, at least, more praise than censure in his remarks. The one element we find wanting in his comparisons and criticism is the relation of planted and bearing area in tea to the total capital outlay—in other words the price per acre of the tea gardens in each Company's books. Seeing that the writer must have had before him our Directory, which is very freely quoted, it is a pity he did not enter on the consideration of this part of his subject; for, although it is by no means an infallible test—tea in the low-country of Ceylon, being, as a rule, far less valuable than in the higher districts—yet it is a very fair guide—*ceteris paribus*—to the position and future stability of the Tea Companies. Next to this point, we should say that the chief defect in the writings under review, is the absence of reference to the available forest-land or other reserve owned by each Company. This again may be a very important consideration. Take, for instance, the New Dimbula Company: the fact that, besides holding 2,200 acres planted with tea on its one compact, rich, Diyagama property, this company has in the same block, very nearly 1,000 acres more of line reserve, half of which, at least, could be put into tea if required, strengthens its exceptionally advantageous position, its tea area scarcely standing more than £40 per acre on its books. And so, with several other leading Ceylon Companies noticed, which have both a good, if not large reserve, together with a low valuation of its acreage under tea.

But now turning to the article in its several paragraphs, we may first notice that rather too much credit is given to the Ceylon Government for studying the wants of the tea industry in railways and roads. The fact is rather that the railways were sanctioned and made mainly with reference to "collee" and "cinchona," and that "tea" has entered into the inheritance of such railway extension. Sir Arthur Gordon secured the sanction of railway extension to Haputale

and to Galle so far back as March 1888; total export of tea for 1887 being under 14 million lb. All that Sir Arthur Havelock secured for "tea" between 1890 and 1895 in the shape of railways, was the extension from Galle to Matara—scarcely serving tea at all—and the short piece of line from Haputale to Bandara-wela, a doubtful advantage, seeing how our late Governor dilly-dallied and bungled in the matter of the indispensable feeding roads which were to lead up to, and make the Uva railway all it might be, in the service of the Planting industry. How, again, the same ruler left the Kelani Railway line—a specially tea planting railway—need not be recapitulated.

"Out of the teeming millions in the Madras Presidency, the Ceylon tea planters obtain a plentiful supply of labour," the critic says, and truly enough, in a general way. But, nevertheless, it is a fact that our tea planters could do with a good many more coolies, and that if the time now lost—a fortnight or more per head—on the journey from village to plantation could be saved, as it best could be done by an Indo-Ceylon Railway, the advantage to the Ceylon tea industry would be very great. It is quite true, as is urged, that the area under young or newly planted tea in Ceylon is comparatively limited, by no means threatening "overproduction"; but then, in this matter our Indian brethren have more than made amends—making hay while the sun shines—eagerly planting up *because* Ceylon planters have been holding back, so that the result is very much the same as it would be if we in Ceylon had added 50,000 more acres to our tea area during the past four or five years.

We must leave the financial comparisons made in the *Review*: here the editor stands on surer ground, especially in comparing different Companies, and we feel sure the Directors of certain Companies singled out for invidious illustration, will lay to heart the need or advantage of changing "methods," so as to secure the solidity and high credit appertaining to some of their neighbours.

It is gratifying to note the praise given to the financial and general management of the New Dimbula Company, as in a more qualified way—on one or two points—to the Ceylon and Oriental Estates Board. The Directors of the Ceylon Land and Produce Company have rather more criticism and suggestions meted out to them, though no more fault than "a lopsided way of doing business," is found; but for the Eastern Produce and Estates management of recent years there is only praise extended, while surprise is expressed at an actual reduction of working expenses between 1893 and 1895 though gross income had increased. No doubt, part of the explanation is due to the successful way in which this Company's staff do a large Agency business in Ceylon for other proprietors, so reducing the outlay on its own office account?

The development of the tea industry of Ceylon has been even faster than that of India, although the start was not made at a very rapid pace. In the year 1867 the first tea garden was planted in Ceylon with seed from Assam; but it was not until 1884 that the tea exports of Ceylon exceeded 2,000,000 lb. Since then the exports have increased at an amazing pace, so that in the eleven succeeding years their total has risen almost continuously, until the present figure of 98,000,000 lbs has been reached. There is little doubt that the island is peculiarly suited for the growth of tea, as its mild climate permits plucking almost the whole year round, and the hill slopes afford that combination of conditions which are most needed by the tea-grower. The progress of planting, too, has doubtless been rendered more rapid, from

the fact that the ruin of the coffee industry had left a number of coffee-planters and coffee-growing companies with large areas of developed land upon their hands. For these experienced planters to turn to tea-growing was an easy matter, as there were not that feeling of forests and other initial stages of development which the planters has usually to go through. Then Ceylon is a dependency by itself, and the tea-growing industry has become the most important in the island. The consequence is that its needs are studied, railways are built to serve its requirements, the coolie question is treated in a manner favourable to the companies, and in many ways the industry is assisted by the Government. This is very different treatment to that meted out to Indian growers by the Government there, which, having a huge area to govern, naturally studies the tea-planter but slightly. A good example of the paternal manner in which the Ceylon Government watches over the leading industry, is seen in the arrangement of the export duty upon tea. The rapid increase in the outturn has for some time been a source of anxiety to Ceylon growers, and their chief aim for years past has been to widen the market for their produce. The British market, large consumer of tea as it is, could only take a certain quantity, and to extend the area of consumption meant a fair amount of expenditure of a missionary character. For some time the requisite funds were provided by a voluntary cess levied upon tea exported, but as a matter of practice this did not work well. Some growers paid the cess, while others did not, so that friction and irritation were caused. About this time the Government came to the conclusion that it would be politic to reduce the freight charges on the railways to tea-growers by about 20 per cent., and it certainly would have done this had not leading men in the industry represented that this proposal afforded an opportunity to create a fund for trade-extension purposes. Accordingly the railway rates were retained at their former figures; but the 20 per cent., or so, of the rates that would have been reduced was set aside as a fund for the spread of a wholesome knowledge of the qualities of Ceylon tea in foreign countries. This fund, in itself, did not provide enough for the purpose, so a tiny export duty of 10 cents per cwt. was levied upon all tea exported. The proceeds from this impost, combined with the share of the railway revenue, amounts to some £7,000 to £8,000 per annum; and while this is drawn from the industry in the least objectionable form, the expenditure of this money year by year has had a most favourable effect upon the consumption of Ceylon tea abroad. There is a great affinity between the teas of Ceylon and those of China, and in this respect the consumers of tea in Australasia, Canada, and the United States and Russia which represents the communities using tea most freely outside the United Kingdom, have already commenced to take Ceylon tea rather freely. The result of these efforts is shown in the following table:—

[Exports of tea from Ceylon to various countries, already given in our columns.—Ed. T. A.]

These figures show the direct exports from the island, but the quantity sent to the United Kingdom contains a fair proportion of tea which is re-exported to foreign countries. We only have the totals of such re-exports for each year, and if these be deducted from the figures for the United Kingdom, we get the following result:—

	lb.	lb.
	1895.	1894.
Retained in United Kingdom ..	78,659,898	70,224,782
Re-exported from United Kingdom to foreign countries ..	7,093,441	5,123,862
Exports direct from Ceylon to foreign countries	12,186,532	9,243,070
Total exports	97,939,871	84,591,714
	1893.	1892.
Retained in United Kingdom ..	71,434,368	61,367,017
Re-exported from United Kingdom to foreign countries ..	4,065,709	3,448,058
Exports direct from Ceylon to foreign countries	8,905,987	6,338,582
Total exports	84,406,064	71,153,657

It appears, therefore, that while in the four years under review the exports of Ceylon tea increased by 26,000,000 lb. the increased quantity which came upon the British market was only 17,000,000 lb. the difference having been absorbed by the greater demand of other customers. In all the leading tea-consuming countries abroad, there is still ample room for a further absorption of Ceylon tea in place of Chinese, and at the present time the greatest attention is being turned to the United States and Canada, where it is claimed a great impression is being made in turning the public taste from China to Ceylon tea. Most of the exports to those two countries would be included in the re-exports, so that the progress shown in the direct exports to those countries only tells part of the tale. From the success attained in Australasia, America, and in Russia, those best able to judge are strong in the belief that there is no immediate chance of the tea market at home being glutted through the expansion of tea-growing in India and Ceylon.

These various considerations have all tended to encourage tea-planting in Ceylon, and, as we have said, the progress of the industry has been simply marvellous. Prior to 1889 the production of the Island was not of general importance, so that in the following table we only give the figures for 1889 and succeeding years:—

Year.	Exports.	Average price per lb.	Planted Area.		Estimated number of Coolies employed.
			Acres.	Acers.	
1889 ..	31,345,852	11½	205,000	135,000	220,000
1890 ..	45,799,519	10¾	220,000	118,000	250,000
1891 ..	67,718,372	10¾	250,000	100,000	250,000
1892 ..	72,279,985	9¾	262,000	92,000	280,000
1893 ..	82,269,353	9	273,000	90,000	280,000
1894 ..	85,376,322	8½	288,000	83,000	290,000
1895 ..	97,939,871	8¾	305,000	85,000	290,000

It will be noted that during this period the immature area—that is, the acreage of plants under five years old, and therefore not in full bearing—has steadily diminished. Consequently the increase in production must be more moderate in the future than in the past, as the new acreage coming into full bearing will steadily diminish. Indeed, the plantings of the last two or three years have been upon a very moderate scale, and there does not seem to be that danger of over-production in Ceylon which at one time was feared. The land most suitable for tea-growing has been absorbed, and what little forest land remains on the hills the Government refuses to sell, as it is needed for other purposes. Planting has commenced in the low country, and some exceedingly abundant crops have been obtained, but the quality was very low; and it is doubtful whether any extended cultivation in this direction would prove a wise investment, for the public taste in tea tends rather to improve than to deteriorate. The companies and growers, too, unlike those of India, have little reserve land, so that their operations are restricted in this respect. Still, the 85,000 acres of immature land now under plants must bring a considerable increase in the outturn for some years to come, while the more extended use of manures will easily increase the yield per acre, which is low, if the increased number of pluckings is taken into account, when compared with gardens in Assam. The growth of tea-planting in India has also to be taken into account; and the great development in that quarter certainly raises unpleasant thought as to the future. But even in case of difficulty from this cause, Ceylon, with its low initial cost of production, should be in a fair

position to meet the inevitable competition that would follow over-production. So far as experience goes, there does not seem to be any danger of exhaustion coming over the tea plants in spite of the more frequent pluckings. The Loolecondura tea garden in Kandy was the first area in the island planted with tea, this being done by Mr. Martin Leake in 1867 with seed obtained from Assam. The first produce from this garden was sold in 1871-72, and since then reports have been continuously received as to the condition of the fields which were earliest planted. These show that there is no sign of decay, and that in 1893 the 20 acres yielded 471lb. per acre; while last year, when the trees were feeling the effect of recent pruning, the return was 382 lb. per acre.

So far as one can see, the industry seems to be a solid one, and is not likely to be demoralised by over-production, while it is claimed that tea-growing is even more profitable in Ceylon than in India. Besides the fostering care of the Government, the mere fact that Ceylon is so admirably situated at the converging point of Eastern trade, gives it a splendid position for shipping produce, for there is not the hundreds of miles of carriage upon the Brahmapootra River, with the subsequent trans-shipment and carriage across land to Calcutta, which most Indian teas have to undergo. So strongly does this freight matter influence the drift of trade, that it accounts mainly for the fact that all the tea drunk in the Bombay Presidency comes from Ceylon, its conveyance costing so little compared with transit from Calcutta. Then a more important advantage even than cheap carriage and freight is the lightness of the charge for labour. Ceylon is almost attached to the southern point of the Indian peninsula, and out of the teeming millions in the Madras Presidency the Ceylon tea-planters obtain a plentiful supply of labour. There is no question of sending sirdars and paying costly premiums in order to obtain labourers. The only inducement offered is that sometimes the cost of travel will be advanced to them, but in this case it is treated as an advance, and is afterwards deducted from the monthly wage. As a consequence, the wage of the Ceylon labourer, which was always lower than that of the Indian tea coolie, has remained the same, while the Indian planter has gradually seen the premium for his coolies rise until it amounts to a sum that virtually doubles the wage of the old days. This rise in the Indian cost of labour has been little noticed, but it goes far to neutralise the much-talked-about benefit from the depreciation of the rupee. Speaking generally, it may be said that it costs about 4d. to 5d. per lb. to produce Ceylon tea by the larger companies which are at work in that island, while the still larger undertakings in Assam find that 6d. to 8d. per lb. is nearer the figure. The Ceylon grower, however, does not obtain the full advantage of this difference, as the average price of Ceylon teas is about 1d. to 1½d. lower than that of India.

Turning now to the companies which work in the island, it should be at once stated that far less is known about them than about those of India. The usual form they take is small plantations of perhaps under 1500 acres, worked by people in practically a private manner. Those companies, too, that do publish reports accessible to the public are very chary of furnishing information. Few, indeed, give the actual amount of tea turned out, while not one furnishes the interesting table of cost of production, and other details which are to be found in the reports of the Indian companies represented by Mr. Earnshaw. There is, therefore, less basis for analysis in their case, and more dependence upon the rule-of-thumb measurement obtained through mere statements of net profits and dividends paid in the past. With this view we have studied the recent reports of a number of the companies, and find that the companies are usually small, and that considerable use of debentures has been made in obtaining money for their development. At the same time there appears to be a due regard for reserves, while many of the companies have redeemed a proportion of their debentures out of revenue. The following table gives the capital and other details of the balance sheets of some of the leading companies:—

Companies.	Ordinary Capital paid up. £	Preference Capital paid up. £	Debentures and Loans. £	Reserve Fund. £	Investments £	Last Divid. on Ordiny. %
Bandarapola Ceylon and Oriental Estates..	15,100	..	9,000	6
Ceylon Land and Produce ..	47,950	26,450	33,790	2,000	..	20
Ceylon Tea Plantations ..	167,380	81,080	..	70,000	71,106	15

Panawal ..	17,000	5,300	800	230	230	10
Scottish Ceylon	41,000	9,000	..	6,000	4,992	15
Scottish Trust and Loan ..	45,000	..	12,550	10,000	..	10
Standard Tea ..	56,000	..	7,000	7,500	..	15
Sunnygama ..	50,000	5,000	10,000	10

Those companies which show small reserves are usually of recent formation; but it does not say much for their Boards that they pay such high dividends and set aside little or nothing for a windy day. On the other hand, there are some striking examples amongst them of prudence and foresight, and the desire on the part of the well-managed concerns to write down their assets, and so place them in a strong position, was never better exhibited than in the reports just issued. Last year was a distinctly favourable one for Ceylon tea-growers, and the opportunity was therefore taken by the better-managed companies to lay by for the future. To show what this means, we have drawn up the next set of figures, which gives the profit earned by each company after paying working charges, office and directorial fees, debenture interest, etc., and the manner in which this profit has been distributed. As the reports differ in their rendering of the accounts, this task has proved a more difficult one than appears at first sight, but we have endeavoured to make the comparison as complete as possible.

A brief study of this table soon enables one to distinguish between the two classes of Boards. A glance at the amount spent on ordinary dividend, and its relation to the profit obtained, generally settles the matter. And it is an astonishing fact that if one looks back to the preceding table it will be found to be precisely those Companies which possess the best reserves that still continue to add thereto. Companies like the Panawal, Bandarapola, and Sunnygama may pay high dividends, but they will never reach the solidity of the Ceylon Tea Plantations or the Standard Tea Company unless they change their methods. To pay dividends is, of course, good, but to pay dividends and provide for the contingencies of the future is far better. And in this respect we should like to point out a rather unique feature amongst Ceylon Tea Companies. Our tables contain the names of the Ceylon and Oriental Estates, Eastern Produce and Estates, New Dimbula, and Scottish Trust and Loan Companies which represent the revivification of a group of coffee and cinchona growing companies. When coffee and cinchona growing were ruined in Ceylon, these companies fell into difficulties, and only by resort to tea-growing have they got into a better financial condition. The change from one class of produce to another was costly, and took a long time, so that for years the majority of these companies paid little or no dividends, any profits that were obtained being required for interest upon and redemption of debentures, or to pay cumulative interest upon Preference Shares. Patient work in this direction has at last effected its object, and all of these companies have, within the last year or two, worked their way into a financial position of ease. To demonstrate their methods all the more clearly, we give a *résumé* of the working of four companies of this type in the Company Notes included in this number. Now that these old companies have cast off the burden of former troubles, their revenue will be all the more available for dividend-paying purposes, and consequently their shares offer a fair medium for investment, especially as they often stand at moderate prices. As will be seen in the following table, the yield in their cases, under present conditions, is not high; but without taking too sanguine a view, it may easily be assumed that dividends in the future will certainly be higher, unless the Ceylon tea industry suffers one of those calamities which now and then befall a planting industry. Of such an event there is, however, no sign at present. We append a table of dividends for the past five years, with the price of the shares, and the return on an investment based upon the distribution for the last twelve months' working of each Company:—

Companies.	Dividends.					Amount Paid per Share.	Price June 15th.	Yield based upon last Yearly Dividend.

THE NEW DIMBULA COMPANY.—Originally a coffee and cinchona growing concern, this Company was forced to resort to tea-planting, and after a hard struggle seems to have reached smoother water. Fortunately it had no debentures, or it is hard to say what fate would have befallen it; but the cumulative dividend upon the "B" Shares at one time was as much as £22,281 in arrears. Five years ago some efforts were made to revive the coffee and cinchona business, but matters went from bad to worse, so that the cinchona trees have died off, while all hope of revenue from coffee has been given up. The Company has therefore become a tea-planting concern pure and simple, and seems to have pretty well attained its full development. Of the total area of 2193 acres planted with tea, 1921 acres were in full bearing last season, and the remaining 272 acres come to maturity in 1895-96. The change from one form of industry to another naturally led to some outlay, and this was provided out of revenue. Two accounts—the factory and machinery and the tea extension accounts—were established, and these, during the period of earlier planting, increased, although deductions were made from revenue each year; but as the planted acreage came more and more into bearing, the deductions from revenue became larger, and last year both accounts were extinguished. During the past five years the amounts written off revenue were £5,069 for "tea extension," and £3,531 for factory and machinery. At the same time, the increasing profits permitted the paying off of the dividend arrears upon the "B" Shares, and the whole £22,281 due upon those shares has been wiped out. The record of the Company in these five years is given in the following table:—

Year ending June 30th.	Revenue.	Working Expenses	Written off Tea Extension.	Written off Factory & Machinery	Nett Profit.	Arrears of Dividend on "B" Shares
	£	£	£	£	£	£
1891..	19,869	12,067	1,000	1,900	4,901	21,169
'92..	24,641	11,657	2,000	2,157	8,824	22,218
'93..	24,410	11,851	1,500	1,224	9,834	20,055
'94..	29,932	12,129	500	1,500	15,802	14,484
'95..	29,842	11,490	69	1,750	15,731	6,685

In addition to finally wiping out the factory and tea extension accounts, last year a reserve fund was commenced with the setting aside of £3000. If the price of tea does not fall, and the rupee exchange keeps steady, the Company should see some further increase in its profits, but no new planting seems to be in progress. Its financial position is an easy one, for the last balance-sheet showed £18,552 of cash, and £6875 of produce in hand, with creditors to the amount of only £8515. The share capital paid up is £22,030 of "A" Shares, £55,710 of "B" Shares, and £8110 of "C" Shares. The "A" and "B" Shares receive 8 per cent dividend before the "C" obtain anything, the distributions upon the "B" being cumulative. After the "A" and "B" have received 8 per cent the "C" receives 6 per cent and then an additional distribution is made at the same rate upon each class of shares, so that when profits are good the "C" Shares will always receive 2 per cent less than the others. Last year, although 8 per cent of arrears had to be paid off the "B" Shares, the Company distributed an additional dividend of 2 per cent upon the whole capital, so that the "A" Shares received 10 per cent the "B" 18 per cent (including the 8 per cent of arrears), and the "C" 11 per cent. Now that the old legacies are written off, and supposing profits for this year were equal to those of last, it would be possible for the Company to pay 12 per cent on the "A" and "B" Shares, and 10 per cent on the "C" Shares, and then place £5000 to reserve, which fund, by the bye, ought to be invested outside the business.

THE CEYLON AND ORIENTAL ESTATES COMPANY.— This is the successor of the Investment Corporation, and the reorganisation, which was effected in 1892, left traces of the old troubles in the balance-sheet. With £63,229 of paid-up capital, there were no less than £100,000 of six per cent Debentures out, which debentures had been issued at £15,000 discount. The expenses of the reorganisation were £3,509, while a deposit of £3556 with the New Oriental Bank had been locked up by the failure of that institution. Meantime heavy expenditure had to be faced in the way of outlay upon new buildings, machinery, and extension of tea, coffee, and cocoa cultivation. The estates held formed one of the most extensive areas, under single control in Ceylon being 11,378 acres of which 4,309 was under tea, and about 2,000 acres under coffee and cocoa, much of the tea being immature. The Board, however, has steadily pursued a course of paying moderate dividends and writing down the unsatisfactory assets, while each year £3,500 of debentures have been redeemed. By dint of this, the debentures in the last balance sheet were reduced to £89,500, the debenture issue expenses, &c. account has fallen to £6,500, and the Oriental Bank deposit account stands at £716. The progress of the Company in this respect is shown in the following table:—

Year ending Dec. 30th.	Revenue.	Working Expenses and Debenture Interest.	Nett Profit.	Written off Debenture Expenses, etc.	Debenture Issues and Expenses Account.	Debentures.	Dividend
	£	£	£	£	£	£	£
1892..	36,576	31,453	5,122	4,378	15,770	100,000	4
1893..	36,631	32,622	4,196	1,740	13,542	96,000	3
1894..	39,645	31,654	7,668	4,042	10,000	93,000	5
1895..	44,160	34,697	9,342	4,000	6,500	89,500	8

It is not clear from the reports whether the redemption of the debentures was effected out of profits or not, as there was an increase of £27,000 in the share capital, chiefly Preference Shares; but some £20,000, was expended upon new extensions, buildings, and machinery, while sales and purchases of estates have led to a nett increase of 710 acres to the area of land held. Out of the 12,089 acres now owned, 5,714 are under cultivation, 5,085 of these under tea. Some 650 acres of this last total have yet to come into bearing, and a fair share of the portion now being cropped is immature, and should give increased returns in the future. The reduction in the debenture issues enabled the directors to reorganise the capital of the Company this year, and by issuing more Preference Shares it has been possible to still further reduce the amount of debentures, and, at the same time, lower their rate of interest from 6 to 4½ per cent. Under this arrangement the debenture issue will amount to £65,000, the Preference Shares to £46,320, and the Ordinary Shares to £55,264. The debenture stock is irredeemable for ten years. This arrangement will reduce the charges upon revenue considerably, and, at the same time, profits ought to show improvement, owing to the large acreage still under mature plants. It should not be forgotten, however, that the Company has no reserve, while the £20,000 spent upon buildings, machinery, and extensions would have been written off out of revenue by a stronger company, instead of being placed to capital. Accordingly, it will be prudent to increase the amount for depreciation each year, so as to bring the valuation of the block account back to a normal condition. No doubt, however, the Board, which must have a keen remembrance of management under poverty-stricken conditions, will see that this necessary task is undertaken. Even then, a moderate increase in dividends seems possible, if events continue to favour the Ceylon tea industry.

THE CEYLON LAND AND PRODUCE COMPANY.—This Company was formed in 1885 when the old Oriental Bank had its first misfortune. Ceylon properties at that time were not favourably looked upon, and no doubt the purchase was effected at a moderate

price. A mistake, however, was made in purchasing and developing cocoa-growing properties, but latterly the Company has turned the major part of its attention to tea. Dividends were small and uncertain for some years, but 10 per cent was paid for 1890 and 1891. An exceptionally good profit in the latter year enabled the Board to take in hand the writing down of the cocoa properties. By that time they had recognised that these were not worth the money they had paid for them, and, like wise men, they proceeded to write £8038 off the book value of the estates out of profits. Not content with that they have further paid off a mortgage of £15,000 out of revenue. This was completed in 1895. These necessary deductions have been a considerable drain upon profits, so that special allocations for the depreciation of buildings and machinery have ceased. The dividend for 1892 also had to be reduced to 7½ per cent, but since then 20 per cent has been paid for 1893, 15 per cent for 1894, and 20 per cent for 1895. The profits of last year were free from any deductions to repay the mortgages, and the Board took the opportunity to commence a reserve fund with a sum of £2,000. It would be judicious, however, to return to the custom of writing off a stated sum each year for the depreciation of buildings and machinery, and this measure would be rendered more instructive if it were accompanied by a division in the balance-sheet of the value of the buildings and machinery from that of estates and nurseries. The Company's progress during the past six years is set forth in the following table:—

Year ending June 30.	Revenue.	Working Expenses, Interest on Debts and Loans.	Depreciation, etc., written off.	Nett Profit.	Amount of Mort. and Debts.	Dividend.	
	£	£	£	£	£	%	
1890	29,380	19,925	3,201	555	5,697	42,997	10
1891	41,25	21,012	2,811	9,233	3,069	39,327	10
1892	33,847	23,215	2,451	4,513	6,119	39,672	7½
1893	38,890	23,587	2,518	1,592	11,192	36,247	20
1894	23,771	21,332	2,194	1,039	4,196	30,810	15
1895	35,838	24,735	2,202	2,063*	8,836	28,760	20

* Includes £2,000 set aside to commence a reserve fund.

The reduction in the interest paid upon debentures is partly the result of a reduced rate. Tea forms the staple resource of the Company, 1555 acres being under bearing; while 286 acres of young tea are in process of development. Some 1553 acres are also under cocoa and coffee, but the revenue from this source is not relied upon for dividends. It is calculated that the properties have been written down £20,000 by deductions from revenue in the last six years, and it is probable that less will be devoted to this matter in the future. The reserve ought, however, to be further increased, and this should give the Company the opportunity to improve its financial methods. At present, in common with many other Ceylon companies, its practice is to bring the value of produce in course of realisation and unsold into the profit and loss account and treat it as revenue. Like "accrued" interest taken as revenue by a trust company, it is a device which opens the way to abuse, and should be discontinued by strong companies. As corollary to this, we find that deposits, sundry creditors, bills payable, and balances due to superintendents in Ceylon, totalled over £28,000 in the last balance-sheet; while cash, debtors, and advances came to only £8,200. This is rather a lopsided way of doing business and when revenue is anticipated up to the hilt, an unforeseen contingency might prove awkward. A stronger reserve should provide funds to remove this danger, and the Board having acted so vigorously before, will doubtless treat this matter with becoming energy.

THE EASTERN PRODUCE AND ESTATES COMPANY.—Apparently this Company succeeded to a poor heritage when it took over the properties and estates of the old coffee-growing concern known as the

Ceylon Company. The debenture issues amounted to £195,200, and the interest upon them at 6 per cent in 1890—the first year of the new Company's working—exceeded the nett balance left after its payment. A large area of the estates had then been planted with tea, half of which was immature, and as this gradually came into full bearing the revenue of the Company improved to a moderate extent. The greatest gain to the Company, however, has been from the prudent financial policy adopted by the Board. Seeing that the debentures were a heavy drag, they devoted all their efforts to reduce the total. Each year a certain sum was set aside from revenue, and realisations of a part of the estates also took place each year for a time. So far did this determination to reduce the charges go, that it was set down in the articles of association that no dividend above 3 per cent should be paid upon the shares until the debentures had been reduced to £50,000. This clause, excellent in motive, proved in practice rather Quixotic, and has been since rescinded. The realisations of property in the past five years amounted to £68,500, and, together with the sums spent out of profits, enabled the debentures to be reduced to £122,500. A great improvement took place last year when the outstanding Six per Cents were replaced by a Four-and-a-Half per Cent issue, which will be paid off by annual redemptions of £7,500. The working of the Company in the past six years is shown in the following table:—

Year ending Dec. 31.	Revenue.	Working Expenses.	Debenture Interest.	Nett Profit.	Debentures Redeemed, Depreciation and other Sums written off Revenue.	Amount of Debentures.	Dividend.
£	£	£	£	£	£	£	%
1890 ..	93,879	71,756	11,712	10,410	6,677	195,200	nil
1891 ..	83,449	71,412	11,393	15,215	6,156	185,190	1½
1892 ..	86,206	64,903	10,903	11,090	7,187	175,410	2½
1893 ..	102,124	71,716	10,361	20,045	8,719	170,880	3
1894 ..	100,923	64,569	9,920	26,466	7,837	149,880	3
1895 ..	116,429	68,940	7,577	40,365	19,115	122,500	5

The chief factors in the wonderful fourfold multiplying of the nett profits in the period have been the reduction of the interest upon debentures and the economical working of the estates. Thus, while the outturn of tea doubled in the time, and gross revenue rose by about 28 per cent., the working expenses actually diminished by nearly £3000. This may be partly accounted for by the sales of portions of the estates, as doubtless the least remunerative properties would be disposed of. The sums spent on tea extensions and machinery and buildings have been carried to capital, but heavy reductions took place each year in the latter item on account of depreciation, so that, with considerable additions each year, the item of machinery and buildings stood on the last balance-sheet at £7221, as against £9938 in 1890. Doubtless this item will be written off entirely in a year or two. The tea extension account is mixed up with the sums spent on fresh land purchased, and this combined asset figured last December for £44,604, as compared with £26,419 in 1890. It would be a wise policy to divide up the item, and then the expenditure upon tea extension could be written down, if the practice of strong tea companies is to be followed. The reserve of the Company now amounts to £15,000 and it holds £23,171 of investments, about the composition of which it would be interesting to have a little information. The recent reduction in the interest upon debentures will further diminish the annual charge by about £2,000, and the cash balances are very good. So careful is the Board of this Company about the chances of the future, that out of its nett profit last year of £40,365, only £14,944 was distributed in the dividend of 5 per cent. Of the balance of £25,421, some £10,189 was taken to pay off de-

debentures and meet the expense of issuing new debentures, £5,000 was placed to reserve, and £10,182 carried forward as a provision for retirement of debentures in the current year. The area owned by the Company is one of the largest under one management in Ceylon, and as the Company furnishes more information than Ceylon companies usually do as to the yield and price obtained for its tea, we are able to give the following table:—

Year.	Tea over			Average Gross Sale Price per lb.
	Total Area.	Under Tea.	Four Years old.	
	Acres.	Acres.	Acres.	lb.
1890..	17,764	9,266	5,400	1,518,000
1891..	16,791	9,236	6,700	2,008,000
1892..	16,756	9,552	8,000	2,020,780
1893..	17,273	9,750	8,740	2,638,000
1894..	17,323	10,048	8,970	2,742,000
1895..	16,630	10,347	9,192	3,276,009

There is thus a fair quantity of plantings to come into bearing, and as maturity is not reached until after the sixth year of planting, the outturn of tea should increase considerably in the next few years if seasons continue favourable. The price, however, has fallen rather sharply, so that the larger output may not mean very much increased profit. But without this the Company ought to be in a position to distribute larger dividends at no distant date.

METROPOLITAN NOTES.

LONDON, July 2.

The following are from a London daily's "City article":—

IMPORTANT COMPANIES.

THE BRITISH NORTH BORNEO COMPANY.

While the Chartered Company of British South Africa has been forcing the pace and attracting the attention of almost every man, woman, and child in the United Kingdom (we know many enthusiasts who bought shares in the names of their children, and who paid £7 or £8 for them), the Chartered Company of British North Borneo has fallen out of notice to such an extent that the transfer fees for the whole of 1895 amounted to £18 12s 6d, showing that only 149 deeds were lodged during twelve months, or barely more than ten each Stock Exchange Settlement.

In presenting their reports and balance-sheet from 1st January to 31st December, 1895, the directors of the British North Borneo Company have but a modest tale to tell. The total receipts on revenue account amount to £40,240, while the expenditure reaches £33,260 in Borneo and £1,300 in London. Needless to say, no dividend is declared upon the called-up capital of £497,000.

We are inclined to think, however, that the Borneo Company has a future before it, and that the steady and withal quiet management of the country promises good results later on. British North Borneo consists of some 30,000 acres of land, so is slightly larger in extent than the Crown Colony of Ceylon, which lies in more or less the same latitude, and grows more or less the same tropical products.

During the early days of Ceylon, or, indeed, during the two centuries when the island nominally belonged to the Portuguese and the Dutch, the jungle-clad hills of the Central Province were untouched, and even unexplored. Yet now the greater part of the revenue is derived from the Central Province. In Borneo the coast lands have alone been made use of, and the planters of tea, coffee, and cocoa have yet to be attracted.

The directors are to be commended for the full table which they give of the imports and exports of the years 1894 and 1895. From the subjoined examples a good deal can be gleaned of the actual development of the country, the figures speaking for themselves, and requiring no comment:—

Exports.	1895.	1894.
Camphor ..	\$33,900	25,300
Coffee ..	14,800	1,500
Cutch ..	114,000	96,000
Gutta ..	46,800	30,700
India Rubber ..	49,000	35,300
Sago flour ..	121,300	122,000
Tobacco ..	1,176,000	875,000

For 1894 the total exports amounted to \$1,698,000 ; for 1895 they reach a total of \$2,130,000.

In the House of Commons, there has been a discussion on

“COCOA BUTTER,”

(not to be confounded with “coconut butter,” of which we have also heard). This is most fully reported in the *Morning Post* as follows:—

COCOA BUTTER.

The House then went into Committee of Ways and Means, Mr. J. W. Lowther in the chair.

The Chancellor of the Exchequer moved the following resolution:—“That the duty of Customs now payable on cocoa or chocolate ground, prepared, or in any way manufactured, under the provisions of the Act 42 and 43 Vic., cap. 21, sec. 3, shall be payable on that product of the cocoa bean which is generally known as cocoa butter.” The right hon. gentleman said the matter was a very small one, and could be easily explained. At the present moment cocoa, raw or manufactured, was liable to duty, and it had been discovered that cocoa butter, though manufactured from cocoa, could not properly be included as a manufactured article because the process of manufacture had not come within the scope of existing provisions. This article was largely used in the manufacture of chocolate. Out of every hundred-weight of raw cocoa 86lb. of cocoa butter was manufactured. As the law stood the manufacturers of cocoa butter in this country were liable to a duty of 11-3d on every pound of cocoa butter, whereas the manufacturer abroad could send the article over here without paying any duty. This was protection for the foreigner against the Englishman—(hear, hear)—and therefore he asked that the Committee would pass this resolution.

Mr. Kearley protested that no notice had been sent to the great manufacturing firms of the country.

The Chancellor of the Exchequer said he had received communications from Messrs. Cadbury, Taylor, Epps, Lipton, and Thorn, all of whom desired this alteration in the law. (Cheers.)

Mr. Kearley noticed one serious omission in that list, and that was a firm which flourished in the district represented by the right hon. gentleman, namely, Messrs. Fry, of Bristol. He understood that they strongly objected to this, and appeared to be quite in ignorance of it.

The Chancellor of the Exchequer said he had received a communication from Messrs. Fry, who, he thought, had not understood the purport of the resolution.

Mr. Kearley asked that the resolution should be postponed for at least a week in order that Messrs. Fry and other firms should be able to obtain a hearing. He maintained that if a duty were imposed on cocoa-butter the foreign trade of certain manufacturers would pass away.

The Chancellor of the Exchequer pointed out that a clause embodying the views of those on whose behalf the hon. member spoke could be placed on the paper and discussed on the Finance Bill. That would give ample time for the matter to be fully considered in the interval by the manufacturers and others interested. (Hear, hear.)

Sir W. Harcourt observed that this was purely a preliminary stage, and he advised his hon. friend to be satisfied with the assurance of the Chancellor of the Exchequer.

The resolution was agreed to, and the House resumed. But *The Times* gives some additional figures; for instance, mentioning that apart from English firms paying duty on the raw product to make this butter, Dutch and German houses that paid less duty on the beans actually got a drawback on the “butter” they exported to England!

MR. ERNEST E. GREEN

writes to me on 1st July as follows, and it is as well his note should be published to prevent any misconception:—

“I have been much gratified by the way the district associations have been coming forward in support of my book on the Coccidæ of Ceylon; but, judging by remarks made in the course of the discussion at the meetings, I fear that there is some misconception as to the scope of the work in question. There seems to be an impression that the term ‘Coccidæ’ is synonymous with ‘insect pests.’ This is not so. The family Coccidæ covers only one group—namely, the ‘scale bugs’; and although the greater number of our pests *do* belong to this family, there are others—and important ones—that do not. ‘Helopeltis’ is one of the exceptions, as I have previously explained you. I shall be much obliged if you will mention this in writing to Ceylon. As I should be very sorry to take advantage of such a misconception and cause disappointment, I hope that anyone who has been led to subscribe solely under the wrong impression will withdraw his subscription.”

For my part, I cannot see how there can be any disappointment, for Mr. Green’s book is sure to be very useful.

LONDON, July 10.

MR. J. L. SHAND

is back from his mission to Central America—Costa Rica—chiefly to report on valuable coffee property in a new district of that rising coffee state, which the owner wishes to develop by means of English capital and probably a Limited Company. I have not seen Mr. Shand yet, but learn his Report is favourable. In this connection it is of interest to read what is said about “coffee” in the adjacent state of Columbia (South America) in the course of a recent Consular Report quoted by *Commerce*:—

COLOMBIAN COFFEE.

Columbia possesses a large expanse of territory, with the favourable (or unfavourable) circumstance that, though geographically situate in the tropics, the climate is diversified in all grades, from that of everlasting snow that covers many summits of the Andes, down to continual heat and burning sunshine. The country, says Mr. Consul Mallet, may be said to be practically uninhabited. The whole number of inhabitants is supposed to be 4,000,000 souls, but as no census has ever been taken, any idea as to the number of inhabitants must necessarily be speculative. The whole country is divided into departments, and each department is subject to the Central Government which has its seat in Bogotá. The machinery of the Government is managed entirely in that city.

The chief agricultural product is coffee. The belt of land lying about 3,000 feet above the level of the sea is where the greater part of this berry is produced, though the part grown at 4,000 feet elevation is of a quality superior to that grown further down. Were there sufficient population, there is no reason why the annual crop should not be much increased. It seems easy enough to remedy this want by merely promoting immigration from other lands, but there are many practical difficulties in the matter. The first difficulty is to get together a certain number of people suitable for the work. When got they have to be brought over to these burning shores; after arriving they have to be conducted up rivers, and over primitive roads until they arrive at the section of the country to which they have been destined. Next comes the housing, clothing, and feeding of them, and all the care that must be taken of their health; next the building of the village where they and their families are to dwell. Add to all these the isolated position in which these immigrants find themselves among people of different race, language, religion, and customs, and it is easy to understand the causes of utter failure and individual suffering in so many immigration schemes.

As a general rule Colombians do not migrate through their country. The warm country man rarely goes to the temperate zone, and those of the latter seldom descend to the warm climates. Thus the coffee growers depend entirely on their own hands, and the result is that no more coffee can be cultivated and harvested than what the actual inhabitants of those regions can accomplish. At present the departments in which the cultivation of coffee is carried on are as follows:—Santander, Antioquia, Tolima, and Cundinamarca. In consequence, however, of the scarcity of labourers, comparatively few large coffee estates are carried on. The very great proportion of the yearly crop is produced on small holdings, which are worked by the holder and his family. Last night we had the following:—

“COCOA BUTTER.

“The CHANCELLOR OF THE EXCHEQUER moved a new clause imposing a duty of 1d per pound on cocoa butter.

“Mr. T. LOUGH contended that the principle of the tax was wrong. This was a subtle attack upon the whole policy of free trade, (Hear, hear.)

“The clause was added to the Bill.”

At length our old friend

“RHEA”

seems to have fallen into energetic hands and Capt. Whitley's Company is looking up: here is its advertisement in financial papers:—

“RHEA FIBRE TREATMENT.

The owners of the Gorness Patents and Rights for the following countries are prepared to receive applications from foreign and colonial companies or financial houses for dealing with such of these Patents and Rights as remain unsold, either in the form of working under licence or purchase outright.

*Austria	Fiji	Portugal
Argentine Republic	Finland	Portuguese Colonies
Barbadoes	*Germany	Queensland
*Bulgaria	Guatemala	*Russia
*Belgium	Greece	*Roumania
Brazil	Hawaii	Spain
British Guiana	Holland	*South Africa
British Honduras	Hong Kong	South America
Bahamas	*Hungary	*Straits Settlements
Bolivia	*India	South Australia
Buenos Ayres	Italy	Sweden
Burma	Jamaica	*Servia
British Columbia	Japan	Switzerland
Borneo	Leeward Islands	Tasmania
*Ceylon	Luxembourg	*Transvaal
Canada	Mauritius	Trinidad
*Cape of Good Hope	Mexico	Tunis
Cougo Free State	Madagascar	*Turkey
China	Newfoundland	*United States of America
Chili	New Zealand	Venezuela
Cuba	Norway	Victoria
Denmark	New South Wales	West Australia
*France	*Natal	
	Orange Free State	
	Peru	

“The Patents and Rights for countries marked * in the above list are either already sold or negotiations are proceeding with respect to them.

“Applications to be made as below, where information can be obtained and samples seen.

“The Foreign and Colonial Rhea Fibre Treatment Syndicate, Limited.

“17, Shaftesbury-Avenue, London, W.”

And two London evening papers discuss the subject as follows:—

“A RHEA FACTORY FOR LANCASHIRE.

Our old friend rhea has turned up once again, this time in Lancashire. It is to be manufactured by a company which has taken over the Castleton Mills, Rochdale, for the express purpose. The process, which will be employed, is that known as the Gorness process. Lancashire spinners appear to be taking favourably to the new fibres which have been recently exploited or perfected. More than one mill in the vicinity of Manchester is occupied with the preparation and production of the particular fibre, and from all we hear they cannot turn out enough yarn to meet the demand. Moreover, we hear of other companies projected in addition to the one

just formed at Rochdale. The capital for this venture, by the way, has all been subscribed privately. There is certainly a big demand for the commodity, and it looks as though it may have come to stay at last.”

MORE ABOUT RHEA.

How far rhea fibre is likely to realise all the great things that its admirers have prophesied for it is open to question. But evidently there is no intention of allowing financial enterprise in that direction to be confined to the flotation of the large Rhea Fibre Company that was offered to the public some months ago. A company has just been registered to acquire a private concern hitherto known as the Rhea Fibre Treatment Company, Limited, and the name of the new enterprise is the Rochdale Rhea Fibre Spinning Company, Limited. The capital is £75,000 in 25,000 preferred and 50,000 ordinary shares. Another interesting registration at Somerset House is that of James Nisbet & Co., which has been formed to take over the well-known publishing business in Berners-street. It is gratifying to see that the directors' qualification is fixed at £1,200. It is not often that directors are forced to take so sensible and substantial an interest in a Company from which they drew their fees.

PLANTING AND PRODUCE.

TALK ABOUT THE TEA DUTY.—The discussion in Parliament on the tea duty, a report of which appears elsewhere, although it came to nothing from a practical point of view, gave the question airing, and brought out a few points in connection with Mr. Chamberlain's Zollverein scheme and its application to British grown tea. In discussing the Finance Bill, Mr. Lloyd-George on the last occasion had moved an amendment to exempt tea grown in any part of Her Majesty's dominions from the tea duty. Since this amendment was moved Mr. Chamberlain has propounded his scheme for an Imperial Zollverein. The amendment gave an excellent opportunity for discussing it. The Radicals, in the interest of progress, were willing to forego the chance, but Mr. Lowther—the champion Protectionist—would not let it slip. He has been organising Protectionist meetings up and down the country, and was back in the House full of encouragement and enthusiasm. There were many demands for the “author,” but Mr. Chamberlain carefully kept out of the House, although he was on the premises. On the withdrawal of Mr. Lloyd-George's amendment, Mr. Lough moved that Ireland should be exempted from the payment of the tea duty, a suggestion which, as the Chancellor of the Exchequer pointed out, would involve the restoration of custom houses between Great Britain and Ireland and a reversal of our settled policy of fiscal unity. This amendment was withdrawn, and then Mr. H. Lewis moved an amendment to the effect that the duties on higher-priced teas should be raised and the duties upon lower-priced teas lowered. This also was withdrawn. Mr. Lloyd-George moved to reduce the tea duty from fourpence to twopence per pound, but the proposal was defeated by 263 votes to 96, and the clause was agreed to by 228 votes to 87. During the discussion Mr. Labouchere was afforded an opportunity of saying that it gave him great pleasure to vote in favour of a reduction of the tea duties, and Mr. Lough, who is in the tea trade, was permitted to express a trade view on the question of duty as it affects the price of tea. The funniest thing in the debate came from that mad wag, Mr. T. G. Bowles, who delivering himself on the accident wheeze about the terrible effects of tea drinking in Ireland, mentioned in his playful way that “the more tea was drunk in Ireland the more the Irish population diminished.” The debate on the whole was conducted in a rollicking spirit, and was not at all a bad advertisement for the tea trade. As for the rights and wrongs of the tea duty, all the advocates of a “free breakfast table” protested against the maintenance of this tax in a year of an overflowing Exchequer, and an unprecedented surplus. That the money raised by a 50 per cent tax on the poor widow's cup of tea had been squan-

dered in "floats armaments" and doles to rich landowners gave the Radicals an excellent text, and they did not fail to improve upon it.

NEW INDIAN TEA COMPANY.—The Oodmarie Tea Company, Limited, Assam, has been formed with a capital of £40,000 for the purpose of acquiring as from January 1, 1896, and working as one concern, the three tea estates known as Oodmarie, Balijuri, and Lung Soong, situate in the district of Nowgong and province of Assam, India, together with all buildings, machinery, stock, coolies under contract, &c.

GROCERS AND PACKET TEAS.—Some correspondents have recently called attention to the evils, from the grocer's point of view, of the packet tea trade. But the *Grocer* gives its readers some advice on the subject, which they must of necessity ponder on. It says: "There will be agents, and there will be packet teas: query, is it practicable for a grocer to refuse to sell all such goods? However desirable the own-blend system may be, you do not get rid of a danger by ignoring it. The feature of these packet teas is that they are so easily handled that no special skill is required in those who sell them. If grocers generally refused to sell them, the wholesale merchants would easily enough obtain the services of confectioners, chemists, or even perhaps tobacconists (who have already somewhat too much experience of packet goods for their comfort) as their agents, and although nobody else could be half so efficient in that capacity as the grocer, the latter would probably lose a little of his trade, and see other people gradually extending their encroachments upon it. Quite so!"

COFFEE DRUNKENNESS.—Medical men are delightfully impartial in their attacks on tea and coffee drinking. When they have finished for a time the operation of jumping on tea drinkers, they give the coffee imbiber a turn. There is an outcry in America and on the European continent against coffee drunkenness, which is said to be one of the latest dangers. A New York doctor, who has made a special study of the subject, says his observation has shown beyond question that chronic coffee poisoning is much more common than is generally supposed. "The symptoms are usually confounded with alcoholic disturbance, because coffee dyspepsia bears a striking resemblance to alcoholic dyspepsia. There is the same disgust for food, morning expectoration of mucus, and marked anorexia. This disgust for food increases in severe cases until the patient can only take coffee or bread soaked in coffee. Nausea follows, and many of the other ills that flesh is heir to. Concerning the same evil Dr. Mendel of Berlin has published a clinical study which is the most thorough yet made, as he had a community of coffee drinkers under his constant observation, the working women in and about Essen. He found many of these women consumed over a pound of coffee a week. The leading symptoms of the ills that afflict them were profound depression of spirits and frequent headaches, with insomnia. A strong dose of coffee would relieve them for a time, then the ailment would return. The muscles became weak and trembling, and the hands trembled when at rest. The victims suffered so seriously they dared not abandon the drinking of coffee for fear of death." All this worked up into the shilling shocker form would be thrilling.—*H. and C. Mail*, July 10.

THE GALAHA CEYLON TEA ESTATES AND AGENCY CO., LTD.

This company is formed to acquire carry on, and develop a group of freehold tea estates, two freehold factories, and the general and agency business of Messrs. Chas. Strachan & Co., in Colombo. The vendor tells us in the prospectus that he estimates the profits for the next twelve months at £13,546. Why not give the actual net profits for last year or the year before, as he has managed the estates and business for many years? Investors could then see the increase of profits as the plantations come into full bearing. Under present conditions we cannot see anything in the prospectus to recommend investors to subscribe to this issue.—*Financial Bulletin*, July 4.

Tea, as a beverage, has been steadily growing in public favour despite the occasional onslaughts of various members of the medical profession directed against its effects on the nervous system. Consequently, it is not surprising that tea-growing is a remunerative industry, and many of the Indian and Ceylon companies are very prosperous concerns, and offer good opportunities for investment to those who want more than 2½ per cent or so for their money. It must not be supposed, however, that every tea estate pays, and the public must exercise caution and discretion in selecting those in which to invest. The Galaha Ceylon Tea Estates and Agency Company (Limited) does not impress us as one we can recommend. It is formed with a capital of £110,000, divided into £60,000 cumulative 6 per cent preference shares of £10 each and £50,000 ordinary shares of £10 each. There is also a debenture capital of £55,000 paying 5 per cent. The objects of the company are to acquire certain freehold tea estates, with tea factories, &c., in Ceylon, and the general agency of Messrs. Strachan & Co., in Colombo. The estates, business, &c., are to be purchased for the sum of £155,000 and the vendor takes the £50,000 of ordinary shares and the balance £105,000, in cash, so that his total interest in the concern will be comparatively small. We do not notice any independent valuation of the properties, &c., taken over. Another point calling for remark is that although the businesses have been carried on some time, no statement of the profits earned in past years is put forward. Instead thereof we have the vendor's estimate of sales, working expenses, &c., from July 1, 1896, to June 30, 1897, showing, of course, a satisfactory profit. We cannot say that this estimate will not be realised, but the intending investor will bear in mind that estimates of future profits are vastly inferior to statements of past profits as a basis on which to value a business. The concern may be perfectly good and sound—we know nothing to the contrary—but if so, the prospectus certainly does nothing to demonstrate the fact.—*Commerce*, July 1.

COFFEE IN THE KELANI VALLEY.

Mr. R. M. Dawkin, who to a certain extent, at least, is the pioneer of coffee planting in the Kelani Valley, has kindly furnished our representative with particulars regarding an experiment he has made on his estate of Kanangama. A year past in April a few bushes were planted, from a nursery, close to the conductor's quarters. These were carefully nurtured, precautions being taken to ensure that they were properly shaded, manured and watered. These bushes have thriven wonderfully, some of them being between 4 and 5 feet high. Quite recently there was a fair crop of blossom on them, which "for the good of the bush" was plucked off and not allowed to mature. In September last year Mr. Dawkin planted 100 acres in liberian coffee. The bushes, like those first experimented with, have a strong and healthy appearance and some of them have grown to a height of between two and three feet. It is Mr. Dawkin's intention to plant another 50 acres in liberian coffee shaded with dadup trees 20 feet apart. The "Laird of Kanangama" is well satisfied with the results of the experiment so far as it has gone, and he is hopeful that his acreage of coffee will have come into bearing in the course of two and a half years. At all events, he is determined to give the experiment a five years trial, holding as he does, that previous coffee growing trials in the K.V. did not get fair play owing to owners preferring to go in for tea which, at the time the experiments were made, was realising long prices. The Hon. T. N. Christie, we learn, takes an interest in the departure inaugurated by Mr. Dawkin and some day intends to have a look at the Kanangama coffee. We wish it and its owner the best of luck.

THE KOTMALE VALLEY ESTATES COMPANY OF CEYLON, LD.

The mail has brought us intelligence of the formation of this Company with a capital of £50,000 divided into 2,000 five per cent cumulative preference shares of £10 each and 3,000 ordinary shares of £10 each. The Company has been formed for acquiring from the Queensberry Estates Coy., Ltd., the estates called Queensberry and Strathlonach situated at Kotmale Valley in extent 1,072 acres. The consideration for the purchase is £4,120.

THE POMELO—COMMONLY CALLED GRAPE FRUIT.

This wonderful citrus fruit was introduced into Florida about 1839 from Jamaica and Pernambuco. It was planted more as a curiosity and not thought much of, only being eaten by the old Floridians as a Spring tonic and to drive away malaria, until the live Yankee got hold of it about 1881, and began to introduce it into the larger eastern cities. As it has great medicinal qualities the doctors of the east soon began to recommend it for indigestion, and as a tonic to tone up the system in the Spring; also as an appetizer.

The majority of people who eat this fruit do not like it at first, and many have not tried to like it on account of the extreme bitterness of the rind and membrane, or lining between the pulp. The correct way to eat this peculiar fruit is to separate, or take away all this lining, and eat only the pulp; or better still, cut the fruit open through the center, dig out the seeds and core, then sprinkle a little sugar over the pulp (working it in a little with a spoon or knife), let stand several hours or overnight; eat just before meals. This way one soon learns to like and even crave for it. Unlike strong drink or stimulants that create a craving appetite, the pomelo is not only harmless but beneficial, and will, I understand, even alleviate the rum appetite and if persistently used cure drunkenness.

There is nothing in the fruit line yet discovered that has the medicinal qualities of the pomelo. Hence, the demand will increase from year to year and take all the fruit that will be grown in the United States for the next twenty years.

The product of Florida was about wiped out by the great freeze in that state in 1894-95, and this past season, what few pomelos the east obtained from the extreme southern border of Florida and South America, brought fabulous prices. A few boxes sent from California sold at from \$10 to \$20 per box in Boston and other eastern cities. Very common and poor fruit from Jamaica sold in Buffalo at from \$12 to \$15 per barrel. Of course these high prices will not continue when the live California planters get trees in bearing. There is not, however, any doubt but the demand has come to stay, and that it will increase as the fruit becomes known.

Now about varieties. Most people think there is but one variety. This is a mistake, as all fruits have different kinds. I travelled over all parts of Florida during the winters of 1890 and 1892 looking up the best varieties, and bought trees of what I considered the four best, and planted them at South Riverside. I found the Seedless a large fine fruit, having all the medicinal qualities desired with only an occasional seed; is a very luscious fruit. The one I considered next best was the Arantium, or Sweet Rind, a cross between the pomelo and orange. It has none of the bitter about the rind or lining, and only a trace of it in the pulp, and still much of the flavor of the pomelo as well as that of the orange, and will suit the taste of all. I do not think, however, that it has the medicinal qualities of the bitter rind. I also found a very fine fruit in St. Petersburg on the Gulf coast called Leonard's Grape Fruit. This has as thin a rind as the orange, is juicy, fine flavored, with all the medicinal qualities. I also found the Walters. The original tree was on the place of a Mr. Walters at Belleview, Florida, and the fruit is the largest of the bitter rind I ever saw. The tree was over twenty years old and had some 5,000 pomelos on it weighing from two to

three pounds each. I secured trees budded from all four of these varieties, and have them all in bearing but the Arantium or Sweet Rind, which will probably bear some fruit this season. I consider these varieties the best yet discovered. The more common varieties of seedlings are about all called Triumph, and will stand in comparison to these varieties as the seedling orange does to the budded varieties.

The Seedless will undoubtedly take the lead over all others. The California growers who get the first orchards into bearing will undoubtedly have a gold mine in the shape of gold-producing fruit that will outdo all other fruits in this respect. It is no fad, but the demand has come to stay and will increase for years to come. It will take at least ten years of active planting for California to make up Florida's loss in this line. I have given this fruit my especial attention for at least five years, and if I were to do any more citrus planting it would be nothing but the pomelo.

The tree is the finest of all the citrus family, is a thrifty grower, has large glossy leaves, and a tough wood that will bear its enormous weight of fruit without propping. I have seen as many as 6,000 pomelos on a single tree that would average 32 ounces each, or 12,000 pounds of fruit on a tree 22 inches through, the trunk three feet from the ground, and the tree over 49 feet in height, and 30 feet across its widest branches. This tree was 34 years old. The fruit from this tree sold for such a fabulous price that I will not mention it here for fear of being set down for a combined Florida and California liar.

C. B. HEWITT.

Pasadena, Cal.—*Rural Californian*, June.

BOTANIC GARDENS AT THE CAPE.—*Nature* of June 25 says:—

The *Agricultural Gazette* of Cape Colony publishes a letter sent by Sir Ferdinand von Mueller to Sir Hercules Robinson, the Governor of the Colony, and appealing for a reserve-ground for the preservation of rare Cape plants. As the veteran botanist of Victoria points out, the vegetation of South Africa is the richest in the world, not only as to number of species, but also as containing an astounding variety of plants of special and peculiar type, aggregated chiefly in the south-western provinces and occurring nowhere else. Hundreds of these are quite local and restricted to very circumscribed areas. They are sure to be swept out of existence altogether, unless special provision is made for their preservation; and it is on that account that the appeal is made for a wild-garden or reserve for the conservation of Cape plants in areas where they can be maintained for the knowledge of generations to come. It may be said that botanic gardens exist already in several parts of the colony, but in a report upon Baron von Mueller's proposal, Prof. Mac Owan remarks: "These places can only exist by making themselves into a lounge or pleasure of idle hours for the population living close by. I speak as one who knows, for it was my lot to run one of these for fourteen of the hardest and most unsatisfactory years of my working life. The conditions of support compel the place to grovel down into a nursery-garden in commercial lines, in order to get money enough to keep it presentable for the daily stroller. Nor did I ever dare to plant up any single portion of it with typical representatives of our Flora. The public would have taken the alarm at once. They care nothing for the special prehistoric flora of the land they live in, compared with the newest hideous abortion in chrysanthemums. . . . So that some of the gardens which we complaisantly call botanic, have it in them to stand between the living and the dead, and stop the slow and sure extinction of the most ancient and interesting part of our Cape Flora. This state of things, brought home to me yearly as I traverse the same solitudes each season, and note the increasing scarcity of rare plants, has been much in mind; but I do not see any other way of dealing with the matter, than by the reserve, now recommended, of chosen localities for all time and inalienable." But much as this is to be desired Prof. Mac Owan has to confess that the idea is not likely of even approximate fulfilment.

THE ASSOCIATED TEA ESTATES OF CEYLON, LIMITED.

The mail has brought us a copy of the prospectus of this Company which has just been brought out by Mr. W. H. Davies of Colombo with a capital £150,000, divided into 8,000 six per cent Cumulative Preference Shares of £10 each and 7,000 Ordinary Shares of £10 each. The Preference Shares are entitled to a Cumulative Preferential Dividend of 6 per cent per annum, and are also preferential as to capital. Mr. Davies' firm in Colombo have heard by wire from him that the capital offered for subscription was over applied for. Mr. Davies is forming another Company of the prospectus of which we are promised a copy shortly. Of the present company the officials are:—

DIRECTORS.—Sir Alexander Wilson (Chairman of the Mercantile Bank of India, Limited), London. *S. R. Earle, Esq. (Director of Alsing & Company, Limited), 7, Oxford Court, London E. C. John McEwan, Esq. (of the Allynugger Tea Company, Limited), 5 Billiter Avenue, E. C. * Mr. Earle being a Director of the Malabar Company (Limited), who are the Vendors, will not act as a Director until after allotment.

BANKERS.—The Bank of Scotland, 18, Bishopsgate Street, London, E. C. The National Bank of India (Limited), London and Colombo.

SOLICITORS.—Messrs. Sanderson, Holland, Adkin & Co., 46 Queen Victoria Street, London, E. C. **AUDITOR.**—J. M. Henderson, Esq., F. C. A., 2, Moor-gate Street Buildings, E. C.

BROKERS.—Messrs. Milln & Robinson, 2, Austin Friars, and Stock Exchange, London, E. C. Messrs. Hart & Watson, 63, St. Vincent Street, Glasgow, Messrs. Higgins N Paton, 21, Dale Street, Liverpool.

AGENTS IN CEYLON.—Messrs. Finlay, Muir & Co., Colombo.

SECRETARIES AND MANAGING AGENTS.—Messrs. Mc-Meekin & Co., 5, Billiter Avenue, London, E. C. **OFFICE.**—31, Billiter Buildings, London, E. C.

The Company is formed to take over as going concerns, and to amalgamate under one management, the following carefully selected tea estates in Ceylon, and to purchase further estates as opportunity offers:—

Name of Estate.	Districts.	Tea in acres.			Forest, Chena, &c.	Total.
		Full bearing.	1 years.	Under 4 years.		
Chesterford	Kelani Valley ..	278	15	266	250	809
†Dukinfield	Uda Pussellawa ..	210	—	20	54	284
Doragalla	Pussellawa ..	620	—	—	371	991
Horagoda	Kalutara ..	150	—	20	248	418
Madultenne	Kelani Valley ..	150	—	52	85	287
		1,408	15	358	1,008	2,789

† Commonly known as "Silver Kandy."

The two principal estates to be taken over by the Company have been carefully investigated and reported upon by experts in Ceylon, and their reports, which are in great detail, may be seen at the Company's Offices. As regards the other estates, the figures have been taken from the Proprietors' Statements.

The following is a Summary:—

There is a total area of about 2,789 acres, of which 1,408 acres are in full bearing.
 15 " 4 years old.
 358 " 3 " and younger.
 1,008 " Forest, Chena, &c.

2,789
 The crop for 1895 was 663,628 lbs., yielding a net profit of .. £9,172 }
 The crop for 1896, taken on the usual basis of calculation for new tea coming into bearing, is estimated at 700,000 lbs., to yield a net profit of .. £9,461 } at Exchange of 1/2 per Rupee.

Of the increase estimated for 1896, so far as the year has gone, the actual result fully justifies the figures given. The reports referred to have been submitted to Mr. W. Forsythe, a well-known Ceylon planter, who is now in London, and he has expressed his satisfaction with the same, and has estimated that, when all the young tea comes into full bearing, there should be a considerable increase in the crop. The original report of Mr. Forsythe may be seen at the Company's office. At the price agreed to be paid for the estates, taking the Forest Chena, &c., at £5 per acre, the land under Tea works out at an average cost of the Company of £55 8s per acre, which, considering the high character of the Dukinfield Estate, is very reasonable. The present average output of the 1,408 acres of Tea in full bearing is at the rate of about 450 lb. per acre, and, when the 373 acres of young Tea come in, there should be a proportionate increase of revenue to the Company; besides which there would be the natural increase upon the Estates generally.

A feature in the selection of the Estates is the distribution over high and low-country, the properties ranging from Udapussellawa, at an elevation of 5,500 feet, to the Kelani Valley with an elevation of 450 feet above sea level. This should lead to a more uniform aggregate result than by having a series of properties all in one locality. There is ample Factory accommodation for present requirements upon the Estates, and there is an experienced staff of officials and employees, which will be taken over by the Company, so that the business will be carried on without any break in its continuity. The price to be paid for the five Estates above-mentioned has been fixed by the Vendors at £103,720, leaving a balance of £6,280 out of the present issue available for working capital, the Vendors agreeing to pay all the expenses in connection with the formation of the Company down to allotment. The purchase price is payable in Cash owing to the difficulty of adjusting, on the basis of a payment partly in Cash and partly in Shares, the interests of the several individual owners from whom the Estates were in the first instance acquired. The Vendors and their friends will, however, apply for a substantial number of Shares. The Vendors have agreed to make out a good title to the Estates to be acquired by the Company to the satisfaction of the legal advisers of the Company in Ceylon. The following Certificate has been given by Mr. J. M. Henderson, F. C. A., to whom the original Reports have been submitted for investigation:—

2, MOORGATE STREET BUILDINGS, LONDON, E. C., 30th June, 1896.

To the Directors, the Associated Tea Estates of Ceylon, Limited.

Gentlemen,—I have compared the tables which you have prepared and submitted to me, as under, with the original Reports from Ceylon referring to the first two estates, respectively, and in the other three estates with the figures given by the proprietors, and Mr. W. H. Davies of Colombo, and I hereby certify that the figures showing the crops in 1895 and the estimated crops for 1896 are correctly extracted therefrom. I also find that the profits in 1895 and the estimated profits for 1896, as given in the said tables, are fairly deduced from the said Reports and statements, and the estimates given therein.

In the estates marked (*) the profits for 1896 are taken on the basis of 1895.

No provision, however, has been made for depreciation on buildings, plant, or machinery.

No.	Estate.	1895 Crop.	1896 Crop (estimated).
		lb.	lb.
1.	Chesterford ..	172,000	190,000
2.	Dukinfield ..	99,640	105,000
3.	Doragalla ..	233,988	*220,000
4.	Horagoda ..	67,000	*85,000
5.	Madultenne ..	91,000	*100,000
Total crop ..		663,628	700,000
Profit ..		£9,172 0 0	£9,461 0 0

Yours faithfully, J. M. HENDERSON.

Taking the profits for the year 1896 as ..£9,461 it will be seen that the Dividend upon the Preference Shares is amply covered, 6 per cent. on £60,000 absorbing 3,600

leaving for Dividend on Ordinary Shares (£50,000), London Expenses, &c., the sum of ..£5,861 besides which there may be reckoned the increase of yield and revenue from the young Tea, which forms a reserve against contingencies.

The following contract has been entered into, viz.:—An agreement between the Malabar Company (Limited) and William Henry Davies of the one part, and the Company of the other part, dated 16th July, 1896, being a contract for the sale and purchase of the five estates above-mentioned.

No underwriting of the Company's capital has been effected, and the Shares will be allotted as far as possible *pro rata* on the application. It is intended to apply in due course for a Stock Exchange settlement and quotation.

THE CRAWFORD CUTCH CO.

We are glad to know that this Company's business at Trincomalee has now been thoroughly established by Mr. G. R. Murray, Secretary of the Company, who left by the last P. & O. mail steamer after a three months' stay in the island. The works, which are turning out at the rate of 6 tons per week, are in charge of Mr. Gillespie.

COFFEE IN NEW CALEDONIA.

Writing to a friend in Colombo, a gentleman well-known in Ceylon says:—

wrote you from Sydney, since which I was asked by a firm to come and report on some coffee plantations in this island. I have been here a month visiting a number of places. Coffee grows like a weed here, and it is grand to see old King Coffee looking so healthy with deep dark green foliage, and really good crops. It is wonderful how it does, seeing the careless cultivation and on land we would not dream of planting. Just fancy, it grows in the low land; the soil is rich chocolate 4 or 5 feet deep, but all grass land like our patanas. It is first scythed down, then ploughed 18 inch deep with a team of 4 bullocks (English); then the grass roots removed, harrowed, and coffee planted, and with it the blackwood tree for shade under which the coffee thrives most beautifully. "Bois Noir" or blackwood seems to kill the grass and weeds once the shade is established. Plants are put in about 8' by 6' and 9' by 5' and until the shade is established, ploughing is done between the coffee, the leaf mould formed from the leaves and seed pods of the Bois Noir are very great, and in fact in the 5 years no weeding is needed. Trees (coffee) are topped at 8 feet and no pruning ever done which is a pity as they are far too thickly knotted in the centres. I saw one field last week at Thio and St. Paul's about 25 acres carrying 12 cwt. an acre, and this on grass land that was. Government are getting out young men as planting emigrants giving them 15 acres each on forest land, and insist on the coffee being planted under shade, so that only the undergrowth is cleared, no burning, and coffee planted. Plants all shapes

and sizes are put in by these men and in a few years this island will ship crops as large as Ceylon did. At present most of the coffee is dried in cherry. Some have pulpers but do not know how to set them. One place I saw pulp and cherry and parchment all coming through together and in some going into the pulp pit. I set this pulper for them, a Gordon's Disc, worked by a 16 foot water wheel. This wheel also works a set of stampers for clearing the parchment, a very slow process. The cisterns are about 4 feet square and high and in this they also wash or try to wash the parchment next day. After setting the pulper and surprising them with the clean way the pulper could work, I also made them make a washing cistern of planks and one day washed the parchment, bringing it to them snow white and no pulp or cherry as they did and put it to dry, and then picked the parchment out. Coffee is selling at 12½d per lb. here, and such rubbish, about equal to our native. The extent of this property is 13,000 acres, of which 500 acres are under coffee and the rest grazing, and about 2,000 acres good for coffee viz. forest and river flats. The climate at sea level equal to about Kandy or Gampola. Very healthy, no fever, in fact no sickness, and strange to say no animal or reptile lives on the island and very few birds. Locusts are bad at times. You can go through grass and jungle and no fear of any snakes. The owner of this land died 6 months ago and they want to realize coffee crop, 60 tons off 320 acres bearing and from cattle which gives about £3,000 profit yearly which pays for coffee cultivation. Last year they netted £6,800. The grazing land for stock I am going to try and get a company up to take it. Rice and cotton grow well but no labour, and the French men are too lazy and the kanaka coolies are good for nothing brutes, get 8s a month and fed with rice, meat and tea and don't pick half a bushel of cherry a day where our Tamils would bring in 1½ to 2 bushels or a box to a box and a half. There is a fortune here in rice and cotton and I wish I had some one with capital to take it up; there is a big fortune here. The island is full of minerals. On the tops of the mountains they get Nickel, Chrome, Cobalt, Copper, and Coal. Nickel chiefly; there is about 200,000 tons lying here waiting shipment, in fact a small mountain of it; owing to low prices the Company will not ship. Convicts are hired out by Government at 16s a month and their feed. Hoping to hear from you in Sydney, where I go tomorrow per "Armand Béhic."

THE RHEA FIBRE QUESTION.—Our Allahabad contemporary, dealing with this subject, warns Indian planters and merchants against lending their capital to machine-rushing companies and adds:—It is only fair to warn them that before the machine is tried the cultivation of the plant should be tried. Rhea is not like jute, which only occupies the ground for a few weeks. Once down it has to stay for years, and its value, as grown in any part of India, can only be tested by experiments extending over a considerable period. We are by no means prepared to say that rhea cannot be raised profitably in any part of India; or that with cheap labour one or two crops a year could not compete against the three or four crops in Java and similar regions where labour is comparatively dear. But it is none the less certain that accurate knowledge of the workable outturn of the plant and the cost of raising it should be obtained in any given locality before capital is sunk there in extensive plantations. If the Forest Departments in those Provinces where conditions are most favourable will consent to carry out experiments which will satisfy capitalists that rhea wands fit for their machine can be grown at reasonable cost and in sufficient quantity year after year, then, and then only, will they be justified in inviting the public to embark in the speculation.

CEYLON TEA COMPANIES AND THEIR DEBENTURES.

Vicissitudes have, writes a London correspondent, been experienced of late by Ceylon tea companies at home in the disposal of some of the debenture stock recently issued by them. It is not easy to realize what has been the cause for this. It seems only natural to expect that an assured interest of six per cent would, with the present value of money as low as it is, prove tempting to investors. It does not seem, however, that these are very ready to subscribe for the debentures of newly-started companies. Those companies that have established their position do not seem to find the least difficulty in placing the whole of such stock that they may desire to issue. But in their case it is the shareholders who readily subscribe for them, and they rarely have occasion to resort to the general public. It is a curious fact, that while new tea companies have little or no difficulty in disposing of their ordinary shares, the same facility is not experienced as regards those on which a fixed rate of interest is guaranteed. The explanation of this, our correspondent supposes, lies in the desire for a gamble. The public will venture freely when a chance lies before it of high, if risky, profits while it holds back from the more moderate, though more assured, profit to be secured from debenture stock investment. In a sense this tendency of the present day—one that is nearly all-pervading—is greatly to be regretted, but there seems little chance, at all events for the present, of its being superseded by a sounder and, as it seems to us, wiser one. And the subject invites us to consider another feature in the case of companies formed or in contemplation for the acquirement of tea properties in Ceylon. Every month almost sees more and more disposition to transfer estate property in this island into the hands of joint stock limited enterprise. We hear the question frequently asked whether this be a healthy sign, or if it bodes well for the future of our tea industry? Those who hold that it does not, rely greatly on the argument that there is going on a steady withdrawal of personal interest in the cultivation of estates that sooner or later will be found to produce ill-effects. Certainly that direct personal interest is becoming greatly limited. The proportion of acreage that is now cultivated by resident proprietors is narrowing in a ratio that seems to threaten such direction with almost entire extinction ere very long. Our correspondent calculates that at the present time quite two-thirds of this acreage is directed by paid superintendence that has no personal proprietary interest in the land dealt with. There are many who hold that this fact must produce results that may have a sensible effect on the future of our chief industry. It is asserted by these that in the past all the pioneering was done and the most favourable results secured by men who cultivated their own land. That these loved it with almost a fatherly affection had much to do, it is contended, with the energy that has time after time pulled the island through successive crises. Will, it is asked, that stimulus be as fully present should we again have to go through such hard times as have been again and again experienced in our planting history? It is difficult to avoid acknowledgments that there may be much force in the apprehension contained in such a question. Time alone can insure it. Meanwhile it is undoubted that the freedom as to working

capital and the widespread interest in the island produced by joint stock endeavour is a stimulant not to be despised; and perhaps this advantage may in the long run fully counterpoise that which it is urged we are abandoning.

TEA IN AMERICA.

New York, July 15.

New crop Formosas have been here about a week. They are flavoury but thin in the cup and not regarded as very desirable quality for teas. An invoice of 900 half-chests sold at 29c, which is regarded a very high average. Other Blacks generally are very dull and steady. Greens are doing little better. Congous steady. There is a great deal of activity in the campaign in favour of machine-made teas. The commissioners here advertise in the daily papers very liberally and are fostering a demand in this and neighbouring cities.

Today at noon the Montgomery Auction and Commission Company will sell 5,003 packages, viz: 693 half-chests Moyune; 444 half-chests and boxes Pingsuey; 136 half-chests Japan, basket-fired and sun-dried; 763 chests Congou; 35 boxes Capers; 161 packages India, Java and Ceylon Pekoe, including all grades; 789 half-chests and boxes Amoy, an attractive assortment of desirable clean leaf-teas; 342 half-chests Foochow; 1,640 half-chests and boxes Formosa, including the celebrated "Black Bear" mark.—*American Grocer*, July 15.

THE CASTLEREAGH TEA COMPANY.

On 3rd August the interim dividend warrants of 7 per cent payable on 1st August were sent out by this Company in respect of the half year ended the 30th June last. To the 30th June there had been secured 90,230 lb. tea against the original estimate of 180,000 lb. for the year, and this has been sold at the nett average price of 46.39 cents per lb. Although the total amount obtained, owing to better prices, is almost the same as last year, the crop secured to the 30th June was less than that at the same date in 1895, but on the other hand 195 acres have been pruned, whereas in 1895 all the pruning remained to be done; and a crop of 200,000 lb. is now looked forward to. As this is also allowing for 35 acres of tea to be left alone, as it was over-plucked when young, the prospect appears to be exceptionally good, while we hear that the estate is in excellent order.—*Local "Times"*.

THE NEW DUTY ON COCOA-BUTTER.

SIR,—Referring to your article on "Cocoa-butter" in the current issue of the *Chemist and Druggist*, we beg to point out that, although in our letter of July 8th we stated that cocoa-butter formed 50 per cent of the whole cocoa-bean, we named this as the exact percentage possible of extraction, and we regret that we led you thereby into supposing that it was usual to extract all this quantity in the preparation of cocoa powder, which is not the case. The actual amount varies with different makers of pure cocoa, from 23 per cent to 30 per cent of the whole material.

We also further stated that the husk of cocoa, which is subject to a duty of 2s per cwt., formed 16 per cent of the whole bean. We would point out that this is not the only loss in manufacture, and that 22 per cent to 23 per cent more exactly represents the whole waste.

If you will compare these figures with the others you quote you will easily understand the cause of variation in the percentage of final product obtained by various makers.—Yours truly,

July 15.

C. BARRY & Co.

—*Chemist and Druggist*, July 15.

“THE INDIGENOUS DRUGS OF INDIA.”

We have received from Messrs. Thacker, Spink & Co. of Calcutta a copy of the second edition, revised and entirely re-written, of “The Indigenous Drugs of India,” by Kanny Lall Dey, Rai Bahadur, C.I.E., F.C.S., &c. The first edition of this work was published in 1867; and as the author still survives, and continues to actively engage in scientific pursuits, with the assistance of Mr. Wm. Mair, A.P.S., he has here brought together the results of nearly thirty years’ additional investigations and discoveries, and has embodied them in this new edition of a book which is of great practical value for all engaged in planting as well as for medical men. Among other plants succinctly dealt with we may mention tea, coffee, cinchona, coconut, palmyra, areca, cinnamon, coca, ginger, cardamom, plantain, pepper, &c. As a specimen of the style of the work we quote the following on tea:—

CAMELLIA THEIFERA.

THE TEA PLANT.

Vern.—Ind.—Chhá, Chai.

A native of China (natural order *Ternstroemiaceæ*). The tea plant, as grown in the hill districts of India, constitutes a very large proportion of the tea supply of the world. It is of little interest medicinally except that the dried Leaves (as well as the seeds of *Coffea arabica*, q. v.) are the source of the crystalline principle—*Caffeine*, also called *Theine* and *Guaranine*, obtained by sublimation of an extract made by aqueous infusion and evaporation, astringent and colouring matters having been previously removed. It might be very profitably manufactured in India from tea dust. The average yield is 3 to 4 per cent. An infusion of tea Seeds was lately suggested by Hooper as a remedy for insect blights.

The seeds contain about 30 per cent. of fixed Oil, somewhat resembling olive oil.

Medicinal uses.—Tea is seldom used medicinally *per se*, except as a stimulant in strong infusion or as an astringent lotion on account of the tannin it contains. *Caffeine* and *Caffeine Citrate* are extensively used in modern practice and are of great value in migraine, hemicrania, neuralgia and similar nervous affections. Like a strong infusion of tea *caffeine* is stimulant, causing wakefulness. It has also diuretic properties. Physiologically the infusion of tea or coffee arrests the molecular change thereby instituting nervous force.

The book contains a portrait of the author, a memoir of whom is given by Mr. Mair. Dr. George Watt contributes a preface.

THE CLUNES ESTATES CO. OF CEYLON, LIMITED.

REPORT OF THE DIRECTORS.

The directors now have pleasure in submitting to the shareholders a duly audited statement of the accounts of the Company for the year ending 30th June, 1896.

The result of the year’s work, after making ample provision for depreciation of buildings and machinery, shews a nett profit amounting to R50,811.69. An interim dividend of 7 per cent having been paid on 25th February last, absorbing R23,100.00, the balance now available for distribution is R27,711.69. The directors recommend the payment of a final dividend of 8 per cent making 15 per cent for the year, and that the balance of R1,311.69 be carried forward.

The crop secured amounted to 345,670 lb. of tea, being 53,427 lb. in excess of last year. The nett average sale price was 40.13 cents per lb., whilst the cost laid down in Colombo was 23.37 cents per lb. The difference in average price realized this year, as compared with last, about six cents per lb., is mainly attributable to a lower level of sterling values and a higher range of exchange.

The Directors have considered it advisable to make a more liberal allowance for Depreciation

this year—it will be noted that the sum set aside under this head is R4,525.73, against R1,380.94 last year.

During the year under review Mr. Dove, the Superintendent, was forced to leave the Island on account of his health, and the Directors, in consideration of past services, paid his passage to Europe and also allowed him six months’ half pay, amounting in all to R2,190. The Estates are now in charge of Mr. R. O. Steward on Clunes and Mr. R. I. Mackenzie on Erracht division. The Directors are pleased to be able to report that all the work is being carried out to the entire satisfaction of Mr. S. L. Harries, the Visting Agent.

The Estimated crop for the 1896-97 season is 375,000 lb. tea on an expenditure of R73,210.00. The Capital outlay not included in the above is estimated at R9,960 for additions to Buildings and Machinery and for the planting next season of another 50 acres of Erracht Estate.

Mr. Donald Cameron having left the Island, on the invitation of the remaining Directors Mr. S. L. Harries consented to fill the vacancy. In terms of the Articles of Association, Mr. Wm. Forsythe now retires from the Board, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

CAMPHOR LEAF OIL.

The demand for a catch crop to be raised by Tea, Coffee and Indigo Planters is of so frequent recurrence that it may be of interest to republish a paper recently written by Mr. David Hooper of Madras on the subject of the Camphor Laurel Tree. The chief interest in Mr. Hooper’s chemical investigations doubtless centres on the fact that he has shown that a fairly large supply of camphor may be obtained from an oil distilled from the leaves. Hitherto it has been supposed that in order that India might participate in the world’s supply of Camphor, it was necessary to plant extensive avenues or forests and to leave the trees for 50 or 100 years before looking for any return. Obviously an enterprise on a large scale of that nature could alone be seriously entertained by Government, and little progress has accordingly been made, though it has been demonstrated that the plant can grow almost anywhere in India. The tree is an exceedingly elegant one, and where avenues are required might with advantage be planted more frequently than has been the case hitherto. The magnitude of the Indian import traffic in camphor should, however, in itself be sufficient inducement to justify the occupation of useless land by such trees even were half a century necessary before they could be expected to give any return. But if Mr. Hooper’s discoveries be regarded as manifesting a possible new direction, returns might be looked for within so short a period as to give the Camphor Laurel Tree a position in the planting world it has not hitherto enjoyed. Mr Hooper, it will be seen, has been able to obtain Camphor in fairly large abundance from the oil distilled from the leaves.

It may be as well to here briefly indicate the botanical sources of the chief forms of Camphor met with in commerce in order to point out more clearly the particular plant to which reference is made in Mr. Hooper’s paper. There are at least three plants known to afford camphor:—

1st.—CHINESE (FORMOSA) and JAPAN CAMPHOR.—This is obtained from *Cinnamomum Camphora*—the Camphor Laurel Tree.

It is the Common Camphor of modern commerce though not the article of historic fame. The tree is a very slow grower and for perhaps half a century would not very possibly attain greater dimensions than that of an elegant large bush.

The Japan Camphor is generally preferred to the Chinese as it is, as a rule, purer. It is prepared by boiling chips of the wood similar to the method pursued in India in the manufacture of Cutch. It comes into India in its crude state and a fairly large industry exists in refining it, chiefly at Bombay,

Delhi, etc. The refiner sells the purified article at nearly the same price as he purchased it, the profit being made on its mechanical absorption and retention of a large amount of water.

2nd.—**BARUS CAMPHOR** (Bhimsini Camphor) obtained from a tree found in Borneo and Sumatra, etc., namely, *Dryobalanops Camphora*. This belongs to the same family as the Indian *Sal* tree. It is a large and handsome tree. To obtain the camphor the trees are felled and cut up into small splinters and the crystals of the naturally formed camphor picked out from the tissue of the wood. The crystals are chiefly found in the interior of the stem often existing as concrete masses which occupy longitudinal cavities, more especially near the knots and swellings formed where branches issue from the stem. The old trees are generally the most productive and a good tree, it is said, will yield about 11 lb. In searching for good trees the natives are reported to pierce the trees to the heartwood, but it is stated, that, if left for seven or eight years after having been pierced, they may then be found to yield a good supply. Only about one-tenth of the trees thus ruthlessly destroyed are remunerative.

This is the Camphor of the ancient writers, and naturally from the small amount obtained and the labour that has to be expended on its collection it is very much more expensive than the "Common" or "Chinese Camphor."

3rd.—**NGAI CAMPHOR OF BURMA AND CHINA.**—This is obtained from a species of *Blumea* and is manufactured very largely at Canton. The plant is a herbaceous or bushy member of the family of the **COMPOSITÆ**. It seems probable that several species are employed, that most commonly being *Blumea Balsamifera*—a species frequent in various parts of India as, for example, on the Eastern Himalaya between altitudes of 1,000 and 4,000 feet; on the Khasia hills, in Chittagong; Pegu and Teuasserim to China.

Ngai Camphor is chemically more nearly allied to Barus than to "China Camphor," and it is in point of price intermediate between these two forms. Good Barus Camphor may fetch R80 a lb., whereas the Common Camphor is little more than half that sum per cwt.—*Agricultural Ledger*, No. 5, 1896.

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed, during the week ending 18th July 1896, under the provisions of Act V of 1888.

Improving the machine known as Jackson's standard cross action rolling machines.—No. 247 of 1896.—Donald John Macrae, tea planter, of Harmutty tea estate, North Luckimpore, Assam, for improving the machine known as Jackson's standard cross action rolling machines.

For Treating Vegetable Fibres.—No. 108 of 1890.—Kenneth Thomas Sutherland's invention for treating vegetable fibres. (Specification filed 4th April 1892.)—*Indian and Eastern Engineer*, Aug. 1.

TEA IN NEW ENGLAND.

A letter written in England in 1740 says: "Tea is now become the darling of our women. Almost every little tradesman's wife must sit sipping tea for an hour or more in a morning, and it may be again in the afternoon, if they can get it, and nothing will please them to sip it out of but china-ware, if they can get it. They talk of bestowing thirty or forty shillings upon a tea equipage, as they call it. There is the silver spoons, silver tongs and many other trinkets that I cannot name." (Coffin, Newbury, p. 191).

Tea parties gradually became the fashion in New England about this period. In 1750 an excise was granted the King of 12d. per pound on tea. New Hampshire laid an excise of 2s. 6d. per pound on green and "Bohea" tea. In 1763 about a million and a half of pounds were consumed in this country, only one-tenth of which came from England (Bancroft, iii., p. 59). Tea was a favorite return

cargo with ships in the China trade. In 1793 three vessels carried 2,532 chests Bohea tea into New York and Providence, R. I.

Tea and coffee supplanted the use of alcoholic spirits in New England between 1713 and 1745. Weedon, in his "Economic and Social History of New England," says "that in this little Chinese leaf was folded the germ which enlarged into American independence." In 1714 Edward Mill advertised tea in the *Boston News Letter*: "Very fine Green Tea, the best for colour and taste." In 1718 it was not much used at Lynn, Mass., and when the ladies went visiting each carried a small teacup, saucer and spoon. In 1740 it was a "fad" among the women of Boston.

In 1666 tea was sold in New England at 68s per pound; in 1719, at 34s per pound; in 1721 and 1723, at 25s per pound for Bohea and Green; 1729, 45s per pound; 1730, 30s per pound; 1735, Bohea, 26s per pound; Congou, 34s; Pekoe, 50s; Green tea, 30s; 1737, Bohea, 16s & 26s per pound; 1745, 35s per pound 1756, £3, O. T., per pound; 1771, 3s per pound; 1773, Hyson, 18s, O. T., per pound; 1774, Bohea, £2 5s, O. T., per pound; 1780, 3s 9d per pound; 1782, 9s 9d per pound; 1783, 5s 10d per pound; 1784, 3s 11d per pound; 1785, 3s 2d, L. M., per pound; 1788, Bohea, 3s per pound.

The history of the tax on tea in 1767 and the subsequent attempts to have it removed is too familiar for repetition. A few items, however, will be new to many. In 1770 there were societies formed to discourage the use of tea. The women of Boston signed the following pledge:

We, the daughters of those patriots who have, and do now appear for the public interest, and in that principally regard their posterity, as such do with pleasure engage with them in denying ourselves the drinking of foreign tea, in hopes to frustrate a plan that tends to deprive a whole community of all that is valuable in life.

Then it was the leaves of the raspberry plant, thyme and other substitutes came into use. The users of China tea were forced to drink the beverage in secret places.

A memorial tablet has been placed by the "Sons of the Revolution" on the site made famous by the tea party. It measures 5 feet by 3, and is a bas-relief, representing a full rigged ship, from which men are tossing overboard chests of tea. Tea chests and tea leaves form the border of the tablet. The following is the inscription:

Here formerly stood Griffen's wharf, at which lay moored on December 15th, 1773, three British ships with cargoes of tea. To defeat King George's trifling but tyrannical tax of three pence a pound, about ninety citizens of Boston, partly disguised as Indians, poured the three ships' cargoes, three hundred and forty chests in all, into the sea, and made the world ring with the patriotic exploit of the Boston Tea Party.

No! ne'er was mingled such a draught.

In palace, hall or harbor,

A freeman brewed and tyrants quaffed,
That night in Boston harbor!

TEA IN OLD ENGLAND.

In 1746, John Wesley, after twenty-seven years' use of tea, abandoned its drinking in order to discredit its use among his followers and resumed the practice twelve years after by order of his physician. For a time he waged a war against tea drinking, but this, his biographer, Rev. L. Tyerman, says was "an amusing episode in Wesley's laborious life." Josiah Wedgwood, the famous potter, made and presented to Mr. Wesley a teapot which held four quarts. On Sunday mornings his preachers used to meet at five o'clock and take tea together.—*American Grocer*, June 24.

NOTES FROM OUR LONDON LETTER. LONDON, July 24.

NEW TEA COMPANIES are being largely advertised. During the week Messrs. Gow, Wilson & Stanton have announced that the Gartmore group of estates in Maskeliya, comprising about 632

acres and belonging to Mr. T. C. Anderson, have been placed in their hands for sale. Such an opportunity for floating a further new company is not likely to be neglected. The two new ventures announced during the week have been the India and Ceylon Tea Company and the Associated Tea Estates of Ceylon. Enclosed are the advertisements made by both of these. That first mentioned you will observe includes in its direction the name of Mr. Thomas Dickson. His association with this company must certainly prove a tower of strength to it. The capital will total £500,000, of which the present issue is limited to £430,000. The Doonars Tea Company is the prime mover in this fresh enterprise. Very little doubt is felt as to the subscription asked for being fully met, though we find many who dislike the association of Ceylon with external interest. A clergyman devoted to Ceylon tea remarked to the writer yesterday that as a consumer of that tea only he thought its reputation would suffer by the union of interest. "Ceylon tea," he remarked, "should stand alone. It is *sui generis*, and to my mind Indian tea, such as we can obtain in London, does not compare at all favourably with it. The reputation of the Ceylon growth will suffer whenever the line of distinction between the two products becomes weakened. The public will always dread the amalgamation of these." This remark is of the character of others that one hears very widely expressed. It is certain that at the very outset this India and Ceylon Tea Company is experiencing a certain difficulty. The *Times* of this morning informed us that the subscription list for London was closed yesterday, and that for the country will close at noon today. But the same issue of the *Times* included the following letter:—

THE EAST INDIA AND CEYLON TEA COMPANY (LIMITED).
To the Editor of the "*Times*."

Sir,—With reference to the advertisement which appeared yesterday, we beg to inform you that on representation being made by us to the Registrar of Joint Stock Companies of the unfairness to this company's shareholders in allowing the name of the India and Ceylon Tea Company, he has informed us that the company has not, and will not be, registered under that name.

We need hardly express our surprise at the directors of that company advertising before registration was granted, or wishing to do so with a name so closely resembling that of this company.

We are yours faithfully, for the
EAST INDIA AND CEYLON TEA COMPANY (Limited),
P. R. BUCHANAN AND Co., Secretaries and Managing Agents.

45, Leadenhall-street, London July 23.

How far the facts thus disclosed may affect the position of this new company it is not for outsiders to say. Yet it would seem that the issue of its shares has been notified before even it had obtained registration, and of course to those who are not "in the know" this has a strange appearance. Can such a course have been legal? Or whether or not this may be so, is it one that in the interests of the public is to be justified?

The second company above referred to is the Associated Tea Estates of Ceylon. Of this venture the public advertisement is also sent you with this. In its case, again, Indian men are taking the lead—the Chairman of the Mercantile Bank of India, Sir Alexander Wilson, who is one of the directors, holds, in a sense, a cosmopolitan position, his bank having large interests in Ceylon. But the other two directors are both associated with Indian tea planting. The estates to be purchased in Ceylon are well-known ones of much reputation, and embrace 2,789 acres in Kelani Valley, Udapussellawa,

and Kalntara. The capital in full is £150,000, and the present issue is 8,000 preference 6 per cent shares and 5,000 ordinary shares, £130,000 in all. The purchase price of the estates is to be £103,720, payable in cash. It is notified that letters of allotment and regret have already been posted, so perhaps it may be inferred that practically the subscription lists, which closed on Wednesday, have been filled up, though for reasons given in a previous letter it is by no means sure that this conclusion is to be fully accepted.

GANGWARILY ESTATES COMPANY OF CEYLON, LIMITED.

Registered July 4, by Harries, Wilkinson and Raikes, 38, Nicholas-lane, E.C., with a capital of £100,000 in £10 shares. Object, to adopt and carry into effect two agreements expressed to be made, as to the first, between John Drummond of the one part and this company of the other part, and as to the second between W. W. Nutshell, of the one part and this company of the other part; and, generally, to carry on, in all or any of their respective branches, the business of planters, growers, manufacturers of and dealers in tea, coffee, cocoa, cinchona, coconuts, spices, rubber, grain, fruit, cotton, rice, and other natural products of any kind; as shipowners, bankers, engineers, merchants, &c., in all or any of their respective branches, and any other businesses which can conveniently be carried on in connection with such businesses, or any of them, including the buying and selling of timber and the manufacture and sale of tea boxes, caddies, and other articles; to acquire and turn to account tea plantations in India, Ceylon, or elsewhere; as miners and smelters, restaurant proprietors, &c. The signatories are:—

J. J. G. Knight, M.L.C., Rose-hill, Stock-bridge, Hants	1
W. H. Anderson, Rupert Lodge, Burnham, Bucks	1
T. Stretch, Billiter-square-buildings, E.C.	1
J. F. Hendrick, Billiter-square-buildings, E.C.	1
P. Somerville, Billiter-square-buildings, E.C.	1
E. G. Parish, Billiter-square-buildings, E.C.	1
W. T. Wilson, 13, Rood-lane, E.C.	1

The first directors—of whom there shall be not less than three nor more than five—are to be elected by the signatories. Qualification, £250. Remuneration to be fixed by the company. Registered office: Billiter-square-buildings, Billiter-square, E.C.

COFFEE PLANTING IN SELANGOR.

The following notes on Selangor Coffee planting may be of interest to your readers. The holes are usually placed ten feet apart and are cut eighteen inches in diameter and the same in depth. The cost is about half a cent per hole. Filling in costs nearly as much. The coffee is topped in the brown wood and generally at six feet. High trees are not liked owing to the difficulty experienced in picking the crop. Flat land is preferred to hill land, but that may be owing to the laterite coming to the surface on the hill while on flat land the laterite is more or less covered with alluvial deposits; also coffee on flat land is more easily worked. The estates are manured at an early age with mineral manures mixed with bones and poonac, etc., etc. Some of the planters have tried the system of leaving two and even three stems but the general feeling is in favor of one stem. Advances are not heavy and the coolies generally have no debt; if a cooly bolt to Penang, Malacca or Singapore the planter cannot sue him in the criminal court but may proceed against him for debt in the civil court at Penang, etc. Felling costs seven or eight dollars an acre, weeding about seventy cents. This is done by Javanese on contract and in return for a contract they supply coolies to the estate. Klings under indenture are not liked and the planters obtain free coolies either in Selangor

or send a mandore to India to collect coolies. For the purpose no advance is given except for expenses and any small advance which the cooly has to repay is placed on the check roll and the mandore has nothing to collect from and has no claim over the cooly. I omitted to ask what inducement the mandore receives to collect coolies. The natives of Selangor are of little use to the planter. Chinese take holing contracts and Javanese cut the deep drains on the flat lands at about 12 cents a cubic yard, the drains are cut before the jungle is felled, say generally in 10 chain squares and three and four feet deep. Transport is good but expensive.—*British North Borneo Herald*, July 1.

INDIA AS A FIELD FOR INVESTMENT.—TEA.

In our pages some seventeen months ago,* we gave an account of this plant based on a paper read at the Society of Arts by Mr. Stanton, and we again turn to that venerable Institution for further information on the same subject, especially as regards the development of tea planting in the Dooars. The paper read on 4th May last by Mr. Geo. W. Christison, before Sir Richard Temple and others, was good itself and was the cause of eloquence in its hearers; eloquence to which we cannot hope to aspire, nor can we pretend to treat the subject in any way exhaustively, seeing that it takes up six pages in Balfour's *Cyclopædia* (who quotes 23 authorities) while Dr. Watt devotes eighty-two pages of his Dictionary to the *Camellia Theifera*, of which his authorities or references take up no less than three whole pages. By the way it is envious [*sic*, for "curious"?—Ed. T.A.] to note that both these great authorities give the German for tea as *Thi* whereas it should be *Thee*. And further some three months ago we ventured to give a little advice to the planters, a thing we had seldom done before, and will be chary of doing too often. Our purpose is now, however, not so much to give a history of the plant or a faithful record of work—but to show to those fortunate individuals who have more money than they know what to do with, that they might invest in worse speculations than in tea. In fact, that tea-planting has got well beyond the speculative region and that, given certain well known conditions, there is nothing pays better and is a more permanent source of steady income than a good tea-garden.

Sir Richard Temple only did them bare justice when he described the Himalayan tea planters as the pioneers of British influence and Western civilisation in regions adjacent to Tibet and the Chinese Empire. "When I look at him," said Sir Richard, referring to Mr. Christison, "I recall the memories of the glorious views, the mighty peaks piercing the sky, and the snowy summits and the picturesque spur on which the Tukvar plantation was situated right over one of the affluents of the river, the glorious panorama with which it is surrounded, the magnificence of the vegetable kingdom, the trees, ferns, and flowering shrubs." The best soil on these hills is found, as a rule, from 2,500 to 5,000 feet, though the plant does fairly well from 6,000 to even 7,000 feet; owing to the broken nature of the ground the roads are very winding and can only be used by pack animals and coolies, still their up-keep is very expensive in proportion to the area they serve, $4\frac{1}{2}$ miles of road to 500 acres of ground! They are used by the Forest Department and serve vast tracts of native cultivation which in neither case contribute materially to their maintenance. Valuable as the Forest Department unquestionably is "profit should not be its chief aim" and if it were charged both land revenue and road cess it would realise all the more adequately "its immense responsibilities in holding such vast territories." Of the 1,234 square miles composing the entire area of the Darjeeling district the Department holds 438; the Government

Cinchona Department, 70; and native cultivators have an unalienable right to 397, leaving only 329 square miles as grants to tea cultivators. Although hardly any land on the hills suitable and available for tea remains unplanted in the old hill District only "about $7\frac{1}{2}$ per cent. of the entire district is actually bearing tea at the present time." Of the 486 square miles forming the new Daling Hill District no less than 421 square miles have been reserved by Government for Forest, Cinchona and natives; of the remaining 65 reserved for tea grants only 8 or 9 square miles have been taken up for the purpose and of this only 1,200 acres, and these close to the Dooars, have been opened out in spite of the eagerness for these grants. The 141 square miles reserved for natives and now largely in possession of Nepalis, who are aliens, and of aborigines and semi-aborigines in smaller proportion, consists of beautiful slopes, most desirable as a place of residence for Europeans and is as suitable a district for European colonisation as can be found any where in the East. The pity of it! Now the land has been "tortured, impoverished and bared of forest and would require to be allowed to lie fallow for many years before it would be suitable for growing tea."

The Terai, measuring 271 square miles, was opened out with "inordinately sanguine expectations" and at present "has become unduly depreciated in public estimation." The climate is undoubtedly unhealthy, but "under an improved water supply and sanitation this district should become more salubrious and with liberal and suitable cultivation, and efficient, but economical management, the Terai should yet compete, not unsuccessfully, with most other districts."

It would appear, therefore, that the only extension possible on a large scale is towards the South-East, where in the Dooars, there is enormous areas capable of tea cultivation, where the land is much more suitable for this purpose than in the Daling Hills as it produces a vastly larger crop. Here the planter would have the same advantage with regard to labour as his neighbours. To quote Sir Steuart Bayley, "The Nepalese labourer had probably more intelligence and industry than those of any other part of India; and among the advantages which the Darjeeling tea-planters had over their neighbours in Assam—and there were many—was the fact that they drew their labourers from the neighbouring country. "As pointed out by Sir Charles Elliott," the two Tukvar gardens, including the one over which Mr. Christison presided, were instances of what could be done by good management. They did not recruit labour; they bred more labour than they could employ. The labourers lived upon these estates permanently; children grew up there and magnified to such an extent that one of the chief difficulties was to find employment in the garden for the children bred on the estates." The only rift in the lute is that Government, according to the planters' story, compete with them in the same recruiting ground and take the pick of the men for the army and the police, whereas there are plenty of other places whence recruits could be had and where planters or their agents come not. Sir Charles gave the official view of the question. "The immigration from Nepal referred to by Mr. Christison," he said, "was employed in three different ways—part went on to the gardens as they were extended, the greatest part went on to the land, especially independent Sikkim, where agricultural extension had been very large; and a small portion was recruited by the Government for military and transport service. All that could be done was to try and arrange that the competition should not be an unfair one." In the Dooars then we have climate suitable to Europeans and to the growing of tea, we have good soil and plenty of it, and cheap, abundant, excellent labour, and, further, every new tea-garden laid out creates a fresh demand for machinery. For it is by the use of machinery alone that India and Ceylon has ousted the Chinese products, and if only this fact should be driven into the heads of the vast host of tea-drinkers, the sales of Chinese teas to Europeans at any rate would dwindle down to zero—that is, as long as

* March 2nd, 1895, p. 127. Vol. XXIV.

they continue to manufacture the article in the crude and filthy way to which they are wedded with characteristic obstinacy.

And here we would venture to make a suggestion, promising that our Indian planters will join heartily in the Australian and American crusade, so pluckily carried on by their *confrères* in Ceylon. The continent of Europe is practically untouched, and yet there are many little colonies of Englishmen dotted all over it, which should be moved to help in the enterprise by precept and example. Tea is so easily brewed as compared to coffee, and, if it were made up into sealed packets containing quantities according to the weights and measures of the country, these would sell like "hot cakes," especially if in each packet there were enclosed a little tract with coloured illustrations of the difference between the Chinese manufacture by hands and feet, and the Indian manufacture by machinery alone.

The use of machines begins with the tree felling and conversion into logs for buildings, battens for chests or mere firewood. Then comes Jobens's Transplanter for moving seedlings with balls of their own earth from the nurseries to the field. A straight digging fork is preferable to the hoe or *Kodli* for cultivating. Mr. Christison mentions the case of an estate rejoicing in a head of water of 1,175 feet at the lowest point, which is only used for watering, drinking and fire extinguishing purposes, with a great length of pipes and hose, and there must be many such places. The plucking is all done by hand, but the "operations of tea manufacture are now performed by machinery in all factories of any importance. Steam is the commonest motor, but water-power (mainly by turbine) is also in use. In the case of the Tukvar Company, the turbine is situated in the ravine about two-thirds of a mile from and 1,500 feet below the level of the factory, the power being transmitted to the machinery there by means of wire rope, travelling upon pulleys supported on standards placed at suitable distances apart. The district owes the conception and accomplishment of this bold and arduous undertaking to the ingenious, indefatigable, and praise-worthy efforts of the late Mr. Thomas B. Curtis, of Tukvar, a well-known and most able tea planter. On another hill garden, electricity has for some time been employed, the turbine and generating apparatus being similarly placed beside the torrent far below and distant from the factory and machinery to be driven. For this laudable pioneer object-lesson in regard to the motor, which I believe to be specially suited and destined to be the power of the future for Darjeeling, we are indebted to the late much-lamented Mr. William Lloyd." And again we say there must be many such places where water power could be utilised to advantage.

After the leaf has been withered it is withered on broad shelves of wire mesh, Hessian cloth or bamboo netting, over which a current of dried air is sent by means of ventilating fans. Then comes rolling by machinery of which there is an infinite variety. Mr. Christison swears by Jackson's "Rapid," which, he says, does the work of 70 men to great perfection. "By an ingenious arrangement of cranks, &c., an eccentric motion with elastic pressure (resembling that of the old hand rolling) is produced between a table and a box above which usually contains as much as 300 lb. of withered leaf at a time. This upper plate or rolling box is generally of metal lined with wood, but also of granite or marble for greater coolness. The lower rolling surface or table is usually of wood, but is sometimes granite or marble-faced. This machine is beautiful though simple in movement, and is a roller as near perfection as can well be conceived." For sifting, dis-entangling the balls and aerating the rolled leaf, machines are also specially designed, "the withered leaf is fed into the hopper of the roller from the loft above by means of a canvas shoot, and the rolled leaf is discharged through a trap underneath into a trolley which conveys it to and from the sifter, and finally to the fermenting room." In this room a refrigerating apparatus

would be useful, as the best quality of tea is made in the cold season when the oxidation occupies an unusually long time. Then come into action the drying-machines; of these also there are a great number of different kinds. We gave the essentials of a good machine, not long ago, in describing Gibb's.*

The important process of classification is also done by machinery aided by some "light finishing touches, hardly amounting to handling in any degree" given by "a few bright, tidy Nepali girls. Then, after a certain number of chests full have accumulated, comes the packing. Machine-made boxes are most uniform in size and the machine-packing of tea obviates "trampling, unequal pressure, breakage and discoloration." The Davidson-Maguire patent packing machine is coming into use on the garden "and the sooner it is also universally adopted in the London warehouses, the better, not only for the above reason, but to supply the only missing link in the entire circle of machine manufacture." Wooden chests, although the material of which they are made has been well seasoned, will lose in weight during a long journey and voyage, thus causing confusion at its destination, but, if the chests were haskinised or vulcanised this would not happen, or if they were made of tin there would be no danger of leakage or damage by water.

The tea now falls into human hands again, for of necessity it has to be carried by coolies to the Railway Station or steamer. "Darjeeling tea is all carried by the hardy hill-men up the steep mountain roads to the nearest railway station on the way to market. It is no unusual day's work for a coolie to carry a tea chest weighing 110 to 130 lb. a distance of five or six miles, making, at the same time an ascent of from 2,500 to 3,500 feet in sheer vertical elevation."

We have all heard the tradition of the Bhooteah who carried a grand piano along 50 miles and up 7,000 feet to Darjeeling. We know that "in the prosecution of their own trade, or on domestic affairs, they frequently undertake long, arduous journeys over ridges and along and across hot valleys, varying many thousands of feet in elevation, occupying many days on end, carrying heavy loads of from 150 lb. to 200 lb. and over, and in addition their own food and bedding most cheerfully lighting a fire, cooking and eating their scanty meal, and going to sleep by the wayside."

We have, we hope, shown sufficiently clearly that tea-cultivation if carried on with ordinary common sense, in the right place and with the right men to work it, cannot fail of success, and as Mr. Christison truly concludes "investors in well-equipped concerns have, in these days of general agricultural depression, landed security of really the very safest class, from the fact of the tea harvest being over eight months annually. This secures the crop against the vicissitudes of season, in the form of a month or even two of adverse weather at any stage. We have lately given an abstract of the dividends made by tea-companies,* and we hope to revert to this subject again shortly.—*Indian and Eastern Engineer*, Aug. 1.

A NEW INSECTICIDE.

The highly poisonous nature of acetylene has suggested to M. Chuard the possibility of employing carbide of calcium as an insecticide for agricultural purposes. M. Chuard proposes to try thoroughly mixing the carbide with earth, so that under the influence of moisture acetylene would be slowly given off at the roots of plants, thus preserving them from attack. At the same time, the bye-products, consisting of chalk and a little ammonia, would have a beneficial effect on the soil. It is proposed to try this method against phylloxera. Whether this would succeed equally well in all weathers, wet or dry, is quite another question.—*Nature*.

* January 1896, p. 24.

TEA COMPANY MEETINGS IN COLOMBO.

The following meetings of tea companies took place on Saturday, 8th August, in the office of Messrs. Whittall & Co., the agents and secretaries of the respective companies:—

THE MAHA UVA ESTATE CO., LTD.

An extraordinary general meeting of the shareholders was held at 11 a.m. Present:—Mr. C. A. Leechman (in the chair), and Mr. A. Thomson, directors; and Messrs. E. S. Anderson, and G. C. Walker, and James Forbes, by his attorney.

An interim dividend of 4 per cent for the year was declared and made payable forthwith.

THE GLASGOW ESTATE CO., LTD.

An extraordinary general meeting of the shareholders was held at 11-15 a.m. Present:—Mr. C. A. Leechman (in the chair), and Mr. A. Thomson, directors; Messrs. G. C. Walker, E. John, W. H. Figg, and Mr. G. W. Carlyon; and Mr. W. H. G. Duncan, Mr. A. E. Wright, Mr. E. C. Baillie by their attorneys.

An interim dividend of 8 per cent for 1896 was declared and made payable forthwith.

THE AGRA-OUVAH ESTATE CO., LTD.

An extraordinary general meeting of the shareholders was held at 11-30 a.m. Present:—Mr. A. Thomson (in the chair) and Mr. C. A. Leechman, Mr. W. H. Figg, directors; and Messrs. C. J. Donald, G. C. Walker, H. S. Rix, E. John, and H. Tarrant, and Mr. A. E. Wright, Mr. James Forbes by their attorneys, and Mr. G. H. Alston by his proxy.

An interim dividend of 8 per cent for 1896 was declared and made payable forthwith.

THE DUNKELD ESTATE CO., LTD.

An extraordinary general meeting of shareholders was held at 11-45. Present:—Mr. A. Thomson (in the chair) and Mr. C. A. Leechman, directors; Messrs. E. S. Anderson, H. S. Rix, and C. J. Donald; and W. H. G. Duncan and Donald Cameron, by their attorneys.

An interim dividend of 8 per cent was declared and made payable forthwith.

THE CLUNES ESTATES COMPANY OF CEYLON, LTD.

The fourth annual ordinary general meeting of shareholders was held at noon, when the following were present:—Mr. W. H. Figg, in the chair, Mr. S. L. Harries, directors; Messrs. H. S. Rix, E. John, and A. Thomson; and Jas. Forbes and G. W. Carlyon, by their attorneys.

The minutes of the 3rd annual ordinary general meeting of shareholders held on 16th August 1895, and the minutes of the extraordinary general meeting of shareholders held 25th February, 1896, were read and confirmed.

The report and accounts were then taken as read.

Proposed by the CHAIRMAN and seconded by Mr. E. JOHN, that the report and accounts as published be adopted.

Proposed by the CHAIRMAN and seconded by Mr. JAS. FORBES, by his attorney Mr. Walker, that a dividend of 8 per cent be declared and made payable forthwith.

Proposed by Mr. H. S. RIX and seconded by Mr. A. THOMSON, that Mr. W. Forsyth be re-elected a director.

Proposed by Mr. JAS. FORBES, by his attorney, and seconded by Mr. JOHN, that Mr. Hercules J. Scott be appointed auditor on the same fee as last year.

THE YATIYANTOTA TEA COMPANY, LIMITED.

An extraordinary general meeting of the above company was held at 12-45 p.m. Present:—Mr. W. D. Gibbon (in the chair), Mr. A. Thomson, Mr. E. S. Anderson, directors; Mr. H. S. Rix; and Messrs. W. H. G. Duncan, G. W. Carlyon, A. E. Wright, and R. Webster, and Mrs. Carlyon, by their attorneys.

The notice conveying the meeting having been read, an interim dividend of 10 per cent for 1896 was declared and made payable forthwith.

THE WE-OYA TEA COMPANY, LIMITED.

An extraordinary general meeting of shareholders was held at 1 o'clock. Present:—Mr. E. S. Anderson (in the chair), Mr. W. J. Smith, directors; Messrs. A. Thomson, W. D. Gibbon, J. A. Martin, G. C. Walker, H. S. Rix, and E. H. Vanderspar; and Mr. Geo. Vanderspar, Mrs. E. C. Baillie, Major Gwatkin, and Mr. W. Cookes, by their attorneys.

An interim dividend of 10 per cent for 1896 was declared, and made payable forthwith.

THE UPPER MASKELIYA ESTATES COMPANY, LIMITED.

An extraordinary general meeting of the above company was held on the 8th August at 1-15 p.m. when the following were present:—Mr. W. D. Gibbon (in the chair), Mr. A. Thomson, Mr. C. A. Leechman, directors; and Messrs. G. W. Carlyon, W. H. G. Duncan, A. E. Wright, R. Webster, Cookes, Jas. Forbes, and J. Gibbs, and Mrs. A. N. Wright, by their attorneys; and by proxy, Messrs. G. H. Alston and T. K. Wright.

The notice convening the meeting having been read, an interim dividend of 6 per cent for 1896 was declared and made payable forthwith.

THE MOCHA TEA COMPANY OF CEYLON, LIMITED.

The ordinary general meeting of the shareholders of this company was held at noon on the 8th August at the office of the agents and secretaries (Messrs. J. M. Robertson & Co.), when Mr. F. W. Bois occupied the chair, the others present being:—Messrs. Edgar Vanderspar, W. E. Mitchell, W. Moir, E. John and H. Gordon Bois (Secretary).

The usual formalities over,

The CHAIRMAN brought up the Report of the Directors for the season ending 30th June 1896, which, he thought, taking all things into consideration, might be considered a fairly satisfactory report, the only unsatisfactory feature in it being the fall in the average price of tea. This, as they would have seen, was almost 54 cents per lb., as compared with nearly 58 of last season's; but compared with the season before last it was not so very unsatisfactory. The crop had been in excess of the estimate and of that of last year. The Directors were endeavouring, if possible, to improve the value of their tea, and for that purpose they had before them a scheme for the erection of a turbine. With these few remarks he proposed the adoption of the Report and Accounts.

Mr. VANDERSPAR seconded. — Carried.

The report of the Directors was as follows:—

Your Directors beg to submit their report and accounts for the season ending the 30th of June last, which they trust will be considered satisfactory. The total quantity of made tea is 34,119 lb. which is 33,500 lb. in excess of the previous year. This yield is equal to 110 lb. per acre in bearing, and after deducting capital expenditure, the cost per pound delivered in Colombo was 25½ cents, whilst the nett

average price realised was 53.61 cents as compared with 57.49 cents last season. The nett profit for the year is R100,131.73, which is equal to 24.78 per cent on the capital of the Company, and adding R1,563.71 the balance brought forward, there is R101,695.44 to be dealt with. Out of this, the Directors have already paid an interim dividend of 8 per cent, absorbing R32,320; a bonus has been paid to the Superintendent of the Mocha and Glentilt Estates of R2,000; there has been transferred to Depreciation account R7,924.33; there has been transferred to Reserve Fund R10,000; leaving a balance of R49,451.11—Total R101,695.44. It is proposed to pay a further dividend of 12 per cent. (making 20 per cent. for the year) R48,480, and to carry forward a balance of R971.11.

The Company's properties now consist approximately of:—840 acres tea in bearing; 15 acres under two years; 56 acres grass land; 123 acres forest and fuel trees; 21 acres buildings, roads, &c. Total 1,055 acres.

The estimates for season 1896-97 will be drawn up on a safe basis of crop and expenditure. Mr. Henry Bois, having left the island, resigned his seat on the Board of Directors, and Mr. F. W. Bois was invited to take his place. Mr. J. N. Campbell retires in accordance with the articles of Association, but being eligible, offers himself for re-election. The meeting has also to elect an Auditor for 1896-97.

DECLARATION OF DIVIDEND.

Mr. JOHN proposed the payment of a dividend of 12 per cent for the half-year, making, with the interim dividend of 8 per cent, 20 per cent for the year.

This was seconded by Mr. MITCHELL and carried unanimously.

DIRECTOR AND AUDITOR.

On the motion of Mr. MITCHELL, seconded by Mr. JOHN, Mr. J. N. Campbell was re-elected a Director; and Mr. H. J. Scott was re-elected Auditor for the season 1896-97, on the motion of Mr. VANDERSPAR, seconded by Mr. JOHN MOIR.

MARKET FOR TEA SHARES.

Thursday Evening, July 23.

Business in most of the older and better known shares has been rather neglected the past week in favour of the rush for new issues, which are being freely offered to the public; some good, others less desirable, so far as intrinsic merit is concerned. The generality of the best shares, however, keep firm in price, the lack of business resulting more from the firmness of holders than from any weakening in the demand.

CEYLON SHARES.

C. T. P. Co. Ordinary.—Nothing further done; but the Prefs. have been done at 18.

C. and Oriental £3 paid shares came on a little cheaper at 3½, but have since been taken at 3¾. Some fully-paid shares might be had at £7.

Ceylon Land shares are being asked for.

Dimbula Valley Ordinary have been done at 5½, and are firmer, and the Prefs. have touched 6½ and 6 3-16.

Eastern Produce shares have touched 6½.

Ceylon properties are being freely mixed with Indian ones in many of the new issues.—*Home and Colonial Mail*, July 21.

PLANTING AND PRODUCE.

THE CHANCELLOR OF THE EXCHEQUER AND THE PRICE OF TEA.—The statement about the price of tea recently made by the Chancellor of the Exchequer in the House of Commons, and reported in our issue of July 10th, has called forth remonstrances from the tea trade. Messrs. Morris and Jones, of Liverpool, say on this subject: "It was a pity that when the Chancellor of the Exchequer made the misleading statement in the House of Commons about teas some

members who understood the matter did not explain how the average was made. There is a lot of rubbish imported into this country and sold in public sale at about 3d per lb; common sorts of better grades fetch 5d to 6d; medium sorts 8d to 10; and so on up to about 2s per lb, and some really fine kinds fetch 3s to 4s and even more. To take one public sale, say—3,000 chests at 3s per lb (in bond duty 4d); 8,000 chests at 6d per lb; 12,000 chests at 9d per lb; 4,000 chests at 1s per lb; 3,000 chests at 1s 6d per lb; 2,000 chests at 2s per lb. This will work out the average price given by the Chancellor, 9d to 10d. Unfortunately the tendency to cheapness in everything induces the public to purchase low-priced teas, but those sold at 1s and 1s 4d have none of the flavour and aroma and invigorating properties of the better sorts, and those who love good teas would never think of using them."

TEA IN NATAL.—Tea planting on the coast in Natal succeeds well, and there is a considerable amount of capital invested in the industry from which important results are expected. Natal tea for South Africa is the idea. A correspondent of the *Globe* writing on the subject says: "The labour is a very grave consideration. It has to be imported; and then it must be trained. It is infinitely more difficult to find a market for tea than for sugar. Tea is not a commodity which improves with keeping, although a certain time is necessary for it to mature its flavour. The estates, which are situated on the coast beyond Verulam, suffer considerably for want of a railway. The actual freight may be higher than the cost of the present waggon transport to Verulam; but in wet weather the risk to so delicate a product as tea is very great. Besides, there is the commercial inconvenience of the delay in delivery, owing to the flooding of rivers. Waggon have been stationary on the banks of the Unvoti River for two months at a time. Some years ago a great effort was made by Mr. W. R. Hindson, of Nonoti, to induce the Government to extend the railway into the tea district. His firm undertook to provide the capital necessary for laying down the new line; and it is to be regretted that the then Government did not see the great discouragement which would have been given to this young industry by such an enterprise. At that time, however, responsible government had not been granted to Natal, and the Governor, Sir Charles Mitchell, did not approve of railways being made in the colony by private enterprise. Quite recently—partly owing to the harbour developments at Durban and the desirability of tapping the coal supplies near the Tugela—the matter has been pushed forward, and a concession was granted to a syndicate for the construction of this line at the close of last year. At Mr. Hindson's estate at Nonoti there are 500 acres laid down in tea. The business has only been in existence twelve years; and, considering that it takes five years before tea plants will show a profit on their cost, it must be owned that a great deal has been accomplished in the twelve years. A new industry of the kind must be experimental at the outset, and proportionately costly. The best kind of tea, both from the consumer's and the grower's point of view, has to be found. Both soil and climate are distinct factors in tea-growing. In fact, the influence of soil and climate appears as marked in tea as in wine—either prejudicing or improving the flavour. The tea at Nonoti is known as the Assam Hybrid, but there is great inequality in the leaf. Mr. Hindson is trying the introduction of a new Indian tea, which he hopes will be an improvement. Perfection has not been reached, but there is such a steady improvement shown that it is confidently hoped that Natal teas may equal those of India and Ceylon. Three things are evident: firstly, that the natural produce of the tea-plant itself is far more abundant in Natal than in India; secondly, that, owing to the climate, coolie labourers can undertake twice the amount of land in Natal that they can in India; and, thirdly, that an increasing local market already exists, which is scarcely the case in India. Mr. Hindson grows all the green leaf which he requires for his own factory, but the large mill at Thearsnoy, belonging to Messrs. Hulett,

though supplied with a very large acreage, also works up considerable quantities of green leaf from small growers. As much as 500,000 lb. were manufactured in one year at Thearsney. The mill has since been destroyed by fire, and is at present undergoing repairs.

IS THE CAUCASIAN PLAYED OUT?—Whether the Caucasian is “played out” or not his operations in tea cultivation are likely to achieve that proud position. According to news from Odessa the great expectations formed as to tea cultivation in the Caucasus are not likely to be realised. A report from Batoum states that the Minister of Domains does not feel inclined to continue the Government subsidies to the planters along the Caucasian coast, as the results of their efforts have hitherto not been satisfactory enough to warrant any further expenditure on their behalf. Neither the quality nor flavour of the tea grown in this region is satisfactory, and this notwithstanding the fact that one or two planters have imported skilled Chinese growers to take the oversight of the harvesting and drying operations. As the Chinese methods of drying are, to say the least, antiquated, it is not surprising that they have failed to teach the Caucasian planters much.—*H. and C. Mail*, July 24.

CULTIVATION OF VANILLA IN MEXICO.

The following information on Vanilla is taken from Sir Henry Dering's report on the productions of Mexico, already referred to:—Vanilla is found growing wild in many districts of Mexico, and it is cultivated in Michoacan, Puebla, Oaxaca, Tabasco, Vera Cruz, and other places. There are six varieties of vanilla known in Mexico, namely the “mansa,” the “cimarrona,” the “mestiza,” the “pompona,” the “pnerco,” and the “mono.” Of these the mansa and the pompona are cultivated. A rich vegetable soil, such as is found in the dense forests of the Tierra Caliente, is best for vanilla cultivation and growth, and in such localities the vine grows luxuriantly, and gives a large pod. The months of June and July are considered in Vera Cruz and Tobasco as most appropriate for planting, and the plants will commence to flower in the second year after planting, and full crops may be expected between the third and fourth year. The flowers appear in March, April, or May in clusters of 20 to 50. The fruits go on growing for a month, but it will take at least eight months longer to ripen sufficiently for harvesting. The proper time for the ripening of the vanilla in the districts of Tuxpan, Misantla, and Papantla is in the month of January, February, and March. The bean, if allowed the necessary time to ripen properly, is black and juicy, and, when well prepared, will keep good for many years, but, if gathered before maturity, is bound to be defective. After the beans are gathered, they are plunged for half a minute into hot water that is almost boiling. They are then put on mats to drain dry, and afterwards are spread out on blankets and exposed to the sun, and in the evening they are shut up in tight boxes to ferment. The box in which the vanilla is to be sweated must be put in the sun during the day to warm it and it must be big enough to hold all the vanilla that has been spread out. The sunning process is continued for a week, or until the pods become brown and pliable, when they are squeezed between the fingers, to straighten them, and to cause the seeds and oily substance inside to be evenly distributed. After the operator is satisfied with his work of sweating, the vanilla beans are then separated into sizes of length, thickness, colour, and appearance. The Mexican vanilla dealers have established five grades, namely:—First, vanilla “fina” or “legal,” the beans or pods from 6½ inches long or upwards, short in the neck, sound and black; the beans which become split, or open, provided they have the foregoing qualities, and the split does not extend more than a third of the pod. This class is again subdivided into “terciada,” which is composed of the shortest pods; “primera chica,” “primera grande,” “marca menor,” and “marca mayor,” the largest of all.

Second, vanilla “chica,” those pods which differ only from the terciada, in being shorter, two of them counting as one of the first-class. Third, vanilla “zacate,” the pods of all sizes, which are off colour through being gathered before becoming ripe or being over cured, “pescozada,” “vana,” “cuerada,” and “apocoyonada,” names for pods in a more or less damaged condition. Fourth, vanilla “cimarrona,” the wild vanilla, in good or fair condition, three pods counting as one of the first-class. Fifth, the “rezacate,” composed of the very short pods, of those split clear up to the stalk, of the badly damaged, of the very immature, and of the very much over-cured. After the sizing and classification is finished, the pods are tied up in bunches of 100 to 150, so as to weigh one pound, and wrapped up in paper and tinfoil. Statistics show that there is more vanilla exported from the port of Tuxpan than from any other port in the world, thus establishing the fact that the Tuxpan valley is the natural home of this valuable orchid. As much as 300 per cent. profit has been made in good years by those engaged in the vanilla industry in Mexico.—*Journal of the Society of Arts*, July 17.

LONDON TEA LETTER.

(FROM OUR OWN CORRESPONDENT.)

10th July, 1896.

L. M. B.

In regard to the Land Mortgage Bank a special meeting of the shareholders was held last week to consider the offer of £366,000 odd made by Sir John Muir, Bart., and Mr. P. R. Buchanan for the properties of the Bank. This offer the Board of Directors had recommended the acceptance of by, or rather had actually accepted subject to the approval of, the shareholders. The Chairman, Mr. R. J. Boyson, informed the meeting that the offer he confidently believed would enable the Company to liquidate, pay off all liabilities, and distribute £1 per share (or at the least not less than 19s 6d) to the shareholders. Some discussion followed, in which it was as a matter of course made doubly plain that the £1 or thereabouts per share would be all the shareholders would receive, that though shares had been bought at a premium, as they had been by many, the £2 paid, or no portion of it, would be refunded in addition to the £1 estimated; and it was also extracted that under the conditions of the offer made by Sir John Muir, the present shareholders of the Bank would have the privilege or option of an allotment of an equal amount in any company formed with the gardens of the Bank, or in any company of whose holding these estates might go to form part. The resolution approving of the sale of the estates was passed without any opposition or dissent, and now only remains to be confirmed at another special meeting (to be called for on the 21st instant), as will doubtless be done. There was some grumblers among those in the meeting who had purchased their shares at a premium. But upon the whole the arrangement is a very satisfactory one for the shareholders. The Company, though called a Bank, has long been nothing more or less than a large and unwieldy tea company with a Debenture Debt (though judiciously reduced within the last twenty years) still much larger than is paid up capital. There also remained the heavy liability on the shares, £18 being unpaid and liable to be called up. About twenty-five years ago, or even less, there was a considerable section of the shareholders who wished to see the Company wound up and they themselves freed from this liability. Had this been done then, doubtless there would have been a considerable call per share to enable the liquidation to be carried through, instead of any return of capital afterwards. Through good report and bad report Mr. Boyson continued sanguine, and he has to be congratulated, and the shareholders are greatly indebted to him for his persistency and courage. Of course Mr. Boyson has been a lucky man. The mainstay of the Bank was tea, and the fall in exchange and the present boom in tea investments has brought about a revolution, that the most

sanguine had no reason to hope for and perhaps never dreamt of twenty-five years ago (or even much more recently). Mr. Boyson has laboured for thirty years for the Bank, and is not a young man. He, more even than the shareholders, has every reason to be highly gratified with the result. May he long enjoy his well-earned repose. It is quite true (perhaps not a single shareholder in the room, and certainly excepting Mr. Boyson himself, the purchasers were not present), can have much idea of what is the fair value of the Bank's gardens. But many know what the result of working them in the past has been, and in the future there will be up and down in exchange, markets, and all the other risks that have hitherto had to be encountered in regard to management, labour, blights, etc., &c. The chances are the gardens would be no better managed *per se* than they have been in the past, and, though it is to be hoped times may be better the chances are, I think pretty certain they shall be worse. It is not unlikely that the practical advisers of the purchasers know the advantages and capabilities of the widely scattered gardens all over a great deal better than anyone else. Be it so. It cannot, however, be denied they are paying a very fair, what would seem even a very full, price for them, and everyone, including the L.M.B. shareholders, may cordially wish the purchasers every success in their investment, that can be achieved by more skilful and efficient working of its gardens.

CONSOLIDATED TEA AND LANDS CO.

Little more has transpired regarding Sir John Muir's monster company. I have heard it said by those who should be best informed *outside*, that the two millions of capital was subscribed several times over! I saw in the money column of one of our daily papers, that "the first batch of letters of allotment and regrets" had been posted. Though that is some time ago, I have noticed or learned of no other intimation in the Press. It is also rumoured that several large applicants have been allotted two or three shares each, and I have seen it quoted that each class of shares, 1st and 2nd Preference and Ordinary are already quoted at £1½ to £1¾ premiums each! So much evidently for the increasing eagerness of the sanguine investing public for tea shares.

FURTHER SALES AND NEW COMPANIES.

Nothing seems to transpire as to who are to be the bidders for the Dooteraah concern to be exposed at auction in a few days. Messrs. Duncan Ibbes. were the highest bidders formerly. It can do no harm for me to hazard a few remarks, as long before this can reach you the matter must be finally settled. Nothing has been mooted in regard to Sir John Muir in this connection, but if the present owners do not consider it too good a thing to let slip from them, or even if they do I should be inclined to back the chances of Sir John Muir, who up to date has the record as a purchaser in Darjeeling since the 1863 days, to the advantage of one of the most deservedly respected citizens Darjeeling ever knew. But I do not speculate so much on that, as I rely upon the universal truth of the saying of a shrewd friend in one of the tea countries that "when a man once gets fairly smitten with the land fever (in connection with tea specially), there is no satisfying him till he gets laid in it himself." Of course there is this in favour of the present partners, that they will only have the half of the purchase money to find; and as the bidding progresses, they must know better than others when the point has been turned that makes it safer for them to be sellers than buyers. I, however, back the honorable Baronet (if he really cares for the property) and his friends. With the "L.M.B.," "D.F.B.," "K.L.P." and "T.F.B." and Bloomfield combined in one monster Darjeeling Company, it would amount almost to a monopoly, and the Darjeeling Company, and its then honored Managing Director, Mr. Roberts, would be nowhere. Of course men of capital and enterprise like Sir John Muir do an immense deal of good to the natives of India and the country, and in the long run even to the tea industry, which the weak, timid and narrow-minded fear he is about to swamp through the magnitude of his undertakings.

The prospectus of the Darjeeling Consolidated Tea Company, Limited, that has been formed, as I before mentioned, to take over your Calcutta, Balasun, Gyabaree, Singbulli and Murnah and Ting Ling Companies of Darjeeling, is expected to be issued daily. The capital is to be £120,000 half in 5 per cent. cumulative preference shares, half in ordinary shares.

Another new company is reported as being formed to purchase the splendid estates of the Borjuli Tea Company and the Dapoota Tea Company in Assam, and certainly extraordinary general meetings of the shareholders of these two companies have been summoned to take into consideration the proposals to purchase the properties of these two companies as going concerns from 1st January 1896. The prices named are £183,945 for the former and £63,000 for the latter, the respective capitals for which the concerns were floated for about two years ago being £120,000 and £41,000 respectively.

What is to be the next surprise? Or is tea company-promotion destined soon to have some little respite? May all end well for the confiding investing public. Up till a very few years ago it could be asserted that almost as much had been lost as ever was made in Indian tea, and that the larger proportion of the gains had been through company-promotion and the "turn-over" of companies and shares. May the same not have to be said four or five years hence?—*Indian Planters' Gazette*, Aug. 1.

THE ASSOCIATED TEA ESTATES OF CEYLON, LIMITED.

With a capital of £150,000, divided into 8,000 six per cent cumulative preference shares of £10 each and 7,000 ordinary shares of £10 each, the Associated Tea Estates of Ceylon, Limited, has been formed to take over as going concerns, and to amalgamate under one management, the following tea estates in Ceylon, and to purchase further estates as opportunity offers: Chesterford, Kelani Valley; Dukinfield, Uda Pussellawa; Doragalla, Pussellawa; Horagoda, Kalutara; and Madultenne, Kelani Valley. The prospectus states that a feature in the selection of the estates is the distribution over high and low country, the properties ranging from Uda Pussellawa, at an elevation of 5,500 feet, to the Kelani Valley with an elevation of 450 feet above sea level. This should lead to a more uniform aggregate result than by having a series of properties all in one locality. There is ample factory accommodation for present requirements upon the estates, and there is an experienced staff of officials and employees, which will be taken over by the company, so that the business will be carried on without any break in its continuity. The price to be paid for the five estates above mentioned has been fixed by the vendors at £103,720, leaving a balance of £6,280 out of the present issue available for working capital, the vendors agreeing to pay all the expenses in connection with the formation of the company down to allotment. The directors of the company are: Sir Alexander Wilson (chairman of the Mercantile Bank of India, Limited), London, S. R. Earle, Esq. (director of Alsing and Co., Limited), and John McEwan, Esq., (of the Allynugger Tea Company, Limited.)—*H. & C. Mail*, July 24.

INDIA AND CEYLON TEA COMPANY, LIMITED.

With a capital of £600,000 in 300,000 preference and 30,000 ordinary shares of £10 each, the India and Ceylon Tea Company, Limited, has been formed to acquire, and combine under one management, the following going tea concerns, which, excepting the Ceylon properties, are taken over from January 1 last:—(1) In Assam: The properties of the Borjuli and Dapoota Tea Companies. (2) In the Doors: The properties of the Good Hope and Kumali Tea Companies and the Haha Patha and Dangua Jhar Estates. (3) In Ceylon: The Lebanon group of tea gardens and the Knuckles group. The total area of

these properties is near 18,000 acres. The purchase price is \$418,000, of which £346,280 is payable in cash, \$4,000 in fully-paid preference shares, and £67,720 in fully-paid ordinary shares of this company. The present issue is of 21,900 preference and 21,900 ordinary shares. The directors of the company are W. H. Verner, Esq. (chairman), Sir W. W. Hunter, K.C.S.I., C. A. Verner, Esq., W. S. Wells, Esq. (chairman and directors of the Doars Tea Company, Limited, and the Singlo Tea Company), W. K. Darley (managing partner of Haiha Patha Estate), Thomas Dickson, Esq. (director of the Scottish Trust and Loan Company of Ceylon, Limited), and H. N. Gladstone, Esq., director, Singlo Tea Company, Ltd. —*H. and C. Maul*, July 24.

TEA IN THE INDIES.

HOW THE PLANT IS GROWN AND THE LEAVES CURED.

CONSUMPTION OF THE BEVERAGE IS INCREASING—MODES OF CULTIVATION AND CURING ALWAYS IMPROVING.

Only a comparatively few years ago the people of the United States knew little of the teas that have of late years made such wonderful strides in displacing China and Japan teas in British markets, and which have recently shown such a large increase in consumption in this country. Notwithstanding that tea is a household beverage, not many know much of its cultivation, either in India and Ceylon or in Japan and China, or that for years, through governmental instrumentality, experiments have been going on in this country, principally in North Carolina, Florida, and California, looking to the propagation of tea in the United States. Regarding the latter, the cost of labor and unfavourable climatic conditions are hard nuts for the experimentalists to crack, and it cannot be said that the work so far has been at all satisfactory, although tea of good quality has been grown, but not for commercial purposes.

To those who know little of the actual work of tea raising or the various processes the leaf must go through before it is ready for use on the table, a short history of the tea plant from its inception will be both interesting and instructive.

As a matter of fact, tea is indigenous to India and was transplanted to China and Japan, as well as to Ceylon, the latter place having been a large coffee producing country, and would probably have so continued had not the leaf been attacked by a scourge which sapped the energies of the plant. The growers seeing starvation staring them in the face, then turned their attention to the cultivation of tea as a means of livelihood, although at first it must be confessed with not great hopes of success, although tea was being cultivated in India, a climate very much similar to that of the island of Ceylon.

TEA SUCCEEDS COFFEE.

The tea seed was first planted in the fields upon which the coffee trees were growing (dying, perhaps, would be the better word), although the plantation owners still had hopes that the disease would be checked. As the tea bushes approached maturity, and the chances of success improved, the coffee trees were uprooted and the tea plants were left in full possession of the field. Three or four years are required before a tea plant becomes productive, the plant in those climates requiring no moisture other than that provided by nature. After a growth of fifteen months, the first important work must be done, and this is called "topping," the object being to keep the plant (it would grow to a tree) at an average height of four feet. All the surplus branches are taken off except the stem and short ones, the surface of the plant being flattened. The work is done by coolies, and that the task is a hard one is shown by the fact that a field of fifty acres will have between 175,000 and 200,000 bushes. After the plants have matured, the leaves are plucked, and this is a task that requires deftness, as well as care and judgment. The early growth of the leaf makes it firm, and it

is in the selection of leaves for the different varieties that the judgment must be shown. If fine qualities are wanted, only a small number of leaves from each shoot will be taken, while if quantity is the principal thing wanted extra leaves will be taken from every shoot.

So expert do the native work people become that it is only necessary to tell them the special grades and they will quickly pass over the bush, selecting only such as are needed. Great care must be taken that the eye or bud shall be left unbroken on the branch.

FAR ABOVE SEA LEVEL.

In Ceylon the tea plant flourishes from 100 to 7,000 feet above the level of the sea, if the soil is rich and the climate favourable, but most of the gardens are laid out on the slopes of hills and mountains. The higher the altitude the less the yield, but the greater the fullness and flavor.

In picking the coolies carry baskets hung from their heads by ropes, the leaves, as picked, being thrown over the shoulder. Each picker's basket has a capacity of about fourteen pounds, which, when full, is emptied into a larger receptacle set at the end of each row. Every plantation of any size has its own factory, a two-storey building with heavy roof, run either by steam or water power, so that the tea in all its processes is handled exclusively by machinery. This use of machinery is one of the real reasons for the enormous increase in the consumption of British-grown teas, as it entirely obviates the use of the hands and feet employed by the Celestials in the rolling processes.

Withering is the first process the leaves undergo upon reaching the factory. Long shelves, covered with Hessian jute, are arranged about the room, and the green leaves are spread upon them and then subjected to a current of dry air. Next comes the rolling, which twists the leaves, breaks their cells and facilitates the process of oxidation. When green tea is required, of which there is comparatively little shipped from either India or Ceylon, the process employed is different.

The rolling being completed, the leaf is distributed in trays to undergo the entire oxidation process by exposure to the air. Then come the firing and drying, and this work is accomplished through the medium of machines, which dries and extracts all the moisture. The sifting and sorting into different grades are next in order, and then the packers take hold and the tea is ready for shipment to any and all parts of the world.

In India the various processes are similar, Ceylon having followed the lead of the former country in the use of machinery, tea having been a commercial product there long before it was thought of in Ceylon.

European capital has developed these countries, and the push and energy of the Anglo-Saxon is gradually leading the world in the production of tea. The fight will indeed be an interesting one for supremacy, if it can be demonstrated that tea may be successfully and profitably grown in this country and the English colonies will have to look to their laurels.

TEA GROWN IN AMERICA.

In this country the introduction of tea received its first real impetus at the Chicago World's Fair, although some desultory work had been done prior to that. Enterprising planters sent commissioners here, and a vast outlay of money was made, and the result attained was so satisfactory that the work has been carried on systematically since, and each year has shown an increase, the last report showing the stupendous gain of 72 per cent.

The English producer claims for his tea first that it is absolutely pure, and secondly that it is all machine cured.

The large importers of these teas into this country have been against the proposed legislation, which makes a standard that allows adulteration. They claim that the use of Prussian blue and other substances is detrimental to public health and should be stopped. Absolute purity is their aim, and it seems that they have the best of the argument when the records of every port of entry in the United

tates fail to show that a single pound was ever ejected for any cause, while it is a common occurrence for teas from other countries to be refused admission.—*Mail and Express*, July 11.

DETERIORATION OF INDIARUBBER BY KEEPING.

We are asked to publish the following copy of a letter dated the 11th May 1896, from the Reporter on Economic Products to the Government of India, to the Inspector-General of Forest, Simla:—

"Replying to your demi-official dated 24th ultimo on the subject of the Assam rubbers, I am glad to find that you underestimated them. That gives a better token of the future, than if you had gone to the other side. As to the want of uniformity in Carritt and Co.'s valuation, so much depends in the eyes of brokers on external characters, that the sample that had got a little more oxidised through more direct exposure to air than another would at once get a lower price assigned to it. It is wonderful how rapidly indiarubber in its crude state suffers. Some of our samples in the Museum have become liquids, devoid of all elasticity. This, I think, should give the practical suggestion that the sooner rubber leaves the producer's hands and is taken over by the purchaser the better. No consignments should be delayed in India."

"But besides oxidization there are many other ways by which one parcel drawn from identical trees and prepared by the self-same process will fetch a lower price. But I think the Assam Conservator told us that the samples were obtained from several recognised races of the rubber tree. So that there may be a botanical reason for the variation in the valuation. I am promised botanical samples of each form, and will, I hope, soon be in a position to express an opinion upon this feature. I hope Assam may be able to furnish us with larger samples. We could easily find willing buyers, as there is a distinct demand for Assam rubber."—*Indian Forester*.

FLOWERING OF STROBILANTHES [NILU] IN BOMBAY.

Strobilanthes callosis flowered along the Western Ghats in the Belgaum District in 1887 and in 1895, showing an interval of 8 years. The flowers appear in the month of August but the seeds do not ripen till the following May.

Strobilanthes scssilis is very common along the Western Ghats at an altitude of about 2,800 ft., and flowered in 1888 and in 1895, showing an interval of 7 years.

THE NYASSALAND COFFEE COMPANY, LTD.

An adjourned meeting of the Nyassaland Coffee Company, Ltd., was held at noon today in the office of the agents and secretaries (Messrs. Carson & Co.). Mr. Macindoe presided, and present were Mr. E. R. Waldoek, G. J. Jameson (by his attorney Mr. Macindoe), Messrs. Carson & Company (represented by Mr. Macindoe), Mr. W. Shakespeare, and (by proxy) Mr. G. K. Deaker.

On the motion of the CHAIRMAN seconded by Mr. WALDOCK the report and accounts as appended were taken as read.

SUPERINTENDENCE.—The Directors have to report that Mr. G. Mortimer Crabbe was appointed Manager and proceeded last year to Nyassaland to take charge of the Company's land. In order to develop the Company's land it was considered advisable that two European assistants should also be sent, and

Messrs. L. T. Moggridge and S. Robins were appointed. They arrived at Chinde on 15th May, 1896.

PROGRESS OF WORK.—The latest advices dated 8th May, 1896, report that 55 acres had been felled, 15 burnt and 12 holed, in addition to the 10 acres planted December, 1895. At the time of writing, Mr. Crabbe had 210 people working, and if labor continued plentiful he hoped to have about 200 acres opened this year.

SEED.—So far the Directors have been unable to procure any from Brazil but efforts are still being made to get some. At present the plants and seed have to be bought from neighbouring estates in Nyassaland.

PURCHASE OF LAND.—Only the 1,500 acres block has up to date been transferred to the Company. For the other block of 2,000 acres referred to in the Prospectus and the circular dated 7th June, 1895, a proper title has not yet been received, but it is hoped will arrive shortly.

It has been suggested to the Directors that an Estate, part of which is in bearing and which adjoins the Company's land, should be acquired. Negotiations are in progress, and if it can be bought at a reasonable figure might prove a valuable addition and enable the Company to give the Shareholders an immediate return upon their investment.

It will be necessary to elect an Auditor.

Mr. SHAKESPEARE proposed and Mr. WALDOCK seconded the adoption of the report. Agreed.

On the motion of the CHAIRMAN seconded by Mr. SHAKESPEARE, Mr. E. R. Waldoek was appointed auditor for the ensuing year at a remuneration of R50 for each audit.

Meeting adjourned.

JOHN COMPANY.

Whatever may be thought of the policy of governing vast expanses of barbarism by the agency of private trading corporations, there can be no doubt this empire owes its present commercial pre-eminence in a large measure to the enterprise of the chartered companies who first settled most of the Greater Britain of today and exploited the natural riches of our colonial soil. The reign of the great East India Company, the largest corporate body the earth has ever seen, was the Golden Age of "Mincing Lane," and the rise of our Eastern drug and spice trade is directly due to the pioneering enterprise of the East India, the Turkey, the Russia, and the Cathay Companies. Indeed, it is a commonplace that it was largely for the sake of securing this trade that we first ventured in the Indian seas and fought the Dutch and the 'Portingales.'

It seems to us that more might have been made of this very interesting branch of trade in Mr. Geo. Cawston and Professor Kean's 'Early Chartered Companies,' which has just been published; but perhaps the authors required all the space at their disposal to deal with the political and economic aspects of the chartered companies from Henry III. to Charles II., and were thus compelled to restrict themselves to the smallest compass in referring to actual trading operations.

How many people are aware that there was a 'Made in India' agitation two centuries before anyone had heard of 'Made in Germany'? That is a fact nevertheless. In 1681 the Turkey Company, a rival concern of the East India Company, brought a charge before Parliament through a Mr. Polaxfen—who appears to have been the Sir Howard Vincent of his generation—accusing the India Company of 'exporting immense quantities of gold and silver with but little cloth, bringing back calicoes, pepper, wrought silks, and a deceitful sort of raw silk,' the importation of manufactured goods from abroad being 'an evident damage to the poor of England.' The East India Company were further accused of encouraging manufacturing industry in India, and the same dire consequences were predicted to our home industries that are now prognosticated from German rivalry. Nobody, however, seems to have been one penny the worse in the end.

This great East India Company, which for several generations stood for the name of Britain in the East, which brought millions upon millions of money into this country, and founded an empire in Hindostan, was established by a Royal Charter of Elizabeth in 1599 with a capital of only 72,000*l.* Four years later the first

cargo of pepper and other spices was imported into London by the adventurers 'after a prosperous voyage of two years and seven months,' and sold, no doubt, to their own exceeding profit. What gains were made on imported produce in those days is shown by Malyns in his 'Centre of the Circle of Commerce,' a contemporary work, from which it appears that the difference between the cost and the sale price of some of the Company's chief imports in 1623 was as follows:—

	Cost in India per lb.		Sold in England at per lb.	
	s	d	s	d
Pepper	0	2½	1	8
Cloves	0	9	5	0
Nutmegs	0	4		0
Mace	0	8	6	0
Indigo	1	2		0
Raw silk	8	0		0

What the City middlemen made in those days one can only conjecture. The mere enumeration of the figures is enough to make a modern Mincing Lane man's mouth water.

In a book dealing with the early British trade with India we naturally expect to find a reference to the now discredited poison-antidote bezoar. Mr. Cawston gives, as the derivation of that word, the Persian *pad-zahr* (lit., 'poison-expelling'), meaning "antidote." The Persians employed the name specially for the balls of silicious matter occasionally found secreted in the intestinal canal of the Persian wild goat, but the East Indian bezoar, as we now know, was mostly derived from monkeys. The popular delusion of the efficacy of the drug in the mental, as well as in physical, afflictions is shown in the line from a contemporary author, where 'the healing bezoartical virtue of grace' is mentioned.

Less accurate is Mr. Cawston's reference to 'worm-seeds,' which were among the first articles imported from India, as 'short for wormwood-seeds, the seeds of *Artemisia maritima*, still used in India as a stomachic tonic.' The seeds brought over by the early Indian traders under this name were probably the Indian variety of *Semen Cina*, the worm-seed which is now chiefly imported from Russian Central Asia for santonin-manufacture. The seeds of the wormwood, or absinthe plant, have no connection with them except that both plants are *Artemisia*. The spice-trade of the Company received a heavy blow in the early years of that corporation's activity by the expulsion of the British from the Moluccas, or Spice Islands, by the Dutch; and from that time may be reckoned the definite establishment of a competing spice and drug market at Amsterdam, which is today a serious rival to London as it has ever been before.

The long duration of the lucrativeness of the Indian trade of the East India Company is shown by the fact that in 1726 it was computed that of the Company's annual imports, representing an aggregate value of 22,000,000*l.*, not less than 8,000,000*l.* was clear profit.

Tea became a trading article of the East India Company about the year 1645. It was first introduced into this country by the Dutch, and sold then at from 120s to 200s a pound. In 1660 the Company presented Charles II. with 2 lb. 2 oz. of the herb—a liberality which was probably well calculated, for shortly afterwards 'tea' became a fashionable beverage with the Upper Ten. A four-shilling duty did not prevent the spread of that popularity, and in 1745 Parliament passed an Act threatening the Company with the forfeiture of the charter if they should fail 'at any time to keep the London market supplied with a sufficient quantity of tea at reasonable prices, to answer the consumption thereof in Great Britain.'

The East India Company's monopoly of the Indian trade was abolished in 1833; but the Corporation itself survived until the Mutiny in 1857, after which it was taken over by the State—a fate that has recently also overtaken its East African successor.

It is interesting in the present day to note that the first real trading company which received a Royal charter in England was not a British, but a German, one. It was composed of traders of the Hansatic League, who established a kind of depot in the City of London, at the place where Cannon Street Station stands now. For nearly three centuries the 'Germans of the Steelyard' were one of the most powerful corporations in England, and it was partly apprehension of their growing influence that caused Elizabeth, in 1597, to revoke their privilege and turn them out.—*Chemist and Druggist*, July 25.

THE TEA DUTY.

Some of the statements which were hazarded in the discussion on the tea duty, when in the ordinary course of business the Finance Bill came to be considered in the House of Commons on Tuesday last, are calculated to fill the mind of those engaged in the tea trade with wondering amazement; and we

are not surprised that the varying accounts of what the Chancellor of the Exchequer said or did not say on that occasion caused such bewilderment that it is thought expedient for the Grocers' Federation to take the matter up and find out the real truth of the case. If Sir Michael Hicks-Beach has been rightly reported, it will be seen, on referring to another part of this Journal, that he stated in the House that ninety-five per cent. of the duty on tea was derived from leaf sold wholesale at less than a shilling a pound! To put the same fact in another way, the tea which commands a wholesale price of over a shilling is, according to the Chancellor's statement, only 1-7 per cent. of the whole; while the wholesale price of the bulk of the tea sold in 1895, varied from 7½d. to 9½d. per pound. Unless Sir Michael's observations are capable of some other explanation they certainly form a serious indictment against the trade, who might obviously be accused of making enormous and unfair profits on their higher-priced teas; so that in their own interests and for the satisfaction of the public such insinuations should at once be repudiated. Fortunately there need be no difficulty in removing any false impression which may have been caused by so strange an assertion. According to official figures now before us, it is plain that in 1895 the wholesale price of tea in London ranged from 5d to 2s 6d per pound, and choice parcels brought even more money than the latter quotation. It seems evident that Sir Michael was speaking on Tuesday without his book, or he meant to say something different to what he is reported to have said. Anyhow, the trade will not be content until the matter has been fully explained. As to the various propositions which were forthcoming why the tea duty should be lessened, differentiated, or altogether abolished, we leave it to our readers to consider them at their leisure. They are all so manifestly impracticable at the present time that it seems little better than childish to have wasted many hours of the precious time at the disposal of the House in bringing them forward. With the heavy expenditure sanctioned by the Legislature to ensure the safety of this country and her vast dependencies, there is no prospect whatever of any remission of existing taxation, and the tea duty cannot be said to press heavily on any class of the community. The trade themselves are in no way desirous of a change which would cause an immense amount of trouble and anxiety with no probable adequate return. "Let well alone" is a safe motto in this instance, and one which all parties concerned will be disposed to adopt.—*Grocers' Journal*, July 11.

PLANTING OF BUCKLANDIA AMONG TEA.

DEAR SIR,—Will you be so good as to inform me through your columns as to the suitability of planting the *Bucklandia* tree for shade, timber and firewood on a Ceylon tea estate, elevation about 3,000 feet, in a dry climate, that is to say, planted in the tea at intervals and along the roads, also for timber clearing alone, on the estate. Also as to the planting out of the seed in nurseries: whether it requires any special soil or preparation of the soil for rearing plants in the nurseries.

I have never seen the seed, so have no idea what quantity (weight) to order to raise, say, 10,000 plants. Can you inform me?

Will you also kindly insert advertisement—

Wanted—*Bucklandia* seed, suitably packed, for transmission to Ceylon. State price for large and small quantity.

Some trees have a marked injurious effect on the tea, whereas *Grevillea robusta* does no injury but rather the reverse.

I should like to know what you think would be the effect on tea if interplanted with *Bucklandia*.

Rothschild; }
Pussellawa, }
Ceylon. }

W. H. HANNAM.

Note.—Perhaps some of our Darjeeling subscribers could kindly forward the required information. The *Bucklandia* seed, so far as we know it, is very small. We think it would have much too heavy a foliage and be too shady for planting in tea.—Hon. Ed.—*Indian Forester.*

THE YATADERIA TEA COMPANY OF CEYLON, LTD.

An extraordinary general meeting was held on the 15th Aug. at 12-30. Present:—Messrs. H. V. Masfield (in the chair), John H. Starey, D. Fairweather (Directors), B. G. L. Bremner, Secretary; C. M. Gawtkin and J. A. Martin, and by attorney O. H. Warren, W. W. Church and A. H. Dingwall.

The Secretary read the notice convening the meeting. It was proposed by the Chairman and seconded by Mr. J. A. Martin:—"That an ad-interim dividend of 12½ per cent for the half-year ended 30th June 1896 as recommended by the directors be declared and made payable forthwith."

The Managing Director, speaking to the resolution, said that first of all he had to point out a misprint in the last annual report where the cost of the tea for 1895, including everything, was stated at 25.9 cents instead of 20.51 cents per lb. This error did not affect the accounts or results in any way. Up to 30th June last about 46 per cent of the crop estimate for the year had been secured, while pruning was rather in advance of last year. He had visited the estate this week and had found it in good order, and managed with the usual good care. Rather finer plucking is being tried.

After a few questions had been answered the Resolution was put and carried unanimously.

ST. HELIER'S TEA COMPANY, LTD.

A meeting of the shareholders of this Company was held in the office of the agents and secretaries (Messrs. Bois Bros. & Co.) on the 15th Aug. The Directors' report, which is appended, was adopted and its recommendations given effect to:—

The Directors herewith have the pleasure to submit their Fourth Annual Report, which, they trust, will be considered satisfactory by the Shareholders, shewing, as it does, a nett profit of about 26 per cent on the year's working.

The crop, which was estimated to be 95,000 lb. of made tea to 30th June, has turned out 98,371 lb., and has realised an average price of 15.83 cents per lb.

The cost of the tea in Colombo, exclusive of the sum of Rs52.22 expended on a new clearing of 29 acres, works out at 21.01 cents, shewing a margin of profit of 21.84 cents per lb., which may be looked upon as very satisfactory.

The total acreage under tea is now 226 acres in bearing, 21 acres 1 year old, and 29 acres being planted.

The Directors make the following recommendations:—

That a final dividend of 15 per cent should be declared, which, with an interim dividend of 10 per cent already paid, makes a total for the year of 25 per cent leaving the sum of Rs87.57 to be carried forward to next account.

Mr. Stanley Bois retires from the board by rotation; but, being eligible, offers himself for re-election.

The shareholders will also have to elect an Auditor for season 1896-97.

INDIAN PATENTS.

Applications in respect of the und-mentioned inventions have been filed, during the week ending 25th July 1896, under the provisions of Act V of 1888.

Improvements in apparatus for packing tea or other substances. No. 255 of 1896.—Samuel Cleland

Davidson, merchant, of Sirocco works, Belfast, Ireland, for improvements in apparatus for packing tea or other substances.

Improvements in the manufacture of tea chests.—No. 256 of 1896.—John Coryton Roberts, planter, of 16, Cromwell Grove, West Kensington, in the county of London, for improvements in the manufacture of tea chests and other packing cases or boxes.—*Indian and Eastern Engineer*, Aug. 8.

INDIA AND CEYLON OUSTING JAPAN TEA.

As already mentioned in these columns, the depression in the tea market has resulted in many tea-growers resolving to abandon this year the picking of second crop leaves. Such a resolution on the part of manufacturers is said to be inevitable, for present quotations really entail loss. A report forwarded from a district in Shizuoka in the middle of last month to the Central Guild in Tokyo, puts the situation thus:—

ESTIMATED COST OF MANUFACTURE PER KWAMME.

	Scn.
Raw leaves, 4 <i>kwamme</i>	792
Pickings expenses	372
Cost of curing	680

Total *yen*.. 1821

Tea of a given quality is now quoted at 1.50 *yen* or so, hence in manufacturing one *kwamme* of this tea, manufacturers are actually losing .321 *yen*.

In a previous issue we noted how markedly the quantity of tea exported has fallen this year compared with last season. The *Kokumin* says that the attention of the authorities has been drawn to the matter, and they have caused inquiries to be made into the subject. According to their investigations, one of the causes that has resulted in the diminution of export is believed to be the over-abundant stock held in New York and Chicago. Another is the gradual encroachment in the American market of the Indian teas. British tea-merchants in India are sparing no pains to push their product in America. In the press, in social conversation, and in almost every conceivable way, the British-Indian merchants are speaking ill of Japanese tea, and are doing their utmost to expel it from the markets of America. Japanese tea-men are entirely indifferent to, or ignorant of, these things. The moment they deliver goods to resident merchants in Yokohama or Kobo, they consider their interest closes, and they do not even take the trouble to ascertain the destination of their goods, or whether they are favourably received or not in foreign countries. Under the circumstances, the gradual ousting of Japanese tea by Indian in the markets of America is not strange. Another point which Japanese tea merchants and manufacturers ought to bear in mind, is this. They must distinctly understand that cheapness is the only quality that recommends Japanese tea to American consumers. Therefore, when Formosan or Indian tea, which generally command higher prices in the American market, can be sold as cheaply as Japanese tea, the middle and lower classes of America, the principal buyers of Japanese leaf, at once transfer their patronage to the products of India or Formosa. In this respect, Japanese tea-growers are placed in a very painful situation this year, for while the cost of production has risen considerably, market values have moved in a contrary direction. Any temptation towards deterioration in quality must be resolutely faced, otherwise Japanese tea will be speedily driven from America by its Indian and Formosan rivals, and then its fate will be sealed. The prospect of the election of Mr. McKinley as President of the United States, must place Japanese tea-growers more on the alert, for, with his election and the imposition of a higher protective tariff, the inspection of imported tea will become more stringent.—*Japan Weekly Mail*, July 11.

PURE MACHINE-MADE TEAS.

INTERVIEW WITH MR. R. V. WEBSTER.

There sailed from this port on Saturday last a representative planter of Ceylon, Mr. R. Valentine Webster, of the Ceylon Tea Gardens Company, of Colombo, Ceylon (formerly known as Ceylon Co-operative Tea Gardens Company), and through whose courtesy we are permitted to present some facts of general interest about Ceylon and its greatest and most prosperous industry. Mr. Webster, called by many the "Prince of India," on account of his travelling all over the globe in the interest of British grown tea, states as the result of his six years' experience that Ceylon and India teas are steadily gaining favor with consumers in all tea using countries.

"Within six years," said Mr. Webster, "India and Ceylon teas have come into general use in Australasia, New Zealand, South Africa, the West Indies, Egypt and Canada, while there is an increasing interest manifested in Ceylon and India teas in France, Spain, Italy and in Russia, which takes the higher grades. Australasia takes the cheaper grades and thereby makes a great mistake. It is folly to attempt to bring Ceylon and India teas into permanent favor unless it is by cultivating a demand for the high grades of tea.

"Four years ago, during my visit to the United States, I could get nobody to listen with patience to my advocacy of Ceylon tea, either in bulk or packets. Your dealers claimed that the United States was a user of green tea, and therefore would never take kindly to machine-made teas. I explained that other countries which had been partial to green teas had made the change and that I could see no reason why the United States should be an exception. This, they claimed, was because other countries had been using Oolong tea and not Japan and China greens, as was the case in this country. I maintained, however, that the United States was the only exception in the world, and that within three years the United States would be importing large quantities of Ceylon tea; that Ceylon could manufacture underfermented tea in obedience to the demand of the American market quite as readily as it could change the character of tea to meet the requirements of London. My prediction has come about and in short time. Why, last year the sales showed an increase of 72 per cent. over 1894, while up to date this year my company alone has sold four times the amount of tea that it did last year, and the general demand is steadily enlarging.

"I would remind my American friends that in Ceylon and India two distinct varieties of tea are made, the one, "mild flavored," is grown on the higher elevations, and where tea is produced better suited to the American market than the stronger, more pungent teas grown on the lower elevations, which are better adapted to the English, Irish, Australasian and Canadian markets. But I would remind you that America is not the only country which goes in for these light-liquored teas, for in Italy, France, Egypt and Germany they are preferred to the heavier bodied teas so popular in the United Kingdom.

"I have been frequently asked by people in the States whether I can send samples of first crop of Ceylon teas. Now, there is no such thing as first crop of Ceylon tea. Ceylon is only four degrees— or, strictly speaking, three and a half degrees— north of the equator, where we have perpetual summer, and pick tea all the year round. In Assam, in the northern part of India, the tea plants do not 'flush' (tea planter's term for sprouting) during the winter. There they begin to pick tea about May 1st and keep it up till about January 1st. The 1896 crop of India tea will be on the English market this month."

In reply to the query if it were possible for Indian planters to manufacture a grade of tea similar in character to that now largely used by American people, and to maintain uniform grades year after year with tea from the same gardens, he said

"Yes, it is possible, and we can so manufacture it that it will keep good and in sound condition. If

any of your tea jobbers in the United States would like to secure any particular style of tea, I would be very much pleased if they would send a sample to the Ceylon Tea Gardens Company, Colombo, Ceylon, and if it is not possible to procure it from tea grown on its estates, I will advise them where it can be procured.

"There are teas grown and cured on certain estates that vary very much from season to season. This is partly due to the manager changing the make of his teas to suit the demand of the London market. There are certain companies that only go in for standard teas, and do not study carefully the peculiarities of the various markets of the world. I unhesitatingly state that dealers can procure a standard grade of tea in Ceylon and India, if they will take the trouble to find the parties. The variation in rainfall, or changes in the soil, have very little effect on the products in any garden. Whatever variations occur are chiefly due to changes in the process of curing and attempts to meet instructions from London factors.

"During my present visit to New York I came across a sample of tea from my own estate, in a one-pound packet, which had been two years in this country, and the flavor of which was fully as good as when it was packed, thus demonstrating that Ceylon teas, when properly fired, will keep. The underfired teas of Ceylon are like the underfired teas of Japan and China, and will not keep their flavor for any considerable length of time.

"I feel satisfied that when American consumers become adepts in the use of straight Ceylon and India teas, they will use no other. They have yet to learn that it is three times the strength of China and Japan leaf. Our greatest trouble has been to teach consumers to use much less in making an infusion than they have been accustomed to of other sorts. When they become convinced of the great saving to be made by using machine-made teas, I feel certain that these will take precedence over China and Japan sorts, and challenge the supremacy of coffee as the favorite beverage. It is at present a campaign of education, and it is making gratifying progress, and is destined to make rapid and wonderful strides in popular favor.

"At the present time Ceylon is enjoying a period of marked prosperity, chiefly through its tea industry, which has made its way into all parts of the world. The coconut industry is a large and profitable interest. A large business has grown up in desiccated coconut. The present export of tea from Ceylon is 103,000,000 pounds, and I look for an increase to 140,000 pounds, which may prove the limit. In India there is a large area suitable for tea cultivation, but want of labour will restrict the very rapid extension of the tea industry in that country. In Ceylon labourers on the plantations receive 8 cents per day, and on this they subsist, getting all that they need in the way of food and clothing, with something to spare for trinkets, of which the natives are very fond, particularly the young women. Those working on the estates live principally on rice, which they cook with curry and herbs, and are quite content."

We made bold to refer to Ceylon's having the silver standard, and asked Mr. Webster as to its bearing upon its position. He said:

"Yes, we have a silver standard and I would dislike to have it changed. It enables Ceylon to compete for the markets of the world. The rupee has fallen in value, so that measured by gold it is only about half its former value, but the rupee buys just as much in Ceylon as ever. There has been an advance in labour, but this is due to an increasing demand. Many of the natives are averse to working on the estates, preferring life in the towns. If rice has advanced the rise is due to other conditions than any change in the value of the rupee. Were the value of the rupee to rise to its par, we could not raise our products and get them into the markets of the world. I believe the silver standard is best for Ceylon, just as a protective tariff is for the best interest of the United States, or a tariff for revenue is best for the United Kingdom."

Mr. Webster is also the pioneer coffee planter of Australia, where he started the first coffee plantation in Queensland, in 1895, where climatic conditions are favourable to the growth of Coffee Arabica and where his experiments for the past four years have been very promising.—*American Grocer*, July 15.

[The above article is accompanied by an excellent portrait of Mr. Webster seated in a drawing-room and enjoying a cup of tea.—*Ed. T.A.*]

OUR NEW CEYLON.

It is most satisfactory to note that the Ceylon papers seem satisfied that British North Borneo will, before long, become a coffee-growing country, and are now willing to give it the advertisement of favourable notice in this respect. This is no doubt owing to the fact that two of our coffee growers, Messrs. Henry and E. R. Walker—unconnected by relationship, but having the common bond being ex-Ceylon planters—have both been successful. Their reports have so thoroughly confirmed the reality of the results obtained on the Development Company's estates that any lingering doubts seem to have disappeared; and the wise policy of the Court in the matter of free grants for experimental purposes—if indeed 500 acres can be termed only an experiment—will, it may be confidently anticipated, produce before long most satisfactory results.

Mr. H. Walker drew the attention of his Ceylon friends to one important point—the absence of those high winds in British North Borneo which prevail during the monsoon in the Spicy Island. But he might have alluded to another matter of not inferior importance—the non-appearance of any fatal form of blight. Here and there, at the Byte for instance, an occasional tree will be found with a few of the lower leaves showing something like the black spotted appearance so dreaded by coffee planters. But, oddly enough, these appear not only to have had no effect upon the bearing of the individual trees but have never spread. The general opinion therefore is that this is not the blight which has occasionally proved so disastrous elsewhere. Such trees, moreover, have to be looked for and do not catch the eye of the casual observer. After some years' experience, therefore, the manager of the estate in question considers himself justified in stating that blight is unknown.

Considering the success that has been achieved by the adoption of hand-pulping only, the introduction of proper machinery will probably give a vigorous spur to the industry. Mr. Walker does not, we observe, allude to this. He lays much stress upon the necessity of roads to and through the coffee-growing districts, and with this opinion everyone will concur. But it would be impossible, with the small staff at the disposal of the Government, for it to undertake such work in isolated localities. The solution of the local question—the Government making and up-keeping the trunk roads—will probably lie in some form of assistance being given to planters whose selections are outside the main routes, either by additional grants of land or otherwise. Mr. Walker states that Dusun labour can be obtained in Membakad district at about 16 cents a day—a boon for which Sandakanites would be devoutly thankful! At this figure, at all events, road-making would not be a very expensive undertaking. The Dusun is undoubtedly impatient of fixed hours for labour. He likes to go to work and leave off at his own time, but will work

well enough when disposed to accept employment. The best way is to contract with responsible head men, taking care never to let the contract be broken without the exaction of an ample penalty. The bane of the labour market hitherto—especially amongst wood-cutters—has been the payment of large advances to the labourers. This can be avoided when they are recruited upon the spot, and have not to be induced to leave a settlement for the jungle. One reason for the success of the Byte, for instance, has been the fact that the employes are free settlers on the ground around the plantation.

Mr. Walker's estimate for bringing coffee into bearing is ten pounds sterling (say \$90 roughly) per acre and the estate seems a fair one if it includes all expenses of management. Mr. Pryer's estimate for 400 acres up to 36 months (when a fair crop may be expected), was \$35,965 which also gives between \$89 and \$90 (these figures appeared in the *Herald* of 1st Dec., 1894) so that the estimate is probably as near the mark as estimates are likely to be. But the latter gentleman is most careful to explain that this result can only be looked for if a supply of cheap labour can be relied on. Weather, too, has an important effect on the preliminary expenses of cleaning and burning. A wet season costs much more than a dry season; but, taking one year with another, his figures seem fairly correct. It would be interesting to know how these compare with the Ceylon expenses.

One other point may be referred to—the saleable price of the parchment berry as delivered in Sandakan, compared with its actual cost of production. In the *Herald* above quoted Mr. Pryer puts the figures for estates in this neighbourhood as \$5 and over \$25, or *five hundred per cent* profit. Such figures could not of course be taken to represent probabilities as regards estates in the interior, or even near the sea where transit facilities are less available. But they may serve to indicate to our Ceylon friends the fact that "there is money" in judicious Borneo estate investments. We have an object lesson in Klang as regards too hurriedly considered enterprise, and it is not likely to be ignored by any sensible prospector. But given suitable soil and the existence of a fairly cheap labour supply, there is no reason why numerous coffee growing centres should not be established in the Territory.—*British North Borneo Herald*, July 16.

PLANTING AND PRODUCE.

THE "BOOM."—In financial circles the "boom" in new tea companies is attracting considerable attention, and pious wishes are expressed that tea company promoting will not be overdone. It is usually safe to be pessimistic and to be wisely critical about popular tendencies. So long, however, as there is a plethora of money and an absence of "gilt edged" securities except at prohibitive quotations the public will seek an outlet for their spare capital. Joint stock enterprise therefore is rampant, and we wish that one half of the projects now seeking capital offered as reasonable a prospect of remuneration to the investor as tea companies. We do not say that every new tea project offered to the public is likely to prove a source of profit. Investors must use their judgment in the selection and endeavour to gauge the position for themselves. The tea industry is a genuine British enterprise which was up to a year or two ago suffering neglect at the hands of the investor. It is now in a fair way to loom large in the financial world, and some of the promises made on its behalf may not pan out, but for all that the industry is in a healthy state, and there is no need

to drop teas over it yet. If the demand for tea falls off and the supply increases, it does not require a sage to tell us that the outlook will be less pleasant. All industries are subject to vicissitudes and the prophet will always find plenty of wilderness to cry in. There is at this stage no special occasion to decry tea, or to lament that wisdom has gone from us, because the public are making up for lost time by showing a disposition to rush in where they formerly feared to tread. There is a limit, however, to the development of tea enterprise unless new markets are opened up, and it is but natural that some of the proprietors in the older concerns should view with apprehension the increase of new ventures. Certainly the activity in the bringing out of new companies should lend aid to the work of finding an outlet for the increasing output of tea which will sooner or later result.

AN OLD STORY RE-TOLD.—It is historically useful to learn from the official "Statement exhibiting the Moral and Material Progress and Condition of India during the year 1894-95"—the year, that is, ending on March 31, 1895, that the tea exports were increased by Rs970,000 in value, and most of them came to the United Kingdom. It is noteworthy that while we took 93 per cent of our tea from China in 1865, and only 2 per cent from India, and not so much as 1 per cent from Ceylon, in 1895 we took 46 per cent from India 32 per cent from Ceylon, and only 16 per cent from China. The importations from China have steadily dwindled.—*H. and C. Mail*, July 31.

INDIA AND CEYLON TEAS.

From the well-known "T. A. C." we have received a profusely illustrated copy of the Sunday edition of the *New York Herald* containing the following parody in the shape of an appeal to buy India and Ceylon Teas:—

Portia:—The quality of those teas is not strained,
They are pure as gentle dew from heaven,
They are twice blest; both blessing him
who sells,
And her who buys;
Bring bliss to her who pours and him who
quaffs,
They're purest of the pure.

The advertisement is accompanied by an illustration of *Portia* in gown and trencher sipping the fragrant beverage.

BURNSIDE TEA COMPANY OF CEYLON, LIMITED.

The mail has brought us a copy of the prospectus of this Company which has just been formed with a capital of £50,000, in 5,000 shares of £10 each:—

Issue of 1,400 Shares of £10 each—£14,000; and 5 per cent Debentures—£7,000:—£21,000.

Besides the above-mentioned amounts, 600 fully-paid Shares will be issued to the Vendors of Burnside and Midlothian Estates on account of purchase-money. The total issue at present, therefore, will be 2,000 Shares out of 5,000, and £7,000 Debentures.

It is not intended to call up more than £5 per Share. The remaining £5 per Share, total £7,000, will be specifically charged to secure the Debentures, the amount of which is limited not to exceed the uncalled Capital of the Company for the time being, and which will be further secured by a floating charge upon the other property of the Company. The Debentures carry Interest at 5 per cent. per annum, and are payable on 31st December, 1901.

Subscriptions for the £7,000 Debentures are payable:—10 per cent. on Application and the balance on Allotment.

They will be issued for sums of £50 or multiples of £50 each. The Interest upon the Debentures will commence from the date of Allotment, and the first payment will be due on the 1st of January, 1897.

DIRECTORS.—George William Paine, Cotswold Lodge, Upper Norwood (Chairman). Sir George Augustus Pilkington, Belle Vue, Southport. Robert Porter (Midlothian Estate, Ceylon), 37 Chalmers Street, Edinburgh. George Gray Anderson (Lyal, Anderson & Co.), 16 Philpot Lane, London, E.C.

BANKERS.—The National Bank of India, Limited, 47 Threadneedle Street, E.C.

SOLICITORS.—Murray, Hutchins, Stirling & Murray, 11 Birchin Lane, E.C.

AUDITORS.—Cape & Dalgleish, 8 Old Jewry, E.C.

CEYLON AGENTS.—Whittall & Co., Colombo.

SECRETARIES AND OFFICE.—Lyal, Anderson & Co., 16 Philpot Lane, E.C.

This Company has been formed primarily to purchase the following Estates:—

Burnside, situated in the District of Rangalla, Ceylon, from Messrs. Robert and George Porter and the Rev. A. R. Cavalier.

Heeloya also situated in Rangalla District, from Messrs. Matheson & Co.

Midlothian, situated in the District of Maskeliya, from Mr. Robert Porter.

Burnside and Heeloya Estates have been secured at prices approved by Mr. Joseph Fraser, of the Pitakande Group, and Midlothian Estate has been purchased at the figure placed upon it by the Vendor, Mr. R. Porter.

The following statement is based upon information received from the Vendors:—

Burnside Estate consists of 178 acres in all, and the elevation is 4,000 to 4 500 feet. According to the Ceylon Directory it contains:—

100 acres Tea in full bearing.
24 „ young Tea.
54 „ Forest.

178 acres.

There is a permanent Factory with a Water Wheel and sufficient supply of water, and a Simplex Roller and Sirocco Drier.

There is a small Bungalow with several sets of lines. A new permanent set has just been built.

Heeloya Estate.—The acreage is as follows:—

380 acres Tea in full bearing.
10 „ Planted in Timber.
30 „ Grass.
40 „ Waste Land, &c.

460 acres.

The Factory is very complete, with two Rollers, two Driers, Tea Sifters, &c., and there is a Water Wheel with abundant Water-power.

The yield of Tea on Heeloya is not so satisfactory as it might be, but the soil is good; the bushes taken as a whole are well grown, and in Mr. Fraser's opinion the Tea would respond to cultivation as well as it has done on the Pitakande Group, and it is the Directors' intention to follow the system so satisfactorily adopted by Mr. Fraser on the Estates named.

Midlothian Estate lies between the well-known Ormidale and Mocha Estates, at an elevation of about 4,500 feet.

It is about two miles from the Cart Road, and can be easily manured.

The acreage is:—

170 acres Tea in bearing.
40 „ „ 3 years old (coming into bearing.)
30 „ „ 2 years old.

240
Say 4 „ Planted in Timber.

244 acres.

There is at present no plau of the Estate, and these acreages are therefore approximate.

The young tea is fine Jât from Mount Vernon and Brunswick seed chiefly, but some of the old tea is not very good Jât, and the worst bushes are being replaced with fine Jât plants.

There is a permanent Factory with a 30-ft. Iron Water Wheel, 3 Rollers, a Double Desiccator, a Tea

Sifter, and a Roll Breaker and Sifter, and the accommodation and Machinery are fit to turn out 100,000 lb. of made tea per annum.

The Bungalow and several sets of Lines are permanent.

Crop.—The estimates for the current year are:—

Burnside .. 36,000 lb. made tea.
Heeloya .. 80,000 " " "
and 80 maunds of teaseed.

Midlothian .. 60,000 " " "

The Estates will be taken over as from 1st July, 1896, and the prices agreed upon for the properties are:—

Burnside	£2,000
Heeloya	5,250
Midlothian	10,000

£17,250

The Vendors of Heeloya are to be paid in cash, but those of Burnside and Midlothian accept payment half in fully-paid Shares of the Company and half in cash; and Mr. R. Porter, the Vendor of Midlothian, guarantees a return on that Estate for the first 18 months at the rate of 10 per cent per annum.

THE KINTYRE TEA ESTATES COMPANY.

DIRECTORS.—G. A. Talbot, Esq., 21, Mincing Lane, E.C. (Director Ceylon Tea Plantation Company, Limited); A. A. Baumann, Esq., 109, Queen's Gate, S.W. (Chairman, Consolidated Trnst, Limited, and Oceana Minerals Company); William Nevett, Esq. (Messrs. Nevett, Oswald & Co., 130, Fenchurch Street, E.C.).

SECRETARIES AND AGENTS.—Messrs. Nevett, Oswald & Co., London; Messrs. George Steuart & Co., Colombo.
VISITING AGENT IN CEYLON.—E. S. Grigson.

PROSPECTUS.

This Company has been formed to acquire as going concerns, three Tea Estates, situate in Ceylon, and known as the Kintyre Estate, the Eltofts Estate, and the Ayr Estate.

The three estates will be acquired by the Company as going concerns, as and from the 1st day of July, 1896, and will include all live and dead stock thereon as of that date.

It will be seen by reference to the enclosed reports that the crop for the current year is estimated at 400,000 lb. of made tea, showing a probable surplus on the season's operations of £5,800 sterling.

After providing therefore for interest on the Preference Shares and Directors' fees the balance should be sufficient for a handsome return on the ordinary shares and in view of the fact that there is another 90 acres of young tea coming into bearing it may be hoped that the profits of the Company will improve.

Mr. Grigson considers that the Kintyre and Eltofts Estates rank among the best estates in Ceylon, as being producers of fine quality teas; he reports that the Ayr Estate is a first-class low country property.

The terms upon which the Company acquires the three tea estates from the vendors, are incorporated in three contracts, bearing date respectively the day of .., 1896, one made between Horace Drummond Deane of the one part, and this Company of the other part, another made between John Geoffrey Fort of the one part, and this Company of the other part, and the other made between Emily Isabella Gibson of the one part, and this Company of the other part. These contracts provide for the purchase price being £62,000, payable £2,000 in Preference Shares, £22,000 in Ordinary Shares, and the balance of £38,000 in cash.

After payment of purchase money this issue will provide £3,000 available as Working Capital, and for further purchase of land as opportunity offers.

The Preference Shares will be entitled to a Cumulative Dividend of five per cent per annum, which will take priority, both as regards Dividend and Capital, over the Ordinary Shares.

It has been arranged that Messrs. Nevett, Oswald & Co., shall act as the London agents of the Company, receiving the usual mercantile commission of

2½ per cent on sales, and which commission covers office room in London, and the necessary clerical staff to do the work of the Company in England. The agents in Ceylon will be Messrs. George Steuart & Co.

No promotion money has been or will be paid.

There are numerous Trade Contracts in existence, and the subscribers will be held to have notice of such contracts, and to have agreed with the Company as Trustee for the Directors, and other persons liable, to waive any claims against them for not more fully complying with the requirements of Section 38 of the Companies Act, 1862.] 3252 3182

NOTES FROM OUR LONDON LETTER.

LONDON, July 13.

We had hoped that for some time at least there would be an interval of rest from fresh application to the public on behalf of

NEW TEA COMPANIES.

There is a very general feeling here that the thing is being overdone. Not only every week, but nearly every day, the daily and other papers contain advertisements of fresh companies prepared either for India, Ceylon or for both countries combined. The *Saturday Review* and several other leading papers have been of late giving expression to the tired feeling—one might almost say the "bored" feeling—with which these oft-repeated advertisements are regarded. There is a very generally expressed opinion that ere very long these applications for public subscription will fall very flat on the market, and that the fact will have an injurious effect upon the public confidence in the future of the tea enterprise. And the conclusion will certainly be drawn that there must be something hollow in it when such a large proportion of private proprietors are hastening to disburden themselves of their holdings. But apparently the end is not yet. We have just received the prospectus of

"THE BURNSIDE TEA COMPANY OF CEYLON," the subscription lists for which were to close yesterday. Of this prospectus a copy is sent you with this. You will see that it proposes a capital of £50,000, of which £21,000 is to be first issued in ordinary shares and debentures, the interest payable on the last being experimentally reduced to five per cent. The ruling rate of these with other tea companies has been six per cent, and even that rate has not proved in all cases to be sufficiently attractive. The board of direction embraces names that will be well-known to you in Ceylon, Messrs. Whittall & Co. being the Ceylon agents, and Messrs. Lyall, Anderson & Co. the secretaries. The estates to be acquired are "Burnside" in Rangala, "Heeloya" in the same district, and "Midlothian" in Maskeliya. £2,000 is to be paid for the first of these, £5,250 for the second, and £10,000 for the third. It yet remains to be seen if the Burnside Company will be the first to illustrate the feeling referred to above that these tea companies are being overdone. We are by no means confident that it would not be better for Ceylon in the long run if some check were experienced in the floating of these innumerable tea companies.

Recent letters of this series have mentioned the dispute as to the title of

THE INDIA AND CEYLON TEA COMPANY.

The following letter addressed to the *Times* explains the nature of the error committed with respect to this. We do not quite understand, however, how a title could be provisionally

accepted for the registration of a company. If it be legal to do this, there must manifestly be some degree of uncertainty as to the permanence of the name of any of the many companies that are daily floated. Anyway it seems a very extraordinary circumstance that a name should in this case have been selected which was manifestly open to the objections raised by the older company.

INDIA AND CEYLON TEA COMPANY (LIMITED.)
TO THE EDITOR OF THE TIMES.

Sir,—The above name was selected by my company as indicating the position of the company's properties, and was provisionally accepted by the Registrar of Joint Stock Companies at Somerset-house. As soon as it was known that objection was taken to the name on behalf of the East India and Ceylon Tea Company (Limited), we instructed our solicitors to arrange for an alteration of the name, and, with the approval of the Registrar, we have now altered the original name to—

Empire of India and Ceylon Tea Company (Limited)

Yours faithfully,

H. F. TURNER, Secretary, Empire of
India and Ceylon Tea Company (Limited), 60, Grace
church-street, London, E.C.

July 24.

“HIGH-CLASS TEAS.”

The following letter, addressed to our “senior” at home, will be read with much interest by all concerned in the prosperity of our tea enterprise:—

Analytical Laboratory, 79 Mark Lane,
London, E.C., July 29th, 1896.

I was very much pleased with your interesting editorial on High-class Tea and think the practical remarks which it contained should be highly appreciated by planters, as well as by all holders of shares in tea companies.

I fully appreciate the kind reference to the numerous letters which, since my first official visit in 1877, I have contributed to the pages of the *Ceylon Observer*.

It is a satisfaction to myself to see that my suggestions respecting the importance of chemical investigation into the various operations involved in the manufacture of tea, are at last authoritatively recognised.

If the various processes which the leaf undergoes from the time of picking to the time of packing are to be carefully and scientifically investigated, the inquiry must be *locally* carried on at the tea factory.

No great expense need be incurred: a junior assistant well qualified in general Organic Chemistry should be attached to each factory, and a careful inquiry instituted into the original composition of the fresh leaf as received from the pickers, and subsequent analyses should be made of the leaf during the various stages of manufacture.

The making of good tea is no doubt an art, but the various processes through which the leaf passes are controlled by chemical principles, and it is most important to ascertain on the spot to what extent the several processes may be varied with advantage.

Of course soil, season, and elevation will materially affect the general character and quality of the tea, in the same way that wine varies according to the locality and season.

It is, however, most important that the manufacture should be aided by chemical knowledge, and the future success in manufacture will doubtless largely depend upon the ability and practical skill with which chemical knowledge is applied.

As regards manuring I think that Dr. Voeleker, in his remarks following Mr. Christison's lecture,

was misinformed in stating that “there appeared to be an absence of knowledge upon points of cultivation, for example, as to what manure should be used and what should be avoided in order to produce the best tea.”

I believe *experienced* planters do know something definite about manuring tea by this time.

At all events I have letters by me giving very satisfactory reports of certain manures of definite composition which have been used on soils of known composition, with such favourable results that fresh consignments have been sent out at regular periods.

You are aware what a number of samples of soil from Ceylon estates were submitted to me for analysis during my official visit in 1877, and since then numerous other samples have been sent year by year.

Having carefully analysed the soil, and with a knowledge of the requirements of tea derived from numerous analyses, it is *possible* to compound a manure that shall under favourable seasons yield a satisfactory and economical result.

Planters are in this respect already availing themselves of the aid that Chemistry can afford in the preparation of fertilisers suitable for tea, and will doubtless do so more fully in the future.
—Yours faithfully, JOHN HUGHES.

CITRONELLA GRASS CULTIVATION.

Since the late boom in the price of citronella oil the Sinhalese in the Galle District have gone in extensively for the cultivation of this grass. Plantations are springing up daily in Gangebodde Pattu, Akmimane and Talpe Pattu. The area under cultivation last year in Galle was according to Mr. Elliott's Administration Report about 1,500 acres, which will no doubt be materially increased by the operations of the current year.—*Cor.*

COFFEE IN COSTA RICA.

COSTA RICA has long been noted as an important coffee-growing country. In our latest sunning-up of the Coffee Production of the World, Costa Rica is put down for a total export of 325,000 cwt., and the crop has ranged between 300,000 and 400,000 cwt. for some time. It is evident that there is room in this State, as in other Central and South American States, for a large expansion of the area under coffee, but two, if not three, factors operate in delaying this process:—(1) the limited and uncertain labour supply, (2) the difficulties and costliness of transport, and (3) in some cases the want of settled government. As regards the last it is of interest to learn from Mr. J. L. Shand—who has been over to report on Costa Rica coffee lands—that there is no prospect of trouble in the State under review; while he considers the two other obstacles may also be overcome in respect of the large enterprise which has been the subject of his inspection and report. In the first place it is worth noting some respects in which Costa Rica and the Ceylon hill-country may be compared. They do not differ much in latitude, both on the north side of the Equator—Ceylon about seven and Costa Rica ten degrees north. The hilly country may be said to lie between two seas or oceans, and rises in both cases to 7,000 or 8,000 feet at the highest; and although full and reliable meteorological returns are wanting for Costa Rica, the seasons seem wonderfully to agree in both countries: the dry season in both being from January or February till May, the rest of the year wet with occa-

sional dry intervals in August or September. In some parts the rainfall, must be more abundant in the far West State, for Mr. Shand speaks of one extensive forest-covered plain in the Concession he went to report on, which he compares to the Durbará Valley—a thousand feet above sea level—but with 150 inches of rainfall. And this brings us to the one great factor on which the two countries differ: the far richer soil and consequently bigger forest, larger and stronger coffee bushes or trees and immensely superior coffee crops per acre, gathered in Costa Rica. On this point there can be no mistake; all evidence goes to show such returns up to a ton or two tons of coffee per acre (from limited areas) as fully justifies an estimate of 15 cwt. per acre average over no less than 1,500 acres, which it is proposed to open and plant on the Concession Mr. Shand has inspected. For ourselves, who have never seen Costa Rica—and with the question of sufficient labour to be considered—we should have been ready to put the estimate down at 10 to 12 cwt.; but the return, as estimated, shows so large a margin of profit—the estimates being by mercantile men who have another independent report besides Mr. Shand's to guide them—that, even if half were taken off, there would still be ample justification for going on. Then, as regards the mode of planting, cultivation, harvesting and especially of preparation, it is interesting to learn that Mr. Shand does not really think there is much to be taught the Costa Ricans. The Ceylon system of clean weeding is quite inapplicable. The soil is so rich as to bear any strain put on it. From 300 to 400 coffee trees per acre are enough to yield the crops spoken of: and to clear and help up the earth for a limited space round each tree seem quite enough. In preparing coffee, especially, the people with the aid of "Gordon Pulpers" chiefly—the late John Gordon at one time had a factory in Kandy,—extensive stores and barbecues (all called "beneficios") excel, Costa Rican coffee selling up to 107s. per cwt. The great difficulty is in the "harvesting"—since, owing to the scarcity of labour, there is only, as a rule, one "plucking" when ripe and unripe cherries are all pulled off together, so making the outcome often very unequal. In this direction there is room for reform if only the needful number of "hands" can be got. It is surprising to learn that the native Indians do no work on the plantations, only the Costa Ricans who pride themselves on being pure Spaniards; and the President and his Government are very anxious to have more Europeans—poor Spaniards or Italians—introduced and settled in the country, to develop coffee lands while supplied with huts or cottages and gardens for their own use.

So far, the part of the country chiefly planted with coffee has been that called "The Interior" surrounding the capital, San José, and alongside the railway. In many places such gardens or fields have been used up so far as coffee is concerned; and then the trees are pulled up, grass or jungle encouraged for a few years, and then sometimes coffee planted again. But Mr. Shand found also a good deal of the old coffee country yielding such poor results, that it is thought very likely the people working on it would be glad to be transferred to the Sarapiquí Concession, where they could earn more and be better off.

Pending the publication of the reports referred to, and the Prospectus of the Sarapiquí Estates Company—which is likely to be supported by several Ceylon men in London—we need not

enter more into detail. The Company is to have a capital of £120,000 and deals altogether with a Concession exceeding 22,000 acres, most of it magnificent forest-land for coffee, and running from 1,000 to 7,000 feet above sea-level. Cacao, sugar, bananas and tobacco are spoken of as subsidiary products; but it is possible subsidiary separate companies may be formed for these. In respect of saving of labour, "spouting" (or "flumes" as locally known) is likely to be largely used in Sarapiquí; and no less important may be the utilisation of river carriage to bring the crops to the sea, boats already plying for a considerable distance.

We have said enough, however, to show that the Sarapiquí Company, established in London, to develop coffee in Costa Rica, is likely to be an important, and we trust, for the sake of enterprising countrymen taking it up, a very successful undertaking. Ceylon can have no jealousy in respect of "coffee-growing"; while there is no chance of "tea" being entered on (profitably) in any part of the Americas.

THE NEW DUTY ON COCOA-BUTTER.

On Thursday last the House of Commons, after a short debate, but without a division, adopted the following Government motion:—"That the duty of Customs now payable on cocoa or chocolate, ground, prepared, or in any way manufactured, under the provisions of the Act 42 and 43 Vict., c. 21, s. 3, shall be payable on that product of the cocoa-bean which is generally known as cocoa-butter." As the House of Lords no longer interferes with questions of Ways and Means, the adopted motion has now the force of law, and accordingly a duty of 2d per lb., equal to about 15 per cent *ad valorem*, is now levied on cocoa-butter, as it has long been on imported ground, prepared or manufactured cocoa, while the raw cocoa-beans used by British cocoa manufacturers pay, as heretofore, a duty of 1d per lb.

At first sight the contention that cocoa-butter, which is the fatty oil extracted from the cocoa-bean in the preparation of the commercial product known as pure cocoa, and therefore essentially a product falling under the denomination of "cocoa, in any way manufactured," should pay the same duty as foreign prepared cocoa appears entirely reasonable. That was the view of the Chancellor of the Exchequer and of the House of Commons. It would appear, in fact, that cocoa-butter has hitherto been admitted duty free by a pure misapprehension on the part of the Customs officers, who have looked upon it as a vegetable fat or wax. In all probability its duty-free importation might have continued to the Greek Kalends but for the action of the German Government who have recently extended to the cocoa manufacturers of the Fatherland a drawback bounty on exported cocoa-butter equal to that which they have already been in the habit of allowing those gentlemen upon exported cocoa. This step has called forth remonstrances on the part of certain British cocoa manufacturers, who contend that the German bounty-fed cocoa butter competes unfairly on the British market with their own product, and the Chancellor of the Exchequer's motion is the result of the British makers' complaint.

If this were the whole of the matter there would scarcely be room for doubt that the action of the Government was justified and no one, we fancy, would have objected to it. But the question is much more complicated, and the British cocoa manufacturers, it seems, are not quite unanimous in welcoming the duty. The great firm of Fry & Sons of Bristol, for instance, are understood to be hostile to it, and their opposition was voiced in the House of Commons by Mr. J. Hudson Kearley, the Liberal member of Devonport, who, as a partner in the wholesale tea and coffee firm of Kearley & Touge, may be expected to know something about cocoa. Another Liberal, Mr. Thos. Lough, the member for West

Islington, who happens to be chairman of the Tower Tea Company, also took part in the debate, though on which side is not clear from his remarks. We have been at some pains this week to collect the views of the leading British and foreign cocoa manufacturers on the matter, and find, as we expected that the first-named with the single exception of Messrs. Fry, are strongly in favour of the duty. Not all of our informants care for the publication of their names in connection with the expression of their opinion, but their arguments for and against the duty may be summed up as follows:—

The two principal cocoa-manufacturing countries are England and Holland. Germany, in spite of the bounty-allowance to which we have referred, takes quite a back seat. Now there are, both in England and in Holland, manufacturers whose output of cocoa-butter as a by-product in the manufacture of "pure cocoa" is larger than their requirements of cocoa-butter as an ingredient in confectionary (which is the purpose to which the article is mainly put, the pharmaceutical use suppositories and the like being comparatively small), and who are therefore compelled to throw their excess on the market. This is mainly done by public auctions, held once a month in London and Amsterdam. About 400 tons of Cadbury's cocoa-butter alone are disposed of in this way in London every year, and a rather larger quantity of Van Houten's cocoa butter is similarly sold at Amsterdam. The Chancellor of the Exchequer gave certain figures showing the percentage proportion of cocoa-powder, cocoa-butter, and manufacturing waste yielded by the roasted beans. His figures are considerably at variance with those supplied us by Messrs. C. Barry & Co. of Finsbury, and by Messrs. C. J. van Houten & Zoon, the leading Dutch cocoa manufacturers, and we hope, for the sake of the British cocoa makers, that the Chancellor was misinformed, and that more cocoa-powder can be made out of a given quantity of beans than he seems to think. Here are the figures:—

	Cocoa-powder Per cent.	Cocoa-butter Per cent.	Waste Per cent.	Beans
Sir M. Hicks-Beach	44·5	32·5	23	= 100
Messrs. van Houten	55	23	22	= 100
„ C. Barry & Co.	34	50	16	= 100

Now, raw cocoa-beans are admitted into Holland duty free, while the British manufacturer has to pay a duty of 1d per lb., or say, about 18 per cent. *ad valorem* on the raw beans, which is equal to a duty of 1½d per lb. on the roasted article. To that extent, therefore, the Britisher is already initially handicapped in competing with the Hollander in neutral markets, and it therefore, speaks volumes for the excellence of Messrs. Cadbury's manufacturing arrangements that they should still be able largely to increase their export trade year by year, as they assure us they do. In addition to this initial vantage ground, the Hollander has hitherto been able to send his cocoa-butter into the British market duty free, while the British maker (who is allowed no drawback or bounty) really pays from one-third to one-fourth of the whole duty on that percentage of cocoa-butter contained in the bean. In other words if, say Messrs. Cadbury Brothers were to establish a branch of their cocoa works in Holland, they would, under the old arrangement, have been able to import that portion of their cocoa butter made across the Channel into Britain duty free, while on that made in Birmingham they would have paid an equivalent of about 1½d per lb. in duty.

The chief argument of those who oppose the duty is that cocoa-butter is employed in very large quantities in the preparation of confectionery, and that it is therefore to the interest of that industry to obtain it as cheaply as possible. The first effect of the new duty will be to diminish, if not to stop, the importation of foreign cocoa-butter in this country; the next, to increase the price of the English product sold by such firms as Cadbury Brothers, Epps & Co., Taylor Brothers, and others. The total quantity of cocoa-butter now produced in England is believed to be barely sufficient to meet the requirements; but the output is probably increased somewhat faster than the demand. The new duty will, it is argued,

come out of the pockets of the British users of cocoa-butter, who will thus be handicapped in their competition with those British confectionery manufacturers who themselves produce cocoa butter. It is further argued that foreign "pure cocoa" or "cocoa-powder" already pays 2d per lb. duty, against 1d per lb. paid by the British cocoa maker for his beans, and that this difference more than counterbalances any advantage the foreigner may have reaped from the free importation of cocoa butter, inasmuch as the English maker only pays 9s 4d duty per cwt of beans, while the foreigner, at the rate of 61½ lb. of cocoa powder yielded by 1 cwt. of beans, pays 10s 3d per cwt. and that therefore, so long as the foreign manufacturer does not send more than 23 lb. of cocoa butter to every 45 lb. of cocoa powder, the Britisher has nothing to complain of. But the advocates of the duty contend that only about 20 per cent of the cocoa powder made in Holland is imported into England, while the proportion of Dutch cocoa-butter which has been sent hither is much greater. This the foreign makers deny. They say that the proportion of foreign cocoa butter to cocoa powder imported into England is much less than 45:100, and they maintain that while benefiting only at most half-a-dozen British cocoa manufacturers, the new duty will not interfere with their trade to any large extent.—*Chemist and Druggist*, July 11.

COFFEE IN BRITISH CENTRAL AFRICA.

"It never rains but it pours" may be the thought of our readers when, after hearing of a great coffee planting undertaking proposed for Costa Rica, they are asked to consider what is being done in British Central Africa. But in reality, the Nyassaland State—under the wise, energetic administration of Sir Herbert Johnston—has a nearer and dearer interest for Ceylon planters and merchants. First of all, it is British territory under a permanently peaceful and stable as well as liberal Government; and seeing how lamentably "coffee" growing has decayed within the British Empire—as we made plain in our recent letter to the *London Times*, which has attracted much attention in "the City" and indeed all over the planting world—it is of peculiar interest to find one new Dependency with a fair prospect of redeeming the balance. For, if only the transport question be solved, by a railway being made from the coast to near the coffee region within a reasonable time as Sir Herbert Johnston remarked, we can see no reason why the history of Nyassaland, or the Shiré Highlands, should not in the next twenty to thirty years, parallel that of the Kandyan country of Ceylon in the "forties," "fifties" and "sixties" of this century. Already a fair beginning has been made: there are several scores of European coffee planters (some of them ex-Ceylon men) at work; the area planted must equal 2,000 acres chiefly young, and the year's export of the fragrant bean is already over 6,000 cwt. There is a vast extent of suitable forest-land untouched, purchaseable at public auction at from 2s 6d to 5s upset price. Of the labour supply being sufficient and at wonderfully cheap rates, Sir Herbert Johnston has no fear, and the climate—though there is always a certain amount of risk in pioneering—is really no such bugbear as many parts of the Ceylon hill-country were fifty and forty years ago when fever and dysentery so often laid low Dumbara and Matala and Yakkessa planters. Here there is a field for "the younger son" trained in a good school as a hard-working, self-reliant planter with the proper amount of patience and tact to work native labour, kindly and considerately but firmly; and with the requisite amount of backing in "capital"—say from £1,000, or better

£2,000 upwards. Already, as we have hinted, Ceylon has a direct interest in Nyassaland separated only by the Indian Ocean—in the fact that the first “Nyassaland Coffee Estates Co.” was founded and supported in Colombo, and is worked by Ceylon men as well as capital. Moreover, we have given surveyors, draftsmen, botanists as well as planters to the new Dependency; only given the Railway, we may well expect to see a veritable El Dorado for coffee speedily developed within easy reach of the coast and of the European markets. No “leaf” or other disease has as yet appeared in Nyassaland. The greatest care has been taken about the seed, and Sir Herbert Johnston has a theory that the fungus is not likely to penetrate so far into the interior. Be that as it may, we are clear that Lord Salisbury may well—with the facts before him—give his best support to his able lieutenant, the High Commissioner, who is so bent on making the road easy to his rich, healthful, highland country. For our part, we think it a great pity, from a planting and commercial as well as social point of view, that the railway from the coast into British Central Africa is not to take precedence of that very long, costly and uncertain line through “British East Africa” to Uganda. But as a Company has been formed for the former, let us hope that no time will be lost in starting and constructing this indispensable line, which is certain to prove more and more useful, and profitable, as years roll on.

THE ACME PACKAGE CO., LTD.

Report by the Directors to the second ordinary general meeting of the Acme Package Company, Limited, to be held within the registered office of the Company, No. 82, West Regent Street, Glasgow, on Tuesday, the 28th day of July, 1896, twelve o'clock, noon. The directors beg to submit herewith the balance sheet of the Company's affairs as at 30th June, 1896.

As will be seen from the balance sheet, the profit, together with £107 13s. 11d. brought forward from last year, is £3,533 10s. 9d. Out of this sum the directors propose to pay a dividend of 12½ per cent. on the capital of the Company as called up, including the interim dividend paid in April—carrying forward a balance to meet bonus to Manager and Directors' fees.

The Directors are pleased to state that the prospects of the Company are exceedingly gratifying, and, to cope with the increased output, they have acquired the Glasgow Steel Works at Polmadie on favourable terms.

MARKET FOR TEA SHARES.

Thursday Evening, July 30.

A quiet tone has prevailed during the past week, the tendency being to curtail commitments for the present, in view of the near approach of holiday time. Attention has also been rather diverted to dealings in the new issues, announced in our last week's report. There have been some exceptions, notably in the case of Lungla Ordinary and Chargola Ordinary, which have touched 12½ up and part respectively.

Mincing Lane has again been characterised by a firm tone. There are indications of the season being one more for quality than quantity of produce.

FRESH ISSUES.

Consolidated Tea and Lands Co.—This company has made formal application to the Stock Exchange for an official quotation and a special settlement for all three classes of its shares. Business has been rather more curtailed, but the Second Pref. are still asked for at 2¼ premium and the Ordinary at 1½ premium. The Firsts are “a shade” easier at about 1¾ premium.

Empire of India and Ceylon.—This is the name of the new Company whose flotation we announced last week as the India and Ceylon

Company. The name had to be altered so as to avoid clashing with the existing company called the East India and Ceylon Company. Quotations for the shares are:—

Preference .. 5 7/8 prem.
Ordinary .. 1 1/2 1 3/4 prem.

Associated Tea Estates of Ceylon and British Ceylon Tea Company.—We do not hear of many dealings in the shares of these two recent issues.

REPORTS.

Bor'uli and Dapoota Companies now issue their reports, which have a special interest owing to the fact of these two properties now forming the *pièce de résistance* of the Empire of India and Ceylon Company's Estates.

CEYLON SHARES.

C. T. P. Co. Prefs. have again been taken at 18. Nothing in the ordinary.

Ceylon and Oriental £3-paid shares are wanted at 3¾, but ask 3 7/8 up to £4.

Dimbula Valley Prefs. have changed hands first at 6 1/16, and then successively at 6 1/8 and 6 1/4, while the Ordinary have been done at 5 1/2 up to 5 1/2.

Lanka Plant. Ordinary have been taken at £7, and the Prefs. at 10 1/2 or thereabouts.

Standard Tea Co. £6 changed hands early ending week at 15 1/2, but are now wanted without finding any more shares.—*H. and C. Ma l*, July 31.

MEDICINAL VALUE OF SUGAR.

The grocer who has a good candy trade, but who is told several times a day by anxious parents that children would be healthy if there was no confectionery on this earth, might find it to his advantage to cut out a part of this article and paste it on the side of the “candy case.” The language as well as the ideas are borrowed from *The Helper*, which takes the ground that “the general public has a wrong impression as to the actual advantages of sugar in the preservation of the human frame. Harm may be done by eating sugar in excess, just as the excess of anything else is pernicious to health. In the stomach it is in part changed to lactic acid; and the latter acts upon calcic phosphate and permits their assimilation. How frequently a mild case of indigestion could be relieved, if not cured, by an occasional drink of sugar and water.

“Do our readers realize the importance of a few bonbons after a healthy meal? The fatty substances that might otherwise overload the stomach then become harmless. Those who enjoy coffee and tea at night, yet hesitate drinking these beverages, can partake of the same in moderation without fear of sleepless night, by the liberal use of sugar. The recent experiments previously mentioned in these pages, showing that sugar increases the muscular power possible to develop during a given period, are only a scientific determination of what is already known. One need only visit a sugar cane plantation in the West Indies to appreciate that the “nigger” can develop more work in a given time, if allowed to eat the cane freely than during any other period of the year. Sugar has its advantages for stout people, a fact known to both of us, but the advantage to be derived from a moderate introduction of sugar as a means of retaining health is too frequently overlooked.”—*Interstate Grocer*.

HORNSEY TEA ESTATES CO., LTD.

The share capital of this Company is £50,000 divided into 4,000 cumulative six per cent preference shares of £5 each and 6,000 ordinary shares of £5 each. Debentures £20,000 in 400 five per cent mortgage debentures of £50 each. First issue £30,000 1,600 cumulative 6 per cent preference shares of £5 each, 2,400 ordinary shares of £5 each, and 200 5 per cent mortgage debentures of £50 each. The Company is acquiring Hornsey and Abercaincy estates in Dikoya, and the price for both estates is £30,000. The London agents are Messrs. L. Reiss Bros., and the London solicitors Messrs. Harwood & Stephenson, and Messrs. De Saram act as legal advisers in Ceylon.

THE "THIRTY COMMITTEE."

Minutes of proceedings of a meeting of the "Thirty Committee" held at Colombo on Saturday, the 15th August 1896, at 12 o'clock noon.

Present:—Messrs. A. W. S. Sackville, Chairman; A. Philip, Secretary; F. G. A. Lane, R. A. Galton, Gordon Fraser, E. Rosling, F. M. Mackwood, John H. Starey, H. V. Mascfield, R. S. Duff Tytler, J. N. Campbell, C. W. Horsfall, H. J. Vollar and F. F. Street, visitor.

The notice calling the meeting was read.

The minutes of proceedings of a meeting of the Committee held at Kandy on Saturday, the 11th July 1896, were submitted for confirmation. Resolved:—"That they be and they are hereby confirmed."

Submitted letters, &c., from the Manager, National Bank of India, Limited.

Submitted letters from the Treasurer of the Colony.

Read letters from the Manager, National Bank of India, Limited, with statement showing the letters of credit issued by the Bank in favour of Mr. Wm. Mackenzie, and the amounts drawn against these credits which have been debited to the Ceylon Tea (New Markets) Fund.

REPRESENTATIVE IN AMERICA.

Read letter from Government confirmatory of previous communication as to the Governor in Executive Council having been pleased, with the advice of the Executive Council, to sanction the expenditure of a second sum of £3,000 sterling in the United States of America in advertising Ceylon tea.

Read letter from Government acknowledging receipt of copy of minutes of proceedings of a meeting of the "Thirty Committee" held at Kandy on Saturday, the 13th June 1896, which were confirmed at a meeting held on the 11th July 1896.

Read letters from Mr. Mackenzie to Mr. Sackville dated London, 25th and 26th June, and New York, 11th July 1896.

Read letter from Mr. D. B. Wallace dated Chicago, June 6th, 1896. Resolved:—"That the matter be left in Mr. Mackenzie's hands."

Read letter from Mr. S. Elwood May dated New York City, 8th July 1896.

Read letters from Mr. Mackenzie to the Secretary dated London, 26th June 1896, and New York, 13th July 1896, the former asking that six sets of photographs illustrating tea garden, factory, plucking, manufacturing, new clearing, &c., &c., might be sent him.

The CHAIRMAN intimated that he had personally made a selection, and hoped that the photographer would have them ready for forwarding without further delay.

Submitted and laid on the table for the inspection of the Committee the Statements of Accounts as received from Mr. Mackenzie.

Submitted and laid on the table for the inspection of the Committee Abstract of the Ceylon Tea (New Markets) Fund as from 1st January to 30th June 1896.

GREEN TEAS FOR THE UNITED STATES OF AMERICA.

Considered Report of the sub-Committee of the "Thirty Committee" appointed to report on the question of the export of Green Teas to America.

Considered letter from Messrs. Whittall & Co., Agents and Secretaries of the Upper Maskeliya Estates Company, Limited, submitting copy of Resolutions passed on the subject. Resolved:—"That the following report of the Sub-Committee as amended be and the same is hereby adopted."

REPORT.

The Sub-Committee have the honour to submit the following scheme for the approbation of the "Thirty Committee":—That the "Thirty Committee" be recommended to offer encouragement to Producers and Shippers of Green Teas, and Oolongs to be consigned direct from Ceylon to the United States or Canada, by granting the value of presentable samples for distribution at destination of the shipment, quantity not exceeding 5 per cent of invoice of same; provided that the results of such shipments as receive assistance from the "Thirty Committee" be placed at the disposal either of the Ceylon Commissioner or the "Thirty Committee" and provided that the "Thirty Committee" restrict the outlay necessary for such a scheme to a sum not exceeding £1000 sterling in the first year out of the funds derivable from the Tea Cess. The Sub-Committee further recommends that the "Thirty Committee" be represented at the place of export by an Agent, who will be relied upon to draw and to pack the proposed samples affixing such label as may be approved, the cost being chargeable upon the Funds of the "Thirty Committee."

CEYLON TEA AT THE INTERNATIONAL EXHIBITION AT GENEVA.

Read letter from the Secretary, the Ceylon Association in London, stating that Messrs. J. Tetley & Co. in acknowledging receipt of £200 being the vote allowed them for the Geneva Exhibition, write that after a visit to Geneva they will furnish full particulars of what they are doing there to push Ceylon tea for the information of the Committee.

CEYLON TEA IN RUSSIA.

Read letter from Mr. Rogivue dated Moscow June 6/18, 1896, enclosing a list of the newspapers and illustrated periodicals in all of which he has had advertisements of Ceylon tea regularly inserted for the last six months as per his last accounts.

CEYLON TEA IN BELGIUM.

Read letter from Mr. E. R. Templer making an application for a grant of Ceylon tea, and of a sum of money to enable him to push and advertise pure Ceylon tea in Belgium and Holland.

Read letter from Mr. R. D. Ormsby commending Mr. Templer's application to favourable consideration. Resolved:—"That Mr. Templer's offer be accepted, and that a grant of 1,000 lb. of suitable Ceylon tea be made together with a sum of £25 sterling for advertising Ceylon tea in Belgium and Holland."

CEYLON TEA IN AUSTRIA AND HUNGARY.

Read letter from Cooper, Cooper & Co., Ltd., London, asking for a grant on behalf of two gentlemen who would use it solely to push pure Ceylon tea in Austria and Hungary. Resolved:—"That the letter be acknowledged, and that Messrs. Cooper, Cooper & Co., Limited, be informed that the matter will have consideration."

CEYLON TEA IN NORWAY.

Considered letter from Mr. C. Palliser. Resolved:—"That 250 lb. of suitable Ceylon tea, at from 50 to 60 cents per lb., duty paid, be granted in such quantities as may be desired by Mr. Palliser for free distribution, and that Mr. Palliser be requested to furnish particulars of the towns and districts in which the samples have been distributed."

The "Thirty Committee" then adjourned.

A. PHILIP,
Secretary to the "Thirty Committee."

ORIENTAL ESTATES COMPANY.

PROSPECTUS.

London, July 31.

At the meeting yesterday of the above Company, the report and accounts were received but not adopted. A general committee of five, viz., three representing the preference shareholders and two representing the ordinary shareholders, was appointed to draw up a scheme of reconstruction, in conjunction with the Directors, to be presented to the shareholders as soon as possible, access to all books and documents being provided for, and if found necessary the committee was authorised to appoint competent valuers to value the assets. The three gentlemen appointed to represent the preference shareholders are Mr. Claude Bishop, Managing Director of the Consolidated Trust Limited, Mr. McCaskie, Q.C., and Mr T. J. Lawrance, the two for the ordinary shareholders being Mr. Slaughter and Mr. Touch.

From the *Times* of the 1st inst. we take the following:—The tenth annual general meeting was held on Thursday at Winchester-house. Mr. Quintin Hogg, who presided, remarked that the year's working had been fairly favorable. A profit had been made both in Mauritius and Ceylon, while the cost of production had been lower in both places. At a recent meeting of preference shareholders a committee was appointed to consider the question of reducing the capital and to confer with the directors, and, if necessary, with the ordinary shareholders. The directors had had one meeting of the committee, who had met them in a very friendly spirit, and had proposed an alternative scheme. It had, however, been thought that it was only fair that the ordinary shareholders should have a voice in the matter, and it was therefore proposed that two ordinary shareholders should be appointed with three preference shareholders, so that both sides should be represented. The committee would then go fully into matters and report to another meeting which would be held as soon as possible. He did not intend to ask them at that meeting to adopt the report, as they would no doubt prefer to receive the committee's report first. He would therefore propose that the directors' report be received, but that its further consideration should be postponed until the shareholders had had the committee's report. The directors wanted to see the company's interests in Mauritius considerably reduced, and steps had been taken in that direction. They contemplated putting some land under coffee cultivation in the Malay Peninsula, but they would not do so if it were not the general wish of the proprietors. They thought, however, that it would be wise to add a further string to the company's bow. Sugar was a very speculative article, and tea depended very much on exchange, whereas coffee was much more profitable. Mr. A. W. Crichton seconded the motion. A discussion followed, at the close of which a committee was appointed, formed as had been proposed.

THE SOUTH TRAVANCORE TEA COMPANY, LIMITED.

Share Capital £50,000, in 5,000 Shares of £10 each.
 DIRECTORS.—T. C. Owen, Esq. (Messrs. Rowe, White & Co.), 16, Philpot Lane. A. V. Holland, Esq., 13, Highlands Gardens, St. Leonard's-on-Sea. Neill Graeme Campbell, Esq. (Messrs. Campbell Brothers & Co.), 36, Eastcheap, E.C. *H. M. Knight, Esq., Venture Estate, Travancore, Southern India. * Will join the Board after allotment.
 AGENTS.—Messrs. Rowe, White & Co., 16, Philpot Lane.

This Company has been formed for the purpose of taking over, as a going concern, the "Venture" group of estates in South Travancore, Southern India, comprising "Venture," "Arnichardi," and "Neddumpara," consisting of a total acreage of about 804 acres, of which about 500 acres are in Tea, averaging 5 years of age; about 125 acres in Liberian and Arabian coffee; about 6 acres in Nutmegs; about 100 acres in Virgin Forest; and a few acres in grass.

The estates are in a very efficient state of cultivation and lie at an average elevation of about 1,100 feet. The factory, which is well built and fitted with machinery worked by steam power, is within three miles of a Government road, to which it is connected by a good cart road. Fuel is abundant on the property. Tea can be manufactured and put f.o.b. at Tuticorin for 26 cents per lb., the equivalent for which, at 1s 2d, is 3½d. The total cost in London, after payment of all charges, is about 4½d per lb.

Judging by past results, the tea may be expected to realize an average of 7½d gross, after making allowance for lower markets than are current at present. The tea crop for the current year, the Vendor, Mr. H. M. Knight, estimates at 200,000 lb., and therefore, the net profit from tea alone should be about £2,500 per annum.

The coffee is mostly young and should give regular and substantial returns, which should increase as the trees mature. For this year, the Vendor estimates the profit will be £700. The tea is now in full bearing. The profits for 1884 and 1895, the last two completed financial years, average over £2,500 per annum. The Vendor estimates that the profits for the current year will largely exceed those of 1894 and 1895. The rainfall on the estates is about 100 inches, and is fairly distributed.

Arnichardi and Neddumpara are freehold, direct from the Government. Venture is held under a lease at a nominal quit-rent from the Government, and is renewable at the option of the Company.

No Debentures will be issued against the property except with the assent of a majority of two-thirds of the Preference Shareholders. The estates will be taken over as from July 1st.

The amount required to meet the yearly interest on the Preference Shares is £825. After making an ample allowance for London expenses, and basing the calculations on the average results of the last two years, there should remain sufficient to pay more than ten per cent. on the Ordinary Shares. In this calculation no account is taken of the fact that the coffee, being mostly young, should give much better results in the future than it has in the past. Mr. Knight has expressed his willingness to undertake the general management of the Company's estates in Travancore. The purchase price of the estates has been fixed at £26,000, payable as to £10,000 in 1,000 Ordinary Shares of £10 each, and £3,250 in 325 Preference Shares of £10 each, and the balance, viz., £12,750 in cash. The present issue of capital amounts to £27,500, which will allow a sufficient margin for working expenses.

THE ACME PACKAGE CO.

The *Glasgow Herald* of the 29th ult. says:—The Acme Package Company (Limited) have declared a dividend of 7½ per cent, which, with the interim dividend of 5 per cent, makes 12½ per cent for the year. A planter in forwarding the extract says:—I enclose a para to hand by today's mail which shows that the Acme tea chests must be more generally used than Ceylon planters are aware of. A company declaring a dividend 12½ per cent must be doing a good business, and in these days of scarcity of Momi chests, the Acme package might be worth more attention from Ceylon growers. Cannot you find out the opinion of the London buyers on these packages?

THE DICTIONARY OF ECONOMIC PRODUCTS OF INDIA.

This magnificent work, by Dr. George Watt, C.I.E., &c., and numerous contributors, was intended, when the first volume was issued in 1889, to consist of six volumes; but Vol. VI had to be expanded to four parts, the last of which was published in 1893; and now we have received from the Government of India an additional volume, containing an index to the work. This has been prepared by Mr. Edgar Thurston, Superintendent of the Government Museum, Madras; assisted by Mr. T. N. Mukerji, F.L.S., Assistant Curator, Indian Museum, Calcutta. The index is a polyglot one. First we have an English list, including classical or foreign names in familiar use. Next comes a list of Sanskrit, Arabic, and Persian names. Then comes a lengthy list of names in all the "Aryan" (or "Gaudian") dialects of India, including the transfrontier districts. Next we have lists in the languages or dialects of the hill-tribes, the Dravidians, the Mongolians, Burmese, Andamanese, and lastly "Cinghalese." (Why will Mr. Thurston adhere to this atrocity?) The spelling of the Sinhalese names is in many cases pretty correct; but in very many by no means so. For instance, we have such fearful and wonderful forms as *calukeale*, *corallia*, *dungazha* (!), *hamarago*, *kwahy-ya*, *kokaba-larz* (!), *kokubulurz* (!), *maha-erraminza*, *maha-maram* (!), *penquin* (!), and, to end up with, *ziniagaha*! Of course the compilers of the index have simply copied the forms given in the body of the work; but surely Dr. Watt might with very little trouble have obtained the correct spellings of the Sinhalese words. This "Cinghalese" list is a blot on an otherwise excellent work. The *Dictionary of Economic Products* is a perfect treasurehouse of useful information; and under the title of *The Agricultural Ledger* the Government of India continues from time to time to issue pamphlets furnishing information supplemental to that given in the *Dictionary*.

THE DOOMOO TEA COMPANY OF CEYLON LIMITED.

The first ordinary general meeting of the shareholders of this Company was held in the office of the Agents and Secretaries (Messrs. J. M. Robertson & Co.) today at noon. Mr. F. W. Bois presided, and present were Messrs. W. D. Gibbon, W. B. Kingsbury, E. John, C. Minto Gwatkin, Moir, Gordon Frazer, and J. B. Mason (Superintendent) and Gordon Bois (Secretary.)

THE REPORT.

The report of the Directors, submitted by the Chairman, was taken as read. It is in the following terms:—

The Directors have now the pleasure to submit their Report and Accounts for the year ending 30th June, 1896.

The quantity of Tea received from the two Estates was 150,692 lb. against 150,000 estimated, and the price realized for that sold locally was 50 ³/₅₀ cts per lb. The Tea shipped to London amounting to 35,660 lb. has been estimated to realize a sum which the Directors consider safe.

During the year about 120 acres of Coffee on Verellapatna have been planted up with Tea, and the acreages of the Estates now stand as follows:

Doomoo	..	160	acres	tea	5	years	old	and	upwards.
		30	"	"	4	"	"	"	"
		20	"	"	3	"	"	"	"
		3	"	planted	amongst	coffee			
		23	"	Timber					
		63	"	Grassland					

Verellapatna	180	acres	Tea	5	years	old	and	upwards
	180	"	"	4	"	"	"	"
				3	"	"	"	"
	35	"	"	2	"	"	"	"
	120	"	Tea	and	Coffee			
	10	"	Grass					
	213	"	Waste	and	Chena			
	688							

The result of the year's working, after writing off R5,941-23 for interest due to the vendors of the properties, show a profit of R26,751-49, and the Directors recommend that a dividend of 6% on the capital of the Company-R100,000-be paid absorbing R24,000 00

That a sum be transferred to depreciation account of .. R2,500 00

and that a balance be carried forward of R251 49

R26,751 49

It should be noticed that the profit shown is really the result for 9 months only, as the share capital was not finally called up until the end of Sept. 1895.

In accordance with the articles of association all the Directors retire, but being eligible offer themselves for re-election.

It will also be necessary to appoint an auditor for season 1896-97.—By order of the Board of Directors, J. M. ROBERTSON & Co., Agents and Secretaries. Colombo, 15th August, 1895.

The CHAIRMAN said he regretted that the accounts were not quite so good as they expected them to be, arising from the fact that the coffee crop had fallen short of the estimate—it was not much more than half—and this made a difference of 1½ per cent on the dividend. Then again interest on the purchase money made another 1½ per cent on the dividend, so that the two together would have made a nine per cent dividend for the year independent of the fact that the shareholders did not pay the value of their shares until the end of September, and, therefore, so far as they were concerned, the working was for nine months only, the dividend of 6 per cent being for that period. Shareholders would notice that there was a very large quantity of young tea. The tea which was higher up did not mature so quickly as that at a lower elevation, and the yield from the four-year-old tea was not much more than sufficient to pay expenses, but as it got older it would show a larger profit. In addition to that there was a large quantity of young tea which gave no yield at all. He did not know that he had anything further to say, but he himself considered that the future of the Company was satisfactory. The estimate for the present year which would be shortly before the directors (it had only just been received) showed a rather larger tea crop and a rather larger coffee crop than they had realized during the present year; but he thought the latter must be considered as very doubtful as coffee was evidently on its last legs in Madalsima. They must not depend on that in future, and the Company must be entirely a tea company. He should be glad to answer any questions that might be asked by shareholders.

MR. GORDON FRAZER:—What was the rate of interest paid to the vendors of the estates?

The CHAIRMAN:—Eight per cent.

MR. GORDON FRAZER asked, with reference to an item in the accounts, at what rate the company had taken over the stock of tea.

The CHAIRMAN replied, at a value of 48 cents. The average for the year was something like 50 cents. They had heard of a sale in the home market before the recent rise which fully bore out their valuation.

Mr. GORDON BOIS said the sale they had heard of was 4 cents per lb. over the rate they had taken.

Mr. GWATKIN asked for an explanation of the item "Rents collected in Colombo R300."

The CHAIRMAN said they collected in Colombo the rent of the post office on the estate. He then proposed the adoption of the report, a motion which was unanimously agreed to.

Mr. JOHN proposed and Mr. MOIR seconded:—"That a dividend of 6 per cent on the capital of the Company be paid."

The CHAIRMAN said they now had to appoint directors. According to the articles of association the three directors, Messrs. F. W. Bois, W. D. Gibbon, and W. B. Kingsbury, retired, but they were eligible and offered themselves for re-election.

Mr. MOIR said he had much pleasure in proposing that the retiring directors be re-elected for the present year.

Mr. GWATKIN seconded, and the motion was unanimously adopted.

The CHAIRMAN said they had to appoint an auditor to audit the accounts for the year 1896-97. The directors had appointed Mr. John Guthrie.

Mr. GWATKIN proposed and Mr. MASON seconded the election of Mr. John Guthrie, as auditor for the year 1896-97 at a fee of R50. Agreed.

Mr. MOIR:—Could you tell me what the estimates are?

The CHAIRMAN replied that the directors were rather against giving estimates because they were disappointing unless realized. As a matter of fact, the estimates only came down yesterday, and they had not gone into them.

Mr. GORDON FRAZER asked how much of the 130 acres bracketed together in the report was three years old and how much four years old tea.

The CHAIRMAN replied that they were sorry they were obliged to bracket them together. It was quite impossible to tell the difference in age. Mr. Mason, whom he had consulted, told him it was very difficult to tell the proportions, and for that reason they were bound to bracket them. Mr. Mason would confirm what he had said.

Mr. MASON remarked that the land was opened in little pieces, and that if he could have told the proportion of three year to four year old tea he would have put it in.

The CHAIRMAN:—Mr. Mason says the four year old tea is giving from 200 to 220 lb. an acre. Although the yield at that rate did not pay expenses it was the yield above that that would pay the profit. I may mention as of interest that all the young tea coming on is superior to the old—it is a better jât.

Mr. MASON:—It is a better jât and in very much better soil.

Mr. GWATKIN asked what was about the elevation.

Mr. MASON replied that the elevation of Verellapatna was from 4,200 to 4,500 feet and of Doomoo from 3,500 to 4,200 the average was about 4,300 feet.

On the motion of Mr. Gordon Frazer, a vote of thanks was accorded to the chairman, and this closed the proceedings.

PINE HILL ESTATE COMPANY.

(By Telegraph.)

KANDY, Aug. 22.

A meeting of this Company was held in the office of Messrs. Borrett & Fisher this afternoon at 12.30. Present:—Messrs. Mackwood, Bowle Evans, Prance, Trimen, Wright, Borrett, and by proxy Mr. Waddilove. The first resolution *re* selling Nahakettia estate was passed, the purchaser

being Mr. Lipton for the amount set down in the resolution. Regarding the second resolution it was decided that R40 per share be used for reducing the capital, utilizing part of the money received by selling Nahakettia, the balance to be placed in the suspense account till the directors decide what should be done with the same. No other business was transacted. The directors' meeting immediately followed the Company meeting, when the accounts were examined.

The resolution referred to is as follows:—To authorize the Directors to sell Nahakettia estate, situated in the district of Haputale, belonging to the Company, at or for the price or sum of one hundred and ninety thousand rupees (R190,000) as from the 1st day of July 1896, as per powers conferred under clause No. 100 of the Articles of Association; and to decide on the best mode of dealing with the money received by sale of the Nahakettia estate.

THE PACKING OF TEA.

A friend writes asking us if the present system under which tea is packed for shipment can be considered altogether satisfactory. In his opinion it seems to be capable of improvement, and he suggests certain directions in which he thinks it possible that this might be effected. We are not prepared to ourselves offer any opinion upon the suggestion he has made. But we feel, that, however crude, however impracticable they may be, any contributions upon the subject might set more practical minds thinking with advantage, and we, therefore, while declining any responsibility for them, proceed to recite briefly what has been written to us on the topic. The argument used as the basis for the discussion is that, practically, under the present system, tea is packed in two cases, one metallic, one wooden. The objection, it is pointed out, to metallic casings of all kinds is their liability to injury by rough handling. The casing of tea lead is open to this liability, hence it has to be protected by wood. The present operation is therefore a dual one, and necessarily therefrom costly. In theory the perfect system would be a single metallic case. But if this is cubical there must be straight edges, and it is these that are the most open to injury. The solution to this difficulty would be to make such metallic cases circular in form. But to this our friend acknowledges a fatal objection. It would add, he thinks, fully 25 per cent to the space required for ship stowage, and this would mean an addition in a corresponding ratio to freight charges. But if the present dual casing is to be abandoned, it involves for the protection of so perishable an article as tea a single metallic case of some sort or other. We are asked whether it would not be possible to use two forms of such cases, the one having concave facings, the other convex facings. In stowing the form of the one would fit into the form of the other and so effect solid stowage. It is suggested that plates of some suitable metal, ready stamped with the concavities and convexities and with tail and top ends included in the form of the sheets, could be readily and economically shipped to us. All that would have to be done here would be to solder the single edge and the cut portions of the ends. The meaning of our correspondent seems to be that the sheets should be corrugated in such a form as when beat into cubical, or nearly cubical shape, there should not be any defined

angle that would be liable to injury. We offer the suggestion without expressing any opinion as to whether the idea could be practically worked out.

THE ROYAL BOTANIC GARDENS, CALCUTTA.

By WM. MAIR.

Calcutta's Botanic Garden would gladden the heart of Examiner-Professor Patrick Geddes, foremost in the Renaissance of Botany, the growing school of bionomics or plant-life study, "Pflanzenleben," as they call it in the botanical atmosphere of Strasburg. The "mercurial professor"—to quote an apt epithet which the versatile Zangwill lately applied to the founder of the newer Renaissance of Celtic culture, would find that for once the canons of taste in gardening he admires so ill, that find expression in crevel-work patterns and in schemes of colour that might as effectually be wrought out by the judicious use of pots of paint in primary colours, had been quite departed from. There are picturesque groups of closely-allied families of plants, clumps of bamboos and other genera of tropical monocotyledons, mostly evergreens of vivid hue; green lawns interspersed with sheets of ornamental water, gorgeous with *Victoria regia* or the white-flowered Padma water-lily (*Nelumbium speciosum*) beloved of the gods; splendid avenues of palms, "their tilted heads like draggled plumes against the sky"; and stately Indian trees and elegant shrubs affording necessary shade in a land where it is summer every day, for more delicate members of the great floral community. There also pretty borders of annuals which blossom gaily in our cold weather months, happy remainder of home gardens. But there is no attempt at arrangement in the natural orders of the books: it would be impracticable with such a profusion of variety; the giant teak and the slender verbena, for instance, would hardly make graceful consorts. The attempt was once actually made by a young superintendent of the garden, whose botanical zeal exceeded his good judgment, to convert the garden into a botanical class-book. Sir Joseph Hooker, K.C.S.I., records (Himalayan journals) that when he visited the place in 1848 "nothing was to be seen of its former beauty and grandeur but a few noble trees or graceful palms rearing their heads over a low ragged jungle or spreading their broad leaves or naked limbs over the forlorn hope of a botanical garden, that consisted of open clay beds, disposed into concentric circles, and baking into brick under the fervid heat of a Bengal sun." The general scheme of the garden has always been economic as much as purely botanical and ornamental, but in its present highly efficient condition, to which it has been brought by its present superintendent, Dr. George King, C.I.E., F.R.S., although only a suggestion of what it will become it is one of the brightest spots in the East.

The garden is quite modern. It was founded over a hundred years ago by the Honourable John Company, but the cyclones of 1864 and 1867 made a clean sweep of everything in it except the great banyan tree to be described hereafter, some sacred peepuls, and a few mahogany trees. It is 272 acres in extent, just about as large as Kew now is, and has exactly a mile of frontage to the river Hooghly. It is four miles out of town, and is a favourite rendezvous with people of the "City of Palaces"—which are mostly stucco ones, by the way—on the numerous holidays bestowed by the Hindu and Christian calendars upon Anglo-Indians, pharmacists, of course, excepted.

It is classic ground to the botanist. Roxburgh, father of Indian botany (the Indian Linnæus), was superintendent here, and Wallich, Falconer, Jack, Griffith, and Royle are among the many great names that are perpetuated in its memorial monuments or its avenues; while one or two of the latter are name in honour living botanists, the Hooker Avenue after the distinguished author of the "Flora of British India," grand old veteran still at 80; and the Dyer Avenue, in some measure of acknowledgment of the good friendship of Kew and its learned director.

Although the range of cultivation is naturally very extensive, and the utility of the garden botanically, horticulturally, and agriculturally correspondingly great, amongst its greatest triumphs may be considered the introduction of tea to Assam and the Lower Himalaya from China, and acclimatisation of cinchona in British Sikkim, it is remarkable that the climate of Lower Bengal is quite unsuited to the growth of very many, even tropical, species. One of the greatest benefits bestowed on India by the garden in its early years was the demonstration by practical experiment that many desirable economic products and exotic plants of economic interest cannot be grown in that portion of the Gangetic delta represented by its soil. Thus, one of the things the honourable merchants had in view at its foundation was that the spices, the pepper-vines, the nutmegs, and the cloves, which had once made the trade of the company with the Moluccas so valuable, might be cultivated in Bengal as an additional source of wealth to that resourceful province, but this was soon proved to be impossible. Similarly, the teak tree (*Tectona grandis*) proved a disappointment. In later years an anticipated scarcity of ipecacuanha, so indispensable in dysentery in India, led to the attempt to establish that humble creeper in the garden and in India. The "Pharmacographia" records that up to 1879 success was still "problematical," and it cannot be said even now to have passed out of the experimental stage in which it has been for thirty years. Coca and one or two species of *strophanthus* are at present under trial; one of the latter, *S. dichotomus*, a climbing-plant, has curious, long, ringlet-like tassels hanging down from the edges of the corollas.

The materia-medicaist finds much that is intensely interesting and much that is complementary to the text-books in a visit to such a garden as this. Here are *Cassia fistula*, the Indian laburnum, uncommonly beautiful in its long pendulous racemes of large bright-yellow flowers or with its familiar legumes a yard long; the gurjun tree (*Dipterocarpus alatus*), straight as a ship's mast and branchless for 60 feet, and a small specimen at that; the sacred bael (*Ægle Marmelos*); the nux-vomica tree, with its lozenge-like seeds embedded in the pulp of its beautiful orange-coloured fruit which contains strychnine, but is nevertheless eaten with avidity by the hornbills and the monkeys; the handsome evergreen, *Tamarindus indica*; *Butea frondosa*, the Bengal kino and the real kino tree of Malabar (*Pterocarpus Marsupium*), which might easily be cultivated extensively in Bengal and thereby make the drug less luxuriously expensive; and quite a museum of others. An interesting group of myrtaceous trees on one of a number of artificial mounds, for the ground naturally is as flat as a pancake, includes, besides such species of eucalyptus as will grow in the, to them, uncongenial climate of Bengal, a number of healthy specimens—all are well and prominently labelled,

of the cajuput tree, remarkable for the peculiar structure of its bark. It is not unlike that of birch externally, sometimes an inch thick, but formed of layer upon layer of easily-separable papery-looking tissue.

The pride and glory of the garden is the world-famous banyan tree (*Ficus bengalensis*). It resembles a small forest rather than a single tree, and throws an area of 1,000 feet in circumference into dark, cool shade, a "cloistered labyrinth," richly garlanded with creepers and orchids, planted, as was the banyan itself by the birds. Milton's picture of the "fig tree, not that kind for fruit renown'd," is realistic:—

Branching so broad and long that in the ground
The bended twigs take root, and daughters grow
About the mother tree, a pillar'd shade.

The three splendid conservatories have not an inch of glass in them, but are constructed of a framework of iron covered with wire netting, on which is stretched a thin layer of thatching-grass, while leafy creepers are trained round the sides—a system which has proved completely successful in the cultivation of many tropical species that would otherwise perish in a climate that can vary from between 40deg. to 110deg. F. in the shade, ensuring, as it does, a fairly equable temperature, access of rain and a gentle broken shade from the relentless sun. In the largest, known as the "Orchid House," 200 feet long, the royal family of plants makes quite an imposing show each year, in the month of March when all Calcutta and his wife go to see them. In this house may be seen fine growing specimens of vanilla, which has to be fertilised artificially, and of sarsaparilla, a pretty creeper. The Palm House is built on the same principle and is devoted to such species of equatorial palms as do not take kindly to life out of doors, and here again is a wise departure from the usual order of things for every plant is established in the ground—an obvious improvement over the plan of growing them in tubs. The Herbarium building, which embraces the Library and the Laboratory, is built on the same principle as that of Kew, with the additional feature that it is fireproof. Its *hortus siccus* is one of the most complete in existence, and includes, besides the flora of the Indian Empire and that of Asia outside India, a fair collection representative of Europe and of Australia, and in a less degree of Africa and America. No other herbarium in the world, Kew not excepted, has an equal record for distribution, so lavish in the early years that this herbarium does not possess a single specimen of the priceless collections of Roxburgh, although there are a few at Edinburgh and elsewhere. Distributions are now made each year to thirty-eight of the principal botanical establishments and notable herbaria of the world.

And now a word about the eminent custodian of this great treasure-house of botany. Brigade-Surgeon Lieut.-Col. George King, C.I.E., F.R.S., the greatest botanist in all Asia, has, during the twenty-five years of his incumbency of the superintendentship of the garden, immensely increased the plant-wealth under his care, and maintained and enhanced the reputation of the establishment as an important centre of botanical industry. During those years has been growing slowly and silently under his care, and authorship for the most part, the "Annals of the Royal Botanic Gardens, Calcutta," stately tomes, in quarto, monographs, chiefly of specially difficult Indian natural orders, every line of which represents hours, days, of patient research, authoritative contributions to botanical literature.

The plates illustrating each individual specimen enumerated in these volumes are drawn from life, lithographed, and coloured by hand by Bengali art-students with a devotion and a precision which is marvellous to those unacquainted with the faculty of imitativeness innate to the educated native of Bengal. The latest of these volumes—the seventh—has just been published by the Government of India. It treats of the *Bambusee*—the bamboos of British India. But what has won for Dr. King the title of one of India's benefactors has been the phenomenal success of the cinchona-plantations in British Sikkin, for which he has been in great measures responsible. Their administration is still part of his duties. The Government of India has not only adopted his recommendations, but has carried them out with a liberality that has been completely justified by results. Figures are tedious, but it is sufficient to say that the considerable initial outlay incurred in the undertaking has been repaid several times over, while something like 40,000*l.* a year has been saved to India by the substitution of country-made quinine and "Government cinchona febrifuge," an unpurified "quinctum," for the imported articles, while the distribution of quinine in unheard-of numbers of 5-gr. doses, which may be purchased by the very poorest for about half a farthing, is as great a boon as has ever been conferred on India's malaria-soaked millions.—*Chemist and Druggist*, July 25.

RHEA PROFITS.—In discussing the financial aspect of rhea cultivation *Capital* argues that with anything but first-class soil the outturn would not exceed ten maunds which would not pay at all. The price which was realised for Assam rhea (dried ribbons) in small quantities was £16 per ton which paid a fair dividend. Reducing this to rupees, the price works out a fraction over R9 per maund. But we see it stated, says the *Pioneer*, that a Mr. Frederick Pincott has contracted to supply 15,000 tons of rhea ribbon at £7 per ton, or as it is put there, in rupees, R130 F.O.B., and we scarcely see how this can pay, as freight, insurance, &c., to export ports will make a big hole in it alone; R130 per ton works out R4-10 per maund, and, by the calculation made above, our readers will notice that R9 only gave a fair dividend; so the rate of R4-10 per maund from Assam would never cover. The steamer freight comes to R2 per maund, including boating to the shipping mookh, leaving R2-10 for cultivation, cutting, and carrying, and pressing. Doubtless, with a good press, the freight might be considerably lowered, if the Inland Rivers Company could be got to go by measurement, but then these surmises are not safe to calculate upon, and all our figures are based on actuals. Supposing one could get, say R180 per acre for the produce, the result would not be by any means to be despised, but if this figure is reduced by about half, it does not read much. To cut, strip, and carry a maund costs about R1-8 to R2 of the dried ribbons, and when to this is added inland freight we fail to see where the profit comes in. 'Tis true that by the Gomess system there is a saving of 30 per cent in weight, so that we have to add this on to profits, or deduct it from the above working expenses, but, even with all that, we fail to see where the profits can be made, and when we say profit, we mean a decent profit, such as all agricultural followings should give, *i.e.*, an average of 10 per cent over a series of years.

VARIOUS PLANTING NOTES.

THE INDIAN FOREST DEPARTMENT.—The Forest Administration Report for the whole of India, is, we see from Indian contemporaries, on the whole distinctly favourable, the net revenue being considerably in advance of the revenue received in 1892-93 and 1893-94. On the whole, there is a slight increase in the net profits although much new country has been opened since the publication of the last Annual Report at no inconsiderable cost to departmental funds.

TEA GROWN IN NORTH DAKOTA.—The Philadelphia *Grocery World* of May 25 says:—

When asked what products are grown from North Dakota soil, one thinks readily of wheat, rye, oats and flax, but who in the world would name tea as one of the cultivatable crops? Yet tea is grown, and grown successfully, in North Dakota. State Commissioner of Agriculture Laughlin has made the discovery that a colony consisting of twenty Russian families in Mercer County raised tea last year from seed obtained from Russia. The experiment is reported to have been a decided success, and tea culture will be tried on a much larger scale in that State this year. It is known as the Asiatic-Russian tea-plant, and the quality is said to be every way superior to the black tea sold by merchants.

THE ORANGE BEETLE TEA PEST.—Mr. S. E. Peal writes from Sibsagar to the *Englishman*:—I understand that a correspondent of the *Planter* refers to the above. I think he will find it figured and described by me in the "Tea Encyclopædia," many years ago—under the rather elaborate name of the "Dinpromorpha Melanops." It is naturally a grass feeder, and is becoming a tea shoot eater, and in some cases can cause serious damage, by eating the stem of the soft shoots, thus causing them to fall over and die. But it can be eradicated by a little perseverance, by means of a few smart little boys with butterfly nets, made of strong "Marking Kapra" a foot in diameter 20 inches deep, and handles 4 feet long. The net should have a pointed, V-shaped bottom, and each boy has a wide-mouthed bottle, half full of water. As a rule each boy can catch and drown 1500 to 2000 beetles per day, and being slow fliers, they are easily captured. It does not propagate rapidly, like "green fly" or the "mosquito" (tea bug), and is not found in forest, but where there is some grass, such as "ulu" and the small "kagra."

COFFEE PLANTING.—Thus the *Pioneer*:—Almost every year the Chancellor of the Exchequer remarks that the consumption of coffee in the United Kingdom has been either stationary or shows a decline, being supplanted in popular favour by tea and cocoa which, as popularly prepared, are more palatable and refreshing beverages. But it does not by any means follow from this that coffee-planting is an unprofitable occupation; on the contrary the enormous reduction in Ceylon, Southern India, and the West Indies of the area under coffee and of the exports of the berry owing to the devastation of the leaf disease that attacked the trees, have resulted in sending up the price and keeping it at a high level. Brazil has seized the opportunity to largely extend her plantations and is now the chief source of supply, the exports from Ceylon, once the great centre of production, having fallen from over a million to about fifty thousand hundredweight in the last eighteen years, and the smaller quantities from South India and the West Indies having diminished by about fifty per cent. In the two first named districts tea has usurped the place once occupied by coffee, but a new coffee-

growing enterprise has sprung up in Coorg, and plantations are also being opened out in Java. But the supply as yet is barely equal to the demand, and so long as that is the case prices will remain high and coffee-planting be anything but a ruinous occupation.

BANANAS IN ENGLAND.—Says the *Fruit-Grower* of July 1:—From time to time we read of the condemnation of large bunches of bananas which have been seized by the sanitary inspectors of the Local Authorities as being unfit for food. It would be interesting to have a case stated settling the point as to when a banana is in this condition. This is a peculiar fruit, and if exposed to the wind or wet will immediately become discoloured on the outside, while the interior fruit is perfectly good and eatable. Fruiterers make the mistake of hanging their bunches of bananas in prominent, exposed positions entirely unprotected. We advise them to use a semi-circular shield, which could be made of straw-board or of thin tinned iron, and which would be promptly supplied by fruiterers' and greengrocers' sundriesmen. The shield, if made of tin, should have a turned edge round, and should hang well above and below the bunch of fruit.

A MAMMOTH PLANTING CONCERN.—Our Coonor contemporary says:—Messrs. Finlay Muir & Co., of the North and South Sylhet Companies, had not been long in Southern India, when it was recognized that their unlimited capital and enterprise would soon be a powerful factor in the shaping of the future of our planting industry. But neither we nor any of our contemporaries, in India or in Ceylon, were prepared for the very big thing they have just floated successfully in London. The Consolidated Tea and Lands Company, Limited, is indeed a mammoth concern, but the apparent ease with which it has been floated is another case in point of the large amount of idle capital at home, idle only for want of sufficient outlet. The capital of the Company is two millions sterling and the properties proposed to be acquired consisted of 180,000 acres of land in Northern and South India and Ceylon; the cultivated area being 31,120 acres, two-thirds being in bearing under tea, coffee, cocoa and coconuts. Of the huge reserve, 90,000 acres are on the Kanan Devans, two-thirds of which are computed to be at between 4,000 to 6,500 feet, a grand elevation for the best qualities of tea and coffee. We are glad to note that coffee is to be taken in hand vigorously, if only for the fact that it will leave less to be planted up with tea. The Assam and Ceylon reserves, 19,000 acres, are to be planted up rapidly; we suppose at least two-thirds will be in tea. Of the two millions of capital, £1,600,000 are to go in the purchase of the lands to be acquired, at the rate of £48 per acre for the cultivated and £1 per acre for the reserve. We are not accustomed to large Companies in South India, and we fancy more regret than appreciation will be felt on the part of proprietors. The swallowing up of the little by the big is inevitable perhaps, but distinctly to be regretted for many reasons. On the other hand, such a large influx of capital and enterprise must do a lot to infuse prosperity in a hundred different ways into the members of our body politic. It is useless to mourn over the change that will surely take place; let it rather be our object to strive to benefit thereby as much as we can. For good or for ill, all the world over, big Companies have come to stay, and small holdings, the dream of statesmen and philanthropists of all nations, will ere long fade utterly away, despite all pious aspirations and legislation to the contrary.—*Planting Opinion*, July 18.

BALATA CONCESSIONS IN GUIANA.—The United States consul at Cayenne, Mr. Leon Wacoguc, writes in a recent report: "An interesting point for the future development of French Guiana was debated some years ago without any practical result, viz.: the working of balata gum, similar to, and even better than, the ordinary India-rubber. A scheme of regulations for grants of concessions was elaborated in 1892 by the director of the interior; but they were soon found to be defective, and a new plan, stimulated by the discussions of the council-general, is now being perfected and it is thought it will answer all the requirements of future grantees in helping forward their searches. On December 5, 1895, thirty concessions for the balata industry had been granted to people in the colony and two or three granted in Franco and Europe. A concession has just been given to the representative of an important company of New York (Franco-American Rubber Co.) under special conditions agreed upon between Mr. Joseph M. Jean and the director of the interior. Up to the present, the above company is in the 'prospecting' stage; however, it seems to be satisfied with the first results, and was able in a very short time to ship to New York about 308 kilograms of India-rubber (*gomme de balata*)."—*India Rubber World*, June 10.

CACAO PRODUCTION AND PRICES.—*Planting Opinion* of July 18 says:—The present prices for this product do not make its cultivation very alluring to planters, but though the profits just now are small, a cocoa plantation is a thoroughly good investment. It has few or no insect enemies, and planted in suitable soil and climate has a bearing life almost equal to that of tea. People in "the know" declare that the low prices are artificial, that is to say the manufactured article, cocoa, chocolate, etc., is priced so high that demand is much restricted. Be that as it may, it is a noteworthy fact that the demand is almost stationary, while cultivation is yearly extending. Were it not for the present small crops in South America, where a yearly increased acreage is being brought into bearing, prices would be even lower than they are. If cocoa ever establishes itself in South India, we hope that a chocolate and cocoa factory will be simultaneously started. Certain it is that, unless organized efforts are made by the growers to stimulate consumption, no rise in the market will take place.

TEA CULTIVATION IN JAPAN.—Mr. James H. Veitch, of the famous Chelsea firm of nurserymen, has just printed for private circulation his notes of his travels round the world in 1892; and in writing of Japan he says:—

About ten miles due south from Kyoto is the village of Uji, surrounded by tea plantations, long famous as producing the finest tea in Japan. The tea plant is cultivated in a way different from what I have seen elsewhere. In nearly all the fields the plants in the rows, ranging from 2½ to 4½ feet high, were so old and so inter-grown that each row was a thick hedge several feet through, and only once did I notice solitary specimens. Picking commences the second week in May, after which the tea is cleaned over by girls in the peasants' houses, and then subsequently rolled between the hands of coolies. There are, of course, no great drying or cleaning establishments, each peasant's house, working independently in a small way. Many fields were entirely covered with straw mats on a low scaffolding of poles, and if looked at from above, such as from a high part of the road, one looked down on several acres of mats. I assume that this is done on account of the plants having reached a picking stage, and, it being impossible owing to the cost of labour to pick all the fields at once, the owners endeavour to retard the further growth of the young shoots. Rain and sun are excluded, and almost all light, for even from the roof of mats a row is hung down all round each field, the

tops of the plants being hidden from view. One of the choicest kinds is the Gyokuro (Jewelled Dew), varying in price from 5 to 7½ dols., equal to 14s 3d and 21s 3d per lb. The Uji plantations are said to date from the end of the twelfth century, though it is believed tea was introduced to Japan from China by a Buddhist Abbot—Dengyo Daishi—as far back as the year 805.

THE ROYAL BOTANIC GARDEN, CALCUTTA.—We give elsewhere Dr. King's report on this garden for the year 1895-96, which, though not lengthy, is interesting. From it we learn that the season from October to March was abnormally dry, and many plants and trees perished or were damaged by the drought. Steady progress has, however been made in improving the Botanic Garden, not only as a scientific centre for botanical students, but also as a pleasure resort for the public. The steps leading to Col. Kyd's monument were renovated and paved with marble; and a cutting from the sacred *Bo* tree at Buddha Gaya was presented by Mr. Grierson, late Magistrate of Howrah, and planted in the Garden. Attention was as usual given to the cultivation and distribution of plants of economic value. Among these the *sida*, a fibre-producing plant, and the *Adhatoda vasica*, a decoction of which is popularly believed to be a powerful insecticide in tea plantations, were cultivated at the instance of the Reporter on Economic Products. The decoction of *Adhatoda vasica* was submitted to a test, but the results are reported to have been of a somewhat doubtful nature. In Ceylon, says Dr. Trimen in his *Handbook of the Flora of Ceylon*, this plant is much cultivated by the natives as a fence, and is largely grown about Jaffna as a green manure for tobacco gardens. The Sinhalese names are *agaladora*, *wanepola*; and the Tamil *aditodai*, *pavettai*. A portion of the Sibpur Experimental Farm was devoted to raising wheat from samples of seed supplied from the various wheat-growing districts in Bengal, and Dr. Prain, the Curator of the Herbarium, is now preparing a report on the races grown and on their relations to the names they bear in different districts. The collection in the Herbarium was increased by more than 17,000 specimens, the chief contributors being the Director of the Royal Garden, Kew, and the Keeper of the Botanical Department of the National History Museum, London. During a portion of the year Dr. Prain was deputed to the wheat-growing districts of Upper India with the object of enquiring into the "host" or vehicle by which the blight affecting wheat and barley, commonly known as "rust," is propagated from year to year. The matter is one of the utmost importance, and it is hoped that Dr. Prain's investigations may render it possible to take effective measures for the prevention of these destructive blights. During the year two volumes were added to the interesting series of Garden Annals, containing monographs by Sir Joseph D. Hooker on Indian Orchids and by Dr. D. D. Cunningham on the obscure phenomena known as sleep and sensitivity in plant, most of which he traces to purely physical processes. Both Dr. King and Dr. Prain also contributed valuable papers on botanical subjects to various scientific journals. The Lloyd Botanic Garden at Darjeeling was in charge of Mr. Kennedy, who carried out various improvements in the roads and conservatories of the Garden. A gigantic specimen of the beautiful Australian fern, *Todea barbara*, weighing upwards of half a ton, was presented to the Garden by the distinguished botanist, Baron Von Mueller, K.C.M.G., F.R.S.

Correspondence.

To the Editor.

SILK IN CEYLON.

Kandy, July 23.

DEAR SIR,—As promised in my letter of 19th May, I now send you further particulars regarding other species of silkworms lately introduced.

The first which occupied my attention, after the castor-oil worms, was *Antheraea Assama*, the 'Muga' of Assam. This worm is only partly domesticated, the worms being reared, by the Assamese in the open air, in the same way as the Tusser in many parts of India. From the cocoons sent me a few moths emerged on the way, and laid their eggs in the box. The worms hatched six days later, but though I offered them leaves of fifteen different kinds, of such trees as seemed likely to suit them, they ate scarcely any and I was obliged to throw them away. We do not seem to have in Ceylon any of the trees on which this worm feeds in Assam, though there are many closely-allied species. The Muga worm gives five broods in a year, and if it can be domesticated will prove a very valuable acquisition. The demand for its silk in Europe is already very large, as it dyes more easily than Tusser and yields much finer fabrics.

The next species introduced was one of the many varieties of the *Bombyx mori*, the mulberry-feeding silkworm, from Bengal. This, like the castor-oil worm, is very prolific and gives eight broods in the year. The worms spin their cocoons about three weeks after hatching, and the moths emerge ten or twelve days later. I cannot say yet whether it is adapted to our higher elevations, but up to 2,000 feet it should do very well. Owing to our more equable temperature in Ceylon, the cocoons produced locally already show a very marked improvement on those reared in Bengal.

A third species, also a mulberry-feeding worm, and producing about eight broods in the year, seems more likely to be adapted to our higher districts, though often reared in the plains of India. My worms are being reared at an elevation of about 700 feet (temperature 75 deg. to 90 deg.), and the moths are very vigorous, but the worms may be found to produce larger cocoons in districts with a cooler climate.

As regards the disposal of the silk there is no difficulty. Until a silk Filature is established here the cocoons can be shipped to London or Calcutta. They should be dried, in the sun, if possible, a few days after spinning, to prevent the moths emerging, and packed in bales of 50 or 100 lb.

As I am anxious to resume experiments in domesticating the Ceylon Tusser worms, I shall be very much obliged to anyone who will send me a few live cocoons of this species. They may be found, at varying elevations, on the country almond, cashew, weralu, loquat, avocado pear, kahaata (patena oak) and other trees. The collection of wild cocoons in India, for weaving or export, has fallen off considerably, owing to the decrease of jungle through extended cultivation, and the demand is steadily increasing.

I am sending you specimens of different cocoons and a rough sketch of the Tusser cocoon, which I hope may be of use.—Yours faithfully,

B.

SILKWORMS AND RHEA OR RAMIE.

Colombo, July 28.

DEAR SIR,—Those who are experimenting in sericulture will find an interesting paper on the subject with a history of the little that has been done in silkworm rearing in Ceylon—by Dr. J. L. Vanderstraaten in the C. B. R. A. S's Journal, No. 23 of 1881. Some extracts from it, giving the experiences of Father Palla and Mr. Alex. Geddes should prove interesting to the readers of the *Observer* if reprinted.

I see from the last *T.A.* that some Ceylon planters have begun growing Rhea, and also that the operations of the Rhea Fibre Treatment Co., have been attended with a large measure of success.

I may mention that within the last year some 2,000 Rhea cuttings have been distributed by the Colombo "School of Agriculture."

By-the-bye, a good deal was at one time written about the value of Ramie leaves for feeding silk worms. Any one wishing to try the experiment can have parcels of leaves free of cost at the school.—Yours truly,

C. D.

BAMBOO DOGCARTS.

Dindigul Club, 28th July 1896.

DEAR SIR,—Mr. W. Turing Mackenzie can obtain "Bamboo Carts" from Eduljee & Co. and Nowrojee & Co., both of Lucknow, Oudh, India.

Eduljee & Co. make them from *R160* upwards, and as they pack very well the freight upon them is little as compared to other carts.

The cheaper Bamboo Cart has no springs, the bamboo shaft acting as such, but much the better cart to have is the "Bamboo Muster" Cart, with C springs and horizontal springs. These are, of course, more expensive. I have one of the latter kind, specially built to hold one person, with lancewood shafts and springs, "Bamboo Muster"—but no bamboo about it, and it is a first-class cart and has stood no end of wear, it was built by Simpson & Co., Madras, and cost about *R450*.

For ordinary use the *£160* cart of Eduljee & Co. is very good and serviceable.—Yours faithfully,

G. MENGEL.

THE COST OF COCONUT CULTIVATION IN CEYLON.

Northern Province, August 1896.

SIR,—I have read with interest what literature I could get hold of during the last ten years or so on the subject of coconut cultivation in Ceylon; but I have never yet come across any article which gives you some idea as to what the upkeep of an estate of say 350 acres in the Northern Province would cost per year.

I think it will be interesting and instructive if some of your numerous correspondents will give the benefit of their experience for the guidance of those who wish to keep within reasonable limits in regard to expenditure.

I give the ordinary heads of expenditure below; but the list is by no means complete:—

- | | |
|--|--|
| 1. Management. | 10. Fences. |
| 2. Overseers. | 11. Hoing say 1-5th of the total area. |
| 3. Picking; assuming the annual crop to be say 400,000 nuts. | 12. Ploughing say 1-5th of the total area. |
| 4. Copra making. | 13. Buildings. |
| 5. Dispatch of crop; including bagging, weighing, &c. | 14. Tanks, wells and roads. |
| 6. Collecting and carting nuts. | 15. Weeding. |
| 7. Stock-keepers. | 16. Manuring. |
| 8. Cattle food. | 17. General transport. |
| 9. Horsekeep. | 18. Nurseries. |
| | 19. Domestic. |
| | 20. Tools, &c. |

Such a table of calculations drawn up in accordance with the present enhanced rates of payment will, I venture to think, prove eminently useful.—
Yours faithfully,
ROGATUS.

AN INSECT ENEMY OF TEA.

Woodslee Estate, Weuda, Aug. 12.

SIR,—I am sending you this day a parcel containing a few worms with some tea leaves, as they were found on the bushes. These I found attacking my tea bushes and destroying them to some extent.

Therefore would you be kind enough to observe these destructive insects and suggest a remedy against *this enemy of the tea bush*, through your valuable journal or otherwise.—Yours truly,

H. D. MARTIN.

[Our entomological authority writes:—"I have examined the tea leaves you sent me yesterday. The 'pooehies' rolled up in the tip of some of them are caterpillars of a minute moth. In large numbers they would do harm to the tea bushes. The upcountry friend who sent them to you must know more about it than we can by a mere examination of the injured leaves."—ED. C.O.]

AN INSECT ENEMY OF TEA.

Woodslee Estate, Weuda, 22nd Aug. 1896.

DEAR SIR,—I am very thankful to you for the interest you have taken in examining the pooehies I sent you the other day and giving insertion, in your paper, to the opinion of your entomological authority about the same. Sorry I am unable to make any better observation of the insects, as I cannot pretend to know the natural characteristics of these, in order to suggest a favourable remedy to destroy them altogether, before they can increase in large numbers, in which case "they would do harm to the tea bushes." But as far as I can observe the insects, they don't seem to be very rapid in their propagation. Therefore, I think, this enemy will not be able to destroy the tea bush to any appreciable extent. Still, I get them picked daily off my bushes and destroy them, this being the only way I could adopt in putting an end to this *insect enemy of tea*.—Yours truly,

H. D. MARTIN.

THE COCOA-BUTTER DUTY.—There seems (says the *Chemist and Druggist* of July 18th) to be a strange confusion about the cocoa-butter duty. On July 2nd the House of Commons resolved that a duty of 2d per lb. should be levied on it. On Thursday, July 9th, after a further debate, it passed a resolution declaring that "a duty of Customs of 1d shall be charged on that product of the cocoa-bean which is generally known as cocoa-butter," the Chancellor of the Exchequer declaring that Messrs. Fry & Sons and other dissenting firms had declared their acquiescence in that modified duty. The presumption was therefore that cocoa-butter imported between July 2nd and July 9th was dutiable at the rate of 2d per lb., and that imported after July 9th at the rate of 1d per lb. But upon making inquiry at the Custom House this (Thursday) afternoon, we were informed that no official order imposing a duty had yet reached that department, and that any cocoa-butter imported at this moment would still be admitted duty-free, unless indeed an order to the contrary should be received from headquarters before the lot was cleared. How to reconcile this statement with the House of Commons' resolutions we fail to understand. Is it possible that the official order giving effect to the resolution has become lost somewhere in the Circumlocution office?

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, Aug. 6th.

CAMPHOR (CRUDE).—The London market is quiet. At the end of last week there were sellers of Formosa for August-October shipment at 95s per cwt., c. i. f. terms, but quotations vary a good deal. At auction today 149 packages of Formosa camphor, imported via Hamburg, sold at a decline of 7s 6d to 10s per cwt. compared with the last auction rates, but at about steady prices compared with the private quotations. The first 99 cases of the parcel realised 110s, and for the remainder 107s 6d per cwt. was accepted.

CAMPHOR (REFINED).—Unchanged. At auction today there were 22 packages of Japanese refined. For 1-lb. tablets a bid of 1s 4d per lb. was rejected, and $\frac{1}{2}$ oz. squares 1s 7d would have been taken, but there were no buyers; $\frac{1}{4}$ -oz. squares were bought in at 1s 8d per lb.

OILS (ESSENTIAL).—Clove oil, owing to a further decline in the raw material, has again been slightly lowered, the present quotation from the English manufacturers being from 1s 10d to 2s per lb., according to quality. On the other hand, there has been an advance in English Oil of cinnamon, which now stands at 7s to 7s 6d per oz. Citronella oil dull of sale, at 1s 4d to 1s 6d per lb. on the spot, according to packing. Lemon-grass oil $2\frac{1}{2}$ d spot, and 2 2s-3d. per oz. e. i. f. Cinnamon-leaf oil is extremely scarce; bids of $4\frac{1}{2}$ d per oz. have been rejected this week. Patchouli oil extremely scarce. The English distillers ask 1s 10d per oz., and for Fisher's Singapore oil as much as 1s 8d is asked.

SEEDS (VARIOUS).—Thirty-five packages damaged dull Coriander seed from South America sold cheaply at 5s per cwt.; fair Malta cummin seed was bought in at 36s to 37s, and for fair bright East Indian annatto, a bid of $2\frac{1}{2}$ d per lb. was refused.

VANILLA.—Eighty-three packages were offered today and mostly sold. Good qualities, which are scarce, realised steady prices, 24s 6d to 26s per lb. for fine six inch, Mauritius, 15s 6d to 19s for mixed sizes. A large proportion of the supply, however, consisted of very badly-ripened mouldy Seychelles vanilla imported via Bombay. The shipment of this has apparently been unduly hurried, and the result was that it has sold at the low price of 3s 6d to 7s 3d per lb.

VARIOUS DRUGS.—Cubebis are quite neglected. Seventy-four packages at auction were bought in; fair, partly stalky, from Singapore at 35s; ordinary, very small dusty and stalky mixed, at 25s per cwt. A case of two 45-lb. tins of very astringent Kino from Bombay was bought in at 12s per lb.

RHEA FIBRE.—*Capital* has the following remarks about rhea:—It is a stingless nettle that will grow in almost any soil that is not inundated. It is indigenous to Assam and can be traced away, we believe, right through Burma and the Shan States into China. That it has been long known in China is beyond a doubt; but the curing of it has not received much attention at John Chinaman's hands, although rude appliances have been in use for scraping the gum from the fibre for many years, and these crude implements can be seen at the British Consulate if any one is anxious to see them. In Assam the so-called Assamese silks are largely mixed with rhea. The great value of the filasse is that it retains its lustre and shines just as the silkworm silks does, until it has been several times subjected to the treatment of the Indian dhotie; wear out though it won't but simply loses its lustre, and those who have been in the habit of wearing Assam silk suits can distinguish the rhea filasse which has been mixed by the tiny knots into which it forms after several thrashings of the Hindu washerman.

CHAFED SKIN, PILES, SCALDS, BRUISES, CUTS, STINGS, NEURALGIC and RHEUMATIC PAINS, SORE EYES, EAR-ACHE, THROAT COLDS, and SKIN AILMENTS quickly relieved by
use of CALVERT'S CARBOLIC OINTMENT.
Large Pots 13 $\frac{1}{2}$ d. each (English rate). Sold at Chemists, Stores, &c.

F. C. CALVERT & CO., Manchester.

TEA CULTURE IN ASSAM.

ANNUAL REPORT FOR 1895.

The following report has been issued by the Assam Administration:—

As in previous years, in the statement appended to this Report, figures are given for each sub-division separately in addition to the totals for each district. The statement has been modified in accordance with the instructions contained in circular letter No. 3070S., dated the 1st July 1895, from the Director-General of Statistics. Silchar continues to head the list in regard to the number of tea gardens and the area under tea cultivation, and the Dibrugarh sub-division still shows the largest outturn.

GARDENS OPENED AND CLOSED, EXTENSIONS, AND RELINQUISHMENTS.

The total number of gardens at the close of 1895 was 812 against 823 in 1894 showing a decrease of 11 gardens. Details are given in the following table:—

District.	Number of gardens newly opened.	Closed or removed.			Total.	Increase or decrease.
		Closed	Amalgamated with other gardens.	Abandoned.		
Cachar ..	1	5	3	—	8	— 7
Sylhet ..	6	—	—	—	—	.. 6
Kamrup ..	4	6	1	—	7	— 3
Darrang ..	2	4	1	—	5	— 3
Nowgong ..	—	1	—	—	1	— 1
Sibsagar ..	2	—	3	—	3	— 1
Lakhimpur...	—	1	1	—	2	— 2
Total ..	15	17	9	..	26	11

During the year 15 gardens were newly opened against 48 in the previous year; 17 were closed against 7 in 1894, and 9 gardens were amalgamated with other gardens, against 10 in 1894.

NUMBER AND AREA OF GARDENS AND AREA OF ALL LANDS HELD BY TEA PLANTERS.

The following statement compares the number of gardens in each district and the area of lands held for purposes of tea cultivation, and also the total area of all lands held by tea-planters for the past two years:—

Total area of tea grants, in acres.		Increase or decrease in acres.	Total area of all lands held by tea-planters in 1895, in acre.
1894.	1895.		
283,097	283,194	+97	283,194
180,399	131,544	— 48,855	200,107
100	100	—	100
852	852	—	852
19,518	18,798	— 720	24,122
104,716	92,956	— 11,760	105,294
50,144*	50,404†	+260	53,592
228,851	230,350	— 1,499	241,451
187,315	187,589	— 274	187,589
1,054,992†	995,787‡	— 59,205	1,096,301

* Includes one unworked garden.

† Revised figures.

‡ Includes 1,286 acres of land not fit for tea cultivation and not included in column 10 of the statement appended to the Report.

District.	Number of tea gardens.		Increase or decrease.
	1894.	1895.	
Cachar ..	206	199	— 7
Sylhet ..	127	133	— 6
Khasi and Jaintia Hills ..	1	1	..
Goalpara ..	3	3	..
Kamrup ..	32*	29*	— 3
Darrang ..	87	84	— 3
Nowgong ..	55†	54†	— 1
Sibsagar ..	175	174	— 1
Lakhimpur ..	143	141	— 2
Total ..	829	818	11

The large decrease in the area of tea grants is mainly due to the decrease of 48,855 acres in Sylhet. The Deputy Commissioner explains that the figures shewn in column 6 of the above statement were obtained from the managers of tea estates, and are not reliable. He estimates the area of tea grants in his district at 159,959 acres. The decrease in Kamrup is due to the closure of some gardens, while in Darrang it is attributed to greater accuracy in the figures now furnished. The total area of grants is the same as the total area of all lands held by planters in the districts of Cachar the Khasia and Jaintia Hills, Goalpara and Lakhimpur. The corresponding totals in respect of the other districts differ considerably. Steps were taken during the year to ensure greater accuracy in respect of the figures contained in this statement, and the matter is still under consideration.

RETURNS AND ESTIMATES.

Some improvement has taken place in the number of gardens furnishing statistics. Out of 812 gardens statistics have been furnished in respect of 717 gardens, against 698 in the preceding year; estimates had to be framed for 95 gardens, against 125 in 1894. The Chief Commissioner's thanks are due to those managers and agents who have furnished the required information.

NUMBER OF PERSONS EMPLOYED.

The table below shows the total number of persons employed permanently and temporarily on tea gardens in each district:

District.	Total number of persons employed during the year.			
	Permanently.		Temporarily.	
	1894.	1895.	1894.	1895.
Cachar ..	61,183	66,229	10,616	6,320
Sylhet ..	72,369	85,094	34,550	10,951
Goalpara ..	275*	262	15*	34
Kamrup ..	1,151	2,915	2,671	372
Darrang ..	22,386	45,972	31,386	6,404
Nowgong ..	15,331	18,663	3,684	2,556
Sibsagar ..	65,117	77,343	11,447	7,597
Lakhimpur ..	90,602	96,864	3,554	5,044
Total ..	331,914	393,342	97,923	39,278

* Revised figures.

The total number employed permanently shows an increase of 61,428 persons. The decrease in the number of temporary hands is attributed to the new method of calculation adopted in accordance with the instructions contained in Circular No. 53—51, dated the 14th of November, 1894, from the Government of India in the Revenue and Agricultural Department. It has not been found possible to reconcile the figures with those in the Provincial Labour Immigration Report. It may, however, be remarked, as in paragraph 5 of last year's report, that of the two sets of figures those in the Immigration Report should be accepted as the more correct.

AREA UNDER MATURE AND IMMATURE PLANTS AND TOTAL

AREA OF TEA GRANTS.

The following statement gives the areas under mature and immature plants and the total area held by tea-planters during the last fifteen years:—

* Including six unworked gardens in 1894 and five unworked gardens in 1895.

† Includes one unworked garden.

(1) Under mature plants. (2) Under immature plants. (3) Total area of tea grants.

Year.	(1) Acres.	(2) Acres.	(3) Acres.
1881..	133,293	25,131	706,649
1882..	156,707	22,141	783,362
1883..	161,707	27,746	922,664
1884..	158,158	31,694	913,476
1885..	159,876	37,631	921,891
1886..	170,138	33,855	934,131
1887..	177,900	33,179	950,171
1888..	188,329	28,347	955,499
1889..	196,689	30,560	1,000,665
1890..	200,658	30,380	991,497
1891..	208,407	33,416	996,746
1892..	213,525	33,667	1,041,984
1893..	221,368	35,257	1,042,277
1894..	229,316	39,480	1,054,992*
1895..	234,909	41,105	994,501

* Revised figures.

AREA UNDER TEA CULTIVATION IN EACH DISTRICT.

The following statement compares the total area under tea cultivation for the past two years, district by district:—

District.	Total area under mature and immature plants.		Increase or decrease.
	1894. 1895.		
	Acres.	Acres.	
Cachar..	59,586	58,216	— 1,370
Sylhet ..	54,926	62,979	plus 8,053
Khasi and Jaintia Hills..	30	30	..
Goalpara	330	400	plus 20
Kamrup	4,534	4,953	„ 419
Darrang	33,101	28,750	— 4,351
Nowgong	11,837	12,239	plus 402
Sibsagar	59,925	63,264	„ 3,339
Lakhimpur	44,477	45,183	„ 706
Total	268,796	276,014	„ 7,218

The total increase of 7,218 acres, as compared with 12,171 acres in 1894, is distributed among all districts, except Cachar and Darrang. In Cachar it is stated that new extensions have not kept pace with the areas of old tea abandoned, and in Darrang the decrease is said to be more apparent than real, being due to greater accuracy in the figures for certain gardens for which estimates had to be framed in previous years.

AREA TAKEN UP FOR PLANTING, BUT NOT YET PLANTED.

The following statement shows the total area of lands taken up for planting, but not yet planted:—

District	Acres.
Cachar	224,978
Sylhet	68,566
Khasi and Jaintia Hills	70
Goalpara	452
Kamrup	13,815
Darrang	64,206
Nowgong	36,876
Sibsagar	167,086
Lakhimpur	142,406
Total	718,487

THE TOTAL OUTTURN OF THE PROVINCE.

The total outturn of tea during the year was 99,524,574 lb., against 94,829,059 lb. in 1894, showing an increase of 4,695,515 lb. The table given in the next column compares the figures furnished by the Indian Tea Association and the figures of the Trade Returns with those reported by the Deputy Commissioners in their annual tea reports:—

OUTTURN BY DISTRICTS.

Total Yield.	1894.		1895.		Percentage Increase or Decrease.
	lb.	lb.	lb.	lb.	
	18,348,061	20,169,133	18,348,061	20,169,133	plus 9.93
	19,944,563	22,710,626	19,944,563	22,710,626	plus 13.87
	4,000	4,000	4,000	4,000	..
	130,191	143,222	130,191	143,222	plus 10.00
	776,495	660,328	776,495	660,328	—14.96
	12,574,480	11,036,662	12,574,480	11,036,662	—12.23
	3,782,818	3,864,257	3,782,818	3,864,257	plus 2.16
	21,837,191	22,240,698	21,837,191	22,240,698	plus 1.85
	17,431,270	18,695,548	17,431,270	18,695,548	plus 7.25

Outturn according to Indian Tea Association ..
 „ to Trade Return ..
 „ to Annual Tea Report ..

The statement below shows the outturn of tea in each district for the past two years:—

District.	Rate of outturn per acre.	
	1894.	1895.
	lb.	lb.
Cachar ..	339	393
Sylhet ..	470	485
Khasi and Jaintia Hills ..	200	133
Goalpara ..	343	377
Kamrup ..	194	136
Darrang ..	487	455
Nowgong ..	352	350
Sibsagar ..	402	339
Lakimpur ..	465	480
Total ..	414	424

There was an increase of 4,695,515 lb., or 4.95 per cent., over the figures of the previous year. Increases occurred in Cachar, Sylhet, Goalpara, Nowgong, Sibsaagar, and Lakhimpur. The districts of Kamrup and Darrang alone showed a decrease in outturn. The Deputy Commissioner of Kamrup reports that six gardens were closed during the year, and that there was no cultivation in five other gardens.

The Deputy Commissioner of Darrang attributes the decrease in his district to the unfavourable weather which prevailed during the year, and also to mosquito blight and red spider, which did much damage to some gardens in both subdivisions of the district. Floods, too, during the rainy season did some damage on certain gardens in Darrang. The increase in outturn in Sylhet and Goalpara is not explained by the Deputy Commissioners. In Cachar, the increase was ascribed to the weather having been more favourable and blights less severe than in the preceding year. In Nowgong, the increase in the outturn is attributed partly to extension of cultivation and partly to favourable weather; in Sibsaagar, an increase in the outturn was obtained because a large area under tea came into full bearing; and in Lakhimpur, though there was an increase in outturn, the planters consulted by the Deputy Commissioner were generally of opinion that the year was not a prosperous one; the season was unfavourable, and most gardens were unable to work up to their estimated outturn. In this connection, it must be remembered that variations in the system of plucking of tea cause considerable difference in outturn. Planters frequently change from fine to coarse plucking, and *vice versa*, according to the prices ruling, or expected to rule, in the market for fine or coarse teas, and such changes are sometimes sufficient to cause considerable differences in outturn independently of the adverse or favourable character of the season.

YIELD PER ACRE.

The yield per acre for the Surma Valley, the Brahmaputra Valley, and for the whole province, according to the district returns, is shown below:—

	1894.	1895.
	lb.	lb.
Surma Valley	396	437
Brahmaputra Valley	426	414
For the whole province	414	424

The yield per acre, as furnished by the Indian Tea Association, is given below:—

	1894.	1895.
	lb.	lb.
Surma Valley	407	420
Brahmaputra Valley	411	418
For the whole province	411	419

TEA-SEED.

The following statistics relating to the import and export of tea-seed for the past two years, are reproduced from the Trade Returns:—

	Imports.		Exports.	
	1894.	1895.	1894.	1895.
	Mds.	Mds.	Mds.	Mds.
Surma Valley ..			2,227	3,469
Brahmaputra Valley ..			2,483	9,858
For the whole province..			4,910	13,327

Most of the district reports furnish no details under this head. The Deputy Commissioner, Cachar, reports that 43 maunds of tea-seed were imported

from the Lushai Hills and 877 from Manipur. The price ranged from R20 to R60 per maund.

COST OF PRODUCTION.

As in previous years, Deputy Commissioners failed to obtain any reliable information regarding the cost of production. The Indian Tea Association have also expressed regret at their inability to furnish any statistics.

PRICES.

The district reports are equally defective so far as the prices of teas are concerned. The statistics furnished by the Secretary to the Indian Tea Association for 1895 are shown below:—

	As. P.
Surma Valley teas ..	7 4 per pound.
Brahmaputra Valley teas ..	8 7 " " "

These figures are considerably lower than those for 1894, which were as follows:—

	As. P.
Surma Valley teas ..	8 8 per pound.
Brahmaputra Valley teas ..	10 5 " " "

It should be remembered, however, that prices ruled exceptionally high in 1884. The figures for 1892 and 1893 were—

	1892.	1893.
	As. P.	As. P.
Surma Valley teas ..	8 1½	6 5
Brahmaputra Valley teas ..	9 9	8 0

DISTRIBUTION OF RAINFALL.

The rainfall at each district headquarters during the last six years is given, in inches, in the following statement:—

Station.	1895.	Average for the previous five years.	1894.	1893.	1892.	1891.	1890.
Silchar	117.56	141.89	176.74	145.83	157.62	108.07	121.19
Sylhet	134.05	186.24	177.65	191.35	198.37	182.60	181.23
Dhubri	115.81	95.86	92.10	91.11	122.92	74.27	108.90
Gaubati	63.09	59.88	74.31	49.36	69.95	46.57	59.21
Tezpur	56.62	69.01	87.99	68.88	67.63	57.12	63.45
Nowgong	62.70	69.59	70.40	66.50	78.63	56.13	78.31
Sibsagar	114.24	93.30	97.02	84.30	103.98	88.39	92.79
Dibrugarh	114.99	115.91	131.17	89.22	138.53	95.58	125.08

As regards the effect of climatic influences on the crop, the Deputy Commissioners report as follows:—

Cachar.—There was one hailstorm during the year. From the 5th of June until the end of the month,

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Ear-drums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN, LONDON.

the weather was rather too dry for tea, and red spider was prevalent. In July and August the weather was variable and at times too cool, and mosquito blight was prevalent.

Sylhet.—The weather was on the whole not favourable. It was too dry at the beginning and end of the season, and too wet in the middle—from June to September. There were also in places disastrous hail-storms, and the cyclone of October did some damage.

Kamrup.—The year was noticeable for the early close of the rains, and the consequent early stoppage of tea manufacture.

Darrang.—The year was remarkable for its very short rainfall, and this seriously affected the outturn of tea. This was notably the case, on some of the finest estates in the district.

Sibsagar.—The weather was on the whole unfavourable to the crop, the rainfall being generally short and badly distributed. The early part of the season was unusually dry, while cold dull weather in July injuriously affected the flushing of leaf and manufacture, and the season closed earlier than usual in November.

Lakhimpur.—The season opened favourably. There were heavy floods in the beginning of July. Temperature was low in August and caused a check throughout the district. The rains ceased in October, and this brought the season abruptly to a close. Prices were much lower than in 1894, and the year was an unhealthy one. A leading planter in this district reports that blister blight, followed by caterpillar and mosquito blight appeared early in the season; mosquito blight attacked the gardens much earlier than usual, and lasted in some cases until the close of the season. A new blight was discovered by Dr. Watt. This blight attacks the indigenous plant only, the mites attacking the edges of the leaves and working their way gradually through the veins to the centre, the colour of the leaves so attacked being of a pale yellow; if not checked, it would spread over the whole bush, prevent its giving any leaf, and possibly kill the plant. Dr. Watt suggested a remedy in the infusion of *Adhatoda vasica*, which he found most useful in preventing and exterminating the blight.—*Englishman*, July 28.

INDIAN PATENTS.

No. 2136 P.—Applications in respect of the under-mentioned inventions have been filed, during the week ending 1st August 1896, under the provisions of Act V. of 1888.

Improvements in or connected with machinery for rolling tea leaf.—No. 261 of 1896.—Nathan William Horatio Sharpe, engineer, of 26, Perth road, Stroud-green, London, for improvements in or connected with and for chlorine machinery for rolling tea leaf.

Improvements in apparatus for packing tea or such like substances.—No. 262 of 1896.—Nathan William Horatio Sharpe, engineer, of 26, Perth road, Stroud-green, London, for improvements in apparatus for packing tea or such like substances.

Improvements to tea equalising or cutting mills.—No. 266 of 1896.—Samuel Cleland Davidson, merchant, of Sirocco engineering works, Belfast, Ireland, for improvements in tea equalising or cutting mills.

Improvements in the process of, and machinery or apparatus for, decorticating, preparing, twisting, and winding, peat fibre or other fibrous material.—No. 75 of 1896.—Gustave Adolphe Cannot, merchant, of No. 20, Bucklersbury, in the city of London, for improvements in the process of, and machinery or apparatus for decorticating, preparing, twisting, and winding, peat fibre or other fibrous material. (Specification filed 14th July 1896.)

The fees prescribed in Schedule 4 of Act V of 1888 have been paid for the continuance of exclusive privilege in respect of the undermentioned inventions for the periods shown against each:—

For a machine for decorticating or extracting the fibre from the leaves of the aloe plant and other fibre bearing plants.—No. 220 of 1891.—Haribai

Khanduji, contractor, residing at No. 13, Bhandup street, Mandvi Bunder, Bombay, for a machine for decorticating or extracting the fibre from the leaves of the aloe plant and other fibre bearing plants. (From 21st April 1896 to 20th April 1897.)

Whereas the inventors of the undermentioned inventions have respectively failed to pay the fees prescribed it is notified that the exclusive privilege of making, selling, and using the said inventions in British India and of authorising others so to do has ceased:—

An improved punkah-pulling machine.—No. 129 of 1891.—Neil Douglas' invention for an improved punkah-pulling machine. (Specification filed 28th April 1892.)

Improved method for preserving India Rubber, gutta-percha and goods made therefrom.—No. 266 of 1891.—Herbert Samuel Elworthy's invention for a novel or improved method for preserving India rubber, vulcanized india rubber, gutta-percha and goods made therefrom. (Specification filed 30th April 1892.)—*Indian and Eastern Engineer*, Aug. 15.

INDIAN TEA SALES.

(From *William Moran & Co.'s Market Report*.)

CALCUTTA, August 18th, 1896.

TEA.—During the fortnight 40,750 packages have been offered and sold. For some of the better grades prices have been a little irregular but not notably lower. Medium sorts have been steady at previous rates, while all common tea has been well competed for and shows some slight rise in value.

This week the sales will be large, aggregating probably 30,000 chests.

Total quantity of Tea passed through Calcutta from 1st April to 15th August.

	1896.	1895.	1894.
Great Britain ..	37,407,642	34,365,964	34,321,216
Foreign Europe ..	101,813	118,846	72,820
America ..	189,947	204,927	107,237
Asia ..	1,200,593	1,298,221	914,736
Australia ..	1,723,659	1,913,217	1,402,120
	40,623,654	37,901,175	36,818,129

(From *Watson, Sibthorp & Co.'s Tea Report*)

CALCUTTA, Aug. 25.

27,739 packages of tea changed hands in the sales held on the 20th inst. In sympathy with London the market was not so active as it has been lately, and prices, although very irregular, generally displayed a downward tendency. The demand for the Colonies, Bombay and other places was strong and kept the range of rates for suitable grades very steady.

The average price of the 27,739 packages sold is As. 8.0 about 8½d. per lb. as compared with 15,513 packages sold on the 22nd August 1895 at As. 7.11 or about 8½d per lb. and 18,994 packages sold on the 23rd August 1894 at As. 9.0 or about 9½d per lb.

The exports from 1st April to 22nd August from here to Great Britain are 41,143,365 lb. as compared with 40,073,207 lb. at the correspondent period last season and 38,473,925 lb. in 1894.

NOTE.—Last sale's average was As. 8.5 or nearly 9½d.

TELEGRAMS.—Reuter telegraphed from London on the 17th inst.—"Type" 7 15-16d, on the 18th—"Type" 7 13-16d on the 20th,—Offered 35,000, sold 32,000 packages. Rather less request and prices irregular. Average 10 l. "Type" 8d, and on the 21st—"Type" 8d.

EXCHANGE.—Document bills, 6 months' sight, 1s 2½d.

FREIGHT.—Steamer—£1-3-9 per ton of 50 c. ft.

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce).

Colombo, Aug. 31st, 1896.

EXCHANGE ON LONDON: CLOSING RATES, Bank Selling Rates:—On demand 1/2 3/32 to 1-16; 4 months' sight 1/2 1/2 to 3-32; 6 months' sight 1/2 1/2 to 5-32.

Bank Buying Rates:—Credits 3 months' sight 1/2 1/2; 6 months' sight 1/2 9-32. Docts. 3 months' sight 1/2 9-32; 6 months' sight 1/2 5-16.

COFFEE.—Plantation Estate Parchment on the spot per bus., R16'00 to 17'00. Estate Crops in Parchment, delivery R85'00 to 87'50. Plantation Estate Coffee, f.o.b. on the spot per cwt, no quot. THE AGRICULTURAL MAGAZINE, COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for September:—

Vol. VIII.]

SEPTEMBER, 1896.

[No. 3.

SEASON REPORTS FOR JULY.

WESTERN PROVINCE.—Yala paddy crops thriving well, and harvest prospects good; dry grains sown to a small extent, but good; rainfall deficient, but better towards end of month; fruits and vegetables scarce, except in Rayigam Korale.

CENTRAL PROVINCE.—Maha cultivation commenced in Kandy district, fair yala crop; in Matale yala cultivation very successful; in Nuwara Eliya ploughing and sowing going on; prospects of dry grains, where cultivated, good; rainfall, generally sufficient; fair supply of fruits and vegetables in Nuwara Eliya. *Stock.*—Some foot and mouth disease.

NORTHERN PROVINCE.—Paddy crops, good average; tobacco harvest over in Jaffna, prices low; rainfall deficient.

SOUTHERN PROVINCE.—Paddy fair in Galle except in Hinidum Pattu; poor in Hambantota, except under Tissa; but good in Matara; dry grains, good or fair; fruit and vegetables, fair supply; some rain in Galle, very slight in Hambantota; a few cases foot and mouth disease in Wellaboda Pattu.

EASTERN PROVINCE.—Paddy prospects in Trincomalee good; tobacco stock sold for good prices and exhausted; rainfall very heavy in Batticaloa; fisheries good; health of stock satisfactory.

NORTH-WESTERN PROVINCE.—Paddy crops and prospects good in Kurunegala, but want of rain has interfered with cultivation in Puttalam; good crops expected in the central Chilaw division, but the want of rain is felt in the southern division,

and many fields have consequently been abandoned; foot and mouth disease in some parts, murrain decreasing in Katugampola but prevailing in Dambadeni Hatpattu.

NORTH-CENTRAL PROVINCE.—Weather dry; yala crop being reaped in Tamankaduwa, in other parts in various stages; murrain among cattle decreasing, foot and mouth disease broken out.

PROVINCE OF UVA.—Maha harvest good or middling; weather dry; vegetables scarce, and fruit scarce except in Wellassa: foot and mouth disease in some districts.

PROVINCE OF SABAGAMUWA.—Prospects of yala paddy crop good, preparation for maha crop commenced; weather favourable for all crops; foot and mouth disease on the decrease.

Greatest amount of rainfall in any 24 hours on the 27th, Thursday, '81 inches.

Recorded by M. W. K. BANDARA,

THINNING OF FRUIT.

The thinning of fruit is an important operation, particularly where the individual fruits in a bunch are, as often happens, much crowded together. One of the chief results of pruning is that the sap which is dissipated over a large number of branches is reserved for the development of a few chosen ones, with the result that the latter are rendered more robust and fruitful. A similar result follows the operation of thinning fruit, for by the removal of surplus fruit, what is left is allowed to develop more perfectly. Again, where there is overcrowding in bunches, light and air are not equally supplied to the individual fruits, some of which become totally shut out from the influence of these necessary agents, which control proper development and maturing.

Some object to thinning in vine cultivation on the score that a bunch of grapes is itself a fruit, and therefore will not suffer being interfered with. This is a fallacy, which those who are unacquainted with structural botany are apt to accept as fact. A bunch of grapes is no more a fruit than a bunch of plantains or a bunch of coconuts. A fruit is the product of a single flower, and the fruits of the grape vine are true berries. There are such things as collective fruits which result not from a single flower but from a number of flowers. Instances of these are the fruit of the fig, jak, and pineapple. Botanists are careful to warn us against the fallacy above alluded to. For instance, in the text-book of structural and physiological Botany by Thomé and Bennet, special reference is made to the fruits of the grape vine as follows:—"The product of an inflorescence such as a bunch of grapes is not a fruit but rather a group of fruits, each separate berry or grape being a distinct fruit." Those of our readers who have seen the marvellously perfect grapes to be met with in fruiterers' shops in London, and are aware of the high prices they realize will not readily condemn the process of thinning which, as a rule, the English gardener adopts. A gentleman who has had great experience in growing table fruit writes to us:—"Thinning is a very necessary and important operation in grape-growing, if handsome bunches and good-looking and well-flavoured fruit are desired." In growing for wine, the necessity for thinning does not arise.

Mr. F. M. Bailey, F.L.S., the well-known Colonial botanist, in his "Half-Century of Notes for the Guidance of Amateur Botanists" has the following note on thinning of fruits:—"If we were not aware of the fact, a glance at the bulk of fruit brought into the city of Brisbane for sale would at once show to the practical gardener or fruit-grower that little or no attention was being paid in Queensland to this most important operation. The exhaustion consequent upon the production of seed is a chief cause of the decay of plants. This explains why fruit trees are weakened or rendered temporarily unproductive, and some killed, by being allowed to ripen too large a crop of fruit, or to 'over-bear' themselves, as it is termed. It is to be sincerely hoped that amateurs, who one may hear often boasting of the breaking down of these trees from the weight of fruit, will bear this in mind. All who understand anything of the subject of fruit-growing consider

that thinning is one of the most important of operations. It should be done with a bold and fearless hand, and the perfection of that which is left on the trees will amply reward the owner at the harvest time; and his reward will not only be in the superior fruit, for the trees being kept unweakened from over-bearing will be enabled to mature their wood, and deposit their store of sap to aid in the production of the following year's crop. Allow the air and light to get round each fruit, and less harbours will be found for the lodgement of insect life."

[Since the above was written we have been favoured with a communication (which we also publish in the present issue) from Mr. W. Nock, Acting Director of the Royal Botanical Gardens, and a horticulturist of large experience, whose opinion on the subject of thinning grapes should dispel any doubts as to the efficacy of the process from the minds of local vine growers.—Ed. J.M.]

OCCASIONAL NOTES.

The article on "Ceylon Bee Culture" gives a record of what has been hitherto done in the island in the way of bee-keeping, and should prove interesting to intending apiarists. So far attempts at improved bee-keeping cannot be said to have been attended with marked success, but that is no reason why the industry, which has been established elsewhere, should not with greater care and perseverance than has hitherto marked attempts at bee-keeping in Ceylon, prove both possible and remunerative with us. In our next issue we hope to refer to the experience of another Ceylon apiarist, and also touch on the subject of hives.

We have been favoured with a copy of the Annual Report of the Sericultural Experiments for 1895-1896, undertaken at the instance of the Department of Land Records and Agriculture, Bengal, and a number of other periodical reports by Mr. N. G. Mukerji, specialist in sericulture. We hope to deal with these papers in our next issue.

By arrangement with the Hull Oil Manufacturing Company, Limited, we shall shortly undertake a series of experiments with the highly-spoken of Homco Rape Meal Manure so well reported upon by Dr. Bernard Dyer. The manure (to which reference was made in our last issue) is well suited to take the place of castor cake, and we shall be glad to have the co-operation of coconut planters and others in giving the fertilizer a fair trial.

The Patent Sultan Water-lift which we referred to and described in our issue of February, 1895, appears to be rapidly gaining popularity. A communication from the Superintendent of the Government Gardens, Bangalore, speaks in high terms of the lift, which we should greatly desire to see given a trial in Ceylon.

In our last issue, Mr. E. T. Hoole refers to the desirability of introducing some improved form of Sowing Machine to the notice of the grain cultivators of Ceylon. Some time ago we communicated with Messrs. Lankaster & Co., the well-known implement makers, with reference to their broadcast hand seed-sower. The Manager of the firm, in replying to us, wrote:—"We have no doubt that this machine would suit the needs of the rice

growers of Ceylon." He informed us, further, that the machine, which costs one guinea in England, can be sent by parcel post for about 5 shillings.

That a beginning has been made of Entomological work in Ceylon is a matter to be thankful for. The co-operation of foreign entomologists is not wanting, and we ourselves have received letters from England with reference to entomological research in the island. Miss Eleanor Ormerod, writing to us a few years ago, strongly urged the necessity for noting down the habits of the most injurious insects in the island, and collecting these notes in a report with figures and correct scientific names as well as popular names; giving us the assurance "If I could, I would most gladly help you." Lately, came a request from Mr. G. F. Strawson for information as regards insect and fungoid pests, with the remark, "The request I make would probably prove of advantage to your growers, as I devote the whole of my time to these subjects, and I should like to have the fullest information as to what is going on in Ceylon."

A fresh demand would appear to have arisen for ploughs, not for use in paddy land, but on coconut estates particularly. During a late tour in the Kurunegala district we saw a number of English ploughs which are drawn by elephants on one of the many estates belonging to the De Soysa family in that district. On application for ploughs being made to the School of Agriculture, some of the larger implements which were given a trial in the early days of the school and found too heavy for work on paddy land, were sold with the sanction of Government. A coconut planter in the Kurunegala district purchased four Swedish ploughs, and another in the Mirigama district took over three turn-wrest ploughs. Since then a planter in Nuwara Eliya has taken a couple of ploughs on loan for use in the cultivation of corn as food for sheep. We have had some light ploughs made locally, weighing about 24 lbs., and costing less than Rs 15, which have worked and worn well at the school.

THE INSPECTION OF MEAT.—II.

BY G. W. STURGESS, M.R.C.V.S., &c., Government
Veterinary Surgeon.
(Continued.)

HORSE FLESH

is rather coarser in texture than beef, dryer, and darker in colour. It has rather a sweet taste, and it possesses a peculiar sickly odour which becomes more pronounced in two or three days. Sometimes the bones are taken out in order to deceive people and make it resemble beef, the term "Boned Horsesh" being then applied. The fat is a very good guide being of a deeper yellow colour and softer in consistence than the fat of the ox.

It is not unfit for food when fresh and the animal healthy previous to death. On the Continent it is largely consumed as food, and to a great extent in some of the large towns in England. It is allowed to be sold, but the person selling must put up a notice to that effect over his shop printed in letters not less than four inches long. It is illegal to sell it for any other flesh.

Regarding the age of the animal a note may not be out of place. If the carcass is whole (with the head on) of course indication of the age is afforded by the teeth, otherwise only an approximate estimate can be formed from the appearance of the bones. In rather young animals the bones are comparatively larger, the ends more expanded, and they are softer and more easily cut than in older animals. Also, they are slightly darker red in colour, especially at the ends. In the case of poultry the leg bones break more easily in young than in old, and the beak is not so hard and tough as in older birds.

Marketable and Unmarketable Flesh.

Flesh may be said to be unmarketable when it presents any abnormal appearance, although it may not be unfit for food. It may be used privately. For instance, a comparatively thin carcass might be consumed privately, but should not be exposed for sale to the public. In one part of the country flesh is eaten that would be refused in another. Any flesh that is likely to produce harmful results in human beings should be condemned, also the flesh of any animal that has suffered from any disease transmissible to man.

Flesh that should be Condemned.

The flesh of an animal that has suffered from inflammation of any important organ, especially where it has led to mortification, or from *Pyæmia*, *septicaemia*, (blood poisoning), *Erysipelas*, *uraemia*, (urine poisoning), *Anthrax*, *variola*, (cowpox or sheepox), *Trichiniasis* (a disease caused by minute worms lodged in the muscular tissue, especially in the pig).

Flesh of animals that have suffered from *Glanders* or *Farcy*, and from *Hydatid disease* (resulting from tapeworms where little bladders containing a clear or straw-coloured fluid are found in the internal organs and tissues); *advanced stages of swine fever*, *cancerous diseases*, *tuberculosis* (or consumption); *flesh showing advanced stages of muscular disease*, or that has undergone *putrefaction*; or *flesh that gives evidence of dropsy*.

The administration of certain medicines to animals imparts an odour to the flesh and renders it unfit for sale; for example, such medicines as ether and turpentine give their characteristic odour to the flesh of an animal that died or is killed soon after a few doses.

In the examination of meat the internal organs must, if possible, always be obtained and their condition compared with that of the flesh.

There are various other organs and glands, whose examination is of the greatest importance, such for instance as the Lymphatic glands and the Haemolymph glands in certain animals. These can only be found and examined by an expert, and their enlarged, softened, discoloured or dropsical appearance determined by those conversant with the healthy or normal appearance.

The flesh should be carefully examined for dropsy, any undue moistness exciting suspicion.

Lining the inside of the cavity of the chest and the abdominal cavity a thin glistening membrane will be found. It is nearly transparent when healthy and slightly moist when the animal is freshly killed. In cases of pleurisy or tuberculosis this membrane is generally diseased.

In pleurisy it becomes thickened, opaque-red in colour, or it may be covered with coagulated

lymph. In tuberculosis it is also thickened and presents a warty appearance, little growths being found all over it, sometimes in bunches.

This membrane should be looked for because a dodge called "stripping" is practised, that is, carefully peeling it off to hide indications of disease. Stripping must always be regarded with suspicion, it is either performed to hide the diseases just mentioned or to remove the green stain caused by food which has escaped from the stomach or intestines. Again, it is resorted to, to remove the green colour arising from putrefaction.

The proper "setting" of the carcase is interfered with in disease, and in warm damp weather, or when the animal has been exerted or exhausted before death.

Abnormal Appearances of Flesh.

WHITE FLESH.

Very white flesh may be an evidence of bad nutrition, dropsy, anaemia or of general fatty disease. It may generally be taken as an indication of interference with the proper oxidation of the blood, probably some chronic lung disease. A localised white appearance may be the result of a muscular strain, and does not render the remainder of the flesh unfit for food.

Pallor of the flesh is also seen in animals that have died from choking, or from being over-driven prior to slaughter.

(To be continued.)

"NITRAGIN," OR THE USE OF PURE CULTIVATION OF BACTERIA FOR LEGUMINOUS CROPS.

The last number of the "Journal of the Royal Agricultural Society of England" contains an interesting contribution by Dr. Voelcker on the above subject.

How cultivated leguminous crops obtained their supplies of nitrogenous plant food and enriched the soil in these constituents for the succeeding crop, while themselves apparently independent of nitrogenous manuring, was, until the recent discovery of Hellriegel, a question that baffled scientific investigators. While the earlier experiments of Boussingault, confirmed as they were by those of Lawes, Gilbert, and Pugh in 1857, led to the conclusion that plants could not assimilate the *free* nitrogen of the atmosphere, it remained a fact well-known to practical men that a crop such as clover, under favourable conditions, grew well without nitrogenous manuring whatever, and that nothing proved such a good preparatory crop and manuring for a cereal such as wheat—an essentially nitrogen-requiring crop—as did a leguminous crop. As long ago as 1868 the late Dr. Voelcker showed as the result of direct experiments that during the growth of clover nitrogenous organic matter was stored up in the soil; that this increase took place where root fibres were most abundant; and that the nitrogenous matter gradually decayed and formed nitrates, in which state they were ready to be taken up by the succeeding cereal crop. He further indicated his belief that in some as yet unexplained way the atmosphere contributed directly to the accumulation of nitrogen in the soil in the case of these nitrogen-supplying crops. In 1886, however, Hellriegel, with his fellow-worker Wilfarth,

supplied the true explanation, viz., that certain leguminous crops are able, by means of "nodules" which form on their roots, to fix the free nitrogen of the atmosphere. The precise nature of the nodules was further ascertained by Beyerinck, who found that the nodules of even the most widely different kinds of leguminous plants contained bacteria, which agreed so nearly with one another in their external properties, that he described them as belonging all to one species, to which he gave the name of *Bacillus radicola*.

Such a discovery as that of Hellriegel, naturally turned the thoughts of investigators to the consideration of the bearing it would have upon the practice of agriculture, and how it might be utilised. The name of Dr. Nobbe, the distinguished scientist, has been chiefly associated with this development, particularly after Hellriegel's death. If the conditions had been discovered under which leguminous crops could assimilate the free nitrogen of the atmosphere, was it not possible to ensure that these conditions should be always present, and that the atmosphere should be, as it were, laid under contribution to supply *gratis*, for the benefit of crops that nitrogen which it contains in such abundance, but which is practically sealed to all crops, save those leguminous ones which possess the power of fixing it? This was the question which Nobbe set himself to solve, with the result that as recently as February 19th of the present year, at a meeting of the German Agricultural Society held in Berlin, Dr. Theil was able to make the interesting communication that Nobbe's work had culminated in the production, *on a commercial scale*, of bacteria for agricultural purposes. It was further announced that arrangements had been entered into with one of the largest firms of chemical manufacturers in Germany whereby the preparation of special inoculating materials for particular leguminous crops was to be carried on at these works, and that in a short time the works would be able, as a matter of business, to supply the preparations to anyone who might apply. To the leguminous inoculating material the name "Nitragin" was given and the designation duly registered. The word should therefore not be confounded with the English word "Nitrogen," since "Nitragin" applies generally to all the inoculating materials employed for special leguminous crops.

When the news of this discovery reached England, the Royal Agricultural Society felt much interested in it, and directed Dr. J. A. Voelcker to investigate the matter on the spot, and to obtain what information he could about it. Accordingly, about the middle of April, he went to Höchst, and also subsequently visited Dr. Nobbe and others who had been at work on the subject. At the Höchst Fabrik he was given every facility for obtaining the required information, and there saw the actual preparation of the "Nitragin," and its production on a commercial scale, and in a form in which it could be put on the market and be utilised directly by agriculturists. The material had for only a week or two previously been thus prepared, but it was then obtainable for general use, and at one or two places had already been tried on ordinary agricultural soils and on a practical farming scale.

In our next issue we shall give further details with reference to the nature and preparation of "Nitragin."

PRUNING.

(Continued.)

When a branch is very weakly in appearance and there seems little hope of improving its condition, or if it is badly attacked by some fungoid disease, it is advisable to remove it at once instead of allowing it to die on the tree. By such interference the neighbouring branches will be benefitted, for the sap which had been appropriated by the weakly or diseased branch, and was practically wasted before will go to further nourish and help in the development of the remaining branches.

I have so far endeavoured to show how rational pruning will add greatly to the *vigour* of the tree which should have our first attention. This result obtained we are free to think about and operate for fruit. But we must first recognise the fact that an exuberance of sap in a branch tends to force its buds to produce wood. Hence it is that those branches where there is an affluence of sap produce more wood, while those which have a more moderate supply produce more fruit and less wood; therefore, when we notice a branch producing too much wood we must artificially obstruct the too free circulation of sap in its direction by, for instance, bending the branches towards the horizontal so as to force it into fruit by this means. On the other hand if wood is desired let the branch be brought to as vertical a position as possible, and the supply of sap confined to two or three buds only. The greater the obstacles to the free circulation of sap the greater will be the production of fruit in that branch or plant. Trees begin to form buds for fruit after a certain number of years. What the fruit grower has to do in order to check the free circulation or dissipation of sap and to induce production of fruit is to prune short at laterals and long on secondary branches. He should also arch or bend the vigorous branches as much as possible, occasionally expose the roots and fearlessly mutilate the thickest and most vertical roots which go deepest into the ground.

The more we force our trees into bearing the more we weaken them, while the more we treat them for wood, the more vigorous we make them. It is hence of the first importance to the fruit grower to know how to maintain the proper mean between fruit and wood, the health and durability of a tree depending upon the treatment directed towards this end. In doubtful cases it is better to give up pruning a branch for fruit than one for wood; for what we may lose this year will be gained in increased fruitfulness in the future.

Where buds that produce wood are more numerous than those which produce fruit, naturally a larger proportion of sap will go to the former, and the crop will suffer. This is why in plants of moderate vigour we find better specimens of fruit than in very vigorous or rank-growing trees.

Trees or their branch to which light, air and heat have not free access will be found to be weak. They will only grow in stature and produce neither new wood nor fruit. This is why it is advisable to give tree a symmetrical form, so that all the component parts of the tree may

benefit by the action of light, air and heat, which are necessary agents for their health and strength.

All wood will not produce buds unless forced by the knife or by some interference with the new wood it carries. This is why orange and lemon trees, as grown here, bear good wood only from 11' to 20' from the ground, whereas if properly treated they could be made to do so at 6' with much advantage.

C. ZANETTI.

BEE-KEEPING IN CEYLON.

In his work entitled "Eight Years in Ceylon," Sir Samuel Baker refers at some length to Ceylon honey bees, of which he himself recognised four distinct varieties. He describes the Bambara as the largest and most extensive honey-maker, and refers to its comb as hanging from the bough of a tree like a Cheshire cheese, being about the same thickness but 5 or 6 inches greater in diameter. He goes on to say that the honey of this bee is not so much esteemed as that from the smaller varieties, as the flavour partakes too strongly of the particular flower which the bee has frequented, so that the honey varies in different seasons, and is sometimes so highly aperient that it must be used with much caution. So partial, he says, are these bees to particular blossoms that they migrate from place to place at different periods in quest of flowers that are then in bloom. The next honey-maker he recognises as very similar in size and appearance to the hive-bee of England. This variety, he remarks, forms its nest in hollow trees and in holes in rocks. Another bee he describes as similar in appearance but not more than half the size of the last-named, suspending a most delicate comb to the twigs of a tree. The nest he says is no larger than an orange, but the honey of the two latter is of the finest quality and quite equal in flavour to the famed "miel vert" of the Isle of Bourbon.

Referring to wax, Sir Samuel Baker states that in 1853 the export amounted to more than a ton, and he considers that a great deal more might be exported, but for the habit which the natives have of consuming the wax with the honey.

The honey bees of Ceylon are the *Mi-messa* (*Apis indica*), Bambara (*Apis dorsata*), Danduvel (*Apis florea*)—all belonging to the family *Apidae*—and the kana-veyiya which belongs to the family *Trigona*.

The last-named does not demand much notice as it is practically of no value as a honey gatherer. Mr. Benton* describes them thus:—The worker of this bee is $\frac{1}{8}$ inch long, has a large head and a small blunt abdomen, the wings being longer than the latter. They are black with one light-coloured ring on the abdomen, which is also light-coloured underneath, stingless, very active, and gather pollen and honey. The strength of the worker is very great. The queen is dark yellow, and has an immense abdomen, her wings not being strong enough to lift her body into the air when the ovaries are filled with eggs. The worker cells of this bee are about half the size and of the shape of short, plump grains of wheat, and are placed in irregular bunches with passages between; the pollen cells or honey cells are fully

* An American apiarist who visited Ceylon,

as large as good sized peas, and each forms a group of its own. These bees are said to sometimes build a tube a foot long and $\frac{1}{2}$ to $\frac{3}{4}$ inches in diameter, composed of particles of wood glued together with some resinous gum. Through this tube the bees enter. The kana-veyiya, according to Jayatilleke Mudaliyar, produces a small quantity of honey which it collects in the hollows of old bees and crevices of rocks or dilapidated buildings. The combs do not yield more than a tea-cupful of honey which has rather an acid taste and is only used for medicinal purposes. The combs are generally about 4 or 5 inches in circumference. They are said to be perfectly harmless and easily handled. This is no doubt the same bee referred to by Sir Samuel Baker as little smaller than a house-fly and building in the hollow of a tree "where the entrance to his mansion is a hole no larger than would be made by a lady's stiletto." The honey, Sir Samuel describes as "thick, black, and rather pungent but highly aromatic molasses."

Of the genus Apidae, the only species that is in any way cultivated, is the mi-messa, the common honey bee of Ceylon which is too well known to need minute description. The following is the method of bee-keeping in vogue among the natives as described by Mudaliyar Jayatilleke in the paper he read before the C.B.R.A.S. some years ago:— They sweeten the pot to be used as a hive by fumigating it with resin and place it in a cool elevated position, smearing the mouth of the pot with a little honey during the swarming season. The wild bees take to them without the least trouble and begin building their combs and filling them. When the proper season comes round the pots are broken and blown into to drive out the bees and all the honey as well as the brood combs abstracted. The honey is of course retained but the combs thrown away with the result that a great waste of material and reckless destruction of bee-life is caused. When the next swarming season comes round, which is between March and April, a fresh pot is set up in the manner described and in the same position for the next supply of honey which is obtained in July or August. The largest supply obtained by the natives in this way is said to be about 3 or 4 bottles. The wild bees build in the crevices and hollows of rocks and trees, and if the combs are not abstracted by hunters at the proper season, they themselves consume the produce and abandon the empty combs, betaking themselves to the woods. It is firmly believed by the natives that when the swarming season comes round the bees return to their old haunts and set to work again.

The Danduvel (*Apis florea*) is called by Mudaliyar Jayatilleke an unprofitable bee producing very little honey. It attaches its solitary combs, 9 in. by 5 in., to the branch of a tree. The honey from this bee is esteemed by the natives as being cool and nice, but the species is not considered to be at all adapted for rearing purposes, as its produce is very scanty.

Mr. Benton mentions that he did not see this bee, but that a piece of its broad comb which he secured was half an inch thick and showed hexagonal wax cells eighty-one to the square inch of worker comb, while the drone comb had twenty-five. The workers, he concluded, must then be about the size of *Apis indica*, but much more slender, being in fact quite wasp-like in shape, although the drones are

on doubt quite as large, if not slightly larger, than those of *Apis indica*. This bee is said to build a single comb which it attaches to the branch of some tree or to the horizontal timber of a building. I think, says Mr. Benton, that under favourable circumstances it will, like other species of the same genus, build additional combs parallel to the first.

It was in 1881 that Mr. Benton visited Ceylon with the object of studying the characters of Ceylon honey bees and securing stocks of them. He declared that the Bambara (*Apis dorsata*) as "the most wonderful bee in the world," and recognised in it a splendid honey-maker. Through the help of Mudaliyar Samuel Jayatilleke of Kurunegala, Mr. Benton secured the stocks which he was in need of. He seemed to have satisfied himself that the Bambara is so much feared by the natives of Ceylon owing to its being confused with the Debara or large wasp, but that if intelligently managed in a manner which accords with its peculiar traits it will be found to be no more dangerous than the other species of the same genus.

The fate of the stocks of bees taken away by Mr. Benton from Ceylon is narrated in a letter written from Cyprus by the Apiarist to Mr. John Ferguson of the *Ceylon Observer*, where Mr. Benton states: "Upon my arrival in Beyrout the large bees, *Apis Dorsata* (Bambara) were still alive having withstood their long hot journey wonderfully well, showing great tenacity of life, so great as to surprise me. The box of little ones *Apis florea* (Danduvel-messo) were also in good order. I had fed both kinds with sugar during the journey. In Beyrout both were permitted to fly. The large bees seemed restless even when the air was cool towards night, and many came out and died, while the small ones were more prudent and only flew out when the air was warm. As a result the former dwindled away, while the latter were still in good order when arrived in Cyprus two weeks later. But an accident happened, soon after my arrival here, to the queen of my little bees, and now they are no more."

It is curious that Mr. Benton should have taken away with him a stock of *A. florea* (Danduvel), the least important of Ceylon bees, as he himself has stated, and not of *A. Indica* (Me-messa) the common honey bee of Ceylon, which is the only one at all cultivated. Indeed, the Editor of the *Ceylon Observer* referring to Mr. Benton's visit writes: (1) Mr. Benton. . . returned to Colombo. . . with some colonies of Bambara (*Apis dorsata*) as well as of the small *A. Indica*." And again (2) "We hope to hear of his (Mr. Benton's) safe arrival there (in Cyprus), and also of the safe arrival of his interesting charge, which will then probably be the first introduction of the *Apis Dorsata* and *A. Indica* into Europe;" while in a contribution written by Mr. Benton to an American Journal he himself states: "I did not see the bee which the natives call by this name (Danduvel-messo, the name heading the paragraph). On the occasion of Mr. Benton's visit to Ceylon he introduced some Cyprian bees into the Island. These bees are reported in the *Tropical Agriculturist* of June, 1881, to be flourishing well with Mr. W. H. Wright (at the Aviary, Colombo) and Mudaliyar Jayatilleke (Kurunegala). Mr. Wright's experiments were not attended with success. He

is good enough to inform me in reply to a letter I wrote him, that he purchased hives from Mr. Benton at R50 each, and also kept several native hives, but regrets to say that he has not been successful in getting much honey. He fears the climate in Ceylon is not very favourable to apiculture. His experience is that the bees gather honey to be consumed by them during moon-lit nights, leaving only some of it for the use of their young during dark-night seasons, which is the only time the honey can be gathered, and what is secured is not very much. Mr. Wright still keeps a few hives on his Mirigama property, but gets no more from one pint to a quart at a time.

In 1882 some German bee-keepers addressed a letter to the Imperial German Consul at Madras applying for stocks of the Bambara bee to which their attention had been drawn by Mr. Benton, with the object (1) of domesticating it, and (2) of crossing it with the *Apis mellifera*. The possibility of this crossing was, however, scouted by Mr. Benton himself. There is no evidence forthcoming as to whether the required stocks were supplied.

A correspondent signing himself "Honeydew" details his experiences in his attempt to domesticate the Bambara in the *Tropical Agriculturist* of September, 1882. Though he had a hive made, as he describes it, "alter the English pattern with sliding frames, glass top, &c." he did not meet with success, for while the bees fed heartily on the honey supplied to them during the dull weather, they all took wing on the first bright sunny day. "Honeydew's" way of securing a swarm is amusing enough. He advises that you should proceed at night with a servant and a pair of pyjamas:—"First, tie up the legs of the article of apparel, then gently put the top part over the bees close up against the rock, then with a stick cut away the bees as they hang and they all fall down in a mass, when by pulling the tape of the pyjamas the top is closed and there you have them." Having removed them they are let out of captivity into the hives by one of the legs.

In 1890 Mr. A. W. Jayawardene, late headmaster of the School of Agriculture and now a notary practising at Madampe in the Chilaw district, contributed some notes on Bee-culture to the *Agricultural Magazine*.

Not long after the publication of Mr. Jayawardene's notes, a letter was contributed to the *Ceylon Observer* of 18th June, 1890, by Mr. Joseph Holloway of Wattedagama, who referring to the statement made by Mr. Jayawardene that the Bambara cannot be domesticated, gave his own experience as follows:—"I had a swarm of Bambara in 1883 for months in a hive (latter made and sent out from Germany) kept in the verandah of my bungalow on Maria Estate. These got as tame as any bee ever will be, made their comb, deposited their honey in the upper, and had their brood in the lower part of the hive. Many visitors came and inspected them. The hive was always open, and the bees could easily have got away. . . . Unfortunately they swarmed during my absence from the estate, and the cooly-gardener was frightened to catch them again as I ordered him to do, and lost them.

Mr. Holloway mentions that Mr. R. Dathe of E-strup, Hanover, the largest bee-keeper in the world, came to Ceylon to secure a swarm of the

Bambara in 1883. This apiarist stayed with Mr. Holloway, and after remaining some two months left with about seven hives full. Most of the bees died on the way to Jaffa, and the balance which were fed on sugar, honey and water after leaving the hives and returning to it on two occasions abandoned it entirely on the third. "Since then," says Mr. Holloway, "Mr. Dathe of E-strup and Mr. Zamalier of Jaffa have pressed me much to send them a swarm of Bambara which they say would be worth £50 in Germany. The difficulty is to get someone who understands how to feed them and keep the hive free from insects, and would not be afraid of a sting. It is on account of the latter that I had to give up bee-keeping, though I made a good start with Egyptian bees brought over by Mr. Dathe and our own bees."

THINNING GRAPES.

On a recent visit to the Agricultural School I was much struck with the fact that no attempt had been made to thin, either the bunches or the berries in the experimental plot of vines, and knowing from practical experience how the neglect of this work tells on young vines—or in fact on all young fruit trees—I have been led to make the following remarks which I trust may be of some use to those now experimenting with the cultivation of grapes.

In order to obtain healthy, well-developed and good-flavoured fruit for the table, it is absolutely necessary that the bunches and berries be early and carefully thinned. This operation requires patience, boldness, and a light steady hand.

The proper time to commence is as soon as possible after the flowers have set. The work when done at this time will save much wasteful expenditure of energy on the part of the vines, and will prove of great advantage in the making of large and handsome fruit.

The first thing to consider is whether the variety about to be thinned has long or short foot-stalks. If the latter, the thinning should be more liberally and evenly done. The berries of those varieties with the greatest length of foot-stalk should be left much closer together at the shoulders, as the berries will force each other upwards and outwards as they increase in size.

The tools required are a pair of grape scissors, a clean light stick and some good tying material. The inner bark of *Hibiscus tiliaceus*, the "Belipatta" of the Sinhalese is just the right thing for the purpose. This material was brought to my notice by Mr. Charles Byrde of Ambalangoda, and through his kindness in sending me a supply I have been able to experiment with it and have proved it to be excellent in every way and a first-rate substitute for the "Cuba Bast" so much used by horticulturists in Europe. It is a common wild plant in the low-country near the coast and the fibre is easily prepared.

To commence the actual work of thinning we should begin by tying up the shoulders, bringing each up to a horizontal position and, arranging them at equal distances all round. These will require 1, 2, 3, or more ties according

to their size and estimated ultimate weight. The ties should be about an inch apart so as to give full support and prevent the shoulders from being broken off (when the berries swell and gain weight) where the tying material is fastened. Should the bunches be large, the second tier of shoulders must be tied up in a line with the centres of the angles formed by those above, and so on until the bottom is nearly approached. This tying up which is only required in large bunches is the most tedious part of the work.

Commence thinning the berries from the base, gradually working up to the top, and cut away all the smaller and inner ones until the berries left are about an inch apart, which, in most cases, will be found to be about the right distance to allow for the full development of the berries. Great care must be exercised in guiding the scissors, so that the points do not prick the fruit, and the central berry of each small cluster must be carefully preserved. At the lower part of the bunch this is generally the only one necessary to leave. The thin smooth stick may be used with the one hand to steady the bunch, while the other guides the scissors in cutting out the berries. It is better not to touch the berries at all with the hand.

If the vines are weak, or if the bunches have set too thick, the bunches will also require to be thinned. If the vine is healthy about 1 lb. of fruit may be left to each foot-run of rod.

In England, where grapes are grown largely for market, the thinning of the fruit often makes the difference between a paying and non-paying crop, especially in a wet season when an extra thinning is beneficial, as it causes the air to circulate among the berries and allows water to pass off without lodging and causing decay, as it would do if the berries were pressing hard on one another.

W. NOCK.

SERICULTURE.

Before giving a short account of some of the better wild silks in India, it would be well to mention that experiments have been carried on in Ceylon from time to time both in raising the wild silkworm as well as the domesticated varieties. But these experiments it would appear have not been followed with any appreciable success.

Dr. J. L. Vanderstraaten, in a paper contributed by him to the Journal of the Ceylon Branch of the Royal Asiatic Society in 1881, makes mention of some of these attempts. So far back as 1663 it appears from Valentyn's History of Ceylon, that "in Jaffnapatam experiments are made to nourish the silk-worm and obtain by it a source of livelihood. Mulberry trees have been planted here and in many other places, and they appear to thrive well. In January and February worms are transported from Jaffna, and other small insects can be collected here. These are occupations which are interesting and can be undertaken with little pains and at small cost."

Dr. Vanderstraaten also gives extracts from other works on Ceylon which have reference to Sericulture. In March, 1740, Governor Van Imhoff left the following memorandum on silk. "Silk has not been so successful as we anticipated when we began to grow it here." It is also mentioned that on the site of the village now known

as Sedawatte, the first experiment in Sericulture was made by the Portuguese. The name Sedawatte means silk garden. Later on in 1879 Rev. Father Palla of the Roman Catholic Mission made attempts to raise the mulberry silkworm at Galle. In November, 1879, Father Palla applied to His Excellency the Governor, Sir J. R. Longden, to use his influence in obtaining a supply of eggs from China or Japan. In December, 1880, the first supply was received from Yeddo and handed to Father Palla. They began to hatch a few days after they were exposed to the air in a ventilated room. The caterpillars were kept in little paper boxes containing tender mulberry leaves.

The late Mr. Geddes, who was the Editor of the *Catholic Messenger*, carried on experiments in raising silk-worms at his garden at Parratte in Moratuwa. It appears from a letter which is published in the Royal Asiatic Society's Journal already referred to, that he succeeded in obtaining silk from cultivated as well as wild varieties, but it is doubtful whether the undertaking was a commercial success.

I have already noted in my previous paper that the three important varieties of wild Indian silks are the Tusser, the Muga, and the Eri worms.

The Tusser silk-worm is the most important of the Indian wild silks; it occurs in the forests of the lower plains. The Tusser goes through its metamorphosis twice a year. The worms hatch out from the eggs about the ninth day. They live and feed for from thirty to forty days passing through five moults at intervals of from five to eight days. After twenty-one days from the commencement of the spinning of the cocoons the moths come out. The cocoons are very compact containing a large amount of coarse buff-coloured silk. They are often of a very large size attaining nearly 2½ inches in length and 1¼ inches in diameter. Dr. Watts, in his Dictionary of Economic Products of India, gives a list of the principal trees on which this worm feeds, and among others he mentions:—

Bassia latifolia var. Mahawa, a tree closely allied to the Sinhalese *Mi*.

Bombax malabaricum, Sing. Katu Imbul.

Careya arborea, Sing. Kahata.

Celastrus paniculata, Sing. Dahudu.

Chloroxylon swietenia, Sing. Buruta.

Eugenia jambolana, Sing. Maha-dan.

Ficus religiosa, Bo.

Lagerstramia indica and *L. parviflora*, Sing. Muruta.

Ricinus communis, Sing. Endaru.

Shorea robusta, Sal.

Tectona grandis, Sing. Tékka.

Terminalia balerica, Sing. Bulu.

T. catappa, Sing. Kottamba.

Zizyphus jujuba, Sing. Masan.

Mr. Geddes in a letter regarding this experience of the Tusser silk-worm at Moratuwa, mentions that the worm also feeds on Kaju (*Anacardium occidentale*), Weralu (*Eleocarpus serratus*), &c. Another plant which he mentions as *Katakaluwa* must be the Sing. Bovitya (*Melastoma malabathricum*).

W. A. D. S.

(To be continued.)

FRUIT CULTURE IN WESTERN INDIA.

The fruit-grower finds a ready market for his produce in Bombay. The large number of steamers that call at the harbour as well as the wealthy European and native population of the city readily purchase the large quantities of fruit that are daily brought to the city and offered for rather high prices.

Bombay is famous for its mangoes; in fact they are *par excellence* the first of the indigenous fruit of Western India. The best varieties are the *Alfonzo* or *Appus* which is classed as No. 1, and the *Piry* which is No. 2. The latter fetches from Rs 8 to Rs 12 per 100, and the former Rs 12 to Rs 15; and so a gardener who possesses a few dozen trees of these varieties can make his fortune in a few years.

A typically good mango should be sweet, fibreless, thin-skinned, fairly large but small-stoned, and have as little as possible of the turpentine-like flavour in it. All these qualities are pretty well developed in the two varieties mentioned above, especially in the *Appus*.

It is by grafting that the excellence of these two varieties is preserved, as it is too commonly found that seed-grown trees do not prove true to their kind. The method of grafting adopted by the Bombay gardeners is that by "approach," seedlings which are a year old being used as stock. They are grown in pots and hung on the branches for the purpose. The grafting is done pretty much in the same way as that adopted in Jaffna.

One should be very careful in the selection of mangoes, for neither their colour nor their smell is a test of their good qualities. Indeed, I might say that the proof of the mango, as that of the pudding, is in the eating! Some inferior kinds give out a better aroma and have a more tempting colour than the superior varieties. Strangers are often misled in this way, and new arrivals from Europe, when they once happen to be so duped, contract a prejudice against mangoes in general.

Mangoes even of the best variety must be fully matured and perfectly ripe before they are eaten. Some of the best kinds are quite sour before properly ripe, and if gathered before they have matured and kept to ripen, they do not develop their best flavours and are often insipid.

The question as to the relative excellence of the Bombay and Ceylon mangoes is rather a difficult one to decide, and some of my Bombay friends would not tolerate the idea of the latter being considered superior in quality. It may, however, be safely said that a few of the Ceylon varieties, especially certain grafted ones of the North, compare very favourably with Bombay mangoes. The real "Japan" mango, so well-known in Colombo, although it is so modest-looking and unassuming in appearance, is not a variety to be despised. The only objectionable feature in it is that it has a little too much of the turpentine-like flavour, and I have seen some fastidious persons soaking the pulp in coconut "milk" or juice before eating it, so as to get rid of this flavour.

A Ceylonese visiting Bombay will be surprised to find how much is made of the custard apple. Soon after the mango season is over in Bombay, custard apples begin to come in and take the place of the former fruit to a large extent. A custard apple tree is considered second only to

the mango as regards profit. The price of a dozen custard apples ranges from twelve annas to a rupee. The tree bears better in Western India than in Ceylon, because more care is taken about it there, and it is attended to almost as much as the orange or any other fruit tree that is usually grown in orchards. Considering the fact that this tree can be easily grown and without any great expense, it will be to the interest of the Ceylon fruit-grower to take to its cultivation; and once the general public acquire a taste for custard apples, there will be a constant demand for them. The custard apple is a much more agreeable fruit than the other two allied fruits of the Nat. Order *Anonaceae*, viz., the "sour-sop" and the "bullock's heart," the peculiar smell and sour taste of the former, and the rank, coarse flavour of the latter being objectionable to many. There is besides a common belief among the natives that the latter fruit when consumed largely brings on boils. None of these objections apply to the custard apple, and a stranger takes a liking to it very soon. But the fruit as we find it in Ceylon is small and requires much improvement which must be effected by careful selection and cultivation, and by introducing superior varieties from India or elsewhere if necessary.

Other fruits grown in and near Bombay in considerable quantities are the bananas, oranges, guavas, melons, the papaw, &c. The vine is grown at various altitudes, and the Black Hamburgh is reputed the best variety as regards flavour and regularity of bearing. English fruits such as apples and pears are brought chiefly from upcountry.

All these fruits find a ready sale in Bombay and here, in Ceylon, there is no reason why the case should be otherwise. With the large number of steamers that now call at Colombo, and with the increase of the wealthy European and native population in the metropolis, and the large towns in the Island, there is bound to be an ever-growing demand for fruit; and the supply must keep pace with it. Superior varieties of fruit if produced in abundance, especially in those parts from which the produce can be transported to the large town markets by rail, may be counted upon to yield good returns. By a system of careful selection, suitable cultivation, manuring, pruning and thinning out overcrowded fruits, many of the indigenous varieties of fruit can undoubtedly be improved and made to fetch higher prices in the market. Some trees that fruit earlier and later than the usual fruiting season should also be grown, if possible, so as to distribute the crops all through the year as far as practicable. Superior foreign varieties should be introduced in cases where the indigenous ones are poor; and grafting and budding should be resorted to as a means of improvement.

When we note the great strides made in America and Australia in fruit-culture, we cannot but admit that there are vast possibilities for a tropical and fertile Island like Ceylon for improving and developing the cultivation of fruits. And for some time to come, at least, there is no fear of the fruit-grower overstocking the home-market. But when we are threatened by such a crisis, then it will be time to think of sending out our fruit, preserved and tinned, to the foreign markets of the world.

THE NUTRITIVE PROCESS IN PLANTS.

(PROF. J. REYNOLDS GREEN, D.SC., F.R.S.)

Turning to more permanent stores than the cells of the leaf afford, how, for instance, is the structure which we know by the name of potato formed? When we cut it we find that, though bulky and solid, it is not woody but is of a succulent consistency, its firmness being largely due to distention of its substance by water. If we cut a thin section of it and look at it through the microscope we find it to be made up of nothing but cells, and that the greater number of them are gorged with grains of starch. These are much larger than the grains in the leaf and have a complicated structure, they are in shape irregularly oval, and their surfaces are marked by nearly concentric lines of striation, dividing them apparently into layers. The centre of these cells is not the geometrical centre of the grain, but lies near the smaller end, and the rings or layers are much narrower at that end than at the other. How did the starch get there? There is no chlorophyll in the part known technically as the tuber, nor has light access to it during its formation and growth.

The appearance of the starch there coincided in point of time with its removal from the leaves, which we have seen first formed it. To remove it a process of transformation was necessary, of just the opposite kind to that which led to its transitory appearance. The chloroplastid converted starch into sugar, something else must have again converted the sugar into starch. This was the first and essential step, for the solid grain of starch could not pass through the wall of the leaf cell and so travel from place to place in the plant. It has been ascertained in the last few years that this change is brought about in the leaf by the action of a so-called *enzyme*, or unorganized ferment, known as diastase, the same body as has been known for so many years to be the active agent in the saccharification of malt. The identification of enzyme in the leaf was difficult, but there is now no doubt of its presence. By its agency, particularly during the hours of darkness, when the constructive activity of the leaf was suspended, the transitory starch in the leaf-cells was converted into sugar. This sugar which is known as maltose, or malt sugar, made its way from the leaf down the stem into the tuber, which is really only an underground branch which becomes very much swollen and does not increase in length. It found a convenient path in those vascular bundles which supplied the leaf with water from the root, and which serve therefore as the channels of conduction not only for water but also for the elaborated products which the leaf has found. On reaching the cells of the tuber a conversion of the sugar into starch again took place. In these cells there are a number of small protoplasmic corpuscles, much like chlorophyll grains, only without the colouring matter. They are called *leucoplastids* because they are white or rather colourless. In their nature they resemble chloroplastids very closely, turning green when exposed for a considerable time to light. They not only resemble chloroplastids thus, but they behave very much like in relation to the stream of sugar solution which reaches them. Absorbing them, they form

in the substance of their bodies starch, which they pour out from some portion of their surface. Thus a little profusion of starch appears at one side of a leucoplastid; soon another outpouring takes place which flows round the first one; a third follows, and a fourth, and so on, the successive layers causing the striated appearance we have seen to be characteristic of the adult grain. Their activity lasts much longer than that of the chloroplastid, and the starch grain is therefore much larger. Their activity continues, indeed, till they are completely used up and disappear. It is not very easy to see these leucoplastids in the potato; they can be seen, however, more easily in other plants where they are larger and not round (*e.g.*, the cells of some orchids). In a few places, such as some pollen grains, starch grains are found in large numbers without the aid of leucoplastids so far as we know at present. They seem in this case to be constructed by the protoplasm of the cell.

GENERAL ITEMS.

The following, with reference to ticks perhaps, is the most troublesome pest of cattle in the tropics, is from *Nature*. In Ceylon, the favourite remedy against ticks is coconut oil with which infested animals are smeared, generally a mixture of common salt and oil being used for the purpose:—
 "Dr. M. Francis, Veterinarian of the Experiment Station, has drawn our attention to an account by him of the method of destroying ticks on the cattle of Texas, and, as the study of the tick pest is one of his principal duties, this description is of great value. After several unsuccessful attempts to destroy the pest by various means, the dipping process has been adopted in Texas with very gratifying results. A large vat of five thousand gallons capacity is used, and the cattle are forced to swim through it. Various carbolic and arsenical sheep-dips were employed as solutions in the vat, but the results were not satisfactory; either the cattle had to be kept in the dips for too long a time in order to kill all the ticks, or they were irritated by the solutions. This led Dr. Francis to try the effect of oil in destroying the ticks. It is well-known that grease or oil, of almost any kind, is fatal to insects, lice, &c., and known facts as to the life-history and structure of ticks gave presumptive evidence that oil might be successfully substituted for the various commercial dips which had been employed. A layer from three-quarters to one inch in thickness, of crude cotton-seed oil on the water in the vat was first used, the cattle being forced to swim through the vat, so that when they emerged they were covered perfectly with oil. This had no apparent effect on the cattle, but was found to be exceedingly fatal to the tick, and was very much superior to any other treatment tried. Dips of different nature were experimented with, but none as yet used has given such satisfactory results as the cotton-seed oil. Kerosene emulsion was found to have no practical value; crude petroleum irritates the skin, and emulsifies with water; resin oil is useless for the purpose; corrosive sublimate is too dangerous and is not very fatal to ticks even in solution 1:250 in water, and tobacco sheep-dips have no practical value. Dr. Francis is at present studying the effects of other oils, the most promising being West Virginia Black, a mineral oil."

If wool-growers, horse-breeders and dairymen were to select their stock in the haphazard manner that many farmers select their seed grain, giving no subsequent attention towards selection and improvement, it goes without saying that several specialities for which our stock are becoming famous would deteriorate in quality with far greater rapidity than it has improved in the time spent in establishing the present standard of excellence. Careful natural selection and breeding are absolutely necessary in every branch of husbandry. By no one is the want of selection and improvement more severely felt than by the grain-grower. Every year the difficulty of obtaining good seed is increasing. Wheat-growers will bear this out. Varieties true to name are almost impossible to obtain. Good-looking seed is sometimes purchased under the impression that it is of the variety desired, but when the crop matures, the seed turns out to be a mixture of perhaps half-a-dozen different varieties. Perhaps not two of these varieties ripen at the same time. With a mixture of this kind an

average ripening is impossible, and a decreased yield the inevitable result.

Why should the farmer depend upon the retailer for his supply of seed grain? Every farmer should make it a point to grow his own seed. If he has to purchase he should endeavour to personally inspect the crop while growing, so that he can satisfy himself not only as to its purity, but also as to its yielding capabilities. A change every third or fourth year will be quite often enough. It does not take long to grow a sufficient quantity of grain for seeding purposes for the whole farm. The main thing is to begin properly. By carefully selecting the best sample of grain it is possible to obtain seed possessing a producing power of fully 50 per cent. greater than under ordinary circumstances. Experiments in this direction have borne out the truth of this statement. "Like begets like," and when we are so careful in the matter of constitution and vigour in the animal kingdom why shou'd not similar watchfulness be displayed in the selection of seed grain?

COLOMBO, OCTOBER 1ST, 1896.

[No. 4.

PLANTING IN VENEZUELA: COFFEE, COCOA, &c.

COMMERCIAL interests in Venezuela are suffering from the by no means uncommon, but none the less unpleasant, experience of reaction after a period of undue inflation, this latter resulting from large amounts of foreign capital being drawn

into the country for the construction of railways and other public works.

Commerical business is, however, on a fairly sound footing in Venezuela. Merchants who give long credits seldom do so without some solid security for the debt. As a rule when owners of coffee or cocoa plantations obtain advances it is on the condition of the crop being consigned to the merchant who makes the loan, and the principal with interest at the rate of 12 per cent. per annum, is deducted from the proceeds. Then, again, the currency is on a sound basis, gold coin being the standard of the country though the *bolivar*, equal to a franc, is the monetary unit. Moreover, the two principal banks, the Bank of Venezuela and the Bank of Caracas, are managed on sound business lines, and are in a perfectly solvent condition. It is difficult to understand why under such conditions money is so dear. The rates vary from 12 per cent. to 15 per cent annually, even when secured on easily realizable real estate or other tangible assets. The very high rate of interest undoubtedly checks the development and progress of the country, and the only plausible explanation for it is the constant fear of revolution and the want of confidence in the ability of any administration to conduct satisfactorily the internal affairs of the country. There is a lack of moral responsibility towards Venezuela amongst the Venezuelans that breeds an ever-present feeling of distrust and uncertainty amongst business men, and many years of peace and prosperity must successively occur before this feeling is eradicated, or even mitigated to any marked extent

As regards the trade of Venezuela with the outside world, the value of English goods imported is greater than that from any other country. Next comes that of the United States, then Germany, France, and Spain in the order named. England supplies cottons, wollens, and general merchandise; the United States breadstuffs, oils, and provisions; Germany cutlery and general merchandise; France silks and fancy goods; Spain and Cuba wines and tobacco. As traders throughout Venezuela the Germans are certainly first in importance and numbers, and German merchants are found in every section of the country. Next in order come the Venezuelans in every class of business, then the French, and, lastly, the Spaniards and Italians. As merchants or traders the English and Americans are hardly existent; a few of either nationality may be established here and there, but the number is so small, and their influence so slight, as to call for no special comment.

The value of the produce exported shows the balance of trade to be slightly in favour of Venezuela. Coffee forms the principal item, the total shipped being some 51,000 tons during 1894; of this, however, about 5,000 tons, though despatched as Venezuelan, came from Colombia and must be deducted. The following is an approximate list of the exports and the values at the port of shipment:—

Coffee	46,000 tons.	£3,680,000
Cocoa	7,000 "	60,000
Hides	170,000 "	90,000
Gold	50,000oz.	180,000
Other products	—	100,000
Total			£4,110,000

I do not vouch for these figures being absolutely accurate, statistics being difficult to obtain in Venezuela but they are as nearly exact as careful inquiries can make them. Thanks to the initiative of Sir Vincent Barrington, a Chamber of Commerce has now been established in Caracas and at other places. A special point aimed at is to compile accurate statistical returns, and in a year or so such information will be available for public use.

The principal industries of Venezuela are the cultivation of coffee and cocoa, cattle-raising, the growth of sugar-cane and its manufacture into sugar

and rum for local use, gold-mining, and the collection of natural products, such as vegetable ivory, ebony and other woods, dyewoods, and a variety of articles of minor importance for exportation. Coffee is the main staple of Venezuelan wealth, the cultivation extending in more or less degree to all districts of the Republic where soil and climate are suitable. The port of Maracaibo ships annually some 30,000 tons from the Andine States adjoining Colombia, Puerto Cabello about 7,000 tons from the country round about Valencia, and La Guayra from 12,000 to 13,000 tons from the districts within reach Caracas. Venezuelan coffee deservedly bears a high reputation, and would gain still more in favour if greater attention was paid to the method of cultivation and preparation for the market. The total area under coffee is estimated at from 180,000 to 200,000 acres, and the average yield at a little under 5 cwt. per acre. The plantations have neglected appearance generally—knee-deep with weeds and the trees unpruned and uncared for. The coffee is grown under shade trees, forming a strong protection from the hot sun. The total cost of cultivation and other charges up to the time of the delivery of the bean in a marketable state in Caracas or elsewhere is calculated at about 35s. per cwt., thus leaving a considerable profit the grower at present values. But many drawbacks exist to deter Europeans from embarking in the enterprise. A revolution breaks out, and the male labourers are requisitioned to serve as soldiers on one side or the other. Other difficulties incidental to these South American countries are always liable to crop up. In the sitting room of Mr. Middleton, Her Majesty's former Minister Resident to this country, are two large water-colours. The one represents a coffee plantation at 8 a. m., everybody smiling and happy, and the routine work in full swing, the other shows the same place at 5 p. m. with dead and wounded men on all sides, and fierce firing going on between the Government troops and the insurgents. I know of no better example of the risks to which the owner of a coffee estate is constantly liable. All these dangers are equally present to the grower of cocoa, and, indeed, to any undertaking necessitating the employment of large numbers of labourers. Under such circumstances it is not a matter for wonder that merchants or others making advances against crops should ask and obtain unusually high rates of interest. The coffee or cocoa, once ready for the market, is despatched on the backs of donkeys or mules to the nearest commercial centre, and there bought for shipment to Europe or the United States.

The sugar industry only survives in Venezuela owing to the fact that the importation of foreign sugars is absolutely prohibited. The result of this extreme form of protection is that a pound of coarse brown sugar costs from 8d. to 10d. in Caracas. Neither soil nor climate is specially adapted to the growth of sugar-cane, and without the help of protective legislation the industry would immediately be killed by foreign competition. Of other branches of agriculture the most important are the cultivation of Indian corn, beans, and the ordinary tropical fruits and vegetables for local consumption. In the western portion of the Republic a little wheat is grown, but the area is extremely limited. Tobacco is produced in some districts; the amount is however, insufficient for local needs, and none is exported. Of the remaining sources of wealth cattle-raising is the most important. Whilst it is impossible to obtain any reliable data as to the number of animals, the generally-accepted estimate of between 4,000,000 and 5,000,000 is probably not far wide of the mark. In the long civil wars and constant revolutions which have so completely devastated Venezuela during the past 70 years the cattle industry has suffered severely, both sides invariably taking prompt advantage of a supply of food so ready to hand and easy to utilize. The districts devoted to cattle-breeding are the vast plains reached after the mountain ranges near the sea coast are passed. These plains stretch away to the southwards as far as the banks of the Orinoco. The climate is hot and malarious, and offers small inducement to European settlers.

Very little has been done to improve the breed of cattle, and they are mostly long-horned, small-bodied animals of no great value except for their hides.

An approximate estimate of the number of labourers employed in the industries which I have mentioned is as follows:—

Industry.	Average Daily Wage.	Number Employed.	Total Yearly Earnings (300 days.)
Coffee, cocoa, and sugar plantations	3s.	41,000	£1,845,000
Gold mining..	6s.	1,000	135,000
Cattle ranches	£2 10s. per month ann food.	8,000	240,000
Other farming	3s.	10,000	450,000
Total ..		60,500	£2,670,000

At first sight the rate of wages may appear high to Europeans, but when the cost of living is considered the value earned is by no means too great. The necessaries of life are costly to purchase on account of the high protective tariff, the duty on flour being over 10. per 100 lb. for the ordinary and additional Custom-house charges.

Of manufactures the only important ones are boots and leather work of all kinds, hats, and soap and candles. The manufacture of these articles is entirely for home use. A little cocoa is refined and made up for foreign markets, but the quantity is small.

One great hindrance to the speedy settlement and development of Venezuela lies in the physical features of the country. The great mountain ranges, beginning close to the sea shore and extending some hundreds of miles inland, make all transport a long and tedious matter, and to overcome these difficulties by extending the existing railway system is beyond the present means of Venezuela. To-day the patient and hardy donkey is the sole medium of carrying merchandise from the fringe of the coast-line tapped by the railways to supply the needs of the inhabitants in the far interior, and the produce of the interior is sent down in a similar manner to meet the railways. Roads, with few exceptions, do not exist, or only as represented by donkey tracks along the mountain sides. On the other hand, this mountainous country makes life possible for the European in these latitudes, the climate of the highlands being temperate and fairly healthy, whilst that of the plains and lowlands is quite the reverse. The Orinoco may in the future provide a more easy means of access to many portions of the interior, but it is little used at present, and hardly likely to be so for many a long year to come, unless thrown open to free navigation.

There are now 406 miles of railway open for traffic. The lines are all situated on the northern coast, the object being to provide transport over the precipitate mountain ranges immediately adjoining the coast-line. In all there are 11 separate companies, six of these being English, three native, one German, and one French. In most cases the Government subscribed a portion of the capital for construction, and to seven of the companies further guaranteed 7 per cent. annually on a capital not to exceed £10,000 per mile of railway built. This guaranteed interest is now a bone of contention between the Government and the companies, the former alleging the inability of the country to meet such heavy obligations, and the latter being unable to pay dividends to their shareholders unless the Government fulfils the terms of its contract. In the case of the La Guayra and Caracas Railway, which has no Government guarantee, good dividends have been earned in the past and should continue in the future if no unforeseen circumstances arise. The railways are all of narrow gauge, varying in width from 2ft. to 3ft. 6in.

Of other public works the labour at La Guayra is the most noteworthy. The port was constructed by an English company, the La Guayra Harbour

Corporation, at a cost of £1,100,000. The wharves and warehouses at the port of Guanta are also in English hands, whilst those at Puerto Cabello belong to the Government. The national telegraph system connects all parts of the Republic with Caracas, the total extension of the wires now exceeding 4,000 miles; it does not, however, work in a very satisfactory manner, and the complaints of delay and interrupted communication are constant and numerous. In Caracas telephonic communication is established throughout the city and suburbs, and connexion is made with La Guayra and Valencia, the latter city also having a widely-extended system. The water-works for the supply of the city of Caracas have passed into the hands of the Government during the past fortnight. They were built by a Belgian company, who have now disposed of them for a sum of 8,000,000f. in bonds specially secured on the works and bearing 5 per cent. interest.

The main facts of the economic condition of Venezuela being as I have described, the natural question is, what is the future likely to be? The prospect is not a very bright one. Until the management of the country is in the hands of more responsible administrators than those who have directed the destinies of Venezuela for the past decade there can be slight hope of any permanent progress. Until such time as tranquillity in internal affairs is assured foreign capital is unlikely to embark further in enterprise tending to develop the natural resources. Small inducement is given to immigration, and, apart from the obstacles of climate and difficulty of transport to where the national lands are situated, the offer of a free grant of one hectare, equal to 2.47 acres, of land to each immigrant is clearly inadequate to compensate for the hardships of life under the conditions entailed. The evolutionary changes must rather be looked for from internal sources than external influence. Until effective measures are taken to break through the dense ignorance of the mass of the population and the people are educated to a standard far above their present one, there is small prospect of any change for the better. The advent of another Simon Bolivar might accomplish the desired end, but where is the man to be found in Venezuela? We are not living in an age of miracles, and the plain facts of the case must form the basis of any opinion about Venezuela. The plain facts now before me indicate clearly that rapid development of the country's wealth or startling advancement in the social condition of the people is, to say the least of it, very improbable.—*London Times*.

A COFFEE PLANTER ON NYASSALAND

SIR,—As British Central Africa seems to interest your readers, I venture to give you a few of my experiences in this country.

On my arrival at Chinde, I was informed of the sad news of Mr. John Buchanan's death, which occurred a few days before my arrival. As one of the oldest and most respected residents in the country, it seemed to cast a gloom over the whole place. Fortunately there was a special boat leaving the next day for katungas' which is the terminal station of the river journey.

Our voyage up the river I must confess was very monotonous. The scenery of the Zambesi is by no means picturesque. Beyond seeing large numbers of beautiful water-fowl there is a sameness about everything which one soon gets wearied of. The heat was intense, the thermometer standing at 100° fahr. in the shade, and our saloon, which was something resembling a third-class rail-way carriage in Ceylon, made it almost unbearable. But one of the chief annoyance was the continual flight of sparks from the engines, which prevented us sitting outside when it grew cool, and most of our coats at the end of the journey were only fit to be given to the niggers. For the trip up the river one is charged £13, and, considering we only took five days, it seems to me to be most exorbitant, as everything on board was bad. I reached Blantyre on March 29th and the change to a higher climate was indeed most enjoyable.

Blantyre is a pretty little place, and I should say fairly healthy, although many instances have occurred to prove the reverse. Until quite recently Blantyre has been practically only a Mission Station, but commerce and the development of the country are fast making the place into a commercial town, and I think it is only a matter of time before the missionaries retire to a more savage and wilder part where their energies may be appreciated. I was sorry to hear before leaving Blantyre that the Commissioner was in the doctor's hands with Blackwater fever; this seems to be the dreaded disease out here, and from all accounts seems very prevalent and from my experience it appears to have a worse name here than on the West Coast of Africa. I left Blantyre, for Mlanji at the end of March, and stayed a short time with my friend Mr. Crabbe. The Mlanji climate although it bears a good name, evidently does not agree with him, for during my stay he had repeated attacks of fever, which he attributes to the turning over the soil whilst cutting holes. He has already cleared 100 acres of land and is making preparations to build a brick house, as the present one is only a grass hut, and has but three small rooms. There are few comforts

to be had in Mauji, and the living consists of fowls, pumpkins, and sweet potatoes with an occasional tin, which is looked upon as an extravagance and a luxury. The prospects of coffee in Mauji are excellent, judging from what I have seen at Mr. Bradshaw's place, Mount Zion, and equals anything I have seen in Ceylon, India or Brazil. The soil, although it has an absence of rock or stone, and is of a chocolate colour, seems to be admirably adapted for coffee. In my opinion Liberian coffee would do extremely well here and would not be here so much effected by borer and insects which are the pests of the country.

Tea also would grow well, but would be greatly handicapped by the labour supply, which is always short during the wet months.

Cardamoms grow wild in abundance, but as yet I have heard of no one giving them a trial, but Mr. Crabbe tells me he has written to his firm for a shipment of seed.

Tobacco is also cultivated by Europeans out here, Messrs. Buchanan Bros. have gone in for this industry on a large scale; it is usually smoked by the residents, and has a very nice flavour. Another gloom was cast over the whole country the other day by the sudden death of Mr. Robert Buchanan from blackwater fever at Blantyre. It is indeed sad that two brothers and members of the largest firm should die within a month of each other. This is the third Buchanan who has met his death from fever in this country. I certainly should advise no one to come out here unless they are provided with a good consideration, and prepared to lead a lonely life, for it is an undeniable fact that fever is prevalent throughout the country, and especially where new land is being opened, and although I fully believe B. C. A. is bound to go ahead, yet I should recommend no one to come out on spec.—I am, &c,

AN INDIAN PLANTER.

Nyassaland, May 22nd, 1896.

THE COFFEE PLANTER

By W. W.

The life of a coffee planter in the Mysore Province has very much to recommend it, in spite of the vexatious labour question. What, after all, are the planters' cares, compared with the positive hardships of existence endured uncomplainingly by the settlers in the bush of Australia, or the sheep farmers of Newzealand?

Is the labour question here equal in importance to the rabbit pest, drought, bush fires, hurricanes, and floods with which the Colonists have to reckon? Then there are, in the Colonies, discomforts of no trifling nature to the man brought up in a good English home, to which perforce he must submit. These embrace the necessity of doing everything for oneself—where servants are but a name, and one must rough it generally with the paid hands.

Contrast this with the conditions under which the coffee planter works. In his case there is the comfortable bungalow, always adequately furnished, and not infrequently a luxurious residence, reared upon some commanding site, giving a panoramic view of the encircling hills with their glorious, ever-changing depths of colouring; the breezy downs, and the dense, primeval forest, in clearings of which are the close ranks of the coffee plant—scenting the air with sweetness from its dainty white blossom. A home amid surroundings such as would delight the soul of the poet!

The planter is not so far removed from railway communication that he need deny himself any of the pleasures of life. His bungalow is usually well, if not liberally, supplied with creature comforts, which cost him but a trifle more than they would do in Bangalore—not a matter of much consideration to the man who sells his crop at some ninety-five shillings per hundred weight, and realizes an income of thousands of pounds annually! There

are fairly good roads round and about the estates, enabling the planters to visit each other as often as they wish, so that no feeling of isolation need be thought of as a factor in the life, whilst there is a flourishing and commodious club at Chickmagalur, where many a jovial evening is spent. Nor is the coffee planter's work of an incessant nature. He has all his energies exercised to the full during certain seasons of the year, and much anxiety as to crop prospects, leaf disease, and the dreaded "borer," but when the harvest is in and despatched for shipment, and the coffee has been pruned and otherwise treated for the ensuing season, the planter has his holiday and may have a run home at the most enjoyable time of the year—for England, or enjoy the term of his freedom in travelling about the country. What rest has the Australian squatter, or the New Zealand sheep farmer? The man "in indigo," on the Bangal side, has, perhaps, a pretty good all-round time of it. He, too, has his time of work and then of rest, and his cares are for the crop and market rates of the dye. He is not, we believe, distressed on the score of labour, and in this respect has the pull over the coffee planter. The Assam tea-man is a martyr! his life isn't worth living. A trip by river steamer as far as Dibrugarh, will convince anyone that the pestilential jungles of Assam, whilst contributing largely to the output of Indian tea, are accountable for a fearful death-rate amongst the planters. Certain places along the banks of the treacherous upper reaches of the Brahmapootra are pointed out to the voyaging stranger as "The white man's grave," meaning that in those particular districts no white man could live for any length of time. Then, planters who board a steamer for a day's run to some other landing place will toll the stranger that they come abroad for breath of fresh air to knock the fever out of them. Poor fellows, they look as though a puff of wind would knock the life out of them. With these brief comparisons before us, how much better is the lot of the Mysore coffee planter? excepting the "man in indigo," but even he works in the hot plains, and has no elevated site for his bungalow.

The labour question for the coffee planter will, apparently, soon be solved, and with the regulations which will then come into force, one of the chiefest obstacles of the industry will be removed. With labour arrangements then offering no difficulties, we would suggest that the planters might and it very distinctly to their interest, and a guard against adverse seasons with, possibly, lower rates in the near future for coffee, were they to utilize such portions as their holding which are unfitted for their staple crop, in raising some other marketable commodity. Were this suggestion carried out, the planter, could face a bad season, or a fall in prices, with comparative equanimity. A reference to the Madras Agri-Horticultural Society would elicit sufficient information for practical experiments. Why not raise the sugar-beet? The country is well adapted for its growth, and it has many claims over cane, which it has, to an enormous extent, crowded out of the market.—*Planters' Gazette.*

CEYLON TEA IN AMERICA.

AN EXPERIENCED PLANTER AND CHINA BUYER
ON THE SUBJECT.

SIR,—Having just returned from a trip through the Eastern States and Canada, I thought your readers might be interested in hearing the result of my observations on the subject of the demand and use of Ceylon teas there. To commence with San Francisco, I find the sale of your staple is but very slowly increasing the reasons being that the demand here runs principally on strong, common cheap teas, and teas of a finer grade having a good deal of "style" about them and *not too strong*.

In the first grade Ceylon cannot compete with China as a "good leaf for the money" goes, say

8 to 11 cents gold per lb., and in the finer grade your teas, though attractive (I refer to the better kinds of pekoe and broken pekoe), are too strong for they, as yet, uneducated taste of the American public, and China can, and does, send teas of the second and third crops, costing 13 to 14 cents, gold, which possess a tippy appearance, and that light smooth liquor which is liked here. Also what militates against its faster increase, is the small amount of your teas which find their way to this market on consignment. And the difficulty of working a Ceylon tea business on standard samples is very great, for it has been found that orders sent to Colombo to duplicate a previous shipment have, when executed, often failed to give satisfaction. The hotels here, it is true, offer the visitor a choice of India and Ceylon tea as well as of teas from China and Japan, but for the reasons I have given I incline to think that the increase in the consumption of the Ceylon tea on this coast will be slow.

I journeyed hence to New York *via* the "Sunset" route of the Southern Pacific, which service certainly deserves praise. The train consists of sleeping cars, a ladies' drawing room car with library and female attendant (a "darky"), gentlemen's smoking car, with barbers shop and bath room. The scenery as far as New Orleans is mostly desert of a very tame character, but from that place becomes more interesting passing through Virginia, Georgia Kentucky, &c., and landing you at Jersey City within a ferry ride of the heart of New York.

In New York and Boston I found the Ceylon staple being pushed vigorously and with some success—one of the most conspicuously successful firms in the enterprise (through their agents) being a somewhat recent addition to your mercantile houses, whose name I will leave you to guess.

From Boston I entered Canada; but whilst on the subject of the United States I would here add that, returning from Canada to San Francisco, *via* Chicago, St. Paul, Omaha, and Denver, I found in each place that Ceylon tea was known, but not being (except in Chicago) vigorously pushed. In Chicago it is being well advertised, but mostly in "blends" of India and Ceylon.

I would here record the fact that the States are a coffee-drinking people, that in nine out of ten cases an American prefers coffee to tea, and that in the tenth case he usually prefers Japan tea, or Formosa oolong. I am also of opinion that it will take a very large expenditure of time and money in advertising Ceylon tea to materially increase its consumption, and I am sure that the same amount of time and money spent in Russia would result ten times more favourably.

In Canada, the case is very different. In the Western Provinces visited by me, that is St. John, New Brunswick, Halifax, Nova Scotia, and the country known as the Maritime Provinces, it is true that Ceylon tea is but making slow progress, because the China teas used there are those kinds which possess a strong rough flavour, and at the price obtainable, that is, from 11 to 16 cents gold per pound, are fully as cheap and as good value as Ceylon Pekoe Souchongs and the lower Pekoes. Very little tea is used costing over 18 cents gold (say 9d.). Some progress, however, is being made by the introduction from London blends of Indian and Ceylon (with doubtless some China), which are put up in metal chests, and in tasty paper packets, as well as in prettily got up canisters holding half pound to 5 pounds. It is the opinion of those in the trade that these blends will gradually give way to "straight" teas from India and Ceylon.

Leaving this part of Canada we come to Quebec and Montreal, and in these districts I found more inquiry for Ceylons, though the trade has not yet begun to use them largely.

It was in the districts comprising Tronto Hamilton, London (Ontario), and the country around Winnipeg and the North West that I found the greatest demand for and life in your staple. Travelling as I was in the interests of China tea, I

was in an exceptionally good position to judge of the hold which your teas had taken in the districts named, and I may say that I found that three-fourths of the trade had been appropriated by Ceylon and India.

In Tronto I had the pleasure of meeting Mr. Mackenzie and his Indian *confreere*, both seemingly well content with the progress of their staples.

I also had a long chat with Mr. Larken, of Messrs. C. P. Larkan & Co., who is most energetically pushing Ceylon Tea, and is making it a great success so far as his own trade is concerned and whose "live" advertisements (specimens of which, as shewn in the local papers, were mailed whilst I was present, to your city) are having a telling effect on the consumption of your teas.

Just here (as the Americans put it) I would call attention to two points on which I heard a great deal. Firstly it is a curious thing that Indian teas, notably pekoes, shew a finer-made and more tippy style than Ceylons of same grade, and yet whether from inferiority in liquor or from some other cause, they are not saleable at as high a price as the latter by quite two or three cents gold per pound. This disparity of value has led, I am told, to a reprehensible practice, and that is that in many cases the name of the Indian garden or such words as would indicate an Indian origin have been scratched off or erased in some way, and a Ceylon equivalent substituted. This passes detection amongst the retailers of the tea, as they know little of the article they sell, but it acts to the detriment of Ceylon tea. It was suggested to me that every chest of tea shipped from Ceylon should have put upon it by your Government a stamp in paint or burnt in, shewing that the chest had really been shipped from Ceylon. This could easily be done at the time of shipment, and would be of great use.

The second point I would mention is, that to cultivate an increased trade in your teas, as little *dist* as possible should be in them. I have seen samples of Broken Pekoes which, otherwise good, have been thrown aside on account of the broken condition of the leaf, and I have often been asked why it is that nearly all Indian teas are, in make and twist of leaf, superior to Ceylons. The question is one which I could not answer, but which is a *pressing one* and well worth inquiring into.

To conclude, I would again state, and in a most emphatic manner, that whilst I would not hint at a large curtailment of the money now being spent in exploiting the United States and Canada, I would suggest that more attention be given to Russia. The United States are a coffee-drinking people, and no matter what amount of money be spent on pushing it, Ceylon tea will be but slow in gaining ground. That it is coming into use is certain—but slowly. Canada, on the other hand, is a tea-drinking country, but I would venture the opinion that the "booming" of Ceylon tea as now carried on by private firms and companies, is of itself almost sufficient to cause a rapid increase in its use, and that some of the funds now being spent in assisting its increase might be much more advantageously applied to Russia. The latter country is essentially a tea-drinking one, and would, I am convinced, repay such expenditure sooner and more liberally than the United States.

I found in my travels that "hard-times" were noticeably present both in Canada and the United States, but especially so in the latter, and every American is impatiently awaiting the end of the reign of the present occupant of the Presidential Chair, convinced that with the advent of a "Republican" President (and a higher tariff) prosperity will once more shower its gifts on the *grandest, biggest, best and most highly-flavored* country in the world. (So say they all).

I trust that this short sketch of my experiences on this Continent, in *re* Ceylon tea may prove of interest and use to your readers. I can but say that from my intimate knowledge of the trade they may rely upon it as a faithful picture. F.

Occidental Hotel, San Francisco, March 25th.

COMMERCIAL FEDERATION OF THE EMPIRE.

Mr. J. G. Colmer's, C. M. G., prize essay on the Commercial Federation of tea Empire has been published in *The Statist*, and the following is a synopsis of the essay.

The scheme may be divided into four parts:—

1. The granting of preferential treatment to Colonial and Indian products in the United Kingdom. 2. Preferential treatment of British products in the Colonies and India. 3. The additional revenue so derived to form a fund, if the Mother Country and the Colonies and India agree, with a view to improve and supplement the defences of the Empire outside the United Kingdom. 4. The formation of a Colonial Council to give the Colonies a greater voice in Imperial affairs, and to provide for the administration of the fund.

1. It is suggested that in the United Kingdom small specific duties should be placed on certain enumerated articles, about twenty in number, when imported from foreign countries—similar imports from the Colonies and India to remain duty free, as at present. These duties, it is anticipated, would realise about £2,700,000.

The enumerated articles are live animals, meats, cheese, butter, wheat, flour, hemp, and other fibres, ivory, undressed leather, sugar, unrefined and refined, wool, tallow, seal skins, fish oil, long wood, mahogany, and nuts and kernels for oil.

It is also proposed to reduce by one-half the existing duties on imports from the Colonies and India of cocoa, coffee, and tea, the duties on the foreign imports of those articles to remain as at present. This re-arrangement of the existing tariff, with a reduction of 5 per cent. in the duties on tobacco from all countries, would mean a decrease in the revenue to the extent of about £2,000,000. It will be seen, therefore, that the scheme involves, roughly speaking, a net increase in the revenue of the United Kingdom of about £700,000.

It is urged that an increase in price is not likely to result from the placing of duties on foreign imports of the enumerated articles, at any rate to the extent of the proposed duties. In every case there would still be a considerable importation of the different commodities from the Colonies and India. As they would remain duty free, the supplies coming from within the Empire would dominate the market, and, with the foreign competition, have a tendency to prevent the increase in prices which perhaps might follow if duties were placed upon such imports from all countries.

2. As the fiscal system of the Colonies and India are so varied, and the nature of their trade exchanges so different, it has apparently been found difficult to make any proposal giving preferential treatment of a uniform character to British imports in those markets, in return for the concessions suggested on the part of the United Kingdom. It is, therefore, recommended in the essay that the Mother Country should take the initiative in the matter, inform the Colonies and India what advantages the United Kingdom is prepared to offer to the imports of the articles enumerated from within the Empire, and ask what concessions of a preferential character they would be prepared to extend to imports from the United Kingdom over imports from foreign countries. It is believed that correspondence of this nature would pave the way for an Imperial conference, at which the details of the proposals could be discussed, and definite arrangements agreed upon, by which in every part of the Empire there would be a preferential treatment, on a moderate scale, for inter-Imperial trade.

3. Assuming that the Colonies were prepared to grant preferential treatment to British trade (upon which no doubt appears to exist, in view of the resolutions of the Ottawa Conference), assuming also that India was ready to follow their example, and that they rearranged their tariffs in favour of British trade

in a manner satisfactory to the United Kingdom; and that the formation of a fund for defence purposes was agreed upon as part of the scheme, it is fair to suppose that the Colonies and India would be able to contribute, as partly or entirely the outcome of their preferential treatment of British imports, according to their local circumstances, a sum equal in the aggregate to the net amount of the additional revenue (£700,000) to be raised in the United Kingdom. In one of the appendixes of the essay a suggestion for the apportionment of the £700,000 among the Colonies and India is offered. This would provide a fund of nearly £1,500,000 per annum, the joint contribution of the Colonies and India and the United Kingdom, which it is suggested could be used to supplement and improve the existing defences, including graving docks and coaling stations, in the outlying parts of the empire. Among other things the maintenance of guard-ships in the leading ports of the empire is proposed. These vessels would be useful not only for harbour defence, but in connection with the training of naval militia, which it is believed could readily be formed in the leading maritime ports of the Empire. This force would not only be valuable locally, but would be available for drafting on Her Majesty's ships that might be operating in the neighbourhood of the Colonies in time of war.

4. In order to give the Colonies a large voice in the affairs of the Empire than they now have, and to enable them to participate the administration of the proposed fund for defence, the formation of a Colonial Council is suggested. It would consist of the Secretaries of State for the Colonies, Foreign Affairs, India, and War, the First Lord of the Admiralty, and the Chancellor of the Exchequer, the Colonial Secretary being president. The High Commissioner for Canada and the Agents-General of the self-governing Colonies—or such persons as the Colonies might appoint—would be members of the Council. It would be, as its name implies, a Council in which the Colonies would have a voice through their representatives in regard to any matters arising out of the preferential trade arrangements, and upon all other subjects in which the Colonies they represented had the right to consult, or to be consulted by the Imperial Government.

Retaliation on the part of countries foreign is not anticipated as the result of the adoption of the scheme, because their import duties are now as high, generally speaking, as they can be made, and any increase would react on the countries themselves. Besides, with the Imperial Customs Union in existence, a policy of retaliation would hardly be lightly undertaken.

The following are some of the advantages which it is claimed would be derived by the Mother Country, on the one hand, and the Colonies and possessions on the other, from the adoption of scheme of commercial federation. It would bring the Mother Country into closer union with the Colonies. By giving preferential treatment, on a moderate scale, to British trade within the limits of the Empire, the bond of unity would be material as well as sentimental. By such preference the doctrines of free trade that prevail in the United Kingdom would not be seriously endangered, and freer trade than at present would be made possible within the Empire. On the other hand, the British manufacturer would retain the control of the rapidly increasing Colonial Council for mutual consultation on matters of general interest. Greater attention than ever would be attracted to the Colonies. Emigration would flow in larger number to their shores, and increase the demand for British goods. The investment of capital in the Colonies would be encouraged, and their powers of production be so increased that the United Kingdom would year by year depend less upon foreign sources for her food supplies.

Attached to the essay are several statistical appendixes, illustrating the commercial affairs of the Empire, and showing that, relatively speaking, the trade of the United Kingdom with the Colonies has been increasing in a greater ratio than the trade with the other parts of the world.

CEYLON TEA IN RUSSIA.

It is of interest at a time when we may hope that Ceylon Tea has taken a real hold of the Russian market with the prospect of a steady increase, to recall the day of small things—the very beginning of the attempt to get the Russians to drink our teas. This is done in the appended letter from Mr. W. B. Steveni addressed to our senior in England. The latter first met Mr. Steveni—a Scandinavian Englishman if we may say so, and brother-in-law of the well-known English artist, Mr. T. B. Kennington—at Vichy in 1887, and there endeavoured to interest him in Ceylon tea, of which samples were provided. What followed, so far as Mr. Steveni is concerned, is best told in his own words; and there can be no doubt that he is deserving of the thanks of Ceylon producers for what he did in the early years in Russia towards the mission so energetically promoted since by M. Rogivne in a thoroughly business-like and successful way. May this enterprise, and all other attempts to extend the use of Ceylon tea in Russia, continue to prosper—and more especially the efforts of Russian tea firms to trade direct in our staple—until its good qualities become duly appreciated in every Russian household.

Meantime, the following *résumé* of the early history of the campaign is well worth putting on record, and we may hope that Mr. Steveni may yet do further service in making known Ceylon products—and especially tea—in Northern Europe, seeing his peculiar opportunities as a writer and journalist. For, it should be known that our friend, who has altogether lived twenty years in Russia, has occupied responsible positions as contributor to the *London Times*, the *Contemporary Review*, *Nineteenth Century*, *United Service*, and American periodicals. He also wrote a book about the great Russian famine, the scene of which he was the first to visit among English correspondents. All this should increase our interest in the writer, who tells the story of how he first introduced Ceylon tea to the notice of the Russian dealers and people:—

HOW I INTRODUCED CEYLON TEA INTO RUSSIA.

It is now about nine years since I first conceived the idea of introducing the fragrant teas of your island into Russia. Like many brilliant ideas that have come to us poor benighted mortals, this one came to me by a mere accident. It happened that on one wet drizzling afternoon in the City, when all nature seemed to be in mourning, that I took refuge in the office of an old City friend, Mr. Robert Heinekey of Seething Lane. Whilst waiting there until the weather had cleared up, Mr. R. Heinekey, the head of the firm of that name, asked me if I would not have “a cup of first-class tea—Ceylon tea!” Curious to know whether that beverage compared with the much-vaunted Kjachta and China teas we got in Russia, I immediately consented. The first time I drank this new kind of tea I was, to say the least, considerably astonished. It was so delightfully aromatic and refreshing that, like David Copperfield, I ventured “to ask for more.” I am glad I did; for I not only renewed the pleasure of drinking what I believe to be one of the finest teas in the world, but learnt that this new aromatic tea was grown on the island of Ceylon, on the estate of a relative of Mr. Heinekey.

For about a year or more I thought no more about Ceylon tea, when, by another freak of fortune, I found myself in Moscow, one of the greatest tea marts in Europe. It then occurred to me, that it would be a grand thing to introduce Ceylon tea into Russia, and, if possible, to drive out the Chinese tea, as I found that a considerable quantity of the tea consumed in Moscow was of the most wretched quality; in short, that the good reputation the Chinese once had for their teas was no longer merited. Acting on this conviction, I immediately imported through Mr. Heinekey's son, about half-a-dozen chests, and sold their contents to my friends, mostly members of the English Colony in Moscow. The tea, however, did not please my countrymen; as they were used to the weaker Chinese infusions. I therefore decided to try the wealthy Moscow grocers; but here I had even still worse luck. The majority of them would hardly look at the samples, and those who did gravely assured me that my tea was artificially scented, whilst others, who were more sensible, said that the tea was too strong for their customers. In fact, nobody would look at Ceylon tea; and I was on the point of throwing up the business, when I made the acquaintance of a very intelligent tea taster on the Moroseika St.—not far from the Kremlin. This Muscovite, who was well up in his profession, immediately recognised the splendid qualities of Ceylon tea, and ordered three or four boxes on trial. He, however, assured me that the tea was too aromatic for his customers in its pure state, and that it would be necessary to mix it with mild China tea. This he did with considerable success, and brought out a new blend, with some unpronounceable name, which could hardly be pronounced by Westerners. Thanks to the numerous advertisements I and my friend inserted in the Moscow papers, the name somehow caught the fancy of the public, and many, who would not look at the tea in its natural state, came and bought it under its new title. In fact, my friend made a large profit on the few chests he took off my hands, but, as Ceylon tea was only bought by the curious and unconservative, I did not grow fat on the proceedings. I therefore attempted to try the native tea merchants and imported still more tea, but all with poor success. Everywhere I went I was stopped by a wall of Muscovite suspicion, obstinacy and conservatism, which, with all my enthusiasm, I could not surmount. I also found it extremely difficult to sell Ceylon tea at a profit; firstly, because it was pure and unadulterated, and, secondly, because I could not afford to purchase it in large quantities.

In the course of my operations I, however, made a great many discoveries respecting the mysterious drugs of the Muscovite tea merchants, and became convinced that it would be *impossible* for an honest trader—without support—to compete with the crafty orthodox-church-going “koopzee,” who were my most dangerous competitors.

I, amongst other discoveries, learned that some of them mixed their tea with “Kaporka,” a kind of shrub that grows around Moscow and in appearance—but not in taste—strongly resembles the tea plant.* Other “saints,” famous for their donations to the churches, smuggled

* Shortly after my departure from Moscow several of these gentlemen were arrested by the police and compelled to pay heavy fines. The majority, however, principally residing in the interior, are seldom caught.

large quantities of tea over the Polish and Persian frontiers, thus saving a portion of the high duty, which in Russia almost amounts to 2s. per lb. This practice of smuggling leads to frequent and often bloody conflicts with the Imperial frontier Customs-guard. Persians and Jews frequently get killed in these encounters.

Another dodge, formerly much practised in Moscow, was for the tea merchants, *i. e.* the more unscrupulous of them, to buy up all the "leavings" from the Traktors, or teashops, to dry the same and then mix this rubbish with cheap China tea. This compound was then sold to the ignorant Monjiks for about 3s. to 3s. 6d. per lb., for which price they would in England be able to purchase genuine good unadulterated tea. The majority of the poorer classes in Russia can hardly ever afford good tea, seeing that the duty and expenses on this necessary of life is from three to four times as much as it is in England.* In consequence of the high duty, and the want of principle among many of the tea merchants, one can safely say that the poorer classes in Russia do not even know yet what good tea means. It is also difficult for the tea merchants—even when they wish to be honest—to sell their tea cheap under the conditions at present obtaining in Russia.

In the course of my frequent journeys through that country and whilst witnessing the terrible devastation caused by Vodka amongst the peasantry, I came to the conclusion that, if the Minister of Finance would increase the duty on spirits and, in proportion, diminish the present excessive duties on tea, coffee, and cocoa, he would be the indirect means of saving thousands and perhaps hundreds of thousands from death, disease and poverty—in short all those miseries that are caused by the abuse and use of spirituous drinks.

Whilst engaged in the work of introducing Ceylon Tea in "Whitestone Moscow," I had the pleasure of making the acquaintance of Sir Graeme Elphinstone, who, hearing what I was about, came all the way from Petersburg expressly to see whether business operations might not be continued on a more hopeful footing. Sir Graeme produced on me such an agreeable impression, that I should have been glad to represent him and the other planters of Ceylon, had not fate willed it otherwise. In fact, if I remember rightly, you, as well as Sir Graeme suggested that I should accept this post of trust. But this was not to be. My health, which had been gradually undermined by an attack of inflammation of the lungs and a severe catarrh, at last compelled me to return to London, where I remained the whole winter under medical care. During my absence from Russia the business naturally passed into other hands.

The Ceylon tea planters, apparently acting on the suggestions made by me in my early letters to the *Ceylon Observer*, decided to establish the business on a proper footing and commissioned Mr. Rogiyne. Under that gentleman's able management, and with the tea planters' support, the business seems to have prospered. There are now shops engaged in selling Ceylon tea all over Russia: in Moscow, Petersburg, Vitebsk, Vilno, Odessa, Rostoff, Kharkoff and other places.

The business is, however, still in its infancy, and much hard work remains to be done. When I call to mind that about eight years ago, when I was in Moscow, the public would scarcely look at Ceylon Tea and that now several million pounds of it

are annually imported into Russia, I cannot but think that there is for the high-class teas grown on your island a great future in the vast Russian Empire. That future will not however benefit my pocket: for although I conceived and commenced this business, its completion and establishment is being left in other hands. My friends in Moscow and elsewhere, who, in 1888, amused themselves at my expense for entertaining such a mad idea as the above, will now see that I was right and that on this, as well as on other occasions, I have seen far ahead of others. I have in fact been a pioneer, and, like many pioneers, have sown that others may reap.—Yours respectfully,

WILLIAM B. STEVENI.

PLANTING OF SHADE TREES.

The following is a tabulated statement of the number of shade and fruit trees growing at the close of 1895. Shade is now given to the weary traveller along many of the most exposed roads of the country.

Province.	Shade-giving Trees.			Fruit Trees.
	Inga-samam.	Margosa & Suriya, &c.	Iron Bark.	Various kinds.
Western	5,525	432	..	697
Central	5,981	12,081	27,304	3,658
Northern	1,979	5,157	..	463
Southern	3,750	7	..	462
Eastern	5,966	110	..	718
North-Western	5,000	41	..	213
North-Central	3,463	617
Uva	5,585	174	..	354
Sabaragamuwa	5,150	4	..	1,509

—Public Works Administration Report.

COST OF PRODUCTION OF TEA ON THE NILGIRIS.

(Contributed.)

The cost of laying down our Nilgiri Teas at the Shipping Port or on the London Market is of such importance to planters that I may perhaps be excused for addressing you at some length on the subject. In doing so I hope it will be understood that my chief object is to gain information from those whose residence and experience on these hills make their opinion of special value in this respect, while at the same time the views of a planter trained in another country and a different school may be of some benefit to them.

With reference to some recent correspondence in your journal on the subject, it would appear that the fact of most, if not all of the estates in this district packing a proportion or, in some cases, nearly all their crops, in 1 lb. or $\frac{1}{2}$ lb. packets has been overlooked, their so doing increases the cost of production per lb. considerably. This does not of course interfere with the profits, provided a corresponding enhanced price is obtained for such packet teas, but the comparative cost of production with other Tea-producing countries such as Ceylon, where with very few exceptions the tea is packed in bulk in chests or half-chests, is obviously unfair. The cost of making up tea in 1 lb. lead packets with wrappers, &c., and putting same in chest, is 1 anna 6 pie per lb. above the cost of packing in the ordinary lead-lined chests in bulk. Suppose two gardens working under equal conditions and turning out say 150,000 lb. of made tea each, one of which puts half its crop in 1 lb. packets: this means that the garden so doing would have an expenditure above its neighbour of Rs. 7,000 odd, or the equivalent cost of about 9 pies per lb. over the garden packing all its crop in bulk in chests.

All things considered the Nilgiris ought to be able to hold its own with Northern India and Ceylon as regards cost per lb. of placing its tea f.o.b. Calicut

* This practice, I am told, is still in existence.

which I understand is the port the greater part, if not all, of the produce is shipped from. The Wynaad with a larger yield per acre and from the fact of that district being in a position to dispense with railway freight ought to be in a better position still as regards cheap production in the keen competition which all tea planters are undoubtedly entering upon. I am sorry we cannot congratulate ourselves on having cheap or even reasonable freights from our chief shipping port (Calicut) to the Continent, London or other important towns in the United Kingdom. Tea freights are excessive, if not exorbitant, and our Planters' Association might well address itself to getting them reduced, no easy task I admit when the apparent combination existing between coast agent and steamer lines is considered. The following figures will show under what a disadvantage the Nilgiri producer labours in this respect. The rates ruling for freight (via West Coast for transshipment at Bombay) have been for some time back and are at present as follows: to London 35/s, to Liverpool 55/s, to Continental ports 35/s per ton of 40 cubic feet, which is equivalent to about 800lb. Tea freight from Colombo to London has varied within the last six months from 12/s to 20/s per ton of 50 cubic feet, equivalent to something over 900 lb. tea, and freight from the same place to continental ports has been proportionately cheap. I cannot say what the exact rates at present from Bombay to London are, but some short time back they were as low as from Colombo; from this it will be seen that the Nilgiri producer is paying more than twice as much as his Ceylon "brother planter" for freight on tea to London and other ports. Perhaps our West Coast friends can give some explanation as to the cause of this. "Home charges," that is to say freight, landing, housing rent, fire insurance, sale expenses, brokerage, commission, interest and petties, should not exceed 1d per lb. of tea, but owing to dear freights the "Home charges" on Nilgiri tea amount to over 1½d per lb., which in these days when profits are small and the strictest economy necessary means a great deal. I have dwelt longer than I intended on the subject of freights; it is one which calls for the special attention of our Planters' Association, seriously handicapping as it does the "Tea Farmer" here. In other respects, however, he has many advantages over his brother producer in the "Spicy isle," not the least of these being cheap though perhaps not so highly trained labour. I hope on a future date (with your permission Mr. Editor) to draw some comparisons between the cost of individual works on these Hills and in Ceylon; meantime I would draw attention to the benefit arising from keeping tea estate accounts on such forms as show at a glance the cost per lb. of tea of each work, which is undoubtedly the right way of looking at it, as well as the good to be derived from comparing notes on these, and mode of manufacture, which for some unaccountable reason does not appear to be in vogue here. The age of secrets is past; it should be kept in mind that Northern India manufactures some 150 millions of lbs. of tea and Ceylon about 100 millions lbs., and that these countries have the most suitable buildings and appliances for turning it out good and cheap, whereas I think I am correct in saying that with the exception of a well-known estate in the Ouchterlony Valley, most of the gardens here are far from being "up to date" as regards their factories. From some interesting statistics lately compiled by the Hony. Secy., N. P. Association, there are said to be 6,015 acres under tea on these Hills and the working expenses on this acreage is said to be Rs. 6,01,500. Presuming this to be all in bearing and yielding say 300lbs. per acre, our total crop is 180,000lbs. and it costs to lay down f.o.b. about 5 annas per lb. These figures must be looked on as approximate, as whether the amount mentioned includes Rail and Shipping charges or only actual estate expenditure I cannot say, but even if it does not, the cost per lb. is by no means out of the way for a high district such as this, more especially when it is considered that perhaps as much as 50%

of the total quantity is made up in 1 lb. packets. Facts are however what we require—doubtless in some cases managers are hampered by the estates under their control being burdened with charges which correctly speaking should not go against cost of production and which prevent them turning out their tea as cheaply as might otherwise be the case. I can hardly imagine, however, that proprietors in such instances could be so inconsiderate as not to bear this in mind. I have before me the results of carefully kept statistics (the accuracy of which I can vouch for) by a Nilgiri Manager of several years' experience on a garden of nearly 100 acres, yielding 500 lb. per acre made up for his last financial year to the 30th June, which show that the crop was placed f.o.b. (all charges on this side included) for the very reasonable figure of 4 as. 9 pie per lb., 20% of the crop in question being placed in 1 lb. packets. The garden referred to is by no means favourably situated as regards transport, but has the advantage of water power for driving its machinery. The fact of tea from a comparatively small acreage such as this being laid down at so low a figure goes conclusively to prove that tea planters on these Hills can hold their own with what are looked on as more favoured countries in point of cheap production, if not in high prices. F. T. TURPIN.

—Planting Opinion, Aug. 15.

HORTICULTURAL GARDENS, LUCKNOW.

From the report on the Government Horticultural Gardens, Lucknow, for the year ending 31st March 1896, by Mr. M. Ridley, the Superintendent, we quote the following:—

I.—FRUIT CULTURE.

The mango crop was again a light one, but pine-apples, which grow below the mango trees, yielded well. Peaches and *alubukharas* gave good crops; also loquats and lichis. The crop of jack-fruits was the worst I have known.

2. The orange and lime crops were light: in fact all the citron tribe yielded poor crops. One exception was a seedling orange tree of the Malta type: this bore a very fair crop of fruit, which, both in size and quality, was equal to any of the named kinds in the Garden.

A.—Improvement of indigenous or acclimatized kinds.

3. A small plot has been planted with forty plants of the garden variety of *alubukhara*, which, so far, is decidedly superior to any other variety yet tried. I hope to extend the area of this very useful fruit.

4. On a small plot of ground which was found available, 55 seedling peach trees were planted: these seedlings are from the seeds of selected fruit. Owing to injury from the flood in 1894, nearly all the seedling trees of this class which were under observation have died—several this year.

5. There is nothing requiring special record in connection with the Arabian date palms.

B.—Introduction of new kinds.

6. Nearly all the orange trees imported in 1887 fruited this year; with the exception of the kind named *Dulcissimo*, all yielded slightly. They were closely observed, and, when ripe, a careful comparison of the several kinds was made with each other and also with the old kinds in the Garden of the same type.

7. The following are the notes recorded:—
DULCISSIMO.—Fruits varied greatly in size, some large, some small; skin a little thicker than *Embiguo*; flavour superior, rich and sweet; and excellent orange.

DULCIS.—Slightly smaller than a common Malta; skin thinner, flavour slightly more acid.

EMBIGUO OR MARVEL.—Fruit the size of an ordinary Malta; skin medium in thickness; flavour fair.

EXCELSIOR.—Fruit somewhat smaller than the common Malta; slightly oblong, skin thinner than Malta; flesh orange yellow with a slightly acid flavour.

EGG.—Fruits variable in size, large and small; skin rather smooth and thin. Fruits have a good appearance and are also of fine flavour. This is the best orange, so far, of his batch.

LONG ORANGE.—Very like a common Malta, both in size and appearance, thickness of skin, flavour, &c.

St. MICHAEL'S.—A good-sized fruit, a little over the common Malta in size; has a thinner skin excellent flavour; a good orange.

SILVER.—Rather a small fruit; skin a pale orange colour; hence probably the name "silver." Skin thin, flesh juicy, of moderate flavour.

8. A plant of the China bitter orange bore several fruits: they were most taking to look at, being large and well-formed. When ripe they were highly charged with juice, but too bitter in flavour to be at all palatable.

9. A Japan orange, named *si-in-kom*, also fruited. It seems to be nothing else than what has been long in the garden under the name of the Mandarin orange.

10. Ten of the strongest plants of the Malta loquats were planted out, and are, so far, doing well.

11. A few years ago a packet of loquat seeds was received from California; the trees raised from this seed fruited this year. I regret to say the fruit proved to be very small and very much inferior to varieties long grown in the garden.

12. The plants of the Mauritius Ber have not made much progress, and are still being grown in pots; so many as room can be spared for will be planted out in the coming year.

13. Plants were received of the following new kinds of mangoes from the Government Agri-Horticultural Garden, Lahore:—

1. Mango Erinnura. | 2. Mango Alphousa.

3. Mango Khusi.

14. There is still hope of establishing the strawberries imported in 1894, as plants of all are still existing in Mr. Reid's garden at Naini Tal, and also in the Muktesar Nursery, Naini Tal.

15. At Naini Tal they have not done well owing to having been planted in poor shaley soil; in a suitable soil they would no doubt do well enough. At Muktesar some fruit was obtained and efforts are now being made to increase the stock of plants.

II.—VEGETABLE AND FARM CULTURE.

20. The usual selection of country vegetables was grown for the purpose of yielding seed.

21. The hot-weather section did well, with the exception of "kakri" (*cucumis melo var. utilissimus*), the fruits of which suffered severely from disease, which attacked and destroyed them when at a mature stage of growth.

22. Imported vegetables were also grown as in preceding years: pears did moderately well only, the excessively dry atmosphere which prevailed all through the cold weather was most unfavourable to this crop. Carrots were to a large extent a failure, owing to the seed germinating badly. With these exceptions, the results obtained with other vegetables were satisfactory.

23. As early vegetables are usually in request by the general public, it may be stated that Sutton's earliest cabbage proved itself the earliest out of the undermentioned kinds by fully two weeks: all were sown at the same time and received identical treatment afterwards:—

Cabbage, Sutton's Imperial.
 " Wheeler's Imperial.
 " Sutton's All Heart.
 " Sutton's Earliest.

24. Through the kind offices of Dr. Bonavia, I received a large packet of onion seed from Egypt, but I am sorry to say none of it germinated. In forwarding the seed Dr. Bonavia expressed the opinion that it was probably the same variety (silver-skin) which has been so long cultivated in this Garden. It is matter for regret that this could not be ascertained.

25. The non-success of previous years has again been repeated this, in the attempt made to raise sugarcane from seed. The repeated sowings made all ended in blank failures. The plantation made in 1893 having exhausted the soil and got into an unsatisfactory condition, a new one has been made of the same kinds.

26. The Japanese fodder plant, *Polygonum sachalinense*, has so far proved a failure, the plants got sickly in the rains and died down to the ground before the cold weather set in: growth commenced again in February, and the plants have a few weakly

stems upon them now. The appearance of the plants afford no ground for thinking that this plant will be of any use as a forage-producer in a climate like Lucknow.

27. Two consignments of Rum plant (*Strobilanthes flaccidifolius*) were received from the Assistant Director; the plants in the first consignment all died, but from the second lot eleven are alive; nine plants in the ground under lichi trees, and the other two in pots. They are only a few inches high and not vigorous, but appear healthy and afford some hope of succeeding.

28. Sufficient seed has been secured of the Italian grams mentioned in last year's report at paragraph 42 to admit of a sowing being made of each on a scale large enough to afford a fair test of the returns they are capable of yielding. This I hope to carry out next year.

29. The plants, or rather roots, raised last year of "canaigre" survived the hot weather and rains underground, and started into vigorous leaf growth as soon as the cold weather arrived. They were much stronger and more robust than last year, and again have seeded freely.

30. From the seed secured last year a number of young plants were raised and planted out on a plot measuring 63 square yards; this contains 259 plants; they have done well and give promise of a good yield of roots: it has been considered advisable to let them have a second year's growth before testing the yield.

31. Anyone wishing to experiment with this plant can be supplied with seed for the purpose. So far as the trial with it here has extended, there is good ground for thinking that it can be successfully grown in this climate.

32. The clover seed sent by the Assistant Director was sown in the horticultural garden on good, well-cultivated soil. The seed was sound and germinated satisfactorily, but proved to be largely mixed with "kasni" (*Cichorium intybus*) the proportion of clover plants in the crop appeared to be about one-fourth of the whole.

33. Both plants reached full growth early in April, when the entire crop was cut; it was weighed at once while green. The total weight was 7½ maunds, or at the rate of 95½ maunds per acre.

34. Comparing this with lucerne, which is said to yield 3¾ tons or 8,400 lb. per acre at one cutting, the yield of this clover and "kasni" crop is less by 589½ lb. per acre. The season was not very favourable; but, after making due allowance on that account, it may still be safely assumed that lucerne would give a higher yield, and I should certainly think lucerne vastly superior in nutritive qualities.

35. There is nothing in this experiment to justify the belief that such a crop can be usefully grown for fodder in this part of India.

36. A plot of ground partly vacant and partly planted with Eucalyptus trees has been cleared, levelled, and made available for the cold weather crops: this will give some relief, as often difficulty was experienced in finding space for crops of annuals and vegetables. The area made available is 3,133 square yards.

IV.—ARBORICULTURE.

53. The demand for Eucalyptus leaves was nearly the same as last year. Forty-seven maunds of leaves were sent out during the year against 37 maunds last year.

54. The effects of the flood of September 1894 are gradually disappearing: and as no damage was done by flood-water this year, the young stocks of trees have had nothing to impede their growth.

55. As shown in column 4 of the following statement, distribution during the year was very small; this is due to the want of trees of a size large enough to plant out not being available, owing to the destruction of all trees of a useful size by the flood of 1894. This year trees of several kinds are available, so that I anticipate a larger issue during the coming year.

56. The trees enumerated as missing in column 5 were chiefly overgrown trees which had become too large to transplant, so were uprooted to clear the space they occupied.

57. Attention is given to raise only such number of each kind as are likely to be required each year; on this

account, the increase for the year is not so large as it might easily have been. As nearly as can be estimated, there will be (barring loss by flood) sufficient for all demands in the future.

58. The total number of trees in stock at the end of the year is more than double what it was at the end of last year.

59. The ground unoccupied by nursery was cropped with oats: the grain-yield was fairly good, but the straw was short, due to the excessively dry atmosphere which prevailed all through the growing period.

EXOTIC PLANTATION.

63. The following additions have been made to the trees previously under trial in the Exotic Plantation: *Tecoma serratifolia*, four trees; *Manihot glaziovii*, six trees.

64. The blanks caused by the flood among those previously planted have all been filled up except in the case of *Aleurites molluccana*, of which no plants are yet available.

65. The plantation of Divi-Divi remains very much in the condition it was last year. One of two things should be done; either to reduce the plot to the three good rows on the west side where the trees are doing well under the shade of the rain trees, or to plant some quick-growing tree among the others to afford them shade. It is quite clear that they thrive best with a certain amount of shade and shelter from tall trees.

66. The rain trees are in better condition this year; the dryer state of the air and soil, which has obtained since September, appears to have benefited the trees. A small supply of seed is now obtained yearly from the largest trees.

DATE PLANTATION.

69. There has been a loss of 100 in the number of date trees previously planted, and as the young trees on hand were considered too small and weak to plant out no blanks were filled up this year. The number of trees now planted out and living is 700.

70. A few look healthy and are growing slowly; but the majority are not doing well, as previously explained: this is chiefly due to the shade caused by the Eucalyptus trees among which they are planted.

71. The Eucalyptus trees are in a fairly satisfactory condition, and give promise of developing into useful building poles in time.

72. The trip of vacant ground bordering the public road on the east side was planted up during the year. The soil in several places is heavy and hard, and on these spots the young trees have died out in large numbers. The result of this year's planting is 5,000 young trees added to the plantation.

73. There is a small blank on the west side planted some years ago, on which only a few trees survive: this has been trenched and a stock of seedlings is being raised to replant it this year. When this is done, the planting will be completed, so far as eucalyptus trees are concerned; the available area will then be filled up: all that will remain to be done will be to fill up the blanks among the date-palms.

INDIA AND GREEN TEA.

To the question of the advisability of reviving the green tea trade in India a most interesting contribution has been made by Mr. Ringler Thomson, British Vice-Consul for Khorasan, in a report upon the trade of that region which has just been published under the auspices of the Government of India. In his report for 1894-95 Mr. Thomson touched upon the subject of Indian trade with Persia and Central Asia, and referred to the prohibitive tariffs with which it had to reckon. The present report deals with 1895-96, and the Vice-Consul takes special notice of the tea trade, showing the relative positions of India and China in this part of the world, and endeavouring to assign a reason for the change which has come over them during the last twenty years. It certainly seems strange, as Mr. Thomson remarks, that "while Indian black tea has been steadily driving the Chinese article out of most of the far-distant markets of the world, Chinese green tea, in a short space of time, and apparently without an effort, drove the Indian article clean out of its own market."

How completely this has been done is manifest from the statement that whereas twenty years ago the whole of the green tea trade with Khorasan was in the hands of British Indian tea planters, to-day they "do not supply a leaf." It must be admitted that on this point Vice-Consul Thomson's observations are not borne out by those of the Collector of Customs, Bombay. That official describes green tea as the most important branch of the trade between Bombay and the Russian possessions in Central Asia, all Chinese tea being, of course, in the first place shipped to Bombay, and thence re-exported. Comparing the quantity thus dealt with during the last five years with that exported from India to Persia the Bombay Collector of Customs shows that the quantities of Indian tea varied considerably from year to year, but that in 1894-95 they reached a total of over two million pounds, while the Chinese article was placed upon the same markets to the extent of nearly four million pounds. In the first nine months of 1895-96 there was, according to the Collector of Customs, a large falling-off in the trade between China and Persia, and a corresponding increase in the export of Indian tea. The totals were: China tea 1,193,090lb.; Indian tea 3,750,685lbs. India also did well, during the period mentioned, by the new Batum route, exporting 121,771lbs. in 1895-96 as against nil the previous year. The Collector of Customs concludes, therefore, that Indian tea has benefited, and that China tea has suffered by the new Customs regulations enforced by the Russian authorities. Vice-Consul Thomson differs from him. He maintains that if the Collector's figures are accepted they amount to saying that India alone is now supplying Central Asia annually with more green tea than that district formerly received from India and China together. Mr. Thomson considers this highly improbable, and adduces the evidence of British planters at Kaugra and Kumaun and of Messrs. Balmer Lawrie and Co., to show that "no green tea is manufactured by Europeans in Northern India and only little by Natives." How is this discrepancy between Mr. Thomson's figures and the Collector's to be explained? Mr. Thomson has a convenient method of accounting for it. He points out that the Collector has said a great deal about green tea and about other exports to the Gulf, but that he nowhere makes mention of black tea. "Therefore I imagine," writes the Vice-Consul, "he has mixed his Indian teas, and has included black with green, which would account for the error." Large quantities of tea go to Bandar Abbas, a million and-a-half pounds being taken by Bushire alone. That is how the Vice-Consul gets rid of the difficulty. It would be interesting to hear what the Collector has to say on the subject. Going back over the history of the transfer to China from India of this important trade Mr. Thomson says that two things happened simultaneously: trade left the Afghan route and China absorbed it. The writer does not attempt to connect the two events, because, as he says, while he is able to explain the reason of the first, he is still doubtful about the causes of the second.

As to the avoidance of the Afghan route that was brought about partly by the heavy import duties levied by the present Amir, and partly by reason of the unsafe, because unsettled, condition of the country at the time of his accession. All independent merchants forsook it, of course, and it would have fallen into complete desuetude but for the compulsion put upon Afghan merchants to carry on their business along the routes of Afghanistan. These facts are sufficient to account for the diversion of the traffic to the Gulf, but obviously they throw no light on the concurrent transference of the trade in green tea from Indian to Chinese hands. Mr. Thomson suggests as a possible explanation that prices had been falling in Northern India for some time and that the European planters at last refused to go any lower, and turned their attention to black tea. About the same period, he supposes, "some enterprising China or Bombay merchant read the signs of the times and began to place the Chinese article on the Bombay market for despatch *via* Meshed." This a charming theory, the parts of which dove-

tail into each other with perfect ease. We wonder what the Bombay Collector of Customs thinks of it. Mr. Thomson, it is interesting to learn, finds that prices are now good again, and thinks it possible that Indian planters may come to renew their interest in the green leaf. There is, he says, a British Consul at Batum, and there are several respectable merchants of various nationalities there who would be delighted to act as agents. The country, too, is being opened up by the new railways which are in course of construction. There would be some consolation in the engineering activity of the Russian Government, if its policy of pelion upon Ossa in the matter of railways should result in facilitating the development of a British Indian industry.—*Englishman*, Aug. 11.

FOREST WEALTH OF BRAZIL.

An interesting report on the forests of Brazil has recently been presented to his Government by the French Consul at San Paulo, who calls attention to the wealth of timber in them, more particularly in the forests situated in his own consular district. M. Georges Ritt says that among the sources of natural wealth in the province of San Paulo, one of the most interesting, but unfortunately, somewhat neglected, is the timber of which the immense virgin forests are composed. The recent industrial exhibition at Rio de Janeiro, where a considerable number of samples of Brazilian wood were on view, was the means of calling attention to the value of these products and to the advantages to be derived from a regular and systematic working of the forests. The most important, as well as the most common, tree is the *pinho*, which is found in great abundance in the State of Parana also, and where it is known as the *araucaria*. In San Paulo the *pinho* has been sacrificed to coffee cultivation, and a large number of these trees have been destroyed, and the forests themselves burnt in order that the land might be prepared for the coffee plants. The *pinho* is, nevertheless, still found in great profusion in the western and southern parts of the province. The tree grows easily and rapidly, and attains a height of 45 metres. In twenty years it can supply large planks, which are used for sleepers, doors, and windows, axletrees, etc. After the *pinho* or *araucaria*, the *acacia* which is known by the Indians as *curupay*, is one of the most useful woods of San Paulo. This wood is particularly hard and able to withstand the effects of the weather. It is used for carriage building, and for making drays and the rough carts of the country. The *acacia* is also employed in ship building and in making railway sleepers. This tree attains a height of from 12 to 15 metres, but it is of slow growth. Much interest is devoted to this tree, not only on account of the usefulness of its timber, but also because its leaves are said to have some medicinal property similar to that of the eucalyptus. Another interesting variety is the *guajuvira* (*Patayoula Americana*), a tree which is found growing throughout the whole of Southern Brazil. The wood is very hard and durable. It is eminently adapted to carriage making, and also furniture and other articles; it is also used for railway sleepers; it grows to a height of about 12 metres. The *soita cavallo*, or *acenta cavallo*, is a wood of very good quality, it is hard and not easily split. It is used for yokes, *sabots*, and broom handles. It also serves for piano making, and is used for furniture, and one establishment on Santa Maria the *acenta-cavallo* is specially used for making chairs. In addition to the above-mentioned trees which are the most common, and the most generally used, there is a large number of other varieties which although not worked, might be so with advantage and profit. There are the following:—*Cabreua ipê lamer*, *cajerana*, *tajuba*, *jacaramba*, *figueira branca* (white fig tree); *aroeira*, *sucupira*, *pereira*, *batalha*, *canella*, *passariva*, *cedra*, *carroba*, *canna frista*, *suinam*, and others. The *cachocan* and the *pis de Brazil*, which are found in great profusion in the forests, are much appreciated by dyers for the beautiful red colour yielded by the bark. An idea may be formed, by the

above enumeration, of the abundance and variety of useful trees in the province of San Paulo. Unfortunately, as M. Georges Ritt observes, everything in Brazil is sacrificed to the coffee industry, all other productions only appearing to be of secondary interest. Sylviculture has always been neglected, and this to such an extent that in the neighbourhood of cultivated districts a large number of forests have been ruthlessly destroyed to make way for coffee plantations. The consequence of this is the increasing rareness of indigenous woods on the market, and their high price. Moreover, it necessitates, in spite of the natural resources of the country, a considerable importation of foreign timber, particularly from Sweden and Norway and California, these importations being required for building purposes. These foreign timbers, notwithstanding the distance from which they are brought are placed on the market in Brazil at a cheaper rate than the Brazilian woods themselves. One explanation of this is that the high price of Brazilian wood is caused by the difficulty and cost of transport in the interior of the province. The majority of the railway companies only serve the coffee districts; in fact, it was in view of this industry that they were originally established, and it is, therefore, perhaps only natural that at certain periods, more particularly during the coffee harvest, the companies devote all their energies to its transport, which is a lucrative one for them, and that the carriage of timber is neglected, stocks of which are allowed to accumulate and to remain for long periods exposed to the inclemency of the weather and to the risk of robbery, which is by no means infrequent. It is owing to these disadvantages, and the insufficiency of the means of transport, that the owners of the forests have been induced to destroy their property rather than to saddle themselves with heavy expenses which they could not recoup themselves for, by a rapid sale of their products. Moreover in San Paulo, although there are many streams and waterways, the advantages enjoyed in other countries in the way of floating the timber to its destination are not available, the streams in question flow towards the western part of the province (the basin of the Parana), which is the sparsely-populated district, all the towns and the centres of industry and activity being situated in the elevated regions of the interior, and at the source of the rivers. The virgin forests being found in the lower plains of the West, it is impossible to utilise the stream for floating the timber to the places where it could be delivered for consumption. In conclusion, M. Ritt says that unless the Government takes steps to put an end to the difficulties which hedge round the timber industry in Brazil, the time must soon come when an industry which could easily be made an inexhaustible source of wealth to the country will entirely cease to exist.—*Journal of the Society of Arts*, July 31.

FACTS ABOUT TEA MAKING AND WATER.

(By a Professional Analyst.)

It used to be a common thing with our grandmothers to put a little soda in the teapot when making the daily "brew," and the custom is still pretty widely existent. This practice of water-softening was not without its justification in the days when China teas alone were imported; but at the present time, with Indian and Ceylon teas in such preponderance, some discrimination is desirable in suiting the water to tea, or the tea to the water, as the case may be. Ordinary potable water contains small quantities of organic matter, and much larger but very variable amounts of inorganic bodies; the latter it is which determine whether a water is "hard" or "soft." Practically the "hardness" of a water is the only thing to be considered in regard to its tea-making properties; the organic matter, though of the first importance in judging of the fitness of the water for drinking, is usually altogether too minute to effect the quality of the tea infusion. With the hardness, however, the case is different. A tea suitable for soft-water infusions will give a different result when made with hard water.

Broadly speaking, the substances extracted from tea by the water, are—(1) the alkaloid theine, to which the chief stimulant and refreshing effects of the tea are due; (2) the oil of tea, which confers much of the characteristic fragrance and aroma; (3) the tannin, imparting astringency and bitterness and acting prejudicially on the digestive system; and (4) the residual extractive matter, including albuminous and other compounds which help to impart "body," flavour and colour to the infusion. Physiologically the theine is the most important constituent, and either hard or soft water extracts it almost equally well if sufficient time be allowed, though soft water appears to act more readily at first. Roughly, about 50 per cent. of the total theine is obtained in the beverage as ordinarily made, or perhaps a little more. It may be asked whether much of the remaining 50 per cent. cannot be extracted. By further "drawing" this is quite possible, but the amount of tannin is also increased, so in practice we have to effect a compromise. With respect to the oil of tea, little is definitely known as regards the comparative efficacy of hard and soft waters. This is to be regretted, since much of the flavour and "bouquet" depends on the constituent in question. Appreciably more tannin is dissolved out by soft water than by hard, at all events from some kinds of tea. Many laboratory determinations made with distilled (perfectly soft) water have shown that the amount of tannin extracted depends on the time of infusion, considerably more being present after ten minutes than after five; but experiments made by Geisler indicate that with moderately hard water the increase is much less than with soft water. The proportion of residual extractive matter is also affected by the hardness of the water. A soft water will extract more albuminoids than one which is hard; and, in fact brewers, who are aware of this general property, make a point of using hard water for clear ales, but a soft one for thick porters. Which, then, should one use—a hard or a soft water? It depends upon the kind of tea. Indian teas, being of rough and pungent flavour, are better made with hard water; soft water yields a stronger but less agreeable infusion. China teas, on the other hand, are more suited to localities where the water is soft; their more delicate flavour allows of the fuller extraction given by the soft water, without the beverage becoming unpalatable. Frequently, however, as will be known to many readers of *The Grocer*, China teas are blended with Assam or Indian teas in different proportions to suit the water of a particular district; for instances, Glasgow, supplied by the very soft water of Loch Katrine, would require a large proportion of China to Assam than would, say, Birmingham, where the water is hard. Ceylons and Darjeelings are of an intermediate character, and are suited to moderately hard waters.

It is, of course, usually easier to choose the tea to suit the water than *vice versa*; but if we desire to drink, say, a delicate China tea and have only a very hard water supply, we may soften the water in a rough-and-ready manner by the old-fashioned device of putting in a little soda. On the other hand, a water that is too soft for Indian teas could be hardened by the addition of a small quantity of calcium sulphate, but practically it is better to blend the tea in this case. Waters that have a large proportion of "temporary" hardness can be considerably softened by half an hour's boiling; but it is an article of faith with tea-tasters that water, whether hard or soft, should not be thus boiled—the tea should be made immediately ebullition commences. There is a consensus of opinion on this point, though the scientific reasons are not well known. Probably the small quantity of dissolved gases still remaining in the water, but which would be expelled by continued boiling, have an aerating effect on the beverage, or possibly some constituent of the tea may be more completely oxidised. Waters naturally alkaline, or made so with a slight excess of soda, give a more nutritious infusion than ordinary water, since they extract the gluten of the tea. In Europe, where tea is only valued as a stimulant this is a matter of merely theoretical interest; but in Thibet

the fact is particularly applied in preparing a kind of food, which is said to be very nourishing. Waters containing iron in solution should be avoided. Iron and tannin together form ink, which does not improve the flavour or colour of the decoction.—*Grocer*.

WANARAJAH TEA COMPANY, LIMITED.

The fourth ordinary general meeting of the shareholders of the Wanarajah Tea Company of Ceylon, Limited, was held in the office of the agents and secretaries (Messrs. Baker & Hall), Queen Street, today. Mr. T. Mackie presided, and present were Messrs. A. Cautlay, J. W. Vanderstraaten, T. W. Hall, F. W. Burt, and (by proxy) H. L. Baker and E. S. Anderson.

Notice calling the meeting, which was published in the *Gazette*, was read, and minutes of the ordinary general meeting held on August 30th, 1895, were read and confirmed.

The CHAIRMAN submitted the report, which is in the following terms:—

ACREAGE.	
Tea in bearing ..	acres 541
„ planted 1892 ..	„ 300
„ „ 1893 ..	„ 124
„ „ 1895 ..	„ 72
	————— 1,037
Timber and Grass ..	acres 57
Jungle ..	„ 40
	————— 1,134

The directors have pleasure in submitting to the shareholders their report, balance sheet, and profit and loss account for the past season. The coffee crop, as anticipated in last year's report, proved a very small one, only 99 bushels 1st parchment, 6 bushels 2nd, and 40½ bushels cherry. The season has been a favourable one for tea, and the yield has reached 238,761 lb., against an estimate of 170,000 lb. The average nett price realized for the teas, sold to date, has been a little over 62 cents per lb.

In last year's account the tea in store and balances on unsold shipments were estimated at R9,006.37. These realized R11,684.85, and the surplus has been included in this year's proceeds of crop.

During the year, 205 acres were manured, with very satisfactory results; and the directors propose to continue their policy of a liberal outlay on this work. The reserve set aside to provide for manuring has been exhausted, and the additional expenditure has been charged to working expenses. This will be continued in each year.

The ordinary working of the estates shows a balance at credit of profit and loss account of R105,383.91. Of this sum an interim dividend of 8 per cent was paid in January last, and the directors now suggest that a final dividend of 12 per cent be paid, making a total of 20 per cent for the year, and that the balance of R28,271.91 be carried forward.

The estimate for season 1896-97 is 290,000 lb. Tea, and 200 or 300 bushels Coffee may be secured; but the Directors do not anticipate any material increase to the receipts from this product in the future.

The expenditure on Capital Account for the present year is estimated at some Rs. 24,000, which includes additional machinery and withering accommodation and new lines.

Special attention will be given to planting up ravines, etc., which will materially add to the appearance and value of the property. It is proposed to plant 13 acres of this land this year, and the balance next year. The Visiting Agent reports very favourably on the general condition of the estate, and his report can be seen by Shareholders at the Company's Office.

The Directors who retire by rotation, Messrs. Thomas Mackie and E. S. Anderson, being eligible, offer themselves for re-election.

Mr. Guthrie, the Auditor, also offers himself for re-election.

The CHAIRMAN, in moving the adoption of the report, congratulated the shareholders on the satisfactory footing of the Company. He presumed that the report might be taken as read, having been in the hands of the shareholders for some time. The outturn for the season under review confirmed the remarks made by the Chairman at the meeting held a year ago, resulting in some 68,000 lb. in excess of the estimate. As illustrating the progressive increase of yield, the following figures might be of interest to the shareholders:

Crops for 1892-3	53,995 lb.
" " 1893-4	86,657 do
" " 1894-5	117,697 do
" " 1895-6	238,761 do

and for the current season the estimate is 290,000 lb. He regretted to say that so far as coffee was concerned no material help could be expected in the future, and before long this heading would cease to exist in the books of the Company. The young fields of tea planted on forestland were most promising, and, being of a superior jât, would doubtless, when in full bearing, give most satisfactory results and add materially to the prosperity of the Company by increasing the yield as well as improving the quality. For further details the Chairman placed the visiting agent's last report on the table to be at the disposal of shareholders.

Having invited discussion, those present remarked that the full information afforded left nothing to inquire about, and the adoption of the report having been seconded by Mr. H. L. BAKER was carried unanimously.

On the motion of the CHAIRMAN, seconded by Mr. F. W. BURT, it was resolved that a dividend of 12 per cent be paid forthwith, making 20 per cent for the year.

Proposed by Mr. J. W. VANDERSTRAATEN, seconded by Mr. T. W. HALL, that Messrs. Thomas Mackie and E. S. Anderson be re-elected Directors.—Agreed.

Proposed by Mr. H. L. BAKER, seconded by Mr. F. W. BURT, that Mr. John Guthrie be re-elected Auditor at a fee of R100 per annum.—Agreed.

The CHAIRMAN having spoken in commendation of the able services of the manager and his staff in bringing about such favourable results, the meeting unanimously recorded its appreciation of their services.

A vote of thanks to the Chairman and Directors closed the proceedings.

INDIARUBBER AND BANANAS IN MEXICO.

Sir Henry Dering, in his report on the productions of Mexico (already referred to) describes the cultivation of India-rubber and bananas. The rubber tree is indigenous to Mexico and is found growing wild along both coasts, below 22 degrees north latitude, from sea level to altitudes running from 1,200 to 1,500 feet, and principally by the river meadows. Rubber is essentially a tropical tree, hence it requires a hot and moist climate. The temperature best adapted for its vigorous growth is above 96° Fahrenheit, and the rainfall should be at least 60 to 70 inches per annum. There are eight kinds of rubber trees that grow wild in the country, but the kind known under the name of "Castilleja elastica" is the most important and the best, as it is very much sought for, for its sap and for propagation. Regarding the work of extracting the rubber one man will tap from 20 to 25 trees a day if the operation is performed carefully and methodically. In most places the tapping is done in May and sometimes again in

October, but it is not advisable to repeat the operation as often as that. The process generally consists in making two or three incisions in the lower part of the tree and collecting the sap that flows from them on clay vessels placed next to the trunk. The process can be repeated every year for 25 years or more especially if the wound is covered with wax or clay after the flow of the sap has ceased. When there is a large quantity of milk gathered it is placed in a barrel having a faucet and a solution of five ounces of chloride or sub-carbonate of sodium in sufficient water to cover the whole mass, which is agitated with a stick every now and then. After lapse of 24 to 36 hours the water is allowed to run out through the faucet; this operation of washing is carried on until the rubber becomes white. About 41 per cent of rubber remains from the original amount of milk after the water and other matters have been eliminated by evaporation. Trees planted on lands having the soil, climate, and elevation adapted for the culture will produce from 5 to 6 lb of juice on the first year that they are tapped, which amount is equivalent to 2.4 lb of pure rubber. This product will be gradually increased every year for the next four or five years, and sell 50 cents per lb on the plantation. The total expense for a rubber plantation of 100,000 trees will not exceed 25,000 dollars, and as the yield of 100,000 trees will be about 240,000 lb at the first year's harvest, this will bring the planter 120,000 dollars, besides the product obtained from the side planting. The net profit on the investment, after deducting the entire cost of the land and all expenses up to the first year of harvesting, will be 95,000 dollars, and each of the succeeding harvests for 25 or 30 years will bring a steady income of over 100,000 dollars.

The Banana grows spontaneously and in very great abundance almost everywhere on the Mexican coast region and on the lower borders of the temperate zone. The plant is cultivated in all the States, excepting in the Distrito Federal, Baja California, Sonora, Coahuila, Chihuahua, Agrás Calientes, Mexico, Tlaxcala, and Campeche. Its cultivation is easy and cheap, and when properly carried out, the first crop may be gathered in ten or twelve months from the time of planting. As to the expenses, large plantations can be made at a cost of 3½ to 5 cents per plant, if planted 1,000 to the acre. The cost of clearing the ground is from six to eight dollars per acre; the price of 1,000 suckers or shoots from 2 to 25 dollars; staking, holing, and transplanting will cost 8 dollars 25 cents per 1,000 dollars; weeding and trimming, 6 dollars 25 cents per acre; and gathering the fruit, 6 dollars 25 cents per acre. At the end of the first year, 1,000 plants will yield 1,000 bunches, which sell at the plantation at 25 cents a piece, producing 250 dollars. The following year the yield is double that amount, and the expenses less than half.—*Journal of the Society of Arts*, July 24.

CONFECTED TOBACCO.—At present a duty of R130 and R60 per candy is imposed on dry and confectioned tobacco, respectively, imported from Tinnevely into Travancore. The Travancore Durbar has now found that, says a Madras contemporary, this procedure is an inducement for fraud and invasion of duty, as the importers have established a confectioning factory at Panagudi, in British territory, near the frontier of the State where the dry tobacco is subjected to a show of confection and the imperfectly confectioned tobacco is brought into the Native State and passed off for purposes of duty as fully confectioned stuff by hood-winking or buying off the Customs and Bankshall authorities. This has resulted in a considerable fall in the quantity of dry tobacco imported and to a consequent loss of revenue to the State. In order to check this the Madras Government has accepted the proposal of the Travancore Durbar to impose a uniform duty of R90 per candy on all Tinnevely tobacco imported into that State.

GOVERNMENT BOTANIC GARDENS,
NILGIRIS.

From the annual Administration Report of the Government Botanical Gardens and Parks, Nilgiris, for the year ending 31st March 1896, by Mr. David Hooper, Government Quinologist, we make the following extracts:—

NOTES ON PLANTS OF ECONOMIC INTEREST.—(1) *Ipecacuanha*.—The cultivation of *Ipecacuanha* does not succeed so well at Nilambur as was at first anticipated. Out of 249 plants put out in 1887, only 149 were alive last June; but they were flowering fairly well and were in a healthy condition. It seems that they require a moister climate than Nilambur, for they die down annually during the dry months between January and May, and sprout up afresh at the first burst of the monsoon. Mr. Malcolm in the Vellara Mulla Hills has discovered that a light shade under fig trees and a moist situation are more suitable for the plant than thick forest shade. Some young plants have been sent to applicants in the untried districts of Peermad, Travancore and Coorg, and reports upon their progress have been promised.

A few flowering specimens of *Ipecacuanha* are being sent from India to London to have their botanical features investigated. A dozen plants were sent to Kew about a year ago, and reached their destination in good condition.

(2) *Jalap*.—Five hundred pounds of jalap tubers from a stock of lb. 1,200 were supplied last January to the Medical Storekeeper, Bombay, and the balance of lb. 700 will be divided between the Medical Stores of Bombay and Madras, as application has again been made for the drug this year. A large order for jalap from Calcutta could not be complied with, as the present crop is not mature enough for lifting. For some years past the whole of the jalap has been grown in the Cinchona Plantations at Dodabetta, and it is intended this month to plant it out also on the terraces above the glass houses in the gardens.

The private planters on the Nilgiris are still holding back from cultivating this useful drug, and are not able to place any of it on the market.

(3) *Dandelion* (*Taraxacum Officinale*).—The crop of Dandelion near Crewe Hall has not been taken up yet, as the roots have not grown much during the dry weather, and are still very thin. After another wet season it is hoped that the plants will be sufficiently robust to yield a large quantity of matured roots.

(4) *Sweet flag* (*Acorus Calamus*).—The sample of oil distilled from the fresh plant and sent to Surgeon-Major Parker of the Medical Stores, Bombay, for experiment, was tried by him, but he reports that the results of its clinical administration were not satisfactory. The fresh root is no doubt the best part of the plant for medical purposes.

(5) *Digitalis*.—In February last the Medical Stores Department, Bombay, asked to be supplied with lb. 30 of these leaves, which were sent there and charged for at the rate of As. 4 a pound.

(6) *Nilgiri Nettle* (*Girardinia palmata*).—The Reporter on Economic Products, on behalf of the Imperial Institute, has been making enquiries regarding a fibre suitable for the manufacture of hats. A specimen of the Nilgiri Nettle fibre, prepared by Mr. McIvor in 1867, was forwarded through the Board of Revenue, and enquiry was made as to the cost at which a similar material could be supplied. A small quantity of the fibre, about half a pound, was prepared from some of the nettles in the Government gardens at the cost of Rs. 3. The Nilgiri Nettle is not so plentiful in the neighbourhood of Ootacamund as it used to be, and the Todas, around whose mounds it is generally found, do not appear to utilise the fibre.

(7) *Litsaea Zeylanica*.—The *Litsaeas* grow in profusion on these hills, and the trees are related to the cinnamon. The Reporter on Economic Products, through the Board of Revenue, applied for some of the essential oil of the leaves for the Imperial Institute. The oil exists in the leaves in a minute proportion which made the process of distillation very tedious. The oil possesses the peculiar

fragrance of the tree, but it has the remarkable property of resinifying or drying up like a varnish when exposed for a short time to the air.

(8) *Indian Maddar* (*Rubia cordifolia*).—In December 1894, some roots of this plant collected at Naduvattam were sent to the Reporter on Economic Products at Calcutta, and in March last another consignment followed of the roots taken when the plants were in their fruiting stage. The authorities at the Imperial Institute wish to determine the difference between the varieties of this plant established in the Khasa Hills, Sikkin and the Nilgiris. The botanical characters are very slight, but it is considered that the quality and quantity of the colouring matter of the root vary according to local or climatic conditions. The *Rubia cordifolia* on these hills is a straggling shrub with long wiry stems penetrating the jungle for a great distance, which makes it a difficult matter to dig out the root.

(9) *Camphor tree* (*Cinnamomum Camphora*).—A certain amount of interest was shown last year in the introduced camphor trees of Ceylon, and a discussion was raised as to the value of the leaves and twigs in affording camphor compared with the stem and root. As the question could only be settled by actual experiment, the leaves from trees grown on this plateau were examined and the results published in a paper entitled *Camphor Leaf Oil*. The leaves from trees growing in the Government gardens yielded an oil containing about 15 per cent of camphor, and some oil distilled from the leaves of trees growing at Naduvattam, at an altitude of 6,000 feet, contained 50 per cent. of camphor.

(10) *Wild coffee* (*Diplospora sphaerocarpa*).—This plant has again been sent by two planters on the Nilgiris for identification. It belongs to the same natural order as the true coffee, and bears a round fruit containing flattened seeds which at once distinguished it from its allies. Colonel Kenney-Herbert, in 1890, made an infusion of the roasted seeds prepared from this plant in the Quinologist's laboratory, and he pronounced it to be very palatable and similar to, but slightly weaker than, that made from ordinary coffee.

(11) *Sequoia sempervirens*.—A young tree of this species was planted last July by His Excellency Lord Wenlock above the Tennis courts near Government House and is now in a thriving condition. This is a Californian plant which yields the redwood of the timber trade, and, in its native climate, attains vast dimensions. The tree has been raised from seed in the Government gardens with some other conifers from North America, but the one planted by Lord Wenlock was presented by Mr. A. Laseelles.

(12) *Adhatoda Vasica*.—In 1888 a chemical examination of this plant was made by the writer and the active principle was found to be an alkaloid named "vasicine." Experiments were made with the plant and its alkaloid, and it was proved that the lower forms of animal and vegetable life were killed when brought into contact with the solutions. At the suggestion of Dr. Lauder Brunton, F.R.S., the dried leaves of the plant were sent last year to Professor Giacosa of Turin for investigation; he found them to be rich in nitrate of potash but failed to find an alkaloid. As these results were conflicting, fresh samples of adhatoda leaves were obtained from Madras, Calcutta and Punjab, and the enquiry was renewed in the laboratory. The existence of an alkaloid in all specimens was proved, and a sample of acetate of vasicine in a crystalline condition and soluble in water, was sent for exhibition to the Indian Museum in Calcutta.

(13) *Eucalyptus species*.—A number of specimens of eucalyptus leaves were sent for identification, but it was impossible to determine the species from the leaves only. Flowering and fruiting specimens should always be sent if plants are to be satisfactorily named. A few enquiries were made with regard to the boiler fluid manufactured from blue gum leaves; but the correspondents were referred to eucalyptus oil distillers in the neighbourhood.

(14) *Datura Stramonium*.—A quantity of the roots of this poisonous plant collected on the hills was sent to Bombay for the purpose of testing the activity

and comparing it with that of the root of *Atropa Belladonna*, with which it is allied. The Medical Storekeeper of Bombay has prepared a liniment, alcoholic extract, tincture and plaster from the roots, but he is not at present able to report on their therapeutic value, as the clinical experiments are not finished.

(15) *Nongana pulloa*.—The Assistant Surgeon of Cannanore forwarded in March to this office a weed called "Nongana pulloa." It was said to be used by the people of North Malabar as a remedy for elephantiasis, and as a substitute for tobacco. It was identified as *Pimbristylis astivatis*, a small plant belonging to the rush family (Cyperaceæ).

(16) *Polygonum Sachalinense*.—The plants of this fodder, which were raised from seed obtained by this office from Japan and mentioned in the last year's report, have nearly all died; so the results of this experiment may be said to be a failure.

(17) *Sandalwood (Santalum album)*.—Some billets of sandalwood were sent by the Forest Department for the purpose of determining the difference in the amount of essential oil yielded by two kinds known as "male" and "female" sandal. A third specimen received at the same time, from a tree grown in the plains, gave a most remarkable result in not yielding a trace of volatile oil and being without odour.

(18) *Indian Dock (Rumex nepalensis)*.—In the cinchona report of last year reference was made to the Indian Dock, and the probable presence in it of chrysophanic acid. Dr. O. Hesse of Stuttgart has kindly examined some root sent from the Nilgiris, and found in it three colouring principles—

1. Golden yellow spangles melting at 186deg., with a composition expressed by the formula $C_{15}H_{16}O_4$.

2. Orange red needles, melting at 136deg., with a composition of $C_{17}H_{14}O_4$.

3. Greenish-yellow prisms, melting at 158deg., and composed of $C_{18}H_{16}O_4$.

The first of these substances is an isomer of chrysophanic acid and may prove to be useful on some future occasion in medicine and the arts.

(19) *Trees suitable for introduction as an experiment on the Nilgiris*.—In paragraph 3 of G. O., No. 5046, Revenue, dated the 11th December 1895, Government desired the submission of a general list of trees which were considered most suitable for experiment with a view to acclimatization on these hills; and also called for another list of such trees as have been proved by experiment to flourish here, and would likely to be of value if introduced on a larger scale. These lists have been drawn up and submitted to Government.

THE COFFEE POT.

The planters assembled in conclave at Bangalore have been discussing a very interesting question, namely, the why and the wherefore of the decrease of the consumption of coffee in Great Britain, and they would seem very reasonably to have found one cause of the thing in the fact that the making of coffee is an art that the *chef* of the English household seems unable to get round. The making of tea is a simple art. *Recipe*: Let the water be on the genuine boil; warm the pot; put in the tea, pour on the water, and we do the rest." The making of coffee, however, like the making of salad, is a real art, and it is not everyone, even though provided with the best coffee-pot in the world, that will turn out a good honest cup of coffee such as shall verily cheer. A cup of coffee supplied by citizen D'Angelis or by any other of the "makers" is one thing, and a muddy infusion of the berry that some of our "boys" dare to dish up as *coffee* is altogether another; and it is assuredly this ignorance of the right way to make coffee that has a great deal to do with inducing people to prefer the homely tea. A cup of coffee in the early morning is a particularly good tonic. In the early morning it produces a highly exhilarating and refreshing effect, and the infusion of the berry is generally recommended as a more appropriate medicinal pick-me-up than an infusion of the leaf; and it was not by mere chance that the coffee-pot became the recognised appendage of the British breakfast table along with the eggs and the rolls, and that

"coffee and oppers" still hold morning sway with the Madrassi crowd. It would undoubtedly be an excellent idea for coffee planters, for the sake of their own interests, as well as for the public good, to give the public a few general hints as to the proper method of brewing the berry. Tea-planters have done it, not only in the shape of Siegel-like "directions" on pound packets, but in the *propria persona* of dainty tea-making damsels at colonial shows.

Another of the why's and wherefore's has been rightly found in the rapid decline of the price of tea. Tea and coffee started pretty fair and square in the race. Tea, indeed, is said to have been drunk in China as long ago as the 5th century; but it was not till the 16th century that it became known to Europeans. Coffee was not drunk by the Arabs themselves, as far as is known, until the fifteenth century, but, as with tea, it was first introduced to Europeans in the sixteenth. But then came the rub. Tea was for a long time regarded as a medicine, while coffee began to be used as a beverage from the beginning, and the consequence was that tea, like any other drug, remained a costly thing, while coffee became cheap. Old Samuel Pepys relates that the "pothecary" had recommended the use of tea to his wife as beneficial for cold and for feminine complaints. Locke, the philosopher, on returning from a trip to the continent, counts it worth recording that he had brought back a pound of tea, which, for the low price of seven guineas, he had purchased in Amsterdam. In the numerous coffee-houses, however, that rapidly sprang up in London and in all continental cities, cups of coffee were of small expense, and the colonial planters supplied the berry in as large quantities as were wanted; whereas it was not till the end of the seventeenth century and the beginning of the eighteenth that we find tea being indulged in as an aid to social small talk, as at that memorable tea-party in 1811 at Hampton Court, where

. . . thou, Great Anna, whom three realms obey,

Dost sometimes counsel take—and sometimes Tea.

The price of tea in 1657 ranged as high as ten guineas per pound; in 1710, by which time the drinking of tea had become fairly common, the price ranged from 7s to 21s a pound. Exactly a century afterwards, in 1810, Indian tea offered for public sale in London fetched no more than from 2s 6d to 3s per pound. Since then things have rushed. Great advertisers like Lipton have stormed the market, missionaries have gone abroad preaching the gospel of tea, and offering it, if not without price, at least very near it, and it is small wonder that homely housewives, who can buy the refreshing beverage cheaply, can make it easily, and can use the tea-leaves afterwards for cleaning the floors of their sitting-rooms or their kitchens, have gone over from coffee to the sister drink. There is perhaps another reason that applies especially to Indian housewives, namely, that tea is ready for use, and the housewife can dole it out straight from her caddy into the pot. Coffee, however, has to be manipulated. It can be bought, to be sure, ready ground and roasted, but the fulness of the flavour in that case is liable to have gone out of it. Between buying the berries and handing them over to the servant to be roasted and ground the housewife, if she looks upon her servants as pilferers, is prone to believe that the prepared powder is not by any means the sum total of the berries.

But it is pushing and advertising that the coffee planters assuredly need. Tea planters have recognised that in this great advertising age they must wag with the rest of the world, and their campaigns have proved a success. Coffee planters have been inclined to think that they have done enough when they have grown a good article and put it on the market, and waited for customers. But the present competitive age demands something more. A coffee campaign, on lines such as might be deemed most fitting, might assuredly go a long way towards restoring coffee to its rights at the British breakfast-table, and if popular "directions" could really be given for making coffee after a duly approved

fashion there are no doubt very many who would be converted to preferring the juice of the berry to the juice of the leaf.—*N. Times*, Aug. 21.

THE DECLINE OF COFFEE.

EXTRAORDINARY ACTION BY THE GOVERNMENT.

ALLEGED OFFICIAL PATRONAGE OF FRAUD.

We all know that coffee as a beverage has been declining in popularity in England for the last five and twenty years. The quantity of coffee now consumed here is less than half that which was drunk in 1873, but the price is probably twice as much now as it was then. You cannot buy a pure coffee in this country for less than 1s. 2d. a lb., and even then it is of very poor quality as a beverage. Tea, on the other hand, has fallen in price to an enormous extent. When fine coffee could be had at a shilling a pound fine tea cost four shillings; now coffee has enhanced its value, and the average price paid per pound for tea, even by the fairly well-to-do classes, is not eightpence. Tea is more than ever a national beverage; coffee is a receding quantity, chiefly, as the experts will tell you, because we hardly know how to make it in England. For the matter of that, we hardly know how to make a well-seeming tea, but that is another story.

Years ago, when tea was even more a luxury than now, the coffee-growers of the hot climes regarded London as their market or clearing house for the world. They mortgaged their crops to London houses in consideration of advances given, and shipped the coffee to London to their order as return for the money. In those days they would not deal with any other than a London house. But, by and by as commercial credit became established in other countries, a draft on a Dutch or a French house grew to be as acceptable as that on a London establishment, and worth just as much. Then the growers, began to dally with other traders, London lost its monopolist position, and the coffee naturally gravitated in large part to the ports nearest to the area of consumption. Holland, for instance, got the greater part of its coffee to its own ports; France did likewise; and though the coffee consumed in England naturally came to our ports, that which England used to export dwindled in quantity before the direct consignments to the Continent.

The English traders then began to find that they suffered through their own honesty—don't smile, that honesty was compulsory! The foreigners had no scruple in packing inferior samples in the casks or bags bearing the marks of much more valuable brands; and putting them on the market at vastly enhanced rates and at great profits to themselves. Their Governments made no effort to stop this fraud; in fact, I daresay, a bland official smile at the discomfiture of English is still its reward. But in England it was difficult to do this successfully in the free warehouse, and quite impossible in bond—up to a short time ago. True, even well-known firms have been suspected of palming other marks of coffee on their customers as brands of fine quality, but only when they themselves had cleared them from bond. If the customer himself went to the trouble of effecting the clearance he knew that the coffee he obtained was exactly that which had been cleared from the ship according to the warrants. To buy coffee from bond was a guarantee of true description and quality, until the Government made an order, a month or two ago, by which it practically becomes the patron of fraud, and lends its warehouses to the swindling of the public.

I ought to explain several things about the coffee trade before I go further. Coffee comes into the market from many sources. There is the Mocha coffee, the taste for which is probably, in most cases, acquired, because there is a peculiar rank flavour about the beverage, which does not commend itself to everyone. Then there is the Mysore coffee, which gives a rich, thick liquor, as though you had infused too much of it; and the Jamaica,

very thin in liquor, but very fragrant; and the Costa Rica coffees, very plentiful and fine in quality; and the Ceylon coffees, declining in quantity every year, owing to the devastations of the leaf disease or blight, from which the Costa Ricans are yet free; and the Guatemala and other Central American growths, as well as large quantities of Brazil coffees and several others. Hardly any coffee of these countries could be sold direct for consumption, except, perhaps, Costa Ricans; they have all marked characteristics, but very few indeed have, of themselves, precisely the desirable flavour or quality. It is the duty of the expert coffee blender to take a coffee with one characteristic, another with a quality lacking in the first, and another with a flavour yet lacking in the other two, and mix them all together to get the properly fragrant blend which the coffee drinker likes. The coffee blender in large houses acts upon his knowledge acquired by long study of coffees. But the grocer who sells coffee generally makes his own blend according to a more or less fixed formula; he may send out the two or three bags of each sort he buys to be ground, but probably he makes his popular blend of a portion of Plantation Ceylon coffee, so much Jamaica, and so much Costa.

Plantation Ceylon coffee comes over here in large casks weighing 10 or 12 cwt.; but it is now a scarce commodity, and the price is accordingly greatly enhanced; Jamaica is imported in barrels of about 2 cwt., is more plentiful than the other, and accordingly is cheaper—though it must not be forgotten that Jamaica is considered to be the finest coffee grown, and a choice lot will always bring a big price: the scarcity of Ceylon alone makes it dearer. Costa Rica, having complete freedom from disease, grows many fine coffees, quite as good as Jamaicas in many cases, quite as skillfully grown, and as well cured, but owing to the plenitude of the supply, the price of Costa Ricans may be some 16s. less per cwt. than Jamaicas. These marks will suffice for illustration. There are tricks in all trades, and there are some in the coffee trade. It is a profitable trick, for instance, to sell Costa Ricans as plantation; and it has been done. Coffee has been shipped from Costa Rica to Ceylon, in its "parchment," or husky stage, cleaned in Ceylon, and prepared for market, packed in Ceylon casks, and shipped to England and sold as "Plantation" coffee. It paid to take all that trouble and cost to secure the enhanced price. Again, the Jamaica coffee berry has a very delicate bloom, which, might almost, be rubbed off by a touch of the finger; the Costa Ricans have invented a method of drying their coffee seeds which produces an exact imitation of the Jamaica bloom, so that even an expert may often be deceived by a sample of coffee thus faked, unless he is able to trace the cargo to the port of issue. This is done to get the higher price for Jamaica coffee. There are other ways of faking, such as that practised abroad, of dyeing the berries with indigo to give them the blue hue which is indicative of the "London cleaned" coffee, but we must let this pass with the explanation that the London cleaned coffee has not the same quantity of water dried out of it as coffee clean abroad, and when polished has a deeper colour consequent on the moisture left in. The point is that by trickery even experts may be deceived; and that by false marks, without any faking, the non-expert grocer may be done again and again in his purchases.

The Government was besought some time ago by the coffee merchants and exporters in London to give them concessions which would put them on a level footing with foreigners in their trickery. The Government consented, as the following order relative to the bulking and mixing of coffee and cocoa, printed in the "Public Ledger" shows. The order is dated May 15 last from the Custom House, and amends the existing regulations thus:—

"Coffee or Cocoa, whether from the same or different countries, or of the same or different importations, may be bulked or mixed for home consumption, exportation, or ships' stores, on condition that

the original marks be obliterated. The remarking of the packages may be carried out in accordance with the wishes of the parties concerned.

"That in cases in which packages belonging to a particular consignment of Coffee or Cocoa are imported by different vessels at reasonable intervals, the original and the subsequent consignment may be operated upon together without application to the Board, under the following arrangements, viz. :—

"That, on request to the Surveyor of the station at which the Coffee or Cocoa is to be warehoused, the bringing to account of the first and subsequent consignments may be deferred until the arrival of the quantity necessary to complete the parcel, when the whole may be weighed and bulked, the weights being brought into one account in the same manner as if the whole had actually arrived by the vessel which brought the original consignment."

This is to say, the holders of coffee in bond may manipulate as they like to suit the market, under Government protection. Already, I am assured by experts, asks of good marks are worth money, for they may be taken into bonded warehouses in London—not as yet in Liverpool—filled with a mixture, or with some cheaper Costa Rican brand, and sent out as Plantation Ceylon or Jamaica. The Costa Rica substitute may, as coffee, be as good as the Jamaica it purports to be, but the regulation will permit a merchant to palm off a coffee worth 16s a cwt. less in the market, and to defraud the buyer of that sum. It is as though you had some cheap, though passable cigars in bond, and the Government permitted you to take in 1,000 boxes of a popular and dearer brand, fill them with the cheaper cigars, and send them out as a grand new consignment of Murias, say, just cleared from bond. If the faking or mixing be done in bond, the original marks must be destroyed; but any other mark may be used, and obviously, whatever the other mark be, it cannot accurately describe the contents of the package. This not only opens the way to the palming of cheaper coffees for dearer ones upon larger dealers; but it makes it quite easy to foist upon the man who buys a small parcel a very inferior coffee, deliberately prepared under lying marks to deceive him. Thus the retailer is likely to suffer, and through him the consumer—who drinks enough poor coffee as it is—that the large export houses may be in a position to manipulate, fake, and cheat as easily as their foreign rivals. The "bought from bond" phrase will be a mere deception, for Government has deliberately shut its eyes and opened its warehouse to possible fraud. It is a very disgraceful policy, it throws principle to the winds, it may involve the Government in connivance in many a swindle, and destroys the value of the security of bond.

Thus we have had a glimpse into some of the secrets of the coffee trade, which, I think, is interesting, and we have seen the great English Government, reputed for honesty at least in some things, willingly making itself a partner in a scheme to meet foreign trickery with home made trickery. Some M. P. with a desire to be useful ought to take a few moments of the time of this wearisome session to make some pointed inquiries on this matter.—*Manchester Sunday Chronicle*, July 26.

INDIAN TEA SHARES.

A great deal of interest is being taken just now in the shares of Indian tea companies, and it behoves us in the interests of the investing public to give some little attention to the matter, especially as there is some probability of a lot of rubbish being foisted on the market. It is no secret that whenever the investing public want a new kind of investment the promoting world is always ready to supply them, and at such times it is necessary to be very careful in making a selection. We give below a table of what may be regarded as the best companies at the present time, taking into con-

sideration the quotations of their shares. It will be found that we have excluded several well-known concerns, for no other reason than that either their shares are difficult to get, or that they have been raised to such a level as to make it impolitic to buy them. For instance, the Dooars Company may be regarded as the very doyen of the business, yet it can scarcely be denied that the shares are as high as they should be. Of course, the Ordinary shares return about 6 per cent. on the money, but these, we believe, are scarcely obtainable. If they can be got they are good enough to keep. The Preferences yield something less than 4 per cent. Among the Ceylon companies there is greater scarcity, and possibly the very best concerns are quite beyond the reach of the investing public. The following list of companies, with their capitals, may be regarded as including those concerns whose shares are not too high, and in which there is a fairly free market:

	Capital.
Assam	187,160
Chargola	153,010
Darjeeling.. ..	135,420
Doom Doona	149,270
Jokai	300,000
Jorehaut	100,000
Lebong	65,656
Lungla	200,000
Jhanzi	83,500
Scottish Assam	79,590
Ceylon Tea Plantation	248,460

The following table gives a list of what may be regarded as the best and relatively cheapest Tea shares at the present time, which are for the most part preferable to those new issues which are of the nature of blind pools. The prices that are given are those which should not be exceeded by purchasers, and if the shares cannot be got at these figures, then they had better be left alone:—

	At not over
Assam	59
British Indian	4 ³ / ₄
Cachar and Dooars	12
Doomes	18
Jorehaut	57
Lungla Ordinary	12
Scottish Assam	10 ¹ / ₂
Chargola	£1
Majuli	8
Chargola Pref.	30s
Lungla Prefs.	13 ¹ / ₂
Assam Mortgage Prefs.	13 ¹ / ₂
Dumbula Valley Prefs.	6 ¹ / ₄

If the investing public, with a weakness for tea shares, will confine themselves to the securities that we have mentioned, they will not go far wrong.—*Bullionist*, July 2.

THE EILA TEA COMPANY OF CEYLON LIMITED.

An ordinary general meeting of this Company was held on the 29th Aug. at noon in the office of Messrs. J. M. Robertson & Co., agents and secretaries. Mr. Henry Bois presided, and present were:—Messrs. W. E. Mitchell, F. Liesching, J. M. Mason, and Gordon Bois (Secretary), and Mr. A. E. Scovell (as a visitor).

The SECRETARY read notice calling the meeting and minutes of last half-yearly meeting, which latter were confirmed.

THE ANNUAL REPORT

is as follows:—

The Directors have the pleasure to submit their Report and Accounts for the year ending 30th June, 1896.

The crop on Eila Estate has slightly exceeded the estimate, but the Crop from Kanangama was a little under that estimated. The total crops from the two Estates amounted to 358,066 lb. against an estimate of 360,000 lb.

The price realized for the Tea was not altogether satisfactory and the net average of the Tea sold from the two Estates was 37.97 cts. against 42.83 cts. last year.

The Net profit for the year, after allowing R6,100.49 for depreciation, is R41,657.11 (equal to nearly 15 per cent on the Capital of the Company) to which must be added the balance brought forward (after payment of the dividend for 1894-95) of R2,095.13 together aggregating R46,752.24.

Out of this an interim dividend of 4 per cent has been paid leaving R34,752.24 available for distribution.

The Directors recommend that this be disposed of as follows, viz :

That a final dividend of 9 per cent be declared on the share Capital of R300,000, making 13 per cent for the year	R27,000	00
That a sum be carried to Reserve Fund of	6,000	00
Leaving to be carried forward to next account	1,752	24

R34,752 24

The Estates on the 30th June, 1896, consisted of—	
Eila	410 acres Tea, 5 years old and upwards
	50 " " 2 " " " "
	105 " " 1 " " " "
	62 " " under 1 year
	330 " " Forest.

957

Kanangama	200 acres Tea 5 years old and upwards
	15 " " 4 years old
	108 " " Forest

323

Mr. H. Tarrant retires in accordance with the Articles of Association, but being eligible offers himself for re-election.

The shareholders will also have to elect an Auditor for Session 1896-97

By order of the Board of Directors,

J. M. ROBERTSON & Co., Agents & Secretaries.
Colombo, 13th August, 1896.

The CHAIRMAN, in submitting the annual report of the Directors for the season ending 30th June, said as it had been in the hands of the shareholders for some time, he concluded it might be taken as read. The Directors regretted the falling-off in the average price of the tea, which was very considerable, and, seeing that one cent per lb. on the price of the tea made a difference of no less than one and a fifth per cent on the capital of the Company it was all-important that the average should be kept as high as possible. Up to the end of the year, that was the half year from June to December, the average was a very good one, but unfortunately a large proportion of the Company's tea came into the second period of the season from January to June, when the prices of tea were very low. The Directors had given careful attention to this and were doing all in their power to prevent such a low average in future. The Kanangama tea was of a low quality, but they were inclined to think that the Eila tea ought not to come into the ruck of low teas and they hoped, if possible in future, that they would be able to prevent it. Notwithstanding this falling-off in the average, which made a difference of nearly 6 per cent on the dividend, he thought they might consider that the Company had done fairly well. Regarding the crops they came out very nearly to the estimate. The Kanangama estimate was 150,000 lb. and, notwithstanding that a small acreage had to be cut down unexpectedly owing to helopeltis, the result was 146,000 lb.; or only 4,000 lb. below the estimate. He might mention there was very little helopeltis to be seen now and that a small amount was provided each year for catching

the insect, and he thought it had been kept down very well. Mr. Dawkin was in the office that morning and had said that there was very little indeed noticeable and that the yield for the last two months had been very satisfactory. The Eila crop was slightly over the estimate, which was 210,000 lb., and everything was going on satisfactorily on the estates. They were in good order and the estimated crop for the coming year was favourable. He moved the adoption of the report and accounts.

Unanimously adopted.

On the motion of Mr. MITCHELL, seconded by Mr. LIESCHING, a dividend of 9 per cent was declared for the half-year.

The CHAIRMAN said the next thing was to elect a Director in place of Mr. Tarrant. Mr. Tarrant retired last year, but the articles of association provided that the director longest in office should retire. This happened to be Mr. Tarrant, so that therefore he again retired.

Mr. LIESCHING proposed the re-election of Mr. Tarrant.

Mr. MASON seconded. Agreed.

The CHAIRMAN intimated that Mr. SHATTOCK, the auditor, had gone home, and in the meantime the directors had thought it advisable to elect Mr. John Guthrie, and he trusted this would have the approval of the shareholders.

On the motion of Mr. MASON, seconded by Mr. MITCHELL, Mr. Guthrie was elected auditor at the usual fee of R50.

This was all the business.

THE RHONDURA VALLEY TEA COMPANY OF CEYLON.

An extraordinary meeting of the shareholders of this Company was held at noon on the 31st Aug. in the office of the agents and secretaries, Messrs. J. M. Robertson & Co. Mr. A. E. Scovell the Chairman presided, and present were Mr. F. W. Pois, Mr. W. Moir and Mr. Henry Bois *per* Mr. H. G. Bois. The meeting resolved to purchase 666 acres of land from Mr. Scovell, and the Directors were empowered to raise the necessary capital for this purpose. The land in question is situated above the cart-road, and practically connects the Company's estates, Broadlands and Rhondura, which abut on the cart-road. The land is in jungle and steps will be taken without delay to have it cleared and planted in tea. A wire shoot will be constructed forthwith at a point on the cart-road down to the factory on Broadlands. By it leaf plucked on Rhondura and on the extended portion of the Company's land when it comes into bearing will be sent to the factory.

THE INDIAN TEA CROP.

The unusual dryness of the present year throughout the spring and early autumn was known to have told seriously against the tea crop all over north-eastern India, in Assam, Cachar, the Dooars and Darjeeling. The unfavourable character of the season is brought out by the figures of the export trade, for the July clearances from Calcutta only amounted to 24 million lb. as against 28½ million lb. in 1895, and nearly 26 millions lb. in 1894. The weather, however, improved in the tea districts as the season advanced, and it is to be hoped that by the end of October it will be found that the later months have made up some of the earlier deficiency.—*Madras Mail*.

MARAGOGIPE COFFEE: A QUERY.

A planter asks:—"Does Maragogipe coffee grow in Ceylon, and is there a market for same in London?" Perhaps some of our readers will be able to give full details. We have seen the seed advertised for sale in Ceylon.

FORESTS IN INDIA AND THEIR REVENUE.

A short time back we drew attention to the handsome surplus accruing to the State from forests in the year 1895-96, and the comparative figures may now be given in detail. The provinces under the control of the Government of India, Madras and Bombay being excluded, yielded the following surplus during the quinquennial periods mentioned:—

1870-71 to 1874-75	...	Rs. 11,12,000
1875-76 to 1879-80	...	" 17,18,000
1880-81 to 1884-85	...	" 23,86,000
1885-86 to 1889-90	...	" 38,42,000
1890-91 to 1894-95	...	" 53,51,000

In the year which has just passed the surplus was Rs. 53,41,000. Madras and Bombay may be taken as giving at least 22 lakhs, so we have a net surplus for all India and Burma of about 80 lakhs of rupees. In years to come it will doubtless rise to a crore, for Upper Burma has by no means reached its limit of production, and as the country is opened out the revenue must expand. The Forest Officers, to whose energy and ability this development is due, as a whole lead hard lives, with a good deal of exposure and a good deal of solitude, often in unhealthy climates. But even if their lives were all cast in as pleasant places as those of the lucky few, it would be no reason for meanly wriggling out of a concession that has publicly been granted and announced.

A NEW INDUSTRY FOR INDIA:
RHEA FIBRE AND DRUGS.

The remarkable development of the Rhea fibre throws for the moment all tariff differences between Bombay and Manchester into the shade. The Indian Government has long been aware that in this widely spread variety of the nettle family its provinces possess a source of unused wealth. In 1869 it offered a reward of £5,000 for the invention of a machine or process which should separate the delicate fibre from the bark at a cost consistent with the requirements of commerce. An offer of Rs. 50,000 was renewed in 1877. Various machines were submitted under these inducements, but they failed in regard to the essential element of cheapness, and after many trials the offers were withdrawn. The effectually attracted, however, the attention of experts in Great Britain, Europe, and America. Rhea became recognized as one of the most valuable fibres known to the ancient or modern world. Its use in Egypt, India, and China dates from before the dawn of history. Rhea cloth is unrolled from the mummies of the Nile and unearthed in the burial mounds of Assam. The nets and lines spun from it had, for strength, fineness, and durability, no rivals among the fishermen of Bengal and the Malay Archipelago. As "China grass" it won its way about the beginning of this century into European commerce.

The difficulty is to separate the strong silky fibres of the bark from the outer cuticle and the tenacious gums in which they lie embedded. In

the past, when labour was of little account, the wives or daughters of the husbandmen and fishing communities scraped and washed small quantities of the bark till, by the persistent toil of many days, each family produced a few handfuls of the much-prized fibre. But the cost of this manual process proved an insuperable difficulty in the adoption of Rhea for modern textile manufactures. Dr. Royle, as industrial adviser to the India Office, showed that the Rhea fibres "are exceeded by none in fineness, excel all others in strength, and may be fitly compared to the trunk of an elephant which can pick up a needle or root up a tree." He declared that, if the difficulty of separating the fibre can be overcome, "the benefits to India and the world will be incalculable." It is this problem that the chemists and machinists of Europe and America have during the past 30 years been endeavouring to solve. France and Germany at once entered the field with factories for the extraction of the fibre. They worked it up into many forms, from ropes and sail canvas to plushes and dress-pieces resembling silk goods in appearance. They failed, however, to produce a filasse, or clean fibre, which should be at once cheap and serviceable. No machine or merely mechanical operation eliminated the resins with a perfection which yielded fine yarns, except at a cost prohibitive of their general use.

The chemists seemed for a time to be more successful. They produced by means of various reagents a filasse which was at once cheap and apparently sound. Beautiful fabrics were woven on the Continent, and the inventors laid out a large capital, in the belief that they had solved the problem. But by the time the fabrics came into the hands of the consumers, indeed often before they passed from the shops of the retail dealers, it was found that the chemicals had injured the fibre, and the goods were often returned to the makers. Process after process and machine after machine failed to extract a Rhea fibre which should be both durable and cheap.

The honour of solving the problem has fallen to an English chemist, born, we believe, in India. Mr. Gomess after many experiments elaborated a process which the Indian Government is at length able to pronounce a complete success. "The difficulties which previously existed," says the official memorandum lately issued by its Inspector-General of Forests, "in regard to the extraction of the valuable textile fibre from the bark of the Rhea plants have been entirely overcome by what is known as the Gomess process, and a large demand has sprung up for ribbons of dried bark with every probability of its increasing to enormous proportions." After referring to the operations of the Rhea Fibre Treatment Company in London and its dependent associations now being established throughout India, Europe, and America, the official memorandum proceeds to indicate how the production of the fibre may be increased in practically unlimited quantities to meet the demand. "These facts seem to point to the conclusion that we are on the dawn of an industry which even promises to rival jute cultivation." The Inspector-General then draws out a scheme for aiding the cultivators by official information as to the areas most suitable for the growth of the plant and the varieties best adapted to each locality, and by Government experiments as to the best modes of stripping, drying, and baling the bark. The subject, he insists, "becomes all the more important and urgent as reports reach us from the French colonies of considerable activity in the Rhea fibre trade, and as it would not be convenient to be outstripped by them."

The Gomess process adopts zincate of soda for the elimination of the resins, and effects it without the slightest injury to the fibre. After the "ribbons" or strips of bark have been freed from dirt they are placed in weak acid baths for a night. Next morning they are passed through a mild alkaline bath, and then boiled in weak solutions of caustic soda to which zinc has been added. When washed and dried by the usual mechanical means the fibres emerge as a long, silky filasse, entirely free from the enticle and resinous gums in which they were embedded; clean, white and ready for the comb of the spinner. They take the most beautiful dyes and can be worked into every variety of fabric from gorgeous velvets to cheap drills and delicate laces. The combined lightness and toughness of the fibre render it peculiarly suitable for tents and ship canvas. Three-fifths more cloth of equal strength can be made from Rhea than from the same weight of linen. That is to say, 1,000 yards of the Rhea canvas weigh only as much as 600 yards of linen. Its durability and resisting power to strain are also much greater. The Government of India is taking effectual steps for the rapid extension of the cultivation. If its forecast be correct, we may congratulate ourselves that what promises to become a great new industry has been rendered possible by the science of an English chemist and has been practically inaugurated by an English company.

Of scarcely less importance to India is the development of its indigenous drugs. If the Gomess process is the invention of a chemist honourably connected by family ties with India, the exploitation of the indigenous drugs has been chiefly the work of an Indian native chemist. Professor Kanai Lal Dey, of the Calcutta University, and formerly chemical examiner to the Government, has just issued an enlarged edition of his treatise on the medicinal products of British India. It brings to completion the researches of Ainslie in 1826, of O'Shaughnessy in 1844, and of Waring in 1868. It supplements them with a wealth of practical knowledge which could only have been accumulated by a chemist who has passed his life in the country, and who is intimately conversant with the languages, the customs, and the requirements of the people. British physicians in India are aware of the vast possibilities lying around them in the shape of native drugs. The Governor-General in Council lately issued a resolution with a view to more fully utilizing the indigenous medicines, and pointing out the difficulties in the way. What it demands are drugs of a stable character, free from adulteration, and at a price not exceeding that at which they can be imported. Professor Dey's work will form a landmark in the accomplishment of this object. Nor should the labours of Mr. T. N. Mukharji, F.L.S., lately of the Imperial Museum, Calcutta, be forgotten. His accurate work, painstaking attention to details, and admirable equipment of the international exhibitions in Great Britain and Europe have slowly but surely compelled recognition of the medicinal remedies used for ages by the East. At one time it seemed as if our Indian Universities were only to produce lawyers and literary men. They are now producing men of research, whose work takes a distinguished position in the scientific journals and libraries of Europe. They are also disclosing, in no small measure, that rarer quality by which men of science bring their labours to bear on the wants and the welfare of their own country. Rapid as has been the growth of Indian vernacular literature under British rule, the progress of India science and

technical knowledge, represented by investigators like Professor K. L. Dey and Mr. T. N. Mukharji, is perhaps even more striking.—*London Times*, Aug. 10.

PLANTING AND PRODUCE.

LI HUNG CHANG AND THE CHINA TEA TRADE.—In the list of presents which Li Hung Chang distributes during his Western pilgrimage chests of choice China tea are conspicuous. The Chinese Chancellor would like to see life restored to the China tea trade, and it would be very agreeable to him if he could help to give it a fillip.

CHINA TEA AND THE LIKIN DUTIES.—Indian and Ceylon tea planters are not particularly anxious that the restrictions which handicap the tea trade of China should be removed, but it is interesting to know how these restrictions affect the tea trade of China. Mr. Allen, the British Consul at Fuchau, in his last report on the trade of that port, says that "an obstacle to the development of commerce in China, less easily remedied than bad roads, is a faulty, not to say an utterly rotten and corrupt system of collecting revenue, wherein the vested interests involved are so enormous that nothing short of the reform of the whole fiscal arrangements of China can set it right. Although the evils of this system are patent everywhere in the empire, there are two places where they are seen in their most aggravated form. One is Canton, the other Fuchau. The system of farming the taxes, or at least making the official in charge of them remit a certain sum every year, while he puts the balance into his own pocket, insures the largest possible collection at the greatest possible cost and the least possible benefit to the Government. It is said that the cost of collecting likin is 70 per cent of the total sum realised. The tax farmers are not low class pariahs like the publicans of Judea. On the contrary, a tax farmer may be, and often is, a mandarin of the highest rank. In Fuchau there are four separate establishments levying taxes on merchandise, each one competing with the others, and looking on the revenue collected by them as a loss to itself. The Maritime Custom House levies duties on all goods imported or exported in foreign bottoms or in Chinese steamers. These press lightly on trade, except in the case of tea, which pays 2-50 taels a picul, which in 1858 was supposed to represent an *ad valorem* duty of 5 per cent. This, then, makes the average value of tea 50 taels per picul. It is now only 15 taels, so that the proportion of duty has risen from 5 per cent. to 16½ per cent. Indian and Ceylon teas pay no export duties, so that this impost alone is enough to handicap the China trade."

A SUGGESTION.—We publish a letter from a correspondent, who writes, apropos the Assam and the Surma Valley dinners, suggesting that an annual gathering of Indian tea planters, comprising all districts, be held in London. The Assam dinner was instituted as a gathering of planters and their friends from Assam, including Cachar and Sylhet. Whether its scope could be widened so as to take in Indian tea planters generally is a point for the committee to decide. We agree with our correspondent that a thoroughly representative Indian tea planters' annual dinner is very desirable if it can be managed. Each district could, if it wished, have a dinner on its own account, but an annual meeting of planters representing all the tea districts in India would prove impressive, lend additional importance to the tea industry generally, and also promote a feeling of good-fellowship between all districts. There may be serious difficulties in the way of carrying it out, but the suggestion is worth the consideration of those immediately concerned.

THE STANDARD OF QUALITY IN COFFEE.—Someone has suggested that "holders of coffee in bond may manipulate as they like to suit the market under Government protection." This has brought the *Grocer* on the track of the author of the statement, and leads our contemporary to say that state-

ment is "totally untrue." It remarks that "it is an invariable rule with the Customs authorities at the port of London not to permit the bulking or mixing of coffee excepting it is done under their own supervision, and even the privilege of 'roasting,' when it is conceded, is extended to only one individual firm, who have a special license for the same. As to 'a merchant palming off a coffee worth 16s per cwt. less in the market' than the description the buyer supposes he is receiving, with the intention of 'defrauding him of that sum,' it is sheer nonsense to say so. The fullest particulars of the parcels in public sales are printed in the brokers' catalogues, and when the wholesale dealers, as purchasers, are experts in judging of the value of the article, such gross frauds and deceptions are impossible. Moreover, the retailers who follow the market pretty closely know well enough that there is a vast difference between the qualities of coffee at 80s and 96s or 90s and 106s, and they could not by any kind of manipulation, even if there were attempts to practise it, be deceived in the lots they buy. A uniform standard of quality in coffee is most difficult to maintain, as the same growths do not arrive regularly all the year round, but only at certain seasons, and there are few articles of commerce so cramped in supply as coffee. Since the production in Ceylon has fallen from 1,000,000 cwt. in 1870 to a mere trifle, the imports of colony sorts suitable for home consumption have been seriously reduced and are very precarious, coming at various intervals from Central America, when not obtainable from older ports of shipment. Thus business between the wholesale dealers and the retailers is rendered extremely awkward in times of scarcity. Hence the high prices paid for desirable qualities year after year. Even the plentifulness of Brazil coffee has been of little or no avail, as it is not exactly the sort that is required for domestic use in this country; and Santos—a superior description of Brazil which has been tried as the nearest substitute for plantation coffee when the latter has not been procurable—has been given up as a failure by connoisseurs in the art of making a truly delicious cup of coffee. Experienced judges in "The Lane" have been heard to say that the rarest kind of coffee is a blend of Cannon's Mysore or other choice East India, colony plantation Ceylon, and rich old yellow Mocha; or a combination of mountain-grown Jamaica and bright blue Costa Rica. But how are these favourite descriptions to be obtained in requisite abundance to keep the trade going steadily on throughout the season? That is the question; and here begins the supreme difficulty of getting really fine coffee always unmixed, and without one distinct class being used instead of another, as the closest approach to the style and quality wanted by the fanciful consumer. In seeking to supply what is required no fraudulent practice is intended. Dealers simply endeavour to suit purchasers of coffee as nearly as they possibly can during periods of dearth."—*H. and C. Mail*, Aug. 14.

STRAITS SETTLEMENTS RAMIE FIBRE CO., LTD.

Registered 24th July by Grundy, Kershaw & Co., 4, New-court, Lincoln's-inn, W.C., with a capital of £50,000, in 48,250 £1 shares, and 35,000 shares of 1s each. Objects: To adopt and carry into effect two agreements, the first expressed to be made between J. M. Macdonald and H. H. Boyle of the first part, and this company of the other part; the second made between the Boyle Fibre Syndicate (European Patents) Ltd., of the first part, and J. M. Macdonald of the second part; to acquire the Macdonald-Boyle invention for the treatment of ramie or rhea fibre for the Straits Settlements and elsewhere; to carry on business as ramie planters and dealers in and planters and manufacturers of all the kinds of vegetable products; as merchants, importers, exporters, shipowners,

forwarding agents, under-writers, &c The signatories are:—

	Shares.
B. J. Broadbent, 34, Royal Exchange Manchester	1
F. C. H. Bowman, Knntsford, Cheshire..	1
J. Wade, Alma-terrace, Manchester ..	1
J. MacCallum, 11, Mosley-street, Manchester	1
T. G. Scarborough, J.P., Halifax ..	1
W. S. Rostron, Lyndhurst, Whitefield ..	1
J. S. Pixton, 12, Half Moon-street, Manchester	1

The first directors—of whom there shall be not less than three nor more than ten—are to be elected by the signatories. Qualifications, 500 shares. Remuneration, to be fixed by the company.—*Financial Times*.

VARIOUS PLANTING NOTES.

RHEA FIBRE.—From our leading English contemporary we also give an extract dealing with the rhea fibre industry in India. The cultivation of rhea is, we believe, being tried certain in estates in Ceylon, and we should like very much to hear the result so far.

COFFEE IN COORG.—From the official forecast of the coffee crop in Coorg for 1896-97 we learn that an indifferent crop estimated at 2½ cwt. an acre on European plantation is anticipated. A yield of 1 cwt. an acre is estimated for Native gardens. The total estimated crop is given as 4,211½ tons. The estimated average yield per acre of ordinarily well cultivated coffee in full bearing for 1896-97 was 3 cwt. Taking the average or rupee crop at 3,569 tons per annum, the forecast of 4,211 tons for the coming season represents a 19 annas crop, the anna equivalent being 4½, or nearly 222 tons.

WILD TEA SEED.—The *Indian Agriculturist* of Aug. 1st says:—Those who have made forward sales of tea seed, for the next two or three years, have reason to congratulate themselves on their foresight. We learn from an authentic source that wild tea, of which the best variety covers considerable tracts in the Lushai and Chin Hills, is likely to come into the market. Our erstwhile unruly neighbours are now convinced of the futility of further resistance, and doubtless will turn their attention to the collection of this valuable forest product. In fact, a commencement was made last year, but the gathering was begun too early—in September—when the nuts had not matured. These wild tea tracts need conserving, as in some instances the men who brought in the seed admitted that they had felled the tree to obtain it. Indigenous tea in Cachar very rarely seeds after being cut down to a height from the ground which allows of the leaf being plucked. What our planters call Munnipoori indigenous seed is in reality a hybrid, and yields prolifically when planted out and kept at the desired height, like the rest of the mixed plants raised on the older gardens. No doubt, the seed from this hybrid is of superior class; but still it is not so prolific in leaf as the pure indigenous variety. We know that large tracts of wild tea exist in the Hukong Valley and the Naga Hills, subject to and north of Munnipoor, so that it is not mere speculation to surmise that the mountain ranges in the valleys of the Chindwin, Maglung, and basin of the Irrawaddy may prove equally rich in this respect. The country is quiet enough now, and neither Singphoos nor Khamptis object to the European traveller, though cherishing a mortal dislike of the Marwaree.

SOIL INOCULATION.

For very many years past medical men have practised "inoculation" against some of the ills of the flesh, but inoculation of the soil for the purpose of affording to plant life its food in a suitable form is a comparatively new idea. Agriculturists are now to have an innings, and the question is one in which, no doubt, planters and agriculturists generally will feel keen interest. Equally should it prove interesting to that useful body of men the manufacturers of manures, who may very possibly have to vary their labours of steaming and crushing bones, milling poonacs, converting fish into guano and grinding phosphates, by turning their attention to the supplying of pure cultivations of different forms of bacteria! How soon may it not be before a planter in ordering his annual requirements of, say, bones and poonac will add a request for so many bottles of a suitable culture of bacteria? *Planting Opinion* has been touching the fringe of the matter in the correspondence that has appeared in its pages about the cultivation of coffee without manure, in connection with the shade-tree *Erythrian lithosperma*; and enquiry has thereby been aroused into the question of the fertilising qualities of the loppings of the leguminous tree, and of leguminous crops. It is now well known that plant-life, with the exception of the legumes, does not avail of the free nitrogen of the air; and that the legumes can only do so by means of the bacteria in the nodules of their roots. Nitrogen is not assimilable in its free form, but the bacteria in some unknown way convert it into nitrates, in which state it can be taken up by the plant. It is suggestive that, as we understand in the case, in soils that are rich in nitrates the nodules do not appear on the roots to anything like the extent they do when the soil is poor. Of course to the coffee-planter the particular benefit of leguminous shade-trees is that the loppings return to the soil more plant-food than they have taken out of it for in their composition are nitrates that they have obtained from the nitrogen of the air that is in the soil, through the agency of these wonderful bacteria.

Now if coffee trees were legumes it would be easy to stimulate and promote their growth in soils poor in nitrates, for we read in the August number of the *Contemporary Review* in a most interesting article by Mr. C. M. Aikman entitled "Nitragin," that pure cultures of the nitrogen fixing bacteria have been prepared, by the usual bacteriological methods, suitable for the commoner leguminous crops grown, which are preserved in glass bottles containing *agar-gelatine*; but—and this is a point of significance to the Indian agriculturist—"they have to be kept from the influence of light, and care must be taken not to expose them to a temperature above 98° Fahrenheit." There are two ways of affecting inoculation of the soil, either by putting the seed in a watery solution of the preparation, drying and then sowing, or by wetting fine earth or sand with the solution and spreading it over the field, afterwards working it into the soil to a depth of about 3 inches. The expense of this latter method is said to be the modest sum of five shillings per acre. But coffee is not of the leguminous order, and how then, it may be asked, is the planter to be benefited. Mr. Aikman tells us on the authority of M. Pasteur that soils teem with bacteria which may be present to the number of 1,260 millions in an ounce of earth, and that these convert the complex forms of food material in the soil into simpler ones easily assimilable by plants;

thus there are bacteria that turn the nitrogen that is in the soil in the form of ammonia into nitrates. Given a soil rich in its natural state, or enriched by the addition of fertilisers, with food materials which are not assimilable by plants owing to the absence of bacteria that may be necessary to effect the conversion of such materials into proper nutrients, it will at once be seen how valuable would be the inoculation of the soil with the desired bacteria of the right type. May it not be the case that enormous quantities of manures are annually wasted owing to the soils to which they have been applied having in some way or another lost their supply of certain forms of micro-organic life?

The following passage from Mr. Aikman's article will be appreciated by those who have watched the discussion about the nodules of leguminous plants:—"The details of the process of nitrogen-fixation, as it is called, are not as yet known with any accuracy. That the organisms found in these nodules invade the roots from the soil and thus give rise to the formation of the nodules seems to be clearly proved. There they multiply with great rapidity and stimulate the growth of the plant cell. Living at first at the expense of the plant, as parasites, they gradually become passive, and the cells then become filled with bacterioids or bacterium-like bodies. It is when this period is reached that the plant absorbs the contents of the nodules, and leaves the cells, out of which they are formed in a limp condition. It seems doubtful whether there are several kinds of fixing bacteria, or whether the organism becomes so altered in its growth with the plant that it is not suited for promoting the growth of other leguminous plants. Whatever the explanation may be, it has been found that the organisms suitable for effecting the fixation of nitrogen for certain plants are not able to act in the same capacity for other plants." In addition to the primary object of the Pasteur Institute in India,—the treatment of rabies by inoculation, the programme of the Committee includes the treatment of cholera, diphtheria, anthrax, etc., and the promotion of independent bacteriological research. In connection with the health of the immigrant army of about half a lakh of coolies annually into Assam, the Indian Tea Association has not been slow to recognise the importance of the Institute, the usefulness of which will be limited only by the funds at its disposal; and the time may not be far off when the planters of Southern India through their U. P. A., may see the desirability of supporting it with the view of investigation being made into the bacteriology of their soils. —*M. Mail*, Aug. 29.

BANANAS, THE FRUIT OF PARADISE.

[BY "EL PERIFARA," IN POPULAR SCIENCE.]

Bananas were little known in northern lands two decades ago. There are even now many small towns in the United States and Canada in which only a few bunches will supply the demand for a month. There has been, nevertheless, a great growth in the habit of eating this fruit. It has been truly said that the banana has made over the appetite of races who a few years ago had never tasted it, a conquest quite as remarkable and far more rapid than that formerly made by the potato.

"Why not!" exclaimed the jolly Vallejo, when I read this to him: "That is as it should be. Surely the *guieno* is the best gift to Nature to man, for does it not promote leisurely meditation and peace? Don't my people plant a few *varas* with the *matas* of the bananas, and so escape the curse which befel mankind because of Adam's transgressions?"

"So it is. Your people are lazy!" the governor retorted. "So I cannot mend the roads you complain about. Your people will not work, for they have only to plant a little today, and then for years pluck and eat. If they were hungry, perhaps they might work a little."

"They have the contented mind with the continual feast," said the consul.

"It is right," replied Vallejo, laughingly, "for was it not with the banana that the evil one tempted our mother Eve? The sly rascal knew that the ease with which she could make it ready for the eating would tempt a housewife when nothing else could. Wasn't Adam led to his downfall, to the lasting regret of all who hate work, not by the blandishments of Eve—for she was already his spouse—but by the tempting appearance, by the charming fragrance, and the bewitching flavour of this fruit?" "That the banana was the true tree of knowledge is shown by its name," the consul remarked gravely. "*Musa sapientum* can surely mean nothing else than the 'fruit of wisdom.' And that it was the tree of paradise is further proven by the name which men of science have given it; *Musa paradisaica* can mean nothing else. Less evidence than this has served well enough to burn many a heretic at the stake in the good olden times."

"If such doubters do exist," he continued, "they may satisfy themselves as to the truth by simply cutting across a ripe banana and finding in it the sign of the cross. I doubt if better evidence was ever shown to prove that it is in very truth the forbidden fruit of the tree of knowledge which has been called the 'apple of Eden.'"

In the homes of dwellers in tropical America and other tropical countries always hang bunches of bananas, some of them ripe and sweet, more of them so green as to be fit only for boiling or for baking, in which state they are to these folk what potatoes are to inhabitants of northern lands, as they may well be, indeed, for the chemical make-up of one is very like that of the other, being:

	Bananas.	Potatoes.
Water	75.71	75.77
Carbonaceous or flesh-making material	20.13	20.70
Albuminoids or fat-making matter	1.71	1.79
Woody fibre	1.74	.75
Ash71	.97

For uncounted centuries bananas have been the chief food for millions of people, as they are this day of multitudes of dwellers in India, in Asia and in Africa, in tropical isles and in the three Americas. And everything eats the banana—chickens, cows and pigs, cats, dogs and cattle, mules, horses and babies, all kinds of live stock; in short, the very birds, and beasts of the forest and the fishes in the streams, all eat the banana when they can get it. And it is good for them that this is so, for it is an exceedingly healthful food, which prevents constipation and resultant evils.

Platinos, which English folk misname plantains, are a kind of bananas for cooking. Most *platinos* are firm of flesh, thick of body, and not good to eat raw. Some of these varieties are big, yellow fellows, as thick as one's wrist and nearly as long as a man's forearm. Others are short and thick as to body and thin as to skin. When fried these taste like fried green apples; when stewed with a dash of lemon or of limejuice, their flavor is like that of stewed peaches; when roasted they are tender, juicy, slightly tart, yet sweet enough they are when baked in an oven with a dressing of butter. All these are yellow or red.

Soups, porridge and puddings, bread, cakes or biscuit may all be made of banana flour, which is said to be so easily digested that it may be safely fed to babes and invalids. Pies have been made of *platinos* with a slice of lemon, of lime or of pineapple, to give more tartness than the banana possesses. A syrup equal to that of the maple of the North is made of bananas,

and the fruit stewed in syrup of the sugarcane makes a conserve found on many a table in the tropics. That variety commonly seen in the North is often stewed and stirred until it becomes like a thin apple sauce. Taken before dinner it dulls the keen edge of that unscrupulous appetite which comes of a day of canoeing, or of tramping through cool and pleasant forests that romancists have deceived us into believing are tangled, steaming jungles.

Those who best know the different members of the *Musa* family will have no difficulty in remembering several other uses to which they are put. The tender, unopened leaves make a soft, bland dressing for blisters of scalds or of burns, and the old leaves make fair thatching for temporary roofs. The dried leaves, torn into shreds, are used as a packing for merchandise, and the ashes of leaf and stock are used as soap for washing clothes and in many of the processes of dyeing.

The leaves of the "wax banana" are coated underneath by a white powder, which is a wax that has long been a valued commodity.

Banana leaves serve a few other useful purposes, for of them are made tough paper, from the thickness of thinnest tissue to thickest cardboard; clothing, hats and brushes, mats and hammocks. Millions of pounds of banana fibre, misnamed Manila "hemp," are each year brought to the United States or taken to Europe and spun into cordage from the fineness of silk up to the size of the twine with which myriads of farmers in the States bound millions of sheaves last harvest, to the bigness of mammoth cables; and many a dainty handkerchief and bit of fine lace has been woven from the fibre of banana leaves by the deft fingers of the women of South America and the far East.

THE INDIARUBBER INDUSTRY.

The United States Consul at Barmen, in a recent report to his Government, says that the world's consumption of india-rubber has been growing so enormously during the past few years, that the time does not seem to be far distant when the demand will greatly exceed the supply. Already the difficulty of getting a sufficient quantity of rubber to meet the current needs, has led consumers to fear that there will be an early famine. One of the chief causes of this heavy increase in consumption is of course the employment of the material in the bicycle trade, and long before the limit has been reached in this direction, another field is being opened up in the use of pneumatic tyres upon vehicles of all descriptions. The United States is one of the largest consumers of india-rubber at the present time, but that country is followed pretty closely by Great Britain. The other markets follow a long way behind, but the quantity imported by France and Germany is a no mean proportion of the trade done in this material. It is certain that the threatened famine in india-rubber—or, more properly speaking, caoutchouc—would not be so imminent as it is, if the owners of the plantations in West Africa and elsewhere had been a little less reckless in their methods of tapping the trees. In order to more easily get at the milky juice, it has long been the custom in West Africa, and in some of the South American States, to cut down the trees bodily, so that the collectors secured only one lot of the caoutchouc from each tree instead of a large number of periodical yields. The prevalent idea that this policy was justified by the almost unlimited range of forests producing caoutchouc, was very soon found to be groundless, and stringent regulations have been made to prevent the cutting down of the trees in many countries, and owners are going to a great deal of expense by laying out new plantations, which must take several years to come to maturity. In the meantime efforts are being made to compensate for these limited supplies by producing artificial india-rubber, and several new processes have lately been brought out in France and Germany, though without as yet producing india-rubber of a suitable quality upon a commercial scale. The most obvious way of meeting the demand for this material is to give more attention to some of the other rubber-producing trees that are to

be found in considerable quantities in South America and elsewhere. At the present time French capitalists are trying to make profit out of the scarcity of india-rubber by utilising the balata, which, for many years, has been employed upon a small scale for a variety of purposes. There are at least two descriptions of balata, one white and one red, the latter being known as the "bullet-tree." The species being exploited in French Guiana is the *Mimussops balata*, a magnificent tree which is peculiar to all the Guianas. It attains a height of from 90 to 100 feet. The wood is very much sought after for cabinet making, on account of its beautiful colour, while it has also the property of resisting the depreciation of insects. These merits are almost fatal to the existence of the tree as a rubber producer, and in some of the South American States, forests are being cut down without any regard to the profit that can be secured by tapping them in an intelligent manner. In Venezuela the tree is also to be found in great abundance, and it grows very freely in the mountainous districts of the northern states of South America. In British Guiana immense forests are found in the low-lying districts of swampy Canje. In a report on the balatas, published recently by M. Hayes, a colonising agent, it was said that there was a sufficient expanse of forest in the Guianas to allow of the exploitation of rubber being carried on for centuries. It was however, necessary that something should be done to prevent the wholesale destruction of the *Mimussops balata*, which would very soon disappear, if allowed to be cut down indiscriminately for its wood, and one of the richest and most prolific resources of South America would thus be destroyed. In fact, both in Venezuela and the Dutch Guiana the trees are cut down with a view to collecting as much of the juice as possible, and in French Guiana the same process was for a long time employed. When the trees are thus felled, circular cuts are made every 12 inches, and receptacles are placed underneath to catch the juice. The bark is also removed from the tree and the juice extracted from it by presses. In British Guiana it is only permissible to tap the trees without felling them, and a similar restriction is now imposed in the neighbouring French colony. The English method of collecting the rubber is to make horizontal incisions halfway round the tree, and connect them with a vertical channel to allow of the fluid flowing down into the receptacle, but a better method is said to consist in cutting out rectangular pieces of bark from which the juice is extracted by presses. Alternate rectangles must, of course, be left on the trunk, and these can be removed at the next tapping, when the exposed parts of the tree are sufficiently healed. To secure perfect vitality in the tree, it is preferable to tap it only over a third of its circumference every five years. If properly carried out, the collection of balata rubber is a very profitable industry. One traveller in French Guiana, who was accompanied by three men, collected 666 litres of juice in 119 days, which produced, on coagulation, 720 lb. of rubber. It is estimated that a single balata will supply 2 lb. of rubber every year without suffering to any appreciable extent from the tapping. The system usually employed for securing coagulation is to pour the liquid into large shallow pans, about 4 inches deep. A hard crust very soon forms at the surface, and this is removed to allow of another crust forming, and so on until the whole of the juice is solidified. The crusts are then hung on lines to dry. The balata rubber, though perhaps slightly inferior to caoutchouc for certain purposes, and notably as an insulating medium, is yet specially adapted for a great many uses, such as machinery, belting, mackintoshes, surgical appliances, &c., but its merits are so far recognised that a considerable trade has grown up during the past two or three years in the Guianas. While the exports of balata rubber from British Guiana in 1881 were only 41,000 lb., they were no less than 363,480 lb. in 1889, and though the total fell to 237,450 lb. in 1892-93, the value has been rapidly increasing. In Dutch Guiana the industry has not been carried on in such a systematic manner, nevertheless two American companies are exploiting the balata on a large scale, and are sending the

product to the United States. That the industry can be made a very profitable one may be seen in the price paid for the rubber, which varies in Paris from three to eight francs per kilogramme (kilogramme—2·204 lbs. avoirdupois), according to quality. It is evident that, while industrial enterprise, says Consul Merritt, is lying under a cloud in South America, it may be to the interest of capitalists to turn these balata resources to account. In this connection, a few notes are added to show the condition of German rubber companies. The new buildings of the German Rubber and Guttapercha Goods Company (formerly Volpi and Schluter) at Berlin, erected during the latter part of 1894, are now occupied. The dividend for 1894 was 4 per cent. The products are mainly supplies for railroads, and the capital is 1,400,000 marks (£70,000). At the general meeting of the Mannheim Rubber, Guttapercha, and Asbestos Factory, it was resolved to pay at once a dividend of 8 per cent. The dividend declared on the business for 1894 of the United Berlin Frankfurt Rubber Goods Factory was 8 per cent., and the same for 1895. An exceptionally good showing is made by the Hannover Rubber Comb Company—a joint stock company. Their profits for 1894, after ample provision had been made for the usual reserves, permitted a dividend of 21 per cent. to be declared. The dividend for the preceding year amounted to 17 per cent. —*Journal of the Society of Arts*, Aug. 14.

THE FUTURE OF COFFEE PLANTING : LADY-BIRD BEETLES FOR COFFEE- BUG, &c.

Among the editorials in the latest file of a London leading financial paper—the *Financial Times* of August 13th—is one on "The Brazilian Outlook," giving an account of the failure of a well-known and old established Rio firm with liabilities of over £600,000! And although our contemporary does not take a gloomy view of the future, it admits that "a mild commercial crisis" is not unlikely, and we know what a disturbing influence that must have on a great planting industry, and especially on the development and extension of planting—on which the continued prosperity of the Brazilian coffee enterprise so greatly depends. Here then we have a new and strong argument for faith in the future of "coffee" as a product not likely to be over-supplied from any quarter for a long period to come. We have already given our reasons for this faith in respect of the Eastern hemisphere, and if any check should be placed on the Brazil enterprise, the encouragement to try our old staple freely not only in Africa and Java, but in the Straits and once again in Ceylon would be very great indeed. We had the other day an interview at Cambridge with Professor Marshall Ward—now permanently attached to the Scientific Staff of the Cambridge University after some eight years' work in connection with Cooper's Hill College. It will be remembered that Professor Ward (who is still in the prime of life) won his spurs as a scientist, by his careful observations and able working out of the Life History of *Hemileia Vastatrix*, the fungus which practically destroyed the Coffee Industry in Ceylon. Professor Ward, who recalls with pleasure his stay in our midst and the many valued friends he made among the planters, was much interested in hearing of the marvellous development of our tea planting, and still more at its so entirely superseding coffee in all the Kandy and higher districts. Like every one else who recalls the old conditions, he deprecates the universal and continuous planting of "tea." "Why can't you have it broken up?" "Why, entirely abandon coffee?"—were some very natural questions; but

the fact that the tea plant was more healthy and profit-yielding, while coffee continued to shew the disease and to be very uncertain in profits or to yield none at all, were sufficient answers. Moreover, Mr. Ward was reassured by learning how very hardy the tea plant with its deep roots into the subsoil proves with us in Ceylon and its special suitability for our leaf-growing climate; while, so far as any rate, no dark cloud appears on our horizon. Nevertheless, no one with the welfare of tea and of the colony at heart can do otherwise than desire, with Professor Marshall Ward, to see our tea plantations or districts "broken up," that is to have something else besides a continuous expanse of the one product. We have, of course, in the high districts far more of tree belts, boundaries and groves than in the coffee days; but Mr. Ward would evidently like to see every tea estate, if possible, marked off from its neighbourhood by goodly belts or groves of fuel or timber trees—or why not, in some cases, by fields of India-rubber yielding trees or vines? This is a subject on which we have to write separately very soon; for there can be no doubt that there is a great future before "rubber"—indeed the demand for cycles alone is increasing every day and the price of the raw product is rising. Ceylon tea planters should take the hint betimes as far as possible.

But none the less may we commend the bold and enterprising few who have been of late replanting coffee in some parts of Ceylon, and we would ask if more cannot be done in this direction? In Uva, we know, planters are not so much afraid of the fungus, as of the coccus, bug-insect; and in this connection we have to introduce to special notice, a letter from Mr. E. E. Green which—to our great regret—has been delayed nearly three months in delivery, through an oversight at one of our old addresses. The letter is as follows:—

Bearsted, Maidstone, Kent, 17 May—'96.

DEAR MR. FERGUSON,—On back you will find extracts from letter from Mr. Kœbele—*re* the importation of Lady-bird beetles from Honolulu.

He seems to think we should get them direct from Australia. But here again is the difficulty that—unless very great care is exercised—the parasites of the beetles may be introduced as well; which would completely nullify the utility of the undertaking. It would require an experienced man to collect the beetles and keep them under observation for some time before liberating them. From the tenor of his letters I gather that Mr. Kœbele himself might be willing to undertake this work—for a consideration.—Yours very truly,

E. ERNEST GREEN.

(Copy of letter from Mr. Albert Kœbele to Mr. E. E. G.)

Honolulu, 21st April,—'96.—It will be useless to attempt sending living specimens of Coccinellidæ (Lady-bird beetles) to Ceylon from here. Of the many sent from here to California, none arrived safe. Why not get them at their home in Australia? Later I may be able to do the work for the Ceylon planters. Surely it would not cost them much if all help together. And I could guarantee that the work would be properly and successfully carried out without any mistake. All things look well here: the coffee trees are now practically clean.

The fact that the lady-beetles have cleared the coffee trees in Honolulu of bug, is a great encouragement to planters in Ceylon and India and the Straits to take steps to introduce them into their plantations; but how is this to be done? We fully agree with Mr. Green that the wise plan would be to employ Mr. Kœbele himself to do the work—as indeed he offers. On the other hand, there are so few proprietors now with any appreciable area under coffee in Ceylon, that the needful contribution might come rather heavy

on their acreage in comparison with the prospective return. Why not, therefore, ask coffee estate proprietors in Coorg, the Straits and even Java to join in the mission? Mr. Kœbele, on his way up from Queensland, could deliver a portion of his consignment at Batavia (or wherever fixed) and to an agent for the Straits at Singapore or Penang, before coming on to Colombo. Who will move, among the Uva planters interested, to make the necessary inquiry—or perhaps the first (or a simultaneous) move would be for Mr. Green to get an estimate of cost from Mr. Kœbele—his own salary or allowance; travelling expenses and contingences, and then to invite contributions from all coffee proprietors or intending planters in the countries or districts named. Mr. Kœbele's mission might, possibly, mark a new era in the history of coffee in Ceylon—marvellously chequered and romantic—full of ups and downs—as that history has been in the past.

J. F.

FARMING IN SOUTH AFRICA.*

Professor Wallace has done something to be proud of in this work. After his annual course of lectures at Edinburgh closed in March, 1895, he, at the invitation of the Government of Cape Colony, started on a four months' tour in South Africa for the purpose of investigating its agricultural condition and resources. Every facility was granted him for carrying this out effectually. The literature of the subject was placed at his disposal, introductions to the leading farmers were given him, through the fruit and wine growing districts of the west he was accompanied by a horticultural expert, as companion in the stock-rearing districts he had Dr. Hutcheon, the well-known colonial veterinary surgeon; and even nature favoured him, for he tells us that although the nights were chilly his journeys were performed in bright clear winter days. The chief danger—and we confess that it made us eye the book askance for many days as it lay on the table—was that he would compile one of these huge mountains of dry fact and arid disquisition which the agricultural mind so often builds up. But, luckily for the reader, Professor Wallace preferred to write a book. He has many sympathies outside of tillage, and he gives one the impression of an intelligent open-minded explorer keenly intent on farming, yet with an eye that seldom misses anything of human interest. The volume has also the advantage of being in the best sense of the word illustrated. For instance, you may follow the author's account of the route on an excellent series of maps produced by Mr. Bartholomew, and one is helped to realize the descriptions by excellent photographs of scenes and homesteads, of carts and markets and rivers, of all that composes African rural life. The plan, after a number of preliminary chapters devoted to the physical features and geology of the district, is to deal with the various branches of farming in succession. One of the most interesting of these is the chapter on viticulture. The Huguenots, who arrived in 1688, brought with them vine-sticks from the South of France, where the heavier classes of wine are made, and the colony soon obtained a reputation for its sweet wines—sweet Constantia, for instance, was at one time a favourite

* "Farming Industries of Cape Colony." By Robert Wallace, F. L. S., &c. (London: P. S. King and Son.)

delicacy of the London season. Only recently have light wines been produced from grapes imported out of Northern France. A great deal of harm was done to the industry by the fate of the wine consigned for competition to the Paris Exhibition of 1889. Barron A. von Babo had been appointed "Colonial Viticulturist" in 1884. He did a considerable amount of good by insisting on cleanliness, but made the mistake of persisting in an attempt to make low percentage beverage wines of the stamp of *vin ordinaire*, and the consequence was they would not stand the equatorial heat of the voyage, but were spoiled by a secondary fermentation on the way. The discouraging effects of that blunder are still visible in the colony, though undoubtedly it has the means of retrieving its old reputation. The chief wine districts are situated in the divisions of the Cape, Stellenbosch, Paarl, Robertson, Worcester, Oudtshoorn, and Ladismith.

Ostrich farming is a prominent South African industry, and into a score of pages the author has compressed as lucid and concise an account as we have read. But he does not recommend any one to place his chief dependence upon it. From the bi-monthly sales held in London he shows the extraordinary fluctuations in price which make ostrich keeping so much of a speculation. The results of it must always depend on the whim of fashion. The record year was 1882, when the declared value of 254,000 lb. was £1,094,000. Last year the declared value of 353,600 lb. was only £527,700. At present the tendency is for the largest and finest feathers to decline in price, while those with this, mention is made of a practice common on some farms of keeping geese for the purpose of plucking them five or six times annually—a custom repugnant to one's notions of kindness to animals.

Professor Wallace is nothing if not an authority on stock, and the practical farmer will find the chapters on sheep, cattle, and horses of the utmost value. In each case photographs of typical animals are given with the text. The two most popular breeds of European cattle are the Holstein Dutch or Friesland and the Shorthorn. A keen rivalry exists between the advocates of the two, but it simply comes to this, that the Dutch will stand hard times better, while the Shorthorn is more profitable where the soil is rich and the climate favourable. Dairying is advancing rapidly, and though, according to the last statistical returns, 1,782,464 lb. of butter was imported into the colony, Professor Wallace looks forward to the time when it will be an exporting country. South African opinion is in favour of Government offering a bounty on exportation, as was done in Victoria. We have not space in which to follow our author into his most interesting history of the various attempts made to improve the breeds of horses, or his equally thorough account of the sheep. Indeed, it has not been possible to do more than glance superficially at one or two aspects of a most complete and ever entertaining book. It promises for long enough to be the standard work on the subject.—*Pall Mall Gazette*.

LONDON TEA LETTER.

(FROM OUR OWN CORRESPONDENT.)

31st July, 1896.

LABOUR QUESTION.

Apart from the increasing momentousness of this subject, owing to the pressure for extensions everywhere, the increased requirements for fully developing the existing areas by more thorough cultivation, and finer and at the same time the closer plucking in most instances practicable, in many cases rendered a matter of life and death by over-capitalising as with new companies generally, there has recently been no lack of matter leading to its consideration. In the first place we have had the opinions expressed by Sir Charles Elliott (fresh from consultation in Calcutta) and Sir Stuart Bayley in the discussion which followed Mr. Christison's paper read before the Society of Arts on "Tea Planting in Darjeeling." Both these eminent officers have been Chief Commissioners of Assam as well as Lieutenant-Governors of Bengal. As referred to in my last, Mr. W. H. Verner dealt with the subject in an able and exhaustive address as Chairman of the Annual General Meeting of the Single Tea Company; and last week at the Annual Meeting of the Indian Tea Association (London), Mr. Berry White, as Chairman, and other leading members expressed their views, all agreeing that of the many important subjects under consideration "the most important was the Labour Question." The two ex-Governors were in accord as to the evils of the present system and their causes, and their descriptions were equally graphic. As pointed out by Sir Charles Elliott, the tea industry incurs an unnecessary outlay of 50 lakhs of rupees annually on the coolies imported into Assam, owing to the suicidal competition of employers in the labour market. He contrasted the colonial emigration, which was effected at a cost of 15 rupees per head compared with R150 for Assam. The difference between the actual cost of conveying the labourer from his home to Assam and the actual cost to the employer is very great, and this difference does not go to benefit the coolie but goes into the pockets of the middlemen. And as Sir Stuart Bayley puts it, "inevitably there is a fierce struggle for this margin. 'Where the carcass is there are the eagles gathered together, a whole horde of middlemen, contractors and their agents, licensed recruiters, unlicensed recruiters, garden sirdars, and what not, all contending for the *corpus vile* which was to yield his profit, and systematic recourse to fraudulent recruiting and even kidnapping became common, sufficiently common to be felt as a discredit to the administration and one not easily to be put down." Sir Charles Elliott's words were:—"The great evil which had arisen with regard to the competition for labourers had arisen from the immense number of different persons which were competing with each other—deceiving each other, stealing each others coolies, kidnapping women and children, or enticing them by false pretences and even using force and wrongful confinement so that they constantly figure in the Police Courts." The remedy for all those evils now generally recommended and believed in is a central recruiting agency under Government control. It is believed that this will be recommended by the Commission recently appointed by the Government of India. Constituted as human nature is, we know from experience that it is impossible to get the majority to realise and act upon it, that what is for the common interest is for the individual good in the long run, and subordinate private needs to the good of the industry, or prevent one employer trying to steal a march upon his neighbour. Hence, all considered, this scheme of a common agency is the best practicable, though not without drawbacks, most of which were reviewed in a very fair and proper spirit by Mr. Verner in the address referred to. He pointed out that such an Agency might lack the energy to recruit so as to meet all the requirements of the industry, and provided it did not, how were the coolies to be fairly distributed among the applicants? All but the authorised agents found recruiting are to be prosecuted as criminals and punished accordingly

COFFEE IN BENGAL.—It is mentioned that the efforts to introduce the cultivation of coffee into Bengal, in the Chittagong Hill Tracts and Hazaribagh, appear not to have been very successful, as from ten acres under cultivation in 1888 there are now only two.—*Madras Times*, Sept. 7.

It is understood however, that garden sirdars will be permitted to recruit for the Dooars and other districts not under the Act. It is admitted that a great deal of the evil is due to the rascally set called "Arkattis," and that they must be got rid of. But will not these Arkattis and other evil-doers endeavour to make out that they are garden sirdars? Mr. Verner did not in his last address allude to this aspect of the difficulty attending the proposed Central Agency, I suppose because the Company meeting he was presiding over was an Assam one; but on a former occasion, I think at a meeting of the Indian Tea Association, he dwelt prominently on it. It is to be presumed the garden sirdars must be under control of the Central Agency in the collection of coolies, but cannot be so in regard to their destination or distribution. With all precaution therefore the recruiting by garden sirdars, a necessity for the Dooars, may lead to misrepresentation, recrimination and serious complications. This point certainly demands careful attention.

SCIENTIFIC EXPERT.

At the Association Meeting referred to, there seems to have been some discussion as to the desirability or otherwise of such for tea. No doubt with the cost of pushing for new markets, it may seem beyond the power of the tea industry to pay a competent expert adequately and retain his services long enough. I am not so very sanguine of a great deal being accomplished beyond what has already been done by the so-called "rule of thumb" experiments in manufactures, because I do not believe that chemistry is calculated to do so much for tea as in many other processes of manufactures. Still it is but science should work hand in hand with practical men, and in the course of years—it might be very soon—be productive of great results even in manufactures. Neither might science soon do much for the case blights and pests, but it could hardly fail to do something, but I think it is in the analysis of soil to ascertain what manure or application is required to yield or improve quality, most that is to be expected. In regard to this vital matter practical men are entirely in the dark, and experimenting is of little avail. Of course in regard to manuring *according to soil* for healthy plant growth generally also, a competent agricultural chemist could not fail to be of the greatest service. The Association engaged an expert (Mr. Bamber), but did not continue his services a sufficient time to give a chance. He was only allowed time to ascertain his position and be prepared to make a fair start. He only visited two out of the many tea countries of India and never set foot in the one conspicuous above others for quality. But we must admit that he perhaps did all that was possible in the time and for that he should have full credit. His report is the only standard work upon Indian tea since Colonel Money's. He gave the various opinions held or expressed by planters on different subjects, described or referred to all the blights and pests that tea is heir to; but without adding much as to their eradication of cure, and whatever was added to our knowledge of the chemistry of tea, nothing was contributed to improvement in the practice of manufacture. Had Mr. Bamber's services been retained for a couple of years longer, I am sure the result would have been very different. Allusion was made to some remark of Dr. Voelcker recently made before the Royal Society (?) that such a scientific enquiry should extend over a period of twenty years and that cannot be denied by anyone taking an intelligent view of the matter. But one speaker asks "how many proprietors of tea gardens could be found who were so considerate for posterity as to spend large sums of money annually from which they themselves could derive no benefit?" But with a long-lived crop like tea especially, this is just what must be done in the interests of the present proprietors quite as much as in the interests of posterity. There is often short-sighted procedure in regard to the management of tea property, that is quite as much against the interests of the present as futurity it rightly viewed. The same applies to the conquering of new markets, and the employment of scientific

experts. The fruits of such labours should all be duly estimated, or in the absence of them discounted in regard to the present value of tea property. Of course, as in America, Germany, etc., the Government ought to stimulate tea proprietors, and contribute liberally towards the funds for continuing the services of competent scientific experts year after year in the interest of an industry that contributes so much towards the prosperity of the Empire as the tea industry does.

To those who can realise the difficulties attending the chemical investigation of tea culture and manufacture, and the nature of scientific research in connection with agricultural chemistry in this country, so far from thinking 20 years too long would fear it more likely not to prove long enough to obtain really valuable results, not to speak of exhausting the subject. We have only to think of the conflicting opinions and results of agricultural chemists in different countries to bear this out. And still we are doubtless bound to steadfastly prosecute scientific experiment and analysis. Sir John Bennet Lawes has for over 50 years been conducting scientific experiments with manures, and in agricultural chemistry generally, aided by that eminent chemist Dr. (now Sir) J. Henry Gilbert. They do not consider the subject exhausted; so far from it, Sir John Lawes, who has all these years conducted these extensive and costly experiments and maintained a fully equipped laboratory at his own expense in 1889 set apart £100,000 under the necessary trust deed in order that the experiments may be continued after his death. Such is his idea of the time necessary for such investigations, and our duty to posterity in such a cause I have for over thirty-five years had my attention directed to Sir John Lawes' experiments and recently paid a visit to Rothamsted, and had the advantages of having the experiments and laboratory shown me and much valuable information supplied by Sir Henry Gilbert. On some other occasion I may have more to say on the subject of a scientific tea expert, the Rothamsted investigations and kindred subjects. Ceylon is not only urging the employment of a scientific expert for the island, but that tea manufacture be taught systematically in their technical schools.—*Indian Planters' Gazette*, Aug. 29.

INDIAN TEA ASSOCIATION.

Abstract of Proceedings of a Meeting of the General Committee, held on the 5th Aug. 1896.

Proceedings of a General Meeting of the Central Travancore Planters' Association, held on the 11th July, were submitted to the Meeting. In these proceedings the Committee noticed that the following Resolution had been carried unanimously:—

"That steps should be taken for commencing an agitation for the removal of the three months' prompt for tea sold in London, and for the substitution of a one month's prompt as in the case of coffee, and that this Resolution be sent up to the United Planters' Association."

The Committee were of opinion that this was a matter which might also be taken into consideration by this Association, and it was decided to draw the attention of the London Committee to the proceedings of the Central Travancore Planters' Association in connection with it and to enquire at the same time whether any alteration in the prompt would interfere with, or be detrimental to, the smaller buyers.

The Report of the Special Committee which had been appointed to investigate the question of the handling of tea at the Tea Warehouse and Jetties, was confirmed. The Report had been divided into two portions, one of which formed the subject of a representation to the Port Commissioners, and the other was embodied in a Circular letter addressed to all members of the association on the packing of tea at gardens.

A note made by Mr. G. B. Paris now came up for consideration. Mr. Paris suggested that all shippers of tea should issue a circular to the liners authorising ship's officers to refuse all chests they are not perfectly satisfied with, the result of which would be that shippers would be in a position to enforce their claims on the steamers.

Mr. Paris having explained the full purport of such action, stated that he himself had got a guarantee from one line of steamers that all claims for damage would be paid in England without any question under this arrangement.

Mr. Paris then referred to a Circular letter which had been issued by the Committee of the Tea Traders' Association to Brokers requesting them to mark in their catalogue all slack-packed and cross-cut packages. He laid on the table Brokers' catalogues for the previous week's sale, and drew attention to the very large percentage of slack-packed packages in the sale.

Mr. Paris further produced a list of invoices each of 300 chests of tea shipped to London, showing losses in weight averaging from $1\frac{1}{2}$ to 3 per cent., and also two invoices each of 300 chests of tea shipped to Manchester, one of which showed a gain of $\frac{1}{2}$ per cent. and the other a loss of $\frac{1}{2}$ per cent. The Manchester shipments had been specially selected before purchase on account of their being in good strong chests and it was fair to deduce from this that with good chests, loss in weight can be reduced to a minimum.

The attention of the Committee was also called to the damage to the Indian tea industry in America and elsewhere by purchasers receiving teas in chests so markedly inferior to those of China and Ceylon. Nearly all buying instructions received from America and the Colonies now contain directions to "select only packages that will reach their destination in good condition."

Mr. Paris finally drew attention to the difference in losses in weight between Ceylon and Indian tea which was fully $\frac{3}{4}$ per cent. in favour of the former.

The Committee having thanked Mr. Paris for the valuable information given them, proceeded to discuss the question of recommending shippers to issue a Circular to the liners such as he suggested, and it was decided that a Circular should be sent to all Members of the Association in the first instance asking for their opinion on the proposal.

Letters of 12th, 19th and 26th June from the Secretary, Indian Tea Association, London with reference to the American Market Fund, which had been previously circulated, were now brought up for final consideration. The Committee noted that Mr. Blechynden arrived in London from New York on the 7th June, and that the Committee had had the advantage of conferring with him on several matters of importance, such as the work in the United States, prospects in Canada and the Southern States, the question of Green Tea and other matters, also that Mr. Blechynden was calling on the principal representatives of the tea industry; especially those who had not hitherto supported the Fund. Mr. Blechynden left again on the 27th June for New York in company with Mr. Mackenzie, the Ceylon Commissioner.

A letter was read from Mr. J. Buckingham, C.I.E. Chairman of the Assam Branch, stating that at the Annual Meeting of the Branch a contribution of R2,000 was voted to the American Market Fund. The Committee had duly acknowledged this communication, and now placed on record their obligations to the Assam Branch for this substantial addition to the fund.

A letter was also read from the Honorary Secretary, Central Travancore Planters' Association, stating that his Association having been under the impression that the campaign in America was going to be discontinued at the close of the current year, had passed the following resolution at a general meeting:—

"That this Association is fully in accord with the Indian Tea Association in its determination to carry on the campaign for pushing Indian tea in America for another year, and, moreover, considers that the work should be carried on from year to year until such time as fully one-half the consumption of America is British-grown tea."

Copy of this resolution was to be forwarded to the London Committee, and the Committee of the Central Travancore Planters' Association were to be informed that no such decision as they referred to had been arrived at.

Statement of accounts of the American Market Fund to 31st July was submitted to the Committee from which it appeared that the total amount of contribution advised to date amounted to R68,407-10-6, and that there was a balance in Bank and in cash of R21,777-2-10

Considered letter of the 27th June from Dr. Geo. Watt, Reporter on Economic Products to the Government of India asking to be furnished with any information on the subject of Let Pet Tea, which the Committee might happen to have and also enquiring as to the amount of Chindwin tea seed imported into Assam, and the quantity of Assam indigenous seed annually turned out from the seed gardens of the province. The Committee were unable to furnish any information with regard to Let Pet Tea, but they had ascertained from the Chairman of the Assam Branch that certainly under 10 per cent. and probably not more than 5 per cent. of the extensions in the Assam Valley had been opened out with Chindwin seed. The information furnished by Mr. Buckingham had been passed on to Dr. Watt.

Considered letter of the 24th July from the Secretary Bengal Chamber of Commerce, replying to the Committee's letter asking for the opinion of the Committee of the Chamber, on a proposal to ask the Government of India to levy small export tax upon tea as is done in Ceylon, the proceeds to be disbursed in connection with the exploitation of the American and other markets. The Committee of the Chamber in this letter pointed out that there would be very great difficulty in the way of any such impost being levied in India, as all the various Governments would have to be consulted and various contingencies might be raised. The Committee of the Chamber deprecated the idea and considered that whatever had to be done in the direction of opening new markets for tea should be done voluntarily.

After consideration of this letter, the Committee were of opinion that it was not worth while pursuing the matter further in face of the difficulties in the way of carrying out the proposals.

Considered memorandum of the 25th July from Chairman with reference to the establishment of a Pasteur Institute for India and asking for the opinion of the General Committee as to the most suitable site.

The Chairman having explained that the present intention of Government was to place the Institute in Kasauli in the Simla Hills, but that both Professor Haffkine and Dr. Ranking were now in favour of its being located somewhere in Bengal, the following minute was recorded unanimously, and ordered to be sent to Professor Haffkine, who was leaving for Simla that evening:—"This Committee having considered the question of the locality to be selected for the head-quarters of the Pasteur Institute for India, and having in mind the requirements of the large labour force estimated at 50,000 annually proceeding to Assam, as well as the increasing demands of the Doars and Darjeeling districts, are of opinion that such head-quarters should be located in Bengal, viz., as near as possible to the possibly greatest demand which may arise for assistance from the Institute."

Consideration of a memorandum prepared by the Secretary, Bengal Chamber of Commerce, with reference to the proposal recently made in the House of Commons, for the abolition of the duty on British grown tea was ordered to stand over until the next meeting.—*Indian Planters' Gazette*, Aug. 22.

TEA SHOOKS.

We have been favoured with an inspection of tea shocks imported from Austria for the local market by Mr. G. A. Marinitseh. The shocks are of white pine free from knots so that there should be little liability to split. There is also an entire absence of resin or of odour likely to taint tea. The shocks are dovetailed and when put together should make a very serviceable chest, which in point of lightness and cost should compare favourably with chests at present offered for sale on the local market.

THE CEYLON PROVINCIAL ESTATES COMPANY, LIMITED.

GENERAL MEETING.

The first ordinary general meeting of the shareholders of the Ceylon Provincial Estates Company, Limited, was held on the 7th Sept. at the office of the Agents and Secretaries, Messrs. Geo. Stewart & Co. Mr. F. L. Clements presided and present were Hon. W. W. Mitchell, C.M.G., and Messrs. T. S. Grigson, J. Paterson, E. John, F. J. de Saram and A. Murray; also Mr. T. S. Grigson represented Mr. E. S. Grigson, Mrs. A. K. Wise, Mr. J. M. Smith, Mrs. Esther Crabbe, and Mr. J. L. Gordon; Mr. C. Gordon was represented by Mr. J. Paterson, Mr. John Anderson and Mr. A. W. S. Sackville by Mr. F. L. Clements, and Mr. H. D. Deane by Mr. F. J. de Saram.

Mr. CLEMENTS, in moving the adoption of the report, made a few preliminary remarks on the satisfactory working of the Company during the seven months ended 31st July last, up to which date their total earnings were R12,919.77 of which R32,487.53 remained for disposal after paying for expenses which were extraordinary. The profits represented an earning of 8 per cent on the seven months or 14 per cent per annum, which was very satisfactory. The crop for the year was estimated at 323,000 lb. of tea of which they had gathered 217,000 lb. up to the end of August last, leaving nearly one-third of the estimate to be yet realized. The average cost of tea per lb. was 29 cents and the sales averaged 50 cents. Out of the profits Directors recommended the payment of an *ad interim* dividend of 4 per cent which absorbed R21,120, and R1,000 to the Directors as remuneration, carrying forward R10,367.53.

Mr. E. JOHN seconded the motion, and the report was adopted.

It was unanimously agreed to pay the interim dividend of 4 per cent after which Mr. F. J. DE SARAM proposed, and Mr. E. JOHN seconded, that R1,000 be paid to the Directors as remuneration for services rendered.

On the motion of Hon. W. W. MITCHELL, C.M.G., seconded by Mr. E. JOHN, the Directors were re-elected.

This was all the business.

The following is the

Report of the Directors for presentation to the first ordinary general meeting of the Shareholders to be held on Saturday, 5th September, 1896, at noon.

Directors:—E. S. Grigson, Esq., F. L. Clements, Esq., John Paterson, Esq.

The Directors have the pleasure to submit their report, together with a statement of accounts to 31st July, 1896.

The property of the Company consists of the Glassaugh estate in Dimbula and the Brownlow estate in Maskeliya. The former was purchased for £18,000, of which £12,000 was paid in cash and £6,000 was left on Mortgage; and the latter property was bought for £20,500, of which £10,500 was to be paid in cash and the equivalent of £10,000 in shares of the Company—the actual sum paid in cash was £8,500 an existing mortgage for £2,000 not having been paid off, and the Directors are now in correspondence with the mortgagees with a view to keeping it on for a time.

The Acreages of the Estates now stand as follows:—

	Glassaugh. acres.	Brownlow. acres.	Total acres.
Tea in bearing ..	270	400	670
" not ..	24	..	24
" planted this year	13	50	63
Forest ..	24	62	86
Waste and Grass	13	72	85
Total.	344	584	928

The Company's financial year does not end until 31st December next, but to comply with the Ordinance

it is necessary to hold the first general meeting within 12 months of the incorporation of the Company.

The accounts now presented show only 7 months' working of the Estates, and the Directors are pleased to be able to say that the results obtained so far come up to their expectations.

After providing for interest on the Glassaugh and Brownlow mortgages to the 31st July a sum of R3,814.56 paid the vendors of Brownlow for interest on purchase money to date of transfer, all preliminary and miscellaneous expenses incidental to the formation of the Company, and all legal expenses in connection with the transfer of the Estate, the 7 months' working shows a net gain of R32,487.53 which the Directors propose to dispose of as under:

To pay an interim dividend of 4 per cent	R21,120.00
" pay the Directors' remuneration	" 1,000.00
" Carry forward	" 10,367.53

R32,487.53

In accordance with the Articles of Association all the Directors retire but, being eligible, offer themselves for re-election.

By Order,

GEORGE STEUART & Co., Agents and Secretaries.
Colombo, 25th August, 1896.

HORNSEY TEA ESTATES COMPANY, LIMITED.

Registered, July 28, by Hurwood and Stephenson, 31, Lombard-street, E.C., with a capital of £50,000 in £5 shares—4,000 cumulative six per cent preference shares and 6,000 £5 ordinary shares. Object, primarily, to adopt and carry into effect certain agreements expressed to be made by this Company with W. S. T. Saunders and Messrs. L. Reiss Brothers & Co., to acquire, by purchase or otherwise, lands, factories, buildings, &c., in Ceylon, or elsewhere, in particular the estates known as the Hornsey Estate and the Abercainey Estate, situate in the district of Dikoya, in the Island of Ceylon; to develop and turn to account the lands, buildings, and rights for the time being of the Company in such manner as they shall see fit, by clearing, draining, planting, cultivating, farming, grazing, mining, building thereon, &c.; to construct and maintain, in Ceylon or elsewhere, roads, ways, rail and tram roads, telegraph lines, telephones, electric light, heat and power works, canals, reservoirs, waterworks, wells, aqueducts, water courses, furnaces, gasworks, piers, wharves, docks, quartz, saw and other mills, hydraulic works, factories, warehouses, &c.; as cultivators and dealers in tea, coffee, cardamoms, and other crops; also as miners and smelters, shipowners, merchants, exporters, and importers, carriers, agents, brokers, storekeepers, builders and contractors, company promoters, &c. The signatures are:—

- H. A. Hancock, 28, Mincing-lane, E.C. 1
- A. Zimmern, 51, Lime-street, E.C. 1
- H. S. Hancock, 28, Mincing-lane, E.C. 1
- D. B. Crane, 4, Woodview-terrace Highgate, N. 1
- A. B. Tomkins, Walmer House Surbiton 1
- H. W. Hubbert, Lincoln House, Catford, S.E. 1
- G. E. Elvish, 96, Embledon-road, Ladywell, S.E. 1

The number of directors is to be not less than three nor more than five. The first are C. A. Reiss, H. A. Hancock, W. S. T. Saunders, and W. S. Siebel. Qualification, £300. Remuneration, 100 each per annum. Registered office: 51, Fann-street, E.C.—*Financial News*, Aug. 15.

CEYLON TEA IN RUSSIA.

Evidence has been plentiful that the efforts made by Mr. Rogivue and his partners to introduce Ceylon teas into the empire of the White Tsar have not been without result. It is difficult to say with precision, however, the exact extent of this. The returns available through Messrs. Gow, Wilson & Stanton, admirable as these are, would not seem to afford an exact indication of the quantities of our teas that find their way into Russia. It is believed that a large proportion of the re-exports from Great Britain to Germany are destined for Russia and eventually find their way there by routes that cannot be reported upon. Anyway, the latest accounts are to the effect that Mr. Rogivue feels well satisfied with the progress achieved. It is additional evidence to that available by customs returns that the Russian tea dealers now feel coerced into keeping stocks of our teas. But we are told that their doing so arises out of no friendly feeling towards Ceylon. Indeed, it is asserted that while meeting any demand for our island production, they endeavour to weaken that demand by more than insinuating comparison disadvantageous to it between their well-beloved China teas and those of Ceylon. This need not surprise us. The same thing, we know, has been experienced in America, in which country the tea vendors have also felt themselves compelled in self-defence to be ready to supply our teas to their customers. But time has apparently broken down much of their practice of dissuading these from the purchase of Ceylons. It may well be expected that the same result will ere very long be apparent among the tea fraternity in Russia. Independently of this parallelism another is to be found between the two countries mentioned. Both are vast in extent, and the areas to be fought upon are so large as severely to tax the energies of those engaged in the struggle. But Russia is even more difficult to attack on this special ground than is America. In the United States, at all events, as in a considerable degree also throughout Canada, railway communication is widely spread. In Russia this is not the case, and it may readily be understood how exceedingly difficult it must be to foster and supply the very many distant agencies established by Mr. Rogivue's efforts. He is fighting our battle even under greater disadvantages therefore than have been experienced in America. We understand that on this ground he asks for further assistance from here. We do not pretend to say how far this should be granted; but it is easy to realise how great are the difficulties he has to surmount in a country so sparsely supplied with railway facilities as is Russia.

NOTES FROM THE METROPOLIS.

LONDON, Aug. 11.

The *Financial Times* on Tuesday this week had an important article on

“INDIAN TEA COMPANIES AND PROSPECTS”

—sure to attract much attention, which I send you:—

INDIAN TEA COMPANIES' PROSPECTS.

It is not surprising to find that with the present demand for sound commercial investments, the attention paid to Indian Tea Companies' shares continues to show an increase. Even now, it may be said without hesitation that people on the look-out for an industrial lock-up, yielding what, in these days of low interest upon capital, may be described as a handsome return, might with advantage devote some attention to the attractions afforded by this

market. The results certainly compare very favourably with those of other industrial investments, and as we have pointed out previously, it is possible by making a good selection to secure substantial dividends and at the same time to reduce to a minimum the amount of risk attaching necessarily commercial holdings. A purchase of Assam, Jorchaut, Chargola, or Lebong ordinary shares at present prices would show a return of fully seven per cent; Jokai, Dooars and Doon Doona bring in six per cent. or thereabouts; while newer, and therefore more speculative, varieties offer still greater temptations in the way of interest. When in February we dealt with Indian Tea Companies' Preference shares we ventured to predict that the next few months would see a continued appreciation of prices. Although a slightly easier tendency is now apparent, our forecast has been none the less borne out—not to a sensational degree, for the very circumstances of the case render advances by leaps and bounds extremely improbable, but by steady advances that indicate healthy conditions. And the increased activity has not been confined to shares of well-known and old-established companies, but has been apparent, too, in the recent outburst of industrial promotions. During the past month or two new companies whose aggregate capitals run well into millions have been publicly floated; and the success with which, as a rule, the issues have been made indicates not only that this field of enterprise is coming into favour, but that before long the market is bound to show a wider tendency, and that the greater popularity will in all probability tend to raise the level of prices all round.

The large amount of this class of share capital now quoted in the “Official List” will before long be swelled to five or six millions as a result of the recent promotions; and in addition there are unquoted securities, consisting largely of Ceylon descriptions, accounting for another couple of millions. Under these circumstances it is the more satisfactory to find that the present position of the industry is very satisfactory and that the prospects for the current year are decidedly favorable. In 1895, as we stated some time ago, the results were not quite so good as those of the previous twelve months, when the conditions were particularly good. The trend of prices was in the downward direction, and competition was much keener, but in spite of these adverse circumstances dividends were on the whole well maintained. The current year, according to present expectations, will probably witness a partial return to the prosperity of 1894. The early pickings of the new crop that are now coming to hand indicate that the season will be one for quality rather than quantity of produce. The anticipations of an excessive supply are therefore not likely to be realised, and the consequent improvement in prices should have an important effect on the net earnings of the companies. Not only is the outlook satisfactory in this direction, but other favourable influences are at work. Tea plantations, like Kaffir mines, have their labour difficulties, and if the reports that the rice and other crops in some of the most important agricultural districts of India are likely to prove very poor be correct, the tea plantations in Assam will find less difficulty in obtaining labour, and will secure it at less expense. Another reason for encouragement is supplied by the fact that the demand for Indian and Ceylon tea is constantly growing, owing largely to the comparatively low prices now ruling, and there is no sign of a reaction from the phenomenal advance of the past few years. The increase is not confined to this country, for planters are showing great enterprise in their efforts to open up fresh markets. Vigorous steps have been and are being taken to stimulate the trade with the United States, and the Ceylon traders are also devoting special attention to the cultivation of Russian custom.

Tea companies, like all other concerns, must have their critics, and, of course, like all other concerns, are not always invulnerable. The article itself, taken in large doses, is generally understood to promote dyspepsia, and the same effect seems to have been brought about in some quarters by

an examination of the accounts of the principal producing companies for 1895. The current number of "The Investors' Review" has some very hard things to say about the group, and though some of them are perfectly reasonable, some of them appear to us to be unnecessarily despondent, if not a trifle unfair. Our contemporary suggests that the delay in the publication of Indian tea companies' reports has been caused to some extent by "preparations for 'consolidation'—a term which appears likely to bear in the future as ill a name in the tea share market as in the Kaffir circus." We have already drawn one comparison between the Indian plantations and South African mines, but the points of resemblance are surely few in number, and in the present case we fail to see the reason for the association of the two classes of enterprise. Kaffir consolidations are "another story," but consolidations are not necessarily bad, and in many ways are productive of excellent effects. The whole question rests on the merits of individual schemes, and our contemporary, while peering into the future, when "consolidations" and their accompanying evils have done their fell work," makes no attempt to show that the various plans that have been carried through recently have, as a whole, involved unfairness to shareholders, or that they have made loopholes for plunder. Most of them indeed, have been framed on equitable lines, and have been justified by the appreciation in market values. The criticism that some of the companies show a regrettable inclination to divide their profit right up to the hilt is certainly justified in some cases; but here again there is something to be said on the other side. Many of the concerns whose financial methods are questioned in this respect have devoted large sums from revenue to betterment purposes, and although the possession of large reserves is obviously an advantage, and the equalisation of dividends an eminently desirable policy, it cannot fairly be said that the companies have been altogether indifferent to future needs.

It has brought forth the following letter and further editorial comment:—

INDIAN TEA COMPANIES.

(To the Editor of the *Financial Times*.)

Sir,—Your carefully-written article of 10th inst. is calculated to lead many investors to pay more attention than they have hitherto done to the tea industry; and as it is difficult for anyone outside the trade to get the materials for forming a sound judgment when choosing a company in which to invest, it may be useful to your clients to have a standard, the more so as all tea plantations are not equally good or safe.

The best criterion is the average price per planted acre which a company's capital shows, taking the share at its market quotation.

Let me take as an illustration two of the concerns you name in your article, namely, the old Assam Company and the Lebong Company in Darjeeling.

The Assam Company's capital of £187,000 at £59 per share equals £555,000, less £50,000 reserve fund, equals £505,000, for its 10,100 acres of tea, that is, about £50 per acre. The Lebong Company's capital of £65,660 at £18 per share equals £118,000, less reserve £18,000 and working capital, equals £100,000 for its 1,550 acres of tea; this is, about £65 per acre.

These two companies represent the oldest plantations in the two districts which produce the finest tea;—their produce commands a high premium in the market, and they may, therefore, be safely taken as the standard by which other concerns should be valued.

The reason why these and several other old companies are now paying such high dividends, in spite of the comparatively low price of tea, is that in bygone years, instead of dividing all their profits, they have largely extended their plantations out of revenue, of which policy they are now reaping the benefit. This, of course, is not generally known.

An investor will naturally desire to know what is the prospect of the value of tea holding up; having,

no doubt, heard the foreboding reports of over-production.

At the moment it is doubtful if the supply will equal requirements, which are constantly enlarging, as the weather in India has shortened the quantity, while giving finer quality than last season; not in all districts, but in Assam to a marked degree.

The immediate effect has been to raise the price of the best growths in Mincing-lane pence per pound, as compared with last season's value; and we find the buyers, not the producers, showing some anxiety as to the future.

It is desirable when investing in tea-planting companies to discriminate between those which have their land in the districts which have proved their ability to yield fine tea during a long period of years, and those which have not; and to examine the record of each company during the last five seasons, which have included bad as well as good harvests.

The details are now compiled and published by your weekly contemporary, the "Home and Colonial Mail."—I am, &c.,
11th Aug., 1896.

A TEA BROKER.

Investors who have turned their attention to the market in Indian Tea Companies' shares will find some good advice in our correspondence columns from "A Tea Broker." Our correspondent agrees with the views expressed in the article on the subject that appeared in Monday's issue, and points out the importance of intending purchasers studying the average price per planted acre shown by the capital of a company. The point is one that we have previously emphasized, but with the increasing popularity of the market, it is well worth repeating. Our statements concerning the probable course of prices for the Indian produce are confirmed, and our correspondent adds that it is doubtful if the supply will equal requirements, and that buyers are showing some anxiety as to the future. This fact can hardly fail to produce a cheerful effect on the quotations for shares, especially those of the better-known companies.

So that the basis on which Tea Companies are formed is likely to be carefully scanned in future. Still, the great difference in the real value per acre, of different properties in different, or even the same, districts, is what home investors can never judge, by mere figure comparisons.

Among new tea companies, or rather business,—is the extension of the

"BURNSIDE COMPANY'S"

purchases and capital. No doubt you have published the original prospectus: here is the supplementary one:—

BURNSIDE TEA COMPANY OF CEYLON, LIMITED.
Incorporated under the Companies Acts, 1862
to 1890.

Capital, in 5,000 shares of £10 each .. £50,000
Original Issue 20,000

Balance Unissued £30,000

The £15,000 shares now to be issued will make with the £20,000 original issue the present issued share capital £35,000.

The £7,500 Debentures now to be issued will make with the £7,000 Debentures original issue the amount of the Debentures issued £14,500.

The 1,500 Shares now offered for public subscription are to be payable as follows:—

£1 on Application; £3 on Allotment; and the balance when called for with an interval of not less than two months between each call.

It is not intended to call up more than £5 per share.

The remaining £5 per share, total £7,500, will be specifically charged to secure the Debentures of the Company, the amount of which is limited not to exceed the uncalled Capital of the Company for the time being and which will be further secured by a floating charge upon the other property of the Company.

The Debentures carry interest at 5 per cent. per annum, and are payable on 31st December, 1901.

Subscriptions for the £7,500 Debentures are payable:—

10 per cent. on application, and the balance on allotment.

They will be issued for sums of £50 or multiples of £50 each. The Interest upon the Debenture will commence from the date of Allotment, and first payment will be due on the 1st of January, 1897.

PROSPECTUS.

Since the Burnside Tea Company of Ceylon Limited, was registered the Directors have been able to secure the firm offer of Wattagalla Estate, adjoining Heeloya, in the district of Rangalla, Ceylon, from Mr. C. Tottenham for £12,000 cash; crop and expenditure to be taken over as from 1st April last.

The following particulars are taken from the Report of Mr. Joseph Fraser, dated 10th March, 1896.

WATTAGALLA ESTATE.

Elevation from 2,000 to 4,000 ft. above sea level. The actual area cultivated in Tea is now 302 acres in full bearing, and 80 acres of young Tea.

There are 180 acres of abandoned Tea that may now be looked upon as valueless, though portions might be cleared up and planted with Grevillias.

There are 10 acres of young Cardamoms, but I put little value on those, as the area is too small to make it worth while cultivating. The land is, however, suitable for Tea. Portions of the 90 acres of patna and scrub are suitable for planting up with timber trees.

The yield of the upper division (203 acres) is very satisfactory, having given an average of 536 lb made tea per acre all round in 93/94, while the lower division, allowing for the 13,000 lb. made tea secured from the abandoned area during the season, gave an average of 270 lb. or an average all round of close on 450 lb. per acre. Finer plucking the past two seasons has reduced the yield to barely 400 lb.

The tea is looking in excellent condition, and is capable of giving 550 lb per acre all round, with cultivation in the shape of manure.

Though portions are rather steep for cultivation, a large area of the cultivated fields are quite suitable.

The facilities for transport are greater than I expected, as the upper fields almost touch the Nitre Cave Cart Road, and would therefore make manuring a simple matter.

Some arrangement could no doubt be come to for the use of the cart road.

There is a complete system of wire shoots to convey leaf to the Factory, and manure, if needed be, to lower fields.

The Sinhalese have taken to the transport of tea chests from the Factory to the cart road at Udas-pattu, so that the Tamil labour is not affected—an important matter.

The Factory and Machinery is ample and complete for present requirements, no steam power necessary, water being quite sufficient during the driest weather.

The Bungalow is in good order and the lines are sufficient and permanent, a good many being iron roofed.

The following is the acreage according to Mr. Fraser's report:—

302	acres	old tea.
80	"	young tea.
180	"	abandoned tea.
10	"	cardamoms.
90	"	patna and scrub.
<hr/>		
662	acres	total area.

The acquisition of this estate by the Burnside Tea Company of Ceylon, Limited, will give the Company 1,126 acres in tea, costing, exclusive of all the other lands, about £26 per acre.

To provide funds for the purchase of the estate and for its proper cultivation, it is proposed to make the above-mentioned further issue of 1,500 shares and £7,500 in Debentures.

The terms of offer of Wattagalla Estate are contained in a letter from Messrs. Lyall, Anderson & Co., to Mr. C. Tottenham, dated 31st July, and his reply, dated 2nd August, 1896.

Copies of the above-mentioned letters, the report of Mr. Fraser, of 10th March, 1896, the Memorandum

and Articles of Association, and the Form of Debenture may be inspected at the office of the Company.

With this circular is enclosed the original Prospectus of the Company, the First Issue of Capital which has been fully subscribed, and Applications for Shares and for Debentures of the New Issue should be made on the accompanying relative forms and forwarded to the Bankers of the Company, together with the amount payable on application.

If no allotment is made the deposit will be returned, and where the amount of Shares, or Debentures allotted is less than the amount applied for, the surplus will be credited in reduction of the amount payable on allotment of the Shares, or of the balance of the Debentures as the case may be.

10th August, 1896.

Here is good news for Ceylon and India in regard to

CHINA TEA,

and surely also in reference to opium too—for the sooner we are done with it the better!—

NEWS FOR TEA PLANTERS AND THE ANTI-OPIMUM SOCIETY.

The Anti-Opium Society has directed its efforts in recent years more particularly against the export of opium to China. It looks as if its occupation in this respect will soon be gone. Chinese native opium last year became an article of export, and Consul Gardner of Amoy, in his annual report, says he has no doubt it will ultimately replace all foreign opium. "The heavy import and transit duty on foreign opium, which is rigorously collected, and the ease with which native opium evades the natives dues, will and must render the latter far cheaper, and the Chinese growers will doubtless continue year by year, as they have done hitherto to improve the quality of the drug." The extinction of the import of opium into China, as of the export of tea from China, is in Mr. Gardner's opinion only a matter of time.

J. F

THE BIG TEA COMPANY.

A fortnight ago we announced that a big allied tea company, with a capital of £1,000,000, would shortly make its appearance, and this week the prospectus of the Amalgamated Tea Estates Company, Limited, has been published. No fewer than ten undertakings will be acquired, and these include the estates of the Land Mortgage Bank of India, an estate in Darjeeling, one in Cochin, three in Ceylon, and four in Assam. They comprise in all 43,302 acres, of which a little over 10,000 acres are under tea.

The vendors state in the prospectus that they have purchased the properties at a total price of £493,693, exclusive of certain miscellaneous assets, which will be separately realised on behalf of the Company, and they go on to declare that they will transfer the whole of the property to the Company at the actual price paid, plus 5 per cent as a commission for negotiating the purchase, which will total up to the very respectable sum of something over £24,000; but out of this they will pay all expenses incurred up to the date of the agreement for the inspection and purchasing of the estates.

We suppose that there is not much to find fault with in this way of doing things, but inasmuch as the majority of the estates which are to be included in the Amalgamated Tea Company are not known, it might have been better to have given fuller particulars as to their past doings and their present value. It is estimated, after an examination of the accounts and figures "supplied by the previous owners" (which is, perhaps, scarcely such a satisfactory state of things as might have been hoped for), that there will be yielded an annual profit from the present bearing area of the estates of £40,000, and this estimate, if realised, would, after paying the interest on the Preference shares, leave a balance

of £20,000 for division among the Ordinary shareholders.

The capital is, as we were enabled to anticipate, £1,000,000, divided into equal proportions of five per cent. Cumulative Preference shares and Ordinary shares of 10 each. At present it is only proposed to issue 40,000 Preferences and 40,000 Ordinary shares, while on the latter only £2 is to be called up. We are sorry that no more satisfactory figures could be given than those "supplied by the previous owners," since, however much it may be taken for granted that people who want to sell tea estates put the exact particulars before the purchasers, it has become a general rule to take independent valuations of concerns which are being bought at a large outlay of money.

The fact that over 10,000 acres of the 43,000 acres being acquired are already planted with tea is a good point, but it might have been better if some information had been given as to how much of the remaining 33,000 acres would be available for tea planting. It is always possible that little of it might be adapted for the purpose. The Company intends to go in for coffee, while it will also cultivate coconuts in Ceylon; but a period of nine years must elapse before the coconut trees now planted will yield a sufficient crop to earn dividends. Their ultimate cultivation is said to be profitable, and the cost of planting and maintenance is comparatively cheap.

The Directors are probably acting wisely in not calling up much of the Ordinary capital until it can be seen how much it will cost to increase the cultivated area; but, on the whole, it seems to us that it might have been advisable to start with a smaller capital or with limits to the power of calling it up without taking the opinion of the shareholders. The Directors and officials of the Company, however, are much the same as those of the Consolidated Tea and Lands Company, Limited; and while we are calling attention to one or two weak points of the prospectus, we do not wish it to be understood that we take anything but a hopeful view of the prospects of the undertaking.

There are some faults to be found with the prospectus, and lack of information is one of them; but as this prospectus has only been privately issued to the shareholders of the North and South Sylhet companies, the Land Mortgage Bank of India, and the Consolidated Tea and Lands Company, we suppose it is a matter which more directly concerns them than the rest of the public. But for an undertaking with so big a capital we cannot help pointing out that the particulars are not sufficiently ample.

—*Bullionist*, Aug. 15

PLANTING AND PRODUCE.

TERRIBLE EFFECTS OF COFFEE DRINKING.—If there should be any difficulty in finding a supply of arguments in favour of tea drinking as compared with coffee, the Paris correspondent of a daily paper supplies a few. It probably is not generally known that coffee caused the French Revolution. But French doctors have discovered—they appear to have been some time about it, by the way—that coffee caused the excitability of the generation of writers who were the precursors of the Revolution, and of advocates who accomplished it. Voltaire and Robespierre were intemperate drinkers of coffee. Michelet says that the want of coffee, consequent upon Napoleon's Continental blockade, so depressed France as to make the return of the Bourbons not only possible but welcome. There had been for some years before a coffee famine. "Those used to coffee were out of their wits with

joy when they could have it cheap again." This line of argument is perhaps a little farfetched, but that is the fault of the French doctors who have made these important discoveries. Now is the time to push the sale of tea in France.

COFFEE PLANTING IN BRAZIL.—An official report lately issued from the Foreign Office refers to the position of Brazilian coffee and the condition under which it is grown. In his report on the trade of Bahia, covering the years 1893-95, Mr. Nicolini, the British Consul, makes some interesting remarks on the decline in the Brazilian exchange. The low rate which has prevailed for the past two or three years, he tells us, has had considerable influence in inducing capitalists to invest money in coffee plantations, the producers benefiting to the extent of about 70 per cent. on the prices in Brazilian currency realised at the recent rates of exchange, as compared with those obtained when exchange ranged from 1s 11d to 2s 3d. With regard to the causes of the decline—the latest telegraphic quotation is 9 3-16d—Mr. Nicolini says that the constant disturbances occurring in most of the Northern States, coupled with the enormous cost of the civil war which for several years raged in Rio Grand do Sul and the naval revolt at Rio de Janeiro, together with the efforts of the monarchical party towards a restoration of the Empire, have greatly tended to destroy confidence; and, notwithstanding the exceptionally enormous natural resources of the country, it is the general opinion of those most interested that for years to come exchange will fluctuate between 9d and 1s. Brazilian coffee growers, by the way, are taking measures for an active propaganda, one plan being to establish cafes and permanent exhibitions in Europe in order to demonstrate the "deliciousness" of Brazil coffee when properly supplied and prepared.

THE MYSTERIES OF THE COCOA TRADE.—At Loughborough, Leicestershire, recently, Dr. Dyer, the county analyst, stated that of the twenty-seven samples of cocoa which came before him nine consisted of genuine cocoa—that was to say, of cocoa partially deprived of its fat, but containing no material addition to its bulk. The other eighteen samples all consisted of mixtures of cocoa with various proportions of sugar and starch, the starch used being generally some variety of arrowroot. In all but three cases the fact that the articles consisted of mixtures of cocoa with other ingredients was declared on labels attached to the packages or parcels in which the mixtures were supplied. In the other three cases the admixture was either not declared at all, or not declared until after the vendor had been informed of the purpose for which the sample had been purchased. Seeing that "cocoa" was the article demanded in each case, he had in his official schedule enumerated all the mixtures as "adulterated"—i.e., as not of the nature, substance, and quality demanded, although, as already said, the fact of the admixture was in most cases actually declared by label, and in such cases the sale was not to be regarded as fraudulent. The prices of the various "mixtures" in the market were very variable, and, generally speaking, might be said to correspond fairly with the proportions of cocoa present, so that the purchaser could not be said to be defrauded in purse. It appeared desirable, however, that the public should know that in purchasing mixtures, or at any rate the lower class ones, they were buying chiefly sugar and starch, with only a small quantity of real cocoa. Sugar and starch were, of course, nutritious, and the mixtures were, in most cases, intrinsically worth the prices charged for them. Cocoa, however, was an article which was not used merely for actual food purposes, but also, like tea and coffee, for the sake of the stimulating properties which it possessed; and if the consumer was to get the full stimulating benefit as well as the mere feeding value, of a cup of cocoa, he must use several times as much of the cheap mixture as he would of pure cocoa, so that he does not gain in the end, but pays for sugar that he could just as well add himself, and for starch which is not more nutritious than bread. These starchy mixtures of course,

produce a much thicker beverage than pure cocoa, as well as a much sweeter one, and no doubt for this reason mixtures are relished by many persons; but it appeared desirable, from a dietetic point of view, that some more precise information should be given on the labels as to the proportion of actual cocoa present than is provided by the mere statement that the cocoa is "combined with other ingredients, the purity and wholesomeness of which are guaranteed in accordance with the Act of Parliament," or similar inscriptions. The best mixtures were two samples representing a well-known make of mixed cocoa, consisting of 50 per cent of cocoa from which none of the original cocoa butter had been removed, the remainder being sugar and starch (arrowroot) in equal parts. Six more samples representing other makes contained not more than 40 per cent of cocoa partly deprived of its fat, the remaining 60 per cent being sugar and starch. One sample contained not more than 30 per cent of cocoa, and two not more than 25 per cent, while five samples contained not more than 20 per cent of cocoa or less, the remainder of the sample in every case consisting of sugar and starch in about equal proportions. With a few exceptions the cocoa present was partly deprived of its fat, though in some few cases the whole of the original cocoa-butter was present. This, however, seemed to be the exception and not the rule, although one plea put forward for the manufacturer of cocoa mixtures in preference to real cocoa was that the admixture of sugar and starch obviated the necessity of removing part of the original fat. From the foregoing remarks it would be seen that in the case of cocoa mixtures it was necessary to purchase from 2 lb. to 5 lb. of the mixture, according to quality, to obtain 1 lb. of real cocoa—a fact which should be borne in mind in comparing prices.—*H. & C. Mail*, Aug. 12.

GRAPE CULTIVATION AT THE AGRICULTURAL SCHOOL.

We have today seen a sample of the grapes grown at the Agricultural School and can testify that they present a very promising appearance, justifying the Government in continuing the experiment which has been carried on during the past year. They have a nice flavour and in the opinion of connoisseurs are up to the average of grapes grown in Australia. The variety shown us is what is called the "Golden Chasselas" and the crop numbers about 250 bunches. Amongst the grapes grown is a black variety, but they are not quite mature. It is hoped, however, that they may be ready for plucking within a week or ten days. The experiment so far can only be characterised as successful and it has had the effect of encouraging others to enter upon viticulture. We trust the Government will see its way to continue the experiment which promises so well.

"NITRAGIN: AN IMPORTANT ADVANCE IN THE SCIENCE OF AGRICULTURE."

The above is the heading of a brief but important paper in the *Contemporary Review* for August, by Mr. C. M. Aikman, D.Sc. It is of more practical interest to agriculturists in the mother country, and indeed is not applicable to planting in Ceylon (unless in some parts of the lowcountry?); but its perusal cannot but prove profitable:—

Among the many important results which have followed from the brilliant researches of Pasteur, not the least interesting has been the discovery of the highly beneficent rôle performed by micro-organic life in agriculture. We now know that in nearly every department of farming the "ubiquitous germ" plays its part; and that to the presence on his farm of

different kinds of microbes the farmer is almost as much indebted as to the presence of his larger stock. The functions discharged by bacteria in the dairy are now recognised to be of the most valuable order; while in the bacteria of milk the bacteriologist is finding an ever-widening field of investigation. The various changes which that invaluable article of food undergoes are all to be traced to the action of its microbial denizens; and it is no exaggeration to say that the knowledge thus gained, during the last few years, has done much to revolutionise the dairyman's art. With the information we at present possess on this subject, there should be no difficulty in keeping milk perfectly fresh, even in the midst of summer, for any reasonable period of time. Of course this involves the expenditure of a certain amount of care, and the application of precautionary measures; but these latter are so simple in their nature that they cannot be regarded as offering any serious obstacle to their satisfactory accomplishment. The timely application of the process of *Pasteurisation** is all that is required; and we may confidently look forward to the time when, in the words of another, "the purveyor will bring his supply of milk round in bottles at any hour of the day that may be convenient, exchanging the full bottles for the empty ones, as does the vendor of beer, aerated waters, and other similar comestibles; and the housewife will keep them to use as she needs, with the certainty that when the bottles are opened the milk will be as pure and as fresh as it was when it left the cow."† We need scarcely say that such a result is calculated to increase very largely the consumption of milk by the public. It would also render its use very much safer. There can be little doubt that the well-known dangers, connected with the spread of infectious diseases, associated with the use of milk, prejudice many people against it.

But a still more striking result of the application of bacteriological science to the practice of dairying has been afforded by the recent introduction of the use of "pure cultures" of bacteria in butter-making. In this respect dairying has followed the example of brewing. Many of our readers are doubtless aware of the enormous service which the introduction of the use of pure yeast cultures has effected for this latter industry; and, while the use of pure lactic cultures in butter-making can scarcely be said to have done as much for the dairying industry as pure yeast cultures have done for brewing, yet it promises to do much to improve the manufacture of butter, and to help the dairyman to secure that uniformity of quality on which the success of his business so largely depends.

The object of this paper is to bring before the readers of this *Review* the latest application, in the domain of agriculture, of the great principle of inoculation, and which, in many respects, is of a more striking nature than anything yet accomplished by this line of research. It consists of the inoculation of the soil with pure cultures of bacteria for the purpose of promoting plant-growth. Indeed, since the introduction of the practice of artificial manuring, it seems to the present writer to be the most important advance made in the art of husbandry in recent years. The full economic value of this important innovation can only be realised by those familiar with the scientific and economic problems of agriculture; but some conception of its importance may be afforded by the statement that it offers a practical solution of the great problem of how to utilise for vegetation the boundless stores in the air of one of the most important of all plant-foods—viz., nitrogen—a problem which we may add, has long

* Pasteurisation, a process named after the distinguished French chemist, consists in the application of temperatures considerably below boiling temperature, yet sufficiently high to destroy bacterial life. Milk may be Pasteurised by heating it, for twenty minutes, to a temperature of about 150° Fahr. The flavour possessed by milk which has been boiled, so disagreeable to many people, is thus avoided by such treatment.

† Dr. Bond, in *Royal Agricultural Society's Journal*, June 30, 1896.

exercised the minds of the plant physiologist and agricultural chemist.

It is only a few months ago since an announcement was made to the German Agricultural Society that certain highly interesting experiments carried out by Professor Nobbe, of Tharand, in Saxony, a well-known and distinguished authority on plant physiology, had culminated in the production, on a commercial scale, of cultures of bacteria for use in agriculture; and that arrangements had been made with one of the largest chemical manufactories in Germany—the very same, indeed, which has already undertaken to supply the medical world with the antitoxic serum for use in the treatment of diphtheritic cases—to supply these cultures to any who might desire to use them. To these cultures the title nitragin has been given; and at the present moment many experimental trials are being either arranged for, or are in process of being carried out, with a view to test its efficacy. With the object of explaining for our readers' benefit the significance of this new development in agricultural science, a short account of the experiments which have led up to it may be given.

It is now a number of years ago since Pasteur showed that the process of the decay or putrefaction of organic matter, constantly going on on the earth's surface, was due to the action of micro-organic life. Subsequent research has demonstrated that the soil of our fields is literally teeming with bacteria, which, according to some recent experiments, may be present to the extent of *forty-five millions* per gramme (the 1-28th part of an ounce) of soil; and that these bacteria are largely instrumental in conducting to the successful growth of vegetation, by preparing, in forms suitable for assimilation by the plant, the different food substances it derives from the soil. Most of these substances are required in vegetable life in a simpler form than that in which they are originally present in the soil; and it is in converting these more or less complex forms of food material into simpler ones, that the useful rôle of the soil-microbes consists. With regard to the nature of this minute life we have but scant knowledge; but we have lately become acquainted with some bacteria which are concerned in the preparation of that highly valuable plant food, nitrogen,* in forms suitable for assimilation by the plant. It has long been known that the plant absorbs most of its nitrogen in the form of nitric acid, or, more correctly speaking, as nitrates. It has also been long well known that nitrogen, in the form of organic compounds and ammonia, was liable, under certain conditions, to be converted into nitrates in the soil; and this knowledge was put to a practical application, in the manufacture of saltpetre, in the earlier days. In the year 1877, however, it was discovered that this process, to which the name nitrification was given, was caused by the action of micro-organic life. Since the year mentioned, further research has revealed that at least two separate forms of bacteria are implicated in this process. The result of these interesting investigations has been to show that the fertility of a soil depends, to a very large extent, on whether or not it is properly stocked with the nitrification bacteria. But a still more interesting discovery was made in the year 1886, by the late Professor Hellriegel and Dr. Wilfarth, of a class of bacteria which infest certain nodules, or fleshy excrescences, to be found on the roots of leguminous plants, and which are able to render the free nitrogen of the air available to the plant.

For many years the question,—can plants utilise the free nitrogen in the air?—was a keenly debated one. The discussion of this question dates from the beginning of the present century. Elaborate experiments by French and English chemists were supposed

to have decided it a number of years ago: and it was believed, till the startling discovery already referred to was made, that plants were unable to utilise the nitrogen in the air. In justice to the distinguished experimenters* whose experiments seem in contradiction to the facts of the case as we now know them, it may be explained that their experiments were carried out under conditions which excluded the agency of bacterial life. It should also be added that the power of utilising the free nitrogen of the air only belongs to certain plants, such as clover, peas, beans, &c.—these generally grouped under the term of "leguminous crops." This interesting discovery serves to throw light on the power possessed by certain crops of resuscitating soils on which other crops had been grown, and which had thus become impoverished. Even at so remote a period as the time of the Romans this fact had been observed; and the adoption of the practice of the rotation of crops, a very old custom, may be said to be based, to a certain extent, on the recognition of the same principle. The existence of nodules on the roots of leguminous plants was a fact which had also been long known; although their true function had been for long little suspected.

The details of the process of nitrogen-fixation, as it is called, are not as yet known with any accuracy. That the organisms found in these nodules invade the roots from the soil and thus give rise to the formation of the nodules, seems to be clearly proved. There they multiply with great rapidity and stimulate the growth of the plant-cell. Living at first at the expense of the plant, as parasites, they gradually become passive and the cells then become filled with bacteroids or bacterium-like bodies. It is when this period is reached that the plant absorbs the contents of the nodules, and leaves the cells, out of which they are formed, in a limp condition. It seems doubtful whether there are several kinds of fixing bacteria, or whether the organism becomes so altered in its growth with the plant that it is not suited for promoting the growth of other leguminous plants. Whatever the explanation may be, it has been found that the organisms suitable for affecting the fixation of nitrogen for certain plants are not able to act in the same capacity for other plants.

We need not enumerate the experiments carried out to test the accuracy of the above theory. Those interested in the question we would refer to two interesting papers on the subject, in the lately issued *Journal of the Royal Agricultural Society of England*, by Dr. Miller and Dr. Voelcker. The early experiments on a practical scale were made by inoculating soils, on which leguminous crops had been found by practice not to do well, with soil from fields containing the nitrogen-fixing bacteria in large numbers. To effect this satisfactorily it was found that no less a quantity than 16 cwt. of soil had to be used per acre. This method, besides proving cumbersome, is not free from other objections, since organisms other than the nitrogen-fixing ones—organisms which may exert a distinctly unfavourable action on plant growth, as well as induce fungoid diseases of parasitic growths—may be present in the soil thus applied. Professor Nobbe consequently set himself to obtain pure cultures of the fixing bacteria by the usual bacteriological methods. Inasmuch as the different leguminous crops require, as we have already explained, either separate organisms or else different modifications of the same organism, Professor Nobbe has prepared a large number of pure cultivations suited for the commoner leguminous crops grown. These cultures are preserved in glass bottles containing *agra-gelatine*—a commonly used developing medium—and are of eight to ten ounces' capacity. They have to be kept from the influence of the light, and care must be taken not to expose them to a temperature above 98 deg. Fahr. Inoculation of a soil with these cultures, on a practical scale, may be effected in either of two ways. First, the seed of the crop it is desired to inoculate may be inocu-

* Nitrogen, it may be mentioned, for the benefit of those unacquainted with the science of plant-physiology, is for many reasons one of the most important of all plants-foods. It may be described as the regulating factor of plant growth; and the question of its supply, in forms suitable for assimilation by the plant, is, for the farmer, of the highest economic importance.

* The experimenters referred to are M. Boussingault, Sir J. B. Lawes (of Rothamsted) Sir J. Henry Gilbert, and Dr. Pugh,

lated before it is sown. This is effected by making a watery solution of the pure cultivation, immersing the seed in it, and subsequently drying it; or secondly, it may be effected by inoculating a quantity of fine sand, or earth, in the same way, and then spreading it over the field and subsequently working it into the soil to a depth of about three inches.

Naturally, a point of considerable interest is the economic question of the cost of such treatment. It is interesting to learn that this is extremely moderate, as the expense of inoculating a field in this way amounts to the very modest sum of five shilling per acre. This cannot be regarded as expensive, and contrasts favorably with the expense of nitrogenous fertilisers. No doubt there are many points in connection with this interesting discovery which can alone be answered by the test of experience. All that we can at present say is that it seems to promise great things for agriculture. It furnishes another example of the beneficent functions discharged by micro-organic life, which is in pleasing contrast to those performed by the disease-producing germs. Not more than a year ago the general application of the principle of soil inoculation was talked about as likely to be made in the future; now it is within measurable distance.

C. M. AIKMAN.

On reading the above we referred it to Mr. John Hughes (Consulting Analytical Chemist to the Planters' Association) for his opinion and Mr. Hughes—now as at all times ready to help Ceylon industries—has been good enough to reply as follows:—

"As regards *Nitragin* or the use of bacteria for leguminous crops I fear it will not apply to tea or coffee.

"You will understand that leguminous crops have been known for many years to have the property of assimilating free nitrogen from the atmosphere.

"In 1836 Hellriegel discovered that this was brought about by means of nodules which form on the roots of such crops. These nodules contained bacteria which could be specially cultivated and when associated with the *seed* or *soil* of a field tends to increase the growth of leguminous crops in soils which would otherwise not produce these crops in economic quantities.

"Of course as this peculiar development of bacteria would only produce an increase in leguminous crops, it cannot apply to other kinds of crops. Thus it would be *no use* applying the bacteria generated from nodules on the roots of leguminous crops for the purpose of increasing the growth of other crops. Hence I don't think planters can expect any benefit from the discovery."

It seems clear, unfortunately, therefore, that Ceylon planters cannot profit by "*Nitragin*" as at present described; but are there not leguminous crops of importance to the natives in the lowcountry, which may well be brought within the scope of the discovery? This will be a matter for the intelligent head of the School of Agriculture in Colombo to take into consideration, and we feel sure that Mr. Dricberg will not be behind in making experiments, nor in making the result known for the benefit of the community.

J. F.

PLANTING IN TRAVANCORE.

In the extensive area of land owned in the Kanan Devan district by Messrs. Finlay, Muir & Co. nearly 1,500 acres have been or will be planted in tea during the present (the South-West) monsoon. This looks as if labour was fairly plentiful. A small area has also been planted in Arabian coffee. The work is under the supervision of Mr. Milne, late of Warwick estate, whose headquarters at present are in the Munaar Valley.

TEA IN MELBOURNE.

Sales include 300 chests of Ceylon at 9d, 200 half-chests of Pauyongs at 6l to 7½d, and 70 quarter-chests of S. O. P. at 8½d; 500 quarter-chests Kaisow buds. At the auction on the 13th August 3,153 packages of Indian were offered, of which 632 packages were sold up to the following prices:—For Darjeeling Pekoe 7d; Darjeeling souchong 6d; Darjeeling pekoe f. 5½d; Darjeeling orange pekoe 8d; Darjeeling pekoe souchong 6½d; Assam pekoe 9½d; Assam orange pekoe 10½d; Assam pekoe souchong 7½d; Cachar pekoe souchong 6½d; Cachar souchong 6d; Terai orange pekoe 11d; Terai pekoe souchong 7½d; Dooars pekoe 10½d; Dooars pekoe souchong 7d; Kumaon orange pekoe 7½d. Biddings were not brisk, and the bulk of the lots submitted were withdrawn. At the auction sales of Indian held on the 18th Aug. buyers' ideas of value were not as a rule in harmony with those of importers; hence a large proportion of offerings were withdrawn. In all 1,172 packages were submitted, and 592 packages sold, Terai pekoe up to 6½d; Dooars pekoe 6½d; Dooars orange pekoe at 8½d; Assam pekoe souchong 8d; Assam orange pekoe 11d; Assam pekoe 11½d; Cachar orange pekoe 9½d souchong 6½d; pekoe 8d; and fanning at 6½d.—*Leader*, Aug. 27.

T E A.

Glasgow, 15th Aug. 1896.

SIR,—Your correspondent, Mr. Jas. Barlow, seems to know very little about the tea trade, and is evidently under the impression that the grocers are making large fortunes. I will enlighten him a little on the subject. Take his last quotation for an illustration, namely, Ceylon, 6 to 6 13-16ths; that is what is called in the trade short price. Add your 4d per lb. of duty and ½ per cent, then the carriage from London, which amounts to a ¼d per lb., a total of 10½d to 11½d. Now, he will buy that class of tea in any first-class grocers at 1s per lb. I have an old official London list before me dated 9th May 1896. The prices range from 3½d to 1s 10d per lb., duty, and ½ per cent over and above. If your correspondent watches the London markets, he will find quotations as high as 3s to 4s per lb., short price. I think the above is quite sufficient to set your correspondent's mind at rest. If he still thinks that there are such large profits I would advise him to start a shop, and he will find if any trade is cut keen, it is the grocery trade. To say that he can only get fair tea at 2s per lb. is absurd, as he will get a fair tea at 1s 4d per lb. from any first-class grocer.—I am, &c.,

TEA MERCHANT.

Glasgow, August 15, 1896.

SIR,—Mr. James Barlow and the public in general seem to look on the tea world as a world of mystery. As one who lives by it, and unfortunately has a great deal of tasting to do, I would like, had I the ability to write down my thoughts, to bring the question down to the level of the ordinary untrained mind. Common Congee tea is the cheapest put on the market, and can be had wholesale in Glasgow at about 4½, on which you have to pay 4d per lb. of duty, and carriage from London. This tea is not sold retail in Glasgow. Indian is 7½d to 8d short price (that is without duty and carriage); Ceylon 6d to 6½d s.p. From many grocers you can buy Indian, Ceylon, or Indian and Ceylon blended at 1s, duty paid, retail. This tea is fairly strong, sweet and quite palatable. At 1s 2d and 1s 4d D.P. you can get a finer grade of the same class of teas. These teas are good enough for anybody who wants strong tea with a fair flavour. In fact, it would please anyone who has a plain, ordinary palate. Teas that are sold retail from 1s 6l to 2s are on the same lines as the 1s 4d, but are finer in quality, thicker, and have more flavour. I might say in passing that teas from 1s 4d to 1s 6d are the best value in the market. The reason is that the great tea estates in India and Ceylon produce greater quantities at this than any other price, hence the wholesale buyer has a large selection to choose from. But I would like you to understand that there

are tea drinkers and tea drinkers—people that are pleased with cheap tea know nothing of the pleasure of a good cup of tea. If you would excuse a vulgar comparison I should compare tobacco and tea. The man that smokes a fine delicate cigar could not tolerate the flavour and strength of common twist, nor could the great mass of men, who enjoy their smoke of common twist, be bothered with the delicate cigar; they want something that will pinch the tongue. In the one case the palate is cultivated, in the other destroyed. The smoker of common twist has so destroyed his palate that if the tobacco does not bite his tongue he does not enjoy his smoke. It is the same with tea. You can take my word for it; if you give the price your grandmothers gave you will get the tea they drank. A fine tea is one full of flavour, quality, strong and juicy, and can't possibly be had anywhere under 2s 6d to 3s per lb. retail. I hope I have cleared the air for Mr. James Barlow and others.—I am, &c.,
Glasgow Herald, Aug. 8. YOUNG HYSON.

NOT MADE IN ASSAM.

No. 27 of the "Agricultural Ledger" is an exceptionally interesting one. It contains a review by Dr. George Watt, Reporter on Economic Products, of the recent correspondence on the Letpet tea and the tea plant of Burma. The number may be said to summarise the arguments that have been used on one side and the other with reference to the connection of the Burma plant with that grown and cultivated in Assam. Mr. C. W. A. Bruce, writing on the subject last year, stated that "all the extensions of the Assam gardens have been planted with Chindwin seed for the last ten years at least." Commenting on this Dr. Watt questioned the accuracy of the observation, unless Cachar alone was referred to by Mr. Bruce. The new tea gardens and extensions of the past ten years were, he continued mainly in the so-called "Indigenous Assam" obtained from the Assam tea-seed gardens. Dr. Watt's opinion was subsequently borne out by that of Mr. J. Buckingham, Chairman of the Assam branch of the Indian Tea Association, who wrote: "Some Chindwin seed may possibly have come in to Assam under the name of Manipur Tea-seed, but I think I am within the mark in saying that certainly under ten per cent, probably not more than five per cent, of the clearances have been opened out in the Assam valley with this seed."

The weight of opinion would, therefore, appear to be decidedly against the Assistant Conservator of Forests in Upper Chindwin on this important point, and his other statement affecting Assam, namely, that there is no indigenous (wild) tea to be found in the country west of the Irrawaddy, is also subject to criticism. This, of course, touches on the old controversy as to whether tea is indigenous to Assam. Dr. Watt sums up the matter by saying, "All writers are agreed that it is indigenous to the tract of hilly country that constitutes the border land of Assam and Burma with China." The methods of preparation employed by the natives of this country may, Dr. Watt thinks, interest as well as amuse planters on this side of the Irrawaddy. At the same time he would not be surprised if the system of steaming the leaves were found adaptable to the European method of manufacture. The following description of the Shan process is given by Mr. W. A. Graham, who, when he speaks of "Leppet" tea, probably, means "Letpet." The word by the way, is said to be a corrup-

tion of "Let-tit-pet," meaning one hand, the fanciful name given to the preparation from some legend associated with its introduction into the Shan country. Mr. Graham tells us that the "leaves, while still green, are boiled in large, narrow-necked pots made for the purpose. When thoroughly boiled the contents of the pots are turned into large pits dug in the ground. These pits are square, and about six feet deep; the sides and bottom are lined with thin walls of plantain leaves, which keep the tea pure from contact with the earth. The pit being full of boiled tea and the juices from the pots, a top made of plantain leaves is placed over it, and earth is piled above it, big stones and other heavy weights being finally placed on top." For some months the tea remains in these pits, being thus preserved. Then when the trading season comes on the pits are opened, and the tea is sold to traders who convey it by bullock caravan to the market at Mandalay. The tea loses weight in transport, but this circumstance is compensated for in a very simple way. On reaching the market the traders throw the baskets for a day or two into the nearest stream. The article regains its lost dampness, and the weight is the same as when it was originally purchased. Mr. Graham adds that in Upper Burma and the Shan States this tea is largely consumed as a drink, but that in Lower Burma it is eaten. "Leppet," he says, is a traditional food among the Burmans, playing an important part in ceremonies connected with birth, marriage and death.

Mr. J. C. Murray, Deputy Conservator of Forests, Mn Division, says the practice is to steep the leaves in boiling water for a short time only. The leaves are then taken out, and, after being rolled by hand on mats, are allowed to cool. "The next process is to ram the leaves down right into the internode of *wabo* bamboo, a wooden ramrod being used for the purpose. A stopper is then made of jack or guava leaves, and the bamboos with the *letpet* are stoppered up." Ashes are put in at the top of the bamboo in order to prevent insects getting to the *letpet*. The people in these parts are, it appears, very badly off, and cannot afford to keep the *letpet*, but sell it for what it will fetch—which no doubt accounts for the fact that *letpet* from the Shan Hills east of the Irrawaddy sells for double the price of the Maingthon *letpet*. The villagers attribute the superior price of the one article to the fact that the Shans east of the Irrawaddy steam the leaves while those on the western bank boil them. The latter have, of course, a traditional reason for employing the boiling process. About three centuries and a half ago a Shan woman who had married a native of the trans-Irrawaddy district, was about to accompany her husband to his home when some neighbours observed that she was carrying off a number of tea seeds. It was seen that if tea culture were introduced on the western side of the river the Shan industry would have to face an undesirable competition. The woman was, therefore, only allowed to take the seeds away on giving a promise that any tea made on the western side should not be steamed, but boiled. She took an oath to this effect, and called down curses upon the head of anyone who broke the undertaking. The people on the west bank, therefore, boil the leaves to this day, under the impression that if steaming is resorted to it will be the worse for them. These are only a few of the many interesting features of Dr. Watt's latest paper.—*Englishman*, Sept. 1.

THE NEW DIRECTOR OF THE ROYAL BOTANIC GARDENS.

Dr. Trimen's successor will be well on his way to Ceylon before these lines come before our readers. Mr. Willis was to have left London by the Orient ss. "Orotava" on the 21st August. We have had some pleasant correspondence with Mr. Willis; but were unable to meet him in London before his departure. At Cambridge, however, where Mr. Willis is well-known and much esteemed, we learned a good deal about the new Director, and all telling in his favour as a practical as well as scientific Botanist, and one well-fitted to do justice in the responsible post he is called on to fill for the Ceylon Government and public. After a distinguished career at the University Mr. Willis went to Glasgow where he has given great satisfaction in his post as Botanical Assistant at the University and very much extended his experience and knowledge. Mr. Shipley, Science Lecturer, connected with Christ's College, Cambridge, spoke in high terms of Mr. Willis, and told us about a very useful Pocket Cyclopædia of Botany (to be published in connection with a series of which, we believe, Mr. Shipley is editor) for the compilation of which Mr. Willis is mainly responsible. Mr. Shipley, in fact, was expecting final "proofs" back from Naples. Professor Marshall Ward who knows well, from personal experience, the kind of man wanted at Peradeniya, had only good to report of Mr. Willis and his fitness to succeed Dr. Trimen. He thinks Mr. Willis's Encyclopædia will prove a very useful little work, and its value had, possibly, something to do with the appointment to Ceylon. In economic matters, there is every likelihood of Mr. Willis proving equal to the occasion; while he will certainly do all in his power to get quickly acquainted with local conditions and requirements. Finally, some one remarked to us in Cambridge:—"Do not make a mistake through Mr. Willis's apparently juvenile appearance, because he looks like 19 or 20, in place of his 28 to 30 years." Mr. Willis is in attainments and experience quite up to his years; and long may he retain his youthful appearance, say we, although we daresay Ceylon will soon effect a change. At any rate, no one in the island is likely to take objection on the above score; and we bespeak for Mr. Willis a hearty welcome on the part of the Ceylon public and especially the planters, as well as from his official superiors.

J.F.

THE "MAZAWATTEE" TEA COMPANY.

At the present time there are ten companies with out number. Almost everyone drinks tea—in point of popularity it stands head and shoulders above every other beverage. Next to tobacco, indeed, it yields the largest customs revenue. Speaking roughly, the country makes about £5,000,000 off tea every year, spirits coming next, and wines next.

Mr. John Lane Densham is verily a King of commerce, since he shares with his brother the task of ruling over the destinies of the "Mazawattee" Tea Company. The house of Densham—started by Mr. John Densham's father thirty-three years since—is an old and respected one. For years the Denshams sold tea and coffee (wholesale) just like anyone else, but 12 years ago they were struck by the quality of the tea which came from Ceylon. They were the first of all their fellows to recognise what Ceylon might develop into as a tea-growing country.

THE ORIGIN OF "MAZAWATTEE."

So, selecting the yields of the best Ceylon gardens only, and allying them with the choicest teas of India and China, they obtained a blend of ex-

ceptional value, exquisite in flavour and aroma a blend grateful to the palate, and of uniform strength and quality, which they called "Mazawattee" (pronounced "Mazawotty.") Advertised right and left, and pushed with the greatest vigour "Mazawattee" soon became the best-known tea in the three kingdoms, to say nothing of the principality of Wales.

"Mazawattee" caught on. If it had been a bad tea people wouldn't have paid the price demanded for it, no matter how much it had been advertised. The public soon distinguished between a commodity that is of real, and a commodity that is only of meretricious, value. But the Denshams' blend was good.

"The Ceylon tea planters," said Mr. John Densham to the writer, "look upon us as the best friends they ever had. Our action, you see, caused a revolution in the tea trade. The China trade is now as near as possible (so far as the English tea trade is concerned) a dead letter. Some old stagers drink China teas but the rising generation hardly dreams of touching them."

Mr. Densham here got out a great ledger.

A FEW FIGURES.

"I want to show you a few figures," he said, "which will prove to you how wonderfully the consumption of Ceylon tea has increased since we first drew the attention of the public to it. In 1884-85 Ceylon exported 2,500,000 pounds of tea, and China 139,000,000 pounds. In 1884-95 Ceylon exported 71,000,000, and China only 46,000,000 pounds. Thus, in ten years, the consumption of Ceylon tea has increased by 72,000,000 pounds, while that of China has decreased by almost 100,000,000 pounds."

From which figures it is evident that if the Messrs. Densham went out to China as missionaries their lives would not be worth many moments' purchase.

"And where," we enquired, "does the discarded China tea find a home?"

"The best of it," was the reply, "goes to Russia, the inferior sorts to other European countries, and the commonest of all to Canada and Australia."

WHAT THE NAME MEANS.

"How did you come to fix upon the name 'Mazawattee'?" was our next question.

"It is a curious jumble formed from several Cingalese words," explained Mr. Densham; "it is meant to denote a standard high-class brand. I need hardly tell you that from the very commencement rival merchants have been endeavouring to copy it. We are constantly opposing names which bear too great a similarity of ours. Among imitations that we have had to squash are Myawattee, Nysowatte, Mallewattee and Ganmazzi. We had to stop the last-named because to the trade our tea is largely known simply as 'Maza.'"

Asked to supply the names of any famous folk whom he supplies with Mazawattee, Mr. Densham explained that in order to do this he would have to send a circular letter to his agents, "since ours is an entirely wholesale trade. But," he added, "I can tell you this, and you can take it for what it is worth. Our agent at Hawarden only sells Mazawattee. I mustn't commit myself. *Mr. Gladstone may or may not drink us.* How can I say? I can at any rate," he went on, "testify to the fact that at least one member of the Episcopal Bench drinks 'Mazawattee,' for not very long ago we received a visit from the Bishop of Gloucester who told us that when at home he invariably drinks our 'four-shilling' tea, and so, when he came up to London and found that he could not get it at his hotel, it struck him the best thing he could do would be to come and buy some himself. Of course we would not hear of his paying for any, but, later in the day, sent him a present consisting of a 6lb. tin of his favourite blend. Our 'four-shilling' tea, I should tell you, is very popular. Curiously enough, we send an enormous quantity of this tea to such wide apart places as Finland and Cape Colony."

£25 10s. PER POUND.

Mr. Densham has still got some of the tea which the company gave such a fancy price for a few-years ago,

By way of satisfying our curiosity he took a square wooden box out of his desk, and opening this, displayed to our view a very fine, light, golden-brown blend of tea, with an enchanting aroma. "Only twelve pounds left now," he said. We bought fifty pounds of it at £25 10s. per pound. Most of it we sent about in small quantities to our agents for 'exhibition' purposes. After great pressure for a sample we sold half-a-pound of it to an Australian merchant for £15."

Mr. Deusham next touched on the pictorial advertisements which have done so much towards making "Mazawattee" a household word. The majority of these have been executed by well-known artists—among them Fred. Morgau, G. Sheridan Knowles, R.I., and Ambrose Dudley. Who is not familiar with the picture of the dear old lady drinking her "Mazawattee" by the side of a great-grandchild who has mischievously donned her aged relative's spectacles? Another famous Mazawattee picture is borrowed from the "Vicar of Wakefield," and represents Olivia showing her mother the love-knots in her cup. The fact that Mazawattee Tea recalls the delicious blends of thirty years ago is so well-known that Mr. Densham quite apologised for introducing the fact into his conversation.

80 TONS PER DAY.

One might ramble, during the whole of an absorbingly-interesting afternoon, through the famous Donsham warehouses on Tower Hill. The walls are of an astonishing thickness. There are eight floors to the warehouses. On one we watched the great revolving mixers, each capable of holding about a ton of tea; lower down were gigantic reservoirs into which the blended tea passes after having been thoroughly mixed above. In close proximity to the reservoirs long lines of boys ("we do not employ a single girl in the whole place," explained our guide), were filling tins and packets with a rapidity that clearly manifested that they were "paid by the piece." Still lower, the engine-room presented a wonderful sight. Three enormous gas-engines, capable of producing something like 110 horse power, are used for turning the "mixers" which are studded all over the building. When the tea-mixers are running at full loads their capacity for blending is something like seventy to eighty tons of tea per day.

A special block of the massive Tower Hill warehouses is laid out for "Mazawattee coffee." The extensive coffee "plant" is driven by electrical power.

The "Mazawattee" printing works are situated in East Smithfield, and the offices proper are in Eastcheap. The "Mazawattee" employes compose quite a formidable army, and it is hardly necessary to point out that the generals commanding it are two of the clearest-headed men in this London of ours.—*Success*, Aug. 15.

PALLEGAMA GRANT ASSOCIATION OF CEYLON, LIMITED.

The ordinary annual general meeting of the Pallegama Grant Association of Ceylon, Limited, was held today at noon, in the office of the Agents and Secretaries (Messrs. Buchanan, Frazer & Co.). The Hon. W. W. Mitchell, presided and present were:—Messrs. E. Rosling, A. Rosling, D. R. Buchanan, W. Bowden-Smith (representing W. S. Bennett) and Mr. Gordon Frazer as a shareholder and as representing the the Agents and Secretaries.

The SECRETARY (Mr. Gordon Frazer) read the notice calling the meeting, and minutes of last ordinary meeting, which latter were confirmed.

THE DIRECTORS' REPORT.

The CHAIRMAN submitted the report of the directors for the past year which is in the following terms:—

The Directors have pleasure in submitting the balance sheet and profit and loss account to 30th June 1896, duly audited.

During the past year 210 acres have been felled and planted, which brings the total area now under cultivation up to 503 acres.

The growth of liberian coffee and coconuts is encouraging, although depredations by wild animals still continue to give some trouble.

The Directors and the Agents and Secretaries have agreed to waive their fees for the past year.

In terms of the articles of Association all the Directors retire, but being eligible, offer themselves for re-election.

The meeting will also have to elect an Auditor in the place of Mr. J. Guthrie, who retires, but is eligible for re-election.—By order of the Directors,

BUCHANAN FRAZER & Co.,
Agents and Secretaries.

Colombo, 15th August 1896.

In moving the adoption of the report, the CHAIRMAN said:—As the report has been in the hands of the shareholders for some time, and as it is not a very long one, I presume it may be taken as read. I cannot say I have very much to add to the information that has been given in the report, but, with your permission, I will read extracts from a report of the Superintendent of date 5th September, which brings us well up to date:—

COCONUTS.—Individual coconuts have all been fenced in and are looking well. Plants in the "98 Acre Field" are much more sturdy than those in the "North East Field." The reason for this is that they were younger plants when put out, neither had they such heavy shade in the nursery. There are, I regret to say, many vacancies, but with careful supplying and fencing in, I hope to have those clearings even by the end of the year. It is useless planting coconuts down here unless they are fenced immediately they are planted, otherwise wild animals will not give them a chance. During the drought watering has been resorted to in some parts of these clearings, principally in "The Bungalow Field."

LIBERIAN COFFEE.—I am pleased to say that "The Forty-five-acre Clearing," planted in November and December last, has stood the drought well without being watered and looks most promising. There are very few vacancies. In the best parts the plants are from 18 inches to 2 feet high. The growth is not so good in the hollows, but will greatly improve when they are drained, which work I hope to commence next week.

CACAO.—This product has not stood the drought well, but, having been constantly watered, it has pulled through. Taking the 13 acres all over, I should say there were 30 per cent. of vacancies. The "Four-acre Field" is decidedly the best, most of the vacancies being in the nine acres.

NURSERIES.—1½ bushels of Liberian seed has been received from Wiharagama estate, and is now in the Nursery. This I expect to be ready for planting out in November. 6,181 coconuts are in the nursery to date and 6,400 more are now on the way down from Rattota. Till within the last fortnight, I have not been able to induce the Matala or the Rattota carters to cart to Leloya, and the tavalams all having had murrain the transport of these nuts has been delayed a month and the nuts that are now arriving would not be ready for planting out, at the earliest, before the end of December.

TIMBER.—A contract has been given out for the felling, squaring and transport of 100 tons of ebony delivered in Matala. About 30 tons are now ready to be transported and I am expecting the carts down daily.

I do not know I have anything else to add beyond pointing out to the shareholders the exceptional difficulties that have had to be contended with in opening new land in such a district, so inaccessible, and where the difficulties of transport are so great. We have every reason to believe that Government will render substantial assistance this year in bridging the culverts between Pallegama and Elleheira, and also we are looking forward to having a ford constructed over the Ambanganga. This is a river in flood at certain times of the year and at other times with hardly any water in it at all, and the Director of Public Works believes a ford would

be least expensive, and most suitable, in the meantime, at all events; and I can only hope that Government will see their way to expend some of the money that has been indicated as the cost of the ford. With these few remarks, I beg to move the adoption of the report.

Mr. W. BOWDEN SMITH:—If this is the proper time for asking questions, and I am not out of order I should like to ask one or two questions: first, as to whether the district has become more healthy now it has been opened up; and second, as to whether there is any improvement in the labour supply.

The CHAIRMAN:—I am glad to say the district has become much more healthy. All the superintendents we have had—and we have had a number before the present one—were being constantly laid down with fever and had to be removed. The Superintendent who is now there, and who has been there for a considerable time, I believe I am right in saying, has not had an attack of fever.

Mr. W. BOWDEN SMITH:—I suppose since it has become more healthy the labour supply has improved?

The CHAIRMAN:—The labour supply is fairly good and we have enough for our requirements. There have been only three deaths during the last year.

Mr. W. BOWDEN SMITH:—It is wonderful that it is so healthy. I gave it about four years before it would have become so healthy a place. I shall be happy to second the adoption of the report.

Mr. E. ROSLING:—I may mention that one of the three deaths in the labour force was due to a hospital falling down. That was hardly due to climatic causes.

By W. BOWDEN SMITH:—There is no tea planted there at all, I presume it is chiefly coconuts. The report does not show what the acreage planted in different products is. I think it would be an improvement if the report gave the acreage of each crop. It is valuable information to the shareholders to know how much there is of each product.

The CHAIRMAN:—That is a matter that will receive attention. We have had a good deal of trouble with wild animals. We have had to fence in almost everything and their depredations have become a regular pest, though, I suppose they will be got rid of in time (Continuing) the Chairman said:—Mr. E. Rosling has supplied me with the information necessary to answer the question regarding the acreage under different products. In coconuts there are, approximately, 393 acres; in coffee 94 acres; and in cocoa 13 acres.

The report was then formally adopted.

RE-ELECTION OF DIRECTORS.

Mr. BOWDEN SMITH:—I have much pleasure in proposing the re-election of the retiring Directors:—The Hon. W. W. Mitchell, Mr. E. Rosling, Mr. E. Gordon Reeves and Mr. A. Rosling.

Mr. GORDON FRAZER:—I second the motion. The retiring Directors were re-elected.

APPOINTMENT OF AN AUDITOR.

The CHAIRMAN:—The next business is the election of an auditor. Mr. John Guthrie is the only applicant for the post.

Mr. GORDON FRAZER:—I propose that Mr. Guthrie be appointed auditor for the current year at the usual fee of R100.

Mr. A. ROSLING seconded, and the motion was unanimously adopted.

A vote of thanks to the Chair, proposed by Mr. W. BOWDEN SMITH, terminated the proceedings.

THE GOVERNMENT CINCHONA PLANTATIONS IN MADRAS.

The Administration Report of the Government Cinchona Plantations in Madras for 1895-96 is of particular interest, for in the first place it is a record of the first year when the whole output of the quinine factory was disposed of—in fact, more than disposed of, former stocks of the sulphate having to be drawn upon; and, secondly, appended to it is the Report made on these plantations by Brigade-Surgeon Lieutenant-Colonel W. G. King last year, a summary of which is given on another page. As a good deal has been written in our columns concerning the appointment of Mr. Standen to the Directorship of the Cinchona Plantations—or the Cinchona Department as it is now called—Dr. King's views in the matter are of interest. It must be remembered that they were written over twelve months ago in the prospect of the late Mr. Lawson's retirement at the end of the official year. Dr. King, having laid down that the officer selected to succeed Mr. Lawson should be an educated man, with a sufficient knowledge of agriculture and horticulture, both theoretical and practical, proceeds to say:—"It might and I dare say would be impossible to get a man with a special knowledge of cinchona cultivation;" clearly meaning that if such a man, suitable in other respects, were available, he would be the right person for the post. Knowledge of the culture of cinchona, Dr. King considered to be more necessary for the new Superintendent than a knowledge of chemistry. He further wrote:—"One qualification which the Superintendent of these plantations should most certainly possess is a capacity for estate management and for the organisation and control of labour." From these remarks it will be seen that the Madras Government, in appointing Mr. Standen to the Directorship, was only following the advice given by the Government expert specially deputed to report on the subject. Mr. Standen's qualifications tally with every one of those specified by Dr. King, who, moreover, deemed it a most important point for the future management of the plantations to secure a continuity of policy. This was also assured by the appointment of the present Director. For many years he had been a near neighbour and close friend of the late Mr. Lawson; he was acquainted with his methods of work and knew his views and opinions regarding the administration of the plantations. We remarked some weeks ago that the appointment of Mr. Standen was an admirable one, an opinion which we now find fully confirmed by Dr. King.

Some interesting information regarding the financial result of the working of these plantations is furnished by Dr. King. It appears that according to the Accountant-General's calculations, the total cost of the estates, plus annual interest at 4½ per cent., amounted to Rs. 13,04,360 at the end of the official year 1875-76. During the seven succeeding years such large quantities of bark were sold in England that the surplus of receipts over expenditure totalled in round numbers R18,39,000, so that at the end of 1882-83 there was, after fully allowing for interest, a surplus of R5,34,640. After this date a steady loss resulted. The net receipts for the next twelve years, ending 1894-95, fell short of the expenditure by R2,81,644, so that on the 31st March, 1895, the balance in favour of the Cinchona plantations was reduced to a little over 2½ lakhs. Dr. King, we notice, proposes to write off R2 lakhs of this credit balance for

interest during these twelve years, though by what manner of book-keeping any interest can be shown to have accrued in this period when a large sum was continuously standing to the credit of the plantations, we fail to understand. The estates should have been earning a considerable sum of interest on their unexpended balance all this time. The Madras Government has apparently accepted Dr. King's figures. Whether we write off these R2½ lakhs profit as due for interest or let them stand as clear profit does not signify, for this important fact remains. On the 1st April, 1895, Government owned, free of all cost and charge, 800 acres of cinchona, a quinine factory in good working order, to say nothing of bungalows, stores, cooly lines, tools, cattle-grazing grounds, &c. "The estates," wrote Dr. King, "are in my opinion a valuable property." The property in itself, quite apart from the cultivation and factory, we may add, is very valuable. At any moment now Government can capitalise and retire from the active life of a cinchona planter and quinine manufacturer, with a comfortable little sum to its credit, gained in this very unconventional branch of administration. We do not desire Government to retire at the present time; but we do wish to most distinctly emphasise that it is in a position to retire at any time now to its pecuniary profit.

We have already mentioned that the sales of quinine during the year under review exceeded the output of the factory. The actual amount sold was 5,644 lb. sulphate and 2,666 lb. febrifuge, against 3,600 lb. and 2,284 lb. in the previous year. These figures are most satisfactory and bear eloquent testimony to the splendid way in which the late Mr. Lawson had worked up this branch of the business. We merely record these figures here; Government issues a paper annually detailing the manner in which its quinine is distributed, and when this comes to hand we shall have an opportunity of going more fully into the figures. In the Administration Report, the full value of their sales is credited in last year's accounts although the output of the factory fell short of the sales by some 2,000 lb. of sulphate and 400 lb. of febrifuge. Naturally a profit is shown, which is set down at R26,135-2-8. Government in its order, states that it "notes with satisfaction that the net result of the operations (during the year under review) was a gain of about R26,135." This does not say much for Government's criticism of the figures. We will give exactly the net results of the operations in 1895-96. The amount of bark harvested was 229,700 lb., the amount treated in the factory was 233,800 lb. For all practical purposes we may say that the whole of the year's harvesting went through the factory. The result of this was 3,600 lb. of quinine which realised R53,600, this after making due allowance for the proportion sold to Government institutions at R14 per lb. and to private parties at R16 per lb. There were also manufactured 2,284 lb. of febrifuge, value R22,840; so the total value of the year's output from field and factory was R76,440. The expenditure for the year aggregated R82,560, consequently the net result of the operations was a loss of R6,120. We are fully aware that it is possible to argue that extraneous circumstances accounted for this small deficit. At the same time, we do not believe that any explanation can be forthcoming to show how this deficit could be turned into the substantial profit, which, regarded from a commercial standpoint, should have resulted. Government occupies the dual position of cinchona planter and

quinine maker, and in both cases is situated almost favourably. As cinchona planter, it is able to dispose of the whole of its produce straight from the field. There are no transport expenses, or expenses for baling and shipping; freight, marine insurance and London charges are also saved, and Government's margin of profit is consequently far larger than the ordinary planter's. In a similar manner as quinine-maker it is spared all the expenses on the raw material between the market and the factory, and it is moreover able to dispose of as much of the manufactured article as it turns out at the same wholesale price as Messrs. Howard and Sons. We do not write with any technical knowledge of quinine making, and it may be that the utilisation of waste products and the facilities for obtaining chemicals places a European factory in a more advantageous position than one in India. But the fact remains that a concern, able to do without the middleman either in the purchase of the raw material or sale of the manufactured article, and situated close to its source of supply and in the centre of the markets it feeds, occupies a most favourable position. Presuming that Government pays no more for its bark than do the London and continental manufacturers, there should be a large profit annually on its operations.

The accounts furnished with the Administration Report are tabulated in such a manner as to supply the least information possible to the outside public. Were these plantations the property of a private Company, the accounts of cultivation and of manufacture would be kept separately, and establishment and superintendence fairly apportioned between the two. This item is and has been an exceedingly heavy one, and in the year under review out of a total expenditure of R82,560, no less than R34,429 appears under "establishment including Superintendent's salary." Now that the appointment of Government Quinologist has been abolished this expense will be lightened but it will still remain heavy. The one thing we wish more particularly to know is what does the factory pay for its bark per unit? The figures we have quoted seem to point to a considerably higher price than the one ruling in the London market, or, to put our meaning in other words, there is reason to believe that Government can buy its bark cheaper in the open market than it can grow it. That this is not unlikely may be gathered from the fact that Mr. Lawson considered two-fifths of the plantations hardly worth cultivating, and Dr. King confirmed his view. Theoretically Government has no more right to cultivate cinchona and make quinine than it has to grow barley and brew malt-liquors. Practically the two cases are not on the same footing, and so long as the quinine is distributed among a fever-stricken population, who could not otherwise obtain the drug, so long, we maintain, is Government justified in its action. But at the same time the work must be carried on on strictly commercial principles, and the annual accounts ought to be drawn up in the same way as though the undertaking were in private hands. The most important work in the future will lie in the field rather than in the factory, and requires the services of a practical planter. The art of successful planting lies in obtaining the maximum crop with the minimum expenditure without any deterioration of the plant. To this end a planter continually works and it is only long experience that ensures success. Unless the very closest supervi-

sion is maintained over the cultivation for the next few years we shall either see the plantations kept up at a cost which entails an annual loss, which is not justifiable, or else neglected with the result that there will be a serious deterioration in their value, which would be deplorable. There is a happy mean between these two courses ; we have no doubt about it ; and we are equally certain that only a person experienced in the cultivation of cinchona will be able to pursue it so long as the market price of the unit of quinine remains at its present low level.—*M. Mail*, Sept. 4.

RHEA CULTIVATION.

According to last year's report of the Agricultural Society of India, the cultivation of rhea has been taken up extensively in Lower and Eastern Bengal, and on many tea gardens in Assam. No less than eighty-seven persons made three hundred and seventy-one references to the Society for information regarding cultivation, manufacture, and machinery, but the greatest secrecy has in all cases been maintained, both as regards localities where rhea is cultivated, and the markets to which the fibre is supplied. It is to be feared that many contemplate taking up the cultivation of the plant in very unfavorable districts. It is curious to note that the references now being made to the Society regarding cultivation of fibrous plants, etc., are identical with those submitted thirty and forty years ago. Some very fine samples of uncleaned, cleaned, and bleached ribbons and floss have been submitted. In some cases it has been mentioned that there are buyers in Europe of bleached ribbons at £45 to £50 per ton, and £30 per ton for degummed fibre.—*Indian Agriculturist*, Sept. 1.

GERMAN SANDALWOOD OIL.

Whatever may be the excellence of German cedar, it appears that sandalwood oil "made in Germany" does not meet with much appreciation in the East. At first, its cheapness brought it into some vogue in Western India ; it seemed to be the right thing, and substantial profits accrued to its importers. But discovery was made before long that the scent had far less permanence than that of oil made from Mysore sandalwood. The latter lasts for years, and comes in very usefully to impart the peculiar perfume to other woods used in Bombay art work. There is, of course, something of fraud in that, but it is of very ancient origin, and only the guileless believe that article labelled "sandalwood" are always genuine. The enterprising Teuton, however, apparently came to the conclusion that there was room for still further sophistication, and, acting upon that appetising notion, supplied himself with inferior sandalwood from other countries. Whether he added other ingredients may be left an open question ; possibly, the knowledge of applied chemistry on which he prides himself, with such good reason, may have come to his aid in this matter also. At all events, it is officially reported by the Mysore Forest Department that the introduction of this German decoction diminished, for a time, the sale of the genuine article. But the latest report from Bombay states that the spurious oil has largely gone out of favour among merchants who have had experience of its inferiority, and we may take it, therefore, that imports will grow small by degrees and very beautifully less.—*Globe*, Aug. 22.

THE CUTCH FORESTS OF UPPER BURMA.

The people of Upper Burma are beginning to realise what a mine of wealth lies in the catch forests, and they run the risk of punishment by illicit traffic in the product. The last Forest Administration Report shows how cleverly the Burman works, and how lenient are the magistrates in dealing with him. He invariably sets up the plea that he has simply cut down catch trees to make a clearing for cultivation, and, it is most difficult to obtain good evidence against him. In the Western Circle the number of offences is steadily increasing, and until forest reservation has been carried out on a large scale matters will continue in an unsatisfactory state. The Conservator points out that the catch exports from this circle are worth eleven lakhs per annum, and that the Government are losing a large amount of revenue owing to the widespread evasion of the regulations. Moreover, it is remarked that the people are now claiming as private land large tracts over which they never dreamed of asserting their rights before, and these claims, if not upset, are likely to give much trouble hereafter. It is suggested that the only effective measure would be the absolute prohibition of catch-boiling on private land, until it has been decided what is private land and what is not. It is not only the villager who sets the law at defiance, but the licensee also. The demand for catch is so great, and prices run so high, that the men who take out licenses are tempted to make illicit profits. The forfeiture of bonds of R1,000 each has followed in cases of detection, and this should have a wholesale effect. The ordinary offender usually gets off with a small fine, if he is convicted at all, and this he pays quite willingly, as his gains are large. It would seem that the magistrates err on the side of leniency, and the catchthief is encouraged in his evil courses. The Burmans give trouble also in the matter of forest-fires, and great efforts are being made to save valuable teak forests from damage due to incendiarism or to carelessness of people in camp. In the Minbu Division the forest staff have had an unpleasant experience, as the Tichaugwa reserve was twice ravaged by fire, and in one instance the villagers refused to give any help in checking the flames. There is evidently much to be done in Upper Burma before the forests can be properly protected, and the Government have acted wisely in increasing the establishment which can make protection real and effective.—*Indian Agriculturist*, Sep. 1.

WANARAJAH TEA COMPANY.—We heartily congratulate the shareholders upon receiving a dividend of 20 per cent for the past year, and trust that the returns may long continue to be as satisfactory as those which were presented at the meeting today. The directors are justified by results in having so much confidence in manuring, and it is to be hoped that the liberal outlay which they propose to continue to make on this work will prove as satisfactory as it has done in the past. The figures given by the Chairman are interesting and instructive as showing the progress that has been made in the field of crop, and the prospects for the future are very hopeful indeed, leaving out of sight, of course, the coffee yield which is diminishing at such a rate that it is expected to disappear altogether shortly. The estates are admirably managed, and the Company's affairs well looked after by the agents and secretaries.

COFFEE PLANTING IN SOUTHERN
ASIA AND THE NEED OF IM-
PORTING "LADYBIRDS" TO
CLEAR AWAY INSECT
ENEMIES.

It was suggested in these columns very recently, that the comparatively few coffee planters or proprietors in Ceylon now-a-days should unite with their brethren in Southern India, the Straits and Java to commission Mr. Kœbele once more to visit Queensland and bring over another consignment of "ladybirds," the enemies of all varieties of "bugs" and other evils on coffee. It was pointed out that the importance of taking care that no parasites accompanied the tiny bug-eaters, almost necessitated the employment of some one as experienced and skilful as Mr. Kœbele, and he has clearly expressed his readiness to serve planters in Southern Asia as he has already done the fruit-growers of California and the planters of Honolulu. In a letter dated 14th August from Devonshire, Mr. E. Ernest Green supports the proposal as follows:—

With respect to your remarks on Mr. Kœbele and the ladybirds, I agree with you that we should find it difficult to raise by ourselves a sufficient fee to compensate Mr. Kœbele for his trouble: but I note in last No. (July) of *T.A.* that the Nilgiri planters are moving in the matter and petitioning Government for assistance in procuring the beetles. Could we not make a joint fund—which, with some possible added assistance from the two Governments, might make it worth Mr. Kœbele's while to help us in the same way that he has already helped the Californian fruit-growers and the coffee planters of the Sandwich Islands? As you suggest, Java and the Straits planters might join too? It is all on the way.

In another column will be found a communication from a correspondent adverse to the introduction of the ladybird, but in view of all the scientific evidence we have heard in favour of it, we are still inclined to the opinion that in the interests of "coffee," the Secretary of the Ceylon Planters' Association might approach the representative body of Southern India as well as those of the Straits and Java, to sound them as to co-operation in so eminently commendable an enterprise, and if the planters do their part, we may feel safe that the authorities will not be behind in giving some aid; while we might also expect the steamer Companies concerned to be specially liberal towards an undertaking, which, if successful, is calculated to revive and extend an industry that did so much for Eastern freights in days gone by. It only remains then that a start should be made, and obviously that ought to come from the Ceylon Association if Mr. Philip, under the sanction of his Committee can find time to add to his many good deeds by sounding the sister Associations in the other coffee countries named on this subject of a proposed mission for Mr. Kœbele.

THE LADYBIRD A HUMBUG.

(By a Correspondent.)

Notwithstanding the interesting comments of the absent editor, backed by a brace of specialists, I am very much disposed to think the ladybird is a bit of a humbug, and, for any practical purpose, valueless, for Ceylon.

This I say deliberately after several years' observation in Australia, where I saw more scaly bug than ever I found elsewhere in the world. That the ladybird feeds upon bug, plant-lice and other enemies of planters and gardeners everybody knows who has taken the trouble to study

the habits of the pretty little creatures, but that their appetite is so voracious—or that they would multiply to such a degree as to clear Ceylon of green bug, seems extremely improbable. Of course the brief report of Mr. Kœbele that the few coffee trees in Honolulu are "now practically clean" looks encouraging, but we must not shut our eyes to the fact that from elsewhere we have the best authenticated reports of her ladyship's complete failure to answer the purpose for which she was introduced at considerable expense. Take the following from the *Ontario Observer*, May 30, 1896:—

While it has been given a fair opportunity to demonstrate its worth as a scale devourer, yet its failure has been sufficiently marked in this county, as to render its efficacy a matter for serious doubt. But it would be unwise not to give it every possible show to vindicate the claims of its friends, but pending such experiments the work of fumigation should be vigorously prosecuted in all infested orchards. Then

Commissioner Van Kirk of Riverside county, in his annual report, says of the work of this ladybird in his district:—"This parasite has been fostered and pushed upon the growers, with the understanding that as soon as colonized, they need have no further fear of the ravages of the black scale. Hence they have been given full sway in several sections and the results (where they have been depended upon entirely) have proved almost a failure on the orange trees. On the olive trees their work is more satisfactory, but is hardly sufficiently marked in any line to justify us in giving them any further consideration.

And finally read what the *Ojai* of July 4th saith:—

When the ladybird was introduced in the valley, it was proclaimed that we had secured an ally which, alone and single handed, would speedily remove the pest from our orchards. For a time the ladybird did her work with satisfaction. But she has gone off duty, with no immediate prospect of going on again. * * The ladybird is not the exterminator she has been "cracked up" to be. She does n't extirpate the fungus. She devours the precise number of scale that suits her appetite, and she then ceases to devour until a strange feeling comes over her and reminds that she is again hungry. * * We said formerly the ladybird to be worth her weight in gold. We still give her credit for being worth her "scale" weight in silver at 1 to 2. But we have become conservative in our opinion as to her ability to totally destroy the scale. She is an enemy of the scale and consequently our friend. We want to give her full credit for all she does. Yet we feel that, after all, she does only as much in the way of freeing our orchards of the scale as does the gopher snake toward removing from the earth the gopher, the cat the mouse, and the birds the insects. * * It is a duty each grower in the valley owes all the other growers to send the Board of Supervisors a sample of his schiography on that petition.

After which it will probably occur to the judicious planter that it would be unwise to incur any extraordinary outlay in that direction.

With regard to coffee leaf blight and its sequel green bug, my impression is that so long as there is a coffee tree in the island there will be leaf disease. If it were possible to pass an edict to stamp out every coffee tree and keep them out for a few years, then it might be re-introduced with some hope of success, as the fungus must die as did the potato blight when deprived of its natural food. Whether it would return again is another question. The occasional return visits of the potato fungus have never however been so serious as the first infliction in 1846.

Few have a greater respect and admiration for the labours of professor Marshall Ward than I have, but the question is did he suggest anything to "ward" off the disease?

The life history of *Hemileia Vastatrix* is all very interesting, but it is its *death* we most desiderate.

The life history of influenza or smallpox would be of small account without a suggested remedy.

The poor Matabele chieftains as they struggle manfully against the British brigands might be interested to the life history of their enemies, but they naturally desire something more than this. They have their fly but that seems not sufficient to protect them. Neither will the ladybird save our coffee bushes. A poor result surely of all our boasted researches and resources if at this time of day all we can do is to simply place our implicit faith in a pretty little beetle!

THE SUPPLY OF PEARLS.

When we speak of the profusion of jewellery at the present day we refer to diamonds. Other gems are scarcely more common than formerly, excepting those of a low class such as garnets, topazes, peridots. Fine pearls, they say, are not to be procured. Why does not Spain work that enormous bank which stretches hundreds of miles to the north east of Borneo, now that she has possessed herself of the Sulu Islands? Its wealth is beyond dispute. For ages it has been the last resource of ruined gamblers and desperate men who braved the risk of working there—upon the high road, as one may say of the pirates; and if they saved their heads they commonly retrieved their fortunes. "The pearl banks," says Sir Spencer St. John, "are perhaps more numerous there than in any part of the world, and if properly developed would no doubt be exceedingly productive." When Mr. Edwards was Governor of Labuan, he bought a pearl found there "which was pronounced by all who saw it in the East as the best that had ever been brought under their notice." Historic specimens have been traced to the spot. The terrible Labuan pirates are homeless wanderers now. The Sulus are subject of Spain. But, still, so far as we have heard, no European has visited those banks.—*Torres Straits Pilot*, Aug. 8.

BETEL BLIGHT.

Dr. George Watt, who was deputed to enquire into the cause of the blight which attacked the betel plantation in Eastern Bengal, has completed an exhaustive Report on the subject, which will shortly pass through the press. He has ascertained that the blight is caused by a very low parasitic organism which by some specialists is considered an animal, by others a vegetable growth. No satisfactory remedy has yet been discovered.—*Madras Mail*, Sept. 7.

NATAL TEA GARDENS.

We recently had occasion to mention the interesting fact that coffee planting was a growing industry in the Shire Highlands of South-East Central Africa. In this marvellous continent the cultivation of tea has not been neglected, and a certain measure of success has attended tea planters in Natal, which might easily have been greater had the Government extended its assistance to them, had they not been quite so jealous of each other, and had they named their teas properly and sent only the superior sorts to market. Despite these drawbacks they have managed to do fairly well, although those who are acquainted with the size of Indian and Ceylon gardens will, doubtless, smile when they learn that there are barely 3,000 acres of land under tea cultivation in the entire colony, and that the number of tea gardens is five. It is only since 1891 that tea cultivation in this part of the world

has made any perceptible progress, although a commencement was made so far back as 1882. The tea district lies within six miles of a place called Stanger, amid beautiful scenery and a fine view of the sea can be obtained from many points in the plantation. As regards the total output of tea from the colony for the present season, the Tropical Agriculturists states that the result will be below that of last year. In December, 1895, the colony experienced sad disaster in the burning of the large central factory at Kearsney, by which one hundred thousand pounds of tea was destroyed at the same time. It cannot after this loss be responsible for more than 300,000lbs. for the season of 1895-96, and so the total crop of Natal tea this season will not be more than 700,000lbs., but next year they hope to reach so high as one million pounds weight. The greater portion of this tea is consumed in Natal itself. Fields, further ahead, to the South and inland, are yet practically untouched; but those who would secure them must do so at once, as the industry with all its drawbacks is rapidly spreading. It must, however, be some consolation to Indian and Ceylon growers to learn that their own trade does not appear likely to suffer from this competition, for Johannesburg does not take to Natal tea, and it is mentioned that Indian and Ceylon teas are getting very firmly established in all parts of South Africa. Like other planters, those of Natal are troubled concerning their coolies. Their discomfiture does not appear due to the causes that vex and irritate planters in this part of the world, but to the cost of coolie labour which is far too expensive, and no wonder if the coolies are imported from India. It is very interesting to hear of this budding industry, but it is somewhat doubtful whether it will ever attain sufficient proportions to be included as an important factor in the tea trade of the world.—*Madras Times*, Sept. 5.

INDIAN PATENTS.

Specifications of the undermentioned inventions have been filed under the provisions of Act V of 1888:—MACHINE FOR PLUCKING OR CUTTING THE LEAVES OF THE TEA BUSHES.—No. 349 of 1895.—Henry Fischer, manager of the Central Duars Tea Co., Ltd., in the Alipur Duar sub-division of Jalpaiguri, Bengal, for a machine for plucking or cutting the leaves of the tea bushes and for collecting the same. (Specification filed 9th June 1896.)

THE KLANG PLANTING AND ESTATE SYNDICATE (LIMITED)

has been registered, by Timbrell and Deighton, with a capital of £6,000 in £1 shares. The object is to enter into an agreement with J. R. Rodgers, and to carry on business as tea, coffee, cocoa, tapioca, and pepper planters and growers in the Straits Settlements or elsewhere. The directors are to be elected by the signatories. Qualification, £100. Remuneration to be fixed by the company. Registered office: 25, Bochurch-lane, E.C.—*L. & C. Express*, Aug. 14.

CEYLON SETS AN EXAMPLE TO SOUTH INDIAN PLANTERS.—The *Madras Times*, after quoting remarks made by Mr. Rogivue's recently published letter regarding Ceylon tea in Russia adds:—Remarks of this kind should be of interest to South Indian planters, who are understood to have recognised the necessity of developing all available markets for their Tea and Coffee. It is to be hoped that, like their Ceylon brethren, they will provide funds sufficient to back up enterprise, and will thus find a way to improve the already large demand for their products. The example that Ceylon Tea has set in Russia and in America is a capital one, and the progress of Ceylon tea there should be closely observed by South Indian planters.

PLANTING AND PRODUCE.

TEA AND THE REVENUE.—In their annual report for the year ending March 31, 1896, the Customs Commissioners take the opportunity of endeavouring to cool the ardour of those who advocate a free breakfast-table. The consumption of tea has developed still further, there being an increase of 4.4 per cent. "over the produce of this source of revenue in 1894-5," but the excess in the consumption reaches the handsome total of 9,192,066 lb. This advance, it is pointed out, is "very remarkable in the absence of any reduction in the rate of duty, especially when it is noted that in 1890-1, following the reduction of the rate from 6d to 4d per lb. the adjusted the figures, showing the estimated true increase of consumption, recorded an advance of only 11,053,000 lb. in the quantity used." The Commissioners suggest apparently that it is not worth while to reduce the duty any further when the nation goes on drinking tea at such a gratifying rate.

THE SAME STORY.—Consular reports from China have but one tale to tell about tea. The British Consul at Amoy says: "The tea season of 1895-6 has, owing to the unfortunate war, with Japan, been fraught with many vicissitudes, and must, on the whole, be regarded as an extremely unsatisfactory one to all engaged in it, foreigners and natives alike. The season in Tamsui opened in April—an unusually early commencement, due to the island being threatened with an attack by the Japanese. All concerned in the trade were anxious to get their teas away for fear that war and its attendant troubles might possibly prevent shipment. This naturally tended to high prices and hasty preparation. In the meantime the consuming markets failed to respond in any way to the high prices paid in the East for early teas, but rather, on the other hand, have fallen below their previous level, and were dull and dragging for the Formosan staple throughout the year, and the losses on shipments are supposed to be not inconsiderable. Chinese holders in Amoy were not willing to face the losses entailed upon them, and at the close of the year were left with a stock of 166,000 half-chests on their hands, a state of affairs unprecedented in the history of our trade. Now that Formosa is ceded to Japan, the future of the Amoy-Tamsui trade is a source of considerable anxiety to those engaged in it, and divergent opinions exist as to whether the first-mentioned port can still remain (as it has done for the last 25 years) the practical headquarters of the Formosa tea business. The Amoy tea districts, which likin and excessive export duty have thrown out of cultivation, and have almost depopulated, are amongst the finest in the world, and with the enlightened methods of cultivation adopted in India, Ceylon, and Japan, and such limited taxation as exists in these countries, need fear no rival. Now that, at our very doors almost, Japan is about to conduct tea cultivation on enlightened lines, surely the time is ripe for China to follow suit, abolish likin and export duty, and admit machinery. Twenty-five years ago 3,000,000 dols was the annual income of the Amoy tea districts; today it is not 350,000 dols. Likin has done it. The quantity of Amoy and Formosa tea for the year 1895 was:—Amoy teas 2,124,400 lb.; Formosa teas, 16,170,667; total, 18,295,067 lb."

COCOA AND COFFEE.—Cocoa and chocolate continue to be in increased popular favour. Ten years ago they brought in £73,593 to the Exchequer. In 1885-96 their yield was £124,745, an increase of 76.9 per cent while the estimated growth of the population during the same years has been about 8.6 per cent. Coffee has been less in favour than it was last year, and very much less than it was in the earlier years of the century. Its gross yield in 1895-96 was £170,959, or £2,301 less than in the previous year. In 1840 it yielded £921,000, so that the change in the popular taste has been very marked indeed.

NATAL PLANTERS AND THE LABOUR QUESTION.—Planters everywhere have their little troubles, and those in Natal are not exempt. A telegram from Cape Town says that "The Natal artisans are agitating against the continuance of protection for tea

and sugar because the sugar planters have tried to introduce Indian artisans." We presume the term artisan is a courtesy title for coolie labourers.

THE INCREASE IN THE CONSUMPTION OF TOBACCO.—The use of tobacco is shown to have been gaining ground. That the receipts from the duty on tobacco rose in 1894-95 by £296,810 above those for 1893 94 admitted of being explained as due to the check caused by the great coal strike in the earlier year. But in the receipts for 1895-96 there is no such allowance to be made, and they increased by no less a sum than £336,730, amounting in all to £10,933,413. The total amount of tobacco in all its forms—raw, manufactured and cigars—on which duty was paid in 1895-96 was 67,551,95 lb, as against 65,528,385 lb. in 1894-95.—*H. and C. Mail*, Aug. 28

VARIOUS PLANTING NOTES,

TEA CULTIVATION IN SOUTH AFRICA.—From contemporaries we see that some interesting samples of tea from Natal have reached London—entered for competition at the Pietermaritzburg Agricultural Exhibition and sent to London for adjudication. They are superior in quality and value to those hitherto seen, and resemble Indian tea of good medium grade, without the same distinctive strength or flavour, and in some respects like high-grown Ceylon tea. They come from estates situated close to the sea-coast, their elevations ranging from 100 to 500 feet above sea level; the unusual rainfall being about 48 inches at the lower level and about 49 inches at the higher. The temperatures are stated to be as follows. In winter at sunrise 50° to 56°; at 11 a.m. 80° to 84°. In summer at sunrise 64° to 70°; at 11 a.m. 92° to 96°. The estates are well wooded and watered. There is a ready sale for the produce locally, and as it is good and palatable, and has the benefit of the protective import duty levied on tea in South Africa, it may be assumed that this Native industry is a profitable one, though, in the absence of details respecting cost of cultivation and manufacture, this cannot be stated definitely. It is not considered probable that it can be exported with profit in view of the low price of tea in all the markets.

CAMPHOR CULTIVATION IN INDIA.—Attention was drawn the other day to the favourable prospects that seem to be before camphor cultivation in India, if it could be successfully started, owing to the increase in the value of the commodity and the exhaustion of the supply, which portends that the rise in price will continue. From an interesting extract which the *Pioneer* publishes out of an old Report of the Chinese Imperial Customs, it appears that so far back as 1869 the decline in the productiveness of the Formosa forests owing to the wasteful methods by which the camphor was obtained, had been attracting notice; and it is therefore pretty clear that the present high prices are not due to the disturbed state of the island, though this may have temporarily aggravated matters, but have a deeper foundation. In 1869 camphor was obtainable in Tamkui at 7-80 dollars per picul (133½ lb.); in the last Hongkong price currents it is quoted at 86 dollars. The destruction of the trees has now been going on for so many years that unless the Japanese come to the rescue very speedily, they will find before long that the camphor export trade which has been the great stand-by of their new possession is a thing of the past. Meanwhile, says our contemporary, this is clearly a case where the Indian Forest Department should see whether they cannot anticipate the future which seems likely to offer such a great opportunity. Experts are inclined to believe that in Sikkim especially the *cinna-momum camphora* would flourish magnificently.

Correspondence.

To the Editor.

CITRONELLA CULTIVATION IN THE SOUTHERN PROVINCE.

DEAR SIR,—Your correspondent's note in regard to the above in a recent issue is misleading in that he quoted only a *portion* of Mr. Elliott's report—giving the extent in the Galle district at about 1,702 acres—and omitted the important fact that in the *Matara* district Mr. Elliott states the extent is no less than 17,352 acres, and that citronella boiling apparatus have increased in number from 290 in 1886 to 476 in 1896. The latter too are many of them of much better make and larger size than in 1886, I understand, and able therefore to turn out a much larger quantity.

It may interest your readers moreover to learn that the grass now so extensively cultivated is somewhat different from that originally used. The leaf is much narrower and the general appearance very like the *mana* grass found on *patanas* upcountry. It is said this variety is much more hardy and requires less care than the old-fashioned citronella grass. The latter is still cultivated by Messrs. Winter & Son at *Baddegama*, and is said to yield a superior oil and one which commands a higher price.

The cultivation as carried out by natives entails very little outlay, unless there is competition for the land, which is frequently the case, but Rs2 an acre is freely given if necessary. The cost of manufacture is also small; the used grass being dried and utilised as fuel and the ashes applied again to the soil. Very large sums of money have been realized during the recent boom in prices by producers, and though the price has since fallen, the production has by no means ceased, nor will it prove unremunerative as long as it brings 50 cents a bottle.—Yours faithfully,
S. MELLIS.

THE LIMITS OF SMALL BREAKS OF CEYLON TEA.

Kandy, 21st Aug. 1896

SIR,—At the request of the Committee I enclose for publication copy of correspondence between the Ceylon Association in London and the Tea Brokers' Association of London on the subject of the increase of the limits of "small breaks" of Ceylon tea at public sale in London.—I am, sir, yours faithfully,
A. PHILIP,
Secretary to the Planters' Association of Ceylon.

(Copy.)

Mincing Lane, London, E.C., 3rd July 1896.

A. Philip, Esq., Secretary, Planters' Association, Kandy, Ceylon.

Dear Sir,—I have the pleasure to enclose copy of correspondence with the Tea Brokers' Association of London on the subject of the increase of the limits of "small breaks" of Ceylon tea at public sale in London.

As the proposed increase may take effect from 1st October next, the correspondence should be published without delay for the information of Ceylon shippers.—I am, &c.,
(Signed) WM. MARTIN LEAKE.

(Copy.)

The Tea Brokers' Association of London, Dunotter House, Mincing Lane, E.C., 26th June, 1896.

W. Martin Leake, Esq., Secretary, the Ceylon Association in London.

Dear Sir,—I am instructed by my Committee to forward to you the enclosed copy of letter addressed to it by buyers of Ceylon Tea, and to inform you that at a meeting held today it was unanimously resolved to recommend the increase of the size of "small breaks" to 18 chests, 24 half-chests and 40 boxes to take effect from 1st October next.

My Committee considers that the large increase in the import of Ceylon tea fully justifies the proposed alteration which, in all probability, would be attended by the attainment of better prices in consequence of a longer time being available for valuation.

I am also to ask the special attention of your Association to the paragraph relating to the sale of duplicate invoices on the same day which, in the opinion of the Committee, it is very desirable to avoid.—I am, &c., (Signed) W. C. PRICE, Secretary.

(Copy.)

Ceylon Association in London,
4, Mincing Lane, 2nd July 1896.

W. G. Price, Esq., Secretary, Tea Brokers' Association of London.

Dear Sir,—I have laid your letter of 26th ult. before my Committee. The recommendation for the increase of the limits of "small breaks" of Ceylon teas to 18 chests, 24 half chests and 40 boxes is approved provided that satisfactory arrangements can be made for the "small break" sales at some time other than immediately after the "large break" sales.—I am, &c.,

(Signed) WM. MARTIN LEAKE, Secretary.

(Copy referred to.)

12th June 1896.

To the Tea Brokers' Association.

Gentlemen,—We the undersigned, buyers on the Ceylon tea market, beg to call the attention of your Committee to the urgent necessity of taking steps to increase the size of the small breaks for public sale to at least the same limit as now prevails in Indian tea on the following grounds.

1. The increasing difficulty, if not impossibility, of accurately valuing so many samples for one day's sale.
2. The saving of time to be effected in the auction room, which would be invaluable to all concerned, and would admit of buyers being able to have their purchases sampled and sent out on the same evening.
3. The extra expense and labour involved in sampling so many small lots after purchase, and in furnishing samples of them all to our agents.

We desire also to take this opportunity of expressing our opinion that the number of grades into which Ceylon tea is sorted might advantageously be curtailed, more especially as regards the produce of the smaller gardens. We also think that the smaller gardens might be advised not to despatch their produce more frequently than once a fortnight, instead of weekly, and we also deprecate the practice adopted by some, even of the larger gardens, of offering duplicate invoices on the same day.

(Signed by) Peak Bros. & Winch, Ltd., Appleton Machin & Co., Joseph Tetley & Co., I. J. Batten & Co., and 38 other firms.

RAPE SEED.

Sept. 4.

DEAR SIR,—Can you or any of your correspondents give me any information about rape seed and the production of rape-seed cake for manuring purposes? Would rape flourish at a high elevation, how long does it take to crop, and where can the seed be procured from?—Yours faithfully,
PACHCHEI,

CEYLON TEA IN RUSSIA.

PROGRESS REPORT BY MR. ROGIVUE.

From Mr. Philip, Secretary to the "Thirty Committee," we have received the following copy of a letter from Mr. M. Rogivue reporting further with reference to his work in pushing the sale of and advertising Ceylon tea in Russia:—

(Copy)

Maroseika House, Lebedieff.
Moscow, 18/30th July 1896.

A. Philip, Esq., Secretary to the "Thirty Committee," Kandy, Ceylon.

DEAR SIR,—I beg to confirm my last respects of the 6/18th June. Everything is now in order at the Nijni Novgorod Exhibition, and I think that no one can visit that place without seeing something about Ceylon tea, and all who have been there to whom I have spoken tell me that it is so. The double pavilion, which everyone who enters the Exhibition must pass, is very handsome, and, being quite a different style from any other building in the place, is bound to catch the eye. In the grounds of the hotel, to which our pavilion forms the principal entrance, is a large museum, immediately behind our place, where a mechanical organ plays most of the day to attract people's attention, and when the passers-by look round, as almost without exception they do, they see our pavilion and archway with "Ceylon Tea" in huge letters on it; and it is quite remarkable to see how many stop to have a good look at the place and read our signboards, etc. I have already had many inquiries from dealers in the country who have visited the Exhibition and tasted our Ceylon tea there, but, until the annual fair, which opened on the 15/27th inst. is more frequented, there will not be many merchants about the place. Every day, however, numbers of the general public come to try the tea; and the man, the young lady and the boy whom I have in charge of the place are all smart enough and able to talk with would-be customers very persuasively. The man who had formerly been in a tea business, speaks well Russian, German, and French. I had him for some time, before going to Nijni, in my place here, tasting with me, learning the chief features about Ceylon tea, so that he is well qualified to look after the place when I am not there. At first owing to slovenly work in the painting and finishing of the pavilions, I had a great deal of unpleasantness with the contractor, but by sticking to it and constantly standing over the workmen I got all I wanted done and well done. I am having photos taken and will as soon as possible send you copies, but I wish some Ceylon people would visit the Exhibition and see for themselves.

In addition to the advertisement already mentioned in a previous letter, on both sides of an electric car inside the Exhibition, I was able to secure at exceptionally low terms, besides placards and transparencies inside all the cars, the whole side on two other cars where the words: "Drink pure Ceylon tea; economical; the best tea in the world," etc., in large white letters on a red ground are to be read. As these trains run continuously the whole day round and round the grounds along the principal pathways and past the chief entrances of all the different sections, people must continually see "Ceylon Tea" and these words in its praise before them.

I have had a large number of new "brochures" specially printed (exemplary enclosed) to be freely distributed by hand among those entering the Exhibition, also at the Fair and in the Pavilions.

One big poster, 7 ft. by 7 ft. bearing the word—"Tea from the Island of Ceylon. Apply to M. Rogivue, representative for Russia of the Ceylon Planters' Association, Moscow, Maroseika House, Lebedieff. Tasting and free distribution at the Nijni-Novgorod Pavilion close to the Exhibition"—I have had made on metal and placed in a splendid position in the town near the approach to the bridge on the river Ora connecting the town and Fair and where all going from one place to the other must pass.

As I told you before, I have placards in the windows on the walls of several of the chief hotels and restaurants and have arranged with some of them for the supply of Ceylon tea. In the Nijni newspapers I am having frequent advertisements inserted during these three months of the Exhibition and Fair. Thus all the plans I made for advertising Ceylon tea at Nijni this year are now in working order and as good in every way as I could, with time and personal attention, make them; but owing to the exorbitant prices for material and labour ruling there this year, which were quite unprecedented in the place, I have had to spend a great deal more than the sum granted to me by the "Thirty Committee" for the purpose. I think, however, the result should justify it, as far as the increased knowledge of and demand for Ceylon tea goes. To continue advertising and pushing pure Ceylon tea in the way I have been doing, I shall require more assistance,—not only pecuniary but also working assistance. I have read in my Ceylon paper lately several suggestions that more money should be spent in Russia, and somebody in addition to myself, be appointed to do the work. Whether the "Thirty Committee" hold this opinion or not I cannot say, but it struck me that if a man with the necessary qualifications could be found and your Committee wished to spend more money on the work, something might be done by his travelling and working in co-operation with me. If a Ceylon man so much the better, but without some knowledge of Russian and the ways of the country it would be a pure waste of money, speaking from my own hard experiences during the past six years.

Since Mr. Dowling joined me, it is true, I have been much freer to get about, but someone to visit the more distant places would certainly be an advantage.

If your Committee wish to adopt more expensive measures for pushing Ceylon Tea here I am prepared to lay my plans before you on more extensive but similar lines to those I have hitherto found successful and would include one or more special travellers.

I think you cannot deny that for the money expended through me you have got good measure, for not only has every penny been spent actually in advertisements, without any personal or management expenses, (beyond certain travelling charges specially incurred), but I have also added a considerable money of my own and I do not think anyone can say that the result has not been satisfactory as far as the demand for and import of Ceylon Tea into Russia in any criterion. I do not think anyone has better facilities or more qualifications for doing the work you require than I have now for the best advantage of Ceylon whose interest I have never placed second to my own since I was requested by the Ceylon Planters' Association to do what I could in Russia for them, with the result that a great part of the business accruing through my advertisements goes to other firms dealing in Ceylon tea, as it is that and not M. R.'s tea, I always make the object of my advertisements, as you know, a result, perhaps, not bad for Ceylon, but which retards what I looked to as the reward of my hard work; i.e. the establishment of a well-known and successful business in Ceylon tea which would also be one of the most convincing advertisements for your produce in this country. It has been evident to me all along that the only way to introduce Ceylon tea here was to create the demand among the general public by giving them the opportunity of trying it for themselves and procuring a supply, as the established tea firms would have nothing to do with Ceylon tea and I did not wish to, but have on the contrary greatly opposed it. My plans have, however, been so far successful that many of the former detractors of Ceylon tea have been obliged to deal in with the result the figures of which you already know. I hear from all sides here that the demand for Ceylon tea, and import of it into Russia, has greatly increased this year, but unfortunately it is impossible to get any figures from the Customs, all tea being classed together, whether it be China or Ceylon, or other sorts, under the general heading of "Tea." Speaking the other day with the agent of the English Lloyd, who is also the British Consul here, he told

me that he was much astonished to note the large proportion of Ceylon tea imported this year by Russian firms in Moscow who insure through him.—I remain, etc.,
(Signed) M. ROGIVUE.

SIR H. JOHNSTON ON CENTRAL AFRICA.

The Report by Commissioner Sir H. Johnston on the trade and general condition of the British Central Africa Protectorate, for the year ending March 31st, has been issued as a Parliamentary paper. The writer estimates the population of the Protectorate at 844,955, composed of 259 British subjects, 30 non-British Europeans, 263 Indians, 23 half castes, and 844,429 natives. The latter represents a considerable increase over former years and the Commissioner divides them among six tribes. He reports that satisfactory results have been met with in employing natives of India, as men better able to stand the climate, in minor capacities where in previous years it would have been necessary to use more highly paid Europeans; and he wishes that Indian traders who are not satisfied with their condition in the Transvaal and Natal would give British Central Africa a trial. The year 1895-6 had been exceptionally bad for health among Europeans and Indians, owing to an epidemic of malarial fever which had ranged as far as the Zambesi valley. Black-water fever was responsible for many deaths, and no other disease was so serious in its effects on the European settlers. But Sir H. Johnston thinks that when a railway is constructed from Quilimane to Blantyre they will hear very little more of the unhealthiness of British Central Africa. On this general subject he observes:—

“Undoubtedly another cause of ill-health here is the increasing consumption of alcohol, which is too obviously prevailing amongst many of the more recently arrived Europeans. The chief bane of British Central Africa is that accursed spirit whiskey. Good wholesome wine and light lager beer do no one any harm, and taken in moderation probably do good; but whiskey is always noxious, and in this climate consumed daily in considerable quantities, even though much diluted with water, is singularly prejudicial to health. I concentrate all my abuse on this one form of spiritous liquor because scarcely any other is drunk except in small medicinal doses. Brandy is imported, for use as medicine, but rum, gin, and other spirits are scarcely used at all. It is whiskey which is at the bottom of much of our ill-health; it is whiskey which is answerable for many of our deaths. I do not mean to say that a man who eschews the daily use of whiskey or any other spirit thereby enjoys immunity from malarial fever; such is not the case, as I can unfortunately assert in my own experience; but what I would like to impress on those who are studying African questions is this—that the man who does eschew the drinking of spirits in Africa is generally much better able to resist the effects of malarial poisoning, and recovers very markedly and rapidly from often severe attacks of malarial fever, whereas the individual whose system is permeated with alcohol has hardly a chance when attacked by severe fever. Paternal legislation is generally of little use, but if there is one point more than another on which I should like to act tyrannically, on behalf of the general welfare, it would be the total exclusion from tropical Africa of any form of spirit, but a little good brandy, which should only be imported by qualified medical men for the use

of their patients. I certainly would not exclude wine or beer, though I think stout and the heavier English beers are unwholesome. The moderate use of good wine of all kinds and of lager beer is distinctly beneficial to health.”

Upon the subject of trade, the Report speaks most favourably:—

“Trade in British Central Africa has markedly improved during 1895 and the first quarter of 1896. The total trade of the Protectorate during the year 1895-96, in imports, amounted to 82,760*l* in value. The imports during the preceding year (1894-95) amounted to a total of 73,667*l*., independently of the goods imported by the administration (which were about the same value as those brought into the country in the year now passed). There has thus been a slight apparent decrease in imports, though, as before explained, this is actually converted into an increase, if the approximate sum of 10,000*l*. in specie be added. The diminution of imports has been under the following heads:—Alcohol, hardware, soft goods, and machinery. The total value of the exports from the British Central Africa Protectorate during the year ended March 31, 1895, amounted to 9703*l*. Consequently, there has been an increase in exports during the year just ended of about 9965*l*. The chief increase in exports has taken place in ivory, of which nearly 9000*l*. worth more was exported in 1895-96 than in 1894-95. In coffee, the increase in export has been about 3200*l*. in value. The export of rubber, oil seeds, beans, and wax has markedly increased during the year just ended; while on the other hand, the output of strophantus drug has greatly diminished. Coffee planting is likely to be our main staple of trade. Satisfactory experiments have been made in the cultivation of cotton on some of Mr. Sharrer's estates. Mr. W. Thiselton Dyer, of Kew, reports that cotton equal in quality to the sample sent would be worth in the English market about 4*d*. per lb., or 39*l*. to 40*l*. a ton. Tobacco is being grown with increasing success by the firm of Buchanan Brothers. Tea is being introduced by some Ceylon planters into the Mlanje district. It is already grown to a small extent by Buchanan Brothers. Quite recently an English firm have given their attention to the valuable fibres produced in British Central Africa by three species of liliaceous plants of the genus *Sansevieria*, viz.:—*S. sulcata*, *S. cylindrica*, and *S. guineensis*. The *Sansevieria* grows in great quantities on all the barren, stony ground of the Protectorate, at low levels, especially on the rocky islands in Lake Nyasa. A machine has been invented which is able to turn out enormous quantities of fibre from this plant in a very short space of time, and it would seem as if the barren ground of the Protectorate would prove to be of almost equal value to the rich coffee producing tracts, since this fibre is worth nearly 40*l*. per ton. Moreover, the *Sansevieria* is of most easy propagation, requires little or no attention, and in three years from the time of planting is ready to reduce to fibre. It is a curious-looking plant, with long, narrow, thick, and fleshy leaves, which latter can be cut in pieces and easily rooted. Besides the *Sansevieria* there are numerous trees and plants which produce fibre of more or less value. Another product which I hope will be greatly developed in the future is india-rubber, which is produced from three species of *Landolphia*, one or more species of *Ficus*, and by a shrub recently discovered and named *Tabernamontana elegans*. Limestone of excellent quality has been found in many parts of the Protectorate where it was not previously known to exist, and the Administration has under-

taken a good deal of lime-burning for its own building operations and also for sale. The native now turns out excellent bricks, which he sells with advantage to the European for building purposes. Important discoveries of guano have been made on the island and islets belonging to Great Britain on Lake Nyasa."

The Commissioner considers that the general condition of the Protectorate is now markedly satisfactory. A sense of peace and security has settled on the natives which has never before been known. They are leaving the chilly hill-country and settling in the warm plains which they love, feeling that they have now nothing further to dread from the attacks of foreign slave-raiders, or from the more turbulent among themselves. This consummation is what the British authorities have all along striven to bring about, viz., the abandonment on the part of the natives of the crags and mountain fastnesses where they could barely grow enough food for their own subsistence, and their placing of the rich, hot, unhealthy plains under cultivation.

Three appendices to the Report are devoted to the subjects of big game, coffee planting, and missions. Upon the first subject the Commissioner says:—

"The best time for sport in British Central Africa is between the months of June and December, and all sportsmen would do well to try the Elephant Marsh, near Chiromo, before they venture farther inland, as it is possible they might make sufficient bags of game in this portion of the Ruo district without going to the further expense and risk of penetrating far into the interior of Africa. Chiromo can be reached direct by river steamer from Chinde in a few days, and is therefore, within little more than a month off England. No difficulties are at present placed in the way of big game shooting, except as regards elephants, rhinoceroses, and the almost extinct giraffe, which are, to a certain extent, protected by a licence having to be taken out for killing them. This licence lasts one year, and costs 25l."

The appendix devoted to Missions gives the history of the Universities Mission, and the later settlements of other Societies, and concludes as follows:—

"No person who desires to make a truthful statement can deny the great good effected by missionary enterprise in Central Africa. There are some missions and some missionaries out here of whose work nothing but praise can be uttered, though much just criticism might be written on their mode of life, which, in some instances, is singularly and needlessly ascetic and uncomfortable. Asceticism is all very well in a wholesome part of England, or in an equally healthy North African desert; but any attempts to live carelessly, uncomfortably, and too frugally in the exceedingly unhealthy climate of central Africa must sooner or later result in the permanent disablement of the missionary's health or his death, and can serve no useful or Godly purpose whatsoever. The missionaries at one station at least eat bad food badly cooked and the rude houses in which they live are, with the exception of the quarters assigned to the ladies, unfit even for a native's occupation. It is pathetic to see highly educated men from Oxford and Cambridge hollow-eyed and fever-smitten, crouching in little huts which no native chief would deign to occupy. They are guided in so doing by a false principle that the funds of the Mission, which are not large, should be devoted entirely to mission work, and that little

or no money should be spent on 'comfort.' I wholly disagree with them. I think that if Europeans are expected to live in Central Africa, and to carry on an active work, whether it be educational, religious, commercial, or political, they should first of all be comfortably housed, and, secondly, they should eat the best of food, cooked by the best of cooks. If they will do this then they may just hope to be able to spend ten or fifteen years of their life in Central Africa without serious deterioration of their health. The next criticism which I might offer on missionary life and conduct almost ceases to have any actuality; it would be to remark that in many cases they have been too apt to throw themselves into politics, native and external, and to wield the great influence they possess over the natives so as to constitute themselves a power in the land, with a self-assumed right to interfere in all questions of administration. This phase is, however, rapidly passing away, and was a not unnatural result of the entire want of Government which subsisted in British Central Africa until its constitution as a British Protectorate. About mission work in other parts of the world I have no direct knowledge, but I can say of all mission work in British Central Africa that it has only to tell the plain truth and nothing but the truth to secure sympathy and support.—*Standard*, Aug. 29.

JADOO FIBRE.

An esteemed correspondent in England has drawn our attention to a new substance of extraordinary value in which plants can be grown. It is called Jadoo fibre—jadoo being presumably the Persian word for magic—and is a patent by Colonel Halford Thompson, R.A., of Teignmouth, South Devon. The foundation of the fibre is peat moss; which is exceedingly spongy and capable of absorbing into its composition any chemicals with which one may wish to impregnate it. This peat moss is boiled with those chemicals which are required for plant food, and to ensure their thorough amalgamation and decomposition the fibre is fermented in a particular way after the boiling process is completed. When the substance is ready for use, it is practically free from any smell, and being also quite clean, it has been found of great advantage in England for such pots as are wanted to be placed in-doors. In India, where ferns and plants are frequently employed in the decoration of dwelling-rooms, the fibre should be found of equal advantage. Our correspondent writes:—"I have been over Colonel Thompson's place at Teignmouth and have seen what astonishing results he has obtained with this most wonderful material, not only with followers but with sugarcane, beetroot, cucumbers and positively also with coffee and tea in his own greenhouses, I cannot help thinking that for coffee and tea nurseries it would be a tremendous success. Colonel Thompson has letters from the West Indies and South America which show that in purely 'planting' products the fibre is likely to give most surprising results. It is no quack manure but a substantial growing medium. I have seen apple-trees grown in *small pots* filled with it, and they are simply weighed down with the fruit, some of the apples being monsters. It looks quite uncanny to see them on the tiny trees. Amongst other wonders Colonel Thompson shows a magnificent crop of clover grown in sterile soil from the Landes District of Bordeaux which has been watered with liquid jadoo." In confirmation of our correspondent's remarks comes a report from the Agri-Horticultural Society of India on jadoo fibre as a propagating medium, the results in its Gardens in Calcutta having been most satisfactory; some plants which had hitherto defied all methods of propagation, except on a hobbed under glass,

having struck in this substance, and all plants on which experiments were tried having propagated much more readily in the fibre than in earth. Jadoo liquid is a fertiliser pure and simple, and apparently of high manurial value, but on its particular merits we cannot speak more definitely here. Apropos of our correspondent's remarks of the advantage of the fibre for tea and coffee nurseries, it seems to us that this fibre promises to provide a certain method for bringing on "supplies." Were our belief to prove true, planters would have good cause to bless the magic of Colonel Halford Thompson. This gentleman, whose address we have given, is only too glad to supply all information to anyone who applies to him, and some of our planting readers may think it worth their while to ask friends in England to communicate with him or to pay him a visit. Arrangements, we understand, are being made for a local Agency, and a small consignment of the fibre for experimental purposes is already on its way out.—*M. Mail*, Sept. 9.

RUSSIAN TOBACCO.

The tobacco crop in European Russia and the Caucasus for 1895, according to the *Journal de St. Petersburg*, was inferior to the preceding year's. Although the extent of ground cultivated (about 52,000 hectares) remains about the same. The most extensive plantations are found in the central and south-western provinces, but these are only for the production of the commonest tobacco consumed by the peasants. In the provinces of the south, on the other hand, only the kind known as Turkish tobacco is cultivated. In the Crimea, Bessarabia, and the Caucasus these tobaccos are excellent, and used in the manufacture of cigarettes, either pure or mixed with Macedonian tobacco. The total crop of 1895 amounted to 64,183,000 kilogs, as compared with 67,654,000 kilogs, in 1894 and 81,207,000 kilogs, in 1893. Three-fourths of the total is of the common kind. Odessa is still the great centre of the tobacco import trade, though for some years past the manufacturers of St. Petersburg and other towns of the north import their material direct from abroad. The quantity imported at Odessa diminishes every year, but in 1895 it still amounted to 321,500 kilogs.

THE AGRICULTURAL RETURNS.

The Board of Agriculture have issued their customary preliminary statement of the agricultural returns of Great Britain for 1896, compiled from the returns collected on June 4. The area under wheat was 1,693,957 acres, an increase of 19.5 per cent. upon 1895, but 12.1 per cent. below the acreage of 1894. Barley, 2,104,764 acres, a decrease of 2.8 per cent. upon last year, and a very small increase over 1894. Oats, 3,095,488 acres—decreases of 6.1 and 4.9 per cent. respectively upon the two preceding years. Potatoes, 563,741 acres, increases of 4.2 and 11.8 per cent. upon the two previous years. Clover and rotation grasses, 2,171,966 acres; and permanent pasture 4,638,722 acres, the former being a decrease of 5.7, and the latter of 2.6 upon 1895. The acreage under hops was 54,249, a decrease of about 8 per cent. of the previous two years.

The number of cows and heifers in milk or in calf is returned at 2,511,675 which is an increase upon last year of 1 per cent., and upon 1894 of 2.1 per cent. Other cattle number 3,981,907, which are a decrease of 4.6 and 10 per cent. respectively in animals of two years and upwards, and increase upon last year of 9.7 per cent. in cattle between one and two years old, and

of 5.1 per cent. in those under one year. The total number of cattle is 6,493,582. Ewes kept for breeding number 9,925,587, and other sheep 16,779,742. All these items show a progressive increase for two years, the total number of sheep, 26,705,329, being 3.5 per cent. above 1895, and 3.3 above 1894. The total of pigs is 2,878,801, which is a small number below 1895, and an increase of 29.5 upon 1894.—*Standard*, Aug. 29.

INDIAN PATENT.

Applications in respect of the undermentioned inventions have been filed, during the week ending 29th August 1896 under the provisions of Act V of 1888.

IMPROVEMENT IN TEA LEAF ROLLING MACHINES.—No. 172 of 1896.—Samuel Cleland Davidson, merchant, of Sirocco Engineering Work, Belfast, Ireland, for improvements in tea leaf rolling machine. (Specification filed 20th August 1896.)—*Indian and Eastern Engineer*, Sept. 12.

RUSSIAN TEA PLANTATIONS IN THE CAUCASUS.

The entry of Russia into the ranks of the tea-growing countries of the Old World is a fact which has scarcely attracted here the attention it certainly merits. The Russian plantation have years ago passed the experimental stage in the Caucasian highlands where they are located, and are being rapidly extended. One firm alone, whose gardens are situated not far from Batum, employes over 600 hands, under the supervision of Chinese foremen, in the culture and preparation of the leaf, and the Government is about to engage in the industry, the Department of Crown Estates having acquired last year over 43,000 acres of land in the district of Chakva for the cultivation of the tea-shrub, and in order that this object shall be attained with the greater certainty of success, a special Commission, consisting of the Inspector of the Imperial Domains and two subordinates, spent a portion of last year in the tea regions of India China, and Ceylon noting the mode of preparation for market in each place and the latest processes employed there, as well as obtaining native experts to undertake the management of the extensive gardens which are to be planted in the Caucasus. The Caucasian home-grown tea is already on the market at Moscow, and finds favour with the Muscovite consumers, who have never shown a disposition to take to the imported leaf from British India and Ceylon. The Russian palate finds the Assam and Colombo growth too harsh and rough, and prefers the softer and smoother product of China. The Caucasian tea is pronounced by good judges to be equal in every respect to the average Chinese article which reaches Russia overland, *via* Kiakhta and Maimachin. Some assert that the Russian, or rather Caucasian, tea is superior in flavour to that imported. Be that as it may, the fact remains that the shrub succeeds well in the mountain-lieutenancy of the South, and the increase in the plantations and product there is now such as to lead Russian publicists, like M. Batalin, to look forward in a few years to the exclusion of Chinese tea altogether from Russian markets, in favour of the home grown article, by which means the State will save for circulation in the country over 42,000,000 roubles, which amount at the present time represents the yearly tea bill paid to the Celestial growers, dealers, and carriers. The anticipation is far from being so extravagant as at first sight might appear. Not so many years ago when wine-making was started in the Crimea, the idea of competing with the French, Spanish, and Italian wines imported into Russia was derided, not alone by foreigners, but by intelligent and liberal-minded Russians themselves. Now the Crimean product is supreme in the market, and the foreign vintages are being every day more and more expelled from the daily consumption of the middle-class Russ,

It is a singular fact, perhaps, and one worth nothing, that it is to Englishmen that the introduction of tea culture to the Caucasus is really due, for it was an Englishman who was the first to point out to Russians that the soil and climate and general conditions of growth in the locality near Batum exactly resembled those of the regions of China where the finer qualities of tea are produced. The early experiments of cultivators, prominent among whom was Professor Butlerov, were dead failures 30 years ago. And Butlerov's successors did not succeed where he had failed. The first success at tea growing in the Caucasus attended the efforts of Colonel Solovtsov, who commenced cultivation on an insignificant scale about 10 years ago—to be precise in the year 1885. He had, as may be anticipated in Russia, many difficulties to contend with ere he could start his experimental garden. Neither seed nor plants could be obtained in Europe, so he had to import young shrubs from China. Seed was not to be relied upon, for the Celestials generally send the outer barbarians old seed which will not germinate, and new seed when it is obtained loses a certain essential oil it contains in the course of a long tropical voyage, and consequently fails to grow when sown. In the month of July, 1885, Colonel Solovtsov succeeded in obtaining from China a few tiny plants, but these had been maltreated by the Customs authorities, who, not knowing one plant from another, took them to be vines, and accordingly disinfected them well with quicklime to prevent the importation of the phylloxera into the country. The young seedlings were at once taken to Solovtsov's garden at Chakva, near Batum, and planted out in a soil of a red clayey nature, which had been trenched two spits deep. At first all grew badly, and the larger shrubs died off, but a few of the smallest of the seedlings lived on, grew to a fair size and bore seed, and from these Colonel Solovtsov was enabled to increase and extend his plantations. The garden covered five years ago five acres of land, contained over 2,000 plants about five years old and 8,000 seedlings and over 42,000 more were to be raised by 1893. The variety grown by Colonel Solovtsov is that scientifically termed *Thea Viridis*, a more northerly species of the *Thea Sinensis*. While Colonel Solovtsov has been carrying on his experimental plantations in the Caucasus, other firms have embarked in the industry as a commercial speculation with a view to remunerative returns. Foremost among these is the house of K. and S. Popov, of Moscow, a firm engaged in the China tea trade as agents and importers. They have over 500 acres of tea plantations at Chakva, near Batum, on the shores of the Black Sea. They are managed by Chinese overseers and superintendents who have been brought from China for the purpose, and they afford occupation to over 600 native labourers. Such has been the success attending these tea-gardens that, it is reported, large extensions of the plantations are contemplated now that the peculiarities of the tea shrub are better understood, and its requirements in the strange soil of the Caucasus have become more clearly known. Some idea of the proportions which the tea industry in the Caucasus is beginning to assume may be gathered from the fact that a force of labourers 600 strong as employed on the Popov plantations is equal to the production of 10,000 lbs. of tea per week.

The plant appears to have no special care or treatment in the districts of the Caucasus where it has been acclimatised. Propagation by means of cuttings is best avoided, it is said, for the cuttings do not take in reasonable proportions, and plants raised from cuttings never make sturdy, bushy shrubs. Seedlings do best and require least attention. They are raised with certainty from the seed which, in the Caucasus, ripens in the course of a year, and are gathered in the month of October, at which time the *Thea Viridis* flowers. The seeds after being collected are mixed with dry sand, and kept in earthenware receptacles until the month of March, when they are damped with a solution of camphor spirits and water, which hastens and promotes germination. They are then replaced in the earthenware vessel, but mixed with a quantity of black soil in which they begin to grow, and as soon as the tiny seedling are large enough to handle, they are care-

fully lifted out, one by one, and planted in nursery rows. Here the soil is improved by an admixture of sea sand, and the plants are protected from the sun by mats stretched over them. In dry weather they require watering once a day, and under the system here outlined every seed without exception germinates, and every plant grows to a sturdy shrub, yielding a full supply of leaves for picking in the proper season, or as it is termed "flushing." When planted out in the permanent gardens at the end of the first year they require no attention whatever, either in shading or artificial watering, but may be safely left to nature, the only thing needful being to keep the ground clear of weeds, by hoeing well twice a year. During the dry season in the Caucasus, that is, the months of May and June, when the heat is intense, the plants do not seem to feel the effects of the drought in any way. And they stand the bitter cold of the exposed region of the Black Sea equally well. The winter of 1892-93 was an exceptionally severe one. The temperature was as low frequently as 6 deg. of Reaumur, 13.5 deg. below freezing point, and although the tea plants were covered with snow and ice up to the tips of the leaves for days together, neither the older shrubs nor the young seedlings suffered in any way. And the tea gardens in the Batum district are in a quite open and exposed situation, where every blast of cold wind sweeps the entire length and breadth of the country.

With a plant so accommodating in its nature, soil and climate adapted to it, and the plantations of one firm already equal to an output of 10,000 lb. weekly, the tea industry of the Caucasus must be pronounced to have made not merely a good start but very remarkable progress since 1885, when the first serious attempts at cultivation had their origin in Colonel Solovtsov's experimental garden. And, now that the Government is going in for the business on a large scale, the industry has every prospect of attaining big proportions. It may not realise all that patriotic Russians expect or assert, but it can hardly fail to deal a serious blow to the Chinese trade, and may indirectly, if not directly, have some effect upon our own plantations in Assam and Ceylon.—*Morning Post*, Aug. 22.

NOTES FROM THE METROPOLIS.

BUXTON, Aug. 29.

I have alluded above to

MEXICO

and its capable President Dias; but I saw lately great complaints about increased export taxes which it is proposed to levy on produce leaving that country. This will no doubt check the extension of coffee planting, among other industries there.

Mr. Steveni writing from Sweden in answer to an inquiry, as to the prospects of

CEYLON TEA IN SCANDINAVIAN COUNTRIES, has given me some interesting information. He writes:—

"You would like to know what prospects Ceylon tea has in Sweden and Norway. As the Swedish and Norwegian people are every year becoming more attached to tea-drinking I should say your tea has a great future here."

Mr. Steveni recommends an agency in the island of Gothland, where he was on a visit; and which he says has a population of about 60,000, mostly well-to-do farmers and peasants. I have endeavoured to interest a well-known Ceylon tea-distributing firm (its partner being old Ceylon planters) in this new opening and hope something will come of it.

Only the other day was my attention drawn to some ill-considered remarks in a contemporary of yours, criticising my letter on

COFFEE PRODUCTION

in the London *Times*, with the snarl that I should be doing the Ceylon planters bet-

ter service by leaving out all mention of their coffee experience, and also of the risk of over-production of tea, I fancy there is no sensible man in Ceylon who thinks so. For, surely any thing that may divert attention and capital from the cultivation in new countries of our present staple, tea, in favour of the old and under-produced staple, coffee, tends to be of service to Ceylon planters at the present time; while to correct a gross misunderstanding and afford correct information was ample justification for the latter. But—as an old pressman—I should really let such trifles pass without notice: to misconstrue is sometimes very natural.

I have a remarkable confirmation from "Cosmopolite" of

THE KEEPING QUALITIES OF CEYLON TEA.

He wrote to me lately as follows:—

"I enclose a cutting from your London letter and would remind you that about 12 years ago 'Cosmopolite' said the same as Mr. Donald Noble says now, and so positive am I in my belief that I keep one chest of tea *maturing* whilst I am drinking the other, in fact I have always a chest in hand ripening."

J. F.

AMONG THE COCONUTS, AND BEYOND.

(From a Planting Correspondent.)
