January 7, 1892.

THE  
JOURNAL OF HORTICULTURE,  
COTTAGE GARDENER,  
AND  
HOME FARMER.

A CHRONICLE OF COUNTRY PURSUITS AND COUNTRY LIFE, INCLUDING BEE-KEEPING.

CONDUCTED BY  
ROBERT HOGG, LL.D. F.L.S.

Established

in 1848.

VOLUME XXIII. THIRD SERIES.  
JULY—DECEMBER, 1891.

LONDON:  
PUBLISHED FOR THE PROPRIETOR, 171, FLEET STREET.

LONDON :  
PRINTED AT THE JOURNAL OF HORTICULTURE OFFICE,  
171, FLEET STREET.

## TO OUR READERS.

---

As will, we trust, be recognised by a glance at the accompanying index, the matter in our pages during the latter half of the year 1891 has not been less varied than in previous volumes. We have reason to believe, also, judging by the estimates of many readers who have spontaneously expressed their opinion, that in interest and usefulness the reputation of the JOURNAL OF HORTICULTURE is fully sustained.

To all who have shared in completing the volume so satisfactorily we desire to tender our hearty thanks, and to record our appreciation of their services in supplying information and affording instruction for distribution over the whole wide world of Gardening.

While we deeply regret that some of our friends and associates have been called to rest from their labours after doing good work in Gardening and for Gardeners, we gratefully remember that the whole of our immediate coadjutors remain to aid us in creating a wider interest in Horticulture, and striving for higher excellence in the cultivation of plants and crops that enrich our gardens and beautify our homes.

In this work we shall continue to engage; and knowing we have as helpers men of ripe experience in every branch, with younger practitioners of bright promise, we look forward in full confidence that as progress is reported week by week the approval of our friends—wealthy patrons of Gardening, earnest amateurs and professional workers, old and young—will be secured.

It is gratifying to observe that more and more attention is being given to Gardening. It is included in the scheme of Technical Education by many public authorities. Schoolmasters and teachers are being taught in order that they may the more effectively give lessons in scientific and practical Horticulture in schools; evening lectures are also attended by all classes of the community, the affluent and the sons of toil taking lively interest in the proceedings, and a true horticultural spirit is being aroused that will not easily subside.

Our "Technical Education Scheme" is of a different character, and we trust it will stimulate to the acquisition of the best information procurable on certain specified subjects of general importance, and that this information will be conveyed in acceptable literary form.

That there is a brighter future for Gardening and for practical, intelligent, accomplished Gardeners is the hope, desire, and belief of the Editors of the JOURNAL OF HORTICULTURE, who wish to reciprocate the good wishes and kind greetings of a host of friends.

## INDEX.

- BUES ALCOQUIANA, 301; A. firma, 305; A. Veitchi, 03  
 Acahyphas, 274  
 Achillea millefolium, 270  
 Adiantums and Anthuriums, 355  
 Esculus, American species, 46  
 African Groundsel, 399  
 Agave americana variegata in flower, 408  
 Agricultural College for Kent, Surrey, and Sussex, proposed, 306  
 Alder, insects on, 12  
 Alnwick Seedling Vine unfruitful, 528  
 Allamanda Williamsi, 63, 91; notes on, 145  
 Allamandas, 397; winter treatment of, 58  
 Allerton Beeches, notes at, 387  
 Alligator Pear, 454  
 Amaryllis Belladonna, 212  
 Amasonia punicea, 397  
 Amateurs and single-handed gardeners, 430  
 Amelanchier florida, 5  
 American Apples, arbitration case, cost of transit, 471; shipments of, 562  
 American Cowslips, 477  
 Ammoniacal carbonate of soda solution and Tomatoes, 255  
 Anemone apennina, 5; japonica alba, 367; blanda from seed, 506  
 Anglian (East) Horticultural Club, 287  
 Annuals for spring, 145; hedges of, 281; in pots, 421  
 Anthurium Liliastrium, 111  
 Anthuriums, new, 7  
 Antwerp Exhibition, 46  
 Apple and Pear tree unfruitful, 12; thinning, 10; twigs barked, 86; pruning espaliers, 569  
 Apples, London Pippin, 34; thinning, 20; New Zealand, 100; Winter Pearmain, 144; early, 156; Benoni, 235, 239; Nonesuch, 277; keeping, 316; early planting of, 388; succession for amateurs' garden, 402; the Croft Angry, 431, 508; Pear shaped, 475; importations, 473; supply and planting, 509; English and American, packing and selecting, 531; canker on light soil, 551; supply, 558.

 Apricots, good varieties, 464  
 Apricot weevil, 147  
 Aquarium (Royal) Fruit Show, 328  
 Aquilegias, white, 6  
 Aralia Veitchi, grafting, 506; as table plants, 557  
 Arboricultural (English) Society's excursion and meeting, 202  
 Arisaema Wrayi, 425  
 Aristolochia gigas, 338  
 Artichokes, White Jerusalem, 539  
 Ashford Vineyard, 557  
 Asparagus, a graceful, 553  
 Asparagus, mulching, 403; refractans arboreus, 310; notes on, making beds, forcing, 447; guano for, 464  
 Aster Harbinger, 156; the perennial, 270  
 Auricula houses, 368, 406  
 Auriculas at Norwood Green, 139; under handlights, 238; notes on, 263; in Scotland, 322; culture and protection of, 381  
 Australia, economic plants of, 48  
 Australian fruit importations, 287  
 Avicennia nivea, 111  
 Azaleas dying, 78; exhausted, 573  
 Azaleas and American plants, 343
- BAPTISIA EXALTATA, 95  
 Barbe du Capucin, 212  
 Barren wall trees, 556  
 Basingstoke Show, 184  
 Beans, kidney at Chiswick, awards for, 133; new kidney, 368  
 Bedding in Hyde Park, 81  
 Bedding plants, 83; and arrangements, 216  
 Beddington, Carshalton, and Wallington Society, 244, 366  
 Bedford Show, 74  
 Bees—sneering foreign, a controversy, 11; queen excluder zinc, disputes on, 32, 55, 99; Doncaster Show, 33; foreign, prolificacy in, snipers, 77; making bees, patent frames, Mr. J. M. Hooker and the standard frame, judges at Caledonian Show, 1875, Scottish Bee-keepers' Association, 78; pure Punic, 77, 120; swarming, 77, 120; experience, supering, comb foundation, 99; evolution of queen, hives at the Heather, with diagram, 120; the weather, 98; ages of, queen's piping, Punic queens, 146; seasonable hints, taking honey, 165; extracting from the brood combs, super clearers, 166; Punic bees, 166, 189; at the moors, drones, 189; driving, modern, teaching, Punic, 211; at the moors, 233; stocks, fixing foundation, 234; apiarian notes, at the moors, clearing supers, 253; position of the frame hive, hiving, 254; prices of Punic queens, 254; notes on, feeding, entrances, frames and hives, are Punic robbers? 275; Heather honey, 276; returning from the moors, 295; Punic robbing, 295; apiarian notes, 315; Punic bees, can bees be improved? preparing for next season, 315, 316; Punic, 335; preparing for the future, economy and utility, feeding, 355; Punic bees, bee societies, 356; seasonable notes, 375; honey at the Dairy Show, 393; bees at home, the drones, queen cells, Punic bees, 419; winter work, wax rendering, 463; a misapprehension and explanation, stands and floors, 485; divisional snipers, section cases, 527; supering, stores, 549  
 Beet, lifting and preserving, 377  
 Beetles, 276  
 Begonia Mrs. Faulkner, 18; Tuberos, 86; semperflorens carminea, 145; in pots and beds, 131; propagating, 145, 163; for winter, 183; Tuberos, 287  
 Benham Park, 536  
 Bertolonia, 165  
 Bilston Show, 186  
 Birch oil, 223  
 Birmingham Gardeners' Association, 308  
 Black Currant buds destroyed, 13  
 Blackberry wine, 235  
 Black Currant enemies, 88  
 Blacklow House, Liverpool, 554

 Boyd, portrait of Mr. Thomas, 167  
 Bradley, death of Mr. S., 178  
 Brambles in gardens, 52  
 Brighton and Sussex New Horticultural and Improvement Society, 155  
 Brighton Chrysanthemum Society, visit to Surrey gardens, 180  
 British Fruit Growers' Association, Conference at Beddington Park, 84; at Cardiff, 54, 55; at Edinburgh, 246  
 Brotherton, portrait of Mr. R. P., 266  
 Brown, portrait of Mr. James, 267  
 Brugmansia planted out, 78  
 Brussels Spouts, 399  
 Buckeyes, the American, 543  
 Buddlea globosa, 88  
 Bulbophyllum amplum, 342  
 Bulbs for spring, 344; plunging, 398  
 Bush fruits, propagating, 525
- CABBAGE, ELLAM'S 5; SEED sowing, 76; heading of, 245; sowing, 252  
 Cabbage Lettices for summer, 328  
 Cactaceous plants, Mr. Major's, 135  
 Caladiums Léon Say and Louis Van Houtte, 134; as table plants, 557  
 Calanthes, versicolor, 504; at The Hendre, 537  
 Calderstones, a visit to, 324  
 Californian fruit, 562  
 Calne Show, 208  
 Camellia buds falling, 572  
 Campanulas, 98, 282; pyramidalis, 244, 307  
 Camphor for seeds, 367  
 Cardiff Parks, 110; Conference Show, Castle Gardens, 154  
 Carnation Germani, 517  
 Carnations and ricotees, 12; Society (National) Southern Show, 66; Northern Show, 161; in September, 263  
 Carnations from seed, 31; stands for showing, 34; tree, 119; at Chiswick, awards for, 132; Edith M. Wynne, Countess of Jersey, Madeline, Mrs. Walford, Queen of Bedders, Ruby, Victory, and Mrs. E. Sydenham, 134; at Slough, 138; Birmingham show of 140; Oxford Show, 142; buds withing, 149; Mr. C. R. Humbert and La Neige, 182; Souvenir de Malmesbury, 225; in pots, 282; dial, 506  
 Carrots, 397; evading maggots in, 34  
 Cae, an interesting market garden, 533  
 Caele Coch Vineyard, 135  
 Cattleya Dowiana aurea (Young's variety), 108; Hardyana Hamar Bass variety, 68; Behrensiana, 182; labiata vera, 262, 263; autumn flowering, 348  
 Cauliflowers, 252  
 Ceanothus Veitchi, 44  
 Celery, earthing, 188; nitrate of soda for, 321  
 Celosia pyramidalis in the autumn, 379  
 Centaurea cyanus nana compacta, 18  
 Chatsworth, Mr. Chester's appointment, 200  
 Chelone barbata, 232
- Cheltenham Show, 272  
 Chemistry of garden crops, 501  
 Cherries in Kent, 5; in houses, 294; forcing, 484  
 Cherry houses, 118; brandy, making, 191  
 Chertsey District Show, 30  
 Chicago Exhibition, 346; horticultural attractions, 493  
 Chiswick Show, 29  
 Chiswick Gardeners' Mutual Improvement Association, 287  
 Chionodoxa, 266

AS we briefly reminded our readers last week, the fifty-second anniversary festival dinner of this admirable institution will take place on Wednesday evening, July 8th, in the Whitehall Rooms of the Hotel Métropole, and we trust there will be a great gathering of friends of the charity on the occasion. The fame of the Chairman, the Right Hon. Joseph Chamberlain, as an orator is of world-wide repute, and he will have a theme with which he will be in full sympathy and worthy of his most powerful advocacy. Mr. Chamberlain takes great delight in his fine and well-equipped garden, and is held in the highest esteem by those employed in it. His desire to benefit the industrial classes and do all he can towards formulating means by which they may receive support in the decline of life is well known, and it may be expected that the speech he will deliver at the meeting in question will be one of considerable importance.

All prominent statesmen have a great number of devoted adherents and about a corresponding number of uncompromising opponents. But this is only politically, and probably there is no leading parliamentarian who is not proud of the number of his enemies, as these indicate the measure of his influence and his power. In these days a public man, whether he is a politician or not, who in his official capacity is never opposed, is soon regarded by the outside world as a mediocrity, and the flattery of which he is the victim is apt to be characterised as a system of "bolstering." But happily in the conflict of opinion on questions of policy true personal respect exists between the opposing exponents, and each admires the abilities and character of the other. Great men in their contests on public questions teach smaller men a wholesome lesson. The former welcome full and fair criticism, and have a profound respect for honest assailants; the latter repel it, and are unfortunately somewhat wont to regard it as a personal attack. Fortunately opportunities arise for men of differing views on public matters meeting on a common platform as true and trusted friends engaged in the furtherance of a common object which all admit to be good, and then they receive as they deserve a great ovation.

Mr. Chamberlain, in advocating the claims of the Gardeners' Royal Benevolent Institution for the support of all who can give it, will assuredly find his efforts fully recognised and his endeavours warmly applauded. All who will meet him at the festive board next week will be his friends, because they are in sympathy with the object with which he by his presence proclaims his sympathy—namely, making provision for aged gardeners and widows of gardeners whose latter days would without the help of friends be days of privation and practical destitution. That this privation ought not to be experienced is a sentiment with which all lovers of gardens, and all who believe that those who labour in them are worthily engaged, will be in absolute unison; of that there can be no doubt whatever.

Than the Gardeners' Royal Benevolent Institution there is no organisation that has done, is doing, and will do more good in a large and important section of the community, nor is there one more firmly established or more carefully and judiciously managed. That it was staggered momentarily by the sudden death of the late Secretary, Mr. E. R. Cutler, who for upwards of fifty years laboured on its behalf with extraordinary zeal and great success, was

only natural; and because of this loss it is necessary that special efforts be made to, as far as possible, counteract its effect. It must be the wish of all to give encouragement and help to the recently appointed Secretary, Mr. G. J. Ingram, a gentleman who, we may be sure, possesses the requisite qualifications for the discharge of the duties which after much deliberation he was elected to perform. He is fortunate in what we may term his public inauguration, in the Institution having as Chairman of the first dinner since his (the Secretary's) appointment, a statesman so distinguished and eloquent as Mr. Chamberlain, who, it will be remembered, was unable to attend on a former occasion through illness. It is our strong hope that the gathering will be large, influential, and successful, and we know that many persons are looking forward to the privilege of hearing a speech that they anticipate will be memorable.

As an example of the power of Mr. Chamberlain as a speaker we may appropriately relate an episode that has not hitherto been published, and which at least one reader of these lines will know to be true. The right hon. gentleman was once upon a time delivering a series of speeches for which the country was waiting. A few days subsequently we happened to visit the town in which the demonstrations had been held, and on asking one of the best gardeners in the district if he had been to hear Mr. Chamberlain received this reply, "Yes, I went to one of his meetings, but only one, and do not think I shall go to another." "Why, was not the speech good enough?" was our rejoinder, and this was the answer we received. "The speech was certainly wonderful. I never heard such a fluent, persuasive speaker; he carried all before him but me, and the fact is I do not think I dare attend another of Mr. Chamberlain's meetings through the fear he might convert me to his views!"

The right honourable gentleman probably never had a greater compliment paid him than that, and he will not regret the fact that the gardener's fears of being converted have left him. The once fearsome listener would be glad to undertake a very long journey to hear Mr. Chamberlain now, and we shall be very glad if it is convenient for him to do so next week.

We trust the Chairman of the meeting of the 8th ult. will be the means of converting many who have not hitherto been supporters of the Gardeners' Royal Benevolent Institution, and at the same time stimulate some of those who are enrolled in the noble army of helpers to renewed efforts on its behalf, for infirm and aged gardeners and widows are wearily waiting and anxiously longing to become participants in the benefits it is established to bestow.

How great these benefits have been in the past, and how they have steadily increased from small beginnings, were concisely stated by Mr. N. N. Sherwood at the election dinner in January of the present year. He reminded his hearers that "the Institution was established in 1839, and in 1840 they had only one pensioner, in 1841 two pensioners, in 1842 four pensioners; in 1850 they paid away £492 in pensions, and they had £2250 invested. In 1860 they paid away £723, and had £5100 invested. In 1870 they paid away £787, and had £7800 invested. In 1880 they paid away £1074, and they had £12,000 in stock. In 1889 the sum paid away was £2345, and they had £23,000 in stock; and in 1890 the sum of £2648 was paid away, and they had £25,000 in stock. In 1891 the pensioners numbered 156. The oldest pensioner was upwards of 103 years of age, and had subscribed £18 18s., while during the thirty-one years that he had been a recipient of the charity he had received £510. The number of pensioners who had been on the Society's books up to the present date was 559, and the amount of money paid, including expenses, was £56,288." Well might that statement be received with cheers, and we shall hope to hear something of a very cheering nature at the gathering of gardeners' friends at the fifty-second anniversary dinner of this splendid charity on Wednesday evening next.

## SOFTSOAP, SULPHUR, TOBACCO AS FUNGICIDES AND INSECTICIDES.

WINTER dressing Vines and fruit trees generally grown under glass or trained to walls with an approved composition for the prevention and destruction of insect pests was formerly a garden practice held in high repute. The mixture varied in its components, but there was a remarkable unanimity as regards the principal ingredients. These were (and still are) found to have considerable value as fungicides and insecticides, and were used in about equal proportions, of which the following is a fairly representative formula:—Softsoap, 1 lb.; flowers of sulphur (some preferred black or sulphur vivum), 1 lb.; snuff (Scotch, best), 1 lb. Dissolve the softsoap in a gallon of boiling water, while hot add the snuff, then the sulphur, forming a pasty wash, and to this add enough clay to form an adhesive cream. Some preferred the strongest shag tobacco to snuff. In that case the tobacco (1 lb.) was placed in a vessel, and a gallon of boiling water poured over it, covering the vessel with a sack; the mixture was allowed to stand until cold, then strained through a coarse cloth. The softsoap and sulphur were added to the tobacco water, well mixed, and clay added to give it the consistency of cream. The mixture was applied with a stiff brush, the Vines and trees having been pruned, stripped of loose bark, and otherwise freed of matter likely to interfere with the application of the compound. It was brushed well into every hole, crack, angle, and crevice, the whole Vine or fruit tree thoroughly coated with the sticky material, care being taken not to injure the buds. That the pigment killed the insects was held to be proven, inasmuch as Vines or trees not dressed with it swarmed with insects and mildew the ensuing season, whilst those dressed were comparatively clean.

Some growers were not content to use softsoap, sulphur, snuff, or tobacco water, but added lime, and to take off its glaring whiteness added soot, forming these into a wash with water, and the whole into an adhesive cream by the addition of a due proportion of clay. Others went further and used gas liquor along with some or the whole of the foregoing ingredients, and a few waxed bold enough to add gas tar or petroleum for the destruction of mealy bug. The ambition was to invent a compound strong enough to kill the whole race of parasitical fungi and insects. Alas! some Vines to which the "improved" mixture were applied pushed their buds tardily and irregularly the following year, others not starting, and those breaking were puny in shoot and leaf, with bunches showing prominently in the points of the shoots when 2 or 3 inches long. These instead of developing for the most part shrivelled and collapsed, the growth altogether very weak, and the prospect poor. The rods became hard and dry. The oleaginous and tarry substances employed in the mixture used as winter dressing had done their work. They had been absorbed, the cells of the bark and underlying tissues had been hardened and contracted, and the flow of sap obstructed. Whilst they were dressed with the softsoap, sulphur, tobacco, and clay all went well with the Vines. The stems thickened, the foliage was abundant and good, the Grapes plentiful and excellent. Why, then, ignore the fact that an injudicious use of substances for the prevention and destruction of insect pests had proved injurious? There was only one remedy—cutting away the old rods of Vines and taking up new. They were cut below where the "stuff" had been applied to the rods and splendid young canes followed. How many Vines have been replenished with fresh, free-bearing, healthy rods in the manner indicated?

The case is not very different as regards other fruit trees. The Fig is notorious for red spider and scale, the Peach and Nectarine being similarly attacked. This occasions the use of preventive and remedial measures. Formerly the pigment before alluded to was exclusively employed, and did not induce hardening of the bark and underlying tissues, but caused the trunks and limbs of the trees to thicken and to have clean healthy bark. The clay absorbed the oil of the softsoap and prevented its soaking into and contracting the tissues of the bark and alburnum, whilst insects were destroyed. Injury is often done by the application of substances which, acting and reacting on each other, set the oil and tarry matter free to soak into the bark, destroying its cells, and the vascular or alburnous tissues beneath. The mixture used by old gardeners did not injure the bark, but improved it, as in claying over grafts and wounds, and it remained until the trees were well furnished with leaves, when it cracked and fell away, leaving the stems and branches clear and healthy.

But the daubing of trunks and branches took up much time, and many persons discarded the clay. I should like to know with what advantage. Softsoap then became the specific, and has even been used at a strength of 1 lb. to a gallon of water. What wonder that Vines, Peach, and other trees thus dressed ceased to enlarge in their stems, and failed to produce profitable crops

of fruit. Lathering Vines or fruit trees with crude softsoap will ruin them sooner or later, but when used in the mixture above mentioned it is safe. I have seen two vineries out of three rendered profitless through this rough and ready method of dressing the Vines with softsoap. I have seen young Vines ruined before they were seven years old by the too lavish use of softsoap. Even "authorities" have recommended a solution of softsoap, 1 lb. to a gallon of water. A lather thus formed may not injure trees with thick bark, but what if it be applied to young trees? Some are more cautious, yet recommend softsoap, 8 ozs. to a gallon of water. That may not injure trees if the weather be wet, but what is the result of its application to growth of one, two, or three years old under glass? A 2-ounce solution will kill aphides, red spider, and thrips. Why, then, use more? True, twice the strength has not done harm to hard ripe wood in winter; but the fact to remember is this—softsoap in strong solution is not safe.

It is a compound of whale oil and potash, and prepared also from linseed oil, tallow, and residuum of various kinds, but the 'cute American is generally careful to prescribe "whale oil soap." Of course, all disasters from its over use are attributed to the badness of the soap. That does not mend matters. The potash causes the soap to be soft. Add soda lye, or saponify the whale oil therewith, and it is hard soap. Potash is softening, soda hardening. That must be taken as regards the effect of potash and soda on trees. Potash collects moisture, keeps the softsoap acting on the insect. Soda dries and crystallises, hence the use of a combined potash and soda wash. Oils and fats are bad absorbents of water, and have acid reaction, hence they prevent the parts of trees to which they are applied benefiting by the moisture of the air, rain, or syringing, and, when dried, close the pores. Thus softsoap acts on insects by the oil adhering to their bodies whilst the action of the potash kills them. On mildews the potash burns up the mycelial threads, and the acid reaction of the oil shrivels up the remains. Mr. Bardney long ago pointed to the efficacy of softsoap in weak solution as an antidote for mildew on Roses under glass. It has been used from time immemorial as an insecticide, while as a cleansing agent it is admirable alike for woodwork and fruit trees that have been infested with insects. A thorough washing by means of a brush reaching well into every hole, crevice, and angle of the bark with a solution of softsoap, 2 ounces to the gallon of water, at a temperature of 90 to 100°, is safe and efficacious for the destruction of red spider, thrips, and aphides. If the whole house, Vines and other fruit trees included, were syringed with water at a temperature of 140 to 160° it would soften the dirt on the woodwork and accumulations of various matters on the glass and trees, whilst making quick destruction of any insects it reached. This should be done so soon as the leaves have fallen, before the pests have found snug hybernating quarters. Then thoroughly cleanse the house, the trees after pruning, and removing the loose bark or rough portions, wash with the soapy water as already advised, whitewash the walls, remove the loose surface soil, and apply a top-dressing of rich material. Objection may be taken to the 2 ounces solution of softsoap not killing eggs. My reply is, kill the adults in autumn or early winter and they will never lay eggs. The Peach or brown aphid lives through the winter on any juicy shoot it can find, therefore let the application of the soap solution be thorough.

The 2-ounces solution cleanses all foliage infested with aphides, red spider, and thrips. It may be syringed on the parts infested, the whole thoroughly wetted; but it cannot always be used in that way on account of its spotting the Grapes, yet it is easy applied with a sponge, and if care is taken to begin soon enough and persist in its use there is no doubt as regards the issue. Any plants infested may be syringed or have the leaves sponged. It, however, is not always safe to use this weak (2 ounces) solution on plants with hairy leaves. These are more susceptible of injury than those with smooth, and these matters must be considered by those using soapy solutions, bearing in mind that they are first caustic and afterwards acid. Stronger solutions are not recommended, except for special purposes, and they must be used upon the object specialised in strict accordance with the instructions.—G. ABBEY.

(To be continued.)

## THE PYRAMIDAL SAXIFRAGE.

FEW plants are more hardy, more easy to cultivate, and more graceful, than "*Saxifraga Cotyledon*," or, as it is better known in gardens in a stronger form, as *S. pyramidalis*. Although a perfect gem, it is certainly not grown to the extent it deserves. The probable reason of this neglect is that it does not flower until its third year, and in the interval escapes the very little attention necessary to grow it to the mature condition. Yet the provision necessary is so

trifling that half an hour's labour for two years in succession will secure a large number of perfect flowering plants. Doubtless any open well-drained soil exposed to the sun will suit it admirably. I have grown my plants for a number of years in a small bed, made under a brick wall, on the surface of a gravel path, no deeper than a brick on edge, the soil being very fine sandy gravel, obtained from the bottom of a running stream. This has been enriched by occasional sprinklings of artificial manure. Now is the season for planting. The offsets for the purpose may be obtained in almost an unlimited quantity from the flowering plants, or from those a year old. These I plant 6 inches apart, and settle the soil about them with a good watering. If the season be very dry they may require watering from time to time. In the following year, about this time, I take up all these young plants, and after removing the offsets replant them about 12 inches apart. They remain then until the following year, when all of them will send up grand flower spikes, and are ready for transplantation into any part of the garden, as may be required for effect, or into pots for house or conservatory decoration. It is as well to have them in the original bed until the flowers begin to open.—EDMUND TONKS.

### RECORD OF STRAWBERRY SEASONS.

As a comparison may be useful I give the following table, which may be read along with the one given by Mr. Sharpe on page 505.

#### DATE OF FIRST AND LAST STRAWBERRIES GATHERED.

1881.—	Record lost.	
1882.—	3 lbs., June 11th to July 27th	= 37 days.
1883.—	2 lbs., June 25th to August 15th	= 51 days.
1884.—	3 lbs., June 25th to August 14th	= 50 days.
1885.—	2 lbs., June 25th to August 10th	= 46 days.
1886.—	6 lbs., July 5th to August 29th	= 55 days.
1887.—	5 lbs., June 25th to July 30th	= 35 days.
1888.—	1 lb., July 1st to Sept. 1st	= 63 days.
1889.—	1 lb., June 15th to August 4th	= 50 days.
1890.—	1 lb., June 9th to August 1st	= 53 days.
1891.—	(1)	

Average period 48.8

During 1889 and 1890 Noble was grown and ripened a few days earlier than Vicomtesse H. de Thury, the variety previously the first to be gathered. It will be seen that 1886 and 1888 were late seasons, with a prolonged crop, this being attributed to the incessant rains in July and August of both years. On the other hand, the Jubilee year of 1887 was the shortest, although about the average in date of first gathering. The present year is one of the latest owing to the severe frosts of Whitsuntide which destroyed fully a fortnight's crop of berries.—F. LOVEL, F.R.Met.Soc., Driffield.

### PRIMULA IMPERIALIS.

At the last meeting of the Royal Horticultural Society at Westminster, specimens of the above named interesting Primula were exhibited, and we this week call again the attention of our readers to the plant by means of the woodcut (fig. 1) and a fuller note. The plant seems to be the same as that referred to by Mr. Dewar in this Journal a few years ago, when his careful and exhaustive review of the genus Primula was published. He described it under the name of *P. prolifera* as follows:—

"As yet this is a novelty, having been introduced only two or three years ago, along with other seeds sent from the Sikkim Himalayas by Mr. Elwes, and raised by the late Mr. I. A. Henry of Edinburgh. The first batch of plants from the home-grown seed has come into the hands of the Messrs. Veitch, a number of which we saw planted out in their nursery at Coombe Wood last year (1885). The plants were small and apparently suffering from being too far south, as those at Edinburgh from the same seed were as large again and flowering most profusely. It will no doubt be much sought after when plants become more rife, and we hope to see it play a prominent part in the hands of the hybridiser. It belongs to the whorled-flowered set, and although the European kinds are most desirable in rockeries, they would be more desirable had they from four to six times the quantity of flowers as the present plant has. It is likely also to prove the hardiest of the whorled set, as it comes from a very high elevation, and therefore better able to stand our winters than japonica, verticillata, or Boveana. *P. Kaufmanniana*, Regel, is said to have two or three tiers of whorls; we have not, however, seen it with more than one. It requires a rich soil in a partly shady position. The leaves coming from a short stem are from 6 to 16 inches long, oblong, running into a broad-winged petiole, irregularly toothed, and

the under side covered with a straw-coloured meal. The flower stem is from 1 to 2 feet in height, with five or six whorls of sweetly scented flowers, pale golden yellow, from a half to an inch in diameter, each whorl containing about a dozen flowers surrounded by narrow acuminate bracts. It commences to flower in June, continuing until August. It inhabits the loftiest mountains of Java, from 8000 to 9000 feet elevation. Syn., *P. imperialis*, Jungh; *Cankrienia chrysantha*, De Vriese."

FIG. 1.—PRIMULA IMPERIALIS (Plant greatly reduced).

The tall habit of this Primula is somewhat against its horticultural popularity, but if a cross could be obtained between it and *P. japonica* it is possible a race of distinct and useful plants might be secured.

### PROLONGING THE SUPPLY OF HARDY FRUITS.

[First prize essay by Mr. A. WRIGHT, Devonhurst, Chiswick, Chiswick Gardeners' Association.]

THE importance of prolonging the supply of hardy fruits cannot be over-estimated where fresh supplies are in demand for home consumption. Each year increases our knowledge of the value of fresh fruit as food for man, and hence the gardener is called upon to supply, not only fruit in greater abundance, but in greater variety, and continued over a longer season. This is no easy task when the numerous enemies the gardener has to contend against are taken into consideration. Birds are some of the greatest pests that attack ripe fruits, but we must not on this account destroy our feathered songsters, as they amply repay us for their share of the fruit by their song and the destruction of insects. Instead, then, of destroying the birds, we rather try to keep them at bay when the fruit is ripe, and for this purpose various methods are tried. Old herring nets are largely used, and when properly employed are a great protection. The birds are sure, however, to effect an entrance in time, and it is

surprising the quantity of fruit they carry off. Matting the bushes is another means often adopted in the case of Red and White Currants, or Gooseberries, but it entails much labour and material, and in the end is not quite satisfactory. It is remarkable that birds very soon discover where good fruit is to be had, and they can also pick out the best. Again, in dry seasons birds become bolder; due, no doubt, to the scarcity of wild fruits or the short season in which they can be obtained. In order to guard against this evil I would strongly recommend the erection of wooden structures covered with wire netting. A house of this description costs very little, and serves its purpose better than anything I know. It can also be covered with roller blinds to protect the trees when in flower against frost, and when the fruit is ripe they can be used to shade it from bright sunshine, and thus help to retard and prolong its season.

#### THE BEST FRUITS.

The fruit trees best suited for planting in a house of this description are Cherries, the season of which can be considerably lengthened in this way; indeed, the fruit of the Cherry improves in quality by being kept as long as possible after it is ripe. Gooseberries, although they are by some not considered worthy of a place amongst dessert fruits, are by others much esteemed, and in most places they would find a place in a house of this description. Red and White Currants should also not be forgotten, for when other fruits are getting scarce they are useful for a change. Black Currants would also prove a welcome dish, also Blackberries, more especially some of the newer introductions, especially as they ripen later than the other kinds. If planted along the side of the house the shoots can be trained to the netting, and are thus secure. Although the Blackberry may not be considered a dessert fruit, it is eagerly sought after for puddings. The Alpine Strawberry could also be grown here. It could be planted along the sides of the paths, and would be prized during the autumn. If our hybridists would take up this Strawberry and improve it a valuable addition to our dessert fruits would be made.

#### DESCRIPTION OF FRUIT HOUSE.

The size of the house would of course depend upon the demand that has to be met, but the following is the method of erection. It should for preference be span-roofed, the posts for the side being about 9 feet long and about 6 or 7 inches in diameter, and if larch posts can be had about that size they last for a long time. Char the base, so as to preserve it as much as possible. Let the post into the ground about 2½ feet in depth, thus leaving about 6 feet above the surface. The posts may be placed 6 feet apart, and see that the tops are kept level. On the top of them place a cell plate, 4½ inches by 3 inches, bevelling off three-quarters of an inch to the inside, so that the water will readily run away. The rafters, which will be placed at the same distance apart as the posts, may be 4½ inches by 2 inches, using a ridge board 7 inches by 1½ inch. At every alternate rafter place a tie rod of half iron across the house to strengthen the whole. It will be necessary to leave a door at each end of the structure, and they should each be fitted with a lock. The netting suitable for covering is 1-inch mesh galvanised wire. This will exclude all birds likely to do any harm. The wire can be put on the length-way of the house, and the edges bound together with wire, making it fast with staples to all the posts and rafters. If considered desirable a covering made with two boards can be fixed at the ridge to protect the roller blinds from wet. The blinds for shading should be of canvas, such as that used for shading, only use the stout kind. Before the netting is fixed it would be well to paint the woodwork so as to protect it from the weather. The roller blind will be found useful in spring, when the trees are in flower, in protecting them from frost, and when the fruit is ripe in shading from bright sunshine, thus helping in the first place to ensure a better supply, also preserving it a longer time in perfection. The arrangement of the house will depend upon its width. If not exceeding 20 feet a path through the centre will be sufficient, but in a wider structure it would be advisable to make a central bed with a path round it, thus leaving a bed on each side. The large trees can by this means be kept in the centre of the house, and the bush fruit round the sides, the ends being planted with Blackberries. This would give ample space for full development.

#### PREPARATION OF THE SOIL.

In the preparation of the ground it is important to trench it thoroughly—viz, two or three spits deep, giving at the same time a good dressing of manure, with plenty of lime rubbish added to it. Where chalk can be had it may be substituted, that which has been pulverised by exposure to the weather being preferred. Wherever stone fruits are grown lime should form an essential element in their successful culture, many failures in Cherry, Peach, and Nectarine growing being traced to the want of this material in sufficient quantity in the soil. It therefore becomes important that simple details like this are not overlooked in making a fresh plantation. This also explains why stone fruit generally does so well on chalky soils. If the soil is too heavy more lime rubbish or chalk may be added as well as plenty of refuse from the fire heap where garden refuse has been burned, all of which will keep the soil open. On the other hand if the ground is light it is best to give a heavy mulching of cow manure.

Having thus prepared the ground laying out the beds will next demand attention. We may suppose for convenience that the house is 30 feet wide, which will allow of a centre bed being formed 12 feet wide, and in which may be planted Cherries, either trained on trellises

across the bed or as pyramids. If the former mode of treatment is adopted the trellises may be constructed under the rafters by placing a support at each side of the bed, and making the top secure to the rafter. The trellis may then be formed by wiring at 6 inches apart and by placing one under each pair of rafters; in this way a space of 6 feet is allowed between the trees, which will be found to be sufficient.

(To be continued.)

EVENTS OF THE WEEK.—A list on another page gives the Rose shows for the week, and it is only necessary to call special attention to the National Society's Metropolitan Exhibition at the Crystal Palace on Saturday, July 4th. The Royal Horticultural Society's Show and Conferences at Chiswick on July 7th and 8th are noted fully in two following paragraphs, as also is the Royal Botanic Society's Evening Fête on July 8th, while the annual dinner of the Gardeners' Royal Benevolent Institution the same evening is referred to at some length in our leading article this week. The Teddington Royal Horticultural Society will hold their twentieth annual Exhibition on Wednesday, July 8th.

— THE ROYAL HORTICULTURAL SOCIETY'S EXHIBITION OF SMALL FRUITS AND CONFERENCES will be held on Tuesday and Wednesday, July 7th and 8th next, in the gardens at Chiswick. Medals and money prizes are offered in the following classes—Eighteen bunches of hardy perennials, distinct; twelve bunches of hardy perennials, distinct; eight bunches of hardy perennials, distinct; six dishes of Strawberries, distinct, not less than thirty fruits to a dish; four dishes of Strawberries, distinct; one dish of Strawberries; collection of Raspberries; collection of Currants; two dishes of ripe Gooseberries, distinct; six dishes of green Gooseberries, distinct; new plants and flowers; new fruits and vegetables; three dishes of Peas, twenty-four pods each, of Sharpe's "Sir F. A. Millbank," Sharpe's "Queen," and Sharpe's "Triumph;" six varieties of Gaillardias, five blooms of each (silver Kelway medal).

— ON Tuesday THE CONFERENCE ON HARDY SUMMER-FLOWERING PERENNIAL PLANTS will commence at 2 P.M., and the papers to be read are as follows—Opening Address by Mr. W. Marshall, F.R.H.S., Chairman. "Some Results from Wild Gardening," by Mr. W. Robinson, F.L.S. "On Some of the Summer Flowers of my Garden," by the Rev. H. Ewbank, M.A., F.R.H.S. "Herbaceous Plants," by the Rev. A. Rawson, M.A., F.R.H.S. "The Picturesque of Hardy Summer Perennial Plants," by Miss Jekyll, F.R.H.S. Mr. Potter (of Messrs. Backhouse, York) has also been asked to read a paper. On Wednesday the Conference on Strawberries, Gooseberries, Raspberries, Currants, and other small fruits will also commence at 2 P.M., and papers to be read on that occasion are an opening address by Mr. G. Bunyard, F.R.H.S., Chairman. "Strawberries for Private Gardens," Mr. W. Allen, F.R.H.S.; "Strawberries for Forcing," Mr. G. Norman, F.R.H.S.; "Gooseberries for Private Gardens," Mr. D. Thomson, F.R.H.S.; "Gooseberries for Exhibition," Mr. C. Leicester; and "Raspberries," by Mr. G. Wythes, F.R.H.S.

— THE ROYAL BOTANIC SOCIETY'S EVENING FETE will be held on Wednesday, July 8th, when the following classes are provided. Division 1.—Natural Flowers, Fruit, &c.—Floral Decorations arranged for a Dinner Table 10 by 5. Ditto, ditto, dressed ready for Dessert. Foliage and Flowers suitable for a Sideboard. Ditto, ditto, Hardy Plants only. Group of specially Sweet Scented Plants. Group of Plants, arranged for the decoration of a Recess in a Room, for an Alcove, or a Fire-place. Standing Basket, Vase, &c., furnished with Plants suitable for growing in a Living Room. Hanging Basket, of any material, with growing Plants. Outside Window Box of Growing Plants for Summer; also another with Hardy Plants for Winter. Bridal Bouquet. Ballroom Bouquet. Bouquet, of other form than the usual circular. Group of Flowers, stalks in water, and neither tied nor wired. Arrangements of Flowers and Leaves for personal adornment, such as wreaths, chaplets, and the like, and also for use in dress trimming. Arrangements of Flowers and Foliage for the Decoration of Ballrooms. Miscellaneous.—Objects for purposes similar to the above but not coming strictly into any class. Division 2.—Works of Art.—Paintings, Drawing, Sculptures of Flowers,

Plants or Trees. Artificial Flowers. All exhibits in Division 2 must be at the Gardens a clear week before the day of the Fête for acceptance, and if accepted remain on exhibition during a clear week after the day of the Fête. Medals, and money prizes from £5 to 10s., will be offered in each class.

— THE *Times* of Saturday announced that "SIR GEORGE MACLEAY of Pendell Court, Bletchingley, Surrey, and Elizabeth Bay, Sydney, died at the Châlet des Rosiers, Mentone, last Wednesday, in his eighty-second year. He was a son of Alexander Macleay, formerly Colonial Secretary and Speaker of the Legislative Council of New South Wales. He was educated at Westminster, and was for many years a member of the Legislative Council of New South Wales. For his public services to that colony, as well as for assisting in Australian explorations, he was created a C.M.G. in 1869, and advanced to K.C.M.G. in 1875." To horticulturists Sir George Macleay was chiefly known through the exhibits of rare and remarkable plants occasionally sent from the gardens at Pendell Court, Bletchingley, where for some years Mr. C. Ross has had charge. Several of these have been illustrated and described in this Journal, the most recent being *Stapelia gigantea* at page 359, October 23rd, 1890.

— GARDENERS' ORPHAN FUND.—At a meeting of the Committee, held on Friday night last, the Secretary announced several promises of flowers and plants for the Floral Fête and Rose Fair, to be held at the Crystal Palace on July 15th, and it was thought that many gardeners and owners of private gardens would like to contribute Roses or other flowers for sale. Messrs. Molyneux and Sharman are vying with each other in getting the best possible cricketers for the national contest between gardeners and seedsmen on the occasion. All who are willing to send flowers are requested to communicate with Mr. A. F. Barron, Chiswick Gardens, London.

— DEATH OF MR. CHARLES PENNELL.—On the day after the publication of our last issue we received an announcement of the death of Mr. Charles Pennell of Lincoln, which occurred after a protracted illness on the 21st ult. Mr. Pennell was an able and high-minded provincial nurseryman, greatly respected far beyond the confines of his native city, of which of late years he was a trusted Guardian of the Poor. Some time ago he retired from the business in favour of his sons, who are well qualified to conduct it. The late Mr. Pennell greatly extended the trade of the firm and formed new nurseries, those at Bracebridge being about 80 acres in extent. He was a successful man, most courteous and kind to all with whom he came in contact. Mr. Pennell was sixty-five years of age.

— AMELANCHIER FLORIDA is useful amongst dark evergreen shrubs. The white freely produced blossoms form a good contrast with the shrubs below and its own green leaves. Three or five tall standards in a clump make a good show in spring. Although this tree flourishes in very strong soil without any special preparation, a little assistance in the shape of manure applied to the roots repays with a fuller crop of flowers and luxuriance of growth.—E.

— THE SCOTTISH PANSY SOCIETY, EDINBURGH.—The forty-seventh annual Exhibition of this Society was held June 19th at Edinburgh, and the Scotch growers were in fine form, a grand lot of blooms, and the best and largest gathering of flowers the Society has had. In the nurserymen's class for twenty-four Show Pansies, dissimilar, First, Mr. M. Campbell, Blantyre. Second, Mr. A. Lister, Rothesay. Third, Mr. John Smillie, Busby. For twenty-four Fancies, dissimilar, First, Mr. Lister. Second, Mr. Smillie. Third, Mr. Campbell. For six seedling Show Pansies. First, Mr. A. Irvine, florist, Tigh-na-bruaich, For twenty-four bunches of bedding Violas, distinct varieties. First, Messrs. Dickson & Co., Edinburgh. Second, Mr. Geo. Wood, Hawick. Third, Mr. J. Forbes, Hawick. The amateur and gentlemen's gardeners' classes were well filled and the competition keen; Mr. A. Ottar, Campbelltown, and Mr. J. Stewart Lenzie, taking leading positions.

— THE superiority of ELLAM'S CABBAGE over others is again apparent by the quick manner in which the plants are ready for use after they commence to grow, indeed its earliness is one of its recommendations, and "non-bolting" during growth is another which cannot be praised too highly. The late winter was a severe test for Cabbages; the frost of November 28th killed hundreds, and so did the frost and snow in the early part of March. In spite of these unfavourable conditions we commenced cutting compact Cabbages from an open bed on May 16th. Another point in favour of Ellam's Cabbage is its compact growth, rendering it especially suited for small gardens. The plants

may be placed out 1 foot apart each way. While many persons are complaining of their Cabbages bolting, I have not seen a single "runner" in our bed. The seed should be sown early in July.—A GARDENER.

— WOODBRIDGE HORTICULTURAL SOCIETY.—We are desired to state the above Society will hold their fortieth annual Show on July 9th, at which £150 is offered in prizes, also the National Rose Society's medals. Next year a 25-guinea silver eup will be offered for Roses.

— THE FRUIT CROPS IN KENT.—The annual sales of Cherries in Kent demonstrate more than anything else the scarcity of soft fruit in some districts this season. At a large sale near Sittingbourne last week an orchard containing 100 acres of Cherries failed to secure a single bid, whereas in former seasons the fruit on the same plantation has been known to realise £1200.

— TRADE ANNOUNCEMENTS.—We are informed that Mr. J. R. Petch, formerly with Messrs. R. Smith & Co., Worcester, has taken the business of Mr. J. Stevens at Saffron Walden, which he and his son will carry on as nurserymen and seedsmen. We also learn that Messrs. Backhouse & Son of York have secured Messrs. Booty & Co.'s nursery at Harrogate as a branch establishment.

— WEATHER AT LIVERPOOL.—A severe thunderstorm visited Liverpool last Wednesday and Thursday. The rain came down a perfect deluge, and it is a great many years since anything like it has occurred. On several days the heat was intense, and Peas with other vegetables are growing rapidly. The rain has had a beneficial effect in removing many insects and withered blossoms from the fruit trees.

— ANEMONE APENNINA is one of the most showy of the early spring flowering hardy plants. The extremely bright blue flowers are always appreciated. When once established it flourishes either in the border or on the rockery, but nowhere does it show to greater advantage than when covering the ground amongst standard Roses. Whether these are planted singly or in a mass it matters not. What could be more telling than a mass of this Anemone 6 feet over when in full bloom?—S.

— GARDENING APPOINTMENTS.—Mr. W. Seabrook, for several years foreman of the gardens at Aston Clinton, the residence of Cyril Flower, Esq., M.P., has been appointed gardener to Lord de Ramsey, Ramsey Abbey, Hunts. Mr. H. Dowding, formerly gardener at Little Gaddesden House, Berkhamsted, has been appointed gardener to the Bishop of Winchester, Farnham Castle, Surrey; and Mr. Joseph Lee, late foreman at Highbury, Birmingham, the residence of the Right Hon. Joseph Chamberlain, M.P., is appointed gardener to Earl Howe, Gopsal Hall, near Leicester.

— THE ESSEX FIELD CLUB.—The members of the above Club had a botanical ramble from Chelmsford to Maldon on Saturday last, June 27th. Directors:—Messrs. F. Chancellor, E. Durrant, and E. A. Fitch. The programme was as follows:—Leaving Liverpool Street Station (G.E.R.) by the 12.5 train (12.16 at Stratford, 12.42 at Shenfield), arriving at Chelmsford Station 1.1. Carriages left the Saracen's Head at 1.30, and the party (in company with members of the Essex and Chelmsford Museum, students' section—botany) were driven along the Baddow Road, and, alighting, walked up the fine avenue of old Oaks, Elms, and Beeches to "Great Graces," Little Baddow, an ancient and once important Manor House, taking its name from the family of De Gras. Then the ramble was commenced through Blake's Wood (110 acres), past "Old Riffhams" (Mr. Charles Smoother's), through "Holly Grove," the home of the Foxglove (Folk's-glove), over Lingwood Common, noting the extensive prospect, and through "Bell Hell Wood," concerning the origin of the name of which Holinshed tells a wild legend. Leaving this wood, they proceeded up the meadows to Danbury, and to the ancient and well-known hostelry called the Griffin, near Baddow (immortalised in these words in the introduction to "Waverley"), where tea was served at four o'clock. This is nearly the highest spot in Essex (366 feet above O.D.). The Club visited Danbury on August 13th, 1881. The early English church (St. John the Baptist) stands within the bounds of Danbury Camp, figured in Morant's "Essex," and more accurately by Mr. F. C. J. Spurrell in "Essex Naturalist," vol. iv., 138. The ancient and interesting features of the church were pointed out by Mr. Chancellor, notably the three cross-legged wooden effigies of crusaders, presumably the St. Clere family (*temp.* Edward I.), figured in Chancellor's "Ancient Sepulchral Monuments of Essex," plates 33 and 34. After tea the ramble was continued along the Rodney Road towards "Cherry-tree Cottage," then through "Fir-trec" and "Pheasant-house"

Woods, which include a large variety of forest trees, notably some fine Beeches, and where the Butcher's Broom is abundant. Across Woodham Walter Common, covered with Oak scrub and the home of the Lily of the Valley, the Sundew, Buckbean, Wood Pimpernel, many Ferns, and other interesting plants, such as the Deptford Pink and Golden Saxifrage. From a sandy knoll just outside the Common, once the home of the badger, an address was delivered, "Botany in its Relations to Geology," by Dr. J. E. Taylor, F.L.S., F.G.S., Editor of "Science Gossip."

— SUPERINTENDENT OF LONDON PARKS.—At a recent meeting of the London County Council a recommendation of the General Purposes Committee was considered to the effect that a salary of £700 should be offered for a Superintendent of Parks and Open Spaces. This was discussed at some length, but ultimately rejected by 41 votes against 40 for the proposal.

— FLORAL DECORATIONS AT WIMBORNE HOUSE.—On the occasion of Lord and Lady Wimborne's great dinner party and ball at Wimborne House, Arlington Street, on Wednesday, June 24th, the floral decorations were extremely tasteful yet simple. Upon the tables were large central and smaller surrounding stands filled with spikes of *Gladiolus Colvilli*. Sweet Peas, and *Cattleya* flowers, with *Asparagus plumosus* and *Pteris* fronds as the foliage, while upon the cloth were wreath of Sweet Peas and sprays of *Myrsiphyllum*. In the other rooms, the corridors, and conservatory were massive vases of handsome *Pæonies*, with some cut *Carnation* flowers; but the great feature was a beautiful bank of *Carnation Souvenir de la Malmaison*, arranged upon a broad mantleshef in front of a mirror, and margined with Ferns. The well-grown plants, their fine glaucous foliage and substantial flowers, were there seen to great advantage in their true characters. The gardener at Canford Manor, Mr. T. H. Crisp, has been as successful in the culture of these plants as he was in the extensive tree-lifting experiments carried out during last autumn and winter.

— PRUNING GOOSEBERRY AND CURRANT TREES.—I know many gardeners do not practise pruning Gooseberry and Currant trees at this time of the year, but I took the hint from the Journal several years ago, and have regularly followed it ever since. It has only one drawback that I know—it has to be done at a busy season, when everything else needs attention. Against this its advantages are—all the sap can flow into the fruit, and the remaining young growths for fruiting next year are exposed to more sun and air; also the fruit is better ripened and more easily gathered. Last, but not least, it is a much more pleasant operation in the summer than in the winter. All the young growths should be thinned to their proper distance, the under-growths and those throwing up from the centre of the tree should be taken clean away, and only the pruning needed in the winter will be to cut away some of the old wood on which the fruits are hanging thickly now, and consequently cannot be removed. I hope my Gooseberries and Currants will be all pruned by the time this is in print. I used to practise pruning Pear and Plum trees at this season, but now I am under the impression it is a mistake to do so before August. I thin the young growths by breaking them off clean where they are too thick, leaving the rest until they have stopped growing in August.—ALMA.

— SCARCITY OF EARLY STRAWBERRIES.—It is not often early Strawberries have been so scarce hereabouts as they have this season. At one time there was every prospect of the crops being both early and exceptionally heavy, but the frosts at Whitsuntide spoilt nearly all the bloom expanded or only slightly so, and it is entirely due to this unfortunate occurrence that the fruit has been, and up to the present time (June 25th) still is, so scarce. On June 22nd they were offered in comparatively small quantities at 1s. 4d. per lb. at Bristol, and in smaller towns they are selling readily at 4d. less, small and large fruit all going together. Our few hundred plants of Noble on a raised south border were well set with fruit when the frosts came, and these escaped; consequently, we were able to gather nearly 80 lbs. of fruit before we heard of anyone else having any ripe in the open. Even those who were disposed to find fault with the quality of Noble last season are now obliged to admit they were unwise in not planting it, and for one more season, at any rate, it will be the most extensively grown early variety in these parts. Nearly all the early blooms on the plants of other varieties in the open were destroyed by frosts, so that there will be but few very fine or moderately early dishes gathered from these this season, and I shall have to depend upon small fruit of Noble to keep up the supply.—W. I., Frome.

— HOYA CARNOSA is a capital plant for covering the back wall of a lean-to late vinery. The shade provided by the Vines, the heat and moist atmosphere necessary for Grape culture, appear to just suit this Hoya. Many persons hardly know what to grow to render walls of fruit houses ornamental, and especially vineries, where they are not only differently constructed, but are more densely shaded than Peach houses for instance. Planted in rough peat, leaves, and sand, and given abundance of water when in full growth, this Hoya will make shoots from 6 feet to almost double that length in one season when once established. Trained on wires close to the wall the trusses of bloom which are freely produced during the early part of June show to the best advantage, as owing to their pendent habit they require to be seen from below. One plant will perfume a whole house when closed in the evening, so powerful is the fragrance of the flowers. The less the blooms are cut the better for the next season's crop, as from the same base the flower trusses spring for next year. The low temperature to which late vineries are often subjected after the Grapes are cut does not interfere with the success of *Hoya carnosa* as long as frost is excluded from the foliage. The low temperature and thorough rest which the Vines receive in winter benefit the Hoya.

— WHITE AQUILEGIAS of the Munstead Giant type make a grand display in the herbaceous borders, where the flowers are well surrounded with greenery, which sets these Columbines off to the best advantage. I lately saw a splendid double variety which deserves to be considerably increased, so well did it look in the position named. It was not one of those compact close petalled sorts which are too neat to catch the popular taste, but one with enough petals to warrant its being classed as a double sort. The foliage of *Aquilegias* is in itself pretty, so many tints pervade the naturally glaucous hue of the leaves to render them attractive; besides this, the leaves last fresh a long time after being cut and placed in water.—M.

#### RICHMOND (SURREY) SHOW.

THE Exhibition of the above Society, held last week (June 24th) in the Old Deer Park, was in some respects superior to those which have preceded it, but in others, due mainly to the season, it was far below the usual standard. The entries were said to be more numerous than before, and the central one of the three marquees had been increased in length by 40 feet to accommodate the additional exhibits. One tent was devoted to floral decorations and Roses, the large one to specimen plants and groups, while a third contained the fruit, vegetables, and cottagers' productions. The quality was good throughout with the exception of the Roses, which constituted the weak portion of the Show, although last year it was the strongest. The season was so late that it was at one time feared no exhibit would be obtained in these classes at the date fixed. Happily the result was better than anticipated, and though the blooms were wanting in size and substance they were fresh and mostly bright in colours. The stove and greenhouse plants were much better than usual, and some fine specimens came from Pewsey, the Heaths in particular being very notable. Of the groups, which always form an attraction at Richmond, Mr. W. Brown, jun., again contributed the most tasteful arrangement, and he bids fair to rival his father's best efforts in decorative skill. There were also non-competing exhibits in numbers and of much interest, and altogether the Committee and officers had every reason to be satisfied with the display. During the afternoon the Duchess of Teck and her daughter visited the Exhibition, when there was a large attendance of visitors. A tent was also devoted to Roses and other cut flowers to be sold for the benefit of the Gardeners' Orphan Fund, and we shall expect to hear that the returns were substantial.

We can only briefly refer to the chief classes, in which the principal winners were as follows. Taking the tents in the order they were visited, amongst the Roses Mr. H. May, Bedale, took the lead with thirty-six blooms, and in the twenty-four blooms class Messrs. D. Prior and Sons, Colchester gained a similar position also with Tea Roses. The leading amateur exhibitors were Mr. C. Warwick, gardener to J. P. Kitchen, Esq., Manor House, Hampton; R. E. West, Esq., Reigate; Mr. W. Croker, gardener to W. Regester, Esq., Lawn Lodge, Isleworth; and Mr. John Parsons, gardener to T. Twining, Esq., Twickenham. A central table, the whole length of this tent, was occupied with stands of flowers, baskets, bouquets, and other floral ornaments, many showing great taste, and the competition was keen. Mr. T. Butcher, Norwood; Miss C. Cole, Feltham; Miss M. Mouflet, Castle House, Isleworth; Miss L. Wigan, Cromwell House, Mortlake; Mrs. W. Lang, Richmond; and Miss E. C. Clarke, Twickenham. Messrs. Perkins and Sons, Coventry, were, as usual, first with a bouquet.

In the next tent the groups arranged for effect were placed round the sides, the specimen plants in the centre. Besides the premier group from Mr. A. Brown, jun., Marshgate, Richmond, already referred to, Mr. H. E. Fordham of Twickenham, Mr. H. James of Norwood, Mr. J. Currey of Salisbury, exhibited distinct and handsome collections of plants well arranged. The six stove and greenhouse plants from Mr. J. F. Mould, Pewsey, Wilts, for which he was placed first, included three admirable Heaths, a *Bougainvillea glabra*, *Dracophyllum gracile*, and *Statice profusa*, all fresh and well grown. *Pelargoniums*, *Tuberous*

Begonias and Orchids, fine-foliage plants, and Ferns were represented by exhibits from the following :—Mr. Charles Turner, Royal Nurseries, Slough ; Mr. J. Wiggins, gardener to D. Baldwin, Esq., Hillingdon Heath ; Mr. G. Watts, gardener to H. Little, Esq. ; Mr. E. Coombs, gardener to W. Furze, Esq., Roselands, Teddington ; Mr. White, gardener to Mrs. Watson, Redlees, Isleworth ; Mr. J. Sallows, gardener to Miss Vaughan, Twickenham ; Mr. R. Mitchell, gardener to W. Cunard, Esq., Orleans House, Twickenham ; Mr. J. Currey ; Mr. W. H. Young, grower to F. Wigan, Esq. ; and Mr. J. Ryder, gardener to C. Young, Esq., Richmond.

The fruit classes were well filled for the season and the exhibits good, especially the black Grapes. The chief prizes were secured by the following exhibitors :—Mr. F. Debnam, gardener to A. Pears, Esq., Spring Grove House, Isleworth ; Mr. T. Barnes, gardener to W. S.

### NEW ANTHURIUMS.

FOR some years much attention has been paid to the culture of Anthuriums at the Dorking residence of Sir Trevor Lawrence, Burford Lodge, and from time to time we have had occasion to note the admirably grown plants and handsome novelties sent thence to the shows and meetings of the Royal Horticultural Society. Two others now demand attention, and they will take a prominent place amongst those already introduced. These were shown at the meeting in the Drill Hall on Tuesday, May 12th last, when the Floral Committee recognised their merits by the award of first-class certificates. The one of which

FIG. 2.—NEW ANTHURIUMS (REDUCED).

Graham, Esq., Abercorn, Richmond Hill ; Mr. W. Bates, Poulett Lodge, Twickenham ; Mr. George Clinging, gardener to W. Greenwell, Esq., Caterham Valley ; Mr. C. J. Waite ; Mr. T. Osman, gardener to L. J. Baker, Esq., Ottershaw Park, Chertsey ; Mr. J. Fanning, gardener to Mr. H. Pocock, East Sheen ; Mr. G. H. Sage, The Gardens, Ham House ; and Mr. D. Campbell, gardener to Dr. Wood, The Priory, Roehampton.

The best collection of twelve dishes of vegetables came from Mr. C. J. Waite, excellent samples ; and Mr. G. H. Sage won premier honours for nine dishes with clean, even, and creditable specimens. Special prizes offered by seed firms also brought several competitors.

The non-competing groups comprised Begonias, Orchids, and foliage plants from Messrs. J. Laing & Sons, Forest Hill ; greenhouse and other plants from Messrs. Cutbush & Son, Highgate ; Palms and fine-foliage from Mr. W. Ieeton, Putney Park Lane ; Violas and Phloxes from Mr. W. Chambers, Isleworth ; Roses from Messrs. Jackman & Son, Woking ; Odontoglossums from Mr. Cullimore, gardener to M. Cooke, Esq., Kempton Hill ; and greenhouse plants from Mr. Mould of Pewsey.

a spathe and leaf are shown on the left hand side of our engraving (much reduced) is *Anthurium burfordiense*, a variety of hybrid of the *A. Andreanum* type, but differing in colour, which is a rich shining crimson. The spathes are nearly circular, 7 inches in diameter, with a fine white spadix that affords a good contrast with the dark spathe.

The other variety shown on the right of the engraving, also much reduced, is *Anthurium Laingi*, which has broad spathes larger than the preceding and pure white ; the leaf also is very handsome, being deeply cordate, 18 inches long and 15 inches broad, of a rich green shade. The ornamental value of this plant is considerable, and in contrast with the preceding or any of the dark-coloured Anthuriums it is seen to excellent advantage. Like others of the family they need stove treatment, a light compost of peat and charcoal, with abundance of water during the growing period.

## ROSE SHOWS.

Now the Rose season has commenced it will be desirable to remind our readers of the dates of the principal gatherings. They are as follows:—

- July 2nd (Thursday).—Farningham, Norwich, Lee, and Brighton (second day).  
 „ 4th (Saturday).—Crystal Palace (N.R.S.)  
 „ 7th (Tuesday).—Diss and Gloucester.  
 „ 8th (Wednesday).—Dursley, Hitchin, Sutton, and Tunbridge Wells.  
 „ 9th (Thursday).—Bath and Woodbridge.  
 „ 11th (Saturday).—Eltham, New Brighton, and Reigate.  
 „ 14th (Tuesday).—Wolverhampton (a three-days Show).  
 „ 15th (Wednesday).—Ealing.  
 „ 16th (Thursday).—Hereford (N.R.S.), Bedford, Helensburgh, and Trentham.  
 „ 17th (Friday).—Ulverston.  
 „ 18th (Saturday).—Manchester.  
 „ 21st (Tuesday).—Christleton and Tibshelf.  
 „ 23rd (Thursday).—Halifax and Worksop.  
 Aug. 1st (Saturday).—Ripley (Derby).

We regret that the alteration of date of the Eltham Rose Show was not made in our standing list, and the original date, June 27th, was transferred to the list of events on page 509 last week. The correct date of the Show is July 11th.

## TEA ROSES AT WESTMINSTER.

IN the account, on page 509, of the National Rose Society's early Show of Tea-scented Roses, the opening sentences (lines 4 and 5) contain a statement to the effect that the blooms exhibited were "cut chiefly from under glass." This strikes me as a most unfortunate remark, calculated largely to defeat the main object of the Show, which is no doubt partly designed to make more generally known the earliness which characterises the blooming of the loveliest of all Roses out of doors, for I imagine that of the blooms staged in the Drill Hall last Tuesday those that had been grown under glass might have been counted on the fingers of one hand.—T. W. GIRDLESTONE.

[We are glad to learn on such good authority that the clean, fresh, and beautiful blooms exhibited had been produced without the aid of glass protection. Mr. Girdlestone is supported by another eminent rosarian, who states that not one of the blooms had been grown under glass.]

## LARGE GROWERS AND SMALL CLASSES.

THE note in your last issue over the well-known signature W. R. Raillem, revives the vexed and still unsettled question which I have ventured to put into the above form. The letter, and the determination which it expresses, are quite consistent with the position taken by your correspondent in opposition to "An Exhibitor," myself, and others on a previous occasion; but I ask leave to point out that this position is an absolutely unfair one, and fully bears out the contention that the small grower is very severely handicapped; that, in fact, he has no guarantee that his fellow competitors shall be men of his own calibre, but he is exposed to the attacks of those whose stock of plants, time at disposal, experience, and other points of equipment are sufficient to completely "swamp" him. Upon the principle *qui s'excuse, s'accuse*, the letter of your correspondent completely admits all this, for it is obviously penned with the desire to anticipate the very reasonable objection which would be offered to the idea of such growers competing in the smaller classes.

We all know that, until the last week, the season has been a most trying one for our Roses, but this only makes it the more unfair for large growers to show in the small classes; for if these gentlemen with their big battalions and the assistance they can command have been hard hit, how have the men fared who have but small stocks, and who are dependent upon their own hands for their cultivation? No, sir, the principle of showing in whatever classes one likes according to the exigencies of a particular season is an unjust one. When once a man has developed ability to show and win in a large class he ought not to be allowed to drop down into a small one unless he has, at least, proportionately reduced his stock.

Let us look how the principle works out. W. R. Raillem claims the same licence for other growers as for himself—that is, that exhibitors in the class for forty-eights last year may show in the twenty-fours this year. Well, then, I suppose the thirty-six and twenty-four men may drop down into the twelves; the former exhibitors of twelves go down to the sixes; and then what is the small, bonâ-fide amateur, who with difficulty can muster six good blooms from his small stock, to do? Simply drop out altogether, or else stand to his guns and be "wiped

out" by such powerful antagonists as your correspondent. For, be it borne in mind, if the rules of the Society and the ethics of good taste will allow a man to drop from forty-eight to twenty-four under the pressure of certain circumstances, the same principle (or lack of it) will cause him to go to the very smallest classes under more severe pressure, and all this is unfair to the small man. The editor of the "Rosarian's Year Book" has more than once referred to this sort of thing, and, if memory serves me, has said of such an exhibitor, "he ought to be ashamed of himself!" I hope he and the N.R.S. will continue this attitude, and also adopt some means of protecting the small grower from his more powerful confrères.

By the time these lines appear the Palace Show will be upon us, and I shall look anxiously to see if your esteemed correspondent has come to a nobler frame of mind and is in his old place. I wish him every success there.—J. B.

## ROSE NOTES.

FEW Roses make a richer display during the early part of June on a wall, and especially if it has a south aspect, than the old Crimson China or Bengal Rose of the Indica type. The colour of the blooms which are profusely borne in clusters is intensely rich, shown to great advantage by the dark green of its own foliage with which the branches are freely covered. Rambling over the walls of cottages are many specimens of this old Rose. Indeed it is surprising how well they succeed, considering the treatment many receive, all current growth being cut in close from where it started with a hook directly flowering is past; new shoots are then made which have time to become partly ripened before winter sets in. From these the new growth and flowers are produced the following year.

Amongst June-flowering Roses there is none more lovely than the Persian Yellow when growing by itself, given space enough for it to develop evenly into a thoroughly rounded bush, which it does with little or no pruning; all it needs is space, and a yearly supply of flowers will result. Growing on grass no lawn plant could look more handsome than this neglected Rose. I lately saw a bush 6 feet high and as much thorough densely clothed with flowers. For cutting singly the stalks are too short, but in clusters, using the branches a foot or more long, a good effect can be made in a large vase. Those who have not tried this old favourite in the manner named should certainly do so.

Captain Christy is one of the best Roses for culture in pots in a small state, say plants to carry from five to eight blooms. As a decorative plant in a small pot this Rose is second to none. The fine tinge of colour which this variety carries in the centre of the blooms renders it simply charming. Under glass, too, the colours are very pure.—E. M.

## THE MIDLAND COUNTIES' PANSY SOCIETY.

THE first of what is to be an annual meeting of this new Society was held in Birmingham, June 24th, and was in every way a pronounced success, a very large number of blooms being staged, and several of the leading growers from Scotland attending and exhibiting—Mr. Cuthbertson, Messrs. Dobbie & Co., Mr. Campbell, Blantyre; Mr. A. Lister, Rothesay; Mr. Irvine, Tighnabruaich; Mr. Smillie, Busby, being present and competing. Mr. Charles Kay, Gargunnoch, sent his blooms, and Mr. Bai'cy, jun., Sunderland, and Mr. Hy. Brooke, Durham, both attended and competed. Several exhibitors in the more distant parts of the Midlands, and many growers in the nearer districts of Birmingham competed.

The Exhibition was originally fixed for the 10th, but owing to the season being late the Show was postponed until the 24th, so as not to clash with York on the 17th and Edinburgh on the 19th, but the hot sultry weather of a few days before the 24th had terribly tried Pansy blooms, and many could not exhibit stands they entered. Had the weather been cooler, as it has been since, the Central Hall, and it is a good sized one, would scarcely have held the blooms.

In the open classes to trade growers and others in eight midland counties, Messrs. Pope & Sons, The Nurseries, King's Norton, were first with fine blooms in the class for twenty-four Fancies; Mr. Pemberton, florist, Walsall, second; and Mr. George East, Leicester, third. For twelve new Fancy Pansies, sent out in the autumn of 1889 and subsequently, Messrs. Pope was first and Mr. Pemberton second. In the other classes in this section the prizewinners were the two exhibitors named; and Mr. Henry Hughes, a Birmingham amateur, secured the first prize for six seedlings not yet sent out.

In section 2, open to amateurs and gentlemen's gardeners only in the eight counties, there were numerous exhibitors. For twenty-four Fancies and eighteen Fancies Mr. A. C. Christie, Shifnal, was first, Mr. Egginton, Wolverhampton, second in each of the classes, others taking third and fourth prizes. For twelve Fancies.—First, Mr. H. Hughes. Second, Mr. W. Fletcher, Powis Lee Farm, Shifnal. Third, Mr. George East. Fourth, Mr. Fowler, Frasley, Tamworth. The several other classes were well filled, Mr. A. C. Christie being a leading winner. A section for amateurs in the midland counties who have never won a prize was arranged to induce amateurs to become exhibitors, and in the various classes Mr. Fowler; Mr. Thomas Woodward, Stoke Green, Coventry; Mr. E. Hill, Bulwell, Nottingham; and Mr. H. Hill, Small Heath, were the leading prizewinners.

The section, however, which created the greatest interest was that open to all comers, and here the great growers met in friendly rivalry. There were seven entries for forty-eight blooms. Mr. Smillie, florist, Busby, near Glasgow, first; Mr. A. Bailey, jun., Sunderland, second; Mr. M. Campbell, Blantyre, third; Mr. A. Irvine, fourth.

For twenty-four Show Pansies.—First, Mr. Bailey. Second, Mr. Smellie. Third, Mr. Campbell. Fourth, Mr. Irvine. For twenty-four New Fancy Pansies.—First, Mr. Smillie. Second, Mr. Irvine; and for six new Fancies of 1890 and 1891, first Mr. Smillie, second Mr. Irvine. Several seedlings by local growers were staged for certificates, but only one was awarded to Mr. James Simkins for "Baccarat" in the style of Allan Ashcroft; Mr. Henry Hughes staged a good variety—Mrs. R. Niven, which almost obtained a certificate. Amongst several of the new sorts to be sent out from Scotland the following are decided acquisitions, many of them from Mr. Irvine—viz., Nellie Cook, May West, John Cook, Mrs. A. Irvine, John Morris, Minnie Tate, W. H. Gabb, Lizzie Irvine, Lizzie Forrest, a very fine yellow with superb blotch. Of the numerous sorts recently sent out the following were very fine:—Helen Christie, Tom Travis, Adolph Wertier, Teenie Mitchell, Maggie N. Scott, Miss Hudson (very fine everywhere), Mrs. Hugh Weir, Wm. Ross, F. R. McDonald, Mrs. W. Dean, George Anderson (so many grand blooms), Mrs. J. McConnell, William Caldwell, John Taylor, James Simkins, Mrs. Archer, Mrs. Freeland, Lord Hamilton, Mrs. M. T. Atkinson, Peter Strachan, Kate McArthur, Agnes Mabel, David Rennie, Donald Morrison, Alexander Ottar, J. J. Ashton, Mrs. R. Niven, and Alice Russell.

Messrs. Dobbie & Co., florists, Rothesay, staged a very fine display of Violas and Pansies, 100 well made up sprays of the former, fully sixty varieties, and 200 blooms or more of Fancy Pansies. These occupied a long table at one end of the room. Some of the most noticeable of the Violas were Duchess of Sutherland, Columbine, Goldfinch, Countess of Elgin, very distinct and fine; Lucy Ashton, a darker coloured Columbine; Lass o' Gowrie, a flower in the style of Mrs. Cobham; and Princess Beatrice, but distinct from either, to which a certificate was given; Annie King, a charming white, shaded with blush pink, to which a certificate was given; Mrs. Bellamy, Duchess of Fife, Bullion, Abercorn, Beauty, Gipsy Queen, Evelyn, Mrs. Grant, a beautiful shaded blue; Ada Adair, Mina Baxter, and The Mearns. A handsome gold medal, presented to the Society by Mr. Paul Lutz, was awarded to this fine collection. Amongst the Pansies were several fine blooms of Miss Hudson, a grand white self Fancy with superb blotch; a very fine bloom of David Rennie, Lord Hamilton and George Anderson, both very fine; Donald Morrison, Maggie A. Scott, Archie Buchanan, and Mrs. John Downie. Mr. W. H. Gabb, Small Heath, took the first prize for twelve bunches of Violas, and Violas are fast coming to the front at all Pansy shows. They richly deserve it, and as exhibited by Messrs. Dobbie & Co. here, are not so stiffly set up as at York.

My official duties as Secretary unfortunately prevented my taking the notes I intended, so that several flowers of great merit have to be passed without notice. This I greatly regret. The Exhibition was all round of a highly satisfactory character, and the Committee intend at once preparing the schedule for next year, as a strong wish was so generally expressed that the Society should continue its operations and on a more open and larger scale. We shall be very glad to receive suggestions and offers of support from any person interested in the culture of the Pansy.

Messrs. Thomson, nurserymen, contributed a handsome group of plants and memorial arrangements of flowers, which helped the Exhibition materially. Messrs. Hewitt & Co., Solihull Nurseries, contributed a fine lot of ornamental and flowering plants for the table, before which the Pansies were arranged, also a fine display of cut herbaceous blooms; and Messrs. Pope & Sons, nurserymen, sent some superb new Gloxinias and other plants; and Mr. Vertegans, nurseryman, the lovely Genista Andreana, Romneya Coulteri with very large, handsome white fragrant flowers, and other plants. An assortment of the Imperial Pansy trays on stands of various sizes were sent by the Imperial Hollow Ware Company, and will be welcomed by exhibitors, as a lid is added which closes down upon the blooms so that they can travel safely.—W. D.

### MUSHROOMS.

HAVING read Mr. Bennett's remarks in your Journal of June 11th on Mushroom Growing I send you a photograph of my Mushroom bed taken on May 27th last. It is a ridge bed, 26 feet long, 3½ feet wide, and 18 inches high, made in a cool shed, and contains 2½ tons of manure. The first gathering was on May 15th, and up to June 15th 133 lbs. have been gathered. I append cost, &c., which I think will compare favourably with Mr. Bennett's statement. I may here state that the bed is now in full bearing and likely to continue so for some weeks: 40 lbs. were gathered on May 27th, and 30 lbs. on May 29th. I have other beds just come into bearing which look equally as promising, and I shall have much pleasure in showing them to anyone interested in Mushroom growing. The spawn was supplied by Mr. George. Although my average is only one-half of Mr. Bennett's, the result is more satisfactory for one month's gathering. Of course the time of year will account for the low average compared with Mr. Bennett's, and also for getting

heavier crops. I cannot give cost of labour as it was done at odd times. I also enclose sample for you to see.

FIG. 3.—A MUSHROOM BED AT PUTNEY.

### WINCHESTER ROSE SHOW.

JUNE 30TH.

A VERY good Exhibition was held in the Guildhall of this ancient city on the date above named. The blooms were not large, nor were all the classes well filled, but many stands were beautifully fresh, especially, perhaps, those of Dr. Budd (Bath), Mr. B. R. Cant, Rev. J. Pemberton (Teas), and Mr. F. W. Flight.

In the class for forty-eight distinct blooms—First, Mr. B. R. Cant, Colchester, with medium-sized flowers, fresh and of good colour. Duchesse de Vallombrosa, Général Jacqueminot (rich), Gustave Pigeneau, Princess of Wales, Caroline Kuster, Prince Camille de Rohan were the best. Second, Mr. C. Turner, Slough, larger but not so good in quality, Hon. Edith Gifford, Souvenir d'Elise Vardon, and Earl of Pembroke being the most noteworthy. Third, Messrs. D. Prior & Son, Myland Nurseries, Colchester.

Twenty-four distinct (trebles).—First, Mr. B. R. Cant, with a very fine collection, the blooms very good in form, colour, and freshness. Ulrich Brunner (rich), Anna Ollivier (full), Mdme. Gabriel Luizet (exquisite), Général Jacqueminot, Duke of Edinburgh (excellent), Souvenir d'Elise Vardon (full), Mdme. Cusin (deep colour), Dr. Sewell, Rubens, Niphotos, and Mdme. Bravy were very fine indeed. Mr. C. Turner was a good second with heavier blooms. Mdme. Gabriel Luizet, Alba Rosea, La France, Marie Baumann, and Earl of Pembroke were particularly meritorious. Messrs. D. Prior & Sons third.

Twelve Teas or Noisettes, trebles.—First, Messrs. Keynes, Williams, and Co., Salisbury, with neat blooms. There were no other competitors in this class. In the amateurs' classes for twelve Teas or Noisettes the Rev. J. Pemberton out-distanced his competitors with a very good stand. Second, Dr. S. P. Budd, who followed closely. Third, Mr. F. W.

Flight, Twyford. Six Teas or Noisettes, trebles.—Mr. P. G. C. Burnand, Wray Park, Reigate, first with small blooms.

Twenty-four distinct Roses, open.—First, Dr. S. P. Budd, 8, Gay Street, Bath, with blooms of excellent form and colour, but not large: Le Havre, Etienne Levet, Marie Baumann, Alfred Colomb, A. K. Williams, Horace Vernet, Charles Lefebvre, and Louis Van Houtte (rich) being the leading varieties. Second, Messrs. Keynes, Williams, & Co. Third, Mr. Charles Kent, Clifton Cottage, Haylands, Ryde. Twelve distinct trebles.—First, Dr. S. P. Budd, who won easily with beautiful fresh blooms, good in form and colour, A. K. Williams, Horace Vernet, Alfred Colomb, Abel Carrière, Marie Baumann, Captain Christy, Mrs. J. Laing being admirably represented. Second, Messrs. Keynes and Co.

Twenty-four distinct, not open to nurserymen.—Dr. S. P. Budd was well first with even blooms, good in colour and form. The Rev. J. Pemberton was a good second, but with rather loose blooms. Third, Mr. F. W. Flight. Twelve distinct trebles.—First, Mr. F. W. Flight with small neat blooms, La France, Dr. Sewell, Madame Gabriel Luizet, and A. K. Williams being the best in the stands. Second, Rev. J. Pemberton. Twelve distinct, six Teas or Noisettes, and six Hybrid Perpetuals.—First, Dr. S. P. Budd, Souvenir de Thérèse Levet being richly tinted; an excellent stand. Second, Mr. F. W. Flight. Third, Mr. P. G. C. Burnand.

Twelve blooms of one variety, Tea or Noisette.—First, Mr. B. R. Cant with Niphotos, large, but rather loose. Twelve H.P.s, one variety, light.—First, Mr. C. Turner with La France, very fine. Second, Mr. B. R. Cant, with Madame G. Luizet, small but good. Twelve H.P.s, one variety, dark.—First, Dr. S. P. Budd with Marie Baumann, medium size, good in form, but pale in colour. Second, Messrs. D. Prior & Son with Fisher Holmes, small, but well coloured. Some other exhibits cannot be described this week.

#### HARDY FRUIT GARDEN.

**LAYERING STRAWBERRIES.**—Lose no time in attending to this as soon as the runners are large enough to be fastened down. The main point to be observed in order to procure a good crop of fruit the first season is to plant early, and to have the plants as strong as possible. Small 60-sized pots are the most convenient for rooting the runners in, and the earliest and best runners are always to be found where the plants are kept specially for stock purposes, and not allowed to fruit. A good soaking of water occasionally about the old plants will also assist materially in starting the runners into growth, and will make them more vigorous. Fill the pots with light loam, or a mixture of heavy loam and leaf soil, and place them in groups about the beds for convenience of watering. Small stones about half the size of the tops of the pots are the best to secure the runners down, as they tend to keep the roots cool and moist; but some persons use pegs with almost equal success. Unless the stock of any variety is limited it is not advisable to lay more than one plant from each runner, and the growing point should be pinched off closely at once; but where it is necessary to obtain every plant the secondary ones may remain for a few days until large enough to remove, and then be dibbled in under handlights behind a north wall. Where the young stock has to be raised from beds of bearing plants place the runners in alternate rows only, so as to leave room for gathering the crops. In all cases provision must be made for convenience in watering, as good plants cannot be had without plenty of moisture, and require daily attention in this respect. Many people use pieces of turf for rooting the runners in instead of pots of soil, and this system has several advantages over pots if the young stock is only required for planting out. It has one great drawback also: if the turf has not been stacked long enough to kill the roots of grass and weeds they will soon spring up after planting, and cannot be removed without greatly disturbing the plants. The pieces of turf should be at least 2 inches thick and 3 inches square. They are placed close together grass side downwards, and a small portion of the soil has to be removed with a trowel when laying the runner, the latter being fastened with a stone or peg. As soon as the runners are cut the turves, with the young plants, are planted intact in the new beds. Where good turf composed of light loam is easily obtained, this is a capital plan for raising young plants for outside purposes.

**APPLES AND PEARS.**—*Thinning the Fruit.*—Any trees that have set fruits too thickly may now be thinned, leaving the largest fruits and those that are most exposed to the sun and air. Young trees, especially those planted within the last two years, need close watching in this respect, and only one or two fruits should be left on these to prove if they are true to name. Cordon trees and any intended to grow fruit for exhibition must be well thinned. It is better to grow one fruit worth storing than to have three which are only large enough for the pigs. Be on the watch for red spider and aphids, and syringe with

Gishurst if any appears. Good fruit cannot be had without large healthy foliage. Give sewage liberally in dry weather wherever there is a good crop of fruit.

**GRAPE VINES.**—As these are growing freely stop all shoots two joints beyond the bunch unless they are required for next season's fruiting or for covering more space on the wall. In warm districts outdoor Grapes do well on the long rod system, training in four or five of the strongest shoots every year and growing them at full length during the summer, but in colder parts of the kingdom these long shoots do not ripen their wood, and the crop of fruit has to be obtained from the old wood year after year by spurring the young growth in closely. Outdoor Vines would in many instances succeed much better if the shoots were thinned out more during the summer in order to admit more sun and air to the remainder.

#### FRUIT FORCING.

**VINES.**—*Early Vines.*—Syringe those well from which the fruit has been cut to preserve the old foliage as long as possible in a healthy condition, for when the leaves fall early second growth not unfrequently sets in when they ought to be resting. A moderate extension of the laterals will usually prevent premature ripening of the foliage, and will not do any harm; but irregularities of growth and particularly gross ones, should be checked by pinching or be entirely removed. Admit air to the fullest possible extent, and maintain moderate moisture in the border, particularly at the surface, so as to keep the roots there instead of allowing it to become dry, and so causing them to descend in quest of moisture. Weakly Vines may have liquid manure occasionally, which will help the Vines to retain the foliage, and assist them in plumping the buds and storing the matter in the adjacent wood.

*Grapes Ripening.*—Directly the Grapes begin colouring afford plenty of air, a little fire heat being essential to the higher perfection of the fruit, especially as regards flavour, insuring a circulation of rather dry air, but a fair amount of atmospheric moisture is necessary for the swelling of the Grapes and preservation of the foliage in health. Allow the temperature to fall to 65° at night, otherwise securing a temperature by artificial means of 70° to 75°, and 80° to 85° through the day for Black Hamburgh and similar varieties with sun heat. Muscats should have a night temperature of 70°, 75°, to 80° by day from fire heat and 85° to 95° with sun heat. Inside borders require a thorough supply of water or liquid manure, enough to reach the drainage, and a light mulching will keep the surface moist, also preventing undue atmospheric moisture. Outside borders must be watered if the weather be dry, using the water or liquid manure in a tepid state.

*Grapes Stoning.*—Dull and cold weather is the worst possible for scorching and scalding. Early ventilation by allowing the moisture to evaporate and the atmosphere to gradually warm prevents scorching, and a gentle warmth in the hot-water pipes with a little ventilation at night and free ventilation by day are the best modes of avoiding scald. It is not desirable to close early at this critical period, but do so carefully; and as the liability to scald does not extend over a period of more than a fortnight to three weeks give particular attention to ventilation. In bright weather succeeding a dull and cold period there is most danger of scorching, and with the modern system of large panes of glass there is absolute necessity at such times of a slight shade from bright sun. A double thickness of herring nets over the roof lights is very beneficial, and affords all the shade required.

*Grapes Swelling.*—Maintain a genial condition of the atmosphere, securing it by a gentle heat in the hot-water pipes, and sprinkle available surfaces in the morning and afternoon, particularly the latter at closing time. Keep the border mulched with short, rather lumpy stable manure, not thick, a couple of inches sufficing, additions being made from time to time so as to secure a supply of ammonia to the atmosphere and nutriment for washing into the soil each time the borders are watered. The mulching should be kept moist, and where it is not convenient to add fresh horse droppings sprinkle the floors, borders, &c., occasionally in the evening with liquid manure. Urine diluted with six times its bulk of water, or guano, 1 lb. to 20 gallons of water, gives out sufficient ammonia for the health of the foliage, and it is inimical to red spider. Avoid a close atmosphere, particularly in dull wet weather. A little ventilation at the top of the house at night will make all safe, but it is desirable to close the house in the afternoon, damping well at the same time, allowing the temperature to rise to 90° or 95°, and after six o'clock provide a little ventilation at the top of the house, as it will prevent excessive deposition of moisture through the night, and the foliage will not be so nearly liable to scald should the sun act powerfully on it before the ventilation is increased, which it ought as soon as its rays act on the structure sufficiently to raise the temperature. Early morning ventilation is the best preventive of scorching. A night temperature of 65°, and a genial warmth of 70° to 75° by day, will be sufficient by artificial means to keep the Grapes steadily progressing in dull weather. Increase the ventilation between 70° and 75°, allowing it to advance to 80° or 85°, and close so as to raise it to 90° or 95°. Permit a steady growth in the laterals, but never allow large extensions which must afterwards be reduced. Avoid overcrowding, not allowing the laterals to interfere with the principal leaves, for upon the free access of light and air depend their elaborating power, and the more these assimilate the crude material the healthier the Vines are, and more food stored in the Vines for the succeeding year's crop. It also is essential to the formation of the coming Grapes in embryo in the buds.

Supply efficient waterings or liquid manure as required, or afford surface dressings, and water them in with tepid water after having made the border thoroughly moist. Outside borders must not be neglected, but have copious waterings where the rainfall is insufficient. Mulch the borders lightly—heavy mulchings do more harm than good. A little fresh stable manure, 1 to 2 inches thick, will lessen evaporation, and from its lumpy nature not deprive the soil of the beneficial action of air, warmth, and the moisture of dew and rain.

**CUCUMBERS.**—A few seeds may now be sown for late summer and early autumn fruiting. The plants from this sowing will be fit to place out in about a month. They do well in frames, and come in useful where plants from having been in bearing some time are exhausted. Plants in bearing must have attention in thinning exhausted growths, removing bad foliage, stopping, tying, and regulating the growths so as to keep up a succession of bearing wood. Add a little fresh soil to the surface from time to time, and light mulching of stimulating material. Syringe at closing time, and maintain a good moisture all day; it is infinitely better than shading. Avoid too much moisture in dull weather, it only makes the growths soft and the foliage more susceptible of injury on a bright period ensuing. Afford liquid manure copiously once or twice a week, according to circumstances. Close early at 85°, and so as to gain 5° to 10°, and only employ fire heat to prevent the temperature falling below 60° at night. Avoid overcropping, especially of young plants, and do not allow the fruit to hang too long, as these exhaust the plants and prevent in a great measure a good and continuous supply.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### SUPERING.

I HAVE as yet deferred putting on supers, but now that rain has come honey will be more abundant. The moment the flowers are profuse supers will be put on, and I am certain that all will be occupied by bees immediately they are in place. Bees never refuse to enter supers when given at the proper time. A little experience is required to be able to know the exact time; this is whenever the hive is full of bees and combs, and the latter filled with brood, honey, and pollen, but not before. The extra heat, when supers are being filled, prevents chilling of the brood.

The Stewarton system of supering is to put in the third box for a day or two, then take it away, putting the supers on at the same time. We used to regulate the slides according to the weather, giving good space when a honey flow was in, and when rain or non-honey weather came closing them all but a bee space. With the slides and the three boxes or divisions the bee-keeper has full control of his bees and supers, and the latter rarely contain brood, and in competition with supers on other systems have seldom if ever been beaten.

If a hive should at any time swarm do not put the bees back, but hive them into one division if the weather is fine with one cover of supers. These will be filled with beautifully white honey. At the end of eight days excise every royal cell except one good one from the old stock, but it is well that there be a spare nucleus at hand to insure against loss of queen. Premising the weather continues fine depose the queen of the first swarm, and on the following day return the swarm, its supers, and frames to the old stock, sprinkling both well with thinned honey. Never attempt to return swarms until the stock has been deprived of all its queens less one, or depending upon one from the returned swarm.

Never join two second or after swarms until there is only one queen, or very likely a swarm will issue, or, perhaps, all the bees will leave. Do not attempt to join an alien queen or queen cell to an old stock till after the laying queen has left eight days. No queen, whether caged or not, is safe till that time has expired, but after that a queen may be given at any time without any precaution whatever; but in all cases where a valuable queen has to be introduced use a cage. My safety cage, now used for nearly thirty years, is placed upon the top of the hive, and is nearly two cages of perforated zinc an eighth of an inch apart, so as to prevent the bees injuring the queen, but allowing them to fraternise. Modern bee-keepers have not yet used the double cage.—A. L. B. K.

## FOREIGN BEES.

### METHODS OF CONTROVERSY.

WE are requested to publish the following letters, and have no hesitation in doing so under the circumstances, though possibly Mr. Russell's reply to "Expert" may yet appear in the pages of our contemporary to which it was addressed.

#### MR. RUSSELL'S FIRST LETTER (PUBLISHED).

Some time ago reference was made by "A Lanarkshire Bee-keeper" in the pages of the *Journal of Horticulture* to the condemnation of foreign bees by "Expert" in a contemporary. "A. L. B. K." suggested, as I was the person who sent him the cutting, that I should write to the Editor of the said contemporary, asking what experience "Expert" had with the foreign bees he had condemned. I did so, and enclose you a copy of "Expert's" reply, which appeared in the journal referred to. I wrote a rejoinder, but this the Editor has not published. I should feel obliged if you would publish it, as well the copy of "Expert's" letter, both of which I enclose.—C. RUSSELL, *Ingmire Hall*.

#### "EXPERT'S" REPLY (PUBLISHED).

In reply to Mr. C. Russell, will he kindly mention with what particular statement as to the Ligurian, Carniolian, or Cyprian races he disagrees, and in what way the Punic race has proved so valuable? My experience, as given, is borne out by most of our advanced bee-keepers, and opinions have long been inclining in favour of our native bee, as being best constituted for our variable climate, more controllable as regards swarming, and giving the largest and best yields of honey. I have not kept Punic bees, but this race come from a district bordering on the Sahara Desert, and I fail to see how they can be suitable to our comparatively cold climate. They are said also to gather a great deal of propolis, or anything sticky, as a substitute, which is very objectionable, and like other foreign races to be great breeders, another objection, as after all it is honey, not bees, that we want.—EXPERT.

#### MR. RUSSELL'S REJOINDER (UNPUBLISHED).

Your correspondent "Expert" entirely evades my question, and I assume he is either unable or unwilling to give a clear answer. I read for information, and I am sure most people will agree with me that this should come from experienced persons. Now, according to "Expert's" own showing, what he teaches is second-hand. It is a fact that out of every hundred bee-keepers not more than five condemn foreign bees, and this small percentage when investigated was found to either have had no actual experience with them or had not managed them properly. I am willing if desired to mention a few names of persons who know how to manage foreign bees, and have had great success with them, not only in this country but throughout the continent and America. What does your correspondent mean by "They are said also to gather a great deal of propolis or anything sticky as a substitute?" As a substitute for what? He is quite right, the Punic bees are great breeders, and are as great honey gatherers, but "Expert" is entirely wrong in saying they are tender; they are very hardy bees. I have no interest in the sale of bees or bee appliances. The following extract from a letter from a friend is to the point and is reliable, and he like myself has no interest in selling the bees.

"The season has indeed been untoward and protracted, yet notwithstanding all my hives are in a forward state, Carniolians, Syrians, Cyprian crosses, Ligurian, and Punic; the latter are a treat to see working. They gather honey when other varieties do not, and are pretty builders and fillers of comb. Superior as the other races are over the old blacks, these Punic bees are superior to those mentioned above. Their great hardiness alone for such cold springs as we have had for some years past is sufficient to recommend them."

I would like to hear how "Expert" can control swarming with the old black bees more than with the other varieties, and, moreover, would like to learn where the pure black bee is to be had in Britain. Queens mate at a distance (bee-flight) of five or six miles, and where is there a place the black bee is isolated more than that from the influence of the superior foreign but much-maligned good honey gathering bees. Stick to your own experience, and give us reliable information, which all desire.—C. RUSSELL.

[We cannot understand why this letter is not published, and are loth to believe it will not be published in the contemporary to which it was addressed. It is a very proper letter under the circumstances, and was called for by the one preceding it. It is in our opinion the best letter of the series, practical and precise, in which the writer has obviously no motive but to elicit the truth.—ED. J. H.]

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Tobacco** (*A Constant Reader*).—Kindly oblige with your name and address, not for publication, but in accordance with the rule that relates to the answering of such questions.

**Currant Bud Insects** (*W. K.*).—We are obliged by the two boxes of specimens, which shall be carefully examined by our entomologist, and replies given as soon as practicable.

**Vine Weevils—Apple Scab** (*G. A.*).—Thanks, the word "scale" in the seventh line from the bottom of the second column, page 504, ought to have been "scab," and obviously the weevils referred to were *Otiorhynchus*, but the writer omitted to say so.

**Royal Horticultural Society's Meetings** (*G. G.*).—The next meeting of the Committees will be held at Chiswick in connection with the conferences on hardy summer flowers on the 7th inst., and on various bush and small fruits on the 8th. You had better write to Mr. A. F. Barron, R.H.S. Gardens, Chiswick, London, indicating the produce you intend sending, and he will give you all requisite instructions.

**Vinery Boiler** (*M. R.*).—With one house started in February and the other a month later, it seems difficult to fix upon a time for alterations. If the weather prove cold and wet fire heat may be necessary when the Grapes are ripening, and we presume the work cannot be postponed until the Vines are at rest on account of plants needing protection from frost; therefore we should say the repairs would be best done whilst least fire heat is necessary, that is, during July and August.

**Melons Flavourless** (*Devonia*).—Sandy soil is not suitable for Melons, as in such they are apt to produce their foliage liable to be injured by scorching or insects, and then well-flavoured fruits are out of the question. The foliage must be substantial and clean, and the plants not overcropped. The atmosphere should also be drier during the ripening period than is good for the free growth of Cucumbers. The work you refer to will be issued in the autumn in future.

**Decayed Mushroom** (*D. W.*).—A crushed mass of offensive putrefaction reached us not fit to be sent through the post. The letter was so saturated that it could not be read. We suspect your Mushrooms are attacked by a fungus, *Aspergillus glaucus*, which is referred to on pages 94 and 133 in the sixth edition of "Mushrooms for the Million." If you possess the work (1s. 2d., post free, from this office) you can see what is said about this and other fungoid enemies which occasionally attack Mushrooms and speedily ruin them.

**Dividing Pyrethrums in Autumn** (*S. S.*).—February and March, as the weather is favourable, are the best time for increasing the stock by division. The operation may be performed in autumn, choosing moist weather at the end of September or early in October. Stools of four years' growth may be divided into three or more pieces according to their size and facility of cutting up, so as to preserve some roots and crowns with good buds to each. The divisions are preferably placed in pots sufficiently large to hold the roots comfortably, with a little soil around. Plunge the pots in ashes to the rim and keep the soil moist, but not very wet. Too much air cannot be admitted in favourable weather, planting out in spring. The divisions may be planted where they are to remain, using fine soil, and firming it about the roots, watering to settle it about them, and taking due safeguards against slugs.

**Morels and Jew's Ears** (*F. C., Alresford*).—Morels are called Jew's Ears in Yorkshire as stated by Dr. Badham, and it was in an extract from his work that the popular term was given. As generally accepted the fanciful reference applies to another fungus, *Hirneola* or *Exidia*, which is cup-shaped and grows on Elder trees, also but less freely on Elms. The specimen you send is so small and was so much shrivelled that it cannot possibly be identified. It bears some resemblance to a Morel, but we are not sure it is one, and we cannot venture to suggest that any fungus may be eaten unless we are certain of its identity. If you can send fair typical specimens packed in freshly gathered green, but not wet, grass they will probably arrive in good condition for determining what they are and whether they may be safely eaten or not. You might also indicate the position where they grow.

**Young Apple and Pear Trees Unfruitful** (*A. B., India*).—When young Apple and Pear trees blossom profusely, but set no fruit, and frost or excessive wet is not the cause, the reason is generally over-effort at fruit production, an excess of blossom buds forming which from lack of nourishment are imperfectly developed. In this case the only remedy is to thin the buds freely before the blossoms expand, leaving the strongest and most promising, affording liquid manure or surface dressings in winter, with mulching and proper supplies of water in summer. We cannot answer your other questions at present, but will see if we can procure the information. We do not, however, recommend foreign nurserymen through these columns.

**Hydrangeas** (*G. C.*).—No doubt you have cultivated your plants in a satisfactory manner, except in keeping them "very dry"—that is unnecessary. They may with advantage be kept moderately dry, but in no stage of growth should the soil ever be entirely destitute of moisture. Whatever treatment you may give your plants it will never alter their character. Your only chance is to throw them away and start again with fresh plants. Sometimes plants that have produced bold large trusses for years will occasionally throw one similar to the one you sent us. When this occurs we throw them away at once, as they cannot be relied upon to produce ordinary blooms afterwards. All varieties of Hydrangeas have the same peculiarity, especially the variegated form of *H. hortensis*, but we had never seen the variety of Thomas Hogg in this abnormal state before, although we have grown thousands. It is not so useful nor so beautiful as well-grown examples of the old *H. hortensis*, which yields enormous trusses, varying from pink to blue.

**Insects on Alder** (*J. McD.*).—The small caterpillar that traverses the leaves, bearing upon its back a case or "cigar" of its own construction, ingeniously cut from the under surface, is the larva of a tiny moth called *Coleophora alnivorella*. Having completed its growth, the little creature closes up the case and shortly after appears as a moth; it is seldom common enough to disfigure the Alder to any extent. No. 2, the insect resembling the Aphis in some things, and the *Cecropis*, or "cuckoo spit" in others, is a *Psylla*, probably the species *P. Alni*, but they are, like the Aphides, difficult to identify; it may be at once distinguished from the Aphis group by its breadth of thorax and its powers of leaping. Their multiplication is not so rapid as that of the Aphides. No. 3 is a species of *Chermes*, allied to the familiar American blight, and also akin to the *Coccus* or scale group, the young brood being enveloped in a woolly secretion.

**Carnations and Picotees** (*Picotee*).—You appear to be going on with your Picotees quite judiciously. Be careful not to overdo them with liquid manure, as with the surfacing already applied you may produce coarse blooms. Give sufficient water in dry weather, especially if your soil is light in texture. No doubt some varieties produce fewer side growths than others, but even in this much depends on cultivation. Layer early, and plant early in the autumn, when you will see a great improvement all round. Picotees are perfectly hardy. It ought to have been noted that size of bloom without coarseness is secured by thinning out the buds, also a shading of tiffany or other light material you will find an absolute necessity to secure clean flowers and pure markings. Old glazed sashes blurred with whitening and supported high above the plants not to touch the blooms is an excellent and easy method of gaining these ends. We wish you every success.

**Strawberries by Post** (*F. A. G., Taunton*).—It is very seldom indeed that Strawberries sent by post arrive in sufficiently good condition to be named, and never except the fruits are gathered before they are fully ripe and each placed in a separate leaf and the whole sent in a tin or wooden box, so that they can neither be injured by shaking nor crushing. Yours simply placed in a chip match box resembled a mass of jam more than anything else. The best way to obtain the names of Strawberries is either to take fruits to an exhibition at which prizes are offered for Strawberries, and there gather the information, or to a nursery or private garden in which many varieties are grown. We can only identify varieties when the fruits arrive in the same condition as when they were gathered, and accompanied with foliage from the plants. It is desirable also that the habits of these be stated, and whether the varieties are early, mid-season, or late.

**Strawberries** (*H. S.*).—Auguste Nicaise Strawberry is a much paler, also a firmer, fruit than Noble, and is of better quality, though not, we think, so early, nor is it so free and fruitful in all soils, though in some it succeeds admirably. Noble has never been described by us of more than second rate quality, but the fruit is so fine and early that good crops are highly profitable for market purposes. We have seen large quantities "look well" enough in the London market to sell at 2s. a pound, but they were sent there by persons who have learned how to gather them carefully before being over-ripe and to pack them well. If the remarks to which you refer are those of Mr. T. Sharpe they are worthy of your attention. His success in Strawberry culture in a field of sand is remarkable. His practice is based on the principle of testing a number of varieties and increasing those the most freely which succeed the best with him and realise the most money. Strawberries are notoriously capricious. Marguerite, which bears fine fruit so abundantly with Mr. Sharpe, is not worth the ground it occupies in some gardens. Alice Maud, mentioned by him, is generally more reliable, but not in all soils the most profitable. In some land those rich and fine varieties, British Queen and Dr. Hogg, grow and bear abundantly, but in many gardens they are among the least thrifty and productive. At Chiswick Sir Charles Napier is much more profitable than Sir Joseph Paxton, but

this is by no means the experience of the majority of cultivators, and probably ten times more of the latter are grown than the former. Mr. Lovel is a good authority on Strawberries for market. Our experience with John Ruskin is too limited for us to speak decisively on its merits.

**Packing Grapes and Flowers (T. C.).**—We have found tin boxes excellent for sending both fruit and flowers by post, separately, the boxes in each case to be firmly filled, so that the contents are immovable. Flowers should be cut young, either at night, and placed in water, or early in the morning before the petals become flaccid. The box may be slightly damped, and the heaviest flowers should be placed at the bottom, the lighter above them. These may be covered with Ferns previously dipped in water, then shaken out, or other soft greenery, and pressed firmly down with the lid. For Grapes the boxes must be dry. A layer of springy moss may be placed at the bottom, this to be covered with tissue paper, which should also reach up the sides and well above the top. The boxes should be a little slanted when filled, one end resting on a table, the other held up, and each bunch placed point downward, and affixed in position so that the stalk reaches a little above the top. Judgment should be exercised in placing the bunches in the right positions at the first, not shifting them in and out, and when all are in they should wedge each other. To render them still more rigid a little wadding may, if necessary, be forced down here and there between the paper and the box, the paper then drawn over and the lid placed on, gently pressing down the stems. We have tried all sorts of packing for surrounding the berries, but find that good Grapes, rightly placed in the boxes, come out of them in better condition when they simply press against each other. Thin-skinned loose bunches of ill-grown Grapes cannot by any method of packing be sent through the post to reach their destination in a satisfactory state.

**Black Currant Buds Destroyed (W. K.).**—We are in receipt of the specimens of the insect to which you attribute so much mischief. Those first sent were certainly in the pupal condition; the second lot, in the winged state, prove that the enemy is a small two-winged fly, it is a species of Phora. (Its exact identification, however, would require the examination of a large number of specimens, as the species are very like each other.) This belongs to a group of very varied habit, some of them are useful, others, as well as the present species, are infesters of buds; examples of them have been found on the Rose and Cherry, in the one case ruining the flower, in the other stopping the development of the fruit. Each bud apparently forms the home of one grub, and since the flies are emerging now, it is probable there is a second brood, which follows the habits of the spring brood, and from which flies doubtless emerge during the autumn. It may be suspected that these latter hibernate, hiding in nooks and corners, then appearing in April, they deposit eggs on the young buds. We almost fear that this is one of those foes with which little can be done; it is impossible to operate upon the grubs buried in the buds, nor could the minute eggs be detected. Of course all infected shoots should at once be removed and burnt. The only measure that could be tried would be spraying or washing the bushes with something that might disgust the flies, and drive them off at the egg-laying season, such as a solution of Fir tree oil, petroleum, or decoction of hellebore; but it has been noticed that flies of this group, although so small, are remarkably hardy. All the damage complained of is not traceable to this fly, we should state, for some of the buds show signs of the presence of the Black Currant mite (*Phytoptus ribis*).

**Destroying Woodlice (M. H. N.).**—Toads and pieces of cut Potato are excellent means of destroying woodlice, but where they "swarm" more wholesale means must be employed. Woodlice most frequent leaves, tan, old boards, and other decaying organic matter, secreting themselves in any cracks of the soil, by walls, or anywhere in moist places, and near their food plants. These habits have been taken advantage of for their destruction. The old-fashioned trap of boiled Potato wrapped loosely in a little hay and placed in a small flower-pot laid on its side in their haunts captures a good many, the baits being examined every morning, and the woodlice shaken out into boiling water. Placing a little hay by the side of walls upon the beds or borders, sprinkling over it a little scalded oatmeal or bits of boiled Potato, and over these scattering a little hay entices the woodlice, and pouring boiling water on the hay through a rose watering can in the morning soon destroys the insects. If the water is not used in greater quantity than to wet the hay, no damage is done to the roots of Cucumber or Melons, and very little, if any, to Mushrooms. Old tan serves equally well if placed on a narrow board at the side of the bed near the wall, especially when mixed with a little boiled Potato, bread crumbs, scalded oatmeal, or pieces of raw Potato, Carrot, Beet, or Mangold Wurtzel, baiting for a few days to attract the woodlice, and then scald them with boiling water. Two pieces of old board placed one over the other, a small stone on one side keeping them about half an inch apart, and scattering a little boiled Potato on the board and over it a little hay, covering with the top board so as to lie rather loosely, answer admirably. Boards of about 2 feet length and 11 inches wide serve the purpose well, or slates may be used, and in the morning remove the boards and scatter the contents in front of fowls. This if repeated a few times will soon clear the worst infected houses or frames, and there is no danger of interfering with the roots. Old boards form a trap that no woodlice can resist, and their use in Mushroom houses and elsewhere are attended with excellent results. Indeed, houses can be cleared rapidly and completely by that means without any injury to the beds of Mushrooms or the roots of Cucumbers and Melons.

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (D.).—*Chrysanthemum leucanthemum*, the Ox-eye Daisy. (T. S.).—1, *Epidendrum vitellinum*; 2, *Odontoglossum crispum*; 3, *Oncidium macranthum*. (W. W.).—1, *Onychium japonicum*; 2, *Asplenium Adiantum-nigrum*; 3, *Adiantum Capillus-Veneris*; 4, *Adiantum reniforme*. (B. W.). 1, *Acalypha Macafeana*; 2, *Francoa sonchifolia*; 3, Insufficient without flowers; 4, *Periploca græca*. (C. D.).—*Buddleia globosa*.

#### COVENT GARDEN MARKET.—JULY 1ST.

Business brisker, with good supplies. Prices generally unaltered, excepting Peaches, which are lower.

Bedding plants (in variety) in boxes, from 1s. to 3s.; in pots, per doz., 1s. to 2s.

#### SMALL FARMS.

It is undoubtedly a want of business aptitude, of keen foresight, of ability to meet a crisis, that not unfrequently tends to cripple the small farmer. The example given last week of an overstocked farm simply because prices had fallen is an instance

of this that should not be passed over lightly. Early maturity of all fat stock and a prompt and timely disposal of all surplus store stock must be insisted upon. Keep well within bounds as to numbers, and see that your stock are of the best. We also strongly advise small farmers to keep out of parish business as much as possible. There is a common craving for posts which bring a man into prominence, and which give him a voice in parochial matters. This is all well and good if he has time to spare for it, but otherwise he is far better without it.

Another mistake which has come under our notice is a tendency of small farmers to copy the practice in force on large farms. Nothing can be attended with more risk than such a course, and we have repeatedly pointed out the evil result of such a mistaken idea. The small farmer must look closely into trifles, and turn every foot of space and every handful of produce to best account. If he has his wits about him he is keen to grasp any special local want and to make special efforts to supply it. It is entirely worth his while to cultivate the earliest Peas for "podders," the earliest Potatoes, and to give some space to a few of the best sorts of fruit. If he can manage to have a few roods of ripe Strawberries while the bulk of that crop is still green he is certain to obtain a ready and profitable market. When ripe Strawberries are being sent off from the local stations at the rate of 50 tons daily he is practically out of it, as indeed he ought to be, for his Strawberry season is over before the glut of fruit is upon the market. Then, again, in planting fruit trees his aim should be the best early and late sorts for which he may fairly expect a profitable sale. We do not advise any rash launching out into fruit culture, but we do and must insist upon the necessity which exists for a radical change in fruit culture by farmers. It presents no insuperable difficulty, and if space is given up to fruit at all pray let it be turned to good account, and not be as hitherto a standing reproach to both landlord and tenant.

Turning now to *la petite culture* of the Continent, we agree with Mr. Clare Sewell Read that it is not desirable that our small farmers should conform still more closely to the model of the Continental peasant, and live and work still harder than he does now. He says well that there is much to admire in the thrift, the self-denial, and the industry of the Continental peasantry, and there may be something to learn from their better manipulation of their small products; but to recommend to a race of hard-working Englishmen a life of grinding poverty is not likely to prove attractive to the individual or beneficial to the community.

Take for example the existing state of things in France. The land which the peasant occupies is generally his own; there are some 8,000,000 landowners, of whom more than 3,000,000 are exempt from taxation from actual poverty. These peasants are worse housed and worse fed than our labourers. Their cottage is generally of one room, having a mud floor, where they and their families herd together in a most filthy bestial fashion. Excessive and prolonged toil is their daily lot, women and children are all constantly employed with the men from early morn till dewy eve, when they turn into their hovels worn out with toil. Yet with all this two English acres yield as much produce as three French, and the superiority of the French lies in their greater business acuteness. The French peasant makes from £20 to £25 a year out of the butter of each cow, and be it remembered the cow has often to take its share of work upon the land. It is quite certain that much improvement is possible both in the breed and yield of British cows generally, even with our well-known superiority in farm produce generally. It is claimed that the British Isles produce more food for cattle than the whole of France with twice the extent, and that England alone produces four times as much meat, milk, and wool as France, which is solely attributable to superior cultivation. Well will it be if we continue to maintain the superiority of our small farmers, and not suffer them to sink down to the level of the French peasant.

### WORK ON THE HOME FARM.

With fair settled weather and a full grass crop haymaking is likely to predominate largely over ensilage this season. Mowing will begin when the grasses are in full bloom, for then the herbage is at its best for hay. Let this be clearly understood, for there is still an erroneous popular impression that the best hay has the seed in it. The best hay is that which is made before there is any actual development of seed, because seed development robs the herbage of much of its most valuable food properties. With the flowering of the grasses full growth has come, and there is no reason for waiting any longer for the mowing.

Sun and wind soon make good hay, and the labour involved in the making is comparatively trifling to what it is in unsettled weather. Let the tedding machine follow the mower closely, and then with a free use of horse rakes the hay ought to be turned and got together at a cheap rate. The chief thing is full exposure to sun and wind with judicious cocking to guard against damage by rain. Do not cart to the rick till the hay is quite ready, or there will be serious risk from overheating. For stacks of from 20 to 30 tons we invariably use a sack stuffed with straw, drawn upwards in the middle of the stack as the building goes on, so as to form a passage for the escape of heat quickly, to facilitate which the sack is withdrawn altogether each night during the building of the stack.

Clover and Sainfoin, as well as mixed seeds, have already been mown for hay or stover. For this class of forage the tedding machine is not used, but after the mowing it is left to wither in the swathes, and is then turned over gently for the under side of the swathe to wither, when it is ready for carting to the rick. The reason for this difference in the making is that the large tender foliage of the Clovers will not bear the rough process of ordinary haymaking, as the foliage would become battered to pieces and the forage would lose much of its goodness.

Some of the first crop of Clover has been folded with sheep in view of sowing seed from the second crop. More caution than usual has been necessary in this folding owing to the very succulent growth of the Clover and the risk of sheep becoming "blown" from overfeeding.

### OUR LETTER BOX.

**Diseased Cow (D. E).**—An examination of the animal by a veterinary surgeon is the only course we can advise in this case. Mr. R. Dean, Ranelagh Road, Ealing, London, can give you authoritative information on the other subject. When writing him enclose a stamped directed envelope for his reply.

**Poor Pasture (Cestrian).**—It would be quite useless applying chemical manure now while the weather continues dry. Your only chance for this season is to procure enough nitrate of soda to afford a dressing of a hundredweight per acre, and to sow it broadcast over the pasture in showery weather. It would then be dissolved and washed into the soil sufficiently to induce growth. Then when you have a fair bite of grass, if you can procure some sheep and fold them upon in small folds, using as many hurdles for each fold as there are sheep, feeding the sheep well with cake and corn, and making a fresh fold daily, you will thus store the soil with a fair amount of fertility by November, when all stock should be withdrawn from it. Next February apply a dressing of chemical manure, consisting per acre of 1 cwt. nitrate of soda, half-cwt. muriate of potash, half-cwt. mineral superphosphate, and half-cwt. steamed bone flour, procured separately from a reliable source, and mixed under your own supervision. You may then reasonably expect a fair crop of grass, but the pasture will not be really first class for a couple of years. By using the chemical manure annually in February it is quite certain to become so in due course, and you will be well repaid for your outlay. You will understand success this season depends entirely upon favourable weather for our scheme.

### METEOROLOGICAL OBSERVATIONS.

### REMARKS.

21st.—Bright and fine throughout.  
 22nd.—Bright, warm, morning, clouded over at noon, shower at 1.30 P.M., and continuous rain after 6 P.M.  
 23rd.—Wet early and drizzly till 11 A.M., then cloudy and a slight shower at 2.20 P.M., a little sun in afternoon, damp drizzly evening.  
 24th.—Fine and generally bright in morning, slight thunderstorm from 1.15 to 2 P.M., and generally threatening after, lightning at night.  
 25th.—Wet till 8.30 A.M., humid and oppressive in morning, thunder from 1.50 to 3 P.M., fair evening, distant lightning at night.  
 26th.—Fine and pleasant but cloudy at times.  
 27th.—Bright and breezy.  
 A generally fine week, with distant thunder on several occasions.—J. J. SYMONS.

## HARDY FLOWER NOTES.

THE protracted period of dry weather through which we have been passing has happily come to a close, and the flowers are now experiencing the cool and moist atmospheric conditions so favourable to hardy plants. A few days ago we were almost in dismay at the prospect of a season even more disastrous on this light soil than that of 1887. Now, although the rain has only penetrated a short distance, all looks favourable, although traces of suffering are still apparent in withered leaves and wholesale loss of lower stem leaves. But as Longfellow says, "Let the dead past bury its dead," and let us rejoice in the brightness of the present and the hopes of the future, and enjoy the feast of beauty so amply spread before us. Stately Delphiniums, among the noblest of our hardy flowers; Pyrethrums, triumphs of the florist's art; glowing Eastern Poppies lighting up the garden with their splendid flowers. Well may Eliza Cook sing:—

"The Poppy with its flaming breast,  
Outshines the crimson of the west."

Tall Lupins with fine spikes of white or blue or blue and white; golden Day Lilies, fragrant Pinks, and many others welcome the opening days of July. Roses, too, and stately Lilies come forward like very sirens to lead their respective claims to the proud title of "Queen of Flowers;" a title which for long years has, by universal acclamation, been awarded to one or other. I am by no means certain that the popular opinion of the day is not decisive in favour of the claims of one of the aspirants; but there are, I should say, many who agree with Cowper in his lines in which Flora is made to say:—

"Yours is, she said, the nobler hue,  
And yours the statelier mien,  
And till a third surpasses you  
Let each be deemed a queen."

(*The Lily and the Rose*, v. 6.)

If the rosarians will forgive the suggestion, Cowper seems to have had a partiality for the Lily, as one of the stanzas of the same poem attributes to the Rose conduct hardly compatible with the calm dignity generally associated with the regal authority. There are, however, so many things to note, not only in my own garden, but in several others I visited last week, that the enticing byways of flower lore must not be entered upon at length.

At this season the Dianthus present many beauties to notice, and they are well represented in this district. I do not think anything can be finer than a good plant of *D. alpinus*, some good specimens I saw being particularly fine, the foliage extremely healthy, and the deep rosy flowers, only about 2 inches high, being very large and fine. Rather inferior, but still well worth growing, is *D. neglectus*, of somewhat similar appearance, but with smaller flowers. A notable instance of that horror of the purchaser of plants was to be seen alongside of the fine plant of *D. neglectus*. This was a plant purchased under the same name, but which was evidently incorrect, the flower being opening, white, and the foliage quite distinct. This sending out plants not true to name is a great disappointment to growers, and is in the end a source of loss to the vendor. I have many times experienced it, and unless one is thoroughly well acquainted with the flower it sometimes leads to its being passed on from one to another. Some of my friends are at present greatly exercised over Campanulas *G. F. Wilson* and *Raineri*. There are in commerce

two under the name of *G. F. Wilson*, and two under the name of *Raineri vera*. One of my friends contends that what is sometimes sold as *G. F. Wilson* is *Raineri vera*, while another is equally confident that he possesses both plants true. I hope in the course of the season to be able to get the dispute authoritatively settled. Bearing upon this question of plants being sent out with wrong names, I have had *Silene Schafta* sent from two different nurserymen as *Lychnis Lagascae*, and I understand this is by no means an uncommon practice. This season I had *Gypsophila prostrata* sent me for *G. cerastioides*, and from another quarter *Alyssum saxatile* for *A. montanum*. I would urge upon nurserymen the necessity and, from a business point of view, the wisdom, of verifying the names of their plants. To return, however, to the Dianthus. One species with which I was particularly pleased was *D. nitidus*, or at least what was grown under this name. This is a neat plant with grassy leaves and pretty pink flowers with a darker centre. The flowers are finely fringed. If this is the plant named in the "Cottage Gardeners' Dictionary," which is, however, described as "red," it is a native of Carpathia, and was introduced in 1822. The popular name of the Shining Pink is quite applicable to *D. nitidus*, from the glistening appearance of the petals. Near this in the same garden was *D. cruentus*, the Blood-scarlet Pink, with smooth, acute, linear-lanceolate leaves, and slender stems growing about a foot in height, and fine blood scarlet flowers, a considerable number of these being arranged in somewhat globular heads. The native country of this species is said to be unknown. Several other Pinks are now in bloom or about to flower, but those I have named are among the best at present, and lead one to appreciate the name given by Linnaeus of *Dianthus* (Divine Flower) from *Dios*, divine, and *anthos* a flower. A beautiful little Alpine, which I had long wished to see in flower, was beautifully in bloom. This was *Stachys corsica*, which was familiar to me from the illustration and description given by Wooster. I am bound to say, however, that the illustration does but scant justice to the flower if it always grows as well as where I saw it. The plant figured in Wooster's "Alpine Plants" was the variety with pinkish white flowers, and was drawn from a plant sent by the late Mr. Niven of Hull. The one I saw recently was the variety with creamy coloured flowers, and was almost entirely covered with its pretty little labiate flowers just rising above the foliage. The plant only grows to about 6 inches in height, and is a very desirable one for the rock garden or the front of the border. As one would imply from the specific name, *S. corsica* is a native of Corsica, whence it was introduced in 1823.

Whether in or out of flower the *Sempervivums* are always interesting. The exquisite rosettes of *S. arachnoideum* or *S. Laggeri* with their beautiful cobweb-like covering of tomentum are always attractive, and some of the dark coloured varieties such as *S. triste* are very fine also. Perhaps the finest is *S. violaceum*, which grows to a large size and possesses tints difficult to describe. The specific name *violaceum* gives no idea of the rich hues not unlike some of those shown by some of the *Coleuses*. Red-brown, purple-brown, and green are so beautifully spread over the sharp-pointed succulent leaves that it forms a most beautiful plant for many purposes. Among other well-grown plants were some good specimens of *Ramondia pyrenaica* just passing out of flower, but showing by the few remaining blooms how well it was doing. Close to these was a good plant of *Haberlea rhodopensis* which had not flowered but which seemed in perfect health. Several dwarf *Campanulas* are now well in bloom, but I was especially delighted with a grand plant of *C. abietina*, which was doing particularly well in a good piece of fresh gritty loam. This seems a plant which is greatly benefited by a change of soil. The splendid violet-purple erect flowers formed a perfect mass of bloom. Another pretty little *Campanula* not too often met with is *C. Allioni*, a dwarf alpine Harebell with pale blue flowers, which are very large for the size of the plant.

Several dwarf Geraniums are also well in flower. The native *G. lancastriense*, a native of Walney Isle, is very pretty, but finer still are the attractive *G. cinereum* and the exquisite *G. argenteum*, with pale flowers and beautiful silk-like silvery leaves. The latter is a native of the Alps of Dauphiny and the Pyrenees, and was introduced as early as 1699, according to the "Cottage Gardeners' Dictionary," but according to the "Hortus Cantabrigiensis" it was not introduced until 1791. The latter date is, in all likelihood, that of re-introduction, as it is liable to perish from damp in winter. *G. cinereum* is a native of the Pyrenees, but the date of introduction seems to be unknown.

I have left myself but little space for notices of taller herbaceous plants, but some are so fine at present that other alpine must be left alone. Among the finest I have seen was the tall *Dictamnus taurica*, known also, I believe, as *D. gigantea*, the Taurian Bastard Dittany. The old *D. Fraxinella* and its white variety are well known, but the Taurian species is of much greater beauty. More vigorous in habit and with larger and finer spikes of flowers somewhat similar in colour to those of *D. Fraxinella*, it would be an ornament to any garden. It possesses, too, the curious property of giving off, when in flower, a vapour which will take fire if a lighted match is applied to it, without injuring the plant. I recollect some years ago a correspondent of *Garden-Work* who had observed this, and whose veracity someone had called in question, producing, to my great amusement, a certificate from the Provost of Auchtermuchty to testify that he had seen the experiment performed. These *Dictamnuses* will stand drought very well, sending down their thick roots a considerable distance into the soil.

Some of the *Eryngiums* or Sea Hollies are coming well forward, although the blue coloured species are only beginning to show faint touches of the fine colour which adds so much to their beauty. The various *Eryngiums* and *Echinops* and other thistly plants are at present very popular in this district, and in a short time will be seen in most gardens with a pretension to having a respectable collection of hardy flowers. And what a wealth of beauty is still untouched! *Lychnises*, *Irises*, *Poppies*, *Stonecrops*, *Saxifrages*, *Veronicas*, tall *Campanulas*, and others of which we may say as did Drayton:—

"With many a flower whose name were now too long to tell,"

open their blooms to our admiring eyes, and we are forced to say with Thomson:—

"Infinite numbers, delicacies, swells,  
With hues on hues expression cannot paint,  
The breath of Nature, and her endless bloom."

—S. ARNOTT.

## MUSHROOMS IN HOT WEATHER.

IF the opinions of most cooks are worthy of consideration, and they ought frequently to be consulted, it amounts to this, that Mushrooms are always of good service to them, and in addition are fully appreciated by their employers. This being pretty generally realised among gardeners, the attempt is made by all in a position to do so to keep up as nearly as possible an all-the-year-round supply. Some few succeed in this, but the majority fail during the hottest part of the year—or say, July and August, and that oftentimes through no fault of theirs. High temperatures and a parched atmosphere are usually fatal to Mushrooms, these causing the beds to become as "dry as a bone," and what few Mushrooms are produced to be thin, maggoty, and flavourless. Nor is this difficulty easily obviated in all cases. Those who have the command of cool cellars or other underground chambers, and these are few and far between, can and do succeed in maintaining a supply throughout the summer, and occasionally instances are met with of ridge-shaped beds being formed under trees where the temperatures are never high, and these being kept sufficiently moist and heavily mulched produce the much needed and fairly remunerative supply of Mushrooms till such times as the beds formed in July are coming into good bearing order.

It is my belief, however, that not a few beds in ordinary Mush-

room houses and sheds are discarded too quickly, a partial breakdown being understood as a complete collapse. When the beds become dust dry, as they very quickly do towards midsummer, the surroundings also being comparatively hot and dry, it is small wonder that what few Mushrooms put in appearance are of little worth; the surprise would be if the opposite prevailed. In all probability there are many hundred beds lying almost forgotten in various positions that are as full of spawn as they can well be, and only require restoring to a moister, slowly decaying state to make them as productive, or perhaps more so, than formerly. What they should have, therefore, is a gradual yet thorough soaking of soft water, or better still freely diluted farmyard liquid manure; the next best thing being water well impregnated with salt, the latter being used at the rate of 4 ozs. to every 3-gallon can of water. The first watering will not make much impression on a thoroughly dry bed, and in most cases at least three liberal applications, extending over as many days, are needed to well moisten the manure throughout the bed, the liquid manure or salt being given at the last watering. Then should follow a heavy mulching of strawy litter, or otherwise the beds soon become dry again. The walls and floors ought also to be frequently syringed or damped down, so as to keep them as cool and moist as possible. Woodlice are particularly troublesome at this time of year, and in many places eat the young Mushrooms as fast as they appear. In all such cases the outer edges of the beds, or all abutting against either walls or boards, should be well saturated with boiling hot water, this destroying woodlice more surely than anything else I have ever tried. All other crevices and dry corners ought also to be similarly treated, and what insects escape may be trapped in flower pots, in which sliced potatoes and dry moss has been placed. If the Mushrooms are twisted out of the beds when not more than half grown there will be few or no complaints of their being maggoty.

As before hinted, high temperatures and a dry atmosphere must be guarded against, and with the thermometer standing at 80° in the shade it is no easy matter to keep a Mushroom house cool. The best form of houses are those with the thatched roofs and walls, these never becoming either very hot or very cold. If the roofs are slated and exposed to the sunshine during the hottest part of the day, keeping down the temperature is almost an impossibility, though much might be done in the way of white-washing or temporarily shading them. The warm air ought to be as rigorously excluded as are the colder winter winds, and the better to accomplish this the doors, windows, and crevices, if any, should be kept closely blocked up, more especially during the day time. The nights being very much cooler, the doors might with advantage be opened, taking care to close them as early as possible every morning. If these precautions are taken the chances are a very serviceable lot of Mushrooms will very probably result.

In order to have plenty of Mushrooms, or at any rate to be independent of the uncertain supply from the open fields, a fresh bed ought to be formed towards the end of July, that being a good time to make a start with ridge-shaped, open-air beds. Should the weather be ordinarily hot and dry, extra pains must be taken in preparing the materials, and more especially in preventing them from heating dry. They ought not to be thrown into a large heap and there allowed to attain a white heat, but would be better kept in a more shallow square heap, and be turned inside out about every three days, being gently watered each time. This being carried out for the best part of three weeks, all rank gases and violent heat will be got rid of, and the manure being in a moist, not saturated state, when the bed is formed, the decay will be steady and certain, and the heat generated quite strong enough to run the spawn. When the droppings are badly prepared, or are at all raw, they will, when made into a bed, heat violently for a few days, and then collapse, the centre becoming dry and musty, and altogether unfit for the propagation of Mushrooms. The materials for ridge-shaped beds require especially to be well prepared, as in this case there is a greater depth of manure pressed together, the heat being much more violent accordingly. Naturally the spawn runs more rapidly, and the beds are more quickly productive when the temperature of newly spawned beds stands for several days at or about 85°, but there are greater risks to be run than is the case when the heat keeps nearer 70°; and these comparatively cool beds, if they are not unduly interfered with in the shape of waterings, the usual, yet most unwise proceeding of many impatient cultivators, will eventually produce extra good crops of superior Mushrooms. The plan of mixing fresh loam with the droppings, at the rate of one part of the former to two of the latter, is a good one, as it has a moderating effect upon the heating of the manure without impairing the productiveness of the bed. It is not advisable to mix the loam with the droppings till the latter have had a fortnight's preparation.—W. IGGULDEN.

## SOFTSOAP, SULPHUR, TOBACCO AS FUNGICIDES AND INSECTICIDES.

(Concluded from page 2.)

SOFTSOAP as a fungicide has been briefly alluded to. Mr. W. G. Smith, the eminent fungologist and delineator of everything relating to plants, suggests mixing sulphur with the soapy solution for mildew. Everybody believes in sulphur, so do I, but I do not believe in undissolved sulphur. Red spider does not like it because it interferes with their webs, and on hot days emits unpleasant fumes. Thrips set it at defiance, but aphides are made uncomfortable. It kills none of those in the form of flowers of sulphur. Then there is the mildew. "Surely it kills that," some may exclaim. If it does so, how is it that mildew returns as certainly as the seasons? Professor Scribner, in his new work on fungus diseases, recommends sulphur as the only remedy needed for powdery mildew (*Uncinula spiralis*) so common a pest in American vineyards, and like our mildew on Vines (*Oidium Tuckeri*), wholly external, and does not penetrate to the interior of the leaf, shoot, or fruit. He says:—"Flowers of sulphur dusted on the Vines (or in hot climates simply spread over the ground beneath them) serves effectually to destroy the powdery mildew. No other treatment is necessary to protect the Vines from this parasite. In regions where the fungus is most injurious it is the custom of Vine growers to make at least three applications. First, when the young shoots are about 4 inches long; second, when the Vines are in bloom; and third, just before the berries begin to colour." Professor Scribner is kind enough to mention "hot climate." Direct contact is necessary in a cool climate—"the flowers of sulphur dusted on the Vines." It kills mildew in a hot climate when placed on the ground by its fumes, and it destroys mildew by contact. Sulphur fumes annihilate mildew, and it is a nice point to know the exact amount to vaporise from hot-water pipes that will kill mildew without injuring the Grapes. Some can do it readily enough. It is only a matter of a little skim milk added to flowers of sulphur so as to form a cream, and brushing it on the hot-water pipes when heated to 160° or more (sulphur vaporises at 170°) with the house closed. I have never had occasion to use it in this way for mildew, for the simple reason that I have never had a mildewed Vine to deal with under glass, but I have seen how others combated mildew on Vines both with it in contact and by its fumes. Yet I have used sulphur on the pipes against red spider, and I have always found it inimical to Grapes. In their early stages of swelling it produces rust (not a fungus), and later the fumes cause Grapes to colour prematurely, often causing the berries to crack. Dusting flowers of sulphur on mildew-infested Vines spoils the appearance of Grapes. But does sulphur annihilate mildew? Is it more than a palliative? Take the Rose mildew (*Oidium leucoconium*), dust the leaves and all infested parts with flowers of sulphur, syringe with softsoap and sulphur. It prevents the spread of and in measure destroys *Oidium*, but it does not prevent *Oidium* "fruits" maturing, and the seeds (spores) from those producing the mature form, *Sphaerotheca pannosa*, nor this from producing its "fruits," which living through the winter reproduce *Oidium* the following season. Those interested in this subject may consult an excellent article, with illustrations, by Mr. W. G. Smith in the *Journal of Horticulture*, vol. ix., third series, page 478.

That sulphur is not a specific for mildew is abundantly proved by the recommendation of it in some other form than "flowers." Mr. W. Taylor recommended its transformation by sprinkling it over fresh lime whilst slacking. That forms a lime and sulphur powder, but Mr. Taylor did not recommend it for mildew, but as a wash for fruit trees, for which purpose it is perhaps unrivalled as a fungicide, insecticide, and preventive of birds taking fruit buds. Its formula was given in the *Journal of Horticulture* a few years ago. Mr. Tonks brought sulphide of potassium into notice as a fungicide or mildew preventer or destroyer. This destroys Gooseberry fungus—dose, half an ounce to a gallon of water. Our French neighbours (also Mr. Tonks) advised the use of bi-sulphide of lime. There are many formulas, but the following is the approved. French: Flowers of sulphur, 1 lb.; fresh burned lime, 1 lb. Slack the lime in an iron pan or copper, adding water to form it into a cream, then add the sulphur; mix thoroughly and add 1 gallon of water. Keep it boiling a quarter of an hour, stirring briskly all the time, then allow the compound to cool and settle. That effected pour off the clear liquid into bottles kept well corked in a dark place. When required for use mix a quarter of a pint with 3 gallons of water, half a pint to 6 gallons, or a pint to 12 gallons of water. This applied thoroughly, so as to wet every part on a calm evening before the mildew appears—the shoots being about 2 inches long—on trees that in previous years were infested, is an almost certain preventive,

or when the mildew first commences its attack syringe two or three times at intervals of as many days, so as to make sure of reaching every part, and repeat, if necessary, at intervals of twelve to fifteen days.

But is it the sulphur or the lime that kills mildew? There is no sulphur in softsoap, yet it destroys (rather holds in check) Rose mildew. Of course there is sulphur in sulphide of potassium, but in this case, is it the sulphur or potash that lays the *Oidium* low? Surely it was the potash, or how are we to account for the potency of softsoap in destroying mildew? It may be mentioned that sulphides discolour paint, but it passes off. Those liking to see white paint, or any colour into which lead enters, must not use sulphides. Let us look at sulphates. There is sulphate of lime, 32.56 per cent. of lime, 46.51 per cent. sulphur. It has no fungicidal value. Sulphate of copper, Professor Scribner says, "It is one of the most effective fungicides that can be used." On the Continent of Europe it has rendered wine manufacture possible through destroying Vine parasites. Mr. B. T. Galloway, U.S. Department of Agriculture, says:—"It is probably the most reliable of all" (remedies for Grape diseases), "as it has stood the test of several seasons, and has never failed us, no matter how favourable the weather for black rot and other diseases." Thus the sulphur and lime come to the front in the Bordeaux mixture, but Mr. Galloway prefers the ammoniacal carbonate of copper solution. The treatment recommended is briefly:—1, In spring, before the buds begin to swell, spray the wood with the simple solution of copper sulphate (1 lb. to 25 gallons of water). 2, About the time the leaves are one-third grown spray with ammoniacal carbonate of copper solution. 3, Repeat the latter treatment when the Vines are in full bloom, and thereafter at intervals of twelve or fifteen days. If this treatment has proved successful, what is there to account for it but the copper? The sulphur and lime in the Bordeaux mixture precludes its use over Vines after the fruit is formed through the danger of spotting the Grapes. Briefly, lime spoils Grapes, and sulphur used over bunches of Grapes renders them not fit to be seen, much less to be eaten. Sulphur in copper sulphide bites keenly, therefore the horticulturists of Europe use it in modified form for Vines, and in America have as little recourse to it as possible, because of the danger of its spoiling the Grapes.

Sulphur fumes can be of little use as generated from surfaces to which they are applied in dusting for mildew. How it acts on mildew in the form of flowers of sulphur I do not know, unless by acting as a corrosive of the "microparasitic cellulose;" but it certainly does not assist the cellulose of the plant in those parts impaired by the mildew so as to repair the damage done, and cause the fruit to become first class. Flowers of sulphur have no manurial value, they act prejudicially on roots, simply killing Heaths, and are undeserving of the high value set upon them as fungicide or insecticide.

Tobacco is one of the oldest and still best of insecticides as a decoction—namely, strong shag tobacco 1 lb., boiling water three gallons, cover over, let stand till cool, then strain. This is effective when used as a spray against aphides and thrips. Syringing is a wasteful process, more of the decoction running off than remaining on the trees. The high duty on this luxury has caused it to fall into little use latterly as compared with former years, but the Government have wisely removed those restrictions as regards its preparation for horticultural purposes. There is "tobacco powder," in which there may be some sulphur, but I do not know the exact terms that govern its preparation, and tobacco liquor, also tobacco juice. These are all good and well-known remedies, and fumigation with tobacco paper or rag suffocates plant lice. The only points necessary are an article free from noxious ingredients (particularly sulphur), to have the foliage dry, deliver the smoke cool, and not give an overdose.—G. ABBEY.

## ROYAL HORTICULTURAL SOCIETY.

JULY 7TH AND 8TH.

THE opening day (Tuesday) of the Shows and Conferences at Chiswick was most unfavourable, the weather being stormy with frequent heavy downpours of rain; in fact, it was more like March than July weather. The exhibits were not very numerous, but interesting; one tent was devoted to the Fruit and Floral Committee contributions, and the other was filled with the hardy flowers, and the only regret was that more visitors were not present to inspect the display. The programme for the Conferences was carried out as arranged—namely, hardy flowers on the first day and small fruits on the second, but we shall have some notes to give respecting these another week.

FRUIT COMMITTEE.—Present: P. Crowley, Esq., in the chair; and Messrs. P. C. M. Veitch, James H. Veitch, W. Denning, W. Bates,

G. Reynolds, G. Wythes, James Hudson, A. Dean, W. Balderson, and J. Cheal.

Mr. G. F. Pontin, Stanley Vinerie, Woking, exhibited some large Melons; Conquerer, weighing 10 lbs. 12 ozs. and 9 lbs. 12 ozs.; Golden Perfection, 8 lbs. 1 oz., 7 lbs. 9 ozs., and 7 lbs. 6 ozs. (vote of thanks.) The Duke of Northumberland, Albury Park, Guildford (gardener, Mr. W. C. Leach), sent three dishes of large fruits of Grosse Mignonne Peaches. Mr. J. W. Church, the Vineyards, Braconash, exhibited a bunch of Alicante Grapes grown in 1890, but cut from the Vine January 6th, 1891. The berries were fairly plump and the colour good. (Vote of thanks.)

Mr. J. Fitt, Panshanger Gardens, Hertford, showed a dish of Premier Strawberries, large, and of rich colour. A bunch of fine Bananas, known as Lady's Finger, was also shown, the fruits of medium size, pointed, with a very thin skin, and rich aromatic flavour (first-class certificate). Mr. G. Fennell, Fairlawn Gardens, Tonbridge, sent fruits of Violette Hâtive Nectarines in three very different stages, from small green samples the size of small Plums to full sized ripe fruits. The tree is grown so that its branches are trained into two other houses, and the exhibitor stated that, "All the successions have finished satisfactorily for several years; it has proved a useful method of prolonging the supply from one tree." Mr. G. Garner, The Gardens, Amberwood, Christchurch, showed two finely netted Melons.

Mr. R. Gilbert, Burghley Gardens, Stamford, showed a basket of fine Strawberries under the name of Chief Secretary. He stated in a letter that "the variety had been grown two seasons, and is undoubtedly the earliest in our collection, which includes John Ruskin, King of the Earlies, and Noble. It is a first class grower, and a remarkable producer." It was shown with Sir Joseph Paxton for comparison, and the Committee recommended it be sent to Chiswick for trial, as some thought it was much like Sir Joseph Paxton, and others that the flavour was superior to that variety.

Mr. T. Coomber, The Hendre Gardens, Monmouth, exhibited eight fine Queen Pines, grandly developed deep fruits (small silver medal). Mr. W. Taylor, Hampton, exhibited three dishes of Strawberries—Sir Chas. Napier, British Queen, and the small brightly coloured Grove End Scarlet. Mr. W. Palmer sent a fine fruit of Suttons' Triumph Melon, the flavour of which was good, but the Committee considered it was over-ripe. Mr. John Watkins, Withington, near Hereford, showed twenty-four dishes of Strawberries and fifteen dishes of excellent Apples, with some Gooseberries and Currants (bronze medal). Mr. W. C. Leach showed several varieties of Strawberries and two large trays of fine fruits.

Mr. John Collis, Balls Lane, Chiswick, showed two seedling Strawberries and one dish of Sir Joseph Paxton (vote of thanks). Mr. R. Daws, High Road, Chiswick, sent samples of a seedling Rhubarb to be tried at Chiswick.

The first prize offered by Messrs. Sharpe & Co. for three dishes of Peas was awarded to Mr. Chadwick for Queen, Triumph, and Sir F. A. Milbank.

#### HARDY FRUIT.

In the class for six dishes of Strawberries, Mr. G. H. Sage won the first prize with large and finely coloured samples of James Veitch, Sir Joseph Paxton, Premier, Keens' Seedling, President, and Noble. The second prize went to Mr. W. Palmer for A. F. Barron, Commander, Bicton Pine, La Constante, Noble, and President of fair quality.

In the class for four dishes of Strawberries, Mr. Chadwick was the only exhibitor, and took the first prize for Vicomtesse Hericart de Thury, Noble, Sir J. Paxton, and British Queen. Mr. Chadwick was also first for one dish of Strawberries with fine fruits of Sir Joseph Paxton.

With six dishes of Gooseberries Mr. W. Palmer was first, showing good fruits of London, Slaughterman, Old England, Hero of the Nile, Shakespeare, and Conquering Hero. Mr. T. Gilbert, Merrow, Guildford, was second with Clayton, Queen of Trumps, Catherine, Forester, Drill, and Duke of Sutherland. There were four entries in this class. A second prize was awarded to Mr. W. Palmer for two dishes of Gooseberries, and he was the only exhibitor of Currants, but failed to secure a prize.

An extensive collection of Strawberries in pots, with baskets of Strawberries and Gooseberries, came from Messrs. Paul & Son, Cheshunt, representing a large number of varieties. Messrs. Bunyard & Co., Maidstone, also contributed a large collection of Strawberries in pots.

FLORAL COMMITTEE.—Present: W. Marshall, Esq., in the chair, and Messrs. H. Herbst, James O'Brien, W. C. Leach, B. B. Lowe, H. Turner, G. Paul, P. Veitch, W. Goldring, R. Dean, C. Jefferies, G. Gordon, and Lewis Castle.

Messrs. J. Veitch & Sons, Chelsea, exhibited specimens of the small and elegant *Philadelphus microphyllus*, *Andromeda speciosa pulverulenta* and *cassinifolia*, the bright yellow *Berberis aristata*, and the interesting *Escallonia philippiana*, *pterocladon*, and *exoniensis*, for the last named an award of merit. Messrs. Veitch also sent a plant of *Gerbera Jamesoni*, with bright orange red flowers, which the Committee desired to see again. A collection of Delphiniums, Canterbury Bells, and choice hardy flowers also came from the same firm's Coombe Wood Nurseries, Gaillardias being very notable. From Mr. C. Turner, Slough, came a group of Delphiniums and three boxes of laced Pinks, for one of which, The Rector, an award of merit was granted.

The Duke of Northumberland, Albury Park, Guildford (gardener, Mr. W. C. Leach), sent a collection of elegant *Alströmarias*, softly and richly coloured flowers, most varied in tint. Mr. B. Ladhams, Southampton, contributed a pleasing group of border Pinks, single

Roses, and Sweet Williams. Mr. T. Laxton, Bedford, contributed several seedlings from Mrs. Sinkins, pink; Marchioness of Salisbury, pure white, being very fine. Another white variety Stanley was good, and Lady R. Churchill, with a crimson centre, was also noteworthy. Mr. A. Waterer, Knap Hill, sent bunches of late flowering hardy Azaleas, from white to deep crimson, and very sweet. Mr. R. Dean, Ealing, exhibited a group of handsome Stocks, Canterbury Bells, and seedling Pinks.

Mr. J. Prewett, Swiss Nursery, Hammersmith, showed a fine variety of *Aërides maculosum* with a large panicle of crimson-lipped flowers. F. Wigan, Esq., Clare Lawn, East Sheen (gardener, Mr. W. H. Young) showed *Angræcum caudatum* and *Odontoglossum cordatum sulphureum*. Messrs. Seeger & Tropp, East Dulwich, showed several fine varieties of *Cattleya Gaskelliana* and *C. Mossiae*, together with *Lælia xanthina* and the new *Grammatophyllum Seegerianum*.

#### CERTIFICATED PLANTS.

*Centaurea Cyanus nana compacta* (H. Herbst).—An extremely dwarf plant, 3 to 6 inches high, with diminutive purple flower heads freely produced (award of merit).

*Tuberous Begonia Miss Faulkner* (H. Cannell & Sons).—A grand double variety with large handsome flowers, rich clear yellow (award of merit).

*Godetia White Pearl* (J. Carter & Co.).—A capital variety with pure white flowers very freely produced. It will prove a useful addition to the fine varieties in cultivation.

*Pink the Rector* (C. Turner).—A dozen blooms of this variety were shown very uniform in character, the petals clear, even, of good substance, the deep rosy crimson edging clearly defined.

*Escallonia exoniensis* (J. Veitch & Sons).—A hybrid with small Epacris-like flowers, with a pink tube and white rounded lobes. The leaves are elliptical and serrated at the margin (award of merit).

*Prunella Webbiana* (Paul & Son).—A beautiful form of the *P. grandiflora* type, with bright rosy crimson flowers in dense heads (award of merit).

*Mimulus cupreus, Prince Bismarck* (J. Laing & Son).—Very dwarf with abundant deep crimson flowers, very effective and distinct (award of merit).

*Lilium maritimum* (T. S. Ware).—An interesting small flowered species, the flowers suggestive of *Clematis coccinea*, but more open, orange red, with dark spots in the throat.

*Delphinium Robin Adair* (Kelway & Co.).—A grand single variety with large flowers, bright metallic blue; the spike is massive, and the variety altogether distinct and imposing.

*Peony Madame Emile Galle* (Paul & Son).—A charming double variety with very delicate blush-tinted flowers.

#### HARDY FLOWERS.

In class 1, for eighteen bunches of hardy perennials, O. T. Hodges, Esq., Lachine, Chislehurst, was awarded the silver-gilt Flora medal for good examples of *Epilobium angustifolium*, *Campanula carpatica alba*, *Prunella grandiflora*, *Campanula nobilis alba*, *Eryngium alpinum*, *Campanula macrantha*, *Pæonies*, *Lilium croceum*, *Delphiniums*, *Erigeron speciosus*, *Astrantia Biebersteini*, *Spiræa filipendula fl.-pl.*, *Spiræa Aruncus*, *Gaillardia picta*, *Campanula carpatica*, *Inula glandulosa*, *Lathyrus Drummondii*, and *Sidalcea oregana*. The second prize went to Mr. G. H. Sage, Ham House Gardens, Richmond, for very bright and good specimens.

In class 2, for twelve bunches of hardy perennials, the premier award was secured by W. Marshall, Esq., Auchenraith, Bexley (gardener, Mr. Pratt) who had *Epilobium angustifolium*, *Lychnis vespertina fl.-pl.*, *Lysimachia thyrsiflora*, *Campanula Van Houttei*, *Spiræa Aruncus*, *Lychnis chalcidonica*, *Delphinium*, *Campanula urticiflora fl.-pl.*, *Stenactis speciosa*, *Thalictrum glaucum*, *Lilium chalcidonicum erectum*, and *Astrantia major*. E. M. Nelson, Esq., Hanger Hill House, Ealing (gardener, Mr. Chadwick), was second with good Irises and other flowers.

In the hardy flower tent Messrs. J. Laing & Sons, Forest Hill, who have of late given greater prominence to representatives of their extensive hardy plant department than heretofore, had a very fine display of hardy flowers, extending down more than half the length of the tent. It was rich and well diversified, including many noteworthy plants, such as *Campanula Raineri*, a charming dwarf species; *Aquilegia chrysantha flava*, *Cyclobotria alba*, *Heuchera sanguinea*, a most graceful perennial; *Calochortus venustus*, *Scabiosa caucasica*; a rich crimson variety of *Mimulus cupreus* named *Prince Bismarck*, for which an award was recommended, an effective and useful thing; many fine Irises, *Violas*, *Pansies*, *Pæonies*, *Gladioli*, *Carnations*, *Pinks*, *Delphiniums*, and other flowers now in season. A silver-gilt Flora medal was awarded, and was well deserved. Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, also had a large and bright display, comprising *Campanula persicifolia alba grandiflora*, *C. Hendersoni*, *Lilium Hansonii*, *L. Washingtonianum*, *L. alutaceum*, *L. Parryi*, *L. colchicum*, the fine new white *Pink Her Majesty*, *Lathyrus grandiflorus*, *Delphinium nudicaule*, *Lychnis hybrida*, and many other plants. A silver Flora medal was recommended. Messrs. Kelway & Son, Langport, had one of their well-known magnificent displays of *Delphiniums* and *Gaillardias*, with a stand of *Iris Kämpferi* varieties, others of miscellaneous hardy flowers, and spikes of the beautiful *Crinum McOwani*. A silver Flora medal was adjudged.

Messrs. Paul & Son, the Old Nurseries, Cheshunt, were represented by imposing masses of *Delphiniums*, *Campanulas*, *Pæonies*, *Liliums*, *Gaillardias*, and *Poppies*; together was *Centranthus ruber*, *Hemerocallis Thunbergii*, *Pentstemon pubescens*, *Campanula grandis alba*, *C. Van*

Houttei, *Geranium armenum*, dwarf Cannas, *Prunella Webbiana*, *Dianthus atrorubens*, *Orchis foliosa*, *Phlox ovata*, *Arnebia echioides*, and other plants. A silver-gilt Flora medal was awarded. Messrs. Barr and Son, 12, King Street, Covent Garden, had a bright and loosely arranged collection, noticeable among which were *Tradescantia virginica delicata*, *Epilobium angustifolium*, *Potentilla nepalensis*, and *Crucianella stylosa*. A silver Bankian medal was adjudged.

A choice assortment also came from the Royal Gardens, Kew, including *Ononis natrix*, *Sphaeraleca rivularis*, *Cathcartia villosa*, *Eremostachys laciniata*, *Perezia multiflora*, *Chrysogonum virginianum*, *Dianthus pulchellus*, *D. viscidus*, a lovely little species; *Gentiana lutea*, *Lindelofia spectabilis*, *Layia glandulosa*, *Hypericum Reicheri*, *Campanula excisa*, *C. alpina*, *Heliosperma chromada*, and *Houstonia purpurea*.

SCIENTIFIC COMMITTEE.—Present: Mr. D. Morris in the chair; Mr. McLachlan, Dr. Müller, Rev. W. Wilks, Sir J. D. Llewellyn, Rev. G. Henslow, Hon. Sec.; Mr. C. A. Barber, and Mr. R. A. Rolfs, visitors.

*Excrescences on Willows*.—With reference to the specimens brought by Mr. Blandford to the last meeting, and referred to Professor H. Marshall Ward for an examination of the tissues, he reported that there was no evidence of any fungus growth, and Mr. McLachlan added that there was also none of insects having ever been present. Hence the true cause of the hypertrophy could not be ascertained.

*Papaver pilosum* (?).—This plant having been referred to Kew was ascertained by Mr. Baker to be *Papaver rupifragum*, var. *atlanticum*, and is figured in the "Bot. Mag.," tab. 7107. It is a native of Morocco, *P. rupifragum* being a native of Andalusia. Mr. Wilks observed upon the fact that there are a great number of Poppies now in cultivation which require a careful systematic treatment.

*Iris, Petals Variegated*.—Mr. McLachlan exhibited three petals half white and half purple, which appeared on a single plant of *Iris florentina*. The question was raised whether the plant was a white variety of *Iris germanica*, reverting. It was referred to Kew for further consideration.

*Scotch Fir and Larch Attacked by Chermes*.—Mr. R. Maher of Yattendon Court, Newbury, forwarded specimen branches of these trees infested with species of chermes. The only remedy is the free use of paraffin spray. At Kew, Mr. Morris observed, they were obliged to cut down some trees growing in the midst of others; as from their height and crowded condition the spray could not be used effectually, and the only alternative is to destroy the infected trees.

*Ash Wood Diseased*.—He also sent specimens of branches having the common cankerous-like hollow places on them. They were from an old tree 18 inches in diameter and a foot from the ground. The trunk and all the branches presented a similar appearance. They were referred to Prof. H. Marshall Ward for further investigation. Mr. McLachlan observed that that the Weevil *Hylesinus Fraxini* or else the larva of a moth *Myelos pinguis*, which feeds beneath the bark, might possibly have been the primary cause of the injury.

*Cynoches chlorochilon* (Klotzsch).—Mr. Rolfs exhibited what is apparently the male flower, as the column is very slender, and the pollen normally developed. This is a well-known garden plant. In addition he showed another form, being a larger flower with a short stout column, which is believed to be hitherto unrecorded, and is supposed to be the female flower of the same species. These two flowers appeared upon separate individuals imported from Caracas as *C. chlorochilon*. They flowered in the collection of M. A. Houjean de Lehaie, Membre de la Chambre des Représentants, Hyon (Mons), Belgium. The special interest attached to the present examples is the great similarity between the two sexes, a character also observed in *C. Loddigesi*, while in *C. ventricosum*, *C. pentadactylon*, and *C. Rossianum* the male and female flowers are very dissimilar. *C. Egertonianum*, the male of *C. ventricosum*, is a familiar example.

*Elm, with Coloured Wood*.—A branching specimen in full leaf was exhibited by Mr. Morris. It was received many years ago at Kew from Van Houtte under the name of *Ulmus sp. libero-rubra*. This is believed to be only a form of the Scotch or Wych Elm, *Ulmus montana*. The peculiarity possessed by the specimen consists in its having the wood immediately beneath the bark of a bright pink colour, which easily distinguishes it from the type. The exact nature of the colouring substance in this instance does not appear to have been investigated.

## IRIS ROBINSONIANA.

FACING the entrance to the succulent house in the Royal Gardens, Kew, a most conspicuous plant is the giant *Iris Robinsoniana*, and for some eight years its bold habit and foliage have attracted the notice of thousands of visitors, while horticulturists have been watching with much interest for the appearance of its reputedly beautiful flowers. This year patience and good cultural attention have been rewarded, for the plant has produced three of its tall scapes and has amply realised all expectations formed concerning it. The first flowers expanded on June 21st, and up to last Friday 157 had opened and faded, the largest number expanded in one day being eighteen, and on the day in question a dozen were out. Like many members of the family the flowers are of short duration, lasting about a day, but the succession produced maintains the interest over a comparatively long period.

*Iris Robinsoniana* is a native of Lord Howe's Island, where it is said to be sparingly represented, and was brought into notice about twenty

FIG. 4.—IRIS ROBINSONIANA.

years ago. The plant at Kew is very strong, and is flourishing planted out in a border where it is fully exposed to sun and air. This seems to have just suited it, for the leaves and scapes have exceeded in size the descriptions of the native plants. The leaves are 6 feet and more in length and 4 inches in diameter, while the scapes are about 8 feet in height. The flowers are 4 inches in diameter with spreading divisions, the outer ovate,  $1\frac{1}{2}$  inch, and the inner a little over an inch across. They are with the small stigmas pure white, with the exception of a small crescent shaped bright orange blotch at the base of each of the outer divisions, and it can be understood why the popular term "Wedding Flower" has been applied to it. The plant is extremely ornamental for its foliage alone, but if the secret can be discovered of flowering it more frequently it would become a great favourite where sufficient accommodation could be afforded. It is said that seed is readily obtainable, and the Kew plant will probably mature a good crop, so that we may expect to see this magnificent *Iris* in many gardens before long. With the exception of a specimen which I understand flowered at Tresco, in the Scilly Islands a year or two ago, the Kew plant is the first which has produced flowers in this country, and one of these is represented in fig. 4. The specific title was bestowed in honour of Sir Hercules Robinson.—L. C.

**EVENTS OF THE WEEK.**—To-day, July 9th (Thursday), Rose Shows will be held at Bath and Woodbridge. For Saturday, July 11th, the Eltham, New Brighton, and Reigate Rose Shows are announced. On Tuesday, July 14th, the Wolverhampton Society, and on Wednesday, July 15th, the Ealing Society hold their Shows, at which Roses will have a prominent position. Besides these events the Fruiterers' Company will hold a meeting at the Mansion House on Monday, July 13th, at 3 P.M. for the distribution of the certificates awarded at the Guildhall Show last October, and to discuss the advancement of fruit culture. The Rose Fair and Fête at the Crystal Palace for the benefit of the Gardeners' Orphan Fund will also be held on Wednesday, July 15th.

— **AT the Court of the FRUITERERS' COMPANY**, held on the 25th ult., it was resolved that the honorary freedom of the Company be conferred on Mr. Samuel Barlow, in consideration of his having exhibited the remarkable Apples from an orchard house tree that attracted so much attention at the Guildhall last year.

— **NATIONAL PINK SOCIETY (NORTHERN SECTION).**—The annual Exhibition of this Society will be held in the Royal Botanical Gardens, Manchester, on the 18th inst. Eight classes are provided, in which the different sections of florists' Pinks may be represented, and growers of these charming flowers are invited by the Committee to bring them before the public.

— **THE COUNTESS STRAWBERRY.**—This is the best Strawberry in the Chiswick collection at the present time. The fruits are above medium size, the majority somewhat flat and cockseomb shaped, dark red, very firm, with a rich, full flavour. The plants grow well, without being robust, and are compact in habit, with neat medium-sized leaves. The crop is good. This is one of Dr. Roden's seedlings, probably the best of them, and seems worthy of more general cultivation.

— **STIRLING CHRYSANTHEMUM ASSOCIATION.**—We observe in the schedule of this Association that a gold medal is offered for twelve incurved blooms of Chrysanthemums in not less than nine varieties, "the competition to be open to all on payment of 2s. 6d." The Show is to be held at Stirling on November 20th and 21st. Mr. Wm. Boswell is the Secretary.

— **THINNING APPLES.**—The young bush Apple trees at Chiswick set an enormous crop of fruit, and the trees are relieving themselves of the burden in a somewhat striking manner. On the ground beneath some of them there are from five to ten times more Apples than on the branches above, yet in most cases sufficient are retained and swelling freely to produce an excellent crop, and on some the fruits are about as regularly placed as if the thinning had been done by hand. Overburdened Apple trees do not always cast the fruits so freely, and varieties differ in this respect. The Chiswick trees appear to have relieved themselves in a very sensible manner and quite to Mr. Barron's satisfaction.

— **FLOWER STANDS AT WINCHESTER.**—Visitors to the Winchester Rose Show annually expect to see tastefully dressed stands of choice and wild flowers, and are never disappointed. The Misses Flight are adepts in the blending of colours, and their arrangements are never crowded. In the Wild Flower class Miss Agnes Flight was distinctly ahead, although Miss Byrne and Miss J. Trask showed stands of no mean order of merit. Miss Flight's first prize stand of other flowers needed but two or three blooms of a higher colour at the base to make it perfect. Mrs. J. L. Trask, Mere Court, Sparsholt, was a good second in the class.

— **JOHN RUSKIN STRAWBERRY.**—I was induced to give this variety a trial along with Noble. Fifty plants of each were planted on an early border. We gathered from John Ruskin three days before Noble, and all who have tasted both varieties are of opinion that the former is much superior in flavour. It is also much firmer in the flesh, and should prove a better traveller than Noble, but it lacks the fine size of the latter. Competitor is a Strawberry we are likely to hear more of by-and-by. The plants I have here are doing well, ripening fine fruit. It would be interesting to hear from some who have tried the above-mentioned sorts as to their qualities.—**JOHN SHORT, Hummersknott.**

— **THE GARDENERS' ORPHAN FUND FÊTE.**—The Floral Fête and Rose Fair to be held on behalf of this charity at the Crystal Palace on Wednesday next ought to attract a large number of visitors. Many Roses and other flowers are promised for sale, and groups of plants are kindly offered by nurserymen to contribute to the general display. The Crystal Palace authorities provide varied attractions, and the national cricket match between gardeners and seedsmen is exciting considerable interest. Mr. Molyneux has men ready from Berks, Essex, Hants, Kent, Lancashire, Middlesex, Northamptonshire, Somerset, and Guernsey, and as he is a Yorkshireman his team will be representative. We have no particulars about the seedsmen, but Mr. Sharman may be trusted to exert himself and set his doughty opponents a task to defeat the active men from warehouse and counter. A fine day is hoped for and a large company, in order that the enterprise may prove a success.

— **MR. E. H. JENKINS**, a well-known authority on hardy flowers, a good cultivator and ready writer, informs us he has taken the Queen's Road Nurseries, Hampton Hill, Middlesex, and intends growing fruit and cut flowers for market. He has our best wishes for his success.

— **ORCHIS MACULATA.**—Mr. A. Harding sends us from Orton spikes of this Orchis as gathered in both a wild and cultivated state. Those from cultivated plants are more than four times the size of the wildings, and distinctly attractive. The plants grown in good soil produce spikes from 18 inches to 2 feet in height, and massive in proportion. This Orchis is highly worthy of cultivation as a garden flower.

— **THE TOTAL RAINFALL AT CUCKFIELD, SUSSEX**, for June, was 1.51 inch, being 0.29 inch below the average. Heaviest fall 47 inches on 22nd. Rain fell on eleven days. Total fall for the six months 9.31 inches, which is 2.86 inches below the average. Highest temperature 82° on the 18th, lowest 38° on 12th, mean maximum 68°, mean minimum 49.1°, mean temperature 58.5°. Partial shade readings about 1° below the average.—**R. I.**

— **CROYDON GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT SOCIETY.**—At the last meeting of this Society the members decided to visit the Crystal Palace on Wednesday next, the 15th inst., on the occasion of the fête in aid of the Gardeners' Orphan Fund. It is expected that the members of the Society will render all the support they can. Mr. Stanley Baxter, the Honorary Secretary, has undertaken the arrangements, and nothing fails in his hands.

— **EARLY PEAS.**—Your correspondent, Mr. Long, mentions the above. On February 24th we sowed Veitch's Extra Early and Chelsea Gem Peas. We have been gathering from these since June 20th. Exonian was sown on March 7th, and we were able to gather on June 25th. This appears to be a satisfactory cropper and of good flavour.—**T. H. SLADE.**

— **THE MARTIN SMITH PRIZES FOR BORDER CARNATIONS.**—The question as to whether the plants being grown to supply the cut blooms to compete in the special classes in which the above prizes are offered having been raised and submitted to Mr. Martin Smith, he has, on the suggestion of Mr. Harry Turner, authorised the publication of the following:—"Each stem to carry not less than three blooms or buds." It is felt that it is impossible to prevent disbudding, especially as the act of removal cannot be detected, even supposing the practice to be disallowed. There is nothing in the regulations governing the competition for these prizes which prohibits disbudding. The prizes will be competed for at the Drill Hall, James Street, Westminster, on July 21st.

— **THE programme of the NATIONAL CHRYSANTHEMUM SOCIETY'S Excursion for July 20th, 1891**, is as follows:—10.50 (sharp), assemble at Euston Station. Train leaves for Leighton Buzzard at 11 A.M. Tickets are also available from Addison Road, Kensington (train leaves 10.42). Camden Town (North London Railway train leaves at 10.39). Travellers by the two last named trains change at Willesden into the 11 A.M. train from Euston, due at 11.11 A.M.; 12.13, train arrives at Leighton Buzzard; 1.30 P.M., dine at Swan Hotel, Leighton Buzzard; 2.15, brakes convey to Ascott Park; 2.45, arrive at Ascott Park, and inspect the gardens and pleasure grounds. The brakes are available for drives during the afternoon, in parties of not more than twelve persons. Special tickets, 1s. each, can be obtained of the Secretary on the ground. Five, assemble in pavilion for tea; 8, brakes leave Ascott Park for Leighton Buzzard; 8.40, train leaves Leighton Buzzard; 9.57, arrive at Willesden; 10.20, arrive at Euston; 10.27, arrive at Camden Town. (change at Willesden); 10.32, arrive at Addison Road. Application for tickets must be received by Mr. R. Dean by Thursday, July 16th.

— FROM Messrs. Kelway & Son, Langport, Somerset, we have received a box of HARDY FLOWERS, comprising a number of the handsome varieties of Delphiniums, Pæonies, and Gaillardias, which have won the firm so many certificates and other honours at metropolitan or provincial shows. The Delphiniums were particularly fine, the flowers large, in soft and brilliant shades of blue. The Pæonies also were massive, beautiful, and some almost as fragrant as Roses.

— VEGETABLES AT WINCHESTER.—Excellent collections of six varieties of vegetables were staged at Winchester last week in competition for the prizes offered by Messrs. Sutton & Sons by Mr. J. Gosney, gardener to Captain C. Mitchell, R.N., West Highlands, Winchester. Sutton's Seedling Potato, Improved Telegraph Pea, Leviathan Beans, and Trophy Tomatoes were the most noteworthy; and by Mr. T. Annalls, gardener to T. G. Shenton, Esq., The Glen, Golden Common, who was a good second; the omission of a dish of Potatoes in his collection proved, as it ought to do, a serious objection to his taking the premier award.

— EARLY PEAS.—On February 17th sowings were made on a south border of the following varieties:—Ringleader, William I., American Wonder, and Sutton's Al. The latter was sown at the end of the border, where, owing to trees, it lost the afternoon sun. On June 19th I made abundant gatherings of William I., Ringleader, and American Wonder. Al came in two days later, and I am convinced that had it not been for the drawback arising from its position, it must have been earlier. It was the best of all in quality—a Marrowfat, resembling Early Paragon, and I think justifies its name.—F. SMITH, *Palace Gardens, Salisbury.*

— WEATHER AT RIPLEY, YORKS, DURING JUNE, 1891.—June opened seasonable, and gave promise of bringing the hoped-for rain, as 0.31 inch fell on the 2nd, and 0.22 inch on the 4th; but, alas! we were to suffer disappointment, as after the last-mentioned date no more fell (excepting two very slight showers on 7th and 13th) until the 23rd, the total fall for the month being 1.05 inch, which fell upon seven days. There were fifteen bright days; wind was northerly on nineteen days. Mean reading of barometer, 30.12°. Mean maximum temperature, 67.7°; mean minimum temperature, 44.9°; mean temperature, 56.3°. Highest maximum temperature in shade, 83° on 19th; lowest minimum temperature in shade, 36° on 1st. Total rainfall for six months ending June 30th, 8.17 inches.—J. TUNNINGTON, *Ripley Castle Gardens.*

— THE DALSTON AND DE BEAUVOIR TOWN CHRYSANTHEMUM SOCIETY is a vigorous and progressive young body of amateurs who are evidently determined to render it a pattern for local societies. At a recent meeting, called for the purpose of electing a President as successor to the late Mr. Wm. Holmes, Mr. Charles Gibson, Morden Park Gardens, Mitcham, and Mr. James Udale, Caterham, were invited to lecture upon the present requirements of the Chrysanthemum. Excellent practical addresses were delivered by both cultivators; they were received with much applause, and numerous pertinent questions were asked and answered. Unanimous votes of thanks were accorded to the lecturers, and general satisfaction were expressed with a most agreeable and profitable evening. For the admirable arrangements, Mr. Arthur Hill, Chairman; Mr. Wm. Butler, Hon. Secretary; and Mr. R. Ballantine, Chairman of the National Chrysanthemum Society, were mainly responsible, and to them the credit of the success is due.

— THE Committee of the CROYDON HORTICULTURAL SOCIETY are to be congratulated on originating a "Rose Fair" in aid of the Gardeners' Orphan Fund. It has been since adopted by other Societies, and proved successful. Last year at Croydon the sum of £15 was realised, this year there was a little falling off on account of the wet morning and the lateness of the Rose season, £12 5s. being the total receipts. Mrs. Gunner, the wife of the Chairman of the Committee, presided at the stall. Thanks are due to her and the donors of the flowers, whose names include Messrs. Smec, Cypher, Horsman, Dart, Barr & Son, Cheal & Sons, Peed & Sons, Butcher, Cooper, Box, Slater, Glover, Rodbourn, Glasscock, Cummins, Penfold, Pawle, Bethune, Budd, Mawley, Slaughter, West, C. J. Salter, and others.

— MR. W. WATSON of Kew obliges us with the following additional note on PRIMULA IMPERIALIS, figured in last week's Journal. "Primula prolifera is a Himalayan plant which was introduced by the late Dr. J. Anderson Henry, and flowered at Kew in 1884, when it was figured in the *Botanical Magazine*. At that time Sir Joseph Hooker considered this and the plant found only on the mountains of Java, and named P. imperialis by a Dutch botanist, to be one and the same species. But he no longer holds that opinion after having seen the two plants side by side in cultivation at Kew. True,

P. prolifera is small and weedy as compared with P. imperialis. P. imperialis has very large leaves and a flower scape from 3 to 5 feet in height. The colour of the flowers is deep, almost orange, yellow. The plant fully merits its specific name."

#### ROSE SHOWS.

- July 9th (Thursday).—Bath and Woodbridge.  
 „ 11th (Saturday).—Eltham, New Brighton, and Reigate.  
 „ 14th (Tuesday).—Wolverhampton (a three-days Show).  
 „ 15th (Wednesday).—Ealing.  
 „ 16th (Thursday).—Hereford (N.R.S.), Bedford, H'ensburgh, and Trentham.  
 „ 17th (Friday).—Ulverston.  
 „ 18th (Saturday).—Manchester.  
 „ 21st (Tuesday).—Christleton and Tibshelf.  
 „ 23rd (Thursday).—Halifax and Worksop.  
 Aug. 1st (Saturday).—Ripley (Derby).

#### THE CRYSTAL PALACE SCHEDULE.

I AM much obliged to "J. B." for the courteous tone of his letter toward myself. He says the question which we debated in the Journal last year is "still unsettled." I imagine, on the contrary, that it has not yet become unsettled. I begged him, and those who thought with him, to bring the matter up at the N.R.S. general meeting, but as it was not mentioned it remains settled, I take it, by the restrictions imposed as before.

I still think his view of the matter would be much the most unfair. He speaks of exhibitors of twenty-fours coming down to twelves, and twelves coming down to sixes, and asks "what is the six exhibitor to do?" Well, at all events he is not precluded from showing at all, whereas many large growers, if forced to enter in the highest classes, would be in this position in a season like the present, and thus those who had expended the most in time, money, labour, brains, experience, &c., would be worse treated than those who had placed the least amount of similar capital in the matter. He says that the small grower "has no guarantee that his fellow competitors shall be men of his own calibre" under the present arrangements; but, if I understand him right, if things were as he would have them, the large grower would have no guarantee that he would be allowed to exhibit at all.

He "hoped to see me in my old place." At all events, it was too late for repentance when I saw his letter; but I was set wondering what "my old place" was. I have shown in six, nine, twelve, twenty-four, thirty-six, and forty-eight. Of these the six is certainly my "oldest place;" but if he means forty-eight, in which I showed for the first time last year, I am sure that a large majority of the members of the N.R.S. would consider it intolerable that a man should not be permitted to show, without reducing his stock, in anything but the highest class to which he has ever aspired.

If "J. B." was at the Palace he will have seen that my conscience is not burdened by having "swamped" or "wiped out" any weak grower. It seems to me obvious that everyone will show in the highest class that he thinks he can manage—the prizes are better, and the competition less keen. You can win in the higher classes with a bad Rose or two in your stand, but not in the lower ones; but you cannot show, much less win, if you have not a sufficient number of varieties out.

I still further maintain, as I have hitherto done (regretting that my personal interest in the matter should have come into the discussion), that the small growers are best able to take care of their Roses against emergencies—frost, wind, drought, &c.; and must once more beg "J. B." to bring up the matter at the general meeting if he thinks he has a grievance.—W. R. RAILLEM.

#### SUCCESS IN TOMATO CULTURE—CHECKING THE DISEASE.

I HAVE been unable to write sooner to thank you for your kind and prompt reply to my inquiry about Tomatoes. The delay, however, has given me time to test so far the remedy you gave, and I am glad to say that I think we have got the better of the disease, and that the Worthing growers' remedy is on the right lines. We could not raise the temperature to 80°, but kept the house as warm as we could, and also perfectly dry. You did not say if the ventilators had to be kept close to get the temperature up to this high figure. I think it would be an error to close the house entirely. We are very strong advocates of fresh air, and you would be surprised to find how well our plants do with so little fire heat. We planted out a house 300 feet long about the middle of April, and have grown the plants without any fire heat.

We were very successful last year. From 700 plants we gathered 2½ tons from the middle of July to the middle of February—seven months—all on single stems, and our longest plant would not be more

than 7 feet high. From some plants we had over eighty fruits 4 feet from the ground. All were smooth-skinned, and averaged 10d. per lb. We topped the market from first to last. Our fruit was admitted on all hands to be the finest ever seen in Glasgow. We have repeatedly obtained as much as 6d. per lb., more than any other Tomatoes sold at the same time. Last year being our first year, the result was very encouraging. We have 16,000 square feet more glass this year, and even though we are not so successful we intend going ahead on a large scale, and shall be glad to see any of the staff of the old Journal at any time. — DUNCAN BUCHANAN, *Forth Vineyard, Kippen, by Stirling.*

[We have times out of number warned against a close moist atmosphere for Tomatoes, and the lower the temperature the drier the air should be. The fruits referred to must have been remarkably fine. We are both glad to hear of your success and obliged by your experience in conquering the disease.]

### LAXTON'S SCARLET QUEEN STRAWBERRY.

MR. LAXTON has sent us better fruits of this new Strawberry than those referred to on page 510. The frost destroyed many of the early blooms, and the largest fruit gathered is represented in the illustration. Scarlet Queen, as before stated, is the result of a cross between Noble and King of the Earlies, the former the pollen parent, and combines the good flavour of the latter with a great addition to its size. The foliage is very large, resembling that of the American variety Sharpless, the pollen parent of Noble, and the character thus transmitted. The fruit of Scarlet Queen is even and symmetrical in shape. Seeds small and rather deeply embedded, colour reddish scarlet, flesh pale red throughout. The flavour is excellent, having some trace of that of the Hautbois. The raiser of Scarlet Queen regards it as a valuable early Strawberry. It ripened at Bedford this year on 20th of June without any protection.

FIG. 5.—LAXTON'S SCARLET QUEEN STRAWBERRY.

### SHOWS.

#### THE NATIONAL ROSE SOCIETY.—JULY 4TH.

THE metropolitan Exhibition of this Society was held at the Crystal Palace, Sydenham, on Saturday last, July 4th, and though it would not bear comparison with many of its predecessors, yet for such a season it was an agreeable surprise in regard to quantity if not in quality. In all respects it was, however, superior to what many had expected to find, and proved at least that any alteration of date would have resulted in but a doubtful advantage. It is strange how rapidly Roses develop in a few fine July days, and had it not been for the storms experienced in some districts the display would have been both larger and better, notwithstanding the earlier adverse season influences.

The entries were not so numerous in some of the large classes, but, judging by our hurried notes, there must have been nearly 4500 blooms in competition, and this is a considerable total. Few stands were remarkable for their evenness, and instances were frequent where it was clear that much difficulty had been experienced in completing the number required by the schedule. Yet some remarkably fine blooms stood out conspicuously in several cases, and the four premier blooms were of exceptional merit. Messrs. Paul & Son's *Gustave Piganeau* and Mr. Prince's *Souvenir de S. A. Prince*, as the best H.P. and Tea respectively in the nurserymen's classes, were grand flowers, especially the first-named. Then, too, Mr. Knight's *Général Jacqueminot* and Mr. Tate's *Madame Cusin*, which gained similar honours in the amateurs' classes, were magnificent blooms, and probably will not be surpassed this season.

During the afternoon the Show was crowded to excess, a continuous procession of visitors four or five deep passing by the tables, and patiently waiting for hurried and imperfect glances at the blooms. Fortunate were those who attended earlier in the day, for it soon became almost impossible to obtain a satisfactory inspection. If any doubt existed respecting the popularity of the Rose it would have been effectually removed by a journey to the Crystal Palace Show, and all the officials of the Society deserve to be congratulated upon the large measure of success which attended their efforts in maintaining the credit of the Queen of Flowers.

#### THE NURSERYMEN'S CLASSES.

The entries in the great class for seventy-two blooms, for which the National Rose Society's challenge cup is in competition, were three only. Last year's winner, Mr. Frank Cant, was unable to compete, as

he could only bring together sixty varieties. To be unable to even make a struggle for retaining the trophy must have been a great disappointment to him. His cut-backs suffered severely from the Whitsuntide frosts. In such a season as the present the task of mustering presentable blooms of seventy-two varieties assumes its most serious proportions. Messrs. Harkness & Sons, the winners in 1889, were also noticeable absentees. They had hardly a bloom out, even on cut-backs, and were consequently compelled to come up empty handed. This was worse even than last year, when the season partially threw them out of court, and is very hard fortune for the great Yorkshire growers. It was quickly noticeable that the blooms staged were distinctly below the average in point of quality. They lacked size, form, and cleanliness, the storms just before the Exhibition having evidently marked them. The colours, too, were not so bright as usual. There were perhaps not many points between the first and second prize stands, and the contest was an interesting one, eventually resulting in a well-earned and popular victory for the veteran Colchester grower, Mr. B. R. Cant, who had not tasted the sweets of victory in the great class since 1886, and it may be interesting to note that this made his sixth win. Considering the backwardness of the season and the inclement weather his exhibit was a most meritorious one. He staged the following varieties. Back row: *Alphonse Soupert*, a large bloom in splendid colour; *Earl Dufferin*, *Merveille de Lyon*, *Madame Isaac Pereire*, *Captain Christy*, a lovely bloom, but slightly soiled; *Cheshunt Hybrid*, *Devoniensis*, *Marie Baumann*, very good; *Paul Neyron*, *Exposition de Brie*, *Duchesse de Vallombrosa*, *Duke of Edinburgh*, *Anna Ollivier* (the last four all excellent), *John Hopper*, *Souvenir d'un Ami*, *Xavier Olibo*, *La France*, *Madame C. Joigneaux*, *Baroness Rothschild*, *Général Jacqueminot*, very good and richly coloured; *Mons. Noman*, *Prince Arthur*, *Madame Gabriel Luizet*, and *Ulrich Brunner*. Middle row: *Duke of Wellington*, *Maréchal Niel*, *Marie Verdier*, *Madame Lacharme*, *Alfred Colomb*, *Lady Mary Fitzwilliam*, *Baron de Bonstetten*, *Catherine Mermet*, *Chas. Lefebvre*, *Madame Hippolyte Jamain*, *Mrs. John Laing*, *Madame Lambard*, *Pride of Waltham*, *Moire*, *Auguste Rigotard*, *Madame Bravy*, a charming flower; *Fisher Holmes*, fresh and bright; *Etoile de Lyon*, *Annie Laxton*, *Souvenir d'Elise Vardon*, *Dupuy Jamain*, very fine indeed; *Madame Willermoz*, *Mons. Alfred Dumesnil*, and a good example of *Madame de Watteville*. Front row: *Souvenir de Paul Neyron*, *Louis Van Houtte*, *Caroline Kuster*, *Countess of Rosebery*, *Comtesse de Nadaillac*, *Eclair*, *Cleopatra*, *Victor Hugo*, *Princess of Wales*, *Victor Verdier*, *Niphetos*, *Prince Camille de Rohan*, *Jean Ducher*, *Madame Cusin*, *Boule d'Or* (both very good), *Abel Carrière*, *Innocente Pirola*, *Dr. Sewell*, *Francisca Krüger*, *Madame Victor Verdier*, *Ernest Metz*, a charming bloom; *Jean Liabaud*, *Madame Hoste*, and a capital *A. K. Williams*. The second prize flowers of Messrs. Paul & Son, *The Old Nurseries*, *Cheshunt*, were small, but otherwise were in perfect condition, being delightfully fresh and clean. Especially good were *Souvenir de S. A. Prince*, *Beauty of Waltham*, *Madame Gabriel Luizet*, *Duke of Edinburgh*, and *Ulrich Brunner*. *Mrs. John Laing* was very good, and there was a splendid bloom of *Gustave Piganeau*. Messrs. D. Prior & Son, *Myland Nursery*, *Colchester*, were third, having *Général Jacqueminot*, *Star of Waltham*, *Madame Verdier*, and *Prince Arthur*, very good.

There were only two stands of forty-eight trebles, but they made a bold and attractive display. Mr. B. R. Cant was again successful, and he once more exhibited blooms of great comparative excellence. His varieties were as follows—Back row: *La France*, *Etoile de Lyon*, *Madame C. Joigneaux*, *Madame Gabriel Luizet*, very bright; *Alfred Dumesnil*, *Souvenir d'Elise Vardon*, *Alphonse Soupert*, *Rubens*, *Auguste Rigotard*, *Niphetos*, *Xavier Olibo*, *Madame de Watteville*, a splendid trio; *Ulrich Brunner*, *Maréchal Niel*, *John Hopper*, *Souvenir d'un Ami*, *Prince Camille de Rohan*, *Mons. Noman*, *Général Jacqueminot*, very fine; *Caroline Kuster*, *Heinrich Schultheis*, *Innocente Pirola*, *Jules Margottin*, and *Pride of Waltham*. Front row: *Duke of Edinburgh*, *Madame Lacharme*, *Catherine Mermet*, *Annie Laxton*, *Marie Van Houtte*, *Marie Baumann*, *Capt. Christy*, *Exposition de Brie*, *Madame Bravy*, *Prince Arthur*, *Duchesse de Vallombrosa*, *A. K. Williams*, *Souvenir de S. A. Prince*, *Fisher Holmes*, *Souvenir de Paul Neyron*, *Dr. Sewell*, *Devoniensis*, *Alfred Colomb*, *Hon. Edith Gifford*, *Madame Cusin*, *Mrs. John Laing*, *Abel Carrière*, *Violette Bouyer*, and *Dupuy Jamain*. Messrs. Paul & Son again came second with blooms of a corresponding character to those in the previous class, the best examples being perhaps *Madame Montet* (though small), *Niphetos*, *Beauty of Waltham*, *Prince Arthur*, *Général Jacqueminot*, *Alba Rosea*, *Duke of Edinburgh*, *Mrs. John Laing*, and *A. K. Williams*.

Competition was much brisker with forty-eight single blooms, distinct, eight competing, and Mr. Chas. Turner, *Royal Nurseries*, *Slough*, proved to be the winner. The stand included some very good examples, though others were somewhat weather-worn. Taken collectively it was a fine stand. The varieties were—Back row: *Duke of Edinburgh*, *Capitaine Christy*, *Prince Arthur*, *Grace Darling*, *Dupuy Jamain*, *Catherine Mermet*, *Ulrich Brunner*, *Lady Mary Fitzwilliam*, *A. K. Williams*, *Mrs. J. Laing*, *Marie Baumann*, *La France*, *Maurice Bernardin*, *Beauty of Waltham*, *Niphetos*, and *Heinrich Schultheis*. Middle row: *Maréchal Niel*, *Auguste Rigotard*, *Caroline Kuster*, *François Louvat*, *Abel Grand*, *Prince Camille de Rohan*, *Her Majesty*, *Alfred Colomb*, *Baroness Rothschild*, *Reynolds Hole*, *Madame Gabriel Luizet*, *Jean Soupert*, *Comtesse de Nadaillac*, *Séateur Vaisse*, *Marquise de Castellane*, and *Dr. Andry*. Front row: *Vicomte Vigier*, *Souvenir d'Elise Vardon*, *Sultan of Zanzibar*, *François Levet*, *Penelope Mayo*, *Merveille de Lyon*, *Victor Hugo*, *Madame Eugène Verdier*, *Xavier*

Olibo, Souvenir d'un Ami, Fisher Holmes, Hon. Edith Gifford, Duke of Wellington, The Bride, Abel Carrière, and François Michelin. Second place was taken by Messrs. G. & W. Burch, Peterborough, with smaller flowers in very good condition. Mr. G. Prince, 14, Market Street, Oxford, was a close third, and Messrs. J. Burrell & Co., Howe House Nurseries, Cambridge, fourth. The competition was very close in this class.

Mr. G. Mount, Canterbury, took the leading place from three opponents with twenty-four singles, and his stand was one of the best in the Show. The blooms were of good size, fresh and finely coloured. The varieties were—Back row: Marie Baumann, La France, Camille Bernardin, Capt. Christy, Duke of Edinburgh, Madame Gabriel Luizet, Ulrich Brunner, and Mrs. J. Laing. Middle row: Her Majesty, a beautiful bloom; Alfred Colomb, Baroness Rothschild, A. K. Williams, Lady Mary Fitzwilliam, Dupuy Jamain, Marguerite de St. Amand, and Louis Van Houtte. Front row: Général Jacqueminot, Souvenir d'Elise Vardon, Abel Carrière, Dr. Andry, Eugène Fürst, Violette Bouyer, Xavier Olibo, and Comtesse d'Oxford. A very creditable lot of flowers from Mr. J. Mattock, New Headington, Oxford, secured him the second prize, and Mr. Eric F. Such, Maidenhead, was third.

A splendid display was made with twenty-four triplets, there being eight stands of them. The competition was close, and the judging a troublesome process. Mr. Prince was eventually adjudged the winner for a grand lot, comprising in the back row Fisher Holmes, Niphetos, Duke of Teck, Marie Van Houtte, Victor Hugo, Madame Gabriel Luizet, Baron A. de Rothschild, Vicomtesse Folkestone, Horace Vernet, Lady M. Fitzwilliam, Duke of Edinburgh, and La France; in the front row Capt. Christy, Mons. E. Y. Teas, Francisca Krüger, Prince Camille de Rohan, Souvenir de S. A. Prince, Marie Baumann, Catherine Mermet, Auguste Rigotard, The Bride, Louis Van Houtte, Princess of Wales, and A. K. Williams. Mr. G. Mount had some excellent examples in his second prize stand. Mr. Turner was a close third, and Messrs. G. Cooling and Sons, Bath, fourth.

The medal for the premier H.P. in the nurserymen's classes was awarded to Messrs. Paul & Son for *Gustave Piganeau* in their second prize stand of seventy-two. It is a new variety of last year, and Messrs. Paul's bloom was so beautiful that we represent it as well as time would permit on page 25. The variety is likely to be largely sought after. In general character it is something between Auguste Rigotard and Comtesse d'Oxford, but distinct from either; perfect in form, with substantial petals, and of a clear lustrous red colour. The growth of the plant is vigorous and the wood stout.

#### TEAS AND NOISETTES.

The nurserymen's Teas produced many lovely stands. The winning one in the class for twenty-four blooms, shown by Mr. G. Prince, approached that successful Tea grower's finest style. The blooms were charming in the extreme. The varieties represented were:—Back row: Souvenir d'un Ami, Souvenir de S. A. Prince, Belle Fleur d'Anjou, Maréchal Niel, Madame Cusin, The Bride, Comtesse de Nadaillac, and Innocente Pirola. Middle row: Mrs. Jas. Wilson, Jules Finger, Marquis de Sanina, Alba Rosca, Princess of Wales, Catherine Mermet, Etoile de Lyon, and Madame de Watteville. Front row: Rubens, Hon. Edith Gifford, Jean Ducher, Marie Van Houtte, Cornelia Koch, Niphetos, Madame M. Arnaud, and Caroline Kuster. This appeared to be the only one in competition. With eighteen blooms there were seven entries, and Mr. J. Mattock won with a charming stand, comprising the following:—Back row: Niphetos, a lovely bloom; Catherine Mermet, Madame Willermoz, Rubens, Amazon, and Souvenir d'un Ami. Middle row: Adam, The Bride, Comtesse de Nadaillac, Hon. Edith Gifford, Souvenir de Thérèse Levet, splendidly coloured; and Madame Welche. Front row: Madame H. Jamain, Marie Van Houtte, Anna Ollivier, Souvenir d'Elise Vardon, Jean Pernet, and Jean Ducher. Messrs. Burrell & Co. were second, also with a delightful collection of blooms, but smaller than those in the first prize stand. Messrs. Paul & Son, Cheshunt, were third, and Mr. Chas. Turner fourth.

Six competed with twelve of any Tea or Noisette, Mr. B. R. Cant winning with a lovely box of Madame de Watteville, Mr. Prince second with a charming lot of The Bride, Mr. Mattock third with the Hon. Edith Gifford, and Mr. Turner fourth with Catherine Mermet. Teas in trebles, eighteen varieties, brought four stands, and the best was that of Mr. G. Prince, a remarkably beautiful one. The varieties were:—Back row: Princess of Wales, Souvenir de S. A. Prince, Catherine Mermet, The Bride, Madame Cusin, Comtesse de Nadaillac, Madame de Watteville, Innocente Pirola, and Jean Ducher. Front row: Alba Rosea, Rubens, Caroline Kuster, Francisca Krüger, Hon. Edith Gifford, Etoile de Lyon, Comtesse de Panisse, Marie Van Houtte, and Souvenir d'un Ami. A charming collection from Mr. Mattock took the second prize, and the third and fourth went respectively to Mr. G. W. Piper, Uckfield, and Messrs. Keynes, Williams & Co., Salisbury.

#### AMATEURS' CLASSES.

In the larger classes devoted to amateurs the competition was much more limited than in previous years, nor could it be said that the general quality was so high as we have been accustomed to seeing, yet several of the leading stands were welcome surprises in such an exceptional season, and brightness with purity of colour made amends for want of size and substance. In some instances heavy storms of the preceding day had told disastrously upon the blooms, injured petals and irregularity being conspicuous; but even with difficulties like these to contend with fairly creditable stands had been formed in several cases, and it was

fortunate that it requires a good deal to damp a rosarian's courage, or the Show would have occupied a much smaller space.

The first class of division C (class 6) was that for forty-eight distinct single trusses, in which the premier award was the sixty-guinea silver challenge trophy offered by nurserymen. There were only five competitors, but the skill of the Judges was rather severely tested with regard to the two or three leading stands, though after mature deliberation the coveted honour was adjudged to Mr. E. B. Lindsell, Bearton, Hitchin, who had extremely bright and fresh blooms, with here and there a weak one, proving how difficult it had been to cut so large a number. The varieties were Xavier Olibo, very handsome; La France, Abel Carrière, Alphonse Soupert, Prince Arthur, Madame Gabriel Luizet, Alfred Colomb, Comtesse d'Oxford, Pride of Waltham, S. M. Rodocanachi, Chas. Lefebvre, Souvenir d'un Ami, Cornelia Koch, Duchess of Bedford, Duke of Wellington, Innocente Pirola, Catherine Mermet, Dr. Sewell, Comte Raimbaud, Boule d'Or, Comtesse de Nadaillac, Mdlle. Marie Verdier, Dupuy Jamain, Marie Van Houtte, A. K. Williams, Violette Bouyer, Victor Verdier, Duchesse de Vallombrosa, Rosieriste Jacobs, Caroline Kuster, Mons. Boncenne, Souvenir d'Elise Vardon, Duke of Edinburgh, Marquise de Castellane, Le Havre, Devonensis, Duke of Teck, Etoile de Lyon, Mrs. John Laing, Lady Mary Fitzwilliam, Duke of Albany, Annie Ollivier, E. Y. Teas, Capt. Christy, Maurice Bernardin, Heinrich Schultheis, Grand Mogul, and Marie Finger. The second place was accorded to Dr. S. B. Budd, 8, Gay Street, Bath, who had notable blooms of Reynolds Hole, Louis Van Houtte, and Mrs. John Laing in a good collection. The Rev. J. H. Pemberton, Havering-atte-Bower, Essex, was third, his blooms being of fair substance throughout; and Mr. A. Slaughter, Jarvis Villa, Steyning, was fourth with rather small blooms.

In class 7 of the same division four competitors arranged stands of blooms, and Dr. S. P. Budd succeeded in this case, taking the first prize for good examples of the following:—Marie Baumann, Mrs. John Laing, Duchesse de Vallombrosa, Louis Van Houtte, Abel Carrière, The Bride, Marquise de Castellane, E. Y. Teas, A. K. Williams, François Michelin, La France, Alfred Colomb, Prince Arthur (extra fine), Her Majesty, Madame Gabriel Luizet, and Etienne Levet. Mr. E. B. Lindsell was second; the Rev. A. Berners, Harkstead Rectory, Ipswich, third; and Mr. A. Slaughter fourth, all staging moderately good collections.

Division D also included two classes, in which the competition was still more restricted than in that just noticed, only three exhibitors entering each. With thirty-six distinct single trusses T. B. Haywood, Esq., Woodhatch Lodge, Reigate (gardener, Mr. C. J. Salter) secured the first prize, a piece of plate value 5 guineas, presented by R. N. G. Baker, Esq. The blooms were not large, but bright and fresh, and the collection was altogether one of the most even in the Exhibition. The varieties were as follows:—Pride of Reigate, very handsome, one of the best blooms we have seen of this distinct variety; A. K. Williams, La France, Etienne Levet, Exposition de Brie, Mrs. J. Laing, Horace Vernet, Madame Gabriel Luizet, Madame Victor Verdier, Marie Baumann, Capt. Christy, Countess of Rosebery, François Michelin; a bloom wrongly named Duchesse de Vallombrosa, thought to be Edward Morren; Mrs. Baker, Violette Bouyer, Marie Verdier, Dupuy Jamain, Duchesse de Vallombrosa, Duke of Teck, Duchess of Bedford, Viscountess Folkestone, Marquise de Castellane, Charles Lefebvre, Ville de Lyon, E. Y. Teas, Her Majesty, Camille Bernardin, Pierre Notting, Pride of Waltham, Dr. Andry, Comtesse de Serenye, Mrs. Laxton, Auguste Rigotard, Alba Rosea, and Comtesse d'Oxford. Col. J. H. Pitt, Turkey Court, Maidstone, was second with rather small blooms, but an excellent example of Viscountess Folkestone deserves mention. The Rev. W. H. Jackson, Stagsden Vicarage, Bedford, was third with blooms which had evidently suffered from the weather.

Class 9 was for twelve distinct varieties, three trusses of each, and Mr. Haywood was first for good blooms of Capt. Christy, Marquise de Castellane, A. K. Williams, Madame Gabriel Luizet, Marie Van Houtte, La France, E. Y. Teas, Etienne Levet, Violette Bouyer, Auguste Rigotard, Mrs. J. Laing, and Duke of Teck. Col. J. H. Pitt and the Rev. W. H. Jackson were second and third respectively.

The competition was much more brisk in division E, which also comprised two classes. Nine boxes of twenty-four distinct single trusses were staged, and A. Tate, Esq., Downside, Leatherhead (gardener, Mr. Mease), won the chief honours with a collection of blooms, good alike in substance and colour. The varieties were Alfred Colomb, La Rosière, Earl Dufferin, Madame Cusin, Merveille de Lyon, Marie Baumann, Niphetos, Ulrich Brunner, Violette Bouyer, Duchess of Bedford, Xavier Olibo, Madame Gabriel Luizet, Jean Ducher, Horace Vernet, Madame Lacharme, A. K. Williams, Madame Isaac Perrière, Charles Lefebvre, Madame Willermoz, Comtesse d'Oxford, La France, Louis Van Houtte, and Catherine Mermet. Mrs. Waterlow, Great Doods, Reigate (gardener, Mr. J. Brown), was second; E. Mawley, Esq., Berkhamstead, was third; and J. Gurney Fowler, Esq., Woodford, fourth.

For eight triplets R. E. West, Esq., Reigate, took the lead with fresh and neat blooms of Duke of Edinburgh, Dr. Andry, La France, Charles Lefebvre, Général Jacqueminot, Madame Gabriel Luizet, Madame Isaac Perrière, and A. K. Williams. Mr. A. Tate followed, Mrs. Waterlow was third, and the Rev. A. Foster Melliar, Sproughton Rectory, fourth.

Four classes were included in division F, and the competition throughout was keen, the entries being numerous in each case. In class 12 the best eighteen single trusses came from F. P. Baker, Esq., Holmfels, Reigate, who had bright but small examples of the following:—Madame Gabriel Luizet, Charles Lefebvre, Alphonse Soupert,

Earl of Pembroke, La France, Mrs. Baker, Xavier Olibo, Mrs. J. Laing, Duke of Edinburgh, Marquise de Castellane, Prince Arthur, Duchess of Bedford, A. K. Williams, Madame Victor Verdier, Pride of Waltham, Fisher Holmes, Général Jacqueminot, and Ferdinand de Lesseps. Mr. Romain, Old Windsor, took the second place. Mr. W. Narrowway, Oxford, was third, and Mr. H. Foster, North Street, Ashford, was fourth. There were five competitors. Class 13, for twelve single trusses, was well filled, no less than nine stands being entered, and Mr. R. L. Knight, Bobbing, Sittingbourne, was adjudged premier honours for beautiful blooms of the following—Etienne Levet, La France, Général Jacqueminot, a grandly developed bloom, which gained the silver medal as the premier Hybrid Perpetual in the amateurs' classes; Mrs. J. Laing, Duke of Teck, Ulrich Brunner, Madame Gabriel Luizet, Charles Lefebvre, Marie Baumann, Marie Finger, Earl of Dufferin, and Alfred Colomb. Captain Christy, Hill Green House, Stockbury, Kent, was second, a fine solid bloom of Earl of Dufferin being prominent in his stand. Mr. C. J. Grahame, Coomb Road, Croydon, was third, and Mr. J. Bateman, Rosevale, Archway Road, fourth, a good bloom of Xavier Olibo being included in his stand.

With nine single trusses (class 14) the Rev. F. S. Taylor, Littleton Vicarage, Evesham, was the premier amongst seven exhibitors, showing fresh and pleasing blooms of La France, Etienne Levet, Capt. Christy, Charles Lefebvre, Maréchal Niel, Souvenir d'Elise Vardon, Anna Olivier, Rosieriste Jacobs, and Madame Gabriel Luizet. Mr. Ernest Wilkins, Lyndhurst, Sutton, was a good second; the Rev. H. B. Biron, Hythe, was third; and Mr. A. Wallis, Farnham, fourth.

The best six single trusses (class 15) came from E. Horne, Esq., Park House, Reigate, but the blooms were small throughout the class. The varieties in the first stand were La France, Duchess of St. Albans, Ferdinand de Lesseps, Madame I. Perrière, Charles Lefebvre, and Duke of Teck. M. Hodgson, Esq., Shirley Cottage, Croydon (gardener, Mr. Shoosmith), W. D. Freshfield, Esq., The Wilderness, Reigate (gardener, Mr. Crofts), and Mrs. B. Denton, Orchard Court, Stevenage, took the remaining prizes in the order named.

Amongst eleven exhibitors in class 16, for six triplets, Mr. O. G. Orpen, Hillside, West Bergholt, Colchester, was first, showing neat examples of Madame Gabriel Luizet, Capt. Christy, Niphetos, Camille Bernardin, Souvenir d'un Ami, Maréchal Niel, D. Sewell, La France, Catherine Mermet, Madame Cusin, Général Jacqueminot, and The Bride. The other prizes were secured by Messrs. E. Wilkins, J. Parker, and F. P. Baker in the order of their names.

Six extra classes were devoted to amateurs, of which the first two (17 and 18) were for those only who had never won a prize at an exhibition of the National Rose Society, and in addition to the premier prizes a bronze medal was offered in each case. In class 17, for twelve single trusses, there were three competitors, and Mr. F. O. Devereux, High Knoll, Steyning, was placed first with creditable blooms of Mrs. J. Laing, Maurice Bernardin, Cleopatra, Eclair, Madame Lambard, Viscountess Folkestone, Rosieriste Jacobs, Catherine Mermet, Marie Van Houtte, Niphetos, Prince of Wales, and Pride of Reigate. The Right Hon. Lord Penzance, Godalming, was second; and Mr. J. de Lamare, Christchurch Road, Croydon, was third; the fourth prize being withheld.

Mr. E. Rutter, Shepperton, was first with six single trusses amongst eight competitors, showing fair blooms of Madame Gabriel Luizet, Etienne Levet, Comte Raimbaud, Marie Baumann, Earl of Pembroke, and Duke of Edinburgh. The Rev. J. R. Buchanan, Canterbury, Mr. R. W. B. Miller, Sutton, and Mr. J. Parker, Hitchin, were second, third, and fourth respectively, each staging rather small blooms. In this section Mr. Tate was the leading exhibitor in class 19 for twenty-four single trusses, and he gained the premier award—a silver cup—for handsome blooms of Louis Van Houtte, Ulrich Brunner, Her Majesty, Horace Vernet, Comtesse d'Oxford, Marie Baumann, Madame Cusin, La France, Madame Hippolyte Jamain, A. K. Williams, Innocente Pirola, Mrs. J. Laing, Violette Bouyer, François Michelin, Xavier Olibo, Marie Verdier, Charles Lefebvre, Madame Gabriel Luizet, Madame Eugène Verdier, Catherine Mermet, Duchess of Albany, La Rosière, and Général Jacqueminot. Mr. E. M. Bethune, Horsham, was second, and equal thirds the Rev. A. Foster Melliar and Mr. A. H. Gray. There were nine exhibitors.

Class 20 was for six single trusses of Roses grown within eight miles of Charing Cross, and the premier prize was at first awarded to a Croydon exhibitor, but it was subsequently discovered that this was outside the radius, and the stand was accordingly disqualified, the first prize then going to Mr. J. Bateman, who had the following varieties:—Madame G. Luizet, A. K. Williams, Xavier Olibo, Captain Christy, Etienne Levet, and Pride of Waltham. Mr. J. E. Coleby, Wimbledon, was second, and Mr. W. B. Faulkner, Wimbledon, third.

There were only three exhibitors of six new Roses, and the Rev. J. H. Pemberton was first with medium blooms of J. D. Pawle, Mrs. Wilson, Cleopatra, Lady Arthur Hill, and Maid of the Mist. The Rev. A. Foster Melliar was second, and the other prizes were withheld.

Class 22, for six trusses of any Hybrid Perpetual, was one of the best filled in the Show, no less than seventeen stands being contributed. Mr. Knight was awarded first prize for Duke of Edinburgh, very bright and of excellent substance, an equal award going to Mr. A. Tate for La France, also very fine. Mr. Narrowway was third, and Mr. Horne fourth with the same variety.

#### TEAS AND NOISETTES.

The amateurs' classes for Teas were admirably represented, and the blooms in several of the leading stand were of great merit, though there

was, of course, a considerable falling off in some of the third and fourth prize exhibits. In class 27, Mr. A. H. Gray of Bath following up his previous successes this year, won the 25-guinea challenge trophy with fresh and finely developed blooms of the under-mentioned:—Alba Rosea, Maréchal Niel, Marie Van Houtte, Francisca Kruger, Catherine Mermet, Souvenir d'Elise Vardon, Caroline Kuster, Edith Gifford, Jean Ducher, Innocente Pirola, Comtesse de Nadaillac, Anna Olivier, Souvenir d'un Ami, Niphetos, Comtesse Panisse, The Bride, Madame Welche, and one from which the name was misplaced. The Rev. H. Berners was a good second, the Rev. Foster Melliar third, and the Rev. F. R. Burnside, Hereford, fourth with fresh and neat but small blooms.

In class 28, for twelve single trusses, Mr. Lindsell was successful amongst eight competitors in taking the premier award, staging good examples of Etoile de Lyon, Anna Olivier, Marie Van Houtte, Rubens, Princess of Wales, Souvenir d'Elise Vardon, Caroline Kuster, Jean Ducher, Comtesse de Nadaillac, Niphetos, and Catherine Mermet. Messrs. Gray, Haywood, and Colonel Pitt were the remaining prizetakers in the class.

Ten boxes of nine Teas were contributed in class 29, and Mr. O. G. Orpen gained the chief position with substantial blooms of Caroline Kuster, Niphetos, Souvenir d'Elise Vardon, Souvenir de Paul Neyron, Catherine Mermet, Rubens, Maréchal Niel, The Bride, and Souvenir d'un Ami. Mr. Tate was a close second, his best bloom being a wonderful specimen of Madame Cusin, for which the silver medal was awarded as the best Tea Rose in the amateurs' classes. In size, substance, breadth of petal, and depth of colour it was remarkable. We hope to give an illustration of it in an early issue. Mr. Crofts was third, and the Rev. Alan Cheales, Brockham Vicarage, fourth.

The small classes gave the greatest number of exhibitors a chance of competing, and in class 30, for six single trusses, seventeen boxes were staged. The Rev. F. S. Taylor had the best blooms, representing the varieties The Bride, Anna Olivier, Hon. Edith Gifford, Maréchal Niel, Niphetos, and Marie Van Houtte. Mr. E. Mawley followed closely, Souvenir d'Elise Vardon and Comtesse de Panisse being notable in his stand. The Rev. H. B. Biron was third, and the Rev. J. R. Buchanan fourth.

Class 31, for twelve distinct varieties, three trusses of each, brought six competitors, and the first prize, consisting of a piece of plate value 5 guineas, offered as a memorial of the late Hon. and Rev. J. T. Boscawen, was adjudged to Mr. A. H. Gray, who had excellent examples of the following:—Alba Rosea, Francisca Kruger, Maréchal Niel, Madame Cusin, Comtesse Panisse, The Bride, Comtesse de Nadaillac, Souvenir d'un Ami, Edith Gifford, Caroline Kuster, Marie Van Houtte, and Catherine Mermet. The Rev. H. Berners took the second place, the Rev. W. H. Jackson was third, and Mr. Slaughter fourth.

With six varieties three trusses of each (class 32), the Rev. A. Foster Melliar was first for good blooms of Princess of Wales, Madame Hoste, Etoile de Lyon, Marie Van Houtte, Francisca Kruger, and Madame de Watteville; Mr. Lindsell was second; and Col. J. H. Pitt third, these being the only exhibitors. For six single trusses of any Tea or Noisette Mr. Gray was first with Maréchal Niel, followed by Mr. Grahame, the Rev. H. Berners, and Mr. Bethune in the order named. There were nine competitors.

#### OPEN CLASSES.

The majority of these were for stands of twelve blooms of one variety, and while some were not represented at all or by few exhibits, in others the competition was good, and the blooms excellent. Taking the classes in the order of the schedule, 34 was for twelve blooms of any yellow Rose except Maréchal Niel, and the only exhibitor, Mr. G. Prince, was awarded the first prize for clean, even, but not large blooms of Comtesse de Nadaillac.

For any white Rose except Niphetos Messrs. Dickson & Sons, Royal Nurseries, Newtownards, were first with a dozen superb blooms of Marguerite Dickson, white, a faint blush in the bud, delicate, beautiful in form, and of good substance. Mr. A. H. Gray followed with Alba Rosea, very fresh and good. Mr. B. R. Cant was third with the same, and Messrs. D. & W. Croll, Dundee, fourth for Rubens.

For any crimson Rose except Marie Baumann and A. K. Williams Mr. B. R. Cant was first with Duke of Edinburgh, extremely rich in colour. Messrs. Paul & Son were second with Prince Arthur, Mr. J. Parker third with Duke of Teck, and Messrs. H. Low & Co., Enfield, fourth for Earl of Dufferin, rather small.

The next class was that for any dark velvety crimson Rose, such as Prince Camille de Rohan, with which variety Messrs. Low & Co. gained the premier prize. Mr. G. Prince followed with Prince Arthur, Mr. G. Mount with Fisher Holmes, and Mr. B. R. Cant with the last named variety.

Maréchal Niel were not very grandly shown in class 38 devoted to it, the premier bloom from Mr. A. H. Gray being much the best. Messrs. B. R. Cant and G. Prince were second and third, these being the only exhibitors. Fairly good blooms of Marie Baumann won Dr. Budd the first prize in class 39, Messrs. Turner and Mount following. Dr. Budd was also first in the next class for Mrs. John Laing with even blooms of moderate size, equal second prizes going to Messrs. C. Turner and Cooling & Sons.

The variety A. K. Williams was not well represented, most of the blooms being rather rough and damaged. The prizes were awarded to Messrs. Paul & Son, Low & Co., and Piper in that order. Excellent blooms of Niphetos from Messrs. B. R. Cant, G. W. Piper, and G. & W. Burch also secured the prizes as named. Her Majesty and Ernest Metz were not

represented by a single exhibit in their classes. For any Hybrid Perpetual not named in preceding classes Mr. Turner was first with *La France*, Dr. Budd second with the same variety, and Messrs. Dickson and Sons third with *Madame Gabriel Luizet*.

New Roses were not very numerous, and the gold medal was not awarded this year. In class 46, for twelve trusses of any new Rose, Messrs. Dickson & Sons, Newtownards, were first with a box of *Margaret Dickson*, the beautiful Rose already noted; Messrs. Paul & Son were second with the *Bourbon Mrs. Paul*, which was accorded special honours last year, and this year the blooms were not at their best, the date being too early. Messrs. W. Paul & Son followed with the Hybrid Tea *White Lady*, which was rather too fully expanded. In class 47, for twelve new Roses, only two prizes were awarded—namely, first and

Mr. E. F. Such, Maidenhead, were second and third, each showing well. In the amateurs' class for eighteen bunches of garden Roses, Mr. C. E. Cuthell, the Rev. J. H. Pemberton, and Mr. A. Tate were the prize-takers. With twelve bunches of Roses for buttonholes, not less than six varieties, Mr. J. Mattock was first with charming buds of *Rubens*, *Marie Van Houtte*, *Madame Lambard*, *Amazone*, *Ma Capucine*, *Niphetos*, *W. F. Bennett*, *Anna Olivier*, *W. Allen Richardson*, and *Madame de Watteville*. Mr. A. Evans was second, and Messrs. Cooling & Son third.

#### MISCELLANEOUS.

The non-competing exhibits were numerous and excellent, occupying a good part of the centre transept. Messrs. W. Paul & Son, Waltham Cross, had a magnificent collection of old and new Roses, arranged in

FIG. 6.—ROSE GUSTAVE PIGANEAU (see page 23).

third, to Messrs. Paul & Son and Cooling & Son respectively. The premier box comprised these varieties—*White Lady*, *J. D. Pawle*, *Souvenir de S. A. Prince*, *Marchioness of Lorne*, *Ernest Metz*, *Sappho*, *Bruce Findlay*, *Mrs. Paul* as the most noteworthy. In class 49, for three trusses of any new seedling Rose, Messrs. Dickson & Sons showed *Marchioness of Dufferin*, full soft pink flowers, but rather damaged. This variety was highly commended, but no other award was made.

#### GARDEN ROSES.

An interesting portion of the Exhibition was formed by the classes for garden Roses and Roses for buttonholes, and they attracted fully as much attention from the visitors as any of the other sections. In class 50, for thirty-six bunches of garden Roses, Messrs. Paul & Son were first with a beautiful collection, including many fine Moss Roses, old climbers, *Polyanthas*, and others. Messrs. G. Cooling & Son, and

front of the orchestra. Mr. Rumsey also had a large collection of Roses. Messrs. J. Laing & Sons, Forest Hill, showed the most tasteful and effective group of Tuberous Begonias they have ever exhibited. Messrs. Barr & Son, Covent Garden, had a great display of hardy flowers, occupying eight tables. Mr. T. S. Ware, Tottenham, exhibited a most beautiful and interesting group of hardy flowers, filling tables 90 feet long in front of the theatre. The same firm also had a group of Begonias. Messrs. J. Cheal & Son, Crawley, had a fine collection of hardy flowers; Messrs. Dobbie & Co., Rothesay, staged numbers of handsome Pansies from their extensive collections; Messrs. Carter & Co., High Holborn, showed a group of miniature Cacti; Mr. C. Turner, Slough, had a box of Carnation flowers; Messrs. Reid and Bornemann, Lower Sydenham, had some tasteful wreaths and good Tuberous Begonias; while Mr. E. F. Such, Maidenhead, contributed a large and choice collection of hardy flowers.

## MAIDSTONE.—JUNE 29TH.

AN early fixture at such a season as the present has been was in itself a discouraging element, but more especially was this the case where the frosts had been unusually severe, and such had been the case with Maidstone; not only had the winter frosts and snow told severely, but that cruel one of Whitsunday, which will ever make this year a memorable one for horticulture, had done immense damage—the trees were severely crippled, and some exhibitors were unable to put in any appearance, consequently the Show was both moderate in extent and in quality. This is always to be regretted, especially where the Society is a struggling one, as here; and because on this occasion it had the honour of the Dean of Rochester acting as one of the Judges, and one would have wished that he had more and better Roses to criticise; but he is not one to despise the day of small things, and perhaps the fact that he acted as Judge may be a fillip to the Society. Colonel Pitt is evidently anxious to keep up the traditions of Turkey Court, but the fates—i.e., the weather—were against him this year; we must only hope that he may be more happy another year.

As the Maidstone Club is exclusively an amateurs' one we see none of those large classes which so help to fill up and add beauty to an exhibition. The room where it was held (the Corn Exchange) is a well-lighted one, and on a dull day is excellent; but, as on this occasion, there was after the early morning bright sunshine, it streamed down the large skylight, to the great detriment of the flowers, which very soon began to expand under its genial influence, and even to cast their eyes to it.

In class 1, for twelve Hybrid Perpetuals and twelve Teas (a very pretty class), the first prize was awarded to R. L. Knight, Esq. of Bobbing Court, Sittingbourne, for La France, Duke of Wellington, Madame G. Luizet, Charles Lefebvre, Le Havre, Madame Hippolyte Jamain, Marie Baumann, Hon. Edith Gifford, Souvenir d'un Ami, A. K. Williams, Catharine Mermet, Grace Darling, Maréchal Niel, Reine Marie Henriette, Madame Lambard, Marie Van Houtte, Souvenir de Thérèse Levet, Innocente Pirola, Souvenir de Gabriel Drevet. Colonel Pitt was second, and Mr. P. R. Burnand third. In the class for eighteen distinct Mr. F. Warde was first with Madame Victor Verdier, A. K. Williams, La France, Prince Arthur, Duchesse de Vallombrosa, Louis Van Houtte, Sénateur Vaisse, Princess Mary of Cambridge, Camille Bernardin, Charles Lefebvre, Dr. André, Reynolds Hole, Dupuy Jamain, Ulrich Brunner, Edith Gifford, Earl of Pembroke, and Marie Baumann. Mr. R. W. Knight was second, and Mr. R. E. West of Reigate third.

In the class for twelve distinct, Mr. F. Warde was again first with Louis Van Houtte, Baroness Rothschild, Prince Arthur, Ulrich Brunner, La France, Abel Carrière, Beauty of Waltham, Madame Cusin, Camille Bernardin, Marie Fougit, Marquise de Castellane, Reynolds Hole. Mr. R. L. Knight was second, and the Rev. H. B. Biron third. For twelve Teas, Noisettes, the Rev. H. B. Biron was first with Souvenir d'Elise Vardon, Innocente Pirola, Comtesse Panisse, Anna Ollivier, Madame Bravy, Francisca Kruger, Madame Hoste, Souvenir d'un Ami, Devonensis, Marie Van Houtte, Souvenir de Mons. Pernet, Princess Beatrice. Mr. R. L. Knight was second, and Colonel Pitt third. In the class for six trebles, Mr. F. W. Warde was first with Xavier Olibo, Violette Bouyer, Duke of Wellington, La France, Le Havre, Lady Mary Fitzwilliam. In the class for six Teas Dr. Ashurst was first with Jean Ducher, Niphotos, Souvenir d'un Ami, Jules Finger, Madame Hoste, Madame de Watteville. Mr. H. Murton was second.

For six varieties Dr. Ashurst was first with Star of Waltham, Marquise de Castellane, Antoine Ducher, Heinrich Schulties, Crown Prince, and Horace Vernct. For six Teas Mr. H. Monkton was first with Francisca Kruger, Madame Caroline Kuster, Madame Bravy, Souvenir de Thérèse Levet, and Homère. In the class for bouquets Mrs. Biron displayed her usual taste, and carried off the first prize. Miss E. Bensted was second, and Miss Amies third. For buttonhole bouquets Miss Bensted was first, Mrs. Biron second, and Miss Bryant third. For shoulder-knots Miss Bryant was first, Miss Davy second, and Miss Cutbush third.—D., Deal.

## CANTERBURY.—JUNE 30TH.

It is sometimes said that cricket is the most uncertain game in the world, but I am not at all sure that Rose showing will not equal it in this point, and for the same reason—both depend so much on the state of the weather. A bad wicket puzzles the batsman, and bad and cold weather especially baffles the Rose grower. I have never seen a greater proof of this than in the Maidstone and Canterbury Shows of this year. Anyone attending the former would have said, "I shan't trouble myself about going to Canterbury as there cannot be any Roses," yet so far was this from being the case that I think it was one of the best shows I have seen during its thirteen years of existence, so great a difference had the twenty-four hours of genial weather made in the character of the flowers, for it must be noted the exhibitors and the chief prizewinners were the same, as a comparison of the two lists will show. Mr. Knight, Mr. Warde, and Mr. Biron were in both places, but in very different form.

The Show was held in the Foresters' Hall, which is a somewhat dark room, but as the day was bright this was not of so much consequence, although I think it a pity that the three best stands of amateurs' Roses were in the darkest corner of the room, where it was almost impossible to see the full beauty of the flowers exhibited, nor, I may add, their defects, if they had any. Here the contest was a very keen one between Mr. R. L. Knight of Bobbing and Mr. Wachter, the former, however, securing the first prize, while Mr. Wachter obtained the silver medal

for the best H.P. in the Show out of his box. Mr. Knight's flowers were Duke of Teck, Marie Finger, Duke of Edinburgh, La France, A. K. Williams, Mrs. John Laing, Ulrich Brunner, Marie Van Houtte, Eugène Fürst, a very fine flower; Mad. Gabriel Luizet, Earl of Dufferin, Maurice Bernardin, Marie Baumann, Gloire Lyonnaise, Duke of Wellington, Maréchal Niel, Xavier Olibo, a very fine flower, and Etienne Levet. Mr. Wachter had some remarkably fine blooms in his second prize lot, such as the La France which obtained the National Society's silver medal as the best H.P., and a fine bloom of Tea Souvenir de Thérèse Levet, which very nearly did the same for the Teas. Mr. F. Warde was third. In the class for twelve distinct varieties, Mr. R. L. Knight was again first with La France, Mad. Gabriel Luizet, Louis Van Houtte, Marie Rady, Duke of Edinburgh, Mrs. John Laing, Souvenir de S. A. Prince, Caroline Kuster, Camille Bernardin, A. K. Williams, Violette Bouyer, Duke of Wellington, and Xavier Olibo. Mr. F. Warde was second; the Rev. H. B. Biron third.

In the class for twelve Teas or Noisettes Mr. R. L. Knight was again first with a box of fine blooms consisting of The Bride, Souvenir d'un Ami, Maréchal Niel, Princess of Wales, Innocente Pirola, Caroline Kuster, Hon. Edith Gifford, Madame Cusin, Catherine Mermet, Marie Van Houtte, Souvenir de Gabriel Drevet, and Francisca Kruger. Mr. Wachter was second and the Rev. H. B. Biron third. In the class for six trebles Mr. Warde was first with good blooms of Le Havre, La France, Louis Van Houtte, Violette Bouyer, Marie Rady, and Marguerite de St. Amand. The Rev. H. B. Biron was second in class 5 for twelve varieties. The first prize, a cup value £2, given by the Mayor, was awarded to Mr. Packham, of Reigate, for good blooms of Thérèse Levet, Marquise de Castellane, La France, Mad. Gabriel Luizet, Dupuy Jamain, Marie Van Houtte, Souvenir de Thérèse Levet, Capitaine Christy, A. K. Williams, Catherine Mermet, and Viscountess Folkestone. Mr. Stanley was a good second, Mr. R. E. West third. In the class for nine Teas and Noisettes Messrs. Hawkins & Co. were first with Marie Van Houtte, Souvenir d'un Ami, Madame de Watteville, Rubens, Catherine Mermet, The Bride, Jules Finger, and Innocente Pirola. Captain Lambert ran a very close second, in fact a neck and neck race. Mr. H. Foster of Ashford was first in the class for nine distinct varieties with excellent blooms. In the class for six Teas Mr. Collard was first with Catherine Mermet, Marie Van Houtte, Edith Gifford, Niphotos, Souvenir de S. A. Prince, and Souvenir d'Elise. In the class for twelve Mr. Packham was first for six varieties. Teas.—Mr. Laslett was first with Anna Ollivier, Madame Berard, Souvenir de Paul Neyron, Madame Lambard. In the class for six blooms of any one Hybrid Perpetual Mr. Knight was first with good blooms of Duke of Edinburgh.

The N.R.S.'s silver medal for the best H.P. was awarded to Mr. Wachter, as I have here already said for La France, and that for the best Tea to the Rev. J. R. Buchanan for a fine bloom of Madame Willermoz. Table decorations, bouquets, &c., are always a feature at this Show, and some excellent ones were shown, the first prize being awarded to Mrs. George Mount for a very graceful arrangement, the second to Mrs. Wachter, and the third to Miss Watson.

The nurserymen's class brought, as usual, a number of fine flowers together, Messrs. Mount, F. Cant, Prince, and Paul & Son being the exhibitors. As Mr. Mount was at home he had of course an advantage, but his flowers deserved the high awards which he obtained, and being first in thirty-six and in twelve trebles. His flowers in the former case were in the back row—Charles Lefebvre, Mrs. John Laing, Général Jacqueminot, Marquise de Castellane, Gabriel Luizet, Dupuy Jamain, Duke of Edinburgh, François Michelon, Marie Baumann, Etienne Levet, Souvenir de la Malmaison, Ulrich Brunner. The middle row flowers were La France, Duke of Teck, Souvenir d'Elise, Madame Cusin, Baroness Rothschild, Duchess of Bedford, Dr. Andry, Louis Van Houtte, Violette Bouyer. The front row consisted of The Bride, Maréchal Niel, Eugène Fürst, Marie Van Houtte, Fisher Holmes, Anna Ollivier, La Rosière, Black Prince, Duke of Wellington, and Sénateur Vaisse. Messrs. Paul and Son were second, and Mr. Geo. Prince third. In twelve trebles Mr. Mount was again first. The varieties were A. K. Williams, Mad. Gabriel Luizet, Marie Baumann, Mrs. John Laing, Duke of Edinburgh, Ulrich Brunner, The Bride, Fisher Holmes, La France, Eugène Fürst, very fine; Général Jacqueminot, and Edith Gifford. Mr. Geo. Prince was second, and Messrs. Paul & Son third. In the class for twelve Teas Mr. Geo. Prince of Oxford was first with some of his fine blooms, consisting of Comtesse de Nadaillac, Souvenir de S. A. Prince, Catherine Mermet, Mons. Furtado, a very sweetly coloured but seldom seen Rose; Princess Beatrice, Hon. Edith Gifford, Madame Cusin, Maréchal Niel, Souvenir d'un Ami, Anna Olivier, and The Bride. Mr. Frank Cant was second; Mr. Geo. Mount third.

The Canterbury Rose Society may well be congratulated on having in such an uncertain year so excellent a Show.—D., Deal.

## BROCKHAM.—JULY 1ST.

IN the early morning of July 1st, as I was making my way in the pouring rain to Burford Lodge under Box Hill, where, at the invitation of Sir Trevor and Lady Lawrence, the Brockham Rose Show was held this year, I saw a solitary goose making the most of his opportunities and enjoying the goods the gods had provided for him, and feasting on the luscious grass. It seemed to me that I was a greater goose than he to be thinking of judging Roses on such a day. How could any Roses be staged and shown in such a downpour of rain? On reaching the place of exhibition, and proceeding to business along with my fellow Judges, Mr. George Paul and Mr. Herbert Bensted (Hon. Sec. of the Maidstone Rose Association), it was surprising indeed to find not only a tent well

filled with Roses, but also that the Roses were of great merit, and that there was scarcely a bad Rose in the Exhibition. Such, however, was the case.

The Reigate Show had been put off for a week. It is always an unsatisfactory thing to put off a Show. Someone is sure to say that it is because the "Secretary's Roses are not ready," just as the farmer said that the parson after getting up his own hay was sure to "clap on" the prayer for rain. In spite, then, of the late season, the Committee of the Brockham Rose Show are to be congratulated on keeping to the date originally fixed. It was to have been held at High Ashurst, but it had to be held elsewhere this year, and Sir Trevor and Lady Lawrence most kindly offered their beautiful grounds for the purpose, and laid themselves out to make everything as comfortable as possible to everyone concerned. The band of the Royal Artillery had been secured, and played beautifully in the garden, while the Show was held in the adjoining field.

Burford Lodge has many features of interest, besides being the home of one of the most enthusiastic horticulturists of the day, the President of the Royal Horticultural Society, who certainly owns one of the largest collections of Orchids in the country. In one conservatory alone there were lying on the stage 800 plants of *Odontoglossum Alexandræ*, which Sir Trevor had lately purchased, as one-eighth of a consignment sent over at a very reasonable rate.

Between Burford Bridge and Leatherhead, about three miles, in very dry weather the river Mole entirely disappears. In the grounds of Burford Lodge there are deep hollows called "hold waters," into which the water rises 20 feet at times, showing an underground connection with the bed of the river and the cavernous nature of the strata beneath.

This will explain Spenser's lines in the "Faery Queene :"—

"The Mole, that like a 'nousing mole,' doth make  
His way still underground till Thames he overtake."

The grounds are completely shut in from the east winds by the ridge of Box Hill, which towers above the Mickleham Valley, and adds very greatly to the beauty of the scenery, which in this neighbourhood can hardly be surpassed. The house was built in 1776, and is covered with creepers; a plant of *Ampelopsis Veitchii* on one side being a "sight to see." The gardens, under the charge of Mr. Bain, were in beautiful order, and filled with all manner of rare herbaceous and other plants. Under the protection of one greenhouse was a long row of *Lilium Moorei*, under another a similar row of *Crinum*s. Here are beds of Iceland Poppies, "Thunberg" Lilies, white Martagon Lilies, *Aquilegia*s, *Delphinium nudicaule*, *Syringa*, *Philadelphus Lemoinei*, *Inula glandulosa*, blue *Delphiniums*, Pansies, *Campanulas*, specially *alba grandiflora* (Backhouse's variety), *Eryngium amethystinum*, annuals of all sorts, *Tropæolum polyphyllum* in beds of *Narcissi*, *Veronica prostrata*, *Heuchera sanguinea*, *Dahlias*, *Spiræas*, and *Pæonies*, and a scarce hardy plant of *Cerinthe major*, grey foliage, flowers purple and cream.

Accompanied by Sir Trevor himself the Committee visited the conservatories filled with *Cypripedium*s, *Oneidiums*, *Odontoglossum*s, *Dendrobium*s, *Anthurium*s (scarlet, purple, and white), *Lælias*, *Vandas*, *Bertolonias*, *Phaius*, and *Masdevallias*, *Cattleyas* and *Sobralias*. In one house we were shown the Swan Orchid (*Cycloches*) and a lovely *Bulbophyllum* in bloom, *Phaius Henryi*, and several blooming plants of a gnat-like Orchid (*Pleurothallis macroblepharis*), two fine plants of *Blandfordia aurea*, and of *Lotus peltorhynchus*, a beautiful trailing plant with grey foliage and a kind of lobster-claw bloom, *Odontoglossum luteo-purpureum*, a grand spotted hybrid. One plant of a most ordinary appearance was *Cypripedium Stonei platytænium*, a sport for which Sir Trevor had been offered a large sum. Other curiosities were an albino *Cattleya* and a *Pothos*, a wide-leaved clinging plant, side by side with a *Ficus elastica*, and a magnificent Lace Lattice plant in water, thus described in a quotation from Dr. Johnson, by Sir Trevor, as having a "reticulated structure with interstices between the interstices;" also the *Vanilla* plant, the black seeds of which form the flavouring, and a beautiful *Asparagus retrofractus arboreus*, with *Cypripedium Veitchii* and *Lælia purpurata Brysiana*, with an exquisite bloom.

There was a very large gathering of visitors to the Show, for besides the attraction of the Roses Lady Lawrence had invited a great many friends to a garden party. In the twenty-fours there were three exhibitors. The first prize (N.R.S.'s gold medal) was won by A. Tate, Esq., with a grand box containing *Duchess of Bedford*, *Marie Verdier*, *Pierre Notting*, *Violette Bouyer*, A. K. Williams, M. de Castellane, Mrs. John Laing, C. Lefebvre, Mad. H. Jamain, Dupuy Jamain, H. Schultheis, Comtesse d'Oxford, Mad. Lacharme, Ulrich Brunner, La France, Marie Baumann, Xavier Olibo, Merveille de Lyon, Mad. Gabriel Luizet, Niphetos, Abel Carrière, Innocente Pirola, La Rosière, and Etienne Levet. Mr. Cuthell took second prize for a box not much inferior. Lady Lawrence's box was highly commended.

For twelve Teas Mr. Tate again took first prize (N.R.S. silver medal) with *Innocente Pirola*, Jean Ducher, *Souvenir d'un Ami*, *Souvenir d'Elise Vardon*, Comtesse de Nadaillac, Hon. Edith Gifford, Madame Lambard, Marie Van Houtte, Hippolyte Jamain, Mons. Furtado, Princess of Wales, Madame Willermoz. Mr. Cheales followed, taking second prize (N.R.S. bronze medal) for a very good box, in which *Maréchal Niel*, Princess of Wales, *Marquise de Santina*, and *Souvenir d'Elise Vardon* were conspicuous. Mr. Cuthell was highly commended. For six triplets the first prize again went to Mr. Tate, who won with A. K. Williams, La France, *Marquise de Castellane*, Madame Gabriel Luizet, Charles Lefebvre, and Madame Lacharme. Mr. Cheales took the second prize.

In the twelves class there was a splendid fight amongst the six competitors. Mrs. Perkins won the first prize (N.R.S. gold medal) with *Louis Van Houtte*, Madame G. Luizet, Marie Van Houtte, Etienne Levet, La France, Catherine Mermet, A. K. Williams, Lady Mary Fitzwilliam, Hon. Edith Gifford, Charles Lefebvre, *Souvenir de S. A. Prince*, and Madame I. Pereire. Mr. Horne took second prize, and the Hon. Dudley Ryder third prize. For nine Teas Mrs. Perkins won first prize (N.R.S. silver medal) with *Souvenir d'un Ami*, C. Mermet, Innocente Pirola, *Devoniensis*, Rubens, Hon. E. Gifford, Marie Van Houtte, The Bride, and Madame de Watteville. Mr. F. T. Wollaston took second prize for an almost equally good box, and Miss Barclay won the third prize. Mr. Wollaston also won first prize for four triplets with *Hippolyte Jamain*, La France, Mrs. Baker, and Madame Gabriel Luizet; Mrs. Perkins and Mr. E. Horne taking the second and third prizes respectively. In the class for six of any kind, Mrs. Hatch took the first, and Mrs. Poland and Miss Dorothy Nesfield equal second. For four Teas Mrs. Poland won the prize with Marie Van Houtte, Francisca Kruger, Innocente Pirola, and *Souvenir d'Elise*. For six of the same kind Mr. Cuthell took first prize for Marie Van Houtte; Mr. W. Thompson second for *Souvenir d'un Ami*; and Mr. Cheales third for *Maréchal Niel*. For six of same kind, not Teas, Mr. Tate won first prize with Madame G. Luizet; Mr. Cuthell second, Charles Lefebvre; and Mr. Horne third with the same variety.

There were three exhibitors of garden Roses, Mr. Cuthell showing a very beautiful collection, which won him the first prize. Amongst them were *Rosa Mundi*, *Bardon Job*, *Œillet Flamand*, *Pissardi*, *Alpina*, *Polyantha*, *Mignonette*, *Damask*, *Setina*, *Golden Fairy*, and *Cristata*. Miss Barclay's was a good collection, but the flowers were very much crowded. It took second prize. For a smaller collection of garden Roses Mr. Cheales took the prize, as he did last year. The Hon. D. Ryder took the prize, which was a rare book called "*Ros Rosarum ex Horto Poetarum*" for the best Rose in the Show with a grand bloom of *Comtesse de Nadaillac*.

The table decorations were all tasteful. The three exhibited as dinner table decorations were each very effective and well arranged. Miss Dorothy Nesfield, who evidently has great talent, won first prize for five glass and iron baskets, containing Iceland Poppies of the three colours, *Sidalcea candida*, Maidenhair Ferns, and Grasses. It was an unusually attractive decoration. For the second prize Mrs. B. Meeke arranged very naturally and cleverly on a large silver dish and six silver bowls *White Pæonies*, *Roses*, *Coleus leaves*, *Begonias*, Ferns. A third very pretty decoration by Mrs. Tate was highly commended. It was a tall basket, and six glasses of *Roses* with *Sweet Briar* arranged all round on the white cloth. Girls under eighteen had a competition to themselves of a basket of *Roses* and Ferns. There were seven exhibitors, and Miss Blake won first prize, and Miss Tate second. The buttonhole bouquets were better done than usual. Miss Dorothy Nesfield easily carried off the first prize, while the second went to Miss de Cetto.

Messrs. George Paul & Son, Cheshunt, showed a box of new Roses, amongst which were J. B. Varonne (T.), *Progress*, *L'Idéal*, *Marchonell*, *Kaiserin Frederich*, *Clothilde Soupert*, *Dulcie Bell* (T.), Ernest Metz (T.), *Madelaine d'Aoust*, Madame Carnot, Janet's Pride (a *Sweetbriar* striped), Comtesse B. de Blacas, *Souvenir de S. A. Prince* (T.), Mrs. James Wilson (T.), Viscountess Folkestone, Madame Renaby, Bruce Findlay, Mrs. Paul, and John D. Pawle. Mr. Appleby of the Box Hill Nurseries, who supplied all the decorative plants in the tent, also showed five *Roses* and three seedling blooms of a Rose similar to *Général Jacqueminot*.

The Committee, as usual, issued an attractive and useful schedule, containing the principal prizetakers of the last eleven years, from which it appears that the Hon. Sec., the Rev. A. Cheales, won first prize for the twenty-fours no less than eight times. He talks of now retiring on his well earned laurels. No, Mr. Cheales, you cannot be spared; there is plenty of pluck left in you yet, and with victories yet to win. Mr. Tate has proved himself, according to last year's prophecy, a foeman "worthy of your steel." Fear him not, though he spent £100 in loam! We shall see you to the front again without doubt.

There are in the schedule two "dim dreams of the distant future" on "blue" *Roses*, taken from the *Journal of Horticulture* of 1882; two notices on Rose seeds, by T. Laxton and W. R. Raillem; a few notes by the latter grower on "some new *Roses*;" and an account of last year's Show, affording fond memories of the past.

The Brockham Rose Association is full of life and vigour. Decay is not in it. Its shows improve merit year by year, the hospitality of its members never tires, new blood is continually flowing through its veins, and the ambition of its exhibitors is kindled by medals. No less than nine N.R.S. medals were given as prizes, but its schedule of prizes needs an interpreter. Let the Committee but "clear the horizon" and rid its "classes" and "divisions" of their "fog," and the critics will go out of office.—A. B. ALEXANDER, *Shedfield Vicarage*.

CROYDON.—JULY 1ST.

THE twenty-fourth annual Show of Roses, plants, fruit, and vegetables was held in the grounds of Brickwood House, Addiscombe Road, J. W. Prince, Esq., having again placed them at the disposal of the Committee. The heavy downpour of rain in the morning prevented many exhibitors showing, but on the whole the Show was a good one, and when the weather cleared up after midday the tent, and especially the one devoted to *Roses* and other cut flowers, were thronged with visitors. The *Roses* were remarkably fresh, and many fine blooms were staged. For forty-eight distinct, Messrs. Paul & Son, Cheshunt, were awarded the National Rose Society's gold medal in addition to the first

prize; Messrs. B. Cant and D. Prior & Son second and third. For twenty-four distinct, three trusses of each, Messrs. Paul & Son were again to the fore, Messrs. J. Cheal & Son securing first for twenty-four distinct, one of each. Mr. G. W. Piper, Uckfield, was first for eighteen, as well as twelve Tea or Noisette distinct, and for twelve Roses of one variety, Mr. B. Cant won with a fine box of Madame Gabriel Luizet, followed by Messrs. D. Prior & Son, who had a good stand of Fisher Holmes.

In the amateurs' classes the Roses from Bath were conspicuous. Mr. J. Bradbury, gardener to Dr. Budd, Larkhall, Bath, secured the 25-guinea challenge cup for thirty-six blooms, distinct. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Reigate, was second, and A. H. Gray, Esq., Beaulieu, Bath, third. Mr. Bradbury was also first for twelve distinct, six distinct, three trusses of each, twelve of one variety, and for twelve Teas or Noisettes, and he was also awarded the National Rose Society's silver medal for the best bloom in the open amateurs' class, it being a fine bloom of Horace Vernet. E. M. Bethune, Esq., Denne Park, Horsham, was first with twenty-four. Mr. C. J. Salter and R. E. West, Esq., Reigate, second and third respectively. E. M. Bethune, Esq., was the only exhibitor in the class for eighteen Tea or Noisette. For six Tea or Noisette of one variety, A. H. Gray, Esq., was first; he also was awarded the large silver Flora medal of the Royal Horticultural for the best Tea or Noisette in the amateurs' classes (open).

In the local classes some good blooms were shown, but had the Show been a week later no doubt the competition would have been greater. A challenge cup and the N.R.S. silver medal were offered for six Roses, distinct, and for the second year in succession C. J. Grahame, Esq., Coombe Lane, Croydon, having been the winner, the cup now becomes his property. Councillor W. Dart, Heathfield Road, Croydon, was a good second, and the Rev. W. Wilks Shirley (a former winner of the cup), third. For twelve, distinct, Mr. Grahame, Rev. W. Wilks, and Councillor Dart took the honours. Rev. W. Wilks was first for six Hybrid Perpetuals, distinct, and Councillor Dart for six of one variety; Mr. C. J. Grahame first for six Tea or Noisette, three varieties, and the Judges awarded him the large Flora silver medal of the Royal Horticultural Society for the best Tea or Noisette in the local classes, which was Madame Cusin, and Councillor Dart secured the N.R.S. silver medal for Merveille de Lyon, as the best Rose bloom exhibited in the local classes.

Table decoration is generally a feature of this Show. Mrs. Bishop, Duppas Hill; Miss Cooper, Sydenham Road; and Mr. Thomas Butcher, George Street, Croydon, all had very tasteful arrangements, and were awarded the prizes in the order named. Mr. C. J. Salter was first for twenty-four varieties of cut flowers, which included some magnificent spikes of Odontoglossums and Cattleyas. Bouquets and hardy herbaceous flowers were well represented. The principal prizetakers for Grapes were—Mr. Clinging, gardener to W. Greenwell, Esq., Marden Park; Mr. C. Blurton, gardener to H. Cosmo-Bonsor, Esq., M.P., Kingswood Warren, and Mr. Playford, gardener to J. W. Prince, Esq., Brickwood house, for six dishes of fruit. Mr. Clinging and Mr. C. J. Salter had the best Melon.

A marquee 180 feet long was devoted to plants. There was a falling off in the number of entries for large specimen plants, but this was nearly compensated for in the quality of those shown, and the nurserymen's groups. Messrs. J. Laing & Sons, Forest Hill, occupied a space at the entrance with a choice group. Mr. J. Box had a group at the other end. Messrs. J. Peed & Sons, Roupell Park Nurseries, had an effective group of foliage and flowering plants. Mr. C. Chaff, nurseryman, Croydon; Mr. T. Butcher; and Messrs. J. Cheal & Sons, Crawley, were also exhibitors. The grand specimen plants of Philip Crowley, Esq., Waddon House (Mr. W. King, gardener), are so well known around Croydon that no one was surprised to see him carry off so many of the chief awards; it would be interesting to see how Mr. James Cypher or other large plant growers would fare with him as a competitor. His nine foliage plants were equally good. Mr. Hazell, gardener to R. W. Mitchell, Esq., Bickley, was second; and Mr. Simmonds, gardener to C. H. Mayhew, Esq., Northurst, South Norwood, was second in another class. Mr. H. Elsley, gardener to Capt. Wright, was a successful exhibitor with Fuchsias and other plants. For nine Ferns in 6-inch pots Mr. G. Kirk was first, also for a like number of Tuberos Begonias; Mr. T. A. Glover, gardener to E. Ellis, Esq., Manor House, Wallington, was a close second.

#### LEE, BLACKHEATH, AND LEWISHAM.—JULY 1ST.

A HIGHLY satisfactory Exhibition was held by the Lee, Blackheath, and Lewisham Horticultural Society, on July 1st, in the grounds attached to The Cedars, at Lee, the residence of Mrs. Penn.

The silver medal and the challenge cup for the winner of the largest amount of prize money was gained by Mr. Nunn, gardener to J. Soames, Esq., Maze Hill, Greenwich. This was keenly contested for this season, and was won only by 5s., the two following exhibitors being only 5s. and 17s. respectively behind—Mr. Mullins and Mr. Jeffery. The silver medal offered for cultural skill was won by Mr. Fox, gardener to Mrs. Penn, The Cedars, Lee, for an admirable collection of vegetables and salad. The rain on the first day prevented many people attending, but in the afternoon and evening of the second day the grounds were crowded to such an extent that it was found necessary to keep the tents open for half an hour longer than usual, it being impossible to get the vans up to them. Next year being the twenty-fifth year of the Society's existence efforts will be made to obtain as many special prize givers as possible, and if any friends of the Society are disposed to add to these

attractions the courteous Secretary, Mr. C. Helmer, 5, Boone's Road, Lee, will be glad to have particulars by October next.

At the Show in question, of which we regret we cannot give a detailed notice owing to the great demands upon our space this week, four large tents were filled with plants, cut flowers, and vegetables, and the quality throughout was far superior to that at local shows generally; indeed the bee exhibition would in all points compare very favourably with any held in the metropolitan district. Besides the exhibitors named the following were successful in many of the classes:—Messrs. Fox, Jeffery, Trollope, Payne, J. Cooke, Rhoden, W. Burgess, Pearce, C. Santle, T. Robinson, H. Startup, Reece, Dobson, Lambert, Aley, Helmer, Hood, Stockwell, Newnham, G. & W. H. Burch, R. L. Knight, Bryan, Goodard, and Neighbour.

Groups not for competition were shown by Messrs. J. Laing & Sons, Messrs. Peed & Sons, Roupell Park; Mr. W. Garton of Blackheath (cut flowers). Mr. Fisher of Lewisham (Orchids), Messrs. B. Maller & Sons, Lee and Lewisham, table decorations and floral devices.

#### PORTSMOUTH.—JULY 1ST.

AN exceedingly good Exhibition was held in the Victoria Park in this flourishing town on the date named, and considering that the surplus funds are distributed amongst local charities the Society well deserves the support of the public. The Committee deserve credit for their labour, and especial praise is due to the Hon. Secretary Mr. B. Miller, for the commendable way in which all the details were carried out. The Duke and Duchess of Connaught spent some time in the marquee; and the Duchess declared the Exhibition open to the public.

Plants were exhibited in large numbers, ample prizes being offered. The principal class was for twelve stove or greenhouse specimens, distinct varieties, not less than six to be in bloom. The value of the first prize was £12 10s., with others in proportion; there were five entries. Mr. J. Cypher, Cheltenham, was first by the superiority of his flowering plants, which were Allamanda nobilis, Ixora salicifolia, with thirty trusses; I. regina, Draecophyllum gracile, Erica expolita obbata, E. tricolor Wilsoni, Croton Countess, well coloured; and Kentia Belmoreana, in good health, were the most noteworthy. Mr. Offer, gardener to J. Warren, Esq., Handcross Park, Crawley, was a good second; Boronia elatior and Ixora Williamsi were his best flowering plants, with a wonderful Croton Warreni in the foliage department. Mr. J. Currey, gardener to Colonel Pepper, Milford Hall, Salisbury, third. The class for four specimens produced seven entries, making a fine display. Mr. Cypher here again took leading honours, Draco-phyllum gracile and Croton Thompsoni being his best plants. Mr. F. Mould, Pewsey, Wilts, was second, staging an excellent specimen of Franciscea calycina major. Mr. Offer third. The best single specimen foliage plant was Croton interruptus from Mr. Offer. It was fully 7 feet in diameter and richly coloured. Second and third honours rested with Mr. Currey and Mr. Cypher. Mr. Mould was first for one flowering plant with a capitally flowered specimen of Erica retorta major. Mr. Cypher second, and Mr. Penford, gardener to Sir F. Fitzwygram, Bart., Leigh Park, Havant, third. The class for three Palms was well filled, Mr. Offer taking first with Latania borbonica, Phoenix reclinata, and P. tenuis. Mr. Currey second. Mr. Offer was also first for one Palm, staging Kentia Canterburyana in admirable condition. Messrs. W. & J. F. Legg, Gosport, second. Mr. Offer took the leading position also for three Ferns and for one Fern with good specimens in both classes. Mr. Peel, gardener to Miss Todd, Shirley, and Messrs. Legg were second and third in the order named. Mr. E. Wills had the best table plants in a strong competition, with highly coloured, light, and graceful examples. Gloxinias were shown in first-rate condition by Mr. Hatch, Garden Superintendent Victoria Park, Portsmouth; as also were Cockseombs, Pelargoniums, and Begonias by the same exhibitor. Mr. J. Burridge, North End, Portsea, had the best Fuchsias. Colcus made a bright display, the best coming from Mr. S. Dee, gardener to Mrs. Mills, Crescent Villa, Portsea.

Groups arranged for effect were numerous and good, the competition being keen. In the open class, space 10 feet by 6 feet, there were five competitors. Mr. E. Wills secured the coveted award with a freely arranged group of plants suitable for the purpose, not being in any way crowded; the base was of Maidenhair Fern, from which rose several arching stems of Francoa ramosa, Gladiolus Colvilli The Bride, Hydrangeas, &c., the whole being neatly fringed with Panicum and Gloxinias. Second, Mr. Currey. Third, Mr. Peel. A similar class was provided for those residing in Portsea Island only, which produced a good display. Mr. J. Burridge was eventually placed first, and Mr. Hatch a remarkably close second, the front of his group failing him in the contest.

Cut flowers, as usual, made a fine display. Mr. Penford, with Orchids, Anthuriums, Ericas, &c., won first honours for twelve bunches in distinct varieties. Mr. W. Peel second. For the same number of hardy varieties there was a strong competition. Mr. Ladhams, florist, Shirley, secured the first prize with a box containing very fine Delphiniums, Campanulas, and Lychnis Haageana. Mr. J. Tavener, gardener to Sir A. K. Macdonald, Bart., Woolmer, Liphook, second. Some boxes were placed out of competition for exceeding the stipulated number of varieties. Ball and bridal bouquets were staged by Messrs. Perkins and Sons, Coventry, in their usual style—a long way ahead of any others.

Fruit, although not in such quantities as in some years, was of good quality. For six dishes, Pines excluded, Mr. Inglefield, gardener to Sir J. Kelk, Bart., Tedworth, Marlborough, was first, having well-finished examples of Black Hamburg Grapes, Royal George Peaches, seedling Melons, Brown Turkey Figs, and very fine Sir J. Paxton

Strawberries. Mr. Penford second; Black Hamburgh Grapes and Lucas Strawberries were his best dishes. Mr. Tavener had superior Black Hamburgh Grapes in the class for three bunches any Black; Messrs. Inglefield and Penford followed, both having the same kind. The last named was first in the class for any white variety with very fine Golden Hamburgh. Mr. Inglefield second with Muscat of Alexandria, unripe. Mr. Penford had the best Melons (scarlet and green flesh) with Syon House and Victory of Bath. Mr. Inglefield showed good Dymond Peaches in the class for one dish. Strawberries were excellent, Mr. T. Hall, gardener to S. Montague, Esq., M.P., South Stoneham House, Southampton, having Sir J. Paxton as the best; while Waterloo won for Mr. T. Wilkins, gardener to Lady Theodora Guest, Inwood House, Henstridge, second prize. Mr. Penford had the best Nectarines, Lord Napier. Mr. Hall, with Knight's Early Black, won first for Cherries.

Vegetables were only fairly good. For nine sorts Mr. Wilkins was a good first, having Suttons' Seedling Potato, Perfection Tomato, Leviathan Broad Bean, Magnum Bonum Cauliflower, and Early Milan Turnips as his best dishes. Mr. Inglefield was a close second. The best Tomatoes were staged by Mr. Penford, a splendid dish of Perfection. Mr. B. Woodward, Liphook, had the best Cucumbers in a strong competition.

Large displays of hardy cut flowers were made by Mr. B. Ladhams, Shirley, and Mr. M. Prichard, Christchurch; Messrs. Keynes, Williams, and Co., Salisbury, and Messrs. Ewing, Havant, contributing excellent stands of Roses.

#### BRIGHTON.—JULY 1ST AND 2ND.

ALTHOUGH the Roses, which usually constitute an important feature at this Show, were not so abundant as might have been desired, they were more numerous than was expected, and the quality was also better than the season rendered likely. To compensate for any deficiency in the Roses there were tasteful groups of flowering and fine-foliage plants, together with some admirable specimens in the stove and greenhouse classes. The Show was as usual under the management of Mr. E. Carpenter, and was held in the principal room of the Royal Pavilion.

With Roses Mr. C. Turner, Slough, was the most successful, as he secured premier prizes in several classes. His leading forty-eight comprised some capital blooms, the varieties being as follows:—Fisher Holmes, Pride of Waltham, Earl of Pembroke, Mrs. John Laing, Xavier Olibo, François Michelon, Hon. Edith Gifford, Devienne Lamy, Marie Van Houtte, Ulrich Brunner, Madame Lacharme, Marguerite Brassac, Niphetos, Camille Bernardin, Innocente Pirola, Marie Baumann, Alba Rosea, Duke of Edinburgh, Madame Gabriel Luizet, A. K. Williams, Souvenir d'Elise Vardon, Prince Camille de Rohan, Madame Margottin, Prince Arthur, La France, Marquise de Castellane, Captain Christy, Dr. Andry, Jean Ducher, Marie Rady, Souvenir de S. A. Prince, Duke of Wellington, Caroline Kuster, Victor Hugo, Souvenir de la Malmaison, Countess of Rosebery, Comtesse d'Oxford, Alfred Colomb, Comtesse Panisse, Grace Darling, Lady Mary Fitzwilliam, John Hopper, Star of Waltham, Charles Darwin, Perle des Jardins, Marguerite de St. Amand, Heinrich Schultheis, and Comtesse de Nadaillac. Mr. F. Woollard, Cooksbridge, was second, and Messrs. G. W. Piper, Uckfield, third.

For twenty-four triplets Mr. C. Turner was again first, showing Senateur Vaisse, Pride of Waltham, Capt. Christy, Marie Baumann, Duke of Wellington, Marquise de Castellane, Heinrich Schultheis, Madame Margottin, La France, A. K. Williams, Madame Gabriel Luizet, Jean Ducher, Charles Lefebvre, Grace Darling, Comtesse d'Oxford, and Princess of Wales. Mr. G. W. Piper was second, and Mr. Booth, Uckfield, third. The best twelve Tea (triplets) came from Mr. D. Booth, and comprised Homère, Maréchal Niel, President, Souvenir d'Elise Vardon, Madame Falcot, Triomphe de Rennes, Marie Van Houtte, Hon. Edith Gifford, Niphetos, Catherine Mermet, Duc de Magenta, and one that was unnamed. For twelve blooms of any Rose Mr. C. Turner was first with Mrs. John Laing, very bright and fine specimens, and Messrs. Piper second with Ulrich Brunner.

In the class for eight stove and greenhouse plants Mr. Portnell, gardener to Sir A. Lamb, was adjudged the first prize for excellent plants of *Statice profusa*, about 4 feet in diameter and covered with flowers. *Ixora Prince of Orange*, *Stephanotis floribunda*, *Bougainvillea glabra*, *Dipladenia amabilis*, a fine globular plant bearing large flowers; *Anthurium Schertzerianum*, *Allamanda Schottii*, and *Erica tricolor Wilsoni*. Mr. Mould of Pewsey was second, his best plants being *Erica aristata*, 4 feet across; *E. ventricosa Bothwelliana*, and *Statice profusa*. Mr. Portnell was also first with twelve table plants, neat and useful specimens for decorative purposes.

Groups arranged for effect were capital, and Mr. H. James, Norwood, was first with one of the best groups he has shown. Mr. Currey, gardener to Col. Pepper, Salisbury, was a close second, and Mr. E. Mcachen, Withdeane, was third. Mr. Currey was also first for an excellent group of Ferns. Non-competing groups of plants were staged by Messrs. J. Peed & Sons, Roupell Park and Streatham Nurseries, who are frequent and welcome exhibitors of choice and useful plants at shows around the metropolis and in the southern counties. Messrs. J. Cutbush & Sons, Highgate, had a fine collection of greenhouse flowering and foliage plants, and Mr. G. Miles, Dyke Road, Brighton, had a large group of miscellaneous plants. Floral decorations were not of a remarkable character, much the best coming from Mrs. F. T. Gadd, 20, Steyne.

#### CHISWICK.—JULY 2ND.

THE eleventh annual Exhibition of the Chiswick Horticultural Society took place in the Royal Horticultural Society's Gardens, Chiswick, on Thursday last, and was in many respects very successful. Much interest centred in the new class provided in this year's schedule

for a group of Gloxinias arranged with Palms and Ferns in a semi-circular space on grass not exceeding 100 square feet. The successful competitors were Mr. A. Newton, gardener to J. B. Hilditch, Esq., Asgill House, Richmond; Mr. Thomas Bones, gardener to J. Donaldson, Esq., Tower House, Chiswick; Mr. A. Wright, gardener to E. H. Watts, Esq., Devonhurst, Chiswick; and Messrs. W. Fromow & Sons, Sutton Court Nursery, Chiswick, who gained the prizes in the order named. The handsome silver challenge cup (value 25 guineas) for seventy-two cut Roses was won with grand blooms by Mr. B. R. Cant, St. John's Street Nursery, Colchester; second, Mr. Charles Turner, Slough; third, Messrs. Paul & Son, Cheshunt; highly commended, Mr. Frank Cant, Colchester.

Vegetables were well shown by Mr. C. J. Waite, Glenhurst Gardens, Esher; Mr. D. White, gardener to Mrs. F. Watson, Redlees, Isleworth; Mr. W. Palmer, Surrey; Mr. E. Chadwick, gardener to E. W. Nelson, Esq., Hanger Hill House, Ealing, and others. Mr. J. Palmer staged faultless fruits of the New Melon Sutton's Triumph not for competition, and which were highly commended.

Non-competition groups of plants and cut flowers contributing much to the attractiveness of the Show were sent by Messrs. Charles Lee and Son, Hammersmith; Messrs. W. Cutbush & Son, Highgate; Mr. Reynolds, gardener to the Messrs. De Rothschild, Gunnersbury Park, Acton, and Mr. M. T. May, gardener to the Marquis of Bute, Chiswick House, whilst special mention must be made of the quaint group of Cacti from Messrs. James Carter & Co., which deservedly attracted much attention.

#### NORWICH.—JULY 2ND.

THE early morning train on July 2nd carried us off to commence once more the round of Rose showing at Norwich. There were already some amateur and professional Rose growers in the train, and at the stations where we expected them familiar faces, peering over their piles of green boxes, were loudly welcomed. Bursting Station was passed in silence, amid expressions of heartfelt regret that the late Rev. H. T. Frere, the pioneer of Rose showing in East Anglia, was lost to our little band.

The Show was held in Catton Park, the seat of S. Gurney Buxton, Esq. (to whom exhibitors and Judges are much indebted for a welcome luncheon), some three miles from the city; but Mr. Pollard, the able Hon. Sec. of the Norfolk and Norwich Horticultural Society, was not oppressed with fear as to the result of holding a show so far off in unsettled weather, for the Society is one of the strongest in England financially, and in the support accorded to it in the rapidly increasing and many church-ed City. The East Anglian Horticultural Club, a useful and flourishing Society, has its headquarters here, and therefore is, I am sorry to say, able to embrace but a small portion of East Anglia proper; and such an institution, whose meetings must, I am sure, be full of harmony and good will with Mr. F. Morris in the chair, is just the thing which many Rose societies and horticultural exhibitions require to support them. As I walked back to the station early in the afternoon the people were pouring out in waggonettes, brakes, and private carriages to such an extent that schoolchildren lined the railings of their playgrounds three deep to see the people go by, as if it was the Derby Day! It was "a sight for sore eyes," especially for some treasurers that I wot of.

A good Rose Show could hardly be expected at such an early date in such a late season, indeed the Committee held a meeting to consider the advisability of postponing the date, but the difficulty of finding another suitable day which would not interfere with another Show proved too much for them, and the original fixture was wisely adhered to. The postponing of fixed dates might, I think, call for some expression of opinion at the next general meeting of the N.R.S.

H.P. Roses were weak, indeed it was plain that hardly anyone had come to his strength on that point, and considering that four strong professionals were represented, it was very noticeable how all the best Teas were to be found in the amateur classes. For forty-eight Roses Mr. Prince of Oxford was first, showing H.P.'s better and Teas smaller than usual. Mr. B. Cant second with Madame de Watteville as his best bloom, and Messrs. Burch of Peterborough third with A. K. Williams in good condition.

In the amateur classes the Rev. H. A. Berners of Harkstead Rectory, Ipswich, was well to the fore, his Roses being evidently considerably earlier than those of his rivals, and Rev. A. Foster-Melliar of Sproughton took a back seat throughout. In thirty-six Mr. Berners was first, having only Alfred Colomb, however, among H.P.'s as a first-class bloom. Mr. Foster-Melliar was second with barely a decent H.P. in his stand, but showing three extra fine Teas—Comtesse de Nadaillac, very fine and high coloured, but quite past its best; Edith Gifford, very solid and large, and a rare specimen of *La Boule d'Or* of unusual shape and colour. Miss Penrice of Witton was third. Four stands of twenty-four were staged, Mr. T. H. Powell of Drinkstone Park being first with a neat fresh box, and Mr. Foster-Melliar second with a good many bad ones, but one fine Jean Ducher. Of the remaining three boxes, much lacking in quality, two had a considerable struggle for the third place, but an unusual amount of eccentricity of nomenclature in her rival's stand gained Miss Penrice the award.

Four boxes of twelve Teas (amateurs) were shown, upholding well the character of East Anglia for growing and showing these lovely flowers. Mr. Berners was placed first with a collection worthy of record. Back row: Madame Bravy, Comtesse de Nadaillac, grand; Rubens, rather empty; Catherine Mermet, good. Middle row: Jean Ducher, Cleopatra, good; Souvenir d'Elise, very fine; Edith Gifford. Front

row : Souvenir de S. A. Prince, Madame de Watteville, Innocente Pirola, Princess of Wales. The Nadaillae gained the medal after a long and tough fight with Mr. Foster-Melliar's Boule d'Or from his thirty-six. Both these exceptional blooms were shown at the Crystal Palace two days later, and were still worthy of admiration. Rev. F. Page Roberts was second in this class, his blooms being smaller, but very neat and clean as usual, and Innocente Pirola very good. Mr. Foster-Melliar was third with Souvenir de S. A. Prince, Comtesse de Nadaillac, and Edith Gifford as his best.

For twelve H.P.'s of a sort (too large an order for amateurs at a local show) Rev. A. L. Fellowes was first, as usual, with a fine stand of La France, Miss Penrice following with the same variety, smaller, but in this box was found the medal H.P., a bloom in which no possible fault could be found, save a little want of size. A box of Gabriel Luizet was third. In six H.P.'s of a sort Mr. Berners was first with Gabriel Luizet, Mr. Foster-Melliar following closely with Marguerite de St. Amand. In twelve Teas of a sort Mr. Fellowes was first again, as last year, with Madame Bravy, large and clean but many imperfect in form. Mr. T. H. Powell second with Caroline Kuster, and H. Robinson third with Maréchal Niel. There was not much quality in the class for six Teas of a sort, Mr. Berners being first with Edith Gifford, Mr. Foster-Melliar second with Nadaillac, and Mr. Page Roberts third with Princess of Wales.

In eighteen trebles (open) Messrs. Burch were first, having Lady Mary Fitzwilliam large and clean, and Messrs. D. Prior & Sons of Colechester second, bright examples of La France being their best. In twelve trebles (amateurs) Mr. Berners was first, Mr. Fellowes second, and Mr. Foster-Melliar third. The local classes did not produce anything extraordinary in the way of rising talent. An extra prize was awarded to Mr. Fellowes for an interesting stand of twenty-four single and Polyanth varieties, among which Ceeile Brunner and Anna Maria Montravel were noteworthy.

There was a poor show of fruit and vegetables, especially of the latter. I was much taken, however, by Daniels Bros.' "Continuity" Lettuce, as shown by them, which will, I think, be an acquisition, if it is as good as it looks and is reported. A fine general stand of flowers, &c., was made by Mr. John Green of Derham, among which the Eckford varieties of Sweet Peas were noticeable.—W. R. RAILLEM.

#### CHERTSEY, WALTON, AND WEYBRIDGE.—JULY 2ND.

THE twenty-sixth annual Exhibition of this district Show was this year held in Ashley Park, by the kind permission of J. S. Sassoon, Esq., and was considered to be the best yet produced. It is not every Secretary who can boast of managing so many exhibitions as can Mr. J. Rawlings, who has officiated for twenty-six years. Groups of a miscellaneous character have long been a feature at this Show, but this year there was a falling off in numbers, but the quality was very high. £4 was offered as first prize for a group in a half circle, 14 feet by 7 feet. Mr. J. Reeves, gardener to Mrs. Vachell, Oatlands Park, Chertsey, was first with a tasteful arrangement, in which every flower and plant could be seen with ease, some well-grown plants of Carnation Miss Jolliffe, *Franeoa ramosa*, *Liliums auratum* and *Harrisi* were employed, these along with graceful Palms rising from a base of Maidenhair created a pleasing effect. Mr. J. W. Reed, gardener to E. Pettit, Esq., Broadwater, Oatlands Park, was a good second, the only fault in this group was its slightly crowded state on one side. For a group 10 feet by 5 feet, also arranged on the grass, there was but one competitor, Mr. A. Millican, gardener to H. Cobbett, Esq., Walton-on-Thames, who was adjudged first prize, an honour which he richly deserved.

Plants were staged in large numbers, and generally of good quality. For eight specimens, not less than four to be in bloom, Mr. J. Reeves was a good first, having a splendid plant of *Erica Cavendishi*, a good *Statico profusa*, *Cycas revoluta*, and *Phoenix reclinata*, Mr. J. W. Reed second. *Ixora salicifolia*, *Clerodendron Balfourianum*, and *Bougainvillea glabra* were his best. For the best six flowering plants Mr. J. W. Reed had *Azalea Duke of Nassau*, *Dipladenia Brearleyana*, and *Clerodendron Balfourianum* in his first prize lot. This exhibitor was also adjudged the premier honour for single specimen flowering plant *Clerodendron Balfourianum*. Mr. Cook, gardener to J. S. Sassoon, Esq., Ashley Park, Walton, was second with *Allamanda Hendersoni*. The last-named occupied first place for six fine-foliaged plants. *Kentia Fosteriana*, *Latania borbonica*, and *Cycas revoluta* were the most noticeable. Mr. Reed second. Mr. J. Reeves had the best six Ferns, *Davallia Mooreana* being particularly noticeable; he also had the prize for four hardy Ferns. *Caladiums* and *Achimenes* were also well shown by Mr. Cook. *Gloxinias* were profusely flowered, first honours falling to Mr. J. Thorne, gardener to H. A. Flood, Esq., Walton-on-Thames. Tuberous *Begonias* in six varieties made quite a feature in the Show, the plants being of high excellence, both in flower and foliage. Mr. W. Stedman, gardener to Miss Verity, Weybridge, was first prizewinner; Mr. W. C. Pagram, gardener to A. F. Hobhouse, Esq., Weybridge, also showed well.

Cut flowers were a decided feature of the Exhibition, Roses being especially noteworthy. For twenty-four sorts, single trusses, Mr. J. Sparrow, gardener to the Rev. A. Bramwell, Barrow Hill, Chertsey, was adjudged first honours with blooms of medium size, fresh, and good colour. Mr. A. Hunt, gardener to W. L. Cohen, Esq., Englefield Green, Egham, second; and Mr. Field, gardener to Captain C. F. Terry, Shrublands, Hersham, third. Ten competed in the class for twelve Roses, distinct, Mr. J. W. Reed being first with fresh even blooms. Stove and greenhouse cut blooms in twelve varieties were best shown by Mr. H. Jacques, gardener to Miss Renny, Chertsey, who also took premier

position for the best collection of hardy herbaceous varieties, staging thirty-six varieties, Mr. W. C. Pagram being second. Trusses of double and single *Pelargoniums* were well staged by Mr. Carpenter, gardener to Major Collis Brown, Byfleet. Vases for drawing-room and dinner table decoration were well represented, the former by Mr. J. Reeves and the latter by Mr. T. Osman, gardener to L. J. Baker, Esq., Ottershaw Park, Chertsey.

The best collection of six varieties of fruit was staged by Mr. Osman, and the best eight dishes of vegetables by Mr. Sparrow. For a collection not exceed ten varieties, Mr. F. Hopkins secured the first prize.

Messrs. J. Laing & Sons, Messrs. B. S. Williams, and Messrs. Peed and Sons each sent a group of choice flowering and foliage plants not for competition, which added considerably to the attractiveness of the Exhibition, and Mr. Jackman contributed excellent Roses.

#### FRUIT FORCING.

**PINES.**—*Starting Suckers.*—These will soon be fit to be taken from the plants which formed the early section of summer fruiters, and the necessary provision must be made at once for their reception, so that the plants may have the benefit of undiminished solar heat in developing growth for as long a period as possible. The means essential are a fermenting bed in a low damp house or pit, and the heat of it in a steady state of about 90° at 6 inches from the surface, but a few degrees higher, or 95°, may be allowed at the start, taking care that it is not exceeded. The suckers should be taken from the parent plants and then placed directly into 5 or 7-inch pots according to their size, and be watered once in order to settle the soil about them. Good fibrous loam torn up by hand without any admixture is the most suitable compost. It should be firmly embedded in the pot and about the sucker, which will tend to cause speedier root action, sturdier and more satisfactory growth. For a week or ten days the house or pit must be kept rather close and moist; shade effectually, and admit but little air, sprinkling from a fine syringe once or twice a week according to external influences. As soon as growth takes place more ventilation with less shade is desirable, which must be proceeded with gradually until the growth is well decided and the plants are inured to the sun, when ordinary treatment should be given. Once the plants are started they must not be allowed to become root-bound, but the growth accelerated as far as is consistent with a sturdiness; consequently there must not be any delay in shifting into the larger pots immediately the roots have taken firm hold of the soil and before they become matted together at the sides of the pots, which for Queens and Black Jamaica may be 10 inches, and for other sorts 11 or 12 inches, using fibrous loam, but more lumpy than for suckers, adding a sprinkling of steamed bone meal, and to prevent worms entering the pots a handful of soot or wood ashes may be sprinkled over the drainage.

**MELONS.**—*Second Crops.*—When old plants are in good health and free from red spider will show blossoms freely on the laterals, even when the fruit is swelling, but these will not set unless syringing is discontinued, which is not advisable, so that lateral growths should be encouraged to insure fruit showing when the present crop is advanced for ripening, and these will set freely with the drier atmosphere, and the crop be somewhat advanced by the time the fruit is cut. The plan is then to cut away such old growths as are useless, and concentrate the fresh growth on the young fruit. A little of the old soil may be removed, lumpy loam supplied, with a fourth of decayed manure free from worms. Give a good soaking of tepid water, and follow at once with equally warm liquid manure. If there is any red spider sponge the leaves with soapy water, 2 ozs. to the gallon, and remove the worst infested leaves. Maintain a good moisture, and sprinkle the beds in houses with horse droppings once or twice a week, not much at a time, but little and often. Failing these sprinkle the paths, &c., with liquid manure two or three times a week, but it is best to use the liquid at all afternoon dampings and weak. It must be kept from the foliage. The plants not having fruit set when the first crop is cut, but being healthy and vigorous, they should be treated as if they had fruit swelling, encouraging growth, and when they show fruit keep the air drier and ventilation free. They will set and swell a crop more quickly than young plants, but if they are exhausted with the first crop, and attacked by red spider, they would be best rooted out. In that case thoroughly cleanse the house or pit, and remove the old soil, supplying fresh. After giving the bed a good watering with liquid manure, when part only of the soil has been removed, fresh plants may be put out. Keep them close, moist, and shaded, and they will soon become established, and show fruit so as to afford a late supply; but such structures must have artificial heat, as Melons in late September are apt to suffer in quality should the weather prove moist and cold. They should have a dry atmosphere, and a temperature of 65° to 75° secured, and a free circulation of air.

*Routine.*—Give support to the fruits before they become heavy, letting the table slant so as not to hold wet, and place slates beneath the fruits of the plants in frames, raising them above the foliage on small

inverted flower pots as the swelling advances. Fertilise the flowers daily until sufficient fruits are set of about equal size on a plant, then remove all the flowers and reduce the fruits to three or four on a plant according to its vigour.

*Shade* only to prevent flagging, it is most needed on bright weather succeeding a dull moist period. Melons directly exposed to the sun are benefited by a slight shade when ripening, especially when the plants do not from indifferent health supply moisture to the fruit freely. Repot any plants requiring it, and keep them sturdy by placing them near the glass. Look well after canker. It often arises from damp, and the remedy is a drier atmosphere or freer ventilation, and rubbing quicklime into the affected parts.

*Stopping and Removing Growths.*—When the fruit is set and swelled to the size of an egg the laterals may be pinched to one leaf, and if this results in too much foliage, so that the leaves upon the primary shoots are crowded or shaded by them, thinning must be resorted to, removing a little at a time in preference to a quantity at once, the latter giving a check unfavourable to the fruit swelling, not unfrequently causing it to cease swelling; in that case its rind becomes hard, also in the flesh, and it sometimes cracks and exudes through gangrene. The plants should be at least once a week, and in the case of vigorous plants twice, for stopping and the removal of superfluous shoots, the principal leaves being fully exposed to light and air.

*Watering.*—Melons never ought to lack moisture at the roots. Water must be given before the foliage flags, as when that occurs a check has been given which will have its effect. Over-watering is even worse, therefore do not afford water until the soil is becoming too dry for the support of the plants, but before flagging takes place, when a thorough supply must be given. Plants swelling their fruit will need water once a week, even those with a large extent of root space; others with lessened rooting areas require it twice a week, and plants in boxes every alternate day or oftener, and those in pots will need water or liquid manure once or twice a day. When setting and ripening it will be sufficient to keep the foliage from flagging, and if watering becomes necessary it should be given without wetting the surface more than can be helped. A poor growth is not good either for setting or ripening the fruit, but a drier condition of the soil is desirable at those times than when the fruit is swelling.

*Syringing.*—When the flowers are about expanding withhold water from the foliage, and when the crop is ripening it must be kept off the leaves, and especially the fruit, which would probably crack; but the chief cause of fruit cracking is a close moist atmosphere at night. At the time of setting and ripening moisture must not be entirely withheld from the atmosphere, but damp available surfaces in the morning and afternoon. When the fruit is swelling syringe well at closing time, and if morning syringing is practised let it be done early; but it is best omitted, damping more liberally. Sprinkle plants in frames or syringe at closing time, being careful to keep the water from the collar of the plants.

*Ventilation.*—As the fruit approaches ripening admit a little air constantly, so as to prevent the deposition of moisture on the fruit; also when the flowers are setting, for when damp settles on the blossoms the pollen is converted into paste, and the delicate organs are destroyed. In frames it is always a good plan to provide a little ventilation at night, and increase it early in the morning of bright days when the temperature has advanced to 75°, and gradually increase it with the rising temperature, keeping through the day at 80° to 90°, and closing sufficiently early to rise to 95° or 100°, and before night admit a chink of air at the top of the house or back of the frame.

*Temperature.*—Melons like plenty of heat. This will now be maintained without having recourse to much artificial warmth; it will suffice if the night temperature does not fall below 65°, and is maintained at 70° to 75° by day. In a dull cold period a little fire heat may be desirable to maintain a buoyant condition of the atmosphere when the blossoms are setting and when the fruit is ripening, and at those times the plants in frames will be much benefited by linings placed against their sides, and if necessary to the beds, as it allows of a free circulation of air, and otherwise the temperature is ruled by external influences.

**STRAWBERRIES IN POTS.**—Early runners for layering in pots are best furnished by early planted runners of last year. The plants will afford the strongest and best runners for layering that are not overcropped, and well supplied with water. The plants should have shown blossoms, because runners from fruitful plants always turn out better than those from fruitless strong-growing parents. The runners may be layered in small pots, turves, or into the fruiting pots. All three plans are good. In any case it is essential that the first runners, which give the finest plantlets, should be selected, and that they be induced by free watering to emit roots speedily, so that they may by after judicious attention develop into sturdy plants and form good crowns. If layered into the largest pots they need not be detached until thoroughly established.

Those layered in 3-inch pots or turves should, as soon as well rooted, be detached and stood in a shady place for a few days preparatory to shifting them into the fruiting pots. These may be 5 inches for very early forcing, 6 inches for succession, and 7 inches for late work. For very early La Grosse Sucrée and Vicomtesse Hericart de Thury are unrivalled for setting, swelling, and finishing fine glossy fruits of good quality. Noble sets well, and finishes off a heavy crop of dull-looking fruit; Auguste Nieaise is much brighter, but the quality is not much better than Noble, but both are esteemed for appearance. Sir Harry is excellent for home use, also President, but neither travels well. Sir

Joseph Paxton is good in crop and quality, but it mildews in some places, and there are none to beat British Queen, Dr. Hogg, and Coombs for late supplies. Waterloo is valued for its deep colour and good quality. The pots must be clean inside and outside, have a large crock in each, and three or four of lesser size with some smaller still, so as to form about an inch of drainage. This should be secured with the rougher parts of the compost rammed tightly down. Turfy loam, strong rather than light, must form the staple of the compost. Break it up roughly, adding a quart of steamed bonemeal and a similar proportion of soot and wood ashes to every bushel of soil. If these are not available, the advertised fertilisers answer equally well, following in each case the instructions accompanying them. Let the compost be moderately dry when used, for if wet it will shrink after potting, leaving the sides of the pot. Bring the soil in the pot up to the required height, ram it firmly, and finish, so that the base of the crown will be about half an inch below the rim, which must be left clear for watering, allowing a little more for the larger size of pot. Stand the pots on a hard base in an open sunny situation, but sheltered from strong winds, with sufficient space between them to allow the full exposure of the foliage. Give water as required, and sprinkle the foliage a few days after potting. If this be followed each evening it greatly assists the plants. When the roots are working freely in the fresh soil copious supplies of water will be needed, and always give sufficient to moisten the soil through to the drainage. The plants must not be allowed to flag, and the soil ought not be soddened by needless waterings. Remove all weeds and runners as they appear.

### THE FLOWER GARDEN.

*Carnations.*—Early raised seedlings ought now to be large enough for planting out where they are to flower, and without much further trouble should give a grand display of blooms next summer. The latter remark applies to the ordinary border varieties, as the newer Margaret, or Marguerite, should flower freely this autumn. They succeed best on sheltered borders and in slightly raised beds, fresh loam and partially decayed horse droppings being freely added to the ordinary garden soil. Supposing the beds are formed 7 feet wide, a very convenient size, with alleys 1 foot wide between them, the former would hold six rows of plants at a distance of 1 foot asunder in the rows. Disturb the roots as little as possible in planting, and fix the plants firmly. After being watered a mulching of leaf soil might advantageously be given. Older plants now well advanced towards flowering should have their stems lightly and neatly supported with stakes, and if extra fine flowers are desired disbud freely. Seedlings flower so very abundantly that it is not often possible to obtain cuttings or layers from them, but cutting-raised plants usually make more growth. Some of the smaller shoots if taken off now, dibbled in boxes filled with sandy loamy soil, and placed in a close frame against a north wall, will strike readily. Later on a little gentle bottom heat will be needed. Layering the stronger growths may also be commenced now, fine strongly rooted plants being quickly had in this way.

*Pinks.*—Although these will remain in a fairly healthy free flowering state for several years, by far the best flowers are obtained from young plants. Fresh beds should, therefore, be made every year, and the same number of worn out plants destroyed. Now is the best time for inserting the pipings or cuttings. As a rule they strike readily in either handlights or frames located behind a north wall, but in high and dry districts a gentle bottom heat is desirable. A few well drained boxes filled with loamy gritty soil, or handlights similarly prepared, will hold sufficient cuttings for most gardens, but if extra large quantities are required place a layer of partially exhausted and not too dry heating material, a mixture of leaves and stable manure answering well, in the bottom of a garden frame, treading it down firmly, and on this place about 4 inches of fine loamy soil, finishing off with a liberal surfacing of sand. Twist off the cuttings from the old plants, lightly trim, and then dibble them in firmly 2 inches apart, a gentle watering being given at the finish. The frames or handlights containing the cuttings to be kept close and shaded from what sunshine reaches them till all are rooted, when they ought to be ventilated freely, those struck early being fit for the beds in the autumn. Pinks are also easily raised from seed, and if pods are found on any of the plants, including the popular Mrs. Sinkins, take care of them. Being duly harvested and stored the seed may be sown in gentle heat early next spring.

*Budding Roses.*—Forward stocks open freely now, and if the buds are sufficiently plump these also will part readily from the wood. This important operation may be carried out any time during July and August, and it often happens that the late inserted buds, owing to their lying dormant till the spring, give much the strongest growths. If the budding has to be done in hot and dry weather give a good soaking of water to the stocks and bud-yielding Roses, two nights in advance, or the bark will not rise freely.

### THE KITCHEN GARDEN.

**PEAS.**—It is not often that Peas are seen in better condition than they are this season, and they are scarcely a week later than they were last summer. If any fail to fill their pods as fast as desirable top them, and the same thing should be done if extra fine pods are required in this case directly the first flowers have faded. It is further advisable to freely thin out the pods, leaving only the best formed, and these, if the variety is suitable, should eventually become quite good enough to win prizes. Heavy and very welcome rains have fallen in most districts, but in but few cases are these sufficient to well moisten the ground

occupied by the roots of Peas, and advantage ought really to be taken of a showery time to give the rows a thorough good soaking of liquid manure of some kind, the drainings from mixed farmyards freely diluted with pond or soft water if at all strong answering well. Blood manure also well diluted is fine for Peas, causing the pods to grow to a great size and to fill rapidly. If liquid manure is given in hot and dry weather let it succeed a soaking of clear water, one preparing the ground for the reception of the other. A heavy mulching of strawy manure is of great assistance to rows of main crop and late Peas, and the least that can be done is to hoe up the Spinach run to seed between the rows, and to distribute this alongside the latter. Peas being in great demand in the autumn sow several rows of Ne Plus Ultra, Latest of All, or other well tried late varieties at once on deeply dug well manured ground, giving the preference to high rather than low positions, the latter being most subject to destructive early frosts. If the ground is at all dry open deep drills, and well soak with water prior to sowing the seed, covering the latter with about 3 inches of fine soil. Thinly sown Peas are the least addicted to mildew, and most late varieties will branch well if given the chance. Either stake Peas before they fall about the rows, or not do it at all.

**POTATOES.**—These again look remarkably well, never better probably. The weather being so favourable for hoeing and cleaning operations there ought to be no weeds, but if there are any left among Potatoes pull them up at once, or otherwise a plentiful supply of seed will be the result, and much extra work provided for the end of the summer. According as the early crops are lifted, clear the ground of rubbish, well level, and fine down the surface, and that will be all the preparation needed for Strawberries, salading, Broccoli, Savoys, Turnips, and other successional crops. Having the ground in proper condition for planting or sowing is always a gain during hot and dry weather. Do not save the smallest tubers for seed purposes, but rather reserve a good breadth of an approved early variety, and save all but the coarsest and smallest tubers for seed. Home-saved tubers of Ashleafs especially are always the best, therefore look well ahead and save plenty, as there are no more profitable early varieties and few (if any) to equal them.

**ENDIVE.**—Plants obtained by sowing seed in May or the early part of June are rarely of much service, being almost certain to run prematurely to seed. Not till Lettuces fail to blanch perfectly is there much demand for Endive, and the latter can be had good when wanted by sowing seed during the last week in June or a week later. The best strains of Green Curled, with the Louviers and Improved Broad-leaved Batavian, may all be sown with advantage, a fairly large piece of open ground or a portion of a border newly cleared of either Potatoes, Cauliflowers, or Onions being suitable. Get this into a finely divided state, water it if at all dry, and then sow the seed thinly and broadcast, a good breadth of ground being given up to each variety, and cover with sifted soil. When large enough the majority of the plants may be moved elsewhere and the rest left to develop and blanch where they are, a capital early crop being thus obtained without much trouble.

**TURNIPS.**—It is not always possible to keep up a good supply of Turnips, the enemies to the young plants being especially numerous. Sowing seed on lumpy ground or in a hot and dry position at this time of year is so much wasted labour, but Turnips do not often fail on north borders, or in other cool well-prepared positions. These having been dug up some time previous, would now crumble down finely. Open the drills 15 inches apart, moisten them if dry, and sow the seed thinly. If either slugs or fly are troublesome, dust over the young plants frequently with soot and lime while yet the dew is on them. For the present sowing Snowball, Veitch's Red Globe, and Chirk Castle Blackstone are all suitable, the last-named being particularly well adapted for late crops. It sometimes happens that these early July sowings prove the most serviceable of any, the bulk of the roots standing or being kept well through the winter.

**TOMATOES.**—These quickly took to their fresh quarters, the start auguring well for future success. Being now well established, the roots spreading far out into the fresh soil, a soaking rain having also fallen, there will be little need for much further assistance from the watering-pot, though those sheltered by copings of any kind will still require to be watered occasionally. Give all a mulching of short manure or leaf soil. It is now when the plants should have the closest attention in the way of training and disbudding, allowing the side shoots to grow to such a size as to need cutting away by armfuls being a very unwise practice. Lay in the strongest branches where there is good room for them, and closely pinch out all the rest, but do not as yet interfere with the strong primary leaves.

**GLOBE ARTICHOKE.**—The heads of these will soon be plentiful, and should be cut directly they are fully grown, whether required for use or not, this favouring the production of good successional supplies. They are naturally rank-growing, gross-feeding plants, soon exhausting the ground of its moisture and fertility, and unless given copious supplies of liquid manure now as well as a heavy mulching of manure in the spring, are liable to collapse in hot dry weather. The young plants, or divisions, and any seedlings put out, ought particularly to be looked after, as they should give useful supplies of heads in the autumn.

#### PLANT HOUSES.

**Watering.**—Experience tends to prove that greater care is exercised in watering during the winter than in the summer months. Not unfrequently during hot bright weather plants receive too much water, and evil consequences follow. Too much care cannot be exercised in the

watering of plants, especially after they have been newly potted and the pots are full of roots. It is then difficult, if the drainage is good, to overwater them. Many seedlings and other plants are ruined in their early stages by the soil being kept too wet. The secret in plant growing is to supply water carefully.

**Feeding with Liquid Manure.**—Each year convinces us that more harm than good results from the use of liquids from cesspool and the farmyard. It is difficult to estimate its strength, and young men, in the hope of pushing on plants rapidly, use it too strong, and burn the roots or poison the surface of the soil so that the roots will not enter it. Soot water in a clear state is practically harmless, and quickly stimulates the plants, and may with safety be used every time water is needed once the plants are rooting freely in the soil. This, with a suitable artificial manure applied to the surface of the soil at intervals of two or three weeks, will be found far better than daily supplies of farmyard liquid.

**Plant Cleaning.**—Constant attention is needed in dipping or syringing plants directly aphides and thrips are observed upon them. Where plants can be fumigated it will be the most economical method of destroying these pests. Plants must be freed from mealy bug and scale on every opportunity when the houses are not hot. It is impossible to have healthy robust plants that are infested with insects. When the houses are cool men can clean nearly double the number of plants that they can when the atmosphere is moist and the temperature high.

**Pot Washing.**—Pots can never be washed so quickly and easily as directly they are emptied. We find it economical to wash them at once. If stored outside and allowed to dry they take more than twice the time that they do when they are moist. If the whole cannot be done as the plants are turned out, a large tub or tank should be handy for placing them in to keep them moist, so that it can be done at the first opportunity. Pots in which plants are growing should be kept clean, for however well plants are grown their appearance is practically destroyed if the pots are allowed to remain dirty. The walls, eurbs, glass, and other portions of the structure should be cleaned thoroughly when the plants are turned over. A few hours devoted to these operations now and again assist materially in maintaining a healthy atmosphere about the plants. The appearance of houses and plants depends almost solely whether they are kept clean or the reverse.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### THE WEATHER.

THE weather continues unfavourable for honey. In another three weeks the Clover will be past, and the lateness of the season does not augur well for the Heather. We have had a week of unsettled weather after the great drought, and there is little indication of a favourable permanent change. Flowers are profuse, and a week or ten days of bright weather would give abundance of honey. It is the 3rd of July, and everything is late, but the copious showers are very beneficial to crops of every sort.

#### QUEEN EXCLUDER ZINC.

I am sorry to have to reply to the statements of Mr. J. M. Hooker, pages 521-22. Mr. Hooker cannot be ignorant of "the previous teachings of this Journal." I have never made a prior claim to any invention or improvement connected with apiculture to which I was not entitled, but I have often had to correct what appeared in contemporaries when they laid claim to contrivances in common use before the claimants kept bees. I did not assume the wire excluders were the same as perforated zinc, but simply showed that the idea was not new. I deny that bees will fill the centre comb of the brood with honey that the queen has not access to so long as a cell is empty elsewhere.

Mr. Hooker is in error when he says the Judges were all Scotch at Edinburgh. The principal Judge was Mr. Symington, the peasemeal man. As for excluder zinc being an improvement on supering, the idea is to me amusing. The Stewarton system has not been improved upon. I observe Mr. Hooker refers to his medal for sections. But I must go farther. At the first Caledonian Apian Society's Show there were five Judges, One, the late Mr. James Anderson, was so displeased with the opinions of the others that he left, Mr. Mark Walker also dissenting, leaving Messrs. Hooker, Abbott, and McLauchlan to decide, with the result that with one exception they awarded the first prize in every class to pure sugar. I entered a protest against the exhibitors, and in every instance an apology was made.

The hives came next. Mr. Abbott on this occasion was assisted by Mr. Hooker, and this is the point I wish to bring out. My hive was a storifying one of the ordinary frame type. The storifying

might, if desired, be dispensed with, or used for supers, and as there were four dividing boards, close fitting, could be transformed into many shapes, and instead of frames supers could be substituted. At the sides there were entrances, so that a nucleus or two nuclei could be formed without interfering with the body of the hive. Mr. Abbott was first in this class.

The next class was for the cheapest storifying hives, competed for by Mr. A. Ferguson, Stewarton, with one of the Lanarkshire storifying hives at 12s. 6d. The first prize was awarded to an English one at 34s. or 34s. 6d. Both instances were decided by English Judges, Messrs. Hooker and Abbott. The following year the same hives were in competition. My hive was awarded first, but on being consulted I agreed to compromise the matter, and allow Mr. Abbott to appear as equal. There were no medals awarded. Messrs. Neighbour's goods were too late in arriving, or the awards in many cases would have been altered.

It is a well-known fact that queen excluder zinc has as yet been a failure, creating labour for the bees, and by keeping the centre of the hive open the super combs are darkened. It has never been reliable to keep queens out of the supers, consequently much comb has been spoiled, both workers and drones being bred in them, and the latter often found dead in the supers. Mr. Hooker admits its failure in his article of June 4th, or why, if it was so good, was there necessity for a new pattern? I am pretty certain that if excluder zinc was to be used on our hives at the Heather there would be few supers. The bees swell to such an extent when there is a glut of honey, that they would actually have to adopt the modern idea, to store it below, then carry it aloft in small quantities.

The best way of using excluder zinc is as I described it some six or seven years ago, and which has been copied elsewhere—the plan of cutting it into narrow strips and running it between the bars. That plan was never attempted till it appeared in the *Journal of Horticulture*. I should be very sorry indeed to make a single misleading statement, and I now call upon Mr. Hooker to prove that I ever made “prior claim to any invention or improvement” not my own.

The form of the “standard” hive, with its flimsy frames of one size, is now altered, and has two different sizes of frames, which are heavier. At my suggestion, but not till then, was an effort made to rectify the error indicated.

In conclusion, may I ask Mr. Hooker to explain why it is that they have abandoned their original styles of hives, and are adapting ours which have been in use so long, although not prize-takers? If that alone is not good proof that I have been in the right, I do not know what is.—A LANARKSHIRE BEE-KEEPER.

[In consequence of extreme pressure on our space, we have been obliged to abridge this communication, and must request that any reply to it be as brief and concise as possible. Our readers prefer practical matter to controversial indulgences.]

## THE BRITISH BEE-KEEPERS' ASSOCIATION'S SHOW.

THE annual Exhibition of this Association, the twelfth held in connection with the Royal Agricultural Society's show, took place at Doncaster, June the 20th to the 26th, where “The Royal” held its fifty-second country meeting. At twelve o'clock each day there were lectures on bee management, with practical demonstrations, bee driving, &c., by Mr. Roland Green, who repeated his interesting lectures periodically during each day.

The lectures and manipulations took place in a bee tent, so made that visitors could hear and see all that was going on through a screen, without the least chance of their being stung. The bee tent was only a few yards from the exhibition of the bee department of the Show, and the lectures were listened to by thousands, who appeared to be greatly interested by what they saw and heard. On the last day of the Show several members of the Council of “The Royal” visited the bee tent and expressed themselves well pleased with the instruction given, and perfectly satisfied with the general management of this department, so ably carried out by Mr. John Huckle, the Secretary of the British Bee-keepers' Association. Among those present were Earl Cathcart, the chief Steward; the Mayor of Doncaster; Mr. Ernest Clark, the Secretary; Sir Jacob Wilson, Hon. Director of the Show, accompanied by Lady Wilson and several other ladies.

The Judges appointed to make the awards in the hives and honey classes, of which there were 144 entries, were Rev. J. F. Buckler, Bedston Rectory, Cheshire; Mr. W. B. Carr, Orpington, Kent; Jessie Garratt, Meopham, Kent; and Mr. Walter Martin, Wainfleet, Lincolnshire. The classes were open to all, the honey not being restricted to that of the present year.

Class 300, for the best collection of hives and appliances, to consist of three frame hives complete; one pair of section crates, fitted with sections; one extractor; one slow stimulating feeder; one rapid feeder; one smoker; one veil; one swarm box for travelling purposes; one nucleus hive; one travelling crate for comb honey; and any other distinct articles not specified; to be staged on 50 superficial feet. Five

only of the seven entries were staged.—First prize, Messrs. George Neighbour & Sons, 127, High Holborn, London; second, Mr. W. Dixon, 5, Becket Street, Leeds; highly commended, Mr. A. C. Jameson, 26, Collurgate, York.

Class 301, for the best observatory hive stocked with bees and their queen.—First prize to Messrs. Geo. Neighbour & Sons, Carniolian bees. Second, Mr. W. Dixon. Third, Mr. E. C. Walton, Muskham.

Class 302, for the best and most complete frame hive for general use, unpainted.—First prize, Messrs. Geo. Neighbour & Sons, price 24s. Second and third, Mr. C. Redshaw, South Wigston, Leicester, price 25s. and 20s.

Class 303, for the most complete and inexpensive frame hive for cottager's use.—First, Mr. C. Redshaw, price 10s. 6d. Second, Mr. C. Redshaw, price 12s. 6d. Third, Mr. W. P. Meadows, Syston, Leicester, price 8s. 3d.

Class 304, for the best honey extractor.—First, Mr. W. P. Meadows, “The Raynor,” price 30s. Second, Messrs. Geo. Neighbour & Sons, price 35s. Highly commended, Mr. Thos. Lowth, Riseholme, Lincoln, price 21s.

Class 305, for the best pair section racks.—First, Messrs. Geo. Neighbour & Sons, price 8s. 6d. Second, Mr. C. Redshaw, price 7s. Highly commended, Messrs. Geo. Neighbour & Sons, price 7s.

Class 306, for the best rapid feeder.—First, Mr. C. Redshaw, price 3s. Second, Messrs. Geo. Neighbour & Sons, price 6s. 6d. Highly commended, Mr. W. P. Meadows, price 3s.

I propose to give an illustration and full description of the hives, &c., to which prizes were awarded at a future time.

## HONEY.

Class 307, for the best twelve sections of comb honey.—First, Messrs. Sells & Son, Uffington, Stamford (last year's). Second, Mr. W. Woodley, World's End, Newbury, this year's Sainfoin honey, and I do not understand why this exhibit was placed second, as the sections were nicely filled. Third, Mr. W. Christie-Miller, Broomfield, Chelmsford.

Class 308, for the best six sections of comb honey.—First prize, Mr. J. Greenhill, Wimbledon (not uniform in colour). Second, Mr. Woodley. Here again I think this exhibit should have been placed first. Possibly the Judges do not like the rich golden colour of Sainfoin honey, although uniform. In my opinion the only honey that can compare with Sainfoin honey is that gathered from Raspberries.

Class 309, for the best exhibit of run or extracted honey, not to exceed 24 lbs.—First, Mr. A. J. Carter, Newfields, Billingham. Second, Capt. St. G. Ord, Bury St. Edmunds. Third, Mr. C. T. Overton, Crawley, Sussex.

Class 310, for the best 12 lbs. of granulated honey.—First, Capt. St. G. Ord. Second, Mr. W. Dixon. Third, Mr. J. T. Harveyson, Finchley.

Class 311, for the best and most attractive display of honey.—First, W. Dixon. This consisted of honeycomb worked to represent the Prince of Wales's feathers with A. E. on either side, last year's production. A crown of 1890 honeycomb and V.R. of 1889 all very well worked out, and shows that with the aid of comb foundation almost any device can be made. This exhibit well deserved the honours it obtained. Second, Miss Cooper, St. Nicolas Square, Leicester.

Class 312, for useful inventions introduced since 1889, silver medal, Messrs. Geo. Neighbour & Sons for section racks (for which they obtained first honours in class 305). Silver medal, Mr. P. Harbordt, Liverpool, for a hive readily put together by means of a piece of wood with male dovetails projecting on one side and at one end, the two pieces to be fixed together, having the corresponding sunk dovetails, so that when in position the male dovetail is pushed into the groove and holds the side of the hives tightly together at right angles. The object sought to be gained is the sending of hives in the flat in such a shape that they can be put together by an amateur upon arrival without the aid of a carpenter. This is an ingenious invention, and makes a firm and rigid hive, but great care will have to be taken that nothing but well seasoned wood is used or they will become loose in the joints. The hive is practically put together without nails. A bronze medal was awarded to Mr. W. P. Meadows for his new registered frame, in which the comb foundation is easily placed and firmly held in position when the metal ends are on. A certificate was given to Mr. W. Dixon for a swarming arrangement, also one to Mr. C. Renshaw for his patent glass sections, in what he calls an observatory rack. The glass sections are held together by small angle pieces of white wood, and are neat and firm. The above are all that have any special merit in this class. There were fifteen entries, but several of them were not staged.

Mr. J. Hewett of Sheffield exhibited metal frame ends and frames, and a rack with glass sections, also a frame of his Punic bees. If these Punic bees are exhibited again it is to be hoped they will have at least three frames in a suitable hive with bees and their queen, having brood and sealed honey, properly ventilated, with the means of egress and ingress similar to those observatory hives to which prizes were awarded.

Class 313, for the best model of a bee tent for lectures.—The silver medal was granted to Mr. F. Harbordt; this was the only entry.

Class 314, for the most interesting and instructive exhibit connected with bee culture.—Second prize, Mr. W. Dixon, for a case of specimens, a swarm on a branch of a tree, other natural specimens, photographs, &c. The Association is to be congratulated on having had a most successful Show.—JOHN M. HOOKER, 9, Beaufort Gardens, Lewisham, S.E.

[This report was prepared for our last issue, but owing to a press of matter could not be inserted.]

## TO CORRESPONDENTS

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Tobacco (F. G. M.).**—Your former letter was not preserved, and it is difficult out of the many hundreds that have passed through our hands since it was received to remember your precise request. We think it was for a work on Tobacco. A very good one, illustrated, by Mr. E. J. Beale, F.L.S., can be had from Messrs. James Carter & Co., 237, High Holborn, London, but we do not remember its price.

**London Pippin Apple—Pears on Thorn Stocks (A. H. D.).**—The London Pippin Apple is an old English variety, and was grown in Somersetshire more than three hundred years ago. We have not seen it grown under the name you mention. We do not advise you to grow any varieties of Pears on the Thorn stock, because Quince and Pear stocks are far better. Pitmaston Duchess succeeds best on the Pear.

**Florists' Tulips (R. C.).**—Mr. Douglas gives very good instructions on the cultivation and management of these beautiful flowers in his work. Perhaps he may extend the matter in a new edition, which is wanted and would meet with wide acceptance. We think Rev. F. D. Horner wrote an essay on Tulips that is incorporated with others on different flowers, published in manual form, but we cannot remember by whom it was issued. If you write to Mr. Horner, Lowfields, Kirkby Lonsdale, we have no doubt he will readily advise you on the subject.

**Azaleas Unhealthy (Kentish Subscriber).**—When these plants become very unhealthy they are difficult to restore. If you will describe the treatment your plants have received we shall be in a better position to advise you. We should like to know their size, the size of the pots they are in, if they have been shifted, and where they have been kept summer and winter—indeed, the conditions under which so many have died. At present we have no data to aid us in finding the real cause of the misfortune, and it is necessary to comprehend it before prescribing a remedy.

**Strawberries not Swelling (M. R. D.).**—We have seen large beds of Strawberries practically ruined this year by the sharp frost which occurred when the plants were flowering. The samples you have sent appear to have been first injured by frost, then attacked with mildew. If the plants are old and much crowded, thinning out the crowns, then giving liquid manure copiously and a surface dressing an inch thick with fresh rich soil, would improve them considerably. We regret your affliction, and are glad you derive pleasure in information from your "favourite paper."

**Fruit and Vegetable Farm (H. N.).**—You omit to state whether you have any interest in the farm or not. We are, however, pleased to learn that such a good start has been made, and know that the soil and district are favourable for the cultivation of fruit and vegetables. We trust your prognostications will be verified, as they may be to a large extent under capable management. Everything depends on that. Individuals, with capital and practical knowledge, not infrequently succeed in an undertaking when boards of advisers do not make equal progress through differences of opinion that are apt to arise. We could tell of more than one failure through this cause. A competent despot may accomplish more than a "board."

**Mushrooms and Maggots (Mushroom).**—Nothing, so far as we know, that can be applied to the beds when earthing will prevent the small black flies attacking Mushrooms in hot weather. Mushrooms can only be obtained fresh and good in summer in very cool places, and if dark so much the better. Thick and very damp coverings are the best preservatives for exposed beds, and the produce must be cut young, as putrefaction soon commences in hot weather, flies and maggots inevitably following. The covering next the soil should be distinctly wet in summer, and if the litter is frequently sprinkled the beds are cooled by the ensuing evaporation, this always extracting heat from the surfaces to which moisture is applied in hot dry weather.

**Carnations Dying (R. M.).**—Whatever small white worms you may have sent shrivelled in transit in the dry box. They were probably the young of one of the millipeds (Julus) which sometimes do considerable injury, but we doubt if they have caused the death of the plant, of which you have sent a portion of stem. This appears to have fallen a victim to the wireworm, and when this enters the stems there is no cure. Wireworms may be caught with bait of Carrots placed in the ground among the plants, with sticks thrust through them for con-

venience of examination and extracting the enemy. Clear lime water might be of some service in your case, or a dredging of nitrate of soda at the rate of an ounce to the square yard, watering the ground, if dry, before the dredging, and also immediately afterwards.

**Worms in Carrots—The Beet Fly (A. H. E.).**—If the worms are in the roots they are beyond the reach of applications for destroying them. You might make a trial of petroleum (commonly called paraffin), mixing about two wineglassfuls in 3 gallons of water, pouring it along some of the rows. If the roots are much infested sow at once a breadth of Early Horn, and you will have a supply of clean useful roots in the autumn. The maggots are caused by a fly, but the period of depositing eggs will have passed by the time the late-sown Carrots are in growth. Your Beet is not attacked by the Celery fly, but the Beet fly, and the fact that the plants under trees are free shows that the fly likes sun better than shade. The Celery fly never attacks Beet nor the Beet fly Celery. Frequent dredgings of soot act beneficially.

**Fern Unhealthy (F. G.).**—Are you sure the plant has not become too dry at the roots occasionally before water was applied? When the pots of Ferns are much crowded with roots it is scarcely possible to give too much water at this season of the year, and the plants enjoy a shaded position and a moist atmosphere. If your plant is in the condition indicated stand the pot in a saucer into which the water that is poured on the soil may be collected, and when this vanishes by evaporation apply more to the soil to drain through, and thus continue throughout the summer. Clear, pale soot water, or water tinged with cow manure, given once or twice a week might be of service in invigorating the plants. Remove carefully all discoloured old fronds, and take especial care that insects do not infest the new. They are the cause of many failures.

**Vine Leaves Warts (R. H.).**—The leaves have good substance and are perfectly clean, but the greater part of their under surfaces are covered with warts, and the upper with corresponding dimples. It is a bad case of contraction of the sap vessels caused by a sudden depression of temperature and withdrawal of atmospheric moisture. It usually arises through the house having been kept close, moist, and warm, and then cold air admitted, which causes the tissues to contract and the stomates to become swollen. There is no remedy but a more careful admission of air, especially earlier in the day, and increasing it with the advancing temperature, taking every possible care to prevent chill. It mostly prevails in Vines that are in a high state of fruitfulness, or in those that have been enfeebled by overcrop and are not very active at the roots. In this last case a judicious application of tepid liquid manure to the roots often stimulates the Vines and secures freer growth, but the chief cause of warts is a chill.

**Stands for Carnations (A Thirty-years Reader).**—The following extract from the schedule of the National Carnation and Picotee Society (Southern Section) gives the information you require. "To obtain uniformity it is urged that the collections be shown in each case in boxes, of which, for twelve, the following are the dimensions—viz., three rows of four each, from centre to centre,  $3\frac{3}{4}$  inches; from centre to outside,  $2\frac{1}{4}$  inches; outside length,  $15\frac{3}{4}$  inches; width, 12 inches; depth,  $4\frac{3}{4}$  inches; to be painted green. The collections of sixes should be in three rows of two each, with the flowers at the same distance from centre to centre, and centre to outside, as in the collection of twelve. The collections of twenty-fours may be composed of two boxes of twelve, making three rows of eight in each row, or in one box as may be convenient to the exhibitor, but the same spaces should exist between the flowers." The annual Show of the Society will be held on the 21st inst. in the Volunteers' Hall, James Street, Westminster.

**Carolina superba Strawberry (F. A. G., Tunton).**—We are pleased to find you have profited by our remarks. You have sent fair samples of your plants, and the fruits arrived in good condition. They could not be in good colour under the circumstances, and no doubt you have gathered some larger. The above is the name of the variety, and is described as follows in Dr. Hogg's "Fruit Manual":—"Fruit, very large; ovate, sometimes inclining to cockscomb shape, with an even surface. Seeds, not deeply imbedded. Skin, pale red, extending equally over the whole fruit. Flesh, clear white, very firm and solid, with a fine vinous flavour and rich aroma, equalling the British Queen. The plant is much hardier, a freer grower, and better bearer than the British Queen; when forced it does not bear so well." That description is of well-grown fruit in the best of condition. Carolina superba was raised at Bath by Mr. Kitley about fifty years ago, and is perhaps not so much cultivated as its merits deserve. We have found it a robust grower in good soil.

**Melon and Cucumber Roots Diseased (West Suffolk).**—The abnormal appearance of the roots is caused by a microscopical worm one-hundredth of an inch long, known as an eel worm of the genus Anguillula, increased from eggs which are found in myriads with the aid of the microscope. The disease when virulent, as in your case, is incurable. By the judicious use of stimulants such as nitrate of soda, and maintaining a high temperature, the plants may sometimes be improved. At a convenient time the soil should be burnt, and the entire house, floors, walls, and every part cleansed as thoroughly as you can cleanse it in the hope of extirpating the enemy. If the loam to which you allude is light it would undoubtedly be improved by clay sufficiently burned to be smashed into powder, raw lumps being of small service in comparison. If the unaffected plants in the frame are supplied with water from a different source from that which affords the supply for the infected house the latter source must be regarded with extreme suspicion.

**Insects on Cucumbers and Roses (S. H. Stott).**—As you say you are sending specimens to an entomologist we will confine ourselves to a practical reply. The Cucumber leaves are in a deplorable state

IF hardy fruit culture is not revolutionised in this country in the course of a few years it will not be through lack of endeavour on the part of individuals and organisations taking an interest in the subject. Many times and oft have we directed attention to the exhausted orchards and patriarchal trees which have too long been relied on to afford produce for the consuming population. The average standard of quality of our home-grown fruit had become deplorably low, and the higgledy-piggledy mixture of varieties, the majority of them worthless, and the rough and reckless methods of handling and marketing the crops, rendered the produce untempting and of comparatively little worth. Time after time have we directed attention to these cardinal defects until at last public interest became aroused, and now the tide has turned. Nurserymen and amateurs, societies and companies, growers, showers, and philanthropists appear to be vying with each other as to who and which can do the most in "carrying it to the flood that leads to fortune." But it will not bring fortunes to all who rush headlong into the work of planting trees that they fondly hope will certainly and soon give them golden harvests. Knowledge is the first essential to success.

We are glad to see the wholesome, friendly, stimulating rivalry now existing. It is a healthy sign. No great good is done by monopolists, except to themselves. If all the nurseries in the kingdom were rolled into one tree would neither be better nor cheaper, but somewhat the reverse. They are better as they are for the greatest number, and not worse for those who are compelled by the powerful law of competition to conduct them so well, and thus benefit, as they should, by their enterprise and skill. Similarly in the fruit crusade the most good will be done by the different agencies working separately, yet in harmony towards the achievement of a common object for the benefit of the whole community. The work in which so many are worthily engaging is of national importance. Fruit well grown in every garden in the land that is suited to its production, would of necessity enhance the wealth of the nation to the advantage of cultivators as well as the great multitude of consumers in our cities and towns. We wish well to all who are honestly and disinterestedly sharing in a work which is so good in itself, and if wisely conducted will be of service to many.

The season's crusade opened under bright auspices on Monday last, when the greatest and most important meeting yet held on the fruit question assembled in the Egyptian Hall of the Mansion House, under the presidency of the Lord Mayor of London. This is a distinct step in advance, and the work had the immediate countenance of the Minister for Agriculture, the Right Hon. Henry Chaplin. It was brought about by the influence of an ancient City Company—the Fruiterers'—which has become revived, and is now working with the energy of youth. The present Master of the Company, Sir James Whitehead, Bart., gave great prominence to the fruit question during his mayoralty, and a past Master of the Fruiterers' Company, Mr. H. R. Williams, gave his powerful support to the movement. With the object of affording the citizens of London ocular demonstration of the fact that the most important hardy fruits, Apples and Pears, can be grown at home as well as abroad by those who understand their cultivation, it was determined to provide a Show in the Guildhall

last year. Its success was overwhelming, and its effect so great as to command the attention of the City authorities, and the highest and most influential personages in the kingdom. Thus it was that the Mansion House was opened to fruit growers and patrons to encourage them in their work and to pass resolutions, having for their object the providing of means for the dissemination of knowledge in aiding occupants of land to devote a portion of it to fruit culture under the guidance of competent advisers.

The Lord Mayor in giving countenance to the movement adverted to the use of fruit as a wholesome article of diet, and expressed the hope that the supply would be both increased and improved. Mr. Chaplin delivered a very practical speech, and adduced authoritative statistics showing that millions of money were lost to this country by negligence or apathy in dairy and poultry management, then passed to the subject of fruit. Respecting the value of the importations he wisely discriminated between the fruits that could and could not be profitably grown in this country. Misleading statements to the effect that fruit to the value of £8,000,000 was imported that might be grown at home were so often repeated two or three years ago that we felt it our duty to correct them, and stated on March 7th, 1889, that the foreign trade with which our fruit growers could successfully compete was much nearer £1,000,000 than £8,000,000 in annual value, and we showed that the average value of the importation of Apples over a period of six years then ending was £750,000. Mr. Chaplin estimates the value of such imported fruits last year as can be grown in this country at £1,200,000, of these Apples being valued at 800,000. Thus what we said two years ago the Minister of Agriculture confirms. The value of imported Apples last year was £50,000 above the average, this being accounted for by the comparative failure of our crops. It is prudent to recognise the contingencies to which fruit is liable; but failures from differing causes occur abroad, and do not deter from further effort, neither should they deter at home, but all should strive who have the means to grow more and better fruit. Mr. Chaplin moved, and Lord Egerton of Tatton seconded, the following resolution, which was passed unanimously:—

"That in the opinion of this meeting vigorous efforts should be made to restore the orchards, and promote the extension of hardy fruit cultivation in our homesteads and cottage gardens, and that the Lord Mayor be invited to open a subscription list with the object of obtaining the necessary funds to enable the Fruiterers' Company to carry out their purpose."

Sir James Whitehead, in supporting the resolution, indicated the methods of procedure. He thought that in promoting their present object they should follow the lines of the Royal Agricultural Society to a very great extent. They proposed to hold annual exhibitions in different parts of the country; to obtain the co-operation of local societies; to give prizes, medals, and certificates; and to organise a system of lectures by competent, practical men, who would give demonstrations both oral and ocular, and spread information as to the best positions for orchards and fruit trees, as to soils, pruning, and the treatment of insects and grubs, and as to the best means of making jams and preserves for winter use. For these objects they wanted public approbation and subscriptions.

On the proposition of the Baroness Burdett Coutts, who made a sympathetic and much-appreciated speech, an influential Committee was appointed, consisting of various noblemen, the Lord Mayor, Masters of City Companies, members of the Court of the Fruiterers' Company, and their pomological advisers (Messrs. G. Bunyard, J. Cheal, A. H. Smee, T. F. Rivers, and J. Wright) to take steps for carrying out the foregoing resolution.

The medal and certificates awarded at the Guildhall Show were presented to the successful competitors, and a hearty vote of thanks to the Lord Mayor closed the first and highly successful

ceeing of the season's crusade. The next will be held under the auspices of the British Fruit Growers' Association in Beddington Park, near Croydon, Sir James Whitehead presiding, and a large gathering is anticipated.

### PERSIAN RANUNCULUS.

WHY do not people grow these more? Such is the question that has come to my lips very often during this month as I have looked out upon my two beds of these most charming flowers. Do you delight in variety of colour? I say advisedly I do not know any class of flowers where the range is so great—from black, at least as black as we get in any flower, to pure white, through every shade of red and yellow, olive green with yellow ground edged with darkest markings like a variety of Picotee; some striped like a Carnation, others spotted, veined; in fact there is hardly a tint of colour which exists in flowers that may not be found in a good bed of Ranunculus. Then do you admire symmetry of form? What can be more exquisite than the beautifully moulded petals of this flower? Some may term it formal, and all double flowers as compared with single ones are liable to this charge; but withal there is an exquisite finish in the form of these flowers that wins admiration, perhaps even from the rigid botanist who declaims against all these things as monstrosities and violations of the laws of Nature.

One objection to growing the Ranunculus has been their supposed difficulty of cultivation, and as it was practised formerly, and as I practised it for some years, there was some difficulty. One used to imagine that the depth at which they were to be planted was to be so exactly gauged (an inch and a quarter) that I used to have my beds boarded round and then a board cut to the required depth was forced into the beds, making a drill of that depth, at the bottom of which the tubers were placed, and then covered over; but I have found that this exactness was altogether unnecessary, and I plant now without any contrivance of this kind. I endeavour to plant them about this depth, and am convinced that shallow planting is required, but I do it in the ordinary way—draw a drill with a small hoe and then plant.

The plan which I adopt with regard to my beds, which are about 35 feet long and 4 wide is to prepare them in the autumn. The soil is ordinary light garden soil, and in the month of October if it is in a fit condition I dig in a good supply of old hotbed refuse, between three and four barrowfuls to each bed. This is left through the winter, and if there is frost it is turned up roughly so that it may get the full benefit of it, levelling the soil, and perhaps destroying grubs, &c. I say perhaps, because I am somewhat doubtful as to the effects of frost. About the 12th of February I prepare for planting, but I am not particular as to date. If the weather is favourable before that I do not hesitate to plant, and if it is unfavourable at that time to defer it for a little longer. It is, I think, essential that the soil should be in good condition at planting time. The bed is then raked down and levelled, the rows are drawn about 4 inches apart, and as I have said from 1½ to 2 inches in depth. I have previously gone through my boxes, for I do not keep to names, but grow in mixture, and pick out for the principal bed the largest tubers. Allowing for three rows to a foot and twelve in each row, the bed will take about 1250. Of course smaller beds can be made. As the Ranunculus, like most of its family, is fond of water, a dry spring is against them, and I found at one time that my blooms would be defective, but abundant rains came and I only gave water once; and during the many years that I have grown them I do not think I have ever had blooms so much to my satisfaction. Formerly I used to take a good deal of trouble to place an awning on the beds; for some years I have discontinued it, and am quite satisfied to do so for the future. The flowering season may be a little shortened, but a good deal of trouble is saved and the beds look better.

The harvesting of the roots is a matter of supreme importance. They must not be taken up before they are ripe, or they will shrink very much, and be feeble next year; nor must they be left too long, which is even more fatal to them, as they then begin to start, and when this is the case the tubers are good for nothing next year; so that should showery weather occur, as it very often does in the early part of July, a good deal of watchfulness is needed to catch the right time for lifting them. They should be placed after the foliage has been cut off in a cool shady place, where they can get all the influence of the air without being exposed to direct sunlight. A cool open shed is a capital place. They can be laid out thinly, and when they have been thoroughly cleared of all dirt they may be placed in boxes and brought into the house and placed anywhere free from frost.

As to varieties, there was a time when we had two great home growers, who had largely contributed, by raising seedlings, to the

beauty of our beds—Mr. Carey Tyso of Wallingford, and Mr. George Lightbody of Falkirk. They have long since passed away, and now one has to go to that grand emporium of bulbs, Holland, to procure a collection. Some years ago I obtained from Messrs. Ant. Roozen & Son of Overveen, Holland, a few hundreds of Persian and Scotch (so-called) varieties. They were all named, and have, with some remains of Lightbody's collection, formed the foundation of my present one. I put them into mixture, knowing that I should probably have to weed out a good many, and so the event proved. Neither in these nor in Tulips are they so particular as to correctness of form, and admit amongst their Ranunculuses many that are not sufficiently double, and which show the black centre much too soon. These I have gradually weeded out, and I can now look on my beds with much satisfaction. I have often mentioned those which I saw as a boy, and which bear out the love that I suppose was in me, and like our tarts and Apples of those days, think there are none like them now. But I give way now, and think that this year mine were as good. Whether I shall ever see it so again, who can say? Enough to have enjoyed the present, and leave the future.

Of late years there has been a race introduced which is called the Giant French Ranunculus. The flowers are much larger than the ordinary Persian varieties, but they are not so double, and have the great defect of showing the eye very soon. They are brilliant in colour, but not so varied. They make a good show in the garden, but will not please the critical taste of a connoisseur.

I hope that what I have said may induce some to try to grow this beautiful flower. They will not do in stiff or clayey soil, but succeed in good ordinary garden soil, and I think we know quite well that nothing can do well in gardening or in anything else without care.—D., Deal.

### A CALL AT READING.

As indicated on another page a call was made at the interesting trial grounds of Messrs. Sutton & Sons early in the month. They may be described as constituting a museum of flowers and vegetables, arranged in the most orderly manner, and in which the work is most carefully and systematically conducted. There is nothing of promise that can be had either from home or foreign sources that does not find fair trial there, and the results are accurately registered. Hundreds of varieties of Peas, Lettuces, Potatoes, Beans, and other crops are grown under equal conditions, their characters determined, and selections made. Only early varieties were sufficiently advanced for displaying their relative merits.

Just to name one or two of each kind, it may be said that among Peas the Improved or selected Ringleader was perhaps the first, but the new Early Wrinkled Marrow, Sutton's A1, was close at its heels, while the massive pods and large tender peas took the shine out of all. It was the Pea of Peas then ready in the extensive collection, and has no doubt a great future before it. A round, blue-seeded Pea, Bountiful, is expected to prove one of the best for market gardens. Among the Potatoes not Ashleafs, Ringleader is a distinct advance, first-class in quality when dug and cooked immediately, and first-class also after the tubers have been stored for twelve months, as was proved by its raiser, Mr. Fenn, who had both new and old on his table with the Cabbage and bacon at home. Then following it quickly for early use is the round and superior Early Regent, also a Fennian and a favourite. Next we passed down the Lettuce ranks, and here, out of the hundreds in Cos varieties, Sutton's White Heart must be written down as the best. It may be described as green outside and white in, distinct from all others, uniform, self-folding, firm and good. In the Cabbage section there was great diversity, some firm, some spreading, some bolting, and it can only be said here that Sutton's Favourite and Commadore Nutt had no superiors at the time. Beans and various root crops were not ready.

In the flower trial grounds and the houses in which Gloxinias, Begonias, Cyclamens, and other plants are so admirably grown there was much more to be seen than can be described in a passing call. Gloxinias were in full beauty, a forest of upright flowers from 3 to 6 inches in diameter, in colours the most diverse that can be imagined from the purest whites to the richest purples and crimsons, many chastely spotted and others marked as if with a network of lace; while the plants were equally noteworthy for their robust leafage and general vigour. It will be perfectly fair, just, and true to describe them in a sentence as splendid varieties splendidly grown—a description which is absolutely devoid of even an approach to exaggeration. Begonias were just unfolding their stout symmetrical flowers in soft and brilliant hues, and are by this time probably as imposing in their way as were the Gloxinias.

A number of plants of the new *Achimenes Rosy Queen* must have impressed the charm of this variety on all visitors. It is distinct from all others of the genus, floriferous, chastely effective, and destined to find its way into all gardens in which *Achimenes* can be grown.

In the grounds all kinds of half-hardy annuals are on trial, but time is needed for their development. Seedling *Verbenas*, however, forced themselves on attention by their extraordinary vigour and fine trusses of flowers. Though planted 2 feet apart in rows 3 feet asunder they were fast covering the space by their luxuriant stems. The plants were raised from seed in February, and were being grown in blocks of separate colours, such as scarlet, white, purple, and others. It was surprising to see how "true" they had come to the parentage; they are, however, most attractive in mixture and afford any number of sweet flowers for cutting. Seeing how easily the plants can be grown from seed *Verbenas* must come back to our gardens. Carnations from seed were affording a bountiful supply of beautiful flowers.

A new annual (*Nemesia*) was flowering that appeared quite distinct. The plants were about a foot high, with a *Dianthus*-like habit of growth, and producing trusses of orange red flowers about half an inch across, the colour reminding somewhat of the old *Diplacus glutinosus*, but varying in different plants. This *Nemesia* promises to be an acquisition to summer flowers, readily obtained from seed. But in view of a journey ahead this call on the way must close, however great the temptation to linger in the trial grounds and pick up hints worth having from the attendant experts.—FENN'S PUPIL.

### THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

WE have pleasure in giving a full report of the principal speeches that were delivered on the occasion of the fifty-second anniversary Festival of this Institution, held on Wednesday evening, 8th inst., in the Hôtel Métropole, the Right Hon. Joseph Chamberlain, M.P., presiding, supported by Lord Stanley of Alderley, Sir J. T. D. Llewelyn, Bart., the Revs. Canon Cromwell and W. Wilks, with Messrs. Harry J. Veitch, H. J. Adams, and N. Sherwood; Messrs. Douglas, Cannell, Ingram, Munro, and Willard presided at the side tables; the attendance numbered 170; the decorations were tasteful, and dessert excellent. The toast list was commendably short, and the opinion appeared unanimous that a more enjoyable evening had never been spent at any previous gathering of the same nature. The Chairman received a great ovation, and his speech was anticipated with considerable interest. It was a graceful and elegant rather than a powerful oration, was listened to with the closest interest, and met with the utmost approval and the warmest applause. Mr. Veitch spoke admirably, and, indeed, all the speakers acquitted themselves well, though they all felt and admitted the overwhelming influence of the Chairman and his highly finished method of delivery.

The CHAIRMAN, in proposing the first toast, spoke as follows:—My Lord and Gentlemen, I have the pleasure of proposing the health of Her Majesty the Queen, their Royal Highnesses the Prince and Princess of Wales, and the rest of the Royal Family. I am quite sure that it is altogether needless for me to stimulate your loyalty on the present occasion; but I may remind you that the Queen and the Prince of Wales are patrons of this Institution, that the Duke of Connaught took the chair at one of your previous festivals, and that many members of the Royal Family are generous donors to the funds of the Institution. The Royal Family have always taken a discriminating interest in horticulture, and have always shown a generous consideration for those who have pursued it in their service, and hence, I think, their names will be fitly commemorated in succeeding generations by the flowers and fruits with which they will always be associated.

The SECRETARY (Mr. George J. Ingram) announced that letters had been received from the following gentlemen expressing regret at their inability to attend:—Lord Ribblesdale, the Earl of Derby, the Earl of Carnarvon, the Lord Mayor, Baron Schröder, Sir Trevor Lawrence, M.P., Sir Thomas Fowell Buxton, and Mr. Brymer, M.P.

The CHAIRMAN then said: My Lord and Gentlemen, I have now the pleasure of proposing "Continued Success and Prosperity to the Gardeners' Royal Benevolent Institution." (Cheers.) Three years ago I was honoured with an invitation to be present at a similar gathering; but, to my very great regret, at the last moment I was prevented by indisposition from putting in an appearance, and I confess I am thankful to the Committee for having now given me an opportunity of performing what I regard as at once a privilege and a duty. (Cheers.) Gentlemen, I suppose we may differ greatly upon many questions, but I think I may at least assume that we are all united in our interest in, and our love of, horticulture. Under these circumstances I do not need to make any defence of our favourite pursuit. It has provided rest for, and brought happiness to, many of the greatest and wisest in the land. Statesmen have found recreation in it, philosophers have commended it, doctors have prescribed it, lawyers have advocated it, and poets have sung its praises. The great Lord Bacon, who devoted one of his Essays to the subject, said, "The cultivation of flowers is the purest of human pleasures, and a great refreshment to the spirit of man;" and he did not think it

at all beneath his dignity to leave behind him the most careful instructions as to the formation and planting of a perfect garden. But I venture to say that one of the greatest recommendations of our hobby in this democratic age is, that it is capable of affording delight to rich and poor alike, and that it can with the greatest ease be accommodated to the income of the millionaire and to the scanty pittance of the humblest labourer. Another statesman, Sir William Temple, has written very truly that gardening is at once the pleasure of the greatest and the care of the meanest, and a cottage garden is capable of affording as much delight to its owner as the finest conservatory attached to the lordliest mansion. A new variety of the Pansy or the Auricula, reared by the careful skill and the tender care of a village amateur, is to him probably a source of as much pride and self-glorification as can be to another the most costly exotic or the scarcest Orchid that ever was imported. I claim, therefore, for all that concerns the cultivation of flowers that it satisfies that love of natural beauty which is inherent in almost every human breast, that it cultivates our intelligence and powers of observation, and at the same time provides variety and excitement by the constant novelty which results from the attention we give to it. And while it does all these good things it is, I believe, the most unselfish of pleasures; for it is enjoyed the most in the largest company, and, unlike some other amusements to which the race is prone, ours inspires no evil passions, inflicts no pain, and causes injury to no man, either in his character, in his health, or in his estate. (Cheers.)

Gentlemen, under these circumstances, it must be a matter of congratulation to all of us that gardening in all its branches is daily increasing in popular favour and attention. Never, I think, before has the use of flowers as decorations been so lavishly and extensively employed. Flowers may be said to accompany us from our cradle to our grave. They adorn our houses, they grace our banquets, and, I may be allowed in passing to thank those who have provided so generously for the delectation of our eyes and for the gratification of our palates in the fruit and flowers shown on these tables. Flowers, I say, adorn our houses, they grace our tables, they add a new charm to female loveliness, and they do something to relieve the repulsive ugliness of masculine apparel (laughter). The interest which is felt in our pursuit is shown by the crowds which attend our great horticultural shows; and we see that thereby our principal growers are stimulated to new efforts. Each favourite flower in turn is taken in hand and improved and developed, while the uttermost corners of the globe are ransacked to find new beauties and new varieties. And in connection with all this enterprise there is a romantic side to horticulture which perhaps has hardly received the attention that it deserves. You all remember how last year the whole world felt a common interest in the recital of the difficulties which had been undergone in the adventurous progress of that little band which penetrated the dark forests of Africa in search of and to relieve Emin Pasha; but I venture to say that there are scores of modest explorers whose names are unknown except to a few who undergo difficulties as great and encounter dangers as serious as those which were happily overcome by Stanley and his followers, animated only by a love of natural science and a spirit of enterprise. The history of many flowers is a record of persistent and courageous achievements, carried out in face of extraordinary difficulties and labour, and unfortunately it is a record which has been made memorable by great sacrifices, by loss of health, and in some cases by loss of life. Horticulture, gentlemen, has its heroes and its victims as well as war, and it behoves us to bear their names in respectful and admiring remembrance. And it is not only adventurers who are always seeking "fresh fields and pastures new" who are deserving of our sympathy and gratitude. I have already quoted Sir William Temple. In another place he says very truly that in the growth of flowers success is wholly of the gardener, and I think you will admit that without the constant care, intelligence, and industry of those who are primarily responsible the most lavish expenditure and the most perfect apparatus would be of little avail to secure a satisfactory result. How, then, shall we repay our debt to those who in this respect have ministered to the pleasure and interest of our lives? (Hear, hear.) The profession of a gardener is a very interesting one, but at the same time I think we must allow that it is not too highly paid. The prizes are few, and the conditions of the life are such that it is hardly possible even for those who are most thrifty and most industrious in the profession to make adequate provision for all the eventualities of life. I have sometimes thought that perhaps the most pathetic position in which a man can be placed is when one who has spent a long life in honourable industry finds himself as age approaches with diminished capacities, and with ever declining resources, face to face with a future which has no bright spot, a future which offers to him only the prospect of the poor house as a refuge for his old age. Recent inquiries have convinced me that this unfortunately is the condition of a large proportion of our working class population, and I have thought that the time is come when it is urgent that the state should intervene to remove what seems to me a blot and a scandal upon our civilisation (cheers). But in the meantime worn out veterans in our industrial warfare have their only hope in the operations of such a Society as that for which I plead to-night.

I commend to your generous support the principles of this Institution. Its object is the relief of the aged and distressed. The subjects of its bounty must have passed the age of sixty years, and must have spent twenty years of their life at least in a responsible position. Preference is given, as it ought to be given, to those who have endeavoured to help themselves, and those who have been for a considerable time contributors to this Institution, and relief is given in the best

form in which it can be offered. The funds of the Institution are not wasted on buildings and costly administration, but the whole of them are paid away, and the recipients are enabled without breaking up their homes to pass the remaining years of their life in comparative comfort amongst their own relatives and friends. (Cheers.) The Institution has now lasted for more than half a century, and it has had a career of continued and increasing usefulness and prosperity. At the present time, as I learn, there are 156 pensioners, male and female, and they are receiving the bounty of our Society at a cost of something approaching £3000 a year. My Lord and Gentlemen—It only remains for me to appeal to you, and appeal to all who have derived profit or pleasure from the gardener's skill, to assist this Institution to meet all the claims that may be made upon it, so that no deserving applicant shall be turned away, so that all shall find relief in their time of need; and I feel assured that we shall all take the greater pleasure in our pursuit if we know that those who have grown grey in their service will not suffer want or dishonour in their declining years. In proposing this toast I shall couple with it the name of Mr. Harry Veitch, a name which for its owner's own merits as well as for the services which have been rendered by his family to the Institution through a long course of years, may very fitly be associated with the toast of the evening. (Cheers.)

HARRY J. VEITCH, Esq., said:—Mr. Chairman, my Lord, and gentlemen, in responding to the toast which has been so eloquently proposed, I feel that it is not necessary that I, as Treasurer of the Institution, should enter into any statistics this evening with reference to its affairs. On a similar occasion to the present this time last year, when my friend, Mr. Sherwood presided, the details of the work of the Institution were given very fully, and it is not necessary that I should repeat them. But there are one or two points to which I should like to allude. In the first place, sir, I must thank you as Chairman for the admirable manner in which you have advocated the cause of the Institution. (Cheers.) I am quite sure that the weighty words which have fallen from your lips have found not only an echo but a resting place in the hearts of all who heard them; and I would offer you the thanks, not merely of the Executive, but of every gentleman present, for your kindness in coming amongst us this evening. Knowing as we all do how many public duties you have to perform we cannot fail to appreciate your kindness in devoting this evening to the claims of our Institution. You have, sir, alluded to the fact that we have 156 pensioners. Since our last festival our oldest pensioner has passed away. I should like to mention that that pensioner died at the age of 103, that he subscribed 1 guinea per annum for eighteen years, that he became a pensioner in 1872, and that he received up to the time of his death £520 from this Institution. That, I think, shows the advantage which may arise from a gardener becoming a subscriber; while if, in God's providence, he should never have occasion to apply to us for a pension, surely he ought to feel glad that he has been able to help others who have been less successful in life than himself. Some other pensioners have passed away since our last festival. Of those who remain the average age is seventy-two years and two months, and we do all we can to take care of them in their old age. But, while we have 156 pensioners, I think we ought to look a little at the other side of the picture. We took on eleven new pensioners in January last, but we had to decline fourteen applicants. One applicant was within seven votes of being successful; but for want of funds we were obliged to decline to add the name to the list, and that poor woman will have to wait until the next election, when I trust she will be successful. Since then we have had many other candidates, and although the Chairman has spoken of the Institution as a successful one, I can assure you that we are still sadly in want of funds, and I would earnestly ask you to bear in mind the kind words in which Mr. Chamberlain has pleaded our cause this evening. I should like just to allude to the death of some friends whose faces we miss this evening—I refer to Mr. B. S. Williams, Mr. Shirley Hibberd, and others. I must also mention the names of Mr. G. Deal, who was taken from us very suddenly; and Mr. Backhouse of York. I cannot help alluding to the death of one whose face you doubtless all well remember, our late Secretary, Mr. E. R. Cutler. It cannot be necessary for me to say anything in praise of Roger Cutler, who was the Secretary of this Institution for fifty years, and to whom it was my privilege to present a testimonial in acknowledgment of his long and faithful services not long before his death. Mr. Cutler was a man to whom this Institution owes a very great deal. He was elected as Secretary, I believe, at a time when there was neither a pensioner on the books nor any money invested, and when he was removed by death he left behind him 156 pensioners and £25,000 invested in Consols. (Cheers.) If he did not do all the work of the Institution, he did, at any rate, the lion's share, and the record of that fact appears to me the best monument that he could have. He was a wonderful worker. He was, I may add, at the office on Monday afternoon, and he passed away on Tuesday at two o'clock. As you might well imagine, the Committee were afterwards very quickly called together. I am thankful to say that we have a good Committee of Management, headed by Mr. John Lee. I am not myself on the Committee, and therefore can speak of it the more freely, and I do claim for the Committee that they met the terrible difficulty in which they found themselves on the death of Mr. Cutler in a manner that deserves our admiration and gratitude. I think you will all agree with me that the affairs of the Institution have not stood still since the death of the late Secretary, but have gone on well; and I feel bound to say, Sir, that we attribute this in a great degree to your having kindly consented to take the chair on the present occasion and thus support us in our difficulty. When you came forward to our assistance in our dilemma it seemed to give us fresh life, and I venture to say that this is

one of the most successful festivals that we have ever had. The Committee had, as it were, to take the bull by the horns, and I think they did the work before them wonderfully well. The first thing they had to do, in order to keep the Institution in good working order, was to elect a new Secretary. Then came a great difficulty. The applicants were most numerous. The Committee felt that there must be great difficulty in getting a man fit to succeed Mr. Cutler, but I do hope, and I do think, that we have in Mr. Ingram a man worthy of the position. (Cheers.) Let me add, gentlemen, that if you should find that everything is not at first quite what you have been accustomed to you must recollect that after fifty years' service there is likely to be something a little different, and I feel sure that if you communicate with the Secretary or with myself you will not make any complaint or remark in vain. I will not, gentlemen, detain you any longer. I thank you very cordially for having received the toast as you did, and once again I thank you, Mr. Chairman, for your kindness in presiding this evening. (Cheers.)

N. SHERWOOD, Esq., proposed "The President and the Vice-Presidents," and Herbert J. Adams, Esq., responded.

Sir JOHN T. DILLWYN LLEWELYN proposed "The Royal Horticultural and Botanic Societies of London and the United Kingdom," and the Rev. W. Wilks, M.A., responded.

LORD STANLEY OF ALDERLEY proposed, in eulogistic terms, "The Health of the Chairman," which was received with enthusiasm.

The CHAIRMAN said, I thank you very much for the compliment you have paid me, but, as I said before, it is a pleasure and a duty for me to have been present among you, and I claim to be one of your body. I have taken great interest in gardening for thirty years. During that time I have grown, or have attempted to grow, everything, from Dandelions to Orchids, and what I chiefly pride myself upon is Dandelions. (Laughter.) But I can assure you that in my devotion to this pursuit I have had my reward, and I believe it would be impossible for anyone to find a more healthy and delightful recreation, or a greater cure for trouble and anxiety, than is found in the pursuit of gardening. During all this time, or at least in later years, my business has been the business of politics, and my pleasure has been the pleasure of gardening. I sometimes think that a parallel or an analogy might be drawn between these two pursuits. The progress of political ideas and the growth of flowers have something in common, and they both require ventilation. (Laughter.) But I don't think the parallel ends there. It is certain that they both very often succeed best in heat. Then you know that in gardening we are troubled greatly by obstructive proceedings on the part of noxious insects, which we know by the names of thrips, red spider, mealy bug, and Orchid devil. (Great laughter.) Well, gentlemen, if you have read your newspapers you must be aware that we politicians are also troubled with insects (laughter), although I should be very sorry here to mention their names. Gentlemen, you will readily understand that, having derived much advantage and pleasure from this pursuit, I am delighted to have any opportunity of helping, however humbly, to provide in some measure for those who are also engaged in it, but under less fortunate circumstances. I again thank you very much for the compliment you have paid me. (Cheers.)

The SECRETARY announced that the contributions to the funds of the Institution in connection with the dinner amounted to £1450, including 50 guineas from the Chairman and 10 guineas from Mrs. Chamberlain.

A selection of music was performed under the direction of Mr. Herbert Schartau, assisted by Miss Ethel Bevans and the Meister Glee Singers (Messrs. W. Sexton, Gregory Hast, W. G. Forington, and Webster Norcross).

TEA ROSE MADAME CUSIN.

SOME extremely fine blooms were shown by A. Tate, Esq., Downside, Leatherhead, at the recent metropolitan Show of the National Rose Society at the Crystal Palace, and Mr. Mease, the gardener, has soon again taken a place amongst successful competitors after leaving the north. The bloom of Tea Rose Madame Cusin represented in the woodcut (fig. 7) was adjudged the prize as the premier Tea in the amateurs' classes, an honour it well merited, for beautiful as this variety always is, it was exceptionally so in this case. The flower was of great size, the outer petals broad and of remarkable substance, while the colour was richer than is usually seen. It was a centre of attraction for quite a crowd of rosarians during the day of the Show, and very seldom has it been equalled.

ROSE SOUVENIR DE LA MALMAISON.

This being a favourite variety, a considerable number of dwarf bushes on their own roots are grown in the open, and also against sheltered walls for the purpose of affording cut blooms. I have never yet known it to fail, but at one time it looked very much like a total loss, the late severe winter having much blackened the wood. Fortunately there were no losses, and many early blooms have been cut, a

successional crop being already well on the way. It is invariably one of the first to flower and the last to give blooms in the autumn, very few imperfect flowers being produced by plants on their own roots.—M. H.

#### OWN-ROOT ROSES.

Dwarf Roses on their own roots frequently survive frosts that prove destructive to Roses, on tall Briar stocks especially. If they are killed down to the ground they yet recover, the severe pruning, so to speak, having the effect of causing them to push up strong shoots from the buried stems. Own-root Roses will also succeed where worked plants fail. Unfortunately they cannot often be bought, and those, therefore, who require them must propagate their own stock. The simplest method

All the Teas strike readily this way, and many of the Hybrid Perpetuals, notably those with few or no thorns, strike readily if properly treated, and a capital lot of plants will be available either for pots or the open ground next spring, or sooner if required.

#### LARGE GROWERS IN SMALL CLASSES.

THE letter in your last issue shows that "W. R. Raillem" still regards the matter from one point of view only—the possible disadvantage to the large grower. The argument that at all costs the man with the big stock must be provided for, and the smaller one alone left to suffer in the event of bad seasons, is a most unsound one, and in more important matters your correspondent would be the last to advance it. Let me

FIG. 7.—TEA ROSE MADAME CUSIN.

of doing this consists of taking off ripened growths in 1 foot lengths, inserting them in the open ground much as Gooseberries are raised, this being done not later than November. Another good plan can be tried now. Frames or handlights may be placed behind a north wall and cuttings inserted in them. Choose young firm shoots from which a Rose has recently been cut, these being taken off with a heel or thin slice of old wood attached, and before the buds are bursting afresh. Two or three joints, the upper one or two being furnished with a healthy leaf, are all that are needed on each cutting, and heels are not absolutely necessary, so that lengths of firm young wood may be cut up into short pieces and struck. Dibble them in very firmly as fast as they are taken off and made, an hour's exposure or even less being fatal to them. Water them in, keep the lights close, and shade whenever the sun strikes on them.

refer him to the action of the trade growers this year. Two of them, who have won the champion trophy previously, found their blooms not ready, but instead of dropping back into smaller classes they did the right thing and stood out, although to a trade grower it is a far more serious matter to go unrepresented at such an important show than it is to the amateur. The question of "guarantee" as to ability to show has no bearing upon the matter. I presume no one rebels against difficulties caused by providential orderings in the matter of weather, &c., but everyone would object most strongly to be overwhelmed by a competitor possessed of immeasurably greater resources, as proved by his previous performances in the higher classes.

May I, with all respect, suggest to your correspondent that the motive he gives for men going into the large classes is a lamentably

low one—"The prizes are better, the competition less keen, &c." If once the principle, "How much can I get out of it?" is allowed to decide our actions in this or any other matter, then good-bye to the good fellowship and the *esprit de corps* which have hitherto so happily characterised N.R.S. exhibitors. "W. R. Raillem's" question as to what I meant by his old position I do not regard as written seriously.

I am very glad that this little controversy is not likely to decrease the esteem existing between those who take part in it; so long as they refrain from personalities, and "measures, not men," are the subject of their attacks, all will be well. The subject of a remedy for what I consider a grievance has my attention, and it is improbable that I shall trouble you any further until I think I have something practicable to propose.—J. B.

#### NOTES ON THE NATIONAL.

"A BAD season for the Roses!" "Yes, indeed; a small Show to day!" Granted, but in many respects one of the most enjoyable the Society has ever held; in fact, there were so many points of interest that the time for closing had arrived before one had time to fairly grasp them.

First among these special features must be mentioned the triumphant presence of many old Roses and varieties that are but seldom seen. The Général Jacqueminot in Mr. Knight's twelve, to which the medal for the best amateur bloom was awarded, was surely one of the very finest ever seen, and this grand old Rose now shares with his young rival Ulrich Brunner the honour of having won the medal in both the amateur and professional divisions. Then what splendid form our sweet-scented old friend Xavier Olibo was in all through the Show; but specially fine was the bloom in Messrs. Burch's stand, which was more than once considered for the medal in the trade division. Violette Bouyer, Barthelemy Joubert, Annie Laxton, Lord Macaulay, François Levet, and Dr. Hogg are varieties that do not often put in appearance at the shows now-a-days; but here they are to-day, some of them in very fine form.

To go from the veterans and their doings to the other extreme, this Show was remarkable for the fine form of the new Roses. Two or three years ago the names of Gustave Piganeau and Souvenir de S. A. Prince were unknown in the Rose world, and yet to-day they win the two medals for best H.P. and best Tea in the trade classes. The former seems to be a specially great acquisition, of good growth, fine size and form of petal, and beautiful glowing colour. It sent deponent home in a great hurry to work every bud he could find on one small plant. But the crown as queen of the whole gathering must surely be awarded to the fair Irish belle, Margaret Dickson, sent out only last month by those energetic growers, Messrs. Dickson of Newtonards. I believe no other Rose has ever won first prize for twelve of a sort in two classes at the same Show, and it was by no lack of competition that she achieved this triumph. The twelve shown in the classes for white Roses could only be characterised by one word—perfection. Not only was there no hint of a faulty bloom among the dozen, but there was not a soiled petal nor a damaged edge to be found. This grand novelty will be wanted by every grower, and will double Messrs. Dickson's already great fame as raisers, and abundantly reward them for their plucky run from Newtonards to Sydenham. Very full of promise, too, is Messrs. Paul & Son's fine seedling, so well named after their able Rose foreman, Charles Gater. A well deserved compliment, Mr. Paul, to an able assistant and good rosarian. Messrs. W. Paul & Sons also showed their fine Tea Corinna in good style, and if of free growth it will be very acceptable. Full of interest, too, was the fine collection of seedlings of various kinds shown by Lord Penzance, and if Mr. A. H. Gray got no award for his beautiful seedling from W. A. Richardson it was only because it was not shown in the class provided, and he must have been compensated by the warm eulogium passed upon it by the President of the Society, Dean Hole of Rochester. Nor was the interest confined to new Roses; but in the person of Mr. E. Tate of Leatherhead the Show produced at least one new exhibitor of great promise. This gentleman may have shown before, but if he has I have overlooked his name, and to-day he was first for twenty-four singles with a most excellent stand, beating such able growers as Messrs. J. Brown, Mawley, Gurney, Fowler, and Rev. Foster Melliar, and winning in at least three other classes. If he continues in this style those who are now at the top of the tree will have to buckle on their armour yet more firmly if they intend to retain their places.

Then, too, the Show was very interesting as "a soldier's battle," that is to say, the greater excellence was found rather in the amateurs' classes than in those of the professional growers. Mr. Lindsell's stand, though only winning from the Bath blooms by two or three points, was one of very level excellence. Mr. Tate's twenty-four has already been referred to, and coming down to Mr. Knight's first prize twelve we had a box which was a centre of admiration all the day long. In addition to the medal-winning Général Jacqueminot he had Duke of Teck in such form and size as must have gladdened the heart of Mr. Geo. Paul; Marie Baumann, such a bloom as I have not seen since she won the medal for Mr. W. J. Grant in the year of the Shah fiasco, and Alf Colomb and others in the very pink of condition. It was an oft repeated remark of several good judges that it was probably the finest amateur's twelve ever staged, and very proud was the writer to get an award in such company.

There are some of the points which made the National Rose Show of 1891 so specially pleasurable to visitors, and in the hope that they may be of equal interest to some of your readers who were unable to be present I send you these jottings.—J. B.

## PROLONGING THE SUPPLY OF HARDY FRUITS.

[First prize essay by Mr. A. WRIGHT, Devonhurst, Chiswick, Chiswick Gardeners' Association.]

(Concluded from page 4.)

### TRAINING THE TREES.

THE best form of training to adopt is that so well known as the "fan." This is without doubt the best for all stone fruits, as a young branch can be more readily laid in, if by chance any should go off with gumming. If on the other hand pyramid trained trees are to be grown, two rows may be planted in the bed, and at 5 feet or 6 feet apart. This will give ample space to form good sized trees, the fruit of which can be readily reached, and it would also be possible to give every attention to them. This system allows of double the number of varieties being grown in the same space. I am inclined to think that there would be little difference as to the quantity of fruit gathered from either system, but where variety is wanted pyramids should be planted.

Round the centre bed make a path 3 feet wide, and edge it with some suitable material. I know nothing better for this purpose than a brick on edge, or placed so as to allow the angle to form the highest part. This will leave a border 6 feet wide on each side. Devote one border to Gooseberries, making two rows, and plant the bushes 4½ feet apart, but have one row in the wake of the other, or what is well known in gardens as "crow footing." This would allow the bushes more room than if they were planted opposite one another at right angles. The other border could be planted with Red, White, and Black Currants, the number of each varying according to the demand. The ends of the houses are now left, and we plant these with Blackberries, which could be trained up the wire, or a trellis could be formed with two wires about 2½ feet from the end, and the plants trained to that. As regards the Alpine Strawberries, I propose planting a row of them on each side of the path round the house or have a row between the Cherry trees. A good supply of fruit could be thus obtained during the latter part of the summer and early autumn, as the plants continue in bearing a considerable time. The most suitable month for planting is October, as early in the month as possible, so that time is allowed for the trees to make some fresh roots before the winter, and enable them to start away strong in the spring. After planting (which should be done when the soil is in a dry fibrous condition) make the trees secure by placing a stout stake to each to prevent them being shaken about by the wind; and in tying them be careful to leave plenty of room for the swelling of the wood or the tree settling down in the soil. It is too often the case that when the trees arrive from the nursery they are at once planted, and if against a wall immediately nailed, with the result that they are often "hung up," and the cause of death never suspected.

### PRUNING.

Nothing further will require attention before the end of February, when pruning may be done. Cherries if grown on the fan-trained system will require little more than the tops of the shoots taken off, or if any strong shoots should be likely to outgrow the others on the tree, cut them back the same length as the weaker ones. The system of cutting the growths back to within 5 or 6 inches of the base, as recommended by different authors, finds few adherents amongst the present generation of gardeners. All stone fruit trees should be cut about as little as possible, and to avoid this in training the Cherry trees I would recommend summer pinching as being preferable. This also exposes the fruit better to light and air, and so improves the flavour. In planting Gooseberries select bushes having stems a foot or more high, which will keep the fruit from the ground, where it is apt to get spoilt after being ripe if the wet weather ensues. The best system of pruning to adopt with Gooseberries is thinning the young shoots, leaving plenty of young growths for fruiting. Spur-pruning still finds many advocates, but in the south thinning the shoots answers better. With Gooseberries I would also advise the removal of all strong growths from the centre of the bushes during the summer, so as to allow plenty of air to circulate among the fruits, and the wood is also better matured. This is often neglected in most gardens, but I think on account of the pressure of work in other directions at the time; but if one goes to the expense of erecting a protection for the trees every precaution should be taken to ensure the greatest success.

Red and White Currants should also be selected with clean stems at least a foot in length between the ground and the lower branches. The fruit is not only kept away from the ground, but suckers cannot form at the base of the bushes. The pruning I would advise being carried out on the spur system, so well known as to need no repetition here; but the same remarks apply to them as to the Gooseberry. With regard to the removal of all gross and unnecessary growth during the summer, Black Currants require somewhat different treatment as regards pruning, and the bushes should only be thinned out at the winter pruning. In cutting the branches back see that some are cut down near the base so as to encourage young growth, which will keep a good supply of young fruit-bearing wood from the base to the top, and so secure a larger crop.

Blackberries should be planted about 2½ feet apart, and the young growths trained to the end of the house, or if planted against a trellis leave sufficient shoots to tie in about a foot apart. Remove all superfluous shoots as they grow, and the old bearing wood will require to be removed every year, the young growths being laid in their place. If the latter are strong and robust they may be cut back to about 6 feet in length. Plant the Alpine Strawberries from runners in the usual

way, and the plants in the rows need not be more than 9 inches or a foot apart. This Strawberry is generally planted in beds, but will succeed better if allowed ample room. It will require to be renewed from time to time by runners or by the raising of seedlings as a means of producing distinct and improved varieties.

#### MANAGEMENT OF THE HOUSE.

The summer management of the house I have described would consist in having all the fruit trees mulched with long manure, such as may be had from the stables. This will prevent evaporation, and keep the fruit clean. During dry weather well water the trees and syringe the Cherries until the time the fruit begins to colour. If insect pests appear steps should be taken to destroy them. Black fly will be found one of the most troublesome to the Cherry, but can be kept in check by syringing with a mixture of soap water and quassia chips. If caterpillars infest Gooseberries and Currants hellebore powder is an effectual remedy. The usual way to apply it is by dusting the bushes, but a better way would be to mix the hellebore powder in water and syringe the bushes with the mixture. After erecting a house of this sort every care should be taken to give the trees the attention necessary to ensure the best results, and this is best done by attending to every detail at the proper time, never putting off until to-morrow what can be done to-day.

#### VARIETIES TO PLANT.

*Cherries.*—In the case of these, early and late varieties are wanted so as to extend their season over as long a time as possible, and for this purpose I would recommend the following varieties:—Early Lyons, fruit very large, light red and yellow, June; Early Rivers, fruit large, black, late June; May Duke, fruit large, red, late June; Frogmore Early Biggareau, fruit large, yellowish red, middle of June; Black Tartarian, fruit very large, black, June to July; Governor Wood, fruit large, light red, July; Large Black Biggareau, fruit very large, black, July; Napoleon Biggareau, fruit large, yellowish red, July to August; Late Duke, fruit medium, red, August. The Morello Cherry I would leave out of this house, as there is generally a north wall which can be used for this useful kind.

*Gooseberries.*—Late varieties are required rather than early ones, as an early supply can be had from the open quarters of the garden, and for this purpose I would recommend the following kinds:—Red: Crown Bob, Roaring Lion, Whinham's Industry, Lancashire Lad, and Marquis of Stafford; White: White Lion, Crystal, and Abraham Newland; Green: Green Myrtle, Laurel and Jolly Angler; Yellow: Gunner.

*Currants.*—Red: La Versailles, Red Dutch; White: White Dutch, and White Grape; Black: Champion and Lee's Black Prolific.

*Blackberries.*—Pride of the Market, Wilson, jun., and Best of All are most useful.

*Strawberries.*—The Red Alpine or a stock raised from selected seed should have preference. If this system of raising from seed and selecting the best varieties were more largely carried out, it might be the means of bringing this class of Strawberry into general culture, especially if crosses could be made with some of the larger varieties, but yet preserve the season of fruiting of the type.

#### CONFERENCES OF THE ROYAL HORTICULTURAL SOCIETY.—JULY 7TH AND 8TH.

PARTICULARS of the Committee meetings of the Royal Horticultural Society at Chiswick on the above dates, with some notes on the Conference exhibits, were given last week, and it was intimated that further reference would be made to the proceedings.

#### THE HARDY FLOWER CONFERENCE.

On the afternoon of the first day a conference on hardy flowers was held in the Gardens, but owing to the exceedingly inclement nature of the weather the attendance was comparatively small, and many prominent members of the hardy plant school were conspicuous by their absence. This is very much to be regretted, as some discussion on the papers that were read would have added materially to the interest of the gathering and afforded encouragement to the Council. The chair was taken by Mr. W. Marshall, and in the course of a few brief but pleasant introductory remarks he referred to the great interest and value of hardy plants, and the desirability of their extended cultivation. Some consideration they of course needed, for the bog plant could not be expected to succeed in sandy arid soil, but generally considered they were very easily grown, and if a miffy or troublesome plant was found it should not be discarded, but studied and persevered with until its culture was thoroughly mastered.

The first paper was by Mr. W. Robinson, and in the absence of the writer it was read by the Rev. W. Wilks, but owing to the fearful downpour of rain he had to resume his seat on one or two occasions, his voice being rendered quite inaudible, a fact which led to a suggestion that the subject of the paper ought to be bog gardens. The lecture discussed some results of experiments in wild gardening, with special reference to the employment of hardy flowers in meadow grass. The writer said he had planted some thousands of bulbs and roots in grass with the most satisfactory and pleasing results. One valuable flower for the purpose was the blue Apennine Anemone, which had been planted in broken groups and masses. It required no attention, springing up from year to year, and the foliage was ripe by the time the grass was cut. It was very hardy, too, and never deteriorated, while the blue Greek

Anemone appeared to be equally hardy and good. Narcissi were also extremely valuable, especially those of the Star group in variety, which thrived remarkably well. The leaves disappeared by mowing time, but spring harrowing was somewhat against them. The Tenby Daffodil was also good, and the Poet's Narciss invaluable. Other very useful flowers were Dog's Tooth Violets, Grape Hyacinths, Snowdrops, Fritillarias, Crocuses, Ornithogalums, Snowflakes, Scillas, Chionodoxas, and Tulipa sylvestris. Success depended on having bold natural groups. A considerable quantity was required, and he thought the trade should grow suitable things largely, and offer them cheaply by the thousand.

The second paper was by the well-known Isle of Wight amateur, the Rev. H. Ewbank, who appeared in person. His subject was "Some of the Summer Flowers in my Garden," and he treated it in a most sympathetic and pleasant manner. The paper was admirably written, and of much practical interest. Mr. Ewbank said he did not go in for effective arrangements, his object was to study the individual plants and make them do well. Amongst the most striking of midsummer flowers were the Eremuri, Bungei at its best being very fine, and he had robustus 12 feet high. The species flowered successionally, and he thought they were far too little grown. They were not difficult to manage, but required plenty of space in well-worked soil. Melianthus major, though too tender for some gardens, was very effective in the Isle of Wight. The pride of the summer garden were Irises. Susiana, Gatesi, paradoxa, and allied species often gave disappointment, but he managed them most successfully by withholding all vegetable and animal matter from the soil, using good loam and road grit. They were dried off in July and August, in fact quite baked; and he had found it of the greatest benefit to fix pieces of glass over them in winter. The Kämpferi group required sunshine and moisture. Amongst other plants to which special mention was given were Romneya Coulteri, Papavers, Tropæolum speciosum, Cypripedium spectabile, Lilioms, Rose species, including Fortune's Yellow and berberidifolia, and Clanthus Dampieri. He deprecated the use of early flowering Chrysanthemums, regarding them as an unwelcome intimation of the approach of the dull season.

The third and last paper, that by Miss Jekyll, whose name is known to all lovers of hardy flowers, was on "the Picturesque Use of Hardy Summer Perennial Plants," and it was read by Mr. Wilks. The subject was treated in a highly attractive and practical manner. Taking into consideration the number of plants at disposal for effective flower gardening, only a portion of which could be utilised, the writer pointed out the desirability of a careful selection of material, and recommended a reserve ground or nursery where observation could be made of other things. An essential feature of picturesque gardening was a well arranged mixed border, and hints were given on the arrangement of plants in such. It was recommended to carefully arrange plants of similar colour together, or even to inter-group such plants as Poppies and Tritomas, but Delphiniums required a contrast, such as white Lilies or Oenothera Lamarckiana. All labels should be abolished entirely. Some flowers, such as Lilies and Pæonies, were worthy of separate treatment. A special word of recommendation was given to Lilium giganteum and Romneya Coulteri. Climbing and trailing plants could be appropriately utilised, and old walls could be furnished with Wall-flowers, Pinks, and other flowers. All results should be such as appeared to have happened and not been done. Discussion on all the papers was invited, but save for a little criticism on what was styled the heretical advice by Miss Jekyll to entirely dispense with labels in flower borders there was no response. A vote of thanks to the writers of the papers was moved by Mr. G. Paul, seconded by Mr. Pearson, and carried unanimously.

#### THE CONFERENCE ON SMALL FRUITS.

This took place in the gardens on the afternoon of the second day, but the attendance was again small, and the interest far from being so lively as might have been expected. Possibly the Rose shows may have kept many away, and the weather, though finer than on the previous afternoon, was threatening, heavy thunder showers subsequently ensuing. The chair was taken by Mr. G. Bunyard, who fulfilled his duties in an admirable manner.

Strawberries formed the subject of the opening paper, Mr. Allan, Gunton Park Gardens, Norwich, describing his method of obtaining fruit from June to October in the open garden. Under ordinary cultivation the supply of fruit lasted, he said, about three weeks only, but by choosing suitable positions, and with a proper selection and utilisation of varieties, fruit could be picked daily over the whole of the period named. He advocated the making of one bed and the destruction of another every year, considering that two seasons were enough for each bed. Yearling plants produced the largest individual fruits, but two-year-old plants the heaviest crop. He recommended bastard trenching the land in winter, with heavy manuring, but it was not necessary to keep the ground fallow till August, the time for planting the Strawberries, as a crop of Carrots or Onions could be taken from it. Amongst the best varieties were La Grosse Sucrée, Vicomtesse Héricart de Thury, Six Joseph Paxton, President, British Queen, Dr. Hogg, Elton Pine, Loxford Hall Seedling, and Waterloo. He characterised the latter as a most valuable variety for planting under north walls to provide a late crop.

Gooseberries for private gardens was the subject of a paper by Mr. D. Thomson. The fact, he said, of the Gooseberry season in the north being longer than that in the south indicated the advisability of choosing as cool a situation as possible for them in the south of England. He referred to methods of propagation, giving preference to cuttings, and detailing the methods of preparing and inserting them.

He recommended a deep cool soil for the plants, well trenched and manured previous to planting, but subsequently enriched only by forking manure in, digging being a mistake. He also particularised the pruning and training, recommending cultivators to fix hoops on stakes round the bushes, and to tie the outer shoots to them in order to secure symmetrical trees. His method of protecting the fruit from birds was to insert stakes about 12 feet apart and 5 feet high round the Gooseberry quarter, fixing rails across the top, and then throwing nets over them. To destroy lichens he used caustic lime, and for the caterpillar he advised dusting the bushes with hellebore powder while damp, and syringing it off when it had done its work. He also recommended removing a few inches of surface soil and substituting good loam, by which not only were a great many larvæ removed, but nourishment was afforded to the bushes. To lengthen the supply of fruit he recommended the culture of a few bushes of Warrington on a wall, and referred to the plan of covering some bushes after the fruit was ripe for the same purpose. The late frosts this year had, he said, severely crippled the bushes.

A practical paper on Raspberries was then read by Mr. G. Wythes. He referred chiefly to garden culture, but mentioned some points in market growing. They planted in heavily manured soil, and there was no doubt that manure was not used freely enough in private gardens. In the market gardens the rows were 6 feet apart, and the plants a foot asunder; but in private gardens he recommended the rows being 12 feet asunder and low crops being grown between them. The bushes must never be dug amongst, even in top-cropping. He recommended an open situation and deep cultivation. In order to secure a long succession some should be planted in an open situation, and others on a north aspect. He considered Superlative to be one of the best varieties, and admirable for light soil. Baumforth's Seedling, Carter's Prolific, Hornet, Yellow Antwerp, Improved Northumberland Fillbasket, Semper Fidelis (for preserving), Red Antwerp, Magnum Bonum, Yellow Antwerp, Belle de Fontenay, and October Red and Yellow, were also recommended amongst others; but he thought there was still room for improvement in the varieties.

The reading of the papers was followed by some interesting remarks by the Chairman on the improvement of varieties in small fruits. With respect to Gooseberries, he thought an effort should be made to get varieties of more upright habit, and also earlier and later varieties. As a proof of what earliness meant in increased value of crop, he instanced a Kentish grower who, by having fruit ready ten to fourteen days earlier than others, had made £120 per acre of green fruit. He recommended their culture as cordons, and to the importance of manuring. The Kentish growers, he said, manured three times a year. Referring to a point of Mr. Wythes in respect to white Raspberries, he thought it desirable to get them of larger size; and as regards Currants, that longer bunches and larger berries should be striven for. He thought it was important that an endeavour should be made to get Black Currants with earlier leafage, so that the fruit might be protected from late frosts; like, for instance, the Whitesmith Gooseberry. He thought there was room for improved flavour in late varieties of Strawberries. Varieties as late as Waterloo with the British Queen flavour would be invaluable. They should have strong leafage to protect them from drought. With respect to other small fruits, Cranberries and Bilberries, which did well on boggy ground, might be noted. American Blackberries, he thought, stood condemned by public opinion, but the Cut-leaved Bramble was excellent, and he should like to see the old wild Bramble more grown. Mr. Laxton said that as regards upright Gooseberries he had found them more affected by frost in the east and midland counties than the others, but Mr. Bunyard said that it was just the opposite in Kent, and he was supported by Mr. Pearson of Chilwell. The latter thought Gooseberries were much over-pruned. He had actually seen a bush being trimmed into shape with a pair of shears. Mr. Laxton spoke to the same effect, and after other discussion the proceedings closed with a vote of thanks to the writers of the papers, moved by Mr. Crowley and seconded by Mr. Pearson. It may be added that the papers will be published in full in the Journal of the Royal Horticultural Society.

#### FRUIT COMMITTEE.

A meeting of the Fruit Committee took place after the Conference to inspect some fresh arrivals in the way of fruit. Mr. Leach, Albury Park Gardens, Guildford, received a vote of thanks for two fine dishes of Grosse Mignonne Peach. A certificate of merit was awarded to E. Amies, Esq., Ashford Road, Maidstone, for Laxton's Latest of All Strawberry, a large conical fruit of fine appearance, but not quite ripe. Certificates of merit were awarded to the following Strawberries in the collection of Messrs. Paul & Sons, the Old Nurseries, Cheshunt, for varietal excellence: Vicomtesse Héricart de Thury, Sir Joseph Paxton, Pauline, Auguste Nicaise, President, and King of the Earlies. Similar awards were made to the following in Messrs. Bunyard's collection: Oxonian, Countess, Lucas, Latest of All, Auguste Nicaise, British Queen, Dr. Hogg, and Elton Pine. Silver medals were awarded to each collection in addition. Vicomtesse Héricart de Thury and Sir Joseph Paxton, in Mr. Watkins's collection, also received certificates of merit. Mr. Allan, Gunton Park Gardens, Norwich, exhibited six boxes of Strawberries, comprising one each of Sir Joseph Paxton, President, and The Countess, and three seedlings. They were splendid examples, and a certificate of merit was awarded to each. Seedling No. 2 was a very large, wedge-shaped fruit, deep red in colour, and with a rich and luscious appearance. No. 3 was a medium-sized bright red fruit, with a fine Hautbois flavour. No. 4 was a large conical fruit as deep in colour

as Waterloo. Mr. T. Laxton also had some fine fruit, and certificates of merit were awarded to Scarlet Queen, illustrated on page 22 last week; and White Knight, a large round very pale fruit, though with more colour than Bieton Pine. The Mayfarth patent fruit evaporator, which has been illustrated in the *Journal of Horticulture*, was tried before the Committee, and approved of by them.

EVENTS OF THE WEEK.—To-day (Thursday, July 16th) is a busy one for exhibitors. The National Rose Society's Provincial Show takes place at Hereford, and the Midland section of the National Pink Society hold their Exhibition in connection with the Floral Fête at Wolverhampton. There are also Shows at Trentham, Helensburgh, Highgate, and Bedford. Ulverston Rose Show is fixed for the 17th, and on the 18th there will be an Exhibition of Roses at Old Trafford, Manchester. The National Carnation and Picotee Society (southern section) hold their annual Show at the Drill Hall, James Street, Westminster, in connection with Committee meetings of the Royal Horticultural Society on the 21st, and Rose Shows are fixed for the same date at Christleton and Tibshelf.

— THE WEATHER.—For some days past agreeable summer weather has been enjoyed in the Metropolitan district, and been particularly welcome to Strawberry growers and haymakers.

— THE EMPEROR OF GERMANY AND BARON SCHRÖDER.—We are gratified to learn that among the honours bestowed upon distinguished Germans resident in England by the Emperor of Germany, in commemoration of his visit, Baron Schröder has received the decoration of the Red Eagle second class with Star. All horticulturists will be delighted at this announcement.

— UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The quarterly meeting of this Society was held on Monday evening last at the Caledonian Hotel, Mr. E. Berry in the chair. The principal business was the election of new members, no fewer than twelve being elected and one other nominated. The sick list has been rather heavy, but at the present date there are only two members on the fund. It may not be generally known to new members that a Convalescent Fund was established last year for the purpose of assisting members to enjoy a change of air after illness. Ten shillings per week would be allowed for three weeks. The subscriptions are not less than 1s. per year, payable in July. The fund is voluntary.

— PRESTON AND FULWOOD HORTICULTURAL SOCIETY.—The annual meeting of this Society was held on Saturday evening last, Mr. S. H. Stott in the chair. The report read by the Secretary showed that the spring Exhibition had been successful, and that the finances were in a sound state, the balance in favour of the Society exceeding £50.

— CEANOTHUS VEITCHI.—Mr. W. Drover, Fareham, sends us a photograph of this Ceanothus as it was growing on a south wall in the garden of W. Pocock, Esq., Wellington House, Fareham. It was planted three years ago, and has made growth 14 feet high, covering a space 13 feet wide. It is a remarkably fine specimen, covered with myriads of flowers, and Mr. Pocock has good reason to be satisfied with the progress his plant has made.

— THE WEATHER DURING THE PAST MONTH has been of a very genial character, with occasional showers, although the early part of the month was cold, and for some days the sun did not present itself; but since then the weather has been all one could desire. On the 25th we had a severe thunderstorm, when 0.51 of rainfall was registered in thirty-five minutes, the heaviest rain this season. Rain has fallen upon ten days during the past month, maximum in any twenty-four hours being 0.51 on the 25th; minimum in any twenty-four hours being 0.01 on the 24th. Total for the month 1.40, against 2.18 of 1890. In spite of the cold spring and late frosts Strawberries and bush fruits, Peaches and Plums, are plentiful, Pears a medium crop. Apples and Apricots suffer the most, but even Apples of the Codlin type there will be a fair crop.—E. WALLIS, *The Gardens, Hamels Park, Buntingford, Herts.*

— **ANTWERP EXHIBITION.**—An international horticultural exhibition devoted to Californian, Chinese, Japanese, Australian, Cape of Good Hope, and South African plants will be held at Antwerp in conjunction with the international exhibition, which is to take place from the 9th of August to the 23rd of September. Entries, for which there is no charge, are to be sent in by the 20th of July to the President of the Committee, Lierre-lez-Anvers, Belgium, and the cost of transit on the Belgian railways will be remitted to exhibitors. There are 165 classes in all. The President of the executive Committee is M. Charles de Bosschere, and the Secretary M. Charles Van Geert, jun.

— **WARE HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.**—A meeting was held by this Society on the 7th inst., Mr. W. H. Smith presiding, and there was a good attendance of members. A very interesting and instructive paper was read by Mr. D. Phillips, West Mill Rectory, on "Vegetable Structure and Botanical Chemistry Useful to Gardeners." Questions were put by several members, to which Mr. Phillips replied in an able manner. A collection of Dipladenias was shown by Mr. R. Smith; a fine Melon, Sutton's Triumph, by Mr. Dover, High Leigh, who also showed blooms of Souvenir de Malmaison Carnations. A vote of thanks was accorded Mr. Phillips for his paper, and a similar compliment to the Chairman brought the meeting to a close.

— **NEW SWEET PEAS.**—Mr. James Udale sends us flowers of three charming varieties of Sweet Peas raised by Mr. Eckford. They were as follows:—Apple Blossom, with bright rose standard, white wings and keel; Cardinal, dark red standard, crimson wings and whitish keel; and Orange Prince, orange standard, rosy crimson wings, and whitish keel. Bright, delicate, and fragrant, these flowers are most useful for cutting purposes, and we can understand that our correspondent has found them serviceable. They were sown and flowered in small pots under glass.

— **DELPHINIUM NUDICAULE** is well adapted for growing on the rockery and for flowering during June in pots, where brightly coloured flowers are appreciated. In pots 4 inches in diameter plants can be grown with several spikes of bloom of a dazzling red. Cold frame treatment at all times, with the pots plunged in ashes, is the best method of culture. A somewhat sandy soil is most suitable for free growth, and abundance of water when showing its flower spikes.

— **GENTIANA ACAULIS** is without a doubt a most striking plant when in flower on a rockery, and its intensely blue flowers compensate for all the trouble experienced in growing the plant successfully. In some gardens it flourishes little, while in others it will scarcely exist. Some persons say it succeeds best in the shade, but my experience is the reverse of that, for it is growing in the most sunny spot on the rockery here, and a clump 1 foot square has had forty-five expanded blooms. The soil is mainly loam, lime rubble and pieces of sandstone being mixed with it. After flowering, some Laurel branches are placed over the clump to afford shade during the hottest part of the day. While growth is being made abundance of water is provided, both when it is growing and also when the flower spikes are developing. Except at the time named shade is not provided, neither does it appear necessary.—E. M., *Swanmore Gardens*.

— **GRAPES AT SWANMORE.**—An "Old Grape Grower" who has lately visited Mr. Myers' well appointed and admirably managed gardens at Swanmore Park, writes:—"Swanmore has long been famed for its Chrysanthemums, and the Grapes grown in three fine vineries have always been above the average, but this year they are better than ever, on Vines that have been planted twelve years. Gros Guillaume and White Tokay are represented by enormous bunches, while Mrs. Pince, Madresfield Court, Muscat of Alexandria, Black Alicante, and Black Hamburgh are, both as respects uniformity of crop and size of bunch and berry, such as any man may be proud of growing. If they finish well, as they promise, Mr. Molyneux will be able to stage Grapes worthy of a place at the best exhibitions, though he did not express any desire to do so. Whether he shows the fruit or not it would be a little difficult to find three more creditable houses of Grapes than may be seen at Swanmore at the present time. The pipes for heating are arranged at 2 or 3 feet intervals from the front of the houses to the path along the back, and the plan undoubtedly answers well in these vineries. The Vines are the strongest and the Grapes the best along the front of the houses, contrary to what some persons might imagine under the circumstances. The Whitsuntide frost did much damage at Swanmore, and appears to have nearly killed about 10,000 Larches from 5 to over 6 feet high in a young plantation on the estate. The case will perhaps be referred to again as it is somewhat interesting."

— **THE REV. H. D'OMBRAIN** sends the following:—It has been arranged to have an excursion, to which ladies are invited, on Wednesday, July 29th, of which the following is the programme. Members and their friends will assemble at the London Bridge terminus (first-class waiting room) of the L.B. & S.C. Railway at 9.15 A.M., thence proceed in special carriage to Three Bridges, where brakes will meet them. A short visit will be paid to Messrs. Cheal & Sons' Nursery at Lowfield, then drive to North Park (Mrs. Montefiore's), from thence through Tilgate Forest to Handcross Park (Mr. Warren's), returning through St. Leonard's Forest to Crawley, dining at the George Hotel at 7.0, returning to London 9.22, reaching London Bridge at 10.33. The price of the ticket, railway fare, carriages, lunch and dinner (red wine) will be 18s. 6d. Those wishing to join the party should kindly let me know, to my private address, Westwell Vicarage, Ashford, Kent, by July 11th.

— **NORTHAMPTONSHIRE HORTICULTURAL SOCIETY.**—As announced in our advertising columns, the summer Show of this Society will open in Dalapre Park, and the substantial prizes offered for plants, groups, and fruit ought to induce good competition and a satisfactory exhibition.

— **GARDENING APPOINTMENTS.**—Mr. M. Sullivan, gardener to the late D. B. Chapman, Esq., Downshire House, Roehampton, has been appointed gardener to — Stern, Esq., Fann Court, Chertsey, Surrey. Mr. Walter Jinks, recently foreman at Downshire House, has been appointed gardener to W. M. Grant, Esq., Fairlawn, Cobham, Surrey. Mr. J. Bailey, for the past five years gardener to Sir John Dorington, Bart., M.P., Lypiatt Park, Stroud, resigns the charge of those gardens on August 8th, having taken over a florist business on his own account at Brighton.

— **LAXTON'S NOBLE STRAWBERRY.**—I was rather surprised to read the glowing account of Noble on page 6 by "W. S., *Frome*." I planted rather largely of Noble last year, a good breadth on a south border, and the plants have given a very heavy crop of noble fruit, but they were so woolly and insipid that my employer would not have them in for any purpose. I gave the men leave to have as many as they liked, but the fruits still lie rotting on the plants. They were much better last year, and I shall plant a few in hope of a more favourable season another year. Last year they realised 1s. per lb., when they first came in; but this year it is very difficult to sell them in the market.—ALMA.

— **ERICA CODONODES** has flowered profusely, and is certainly deserving of extended cultivation where hardy Heaths are appreciated and succeed. Not only does it remain a long time in flower, but it is one of the few plants which flower twice a year, in spring and autumn. We have it growing close to water, backed up by Rhododendrons, the deep green foliage of which improves the appearance of the Heath, making an agreeable contrast with the nearly white bloom and the green leaves. Some plants show distinct effects of the severity of the winter, although not more than 8 feet apart. One escaped wholly, although its roots are close to the water, and flowered well, while others on a dry mound have been much injured.

— **A GLOXINIA SHOW.**—During recent years Messrs. John Peed and Sons have held an annual competitive and non-competitive exhibition of Gloxinias at their Roupell Park Nurseries, Tulse Hill, S.W., and that for the present year was open to the public on Wednesday and Thursday, July 8th and 9th. The plants occupied three divisions of a lean-to house 150 feet long, and being arranged with abundance of fresh green Adiantums a beautiful effect was produced. The Gloxinias were mostly healthy floriferous young plants in small pots, but there were also some large specimens in grand condition. The strain is a well selected one, and the most distinctly marked varieties have been named for increase, the flowers large and well formed, the colours varied from the richest shades to pure white, and the habit excellent. Most remarkable of the novelties were "Loveliest Among the Lovely," brilliant rosy crimson edged with white, very compact in habit, and free flowering. Shirley Hibberd, a rich violet purple, very handsome. Princess Louise von Anhalt, white, densely dotted with purple. John Peed, bright crimson, with a broad white margin, most effective and distinct. The majority of the flowers require no supports, but for a few varieties with larger flowers on larger stalks a neat wire is employed, which has the point turned into a horizontal ring, upon which is slipped a small indiarubber tube to surround the flower stalk and protect it from injury. The prizes offered by the firm brought good competition and capital plants.

— LEMOINE'S HARDY HYBRID GLADIOLI.—Mr. W. E. Gumbleton of Belgrove, Queenstown, asks to be allowed "to enter a most emphatic protest against the accuracy of the statement of 'D., Deal,' page 491, to this effect, that 'in beauty these hybrids cannot touch the hybrids of the gandavensis section.'" I have been a grower of the latter—at least several hundred varieties—for twenty years, and have also grown the supposed "hardy" hybrids raised by Lemoine. Their great merit is supposed to be that they are "hardy," but my experience is that they are not, and that when the young growths come through the ground in May or later they are just as liable to be cut back as any of Souchet's, Kelway's, Burrell's or Campbell's. These latter will remain in this climate quite safe in the ground any ordinary winter, say 4 inches deep in friable soil. But what is gained by that? I find it more convenient and more desirable to lift my limited stock out of the ground every season, and remake the beds or lines, while the corms fully mature and ripen indoors. Now as to the "beauty," I am thoroughly in accord with "D., Deal," and as to size (an item in the consideration), the hybrids of Lemoine, even the newer varieties, not generally known except to a favoured few, are, I venture to say, nowhere. If this is contested there is an easy test accessible to Mr. W. E. Gumbleton or any other grower. Let a box of say twenty varieties, or more if possible, be shown at one of the exhibitions of the Royal Horticultural Society against a corresponding number of the hybrids of gandavensis, and the public and members can then judge between "D., Deal," and your correspondent. I believe that "D., Deal," will himself freely dispose of any opponent with his own hybrids of gandavensis. There is plenty of room for growers who prefer those curiously incurved and oddly tinted flowers to those immense blooms of gandavensis with thirty on a spike that you could run your hand into, as richly marked as a Cattleya.—W. J. MURPHY, *Clonmel*.

— EARLHAM HALL GARDENS, NORWICH.—A visit to the old gardens attached to the residence of the Rev. W. N. Ridley is always well repaid, abounding as they do in old and fine timber. Particularly noticeable amongst the Orchids, in the culture of which the courteous head gardener, Mr. Bartlett, excels, were *Sobralia xantholeuca*, an immense plant with three dozen stems bearing fine blooms; *Thunia Marshalliana*, a handsome specimen; *Miltonia vexillaria*, a truly magnificent example, outvying anything I have seen in this respect, in a 7 inch pot, bearing thirteen huge spikes, and had been grown from a single bulb. A few varieties of *Odontoglossum Alexandræ* were conspicuous, and deservedly held in high esteem. The *Freesias* (both *refracta alba* and *Leichtlini*) too, are grown with great success, attributed to never thoroughly drying them off. Recourse to manufactured Mushroom spawn is never required here, as from an old manure bank formerly made to raise the heat in an old vinery plenty are gathered from time to time. Plants of *Vicomtesse Hericart de Thury* Strawberries are worthy of inspection in frames; they were lifted and planted in March last on an old bed after *Asparagus*. This variety, Sir Jos. Paxton, President, and Lord Napier, are successfully grown. In the Peach houses Hale's Early, Stirling Castle, Diamond, Royal George, *Violette Hâtive*, Barrington, Early Alfred, and Late Admirable were exceedingly well set. Fine Cauliflowers were being cut three weeks ago from seed sown the 24th of January. A fine trained tree of *Oullins Golden Gage Plum* promised a heavy crop, indeed it is worthy of note that this variety always bears when others fail. A wonderful head of bloom was to be seen on an eighteen-year-old Quince, which bears freely every year, but whose trunk was nothing but a shell. Indeed the whole of this charming place, both outside and in, is brimful of interest.—ALBERT F. UPSTONE.

### MR. ROBERT FENN AT HOME.

"COME when you can and stay as long as you like; you will find a welcome and a change of food—cabbage and bacon one day, bacon and cabbage the next; with potatoes and buttermilk always, also wine, jellies, and jams, all and everything home raised, grown, and made. So if that style suits you come to Sulhamstead, and don't go back very soon." Such is the substance of an invitation received a long time ago and often since repeated from the youthful veteran Robert Fenn, Potato maker, wine brewer, and knight of the pen. On the second day of July, 1891, I went, and so far as can be remembered was only about thirteen years behind time.

The address, "Sulhamstead, near Reading," naturally suggested the capital of Berks, famous for its clean wide streets, seeds, and biscuits, as the base of operations, and Messrs. Sutton & Sons

as the inquiry office for the best way of reaching the cottage farm of which I was in quest. They gave good guidance, and also an invitation to their trial grounds, at which a pleasant hour was spent, and a few vegetables and flowers noted, as mentioned in another column. Mr. Fenn's home was, I found, nearly an hour's drive from Reading, though there is a railway station—Theale—within a mile or two of his village. The country traversed is beautifully wooded, the Elms being particularly fine, showing that the soil is good, but much of the land is not well farmed. We passed the Cob-nut gardens at Calcot about which so much was heard some years ago, then turned from the main road down to and along a narrow tree-lined leafy lane skirting the estate of Major Thoyt's. It is a "truly rural" lane, which Mr. Fenn is pleased to call his coach road, and we eventually reached the Cottage Farm, the cosy and commodious Rose, Clematis, Honeysuckle, Fig, and Vine-clad home of the veteran who has made his mark in the domain of gardening, and will leave the world (may it be long first) the richer for his work and his teachings through the Press. His first communication appeared in the *Cottage Gardener* in 1851, his last in March, 1891, covering a period of forty years. But he has not finished, for did he not write in the month just mentioned, and on page 214 of the last volume of the *Journal of Horticulture*, "The cultivation of Potatoes must go on, and if you will permit me to do so I will still strive in these pages to assist to shape our course, and make it better, surer, and easier to live?"

He has told us in his sprightly narrative "As of a Dream," that was so widely appreciated, what he had done—of his disappointments and rewards, his predatory difficulties and home happiness—that the "reality" is looked for; and a description of how he, with "Eliza Temple's" aid, made the wines, jams, and jellies, and how they worked together to make life so good, easy, and happy could scarcely fail to meet with an unanimity of acceptance. Though the veteran has told us it is fifty-five years since he planted his first orchard, he is as active, physically and mentally, as if in his teens, and there is yet much to come, if he wills it, from his well-stored mind. Mr. Fenn has now and then half suggested that he has lived so long as to be forgotten. That is not so by those who are familiar with his career. He has himself outlived many of his once old friends, and a new generation has succeeded who knew him not in the earlier years of his experiments and their records through the press. He is not to be forgotten, but his features, as they are now, ripened with time and brightened by "a mind at ease" after a well-spent life, are transmitted to posterity through a medium with which he has been so long and so pleasantly connected.

What has he done? He pointed the way to the revolution and evolution of the Potato, and the world is more indebted to him than to any man living for the great improvements that have been effected in the "noble tuber." He was not the immediate raiser of several of the most serviceable varieties, but he was the Columbus who led the way and others followed to further discoveries. It was not, for instance, by the work of his hands that *Magnum Bonum* was produced, yet if it had not been for him the famous variety would probably never have appeared. His neighbour, the late Mr. Clarke, was busy in crossing the American sorts, but he was advised by Mr. Fenn to let them alone and work for quality with vigour by crossing Fox's Seedling with Patterson's Victoria, and so came *Magnum Bonum*. Mr. Fenn's aim has been for still higher quality, and in the varieties he has raised, some in commerce, and others to follow, he has accomplished his object, for they are remarkable for culinary excellence.

But what about his home? On arrival, rosy faced "Alice," her mother's cheerful helper, bounced in to fetch out the "Eliza Temple," as was, the Royal prize girl of thirty-three years ago, and we received a hearty greeting. Mrs. Fenn is a model gardener's and farmer's wife, and has, without doubt, been a real practical helper of her experimenting husband over many long years. Those who knew them in the great Potato raising period tell how she urged him on. It was dig, dig, dig, root after root, row after row, and nothing good turned up. "We must give it up, my girl, it's weary work." "No," was the encouraging response, "we must never give up; keep digging away, Bob, we shall come at 'em yet." "Come at 'em" they did, just as many another reward has been found by "digging away." Bravo, Mrs. Fenn! The late Prince Consort's words, on handing you the medal for long and good service in a first place, were prophetic—"As the first prize girl educated at the Queen's School you ought to be distinguished," and so it came to pass, but distinguished in a way that no prince could have anticipated—namely, in helping "Bob" to become famous as a raiser of seedling Potatoes.

"But where is the young man?" was our inquiry on arrival. "Oh, dancing about in the hay field." There sure enough he was, whirling his fork and hat, and no doubt talking to us two fields off;

at least as he came skipping over fence and ditch the wind wafted faint sounds that increased as the white man approached, and gave us a jovial welcome. It was a hot day, and he was in sensible summer dress—white as his beard from head to foot—and he soon had us in the garden. Splendidly cropped it was with fruit

cottage wall, wandering in wild festoons along the top of the roof for growing Grapes for dessert and wine; but for the latter purpose the outside crops of this and the Esperione Vine ripen sufficiently.

"Well, now," remarked the host, "you have kept your word

FIG. 8.—MR. ROBERT FENN.

and vegetables, as productive an acre or so as one could wish to see; Gooseberries, Currants, and Strawberries laden, the fruit of the latter kept clean with a couple of rough haybands laid along the rows, a capital plan quickly put into operation, and the bands as quickly removed. There, too, is the old lean-to greenhouse, with the trough along the front in which he sowed his Potato seed, and the Muscadine Vine, brought in from the

and arrived at last, and I have kept mine. Come in for the Cabbage, bacon, Potatoes and wine, all grown, cured, brewed and cooked on the premises." A bountiful provision truly, and a treat to a tired townsman. The new wine is drawn from the cask, poured in tumblers and used as a light cool beverage, and we had a bottle of the delicious '52 vintage for dessert, or thirty-nine years old. The Potatoes were Ringleader, new tubers in one dish, old or last

year's crop in the other. "Now tell me which sample is the best, old or new?" was the invitation. No one at the table could decide the point, and "both good alike, first rate," was the general verdict. "One of the earliest Potatoes, one of the latest, and one of the best," was the response of the raiser. "The Reading people are sending it out, and who the 'Reading people' are all the world knows." The Cabbage was also a home-raised variety, no other having stood the winter, medium in size, early and delicious; the bacon was from an animal quite different in colour from its master, who is only a white settler, the pig a black native. Thus ends the dinner.

We have next to see the orchards, memorial trees, and farm. Mr. Fenn bought the property, I think fifteen or sixteen acres, about as many years ago. It is beautifully situated, with grand views all around and gentlemen's seats in the distance. His new orchard is just coming into useful bearing, the older having been renovated, and the whole well fed with sewage conducted by gravitation from the farmstead on higher ground. The liquid is conducted in trenches dug in the grass to where the support is required, and there is no mistaking the tracks of the fertiliser. It is here that Mr. Fenn found what he calls his Pay-the-Rent Apple, because he calculates that the produce of the tree has paid what would be a fair rent for the orchard for several years. It is a splendid tree laden with fruit, and young trees of the variety are growing and bearing better than any others in his new cultivated orchard. He tells how he sent samples to the R.H.S. Fruit Committee, but the savants discovered some spots in them, and that was enough. However, he says, if there had been no spots the fruit would no doubt have been "passed" as lacking in size and colour; but all the same it is first favourite at Sulhamstead, because it is good for cooking, eating, and paying the rent. Golden Spire, Lane's Prince Albert, Wellington, and Bramley's Seedling find favour in the collection.

Along the bank of the ditch that divides two fields a row of trees of the Wellington (Dumelow's Seedling) ought to be in their prime, but they are cankering seriously—at least, all those which are exposed, and were pitted with a driving storm of hail are, the trees at the other end of the row and sheltered being healthy, an object lesson for Mr. Hiam, who still appears to believe that insects are the originators of canker in trees. Mr. Fenn is inserting grafts in the injured trees, the best thing he can do; but he should add more of hardy strong-growing sorts, like his favourite. The Wellington is a short-lived tree, especially in exposed positions. Mr. Gladstone, Cox's Orange Pippin, and Wheeler's Russet are his approved dessert sorts. The little Early Doyenné d'Été Pear is much liked; but the birds ate the buds, so he shifted the tree near the kitchen door, where they feed the cats, and it now bears fruit for the family, not of cats, but Fenn's.

Most of the farm is under grass, the crops of hay and herbage being splendid, and the cows look as happy as their owners. The fertility of the land is sustained and increased mainly with dressings of burnt refuse and clay. A good body of fire is made, then clay dug, carted, scorched, crushed, sifted, and used. This has more than doubled the produce, as could be seen by part of the field to which the dressing had not been applied. Pots, pans, and all sorts of hard refuse are buried in the trench from which the clay is dug, and the head digger supposes that when they are found in some far remote future learned archaeologists will rejoice over the discovery of an ancient Roman station. Victorian coins are kept out of the trench.

Mr. and Mrs. Fenn show what can be done with a small farm, including a good garden and orchard. If all the land in the kingdom were as well managed as this picturesque and productive homestead the wealth of the nation would at a low estimate be trebled. The memorial trees referred to are the gifts of friends and called by their names, and are thus an interesting feature of the cottage farm. Mr. Fenn is also a sort of village factotum—guardian, road surveyor, churchwarden, tax gatherer, and I know not what besides, nor does it matter; it is sufficient to see him happy in his embowered home, trusted and respected by the community. The visit was too short but very enjoyable, and on arriving at Reading Cabbages and flowers, eggs and bacon were espied snugly packed among rugs and baggage in the box of the trap. Oh, you Fennians!—AN OLD PUPIL.

## FLOWERS FOR CUTTING.

### DAHLIAS.

THESE are quite a host in themselves, the several sections into which they are divided providing a great range of variation in form and colouring. The best for cut work are doubtless to be found with in the Cactus section. Juarezi is probably still the

best, taking colour and form into consideration. It is occasionally condemned on account of its tendency to flower late when propagated from cuttings. This tendency is so very much overcome by the simple method of planting the old tubers each with one or two started growths that it is surprising this method is not more generally employed than it appears to be.

Reverting to sorts which should be grown Mr. Tait for a long time held the first place as a good white; but Henry Patrick is so great an improvement that the above and other white kinds can be very well dispensed with. Henry Patrick is of neat spreading habit, not so free flowering as to necessitate the thinning of the buds (white, very pure). William Pearce is a deep yellow shade, the shape of flower very good. These are a capital trio. Of other shades, Asia, Panthea, General Gordon, and Miss Jekyll are very good. Mrs. Hawkins may also be grown, but the place of this sort has now been filled with better. The Show and Fancy varieties are useful where large vases require constant refilling. Miss Browning is one of the best, Mrs. Gladstone a beautiful flower. Spitfire, Julia Wyatt, and Charles Leicester are a few of the best kinds for cutting purposes. Pompons are in much request, but these I do not favour so much. White Aster is an old and good sort. Of single varieties a few sorts only are grown, the great bulk being cultivated from seed. Chilwell Beauty is so distinct and attractive, and withal so well adapted for vase furnishing, that of this at least a supply should be annually grown. Paragon is also good.

The value of Dahlias as decorative flowers has been greatly enhanced during the past dozen years. The Cactus forms are the most valuable, and are alike useful for furnishing medium vases, specimen glasses, dinner-table decorations, church and altar decorations, and the white varieties for wreaths. Single forms are most useful for furnishing medium-sized vases or mixing with other flowers. The Show sorts, as already pointed out, are capital for large vases. Long stalks should invariably be cut with these, along with a fair proportion of foliage and buds in various stages of development. They associate very well with good Gladiolus, Hyacinthus candicans, the taller Michaelmas Daisies, and hardy Chrysanthemums. Iris Pseud-acorus and the common Rush are valuable as good foliage adjuncts.—B.

## THE ECONOMIC PLANTS OF AUSTRALIA.

(Continued from page 370, last Vol.)

WE now turn to the timbers, by far the most important of Australian economic plants in number, variety, and actual value.

Our timbers are principally hardwoods, which chiefly, though by no means exclusively, belong to the Natural Order Myrtaceæ. Most of these belong to the genus *Eucalyptus*, and are generally known as "Gum Trees," with sub-divisions based on the texture or colour of the bark, wood, and so on, such as Ironbarks, Stringybarks, Box, White Gum, Red Gum, &c. The Ironbarks, of which there are some half dozen, yield timber proverbial for durability and strength, and do not present important differences; the Stringybarks, which are equally numerous, have very fissile timbers, chiefly utilised for palings. Having noticed these two groups we will speak of a few other timbers a trifle more in detail. The West Australian Jarrah (*Eucalyptus marginata*) is a timber of great strength and power of resistance to insect pests and marine borers. It is one of the best known of all timbers of this class, and a most valuable all-round wood. From the same colony we have two other valuable timbers—viz., the Karri (*E. diversicolor*) and the Tuart (*E. gomphocephala*), both obtainable of very large size, durable, strong, and suitable for engineering and architectural works where great strength is required. *E. botryoides*, *E. robusta*, and *E. resinifera* are called Mahoganies of one sort or another, owing to their fancied resemblance to the West Indian wood. They are dark coloured, strong, very durable timbers. The Spotted Gum (*E. maculata*) is a pale coloured timber, not so durable for outside work, but useful for wheelwrights' work and many other purposes. *E. microcorys* is a strong, durable, useful wood, known as Tallow-wood, on account of its greasy nature; *E. tereticornis* and *E. rostrata*, Red Gum, are closely allied timbers of unlocked grain, most durable, very strong, and also excellent fuel woods. *E. saligna*, the Sydney Blue Gum, is a very free working timber, much valued on this account, and also because of its durability. The Mountain Ash, or rather one of them (*E. Sieberiana*), yields a fissile and particularly tough wood, which is used for wheelwrights' work, and generally as a substitute for American Ash. Another Mountain Ash, the Gippsland and Southern New South Wales one (*E. amygdalina*), is very fissile and also an excellent stave wood. These notes on our *Eucalyptus* timbers, brief as they are, must include the names of the excellent timbers—Box (*E. hemiphloia*), Blue Gum (*E. globulus*), and Bloodwood (*E. corymbosa*), resistant to white ant, while there are a large number of other *Eucalypts* of great merit.

Besides the *Eucalypts*, a number of Myrtaceous trees yield hard wood timbers of more or less excellence. Perhaps the first place may be given to the Turpentine Tree (*Syncarpia laurifolia*), a fine timber tree, yielding a very durable timber for posts, rails, sleepers, &c., and one of the best for withstanding marine borers.

The colonies can boast but few timbers belonging to the pine or deal class. The colonial Pine (*Araucaria Cunninghamii*) is a useful ordinary soft wood timber, but is now getting scarce, and we are more than ever dependent on America and Europe for a supply of soft woods. The Huon Pine of Tasmania (*Dacrydium Franklini*), is also getting scarce, and strict conservation has been necessary to prevent the tree being exterminated in accessible localities. Some of this timber is beautifully figured and commands a high price. It would appear that the coniferous trees of Australia are more remarkable for their yield of ornamental timber than similar trees of northern latitudes. The Cypress Pines (*Frenela*) belong also to the *Coniferae*, and while they have been alluded to under ornamental timbers, they are chiefly used for ordinary purposes in the districts in which they are found. Thus they are used for lining boards, and have the important recommendation of withstanding the white ant perhaps better than any other Australian timber.

Of ornamental timbers we have no lack, amongst which may be mentioned the Tulip Wood (*Harpullia pendula*), with its gorgeous shades of yellow and black; the various Cypress Pines (*Frenela* or *Callitris*), not so gorgeous, but still highly ornamental. The Cedar tribe, including the Red Cedar (*Cedrela australis*), and Rosewood (*Dysoxylon Fraserianum*), often highly ornamental, the former particularly so; the Bean Tree (*Castanospermum australe*), a rich brown wood, reminding one of Walnut, and very easy to work; and one of the Silky Oaks (*Stenocarpus salignus*), yielding a remarkably handsome dark-coloured wood, with blotchy markings. Speaking of ornamental timbers, it is often a fact that the most highly ornamental wood is left in the ground, forming the rootstock or gnarled stump. The Musk Tree (*Aster argophyllus*), found in several of the colonies, yields a neat but not remarkable timber, but the rootstock is most beautiful, and well worthy of being cut into veniers. There is no doubt that it would be desirable for the rootstocks of other of our native trees to be critically examined, as good ornamental timbers always command a high price.

The Blackwood (*Acacia melanoxylon*) is one of the most valuable of Australian timbers, and it is put to an infinity of uses. It is strong and tough, and at the same time ornamental.

Then comes the Cedar (*Cedrela australis*), perhaps the most valuable of all our timbers. Every Australian knows the Cedar, but for residents out of this continent it may be well to mention that the wood strongly resembles mahogany, to which, in fact, it is closely related. It is very facile to work, is very durable, and frequently shows a handsome figure. Like most of our good timbers, it has been so much appreciated that it is now getting scarce, and it is a serious fact to ponder over that, at the present rate of destruction, there will not be, at the close of this century, a single Cedar tree of workable size in New South Wales, unless a rigid system of conservation is put in force without delay. In regard to some of our best timbers—Cedar, Pine, Ironbark, &c.—we have been acting the spendthrift like our fathers before us, but Australia is making such rapid strides in population, and consequently in timber consumption, that we shall soon have to cry halt.

Our chief so-called Beech is *Gmelina Leichhardtii*. It yields a plain tough timber, whose chief recommendation in these lands where great variations in temperature are frequent is its unalterability. In Victoria and Tasmania we have a true Beech (*Fagus Cunninghamii*), which attains enormous size and furnishes a very useful timber, which also is frequently ornamental. Then we have the Coachwood (*Ceratopetalum apetalum*), a most useful tough timber used by coachbuilders when thoroughly seasoned; a number of *Flindersias* and *Elaeocarpus* yielding ash-like timber, hard and tough. We must not omit the Myall (*Acacia pendula*), which yields a hard ornamental wood, whose odour reminds one of Violets, but the great majority of *Acacias* are not taken into consideration by the timber merchant, either because they are so small or because the timber is affected by borers, and has, at the same time, nothing particular to recommend it.

For timbers with miscellaneous uses we may point to the Stave-woods, amongst which may be mentioned the Mountain Ash and Blackwood, already alluded to, the Red Ash (*Alphitonia excelsa*), the Stavewood (*Tarrietia*), a Silky Oak (*Stenocarpus*), and the Silky Oak *par excellence* (*Grevillea robusta*), a tree which promises to come into increased prominence, owing to the apparent suitability of its timber for wine casks. The Casuarinas, or Oaks, yield fissile timber, often dark coloured and frequently highly ornamental. These are also some of our best fuel woods.

A large number of our Australian timbers have been tested with the view to their utilisation for wood engraving, but not with much success hitherto. Some of the Cheesewoods (*Pittosporum*) promise well, as also do a native Pomegranate (*Capparis*); the Native Cherry (*Exocarpus cupressiformis*) is useful also for wood screws. We also possess a number of timbers excellent for carving.—J. H. MAIDEN, F.L.S., F.C.S., &c., Curator of the Technological Museum, Sydney; author of "The Useful Native Plants of Australia," (in the *Year Book of Australia*.)

## THE BRITISH FRUIT GROWERS' ASSOCIATION.

### FRUIT PROSPECTS.

At a meeting of the above Association, held in the Horticultural Club, Hotel Windsor, on Thursday, July 9th, at 6 P.M., the ordinary routine business was transacted, and further arrangements were made for the various Conferences. It was announced that at Cardiff, on August 12th, Mr. A. Pettigrew would read a paper on "Hardy Fruit

Culture in South Wales," also that several other valuable papers had been promised. Two Vice-Presidents were added to the already long list of influential gentlemen—namely, Cyril Flower, Esq., M.P., Aston Clinton, and H. L. Stephens, Esq., Finchley, both of whom are especially interested in horticulture. It was also stated that at the Beddington Park Conference, on August 3rd, Sir James Whitehead, Bart., would preside and deliver an opening address, to be followed by short papers on different aspects of fruit culture.

Reports on the condition and prospects of fruit culture had been received from numbers of members, of which the following were selected and read:—

*Bucks.*—Very sorry I cannot send you a favourable report of our large fruit orchards. The trees were in full bloom on the 17th of May, when we had 7° of frost, and again on the 19th we had 7°. These frosts killed all the young shoots on our Walnut trees, and cut off half the bloom on the Plum trees. Still I think on many trees we shall have half a crop. Apples being much later, they will be a good all-round crop. Pears and Plums on walls are a good crop, Peaches and Nectarines a good regular crop, Apricots the same, Cherries half a crop. Small fruits of all kinds are plentiful and good. Strawberries are a very heavy crop.—J. SMITH, *Mentmore*.

*Herts.*—I send a few details of hardy fruit prospects in this district. Apricots heavy crops on all trees. Apples not so plentiful as the early promise. Fruit thinned by frost and cold winds, but here most trees have a fair crop. Pears are generally well cropped. Plums heavy crops, trees breaking down by the weight of fruit, including Damsons. The same may be said of Gooseberries and Currants. Cherries are plentiful. Strawberries good crops, but not such fine fruit as in past years. Plants were much injured by caterpillars, and the fruit is not so good in flavour. Too much wet. Peaches and Nectarines partial; some trees are well cropped, others thin. Raspberries show well. Filberts thin crops.

The above remarks respecting the fruit crops in these gardens will apply also to the surrounding neighbourhood. All vegetable crops are looking splendid owing to the showery weather. We have been quite free from the caterpillar on Apple trees, which wrought such destruction in the three past years.—JAMES C. MUNDELL, *Moor Park Gardens*.

*Fruit Crops at Sawbridgeworth.*—Black Currants very scarce; Red, plentiful. Gooseberries plentiful. Cherries are not grown for market in this district. Plums.—Early Rivers, an enormous crop; Czar (Rivers), an enormous crop; Sultan (Rivers), a fair crop; Archduke (Rivers), a very large crop; Monarch (Rivers), plentiful, but not excessive; Prince Englebert, very abundant; Victoria, a very poor crop; Belle de Louvain, a very poor crop; Late Black Orleans, a very poor crop; Oullins Golden Gage, enormous, trees already breaking down; Cluster Damsons, moderate. Pears.—Beacon (Rivers) and Fertility (Rivers), abundant crops. Apples.—Duchess of Oldenburg, plentiful; Stirling Castle, plentiful. The Apple crop has partially failed.—T. F. RIVERS, *Sawbridgeworth*.

*Somerset.*—Apples are disappointing. The trees flowered grandly, but were much damaged by frosts, and there are many failures, the rest of the trees being fairly well cropped. This applies to both orchard and garden trees. Crop apparently below the average. Pears against walls were never more promising, failures being few and far between. The trees in the open flowered later, and were caught by the frosts, and the crops are very partial. Much the same remarks apply to Plums, the wall trees being heavily laden, and the rest lightly cropped. Cherries, with the exception of Morellos, are a poor crop generally. Apricots and Peaches good, especially where well protected. Gooseberries and Black Currants were much injured by the Whitsuntide frosts, and the crops are very light. Red Currants are fairly good, and Raspberries very promising. Strawberries were injured by frosts, checked by dry weather, and now are suffering from too much moisture. So far as I can ascertain the foregoing is a similar experience to what holds good hereabouts (Chard district, Dorset, and Somerset).—W. IGGULDEN.

*Hants.*—The fruit prospects in this neighbourhood are, on the whole, very promising. Strawberries are abundant, but late, owing to the severe frost of May 17th killing early blooms. Gooseberries, Currants, and Raspberries plentiful. Apples on the whole are an average crop, variable, in some places heavy, others light. Pears are a full crop on walls; Plums on walls full crop, in the open generally thin, a few exceptions have heavy crops. Damsons are very thin; Cherries a full crop. The trees on the whole are fairly clean. On some aphids has been troublesome, but there is no appearance of caterpillar.—E. MOLYNEUX, *Swanmore Park Gardens*.

*Notts.*—With us Peaches do not come under the heading of "hardy fruits." Apricots on walls are about half a crop. I saw some on my own house, the blooms of which were (on the Saturday preceding Whitsuntide) filled with snow, and during the night following were subjected to 9° of frost, and yet there is a fair sprinkling of fruit. Apples, the most important factor, are disappointing after the wealth of blooms which covered every tree and made them look like sheets of colour. I attribute the failure chiefly to the fact that it rained almost continuously during seven days of the blooming season. The flowers remained on for a long time and then dropped off. Most people think the frost caused the mischief, but having examined very many blooms after the frost and finding a large proportion uninjured I think the frost must be released from the charge. Duchess of Oldenburg is as usual to the front, and has come through both frost and wet. Some of the late Apples will carry a full crop, but Keswicks and many of those which bloom at midseason will have but little to carry. Pears

are almost all full, except early kinds on the Quince, which were frozen. Of Plums, the hardier kinds, Victoria, Czar, &c., are full; but tender kinds, such as the Gages, were washed away and frozen. The frost made great havoc with many. Damsons are nearly all gone. Gooseberries and Red Currants a fair crop. Black Currants scarce owing to frost. All the early blooms of Strawberries were frozen. A grand growing season, trees healthy and free from blight or any insect pest.—A. H. PEARSON, *Chilwell*.

*Sussex*.—The fruit crop in this district is a favourable one, due in a great measure to the fine autumn for ripening the wood, also to the absence of spring frosts and to the diminution of the caterpillar. Compared to the two previous years we were remarkably free from it, although in some orchards the destruction has been great, owing to neglect at the proper time in spraying the trees. Apples.—An abundance of bloom, and everything looked promising for an extraordinary crop. Early sorts set well; main crop in full bloom, when a series of eight or nine wet days severely thinned the blossom. Although we have a good general crop in the nursery there will only be a partial crop of the main sorts in the district. To sum it up, a good crop of early sorts, main crop partial, late sorts good. Pears.—A very fine crop indeed, one that we have not had in this district for several years, the blossom having set well before the rain commenced. Plums.—A very heavy crop. The best we have had for two or three seasons. Cherries.—A fair crop. Peaches and Nectarines.—A very heavy crop of fine fruit, have had to be severely thinned. Gooseberries.—A very good crop. Currants.—A good crop. Strawberries.—Good. Raspberries.—Good. We have been favoured here with warm heavy showers of almost tropical rain. Trees are making rapid growth, and all kinds of fruit are swelling fast. Should the season continue warm there will probably be a heavy crop of unusually fine fruit.—J. CHEAL, *Crawley*.

*Essex*.—Apples good. Duchess of Oldenburg, Worcester Pearmain, Stirling Castle, and Cox's Orange have the best crops. Apricots good. Cherries scarce, except on walls. Currants: Red scarce; Black moderate. Figs moderate. Gooseberries good (abundance). Peaches good. Pears good on walls and cordons. Plums moderate. Raspberries and Strawberries abundant.—W. GOARING, *Weald Hall, Brentwood*.

Apples, Pears, and Peaches, an average crop; Apricots and Plums, above average; Cherries and Strawberries, average; Black, Red, and White Currants, and Gooseberries, under average; Raspberries, average. Gooseberries and Currants were injured by the frost and snow on the 16th May.—H. LISTER, *Easton Lodge, Dunmow*.

*Kent*.—As regards the crops for this year my present estimate is as below:—Apples.—Early kinds good crop, later ones patchy. Cox's Orange and Wellington suffered from the Whit-Sunday frost. Blenheims short, other later kinds a good crop. Nearly all kinds grand on Paradise. Pears.—Orchard trees well set. On Quince, &c., fine crop of nearly all kinds, but Doyenné de Comice and Beurré Hardy suffered from the low temperature. Cherries.—Very partial, better in Mid than East Kent; Morcellos very full. Plums.—Rivers' Prolific short, Czar grand, and a fine crop of all other kinds except Green Gage. Damsons.—Fine crop of all sorts. Nectarines, Peaches, and Apricots.—Moderate. Black Currants.—Partial, good on heavy soils, and where the old Dutch Black is grown. Red Currants.—Three-quarter crop. Gooseberries.—Thin, growing out well. Warrington and Rifles suffered from frost. The Whitesmith race are best this year. Strawberries.—Marvellous crop. King flowers cut by frost, making us ten days later than usual. Raspberries.—Canes much frosted, three-fifths of a crop.—G. BUNYARD, *Maidstone*.

Prospects of fruit in this neighbourhood. Apples fair crop. Plums a heavy crop. Damsons partial. Cob Nuts good. Pears not grown.—ALBERT BATH, *Sevenoaks*.

*Warwickshire*.—Apples a light crop on most varieties, those having the best on both young and old trees, Manx Codlin, Keswick Codlin, Nelson Codlin, Lord Derby, Lord Suffield, Stirling Castle, Flanders Pippin, and Blenheim Pippin. Pears a fair crop. Plums on walls fair, on standards light, with the exception of the Pershore, which in general have a full crop. Damsons partial; while some trees are light, others have a full crop. Apricots, Cherries, and Peaches light crop. Small fruits: Strawberries lost all the first blooms by frost, and that with the lateness of the season made it the end of June before we picked the first dish, which is usually done about the middle of the month. We have a fair crop, King of the Earlies, Noble, Wonderful, and Vicomtesse H. de Thury doing best. Gooseberries, Red Currants, and Raspberries are an average crop. Black Currants very light crop, owing to the frost in May.—A. CHRISTIE, *Ragley Gardens*.

## OUTDOOR MUSHROOM CULTURE.

IN the *Journal of Horticulture* of July 2nd a record on outdoor Mushrooms was given, and a bed illustrated. As a further proof of the successful adoption of Mr. Wright's plan I send you a few notes. Kenilworth is fast becoming a market-growing district for Strawberries, Tomatoes, and Mushrooms especially, and the culture of the latter on outdoor beds is successfully conducted by Mr. Joseph Murdock, the Manager of the Crewe Gardens near Kenilworth. There are several beds now in full bearing, and have been so for a long time. Instead of the ordinary 3 feet wide beds at the base, as made by some growers, Mr. Murdock starts with a 4 feet wide, rising to from 2 feet 9 inches to 3 feet high in the centre, and about a foot wide at the top. The manure used is obtained chiefly from the railway stables, with a little long

manure worked in with it, prepared in September, and subsequently made up. These broader beds hold the heat much longer than the 3 feet wide beds.

From 5 to 6 weeks after being spawned, and only the ordinary garden soil used for surfacing, the young Mushrooms began showing, but the very severe weather of December destroyed them, although the beds had a foot depth of straw litter over them. The spring-like weather of February brought out another crop, which would have reached maturity had March been mild, but the severe frost again destroyed the young crop, and for a long time the beds were frozen to some depth, but this caused no injury whatever to the spawn. I saw the beds in full bearing at the end of May, and a very large crop was then being daily gathered from them. They are still (middle of July) yielding well, and will continue for some time.

Mr. Murdock exhibited at the Kenilworth Flower Show on July 9th a fine lot of Mushrooms from these outdoor beds, and one has only to see them at Crewe Gardens to be convinced that properly made with suitable manure, and good spawn used, the cultivation of Mushrooms outdoors is easy.—D.

## NEPHROLEPIS.

THE Nephrolepis, or "Sword Ferns" as they are sometimes called, comprise a very handsome group, and also a very useful one, their long graceful fronds mingling very happily with those of different habit. The members of this family are of easy growth, and also easy to multiply, as some of the species may be readily procured from spores, while all may be readily increased by planting out on a bench in a Fern house in order to allow the rapidly growing rhizomes or creeping stems to develop. In fact, some species may be planted outdoors in a shaded place during the summer with good results, both *N. exaltata* and *N. pectinata* doing well under such treatment, and the plants so grown make admirable specimens for decorative work during the following winter. These plants make long, wiry rhizomes which travel either on or just beneath the surface of the soil, and on these at short intervals are produced the young plants.

Regarding temperature during the winter, it may be stated that any of the Nephrolepis may be grown in a house that ranges from 55° to 60°, while *N. exaltata* and *N. cordifolia* (or *N. tuberosa*) will thrive in a much lower temperature. In cultivation there is one very essential point to be remembered, and that is never to allow any of the Nephrolepis to get very dry, as the pinnae are articulated, or jointed to the midrib, and the consequence is that if allowed to become very dry they will drop much of their pinnae.

Among the finest should be included *N. davallioides furcans*, a very strong grower and an elegant exhibition plant, or may be used with good effect in a decoration by placing the specimen on a pedestal so that its fountain-like growth of long, graceful fronds may be displayed to advantage. The fronds of *N. davallioides furcans* are light green and glossy and from 3 to 5 feet in length, the tip of each pinna being divided into from two to five segments or forks, this giving the fronds a crested appearance. In order that this Fern should be in condition for decorating it should be grown in a moderately light house and well ventilated, as by this means the fronds will be hard and of good substance.

Another excellent species, and one of the hardiest, is *N. exaltata*, also a strong grower, and produces long arching pinnate fronds of dark green and attaining a length of 3 to 4 feet. This is well known and makes a first rate window Fern, or may be used as a vase plant during the summer, providing it is not placed in the full sun, and in addition to these advantages the fronds stand well when cut; so taking all things into consideration this is one of the most useful species in the genus.

*N. pectinata* is of much dwarfer habit than the preceding, and consequently makes a more useful small plant for table ferneries and other work of similar character. It has slender fronds from 1 to 2 feet long and closely clothed with dark green pinnae, and as it is evergreen (as are most of this genus) and grows freely during the winter, it has already proved its value as a florist's Fern.

*N. cordifolia*, better known as *N. tuberosa* from its habit of forming small tubers on its rhizomes, is still another good species, being easy to grow and nearly as hardy as *N. exaltata*, and to which it bears some resemblance. It spreads rapidly, and in common with most of the Nephrolepis makes a good basket plant. It bears long stout fronds of light green, and is a useful one for cutting from for large work.

*N. Duffii* is quite a dwarf grower and also very pretty when well grown. It is of tufted habit, the fronds being comparatively upright and dark green in colour, more or less clothed with brown tomentum, and the tips of the fronds several times forked or divided. This species makes a very pretty plant in either 3 or 4-inch pots, and presents a very distinct appearance.

One of the latest additions to this genus is found under the somewhat unwieldy cognomen of *N. rufescens tripinnatifida*, and was introduced about four or five years ago. It is unquestionably one of the handsomest of the genus, but unfortunately is nearly deciduous in the winter; this fact of course detracting from its value for florists' use, though in a well grown specimen it is remarkably attractive during the summer and fall.

*N. rufescens tripinnatifida* bears large plume-like fronds that are comparatively erect in habit, dark green in colour, and the entire plant is more or less covered with reddish brown tomentum, the pinnae being

much cut or divided, so that they have the appearance of being crested.

There are several others catalogued in addition to the species and varieties briefly referred to above, but these comprise the cream of the genus and give variety enough for all ordinary purposes.—W. H. TAPLIN (in *The American Florist*).

## ROSE SHOWS.

GLOUCESTER.—JULY 7TH.

THE promoters of this new and vigorous Society have hitherto been so fortunate in the very material point of fine weather that it was a rude shock to them to find the morning opening in that drizzling sort of rain which is so depressing to all with attractions which are so dependent on a fine day for success. It was fortunate for them that the Show was held under cover in the Corn Exchange, and in the afternoon the weather cleared off in time to allow visitors to see the treat that was provided for them. The liberal schedule and the excellent arrangements that had been made for the exhibitors under the able and courteous Secretary brought together a large number of exhibitors. Very many flowers of excellent quality were exhibited. Thus in the class for seventy-tvos there were five competitors, although at the Show of the National at the Crystal Palace there were only three; and although, as generally has hitherto been the case in this season of violent thunderstorms, there were few flowers of special excellence there were many which were of real merit, and especially was this the case in the amateur classes, those of Mr. S. P. Budd and Mr. Pemberton being specially noticeable.

In the class for twelve distinct the first prize was awarded to Mr. B. R. Cant of Colchester for a fine stand of the following varieties:—Alfred Dumesnil, Queen of Queens, Ulrich Brunner, Madame Caillot, Duke of Teck, Marie Van Houtte, Magna Charta, Madame de Watteville, Abel Carrière, Niphetos, Ferdinand de Lesseps, Countess of Oxford, Annie Laxton, Madame Bravy, St. George, Jean Soupert, Caroline Kuster, Duke of Wellington, Grace Darling, Sultan of Zanzibar, Madame Cusin, Caroline Kuster, Boule d'Or, Countess of Rosebery, Etoile de Lyon, Alfred Colomb, Baroness Rothschild, Souvenir de S. A. Prince, La France, Cleopatra, Marie Verdier, Marguerite de St. Amand, Camille Bernardin, Marie Cointet, Marie Baumann, Rubens, Marquise de Castellane, Comtesse de Panisse, Souvenir d'Elise Vardon, Mrs. John Laing, Violette Bouyer, Innocente Pirola, Madame Clemence Joigneux, Catherine Mermet, Général Jacqueminot, Madame G. Luizet, Angèle Jacquier, Merveille de Lyon, Le Havre, Souvenir de Paul Neyron, Lord Macaulay, and The Bride. Messrs. Paul & Son were second with a good stand, in which was conspicuous a fine bloom of their new Bourbon Mrs. Paul. Mr. Frank Cant was third; the English Fruit and Rose Company (Cranston) fourth; and Mr. George Prince fifth.

In the class for twenty-four trebles Mr. B. R. Cant was again first with a good stand of Abel Carrière, Souvenir d'Elise, Prince Arthur, Magna Charta, Baroness Rothschild, Annie Laxton, Maréchal Niel, Duke of Wellington, Ulrich Brunner, Innocente Pirola, Madame de Watteville, Camille Bernardin, A. K. Williams, Marie Van Houtte, La France, Madame Cusin, Général Jacqueminot, Souvenir d'un Ami, Madame G. Luizet, Victor Hugo, Duke of Edinburgh, Duchess of Vallombrosa, Merveille de Lyon, Dupuy Jamain, and Alfred Colomb. Mr. F. Cant was second, and Mr. Geo. Prince third.

In the class for twenty-four single trusses, Messrs. G. & W. Burch of Peterborough were first with Her Majesty, Exposition de Brie, Mons. Noman, Marie Baumann, Antoine Ducher, Violette Bouyer, Etienne Levet, Madame G. Luizet, Duke of Edinburgh, Lady M. Fitzwilliam, La Rosière, Niphetos, Reynolds Hole, Catherine Mermet, Comtesse de Nadaillac, and Madame V. Verdier. Miss Tressider of Cardiff was second. In the class for twelve trebles Messrs. Jefferies & Sons of Cirencester were first with Madame V. Verdier, Mrs. John Laing, Captain Christy, La France, Exposition de Brie, Duke of Edinburgh, Viscountess Folkestone, Duke of Teck, Rubens, Etienne Levet, and Charles Lamb. Messrs. Burch were second, and Messrs. Mattock of Oxford third.

In the class for eighteen Teas and Noisettes (trebles) Mr. George Prince of Oxford was first with lovely blooms of Comtesse de Nadaillac, Rubens, Souvenir d'un Ami, Alba Rosea, Maréchal Niel, Anna Ollivier, Marie Van Houtte, Catherine Mermet, Souvenir de S. A. Prince, Francisca Krüger, Hon. Edith Gifford, Jean Ducher, Princess of Wales, Cornelia Koch, and Souvenir de S. A. Prince. Mr. F. Cant was second. In the class for twelve Teas and Noisettes (single trusses), Mr. John Mattock was first with Comtesse de Nadaillac, The Bride, Catherine Mermet, Princess of Wales, Souvenir d'Elise, Souvenir d'un Ami, Francisca Krüger, Cornelia Koch, Adam, and Madame Hippolyte Jamain. Messrs. Burch were second, and Mr. Rumsey third.

In the amateurs' class for thirty-six blooms there was a sharp contest between those two redoubtable champions, Mr. S. P. Budd and the Rev. J. H. Pemberton, the former gaining the victory with an excellent box, containing Her Majesty, Exposition de Brie, Marie Baumann, Duchess of Vallombrosa, Magna Charta, Ulrich Brunner, Antoine Ducher, Violette Bouyer, Madame G. Luizet, Pride of Waltham, Madame Bravy, Duke of Edinburgh, A. K. Williams, Lady Mary Fitzwilliam, Madame Willermoz, La Rosière, Niphetos, Comtesse de Nadaillac, Reynolds Hole, Innocente Pirola, Marie Verdier, Souvenir d'Elise Vardon, Madame

Cusin, Louis Van Houtte, Merveille de Lyon, Alfred Colomb, &c. The Rev. J. H. Pemberton was second with fine blooms, among them being a grand bloom of Ulrich Brunner, for which the silver medal of the National Rose Society for the best H.P. in the amateur classes was awarded. In the trebles, twelve varieties, the same order was observed. Mr. Budd's flowers were Madame Verdier, Merveille de Lyon, Captain Christy, La France, The Bride, Mrs. John Laing, Exposition de Brie, Duke of Edinburgh, Viscountess Folkestone, Duke of Teck, Etienne Levet, Rubens, Madame Gabriel Luizet, Charles Lamb. Mr. Pemberton was second. In the class for twelve blooms of any light Rose Mr. B. R. Cant won the first prize with a beautiful lot of Madame de Watteville; The Cranston Company were second with La France; and Mr. Budd third with Mrs. John Laing. In the prize for twelve of any dark Rose Mr. Prince was first with Camille de Rohan; Mr. B. R. Cant second with Ulrich Brunner; and Mr. Frank Cant third with the same variety. In the class for twelve of any yellow Rose Mr. Prince was first with Marie Van Houtte; Mr. B. R. Cant second with the same variety.

Silver medals were awarded as follows:—1, The best H.P. by any amateur, Marshal P. Wilder, Rev. J. H. Pemberton; 2, The best Tea by any amateur, The Bride, Dr. Budd; 3, The best Rose by a Gloucestershire amateur, The Bride, Mr. T. A. Washbourn; 4, The best Rose by an amateur within the boundary of the City of Gloucester, La France, Mrs. Pike; 5, The best Tea by a Gloucester amateur, The Bride (the same Rose as No. 3), Mr. T. A. Washbourn; 6, The best Rose in the Cottagers' Division, La France, Mr. F. Bircher. The first four medals were given by the Gloucestershire Rose Society; 5, by Mr. W. J. Grant; 6, by Mr. J. Thorpe.

I have only enumerated here the principal classes, but I cannot close these notes without expressing the great satisfaction experienced by seeing the progress made by local amateurs in the exhibition of their flowers. When the Show was first contemplated a gentleman long resident in the city said it was no use trying to grow Roses in Gloucestershire, and when he saw the first exhibition he might have pointed to local stands as proof of his statement, but he would have thought very differently of this Show; there was an absence of bad blooms and the presence of some really excellent ones, which was most creditable to the growers, and only showed how much good is done by such exhibitions. It may be added that one bloom exhibited in this class obtained two silver medals, and Mr. Conway Jones' blooms were all very creditable, and this fact alone would be sufficient to encourage the promoters of the Show to go on and prosper, for to give people greater enjoyment in their gardens, to encourage the standard of excellence, and to bring into the pleasant arena those who have feared they could not grow Roses good enough are surely aims worth seeking after, and these aims were very successfully prosecuted by the Gloucestershire Rose Society.—D., Deal.

DISS.—JULY 7TH.

THIS is a most excellent and plucky little Show, where all the arrangements are of the first order and the exhibits are generally of a high class. All that is wanted is a sufficient number of people to come and see it, and the neighbourhood, being not thickly populated, this desirable foundation of prosperity is often sadly shaken by a shower or two. A fine afternoon will bring people into a flower show if they are close at hand, but if they have some miles to drive, a thundershower in the middle of the day (and Diss has often been unfortunate in this respect) will keep them at home, although the weather should completely clear up afterwards. An additional attraction was provided this year in the shape of a £10 challenge cup for twenty-four Roses (amateurs), which was given by a few friends in memory of the late Rev. H. T. Frere, who lived near Diss. The candidates for this trophy, consisting of the usual habits of amateur Rose growing in East Anglia, duly arrived therefore by the first train, but it was noticeable that they became somewhat thoughtful and subdued when the legend, "E. B. L., Hitchin," was discovered on some of the boxes in the van. The Show was held on the lawn, by permission of Francis Taylor, Esq., M.P., and when setting up commenced, the presence of representatives of not only the amateur champion, but also the present and late professional trophy holders, gave promise of a good show of such Roses as were to be had for the good folk of the little town of Diss and neighbourhood. The professionals, however, had evidently not yet begun to cut from their maiden or strongest shoots, and the best blooms, both H.P. and Tea, were still to be found in the amateur classes.

In the open class for thirty-six five stands were shown, and Mr. Frank Cant of Colchester was placed first with a fairly even collection, in which, however, no blooms could be called quite first class, unless it was a solid one of Lady Mary Fitzwilliam. Rev. A. Foster-Melliar of Sproughton was second with well coloured and tolerably clean examples, but nothing of more than average merit. D. Prior & Sons of Colchester were third with smaller blooms. Mr. B. R. Cant and Rev. H. A. Berners of Harkstead also exhibited in this class. Three stands were shown for two prizes in the eighteen Teas (open) class, and Mr. Berners was placed first, having fair specimens of Innocente Pirola and Cleopatra. Mr. B. R. Cant was second with a lot of medium quality; and Mr. Foster-Melliar was unplaced with a poor looking stand.

For the new challenge cup in the class for twenty-four (amateurs) there were four exhibits. Mr. Foster-Melliar was placed first with a good box of H.P.'s, large, solid, and highly coloured. Among his best blooms were Madame G. Luizet (which gained the medal as the best H.P.),

E. Y. Teas (very fine), Lord Macaulay, and Le Havre. There was an absence of pointed shapes and of light coloured varieties, but the whole were smooth and good. Mr. Berners was second with blooms of less substance, Victor Hugo, John Bright, and Le Havre being among his best. Mr. Lindsell of Hitchin was third, his best bloom perhaps being Grand Mogul. Five boxes were shown in the class for twelve Roses, and Mr. T. H. Powell of Drinkstone was easily first, showing good examples of *Maréchal Niel* and *The Bride*, and also a fine specimen of the new Rose *Gustave Piganeau*, which, if it proves thoroughly distinct, as I think it will, is likely to take a high place as a Rose of the *Ulrich Brunner* order. Mr. Page Roberts of Scole was second; and Mr. Bunn third.

In twelve Teas (amateurs) Mr. Berners again showed his superiority in this department by taking the first prize; he had here a large flower of *Comtesse de Nadaillac*, somewhat blunt in point, a solid *Souvenir de S. A. Prince*, and a fine, but badly coloured, *Madame Hoste*. Mr. Page Roberts was second, having a fine *Niphetos*, a good *Souvenir d'Elise*, and a quite small, but exquisitely perfect, specimen of *The Bride*, which took the medal as the best Tea Rose. Mr. Foster-Melliar was third, having as his best a good example of *Princess of Wales*. There were creditable exhibits in the local classes, Rev. A. T. Farquharson, Messrs. A. G. Bobby, and W. Burrows in the twelve, and C. S. Alger, A. G. Bobby, and W. Bunn in the six, winning in the order named. Mrs. H. T. Frere gave a silver N.R.S. medal for the best Rose in these two classes, which was won by a bloom of *La France* in Mr. A. G. Bobby's six. Mr. Page Roberts and Mr. Foster-Melliar staged extra boxes of *Madame G. Luizet*, large, and in good condition.

Hardy perennials always form a strong feature at Diss. Mr. Page Roberts was placed first in the principal class for thirty-six, a bunch of *Scabiosa caucasica* being the most noteworthy variety. Colonel Rous was second. Rev. C. W. James of Upper Rickingham, and Mrs. Norris of Blo Norton were also successful exhibitors in this department.

Collections of rare wild flowers have often been a strong and most interesting part of the Diss Show, but the two stands exhibited did not seem to be of so varied or attractive a character as usual. Nevertheless, there was a class in the cottagers' division with three small prizes for wild flowers, and here there were, unless I made a mistake, no less than fifty-two exhibits, showing that somebody must have interested the children very strongly and happily in the matter. Though the prospect was not cheerful when I left, I heartily trust that the attendance and receipts were of a nature to strengthen this capital Society and cheer the heart of its mainspring, Mr. Page Roberts, the Hon. Secretary and clever manager.—W. R. RAILLEM.

#### HITCHIN.—JULY 8TH.

THE Hitchin Rose Society has taken a new departure, for those who were interested in it found that the Rose itself had not sufficient attractions to draw the general public, and that it was only those who were practically interested in them, who grew them and knew something of them, who would visit the Exhibition, whereas by opening it to other things it was thought that the same sort of a bait would be widened, and "draw" a large attendance. There are many persons who are sure to admire Carrots and Potatoes, Cucumbers and Melons, who would merely give a glance at a Rose stand; and the result justified the view taken, for although there was a most terrific thunderstorm in the afternoon, yet there was a very good attendance of visitors.

The Show was held in tents on the grounds attached to the Grammar School, a new institution, and were admirably suited to the purpose, being in the centre of the town, and affording, had the day been fine, ample space for promenading and listening to the excellent band. The principal tent was a large and lofty one; the Roses were ranged round the sides, while plants, stove and greenhouse, foliage, Ferns, and others filled up the centre, being placed on the grass.

As our champion amateur (for he has won the challenge trophy for the last two years) Mr. E. B. Lindsell resides here, it was natural to expect some good Roses would be exhibited, and as the town occupies a very central position for the counties of Herts, Bedford, and Cambridge, it ought to attract exhibitors from the three counties, and in a more favourable season it might do so; but I had no conception until I had been round Mr. Lindsell's garden that Roses could be so backward as they are, for while mine are over for the season, there they are hardly in—indeed in most instances the trees are a mass of green foliage, the buds not even showing colour, and in many instances only just formed; the soil, though suited for the Rose, is cold, and in seasons like the present retards the blooming. This, however, is a digression, and I must now notice the Roses.

In the nurserymen's class the first prize was taken by Messrs. G. & W. Burch of Peterborough with a good stand, containing *Her Majesty*, *Ulrich Brunner*, Mrs. John Laing, *Abel Carrière*, *Madame G. Luizet*, *Exposition de Brie*, *Alfred Colomb*, *La France*, *Madame Willermoz*, *Horace Vernet*, *Mons. Noman*, A. K. Williams, *Fisher Holmes*, *Violette Bouyer*, *Auguste Rigotard*, *Innocente Pirola*, *Alfred Dumesnil*, *Madame de Watteville*, *Prince Arthur*, *Merveille de Lyon*, *Camille Bernardin*, *Niphetos*, *Heinrich Schultheis*, *Grand Mogul*, *Lady Mary Fitzwilliam*, *Madame Eugène Verdier*, *Grand Mogul*, E. Y. Teas, *Catherine Mermet*, *Madame Bravy*, *Camille Bernardin*, *Comtesse de Nadaillac*, *Marquise de Castellane*, *Viscountess Folkestone*, *Queen of Queens*, *Pierre Notting*, *Baroness Rothschild*, *Etienne Levet*, *Magna Charta*, *Reynolds Hole*,

*Earl of Dufferin*, and *Crown Prince*. Messrs. J. Burrell & Co., *Howe House Nurseries*, Cambridge, were second, and Messrs. Paul & Son third.

In the class for twenty-four, amateurs, the first prize was won by Mr. E. B. Lindsell with a box of his well finished blooms, although they were not up to the mark of former years. The flowers were *Charles Lefebvre*, *Baroness Rothschild*, *Louis Van Houtte*, Mrs. John Laing, *Horace Vernet*, *Susanne Rodocanachi*, *Ulrich Brunner*, *Viscountess Folkestone*, Dr. Andry, *Merveille de Lyon*, *Alfred Colomb*, *Duke of Wellington*, *Abel Carrière*, *Camille de Rohan*, *Hippolyte Jamain*, *Marie Verdier*, *Madame Hausmann*, *Victor Hugo*, *Sénateur Vaisse*, *Le Havre*, *Catherine Mermet*, *Madame G. Luizet*, *Général Jacqueminot*, and *Dupuy Jamain*. Mr. Edward Mawley was second, and Mr. J. Gurney Fowler third.

In the class for twelve Teas Mr. E. B. Lindsell was again first with *Madame Cusin*, *Catherine Mermet*, *Boule d'Or*—this bloom was in the trophy stand on Saturday, and has since been exhibited at Diss. *Souvenir d'un Ami*, *Innocente Pirola*, *Etoile de Lyon*, *Comtesse de Nadaillac*, *Souvenir de S. A. Prince*, *Madame de Watteville*, *Souvenir d'Elise*, *The Bride*, and *Anna Ollivier*. The Rev. W. H. Jackson of Stagsden Rectory, Bedford, was second. In the class for twelve Roses, distinct, Mr. Lucas was first with *Violette Bouyer*, Dr. Sewell, *Madame G. Luizet*, *Rosieriste Jacobs*, *Ollivier Delhomme*, *Catherine Mermet*, *Duchess of Bedford*, *Dupuy Jamain*, *Charles Lefebvre*, *Duke of Edinburgh*, *Marie Finger*, and *Louis Van Houtte*. Miss Bailey Denton was second, Mr. George Moules third, and Mr. James Parker fourth.

In the class for nine, distinct, Mr. Lucas was first with *Marquise de Castellane*, *Charles Lefebvre*, *Victor Verdier*, *Alfred Colomb*, *Madame G. Luizet*, Dr. Andry, *Madame Eugène Verdier*, *Louis Van Houtte*, and *La France*. Mr. Lines was second. For six Roses, distinct, Mr. L. Moules was first with *Souvenir d'un Ami*, *Horace Vernet*, *Marquise de Castellane*, *Duke of Edinburgh*, Mrs. J. Laing, and *Duke of Teck*. Mr. P. T. Karns was second, Colonel Tyler third, and Mr. W. Ransom fourth. In the class for six Teas Mr. George Wiles was first with *Jean Ducher*, *Caroline Kuster*, *Catherine Mermet*, *Comtesse de Nadaillac*, *Innocente Pirola*, and *Souvenir d'Elise*. For six of any one kind H.P., the Rev. W. H. Jackson was first with *Madame G. Luizet*; Mr. E. B. Lindsell and Mr. J. Gurney Fowler equal second with Mrs. J. Laing and *Ulrich Brunner*. For six Teas of any sort Mr. Jackson was the only competitor with *Marie Van Houtte*. The silver medals were awarded for the best H.P. to Mr. E. B. Lindsell for *Madame G. Luizet*, and Mr. E. Mawley for *The Bride*. Two boxes of new Roses were exhibited by Messrs. W. Paul and Son and Messrs. Paul & Son. In the former were two promising Roses, a light pink something of the *Baroness Rothschild* type of flower, and a richly coloured Tea. In the box of Messrs. Paul & Son were blooms of their beautiful new Bourbon Mrs. Paul, and also of a red coloured H.P. *Charles Gater*, bearing the name of their able Rose foreman, who is so well known everywhere.

Amongst the miscellaneous exhibits I was glad to notice a goodly number of stands of cut blooms of herbaceous plants. Most worthy of note amongst these were the two large collections of Messrs. Burrell and Son of Cambridge and Mr. Tuke of Hitchin. The former were shown in large bunches, and amongst them was *Heuchera sanguinea*, about which so much has been said as to the best way of growing it, many having found it difficult to get any number of flowers, while others say it flowers abundantly with them. There were also *Stenactis speciosa*, *Delphinium Belladonna*, *Iceland Poppies*, *Monarda didyma*, and many other good border flowers. Mr. Tuke's collection also was rich and varied, and came from a most delightful garden in the town of Hitchin, of which I may have to say something at some future time, and in which it was a pleasure to saunter on the beautiful July morning on which I visited it.—D., Deal.

#### WOODBIDGE.—JULY 9TH.

WOODBIDGE Flower Show has long been celebrated in three particulars—first for the hearty and unanimous way in which the whole of the little town takes holiday, decks itself with flags and bunting, and treats the Show as one of the greatest and most firmly established institutions in the neighbourhood; secondly, for the excellence of the general exhibits of fruit, flowers, and bouquets, in which it has probably no rival in East Anglia; and last, but not least, for its extraordinary good fortune in always having a fine day. I am almost afraid that lawn tennis parties and cricket matches will soon begin to choose Woodbridge Show day as the only day on which absence from rain can be safely counted on. Last year it had the only fine day in a wet week, and this year, in the middle of a heavy thunderstorm on the afternoon before, the glass began to rise as if it felt the influence of the approaching day, and on the day itself (the fortieth anniversary), though they had three hours' continuous rain in the forenoon not twelve miles off, two or three passing showers in the morning gave place at Woodbridge to a brilliant afternoon. The Society is under new management, and is improving in every way yearly; it is considerably stronger financially, and the officials are courteous and obliging.

As a Rose Show the schedule has been slightly altered and enlarged, but there is here considerable room for improvement. A class for forty-eight, and then no larger class for single trusses than eighteen, omits that which is the best of all classes—twenty-four; and a number of classes for six gives the tent a spotted appearance, and is not calculated to draw the best Roses from a distance. Moreover, "J. B." would have reasonable ground of complaint here, in that there is nothing to prevent

a strong amateur showing in the forty-eight and in the six class. The latter should be at least partially protected, and then there would be no need of so many small boxes.

There was a good attendance of professional Rose growers, but amateur competitors were not numerous, and the same two or three rang the changes throughout. Five stands of forty-eight were shown, and a close competition ensued for the first place between the two leading growers of Colechester. Mr. Frank Cant was placed first, showing good specimens of Victor Hugo, Charles Lefebvre, Madame G. Luizet, Mrs. John Laing, The Bride, and that most decorative H.T. Viscountess Folkestone. The battle for the medal for the best Rose in the open classes was fought between the two first-named Roses, and eventually went by a very little to the Victor Hugo. Mr. B. R. Cant was second, showing Madame de Watteville very fine as usual, and Madame Cusin, Gustave Piganeau, and Alphonse Soupert good. Rev. A. Foster-Melliar was third, his best blooms being Xavier Olibo (which seems to be unusually good this year), and Le Havre a little off colour.

In twelve Teas (open) Mr. Foster-Melliar was placed first, Mr. Blant second, and Mr. Hart third. Truly, as I remarked last year, Tea Rose showing in showery weather is a funny business, for nine out of the twelve blooms in the first prize box had been shown and unplaced at Diss two days before. There was nothing noteworthy in the class, Madame Cusin and Catherine Mermet being pretty well shown in each box.

For six Teas (open) Mr. Orpen of West Bergholt was first, Rev. H. A. Berners of Harkstead second, and Mr. Woods of Woodbridge third. The latter had some fine blooms, but one or two of them were a trifle overdressed. In twelve trebles of H.P.'s (open) Mr. F. Cant was first, having good triplets of Mrs. John Laing and Victor Hugo; Mr. Berners second, with fair examples of Ulrich Brunner and A. K. Williams; Mr. Foster-Melliar third, showing Le Havre and Marie Baumann well, but some roughness in his other blooms. Two stands were disqualified for including triplets of Teas. As twelve trebles of H.P.'s is a somewhat unusual class it would be well if it be repeated that special prominence should be given in the schedule to the fact that only H.P.'s are to be shown.

In the class for eighteen (amateurs) two fine stands were shown by Mr. Foster-Melliar and Mr. Berners. The former was placed first, having capital examples of Duke of Wellington, Xavier Olibo, and Le Havre. Mr. Berners, in the second prize stand, had an unusually good specimen of Prince Camille de Rohan (not in full colour), and a good Le Havre. Mr. J. G. Fowler of Woodford was third, having a perfect bloom of Duehcsse de Morny, which took the medal as the best Rose in the amateur classes, though it was decidedly undersized. In twelve Mr. Berners was first with average blooms; Mr. Fowler second, having a fair specimen of A. K. Williams; and Mr. Foster-Melliar third, having Le Havre, Xavier Olibo, and Ulrich Brunner, pretty good; but the rest below par. In a large class of sixes Mr. Foster-Melliar was first, having Le Havre, Duke of Wellington, and Dupuy Jamain, good. Mr. Berners was second, with Mrs. John Laing and Le Havre as his best. Mr. Fowler was third, some way behind.

In the local class for sixes Mr. Foster-Melliar was first, and Mr. E. R. Barlow second. In six Teas (amateurs) Mr. Berners was first, having The Bride and Madame de Watteville, good; Mr. Orpen second, showing a pretty Niphetos, and Mr. Foster-Melliar third. A bronze medal offered for the two best H.P.'s shown by themselves, was taken by Miss Penrice; this is an almost obsolete form of showing, and should be done away with. No one will spoil his box by taking the best Rose out for the sake of a bronze medal. D. Prior & Sons of Colechester showed extra boxes of Mrs. John Laing and Baroness Rothschild in good condition.

In the use of miniature Roses for decoration Mrs. Orpen of West Bergholt came well to the front, and won all round by sheer good taste. In the best basket of cut Roses with any foliage she used W. A. Richardson and L'Idéale with winning effect, but wisely discarded these varieties as too heavy in a "spray for ladies' dress," and so won again against these sorts with a lighter exhibit of a white Polyantha. In the buttonhole bouquet of Roses she won with charming triplets of tiny but high coloured specimens of W. A. Richardson, Ma Capueine, and Moss Blanche Moreau. In another buttonhole class she was only beaten by a choice Orchid. This was a good record, as the competition in each class was strong.

Orchids (principally Cattleyas) were effectively shown by Hormann and Co. of Colechester. Gloxinias made a fine show, especially the stand of Mr. F. Buckingham of Ipswich. There was a famous display of fruit and other general exhibits, well worthy of Woodbridge tradition. May the whole institution continue to flourish, never lose its fine weather reputation, and endeavour to improve its Rose classes on the lines suggested.—W. R. RAILLEM.

#### REIGATE.—JULY 11TH.

THIS Rose show was held on the date named, having been postponed from June 27th. It may be doubted whether a change of date at the last is justifiable. If people have pruned for an early show it is hardly fair to call on them to exhibit at a late one. If people have arranged to be at home at one date and away at another, it is hardly fair to call on them suddenly to reverse this. At the same time you cannot have "Hamlet" without the Prince of Denmark, or a Rose show without Roses, and this seems to have been, to some extent, the position at Reigate. Their entries for the 27th were very small,

and the Committee are certainly to be congratulated on their final success.

In such a season when obstinate buds like bullets alternate with masses of washed-out pulp in many gardens it is something to have brought together so grand a collection. It was stated at the luncheon at which the President of the Association yearly entertains most hospitably the Judges, Committee, and other friends, that the acting officials were more than satisfied of the wisdom of the postponement, having obtained twice the number of entries ever known before, all of which, but for the late storms, would have been fully represented. The competition was good, and in some classes very keen. The following were the prizetakers:—

Division A, open to all England.—Forty-eight varieties, three competitors.—First, Mr. F. Cant. Second, Mr. B. Cant. Third, Messrs. Paul & Son. Niphetos, The Bride, the Duke of Connaught, Dr. Andry, and Madame de Watteville were very fine in the first box.

Twenty-four varieties, three competitors.—First, Mr. T. B. Haywood. Second, Messrs. G. & W. Bureh. Third, Mrs. A. J. Waterlow.

Eighteen Teas, three competitors.—First, Mr. F. Cant. Second, Mr. Prince. Third, Messrs. G. & W. Bureh. Madame Cusin and Comtesse de Nadaillac were magnificently shown in these classes.

Twelve of one variety, four competitors.—This was a grand class, and difficult to judge, Teas competing with Hybrid Perpetuals. Mrs. A. J. Waterlow was a good first with a box of Mrs. J. Laing magnificent in size and perfect in colour. Mr. Prince was second with most lovely Comtesse de Nadaillac. Third, Messrs. G. & W. Bureh with Ulrich Brunner large and bright.

Division B, Members of the Society.—Eighteen varieties, twelve competitors.—First, Mr. Slaughter, whose box contained fine specimens of Marie Rady, Général Jacqueminot, and Dr. Andry. Second, Rev. J. H. Pemberton. Third, Rev. H. A. Berners. This was a very fine class. Six triplets, twelve competitors.—First, Mr. Slaughter. Second, Rev. H. A. Berners. Third, Rev. A. Foster-Melliar.

Twelve Teas, six competitors.—First, Rev. F. R. Burnside. Second, Rev. H. Berners. Third, Mr. Bethune. Etoile de Lyon, The Bride, Jules Finger, and Comtesse de Panisse were fine in the first box, also Comtesse de Nadaillac and Anna Ollivier in the second.

Twelve of one variety, four competitors.—First, Rev. A. Foster-Melliar showing Madame Gabriel Luizet. Second, Mr. Lindsell with Mrs. J. Laing. Third, Mr. Slaughter with Marie Baumann.

Division C, Members.—Twelve varieties, nine competitors.—First, Mr. W. Wilkins. Second, Mr. Mawley. Third, Mr. Grahame. Four triplets.—First, Mr. Wilkins. Second, Mr. F. C. Pawle. Third, Mr. Cuthell. Nine Teas.—First, Mr. Bethune. Second, Mr. Mawley. Third, Mr. Grahame. The Bride shown in Mr. Bethune's box was perhaps the finest in the Show. Nine of one variety, five competitors.—First, Mr. W. J. Dart, with Merveille de Lyon. Second, Mr. Wilkins, with Madame Gabriel Luizet. Third, Mr. Cuthell, with the same variety.

Division D, Members.—Six varieties, five competitors.—First, Mr. J. de la Mare. Second, Mr. J. Watney. Third, Mrs. Hatch. Six Teas, two competitors.—First, Mr. W. D. Freshfield. Second, Mrs. Hatch. Three H.P.'s and three Teas.—First, Mr. Newton. Second, Mr. J. Watney.

Table Decoration for Six Persons.—First, Miss Lorent, with a very graceful arrangement of Poppies and Grasses. Second, Miss Watney, with one similar and little inferior. Devise, Roses with foliage.—First, Miss Horne. Special prizes, twenty-four varieties, eup value £5, open to members residing within five miles of Reigate whose collection does not exceed 2000 plants.—Mr. West was the winner (three competitors). Mr. Prince's prizes £3, £2, £1 for twelve Teas, open to members residing within five miles of Reigate.—First, Mrs. A. J. Waterlow. Second Mr. N. Haywood. Third, Miss Baker. Mr. W. Paul exhibited new Roses. Messrs. Cheal, Roses and a general collection of flowers. Mr. Wollaston had a very pretty box of the Himalayan Briar introduced by the late Mr. Wilson Saunders.

#### HARDY FRUIT GARDEN.

GRAFTED TREES.—These have started into growth well in most instances, and must now have the clay removed and all young growths on the stock also, excepting those left for budding in any place where a failure has occurred in the grafts. It is not well to make any large wounds now on the trees, and the thicker portions of the branches left for drawing up the sap into the grafts may be left until the autumn, and be disbudded in the meantime. The matting used for tying in the grafts should remain for a short time longer until the union of stock and scion is a little farther advanced, and as soon as the matting is removed a short stick must be secured to the stock on which to tie the graft in order to support the young growths and prevent the wind from blowing them out.

**APRICOTS.**—These must now have their final thinning, leaving them evenly disposed over the trees at not less than 9 inches apart each way for the large fruited varieties, and 6 inches in the case of the smaller fruited kinds; the latter are often left much thicker than this, as they are generally used for kitchen purposes, but this is no reason why they should be overcropped one year at the risk of failure in the next. All fruit that is thinned off now will do for the kitchen; besides being useful for tarts they make excellent preserve.

**SUMMER PRUNING.**—All fruit trees on walls, &c., should now be looked over, and those shoots which are required for furnishing the tree must be fastened into position, and all others removed, leaving three or four sound leaves at the base of each one that is taken off to assist in perfecting the crop. The shoots left on may in most instances be easily fastened by placing a shoot of Privet or some similar plant in front of them, and tucking the ends of this under some of the permanent branches. This is much quicker than nailing, which is really of little use at this period, as most of these shoots have to be removed to another place at the winter pruning, and by this means the young wood is not so liable to be damaged. All extremities of branches which are required to extend must be carefully nailed in the direction they are required to go. Peaches, Apricots, and Nectarines should be first attended to in this respect, afterwards Cherries, Currants, &c., leaving Pears and Apples until last, as most of the shoots have to be cut away from the latter, except the extremities of the branches; and it is best to defer their pruning until the first or second week in August, when the wood is firmer and the buds left are not so liable to start into fresh growth again. In summer pruning of all fan-trained trees a certain amount of young wood must be laid in every year to keep a supply near the centre of the tree, and allow of the gradual removal of the old wood, but this must be done judiciously so as not to overcrowd the tree with foliage. The young wood that remains must always have access to abundance of light and air, so that it may get well stored with the necessary materials for the support of the next season's crop, and be fully exposed to the autumn sun to ripen it. If these conditions are not fulfilled a crop of fruit cannot reasonably be expected in the following season.

**MULCHING.**—All wall fruit trees that have good crops of fruit, and any that have been recently planted, will be much benefited by mulching with some half-decomposed manure or some similar material, and in dry weather this should be supplemented with an occasional soaking of water or liquid manure, the latter not to be used where the trees are in the habit of growing too strongly at the expense of fruiting. In all cases enough should be given each time to thoroughly soak the border. Trees sheltered by walls are especially liable to suffer from dryness at the roots during summer, and east aspects are the worst in this respect. In dry seasons mulching is very beneficial to fruit trees in any position which have good crops of fruit, especially Raspberries, Currants, Gooseberries, Morcello and Bigarreau Cherries, Peaches and Nectarines, as it checks evaporation at a time when great quantities of water are required by the trees in order to swell off the crops of fruit. Too often there is very little rain at this period, and any assistance to the trees is amply repaid afterwards by the better quality and larger size of the fruit, also by its assisting the foliage to retain its freshness and plump up the buds for next season's fruiting.

#### FRUIT FORCING.

**VINES.**—*Earliest Vines.*—These will now require a dry atmosphere to thoroughly ripen the wood, but it will not be necessary to employ artificial heat to insure the requisite warmth, as that can be effected by regulating the ventilators according to the weather; but avoid a close atmosphere, especially at night, which would have the effect of inducing lateral growths that must be restrained, keeping the laterals and all late growths well in hand, and seek complete rest by keeping the house cool and dry. A drier condition of the border is also desirable, but it is not advisable to allow the soil to become parched and cracked, which will not occur if the mulching has been attended to, or the surface kept loose. The outside borders, which are great mistakes in early forcing, may be covered with dry bracken or litter, and in case of heavy rains with tarpaulin.

*Vines in Pots for Early Forcing.*—Those intended for fruiting next season should by this time have completed their growth, especially those required for very early work, which should have no more water than will prevent the foliage from becoming limp, and they should be exposed to all the light and sun possible, so as to thoroughly ripen the wood and buds. Keep the Vines free from insects, as it is important that the leaves perform their functions to the last. After the wood becomes brown and hard the Vines may be stood in front of a wall with a south aspect, securing the canes to the wall to prevent the foliage being damaged by wind.

*Mixed Houses.*—In early forcing it is hardly possible to escape attacks of red spider on Vines; more especially is this the case when the Grapes are kept for any length of time upon the Vines after they are ripe. On account of this liability to red spider and the disastrous effect loss of foliage has on the succeeding year's crop we do not advise large houses with a number of varieties of Vines for forcing, but houses only of such size as will admit of a supply of Grapes for the establishment for a period of not more than six to eight weeks, and the shorter the time the better for the health of the Vines. The dry warm air essential to the ripening of early kinds will cause red spider to increase on the foliage of the Muscats and other late sorts before they are ripe. This is most disastrous to the present and next year's crop of Grapes. Instead of having a mixed collection, that would afford a supply of

Grapes from May to August inclusive, we would divide the house into three compartments, so that the respective kinds may have secured to them their essential conditions. In case of an attack of red spider paint the hot-water pipes with a mixture of lime and sulphur, heating them to 170°, at which point sulphur vapourises, and keep hot about an hour, having the house, closed, after which allow to fall to the ordinary heat. Care must be taken not to overdo the painting of the pipes with the sulphur, or it will spoil such tender skinned Frontignans and Muscats, it often causing brown spots upon the skins, and imparts a purple hue to white Grapes; therefore sulphur applied to heated surfaces must be done very carefully.

*Muscats Ripening.*—These require time and assistance from fire heat, so as to insure a night temperature of 70° to 75°, 85° to 90° by day, with abundance of air. They also require a rather dry warm atmosphere, for under no other conditions will they attain to that rich golden hue characteristic of their inapproachable vinous flavour. Muscats require very plentiful supplies of water when swelling and in the early stages of finishing their fruit. They can hardly be overdone with water at the roots after the leaves are full-sized until the Grapes are well advanced in ripening, the border having thorough drainage; therefore, attend well to the watering of inside borders, and outside also in dry weather. Too much atmospheric moisture, however, is fatal to Muscats when ripening, causing them to spot; therefore, keep a gentle warmth in the pipes, and admit a little air constantly to prevent the deposition of moisture on the berries, surfacing the borders inside, after a final watering, with a few inches thickness of dry material.

*Scalding.*—This season Vines have scorched leaves and scalded Grapes to a greater extent than ordinary, which usually prevails where the panes of glass are large and ventilation inadequate; but it occurs often through neglect of early ventilation and a gentle heat in the pipes, so as to maintain a buoyant atmosphere. Various causes have been assigned to scalding, but there is no question that it is accelerated by the same conditions that cause the foliage to scorch. Both can be avoided by careful attention to the temperature and ventilation. Air should be admitted rather freely, especially in the early part of the day, with a little at night and a genial warmth in the pipes, so as to maintain a temperature of about 70° artificially. It is most prevalent on Lady Downe's, and in lesser degree Muscats; but Hamburgs will scald especially when the Grapes are exposed to the fierce rays of powerful sun after a period of dull cold weather, and always occurs at the close of the stoning period just before (a fortnight to three weeks) the Grapes change colour for ripening. A slight shade is advantageous at this period and during the early stages of ripening in houses with large panes of glass, particularly for Muscats, a double thickness of herring nets drawn over the roof-lights being of great service in breaking the fierce rays of the sun from mid-June to the latter part of July or August, according to time of the Grapes finish stoning. Some vineries are the better for a slight shade during the hot summer months. This applies only to those with large panes of glass and clear.

*Shanking.*—This may be due to suspended root action at the critical period of the Grapes ripening. To avoid it properly made borders, or soil of suitable staple, with efficient drainage and well-managed Vines are essential. The foliage must be fully exposed to light, allowing no more growths than can have space for development without crowding, and at no time seeking to encourage root action by a thicket of growth, which must sooner or later be removed in quantity, and give a check, accelerating the failure of supplies when most needed; but contrariwise, keeping as much foliage as can have due exposure and no more in a healthy state, so that the supplies of nutriment may be properly maintained. Vines prone to shank should be given time, avoiding sudden fluctuations of temperature, paying particular attention to the ventilation, thereby securing a steady supply of nutriment for the formation of starch and the storing of chlorophyll, so that at the proper time they may be converted respectively into sugar and the purple-black or golden-amber of the Grapes. This securement can only be effected by judicious ventilation in the early stages of development, not keeping the air too moist, so as to insure firm textured foliage, sturdy short-jointed wood. The young growths must be kept well regulated, adopting the extension rather than the restrictive system where there is room for it without crowding, keeping all gross laterals stopped so as to cause an equal flow of sap throughout the Vines, and this will do much to prevent the liability to shank. The great cause, however, of shanking is unsuitable border material, its effectiveness through inefficient drainage, or roots deep in staple more suitable than the surface. Heavy coverings of manure in autumn or winter allowed to become sappy, soddening and souring the soil, and then exposing the soil to the heat and drought, are certain means of securing shanked Grapes. Souring the soil with liquid manure whilst it is saturated and cold destroys what few fibrelets remain, and the Grapes shank; in fact, the evil is a result of errors in treatment.

#### PLANT HOUSES.

*Hydrangeas.*—Plants that were assisted to make their growth indoors will have produced abundance of cuttings suitable for striking. The sooner the cuttings are rooted after the shoots have ceased to lengthen out the better. The softer the wood the quicker they root. It is not necessary to cut the shoots to a joint, but two good leaves should be left at the base of each cutting. The cuttings should be inserted singly in 2½ or 3-inch pots filled with loam, manure, and sand, a little sand being placed in the centre of the pot. They root quickly under handlights in a vinery or any structure that can be kept moderately close. After insertion give a good soaking of water, and keep the cuttings close, shaded, and moist, until they are rooted, then gradually harden and

expose the plants to full sunshine, and finally stand them outside to ripen and swell their buds.

*Calceolarias and Cinerarias.*—As soon as the former are large enough prick them out 1 inch apart in pans or boxes, and when they cover the space allowed them they should be placed in small pots. Grow the plants in a frame with a northern aspect where the base can be kept cool and moist. Even in this position it is necessary to use light shade occasionally. Do not allow Cinerarias to become root-bound before they are transferred into larger pots. A check from this cause will practically destroy them. Transplant the latest seedlings and grow them with the Calceolarias.

*Mignonette.*—Standards should be placed in their flowering pots, and the trellis upon which they are to be trained placed to them. Grow them on in a frame where the pots can stand upon ashes and abundance of air be given. Apply water carefully, remove the flowers as they appear, and tie the shoots. A number of 6-inch pots may be filled with soil and seed sown thinly over the surface. Place them in a frame, and shade until the seed has germinated. After being exposed to light and air subsequently grow them outside on a bed of ashes. Care is needed that they do not suffer by insufficient water.

*Celosias.*—Place all that are ready into 5-inch pots, and stand the plants in cold frames. Keep the frames close for a few days and then admit air freely. Under cool airy treatment they grow sturdily, and are not troubled with insects. Plants that are hurried forward in heat seldom do much good, and even if they produce fair plumes they are very liable to damp off at the base as soon as they are placed in houses with a lower temperature. Those that are not ready for their flowering pots should be grown cool and placed in them when well rooted. We generally grow the latest plants in 4-inch pots, and find them useful.

*Pelargoniums.*—The main batch of cuttings of French and Fancy varieties should now be inserted. They will be found to root quicker and better if dibbled into a sunny border outside than if placed in pots and stood in frames. The firmer the cuttings are at the base the better. Those who have small plants on hand should pinch them well back and allow them to break outside, and then shift them into larger pots. These are ready for pinching again in September, and make capital plants for early flowering.

*Zonals.*—Those for winter flowering that are filling their pots with roots should have artificial manure applied to the surface occasionally. Pinch free growing shoots, and remove all flower trusses. Those still in 3-inch pots may be placed into 5 and 6-inch without delay and stood in a sunny place outside. A good number of cuttings may be inserted singly in pots, standing them outside, or even dibbling them into a border, and potting them after they are rooted. These if well cared for throughout the winter will flower admirably early in spring.

*Ivy-leaved Kinds.*—These are most useful for producing flowers for cutting. A number of cuttings should be inserted singly in small pots for flowering next season. Those intended for autumn and winter should be stood in the sun outside to ripen and harden.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### THE WEATHER.

AFTER fully a fortnight of thunderstorms and rain, with a low barometer, the weather is fine but cool. As yet the bees have stored very little honey. Young queens remain sterile, and hives generally are further from swarming than they were in May.

#### YOUNG QUEENS.

Within the past two months upwards of a hundred hives have come under my notice that had old queens, and upwards of 90 per cent. of these are dead. There are several phases of the subject of hives and old queens which should be considered. The first is, the queen regnant may be deposed or die in early spring. If eggs are present a young queen follows, but is almost sure to become a confirmed drone breeder, and not unfrequently the old and young queen are tolerated in the same hive. A second phase is, the queen regnant may be deposed or die later in the year, and the hive, through a paucity of bees, may only be serviceable for the Heather or for the following year. A third phase is, and it is not the least frequent during the month of May or June, young queens are brought forward, and the hives, whether crowded or not, may, and they frequently do, send off a swarm, sometimes with the old queen, sometimes with a young one, and sometimes with both together; but invariably the old queen is killed unless when she comes by herself, and in that case she is of little or no use.

These phases comprehended will give a proper idea of what takes place, and the reason of hives that were active becoming suddenly inactive, much to the surprise of many bee-keepers of supposed experience. The decline of the hive is either attributed to the loss or decline of the queen. A queen is procured, the supposed reigning queen is deposed, and the alien queen introduced forthwith, but the hive progresses not. The reason is that in many cases either two queens are in the hive at the same time, or royal cells are in an advanced state. Under these circumstances bees will not accept an alien queen. When beginners are uncertain what to do they should test the hive by putting in comb containing eggs, and if queenless the bees will raise queen cells; if they do not, then it is evident a fertile worker or imperfect queen is present, and it is never safe to introduce a queen to a hive that refuses to raise queen cells, nor while they have an egg or larvæ.

#### CONTROLLING INCREASE.

Never attempt to return swarms. Eight days after the issue of the first swarm is the proper time to excise all royal cells that are not desired, or to divide into nuclei. Where the latter are not wanted, and on the day of the issue of the first swarm, remove the old stock a good distance, and place the swarm on its site. Now bring the old stock close to the swarm, examine every frame, destroy all queen cells, and force as many of the flying bees as possible on to the swarm, keeping the very young ones upon the combs, because these youthful bees will be of no use for some time as outdoor workers, and the swarm will have no use for them for some days within doors. Next take the combs with the young bees adhering and divide them amongst the other hives, adding more space if necessary, or making the brood combs take the place of honey-laden combs. If the foregoing advice is taken along with some forethought the key to the most sensible solution to the controlling of swarming will be found. But always bear in mind that swarming, unless by young queens and extra breeding space, cannot be prevented.—A LANARKSHIRE BEE-KEEPER.

#### QUEEN EXCLUDER ZINC.

It is difficult to understand how any person can make such statements as those made by "A Lanarkshire Bee-keeper" on pages 32-33, in last week's number of your paper, and which can so easily be exposed.

I was present as a visitor at the Caledonian Apiarian Society Show at Glasgow in 1875, and at Edinburgh as an exhibitor in 1877. On neither of these occasions did I act as a judge. He says, "At the first Caledonian Apiarian Society's Show there were five Judges. One, the late Mr. James Anderson, was so displeased with the opinions of the others that he left, Mr. Mark Walker also dissenting, leaving Messrs. Hooker, Abbott, and McLauchlan\* to decide, with the result that with one exception they awarded the first prize in every class to pure sugar. I entered a protest against the exhibitors, and in every instance an apology was made." Fortunately the names of the Judges who acted at the Show (the first), held the 8th September, 1875, at Glasgow, are recorded in the "British Bee Journal" of October 1st, 1875, page 119, as follows: "The Judges were Messrs. J. Lauchland of Kilmarnock, James Anderson of Dalry, Alex. Shearer of Yester Gardens, and M. Walker of Glasgow, with the Editor of 'The British Bee Journal' as referee in case of a difficulty in coming to a decision." This shows his statement as to my being one of the Judges to be incorrect.

As to any disagreement having taken place among the Judges I know nothing, but as Mr. James Anderson was an exhibitor who obtained the first prize for the largest and best display of honeycomb he would not be likely to be "displeased," and quarrel "with the opinions of the others." Is it not more likely that he, being an exhibitor, was not allowed to act as one of the Judges, as is always understood? The following are those who took first prizes for honey at the Show:—James Anderson, W. Dick (Kilbirnie), D. Wallace of Rothesay, A. Montgomerie of Kilmaurs, David Anderson of Dalry, and D. Paterson of Struan. "Lanarkshire Bee-keeper" says that only one out of these six exhibitors staged pure honey—not very complimentary to his own countrymen; but if this was so, which I do not believe, I was not one of the Judges who did not know sugar from honey. It is astonishing what excuses disappointed competitors will make.

"Lanarkshire" goes on to say, "The hives came next. Mr. Abbott on this occasion was assisted by Mr. Hooker, and this is the point I wish to bring out." This is not true. I did not assist Mr. Abbott, neither do I believe Mr. Abbott awarded himself the first prize. He is away from home in Ireland, and has probably not seen the statement. He,

("Lanarkshire,") speaking of the next hive class, "The first prize was awarded to an English one. Both instances were decided by English Judges, Messrs. Hooker and Abbott." This is incorrect; I never acted as a judge at any exhibition in Scotland. I was not in Scotland the next year, 1876, and personally know nothing about that Show. In the report in the "British Bee Journal," page 102, vol. iv., for that year the following names are given:—"The Judges for *honey* were Messrs. Abbott, Shearer, Saunders, Findlay, and Anderson, and owing to the great beauty of the produce brought to the Show they had great difficulty in deciding the prizetakers. *The hives and appliances* were judged by Messrs. Shearer and Findlay, assisted by the "Renfrewshire Bee-keeper." The names of the Judges are not given in the report of the 1877 Show. "Lanarkshire" says, "The principal Judge was Mr. Symington, the peasemeal man." This is another random statement, for Mr. Symington was a manufacturer of quite a different article and not "the peasemeal man."

"As for excluder zinc being an improvement on supering the idea is amusing." "The Stewarton system has not been improved upon." "It is a well-known fact that queen excluder zinc has as yet been a failure, &c., &c." These are statements not borne out by facts. All the largest honey producers in England and America use queen excluder zinc, and would not do without it on any account. I could give a long list of names of these if you would insert them. When I tell you that Messrs. Harvey have sold between one and two tons of the British pattern advertised in your paper this season, you will see there are a good many who think differently to "A Lanarkshire Bee-keeper." Does he think, because a thing is capable of improvement, it is a failure? Was the first locomotive a failure because those at present in use are great improvements on it? He goes on to say:—"The best way of using excluder zinc is as I described it six or seven years ago and which has been copied elsewhere, the plan of cutting it in narrow strips and running it between the bars." At what date did this appear in the *Journal of Horticulture*? "I am pretty certain that if excluder zinc was used in our hives at the Heather there would be few supers. The bees swell to such an extent, &c." Had "Lanarkshire" used excluder he would know for certain that bees filled whether in a honey glut of either Clover or Heather, they have no difficulty in passing through the same.

There never has been a *hive* accepted as standard by the British Bee-keepers' Association. After a good many meetings a *frame* of a certain size was adopted and has not since been altered. I am at a loss to understand what is meant by the following statement:—"At my suggestion, but not till then, was an effort made to rectify the error indicated." No alteration has been made in the size of the standard frame, and there are not two sizes of frame. This is another random statement, and is incorrect. I am asked to explain why "they have abandoned their original styles of hives and are adapting ours, which have been in use so long, although not prizetakers." I do not understand the question. If by "they" he means the Association, I can only repeat "they" never had any particular style of hive. Neither do I understand the kind of hive referred to as "ours," which certainly has not been "adopted."

It is easy to say I did this or invented that so many years ago, but statements without dates or reference are not worth much. Why not say when and where mentioned, that others may judge for themselves if this was so and if the invention bears any similarity?—JOHN M. HOOKER, 9, Beaufort Gardens, Lewisham, S.E.

[\*The name of Mr. McLauchlan published last week was a misprint, and ought to have been Lauchland. Mr. Hooker has a right to this rejoinder, and though he has not attempted to justify his allegation of "A Lanarkshire Bee-keeper" claiming credit for inventions and improvements not his own, we do not wish for any reply to this communication, nor any more disputations between our able correspondents.]

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Fruit and Vegetable Farm (H. N.).**—We are obliged by your postcard. We know the farm very well, and under capable manage-

ment the enterprise ought to prove successful. Further experience is needed for the development of facts in which the public would be interested.

**Mignonette (Anxious).**—You cannot grow the plants by dates and measurements, no matter by whom given, but you must exercise your intelligence in carrying out instructions, not permitting the plants to be root-bound before shifting them, nor allowing the growths to get hard prematurely. Your letter shall be submitted to the writer of the excellent article referred to.

**Making Cider (A. B., India).**—A practical illustrated handbook on making cider, by Mr. J. M. Trowbridge, is published by the Orange Judd Company, 52 and 54, Lafayette Place, New York, from whom you can obtain all the particulars you need respecting the appliances. Refreshing and wholesome drinks can be made from different kinds of fruits, including those you mention. A standing rule of this office forbids our answering your third question through these columns. Your first was answered on page 12, our issue of the 2nd inst.

**Tomatoes not Setting (F. R.).**—The plants are much too hot, close, and moist, as is evidenced by the Melons being "attacked by canker as soon as planted, at least they damp off." The only remedy is more air and a not less genial condition of the atmosphere. Canker is induced by the stagnation of the plant tissues and the deposition and continued presence of moisture on the stem, and non-setting of Tomatoes is a result of confined air, ill-formation and development of the flowers, the condensation of moisture on and consequent inertness of the fruitifying organs. Admit more air, a little constantly in dull weather and at night, and restrict the roots so as to insure the solidification of the growth as made, which is essential to fruitfulness.

**Summer Pruning Plum Trees (Kent).**—1, The spurs of the wall tree ought to be cut back now so as to admit light and air to the fruit, but the pruning should not be done excessively, or it may have the effect of inducing late growth and prevent the maturing of the wood and buds. Judiciously thinning and moderately shortening the long growth would be preferable to close pruning; this would insure the fruit ripening as well as the development of the buds for next year's bearing, and the solidification of the wood so essential to health and fruitfulness. 2, You do not say whether the standard tree produces blossom or not. If weakly a judicious thinning of the head would be advisable, and there is no better time than the present, removing the oldest and weakest growth or where most crowded. Many trees fail in producing fruit simply because the buds are eaten by bullfinches or the blossoms destroyed by frost.

**Figs Ripening Unevenly (Pericles).**—This is occasioned by the "fit and start" formation of the flesh, some parts having the juices highly elaborated and assimilated, whilst others are badly digested and the parts are soft and watery. The cause of decay is usually due to condensation of moisture on the fruit whilst ripening. Free ventilation in bright weather is an absolute necessity, and a circulation of warm, rather dry air constantly in dull weather when the fruit has passed the flowering stage is essential; also when the crop is ripening air must be admitted so as to prevent the condensation of moisture on the fruit. Admit a little air continuously, so as to insure a constant circulation, which, when the Figs are ripening, should be warm and dry, and the fruits will not probably decay; but that is contingent on their not being affected with "spot," which often infests Figs in the early ripening stages.

**Making Mushroom Ketchup (F. L. B.).**—We give you a choice of methods, and you can, of course if you wish, try them all, and in future adhere to the one you like best. (1) Take 4 lbs. of Mushrooms, and the same of common salt; sprinkle the salt over the Mushrooms, and when the juice is drawn out add 8 ozs. of pimento and 1 oz. of cloves. Boil these for a short time, and press out the liquor; that which remains may be treated again with salt and water for an inferior kind. (2) Take the large flaps of Mushrooms gathered when dry, and bruise them; put some at the bottom of an earthen pan, and strew salt over them; then put on another layer of Mushrooms, then salt, and so on till you have sufficient. Let them stand a day or two, stirring them every day; strain the liquor through a flannel bag, and to every gallon of liquor add one quart of red wine; mace, cloves, allspice, of each half an ounce, with a race or two of cut ginger. If not salt enough add a little more. Boil it till one quart is wasted, strain it into a pan, and let it get cold. Pour it from the settlings, bottle it, and cork it tightly. (3) Take care that the Mushrooms are of the right sort and fresh gathered. Full-grown flaps are the best. Put a layer of these at the bottom of a deep earthen pan, and sprinkle them with salt; then add another layer of Mushrooms, with more salt, and so on alternately. Let them remain two or three hours, by which time the salt will have penetrated the Mushrooms, and rendered them easy to break; then pound them in a mortar, or mash them well with your hands, and let them remain two days, during which stir them up and mash them well; then pour them into a stone jar, and to every quart put 1 oz. of whole black pepper; stop the jar closely, set it in a stewpanful of boiling water, and keep it boiling two hours. On taking out the jar pour the juice clear from the sediment through a hair sieve into a clean stewpan, and let it boil gently half an hour; skim it well, and pour it into a clean jar or jug; cover it closely, let it stand in a cool place till the next day, then decant it off as gently as possible through a tamis or thick flannel bag till it is perfectly fine, and add a table-spoonful of good brandy to each pint. Now let it stand again, when a fresh sediment will be deposited, from which the ketchup

must be gently poured off into bottles which have been previously washed with brandy or other ardent spirit. Kept closely corked and in a cool place it will remain good a long time. Examine it, however, occasionally by placing a strong light behind the neck of the bottle, and if any skin appears upon it boil it up again with a few peppercorns. This is called double ketchup, and a table-spoonful of it will impart the full flavour of Mushroom to half a pint of sauce.

**Tomato Fruits Diseased (W. H. G.).**—The decay of the fruits you have sent has been caused by a fungus, and this is what Mr. W. G. Smith has said and shown in reference to attacks of this nature:—"The fungus most worthy of attention when growing upon Tomatoes is the destructive parasite known as *Cladosporium lycopersiei*. This fungus causes the decay of the fruit. It begins with a minute black spot, which surrounds the small decaying style. The black spot gradually increases in size by new circles of growth, one beyond another in the style of fairy rings. The fungus growth at the same time flattens the apex of the fruit, till at last the whole substance is blackened and entirely destroyed by the *Cladosporium*. The fungus spreads from the leaves (as I believe), or from one fruit to another, till at last leaves, stems, and fruits are all alike rotten. A small illustration is here given (fig. 9) natural size, of a half-destroyed fruit, and a view of the assailing fungus which has been named *Cladosporium lycopersiei*, enlarged from the microscope 500 diameters. The brown spores of this *Cladosporium* are often produced in such enormous numbers upon both sides of the foliage that they fly from the leaves in millions. If the Tomato foliage is briskly touched, a cloud of spores will taint the air and be distinctly perceptible in the mouth and lungs if they are inhaled. Most of the Tomato fungi are in their earlier stages quite superficial, so that if remedies are applied in good time recovery seems to be possible. Many recipes and suggestions have been printed of late in the *Journal of Horticulture*." All such fruits as you have sent should be gathered and burned, the house kept warm, dry, and well ventilated, and carbonate of

FIG. 9.

DISEASE OF TOMATOES AS CAUSED BY *CLADOSPORIUM LYCOPERSICII*.

copper remedy, mentioned on page 35 last week, may be tried. But the fungus ought to have been attacked sooner, and before it became so firmly established. See also page 21 of the same issue.

**Peach Tree Leaves and Fruit Spotted (A Constant Reader).**—The leaves are not only spotted, but have small circular holes in them as if made by a weevil. To find weevils spread a white cloth or sheet on the ground beneath the tree in the daytime, and at night approach the tree very gently with a lantern kept dark, and give the branches a good shaking, then turn on the light, and if the causes of the small holes are weevils they will be found to have fallen on the cloth, and should be captured and destroyed. This repeated a few evenings will rid the tree of that plague. The brown spots may have been caused by the sun acting powerfully on drops of water caused by syringing or a leaky roof. Fumigating the house whilst the leaves were wet or an overdose of tobacco smoke would produce the spots. The leaves and fruits are not infrequently spotted when infested with gum disease. The best thing you can do is to cut away all the gummed parts to clean growth a little below the affection and burn them. Any gum on older growth should be wiped off and burned; but growth of the current year, and even last year's wood where it can be spared, should be cut away; then sprinkle the tree lightly with tepid water, and dust it whilst damp with "anti-blight." Do not syringe the tree for some time, or not at all unless necessary for the prevention or spread of red spider, &c., and then as little as possible. Admit air freely, especially in the early part of the day, and a little constantly at night. Dress the border with superphosphate two parts, muriate of potash one part, mix, and apply at the rate of 2 ozs. per square yard, repeating in about six weeks, and wash-in lightly. Water no more than is necessary to keep the foliage from becoming limp. In autumn, when the leaves give indication of falling, lift the tree carefully and replant, preserving all the small roots possible. Add to the loam a fourth to a sixth of old mortar rubbish according to texture, making the soil firm under, about, and over the roots.

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes.

Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*C. P.*)—1, *Lycaste Deppei*; 2, *Asplenium bulbiferum*; 3, *Acalypha Macfarleana*; 4, *Insufficient*, apparently a *Carex*; 5, Not received; 6, *Heuchera americana*. The specimens were well packed in grass, and arrived in good condition. The *Geraniums* you mention are not florists' flowers, but you could obtain them from most of the large nurserymen or florists. (*Iris*).—It is one of the numerous varietal forms of the Spanish *Iris*, and not a species. Possibly you might obtain the name from the vendor of the corms. See our notice. (*H.D.*)—Perhaps *Anthericum variegatum*; but why did you top the flower spike? The *Pinus* shall have attention. It opens a point of interest.

**Bees in a Straw Hive (W. Stephens).**—As we do not know how you mean to keep your bees we cannot advise to our mind, and probably not to your satisfaction. Your bees, which appear to have been a prime swarm, will by this time have the hive well filled with combs containing brood and honey, should, if the weather keep fine, have a small super. Remove this when full, and see that the hive is of proper weight to stand through the winter. Cover up, and protect from wet. Have a wooden floor for it, and it will be better if it be a ventilating one. But if the queen is an old one, so there is a risk of the hive failing next spring just at the time your expectations are high, a young queen can be easily joined after the old one has been deposed by using the usual and necessary precautions. If disposed to use frame hives you ought to provide yourself with at least three to be in readiness when the bees swarm next year, or straw hives if so disposed to keep them in them. You have the alternative of driving the bees from the present hive after they have gathered all the honey they can, transferring the bees into a frame hive, and proceed as advised above. A postcard does not enable you to explain matters sufficiently.

#### COVENT GARDEN MARKET.—JULY 15TH.

MARKET now very active, outdoor fruit making an appearance, although light at present.

### TEMPORARY PASTURE.

FROM a really good field of "seeds" the crop of wholesome nutritious forage is often twice or three times more than that of permanent pasture, and the reason of this greater abundance of yield is obvious enough, for with land in good heart, and pasture consisting of the best strong growing Grasses, with a fair admixture of Clovers, heavy crops are practically a certainty. Perennial Rye Grass, Cocksfoot, Meadow Fescue, and Timothy are all remarkable for robust growth, and with them we should have White Clover and Alsike, with Perennial Red Clover; or on good mixed free or chalky soil, Sainfoin, Lucerne, and Tall Fescue.

The clearance of a heavy first crop is often immediately followed by a top-dressing of manure, which July rains wash down into the soil and ensure an almost equally heavy second crop. If the weather is showery as the first crop is cleared about 2 cwt. per acre of the mixed nitrogenous and mineral chemical manures answers admirably; so, too, does a dressing of sawdust or peat moss litter well saturated with urine. But the dressing must be a moderate one, and be used promptly, for some of the Grasses, notably Cocksfoot, send up a strong second growth at once. It should be understood clearly that such an application of manure is a bit of sharp practice upon which a beginner could hardly venture in safety. To do it really well and effectually experience and sound judgment are requisite, without which it may do harm; with it excellent results are possible. For example, chemical manure would not tell in hot dry weather, but in showery weather with the temperature of midsummer it would not only then induce growth of remarkable vigour, but the soil would be so rich in fertility that there would be no appreciable exhaustion by the vigorous second growth.

Very seldom indeed do we see crops of such vigour as we know to be possible, simply because the soil is so often in a state of incipient exhaustion. We must have sustained fertility of soil if we would have sustained vigour of growth. In saying this we do but repeat an oft-told tale, yet we would give greater emphasis to it if possible, because we know that the soil generally is not half so productive as it ought to be.

It is certain that the best plants of our temporary pastures repay us well for high culture. What is possible under such culture has been shown with Rye Grass and Maize, especially on sewage farms; and it is well known what magnificent crops of Sainfoin, Lucerne, Timothy, Cocksfoot, and Clover can be had without extraordinary pains. In the United States of America Timothy yields crops of marvellous abundance. So, too, does Cocksfoot in New Zealand; but then it has special culture, with the plants set far enough apart to admit of full development, and no one can form an idea of what that is who has only seen this Grass in an ordinary pasture. Take a young plant of Cocksfoot and plant it in your garden in really rich soil; suffer no other plants to crowd it or to rob the surrounding soil of fertility, and you will have so remarkable an object lesson as to set you longing for an acre of such growth. No objection can be justly taken to the coarse herbage of this Grass, as analysis has proved it to be as nutritious as any of the finer-growing Grasses.

We regret that farmers are not wont to test such things for themselves more than they do. What can possibly be more useful or interesting on a farm than a trial plot where manures, corn, forage, and roots can all be tried? The comparative value of all crops would then be known, and the practice would be better, the

results better, and far more certain and profitable than is possible without such tests.

Now is the time to look carefully over the farm, and to consider well if the crops are really good. If not the cause should be ascertained, and the remedy applied in due course. The drought of last autumn told severely upon those dairy farmers having nothing but poor permanent pasture for their stock. What a boon would a few acres of rich temporary pasture have proved to them then! But where the whole of the farm is in permanent pasture the farmer is very much the sport of seasons, for he has nothing else to turn to. Well would it be for him if even a few acres only of his farm were available for special treatment, and some of those special crops which we have indicated in this article.

### WORK ON THE HOME FARM.

A case of stupid blundering which caused the loss of four fine lambs must be noticed this week. A flock of ewes and lambs much infested with ticks were dipped in Cooper's mixture on July 3rd, and on the morning of the 5th the four lambs were found dead, and others were evidently suffering from poisoning, but they did not die. Our advice was asked, and we found that the lambs had actually been allowed to run with and be suckled by the ewes immediately after the dipping. It was obvious that they imbibed enough of the dip poison from the ewe's udders to kill four of them, and to seriously affect several more. In future this bit of dear-bought experience will cause the owner of that flock either to wean the lambs before dipping—as should always be done—or to keep them apart from the ewes after dipping till there is no risk of poisoning. By all means dip all sheep and lambs for summer, but do take ordinary precaution against the poison. Our plan is to dip off the pasture, and to keep the sheep off it till they are fairly dry. As the dipping is done two or three weeks after the shearing, the short wool becomes dry enough in a few hours to make all safe; but to dip the sheep and turn them out at once upon the pasture they feed upon is to incur serious risk of poisoning.

The unsettled state of the weather has interfered seriously with the haymaking. All that grass mown for hay, whether in cocks or swathes, has been made into hay as fast as was possible, but more of the unmown grass will be used for ensilage than would have been the case had we had settled weather. Where hay must be had it must be got into cocks a few hours after the mowing, and only shaken out when there is fair promise of a few hours of fine weather. Of course the haymaking is more expensive in this way, but there is no other way in showery weather, for hay that is turned a few times and then exposed to rain loses quality very fast, and is never so nutritious as well-made hay. Great care must also be taken that hay which has been in cocks is shaken out and thoroughly dried before the carting, or it will become musty in the rick.

**SPRATT'S PATENT.**—We are requested to say that our readers, before leaving for their holidays, should entrust their canine pets as boarders to Spratt's Patent Dog Sanatorium. The Sanatorium is on a healthy site near Mitcham. The kennels are large and spacious. The dogs are well groomed and exercised for several hours daily, and, above all, are not caged or chained. Mr. Sewell, the canine specialist and vet., supervises all. Write, Spratt's Patent, Limited, Bermondsey, London, for particulars.

### REMARKS.

5th.—Generally overcast, with frequent spots of rain in afternoon.  
6th.—Dull and drizzly early; breezy day, with occasional sunshine; thunderstorm at 4 P.M., and bright evening.  
7th.—Generally overcast, with frequent heavy showers, but occasional bright sunshine.  
8th.—Generally overcast morning, with thunder and spots of rain at 11; thunderstorm with heavy rain from 3 to 5 P.M.; fair evening.  
9th.—Fine, and generally bright.  
10th.—Fine, but frequently cloudy.  
11th.—Bright and warm.  
A generally dull week, and on the 8th the only heavy thunderstorm which has occurred this year.—G. J. SYMONS.

BEING a lover of home and home surroundings, it has been only after long consideration that I could determine to have a tour of inspection amongst those who, like myself, are engaged in, and who also love Grape growing. With an early start to secure the 6.15 A.M. train at Newcastle, eight miles distant, I secured a tourist's ticket for 22s. 6d., which permitted me to travel to Edinburgh and Glasgow *via* Galashiels, and also gave the privilege of stopping at all intermediate stations. Having had several times repeated a very kind invitation from Messrs. W. Thomson & Sons, of the world renowned Tweed Vineyards, Clovenfords, I chose that station of industry and rare excellence for my first call. On my arrival, much to my regret, I learned that Mr. Thomson, sen., was from home, and thus was frustrated for the time being my long-cherished anticipation to have a conversation with one of our leading authorities, and with one who has a great claim to be termed the father of Grape growers. But I soon found that with the same confidence that I had left home Mr. Thomson had also left those in charge who possessed all the qualifications necessary to keep a horticultural establishment moving in the right groove that both deserves, and, as a rule, secures compensation. Enthusiasts in their profession, with characteristic intelligence, Mr. Thomson's two sons speedily led the way to a discussion on all the knotty problems associated with Grape growing, and how best to secure excellence in every branch of fruit culture.

The Tweed Vineyards are surrounded by those majestic hills that are to be seen nearly everywhere in Scotland, so renowned for purity of air, and which contributes so largely to the golden colour of those beautiful Muscats you see so frequently staged at Edinburgh. My first look into a large Muscat house was certainly a surprise; bunches, nearly ripe, were simply everywhere, from end to end, in a very long house. The sight was that of a solid mass of Grapes. Situation, intelligence, and Thomson's manure evidently produce great results in Grape growing. These lengthy spans, too, that I had so frequently read about, and also verbally heard of, I now, though at an early stage, beheld in all their magnificence with my own eyes. In addition to Muscats there were Dukes, Gros Colmans, and Lady Downe's, in full health and vigour, and as house after house was reached I recognised that success had already stamped my tour. I had seen my own calling in all its perfection and also more extensively carried out than I had ever previously observed Grape growing.

The Messrs. Thomson kindly supplying me with a rather lengthy list of other horticultural establishments well worth visiting, I next set off to Edinburgh, intending, with that magnificent city for a focus, and, armed with my "Tourist," to perambulate hither and thither during the few days at my disposal. Next morning with my son—who knows Edinburgh well, he being a University student—as my guide, an early start was made, and, before breakfast many places of much interest were visited. Newbattle Abbey and Melville Castle being handy, and the gardeners of both these places being well known in exhibition circles, it was thence I determined to wend my way after breakfast. The former place is the seat of the Marquis of Lothian, whose interests in horticulture are here entrusted to Mr. McHattie, a gentleman who more than once has victoriously crossed the border, he being the fortunate grower of fruit worthy to be set before either kings

princes, or notable subjects, and which has thus secured the favourable recognition of fruit experts in open competition. The Newbattle Abbey vineries and peacheries I found to be just such as might be calculated to sufficiently supply his lordship's table, and a careful selection of early and late varieties seemed to be more depended on than a multiplicity of houses. With Hamburgs ripe, others were in natural rotation, they being grown under the same treatment. To say that the fruit, and especially the Grapes, was well grown, scarcely conveys an adequate idea, as size was exceptional, and the berries of the Gros Colmans were, I think, larger than I had ever previously seen; and colour was most promising—there was Lady Downe's, as all growers like to see, jumping from green into black without taking that longer course of a gradual transformation, and with all the intervening tints. Muscats were very fine indeed, and I could easily imagine what they would be like by the time that the International comes round. Young canes, but apparently in the second year, were carrying one bunch each, clearly evidencing that judicious treatment which will tell twenty years hence when, if proportionately treated, in all probability these same Vines will still be retaining all their youthful vigour. They were a little late, but the grip that the roots had evidently got of a good pasture was as discernible to the practised eye as though each stem and rootlet had been laid bare. Mr. McHattie having to send off the usual consignment of fruit, &c., to the Marquis's London residence rather hurried away from several specimens over which the mind still lingers, and that, with the exceedingly kind reception I had received, speedily fixed the determination, should I ever again, with time to spare, be in the neighbourhood of Edinburgh, I should remember Newbattle Abbey, its fruit houses, vineries, and most excellent Grapes.

It was with pleasant thoughts that I made off to one other notable establishment close by, the gardens of Melville Castle, the seat of Viscount Melville. There also I soon found in Mr. George McKinnon the right man in the right place. But I think it is due to the fraternity to say that kindness and courtesy is the common characteristic of gardeners; I suppose it is their being so surrounded with the beautiful that sweetens, and hence the right good fellowship when stray members of the brotherhood meet. But, be that as it may, under the guidance and special attention of Mr. McKinnon I very soon found, as house after house was inspected, that I had been drinking to the fulness of delight by the good succeeding the beautiful as each section of the fine panorama of Melville was being unfolded. I now rather feel the loss of taking no notes on my tour, though it needs none to bring to my remembrance one more example of Muscats, as they are, I think, only grown in Scotland, and the Madresfields, Mrs. Pince's, and many others in those teeming luxuriant vineries. Being substantially remembered, as a stranger in a strange land, I again set out for fresh discoveries in this land of plenty, but a thunderclap in the park and a splash ruthlessly reminding that "the schemes of mice and men gang oft a-gley," with my compass ominously pointing stationwards, I speedily made tracks that way, and once more reaching the grand old rock-capped city, the second day of my rambling ended.

After an early start the next morning a little after six I might have been met threading my way through the multiplicity of hampers, boxes, and bundles, and the numerous allies of the Glasgow fruit and vegetable market. But here I met one other misfortune—somehow I had got off the track, it not being market day. But, and fortunately, I found a substantial breakfast supplied at a handy station hotel. By the 8.45 A.M. train I was again a passenger, this time my destination being Polmont station, near by which is the seat of T. L. Learmouth, Esq., an Australian gentleman, I understand, who occupies Park Hall, and at which has been erected extensive vineries. Here both the manager, Mr. Murray, and Mrs. Murray, joined in giving me a hearty welcome. So once more my trip was surrounded by sunshine, and before I left Polmont I had solid reason for believing that the sun also did shine on Park Hall vineries.

It was clear I had been well advised as to the track that would open out to still more interesting discoveries, as, sure enough, here was Grape growing with cropping and luxuriance such as I had never previously seen. My first impression was, Were those Grapes mine I would pray night and day for a season with fourteen months' sun, as how such a growth of wood could be ripened without it was past my comprehension. And, undoubtedly, there was cropping in proportion to growth. On one Muscat cane I counted fifteen bunches, and I have weighed Grapes too long not to know that they would cast the scale at 45 lbs. Mr. Murray I found delayed his stopping till laterals were some 6 or 7 feet long, and this undoubtedly resulted in root vigour proportionately. Bunches generally were large to an extreme, and Lady Downe's, Golden Queen, and Mrs. Pearson especially so, they in many instances averaging between 3 and 4 lbs. Up to now I had concluded that I held the whip with Alicantes; but here I saw that I was caught up, and with Mr. Murray being a few days earlier, at any early date I might be passed. Our Gros Colmans I saw just about the same stage, though here again, and especially after getting home, I concluded that foot for foot of glass I should probably cut greater weight and value. This allusion to home your readers will perhaps kindly pardon, but as journeyings are frequently after knowledge so were mine, and it is by comparison that we find out where knowledge is most necessary. At Park Hall, too, were Black Hamburgs, Alnwick Seedlings, Raisin de Calabrias, Gros Marocs, Muscat Hamburgs, and Madresfield Courts, all growing in the greatest luxury and abundance. After leaving Mr. and Mrs. Murray's hospitable roof and accompanied by a shorter cut to the station, when left alone my mind was at once set meditating on the rich store of pleasant remembrances that I had happily to carry home, and the evident lessons that there might yet be learned anent Grape growing.

The next morning once more found me early astir, and again accompanied by my son we reached Milbank, so long under the charge of my old friend and superb plant grower, Mr. Patterson. It was with much regret that I learned that regrettable changes were contemplated which would probably result, after some forty years' residence, in Mr. Patterson having to seek out a new sphere for his declining years. Thrift and prudence fortunately, I am glad to know, will prevent the necessity of choosing a new home in a hurry, but in all probability the new home will be necessary, and which I much hope will be as suitable as Mr. Patterson's life-long character and abilities have been esteemed.

The place of the cousins Buchanan, near Stirling, was the one I next wished to see, but I was in this dilemma—I had reached my last day, and it was the day on which the renowned Grace with his Gloucester team was timed to play the gentlemen of Scotland, consequently I determined to secure what might never be repeated, a special treat on the cricket field, in which I take great interest, and so my visit to my old neighbours and much-appreciated friends and other places on my list was left over to some future opportunity. — JOSEPH WITHERSPOON, *Red Rose Vineeries, Chester-le-Street.*

### PINUS INSIGNIS.

I AM forwarding to 171, Fleet Street, by the same post as this communication, a small shoot cut from a rather remarkable specimen of the above named Conifer, remarkable on account of the way in which it has passed unscathed through many severe winters, while large numbers planted near it at the same time have all been killed. A brief statement of the facts, which I have gleaned from a person who helped to plant the trees, are as follows:—

About forty years ago young trees of *Pinus insignis* and *Cedrus Deodara* were planted alternately to form an avenue in the park here. A very severe winter occurred five years after they were planted, and killed every *Pinus* in the avenue, with the exception of the one from which the specimen sent was cut. Throughout the many severe winters which have occurred since this sturdy Conifer does not appear to have been injured in the least, although not sheltered in any way, more than the others which succumbed

to the influence of severe weather. As my noble employer is greatly interested in Conifers, and indeed trees in general, I should be glad to know if you can detect any difference between the shoot sent and those of the variety generally grown. It differs slightly from smaller specimens we have about the grounds, but that may be accounted for by the great disparity in the size and age of the trees.—H. DUNKIN, *The Gardens, Warwick Castle.*

[This communication re-opens the question of the synonymity or otherwise of *Pinus insignis* (Douglas) and *P. radiata* (Don). The former is so distinct and beautiful that its well-proved tenderness is a great misfortune. Trees of it have thrice in our recollection been practically swept out of the country, only a few remaining uninjured. A really hardy *Pinus* of the colour and character of *P. insignis* would be a welcome acquisition, and this appears to exist at Warwick Castle. Dr. Hogg has a noble specimen on one of his Sussex estates that has passed unscathed through more than forty winters. Is the Warwick Castle specimen the true *P. insignis*, or is it *P. radiata*? This latter Gordon, in his "Pinetum," distinctly states is hardy, while he describes *P. insignis* as only "tolerably hardy." After describing the characters of the leaves of *P. radiata* syn. *P. insignis macrocarpa*, Hartweg, and stating that the cones are "6 inches long and 3½ inches broad at the base," he goes on to say:—"This beautiful Pine resembles *Pinus insignis* in some respects, but differs very much in foliage and cones; the leaves of *P. insignis* are much longer and stouter than those of *P. radiata*, while the cones of *P. radiata* are nearly three times the size of those of *P. insignis*, and with the scales much more elevated. It was first discovered by the late Dr. Coulter in Upper California, in latitude 36°, near the level of the sea, and almost close to the beach, growing singly, and attaining the height of 100 feet, with a straight stem feathered to the ground with branches. He says it affords excellent timber, which is very tough, and admirably adapted for boat building, for which purpose it is much used at Monterey. Mr. Hartweg met with it on the descent towards the sea, on the mountains of San Antonio, 60 leagues south of Monterey, forming a small wood, extending along the beach, where the deep grass-green of its foliage formed a great contrast with the parched-up vegetation around it at the time. It is hardy, and well adapted for planting near the sea coast."

Gordon says the cones of *P. insignis* are only "three inches and a half long and two inches and a half wide." He was Superintendent of the Horticultural Society's Gardens at Chiswick when Douglas and Hartweg were collecting, and must have founded his observations on actual specimens and obtained his information from the fountain head, so to say, and consequently is entitled to be listened to.

The close similarity in appearance of *P. insignis* and *P. radiata* may have justified subsequent observers in regarding them as synonymous; but however great the resemblance may be, if trees of one succumb to severe frost and those of the other withstand it, surely there is a practical and substantial difference. Dr. Hogg suspects his tree is the *P. radiata* of Don and not the *P. insignis* of Douglas, and it is at least possible that the hardy *P. insignis* at Warwick Castle may be *P. radiata*. We shall be glad if any of our readers can supply information on the matter.]

### HOME-MADE WINES AND PRESERVES.

A VERY large number of readers of the Journal will have experienced a keen sense of pleasure in seeing in your last issue an admirable portrait of Mr. Robert Fenn, who has won for himself a distinguished position amongst horticulturists of eminence. His contribution to your pages, "As in a Dream," was delightful reading, and articles from his pen have always been practical and readable.

My object now in referring to him is for the purpose of drawing attention to the subject of home-made wines, on the making of which both he and Mrs. Fenn are great authorities. I have never had the pleasure of seeing his old home at Woodstock or his present one at Sulhamstead; but I distinctly remember his home-made wines at a great horticultural exhibition at the Aston Lower grounds, Birmingham, many years since, when he brought several bottles of various wines made by him and Mrs. Fenn at Woodstock. Several horticultural friends were invited to taste these wines, and a general feeling of pleasure was experienced with these pleasant refreshing substitutes for beer, and I have often wondered since why the manufacture of pure home-made wines has not been taken in hand by some enterprising person or persons, so that the general public may be enabled to obtain them at a moderate price. I well recollect in the trial of these wines at Aston we tasted some which closely resembled good Burgundy, Moselle, champagne, and other wines, all pleasant and most acceptable additions to the dinner

table, especially for those who do not belong to the wealthy class. Mr. Fenn then stated that the wines I have referred to could be made to pay at a very low price per gallon.

I feel strongly that a large paying industry may be created if this subject was taken up in earnest in various parts of the country and in a proper way. Thousands of tons of Rhubarb annually wasted could be utilised, and produce a pleasant drinking wine at a very cheap rate, and especially when matured by a little age. Parsnips, again, make a delicious wine, so also do Gooseberries and other fruits; and this year in many parts there will be a heavy crop of Damsons, and Damson wine is a very pleasant beverage. There are many things that could be utilised—such, for instance, as Cowslip flowers, and wine from this flower needs no praise from me, from those who know what it is.

Mr. Fenn uses Grapes, not at all necessarily ripe or near it, for his excellent wines; and as it is now the fashion to encourage the cottager to grow fruit, Vines could be planted against many a cottage, selecting the hardier kinds at a cheap price, for growing fruit for wine-making purposes. With manufactories for making wines, and a system of collecting from the outlying districts, a great trade could be created, and money put into the pockets of producers, while the public generally would be able to procure pure refreshing drinks, intoxicant only in a remote degree, and a thousand times preferable to very much of the manufactured beer of the present day.

The Baroness Burdett Coutts at the Mansion House meeting of the Fruiterers' Company spoke of the improved knowledge required in the making of jam. Her words are words of import. In these days of manufactured butter, when real butter is entirely beyond the reach of families of the struggling class, and in large towns especially buy as butter a composition the origin of which is doubtful, good wholesome unadulterated jam at a low price would be an inestimable boon to thousands in every large town. There are already large makers of jam about the country, and Lord Sudeley's people are making jams on an extensive scale, but there is ample room for more, and what is particularly needed is that our cottagers and working classes may be taught how to make these preserves with a view to their keeping for winter use.

The bottling of fruits could also be taken in hand and useful information given to those in the rural districts as to how this should be done, and thus have in stock a supply of fruit for the winter. Sugar is so cheap now that preserving fruit in any form is not an expensive matter.

I wonder if many of your readers have heard of, much less tasted, pickled Damsons! I never did until three or four years since, and it was a new sensation in eating to me. Delicious is the word, and as Damsons in the midland districts are plentiful pickled Damsons will be in demand by my friends.—D. R. S.

#### MIGNONETTE AS STANDARDS.

As week by week goes by I am eagerly at work scanning and profiting by the contents of my favourite paper, the *Journal*, and one item of information I gathered from its pages bids fair to become a good success; but I am in a little fog about the matter, and I am seeking for your kind assistance if you will please to afford it me.

I refer to the splendid article on "Mignonette as Standards" in your issue of May 21st of this year. The directions there given are that seed should be sown about the 24th of May. That fell on Sunday this year, so I sowed mine on the 23rd. I do not get the *Journal* till Saturday, and I had two dozen small pots (2½-inch) sowed with 'Miles' Spiral within two hours after I read the article. The seed germinated in twelve of the pots and in twelve it failed. As soon as roots showed through the drainage I shifted the plants into 4-inch pots. Now here comes my query. The article says, "The plants are shifted into 4-inch pots, &c," and then goes on to say, "The plants are returned to the frame and kept there until the end of August." Now does that mean that they are not to be put into the 7-inch pots it speaks of until the end of August? because my plants will be hard root-bound long before that time, as the roots are now showing plentifully through the pots and the plants are pictures of health, 6 inches high, and a root-bound condition your correspondent speaks of as one to be "rigidly avoided."

Will you also please state if the side shoots are entirely removed would more side shoots spring after the topping? because they can only spring from the base of the leaves on the main stem, and if they are entirely removed would it not be equal in its effects to the removal of a bud from the base of a Gooseberry cutting—viz., that no other shoot or bud would spring therefrom? If so, how about the production of side branches of which your correspondent speaks? Does he mean their entire removal, or would it be better to pinch all side shoots to one leaf?

I do not quite understand the instructions for making the trellis. Does "Practical" mean that the trellis before it is put on shall be

1 foot high or deep, whichever he likes to call it? If the plant is kept to one stem till, say, it is 2 feet high and the trellis is only 1 foot, what does he do with the 1 foot above the trellis? Does he bend it down, or how does he manipulate the affair?

Would you kindly say how many wires (which would correspond to the frame wires of an umbrella on which the material is sewn) should be used, and if any circular wires are placed on these? In short, I should be pleased with instructions as to making one of this kind, as I have never made one, though I have made other shapes.

I am afraid I am giving much trouble on this subject, but my employer is very fond of Mignonette, and likes to have it all the year round; therefore the matter is to me one of importance.—ANXIOUS.

[With the object of relieving the anxiety of our correspondent we placed his letter in the hands of the writer of the article referred to, and the following is his reply:—"The germination of my Mignonette seed this year was much below the average. The plants should be shifted from 4-inch to the 7-inch pots when the former are full of roots independently of any fixed periods. Such details as these must be attended to on the spot, and as far as I am aware I do not give any hard and fast line as to when successional pottings should be carried out. Rigidly avoid having the plants root-bound in the earlier stages, or their growth will be checked, and continuously free growth is absolutely essential to success. The roots must be kept moving, even if an extra small shift is resorted to.

"The side shoots which spring from the main stem must be removed as often as they appear below the point where it is intended to lay the foundation for the future head, and this would be about 18 inches or 2 feet from the top of the pot. For this length it is intended to have a clean tree-like stem, which would not be the case if side growths were allowed to extend even to one leaf from the main stem. It is only when the desired height or length of stem, as previously named, is obtained, that what I term side shoots are allowed to extend, and removing all side growths up the stem, confining the growth to one shoot, is the way to obtain the necessary height which will enable the plant to rank as a 'standard.'

"Regarding the trellis, 'Anxious' misses the point. If, as he says, 'the trellis is 1 foot high, what is to be done with the remaining foot of stem?' Obviously it must appear above the top of the trellis. If a trellis 1 foot high were placed on the top of the pot the plant could not be a standard. What is meant is that the actual trellis is 1 foot high. To raise it to the point where the shoots branch, a stake 2 feet high from the top of the pot must be provided. The inside centre of the trellis rests on the top of the stake in true umbrella fashion.

"To have a trellis 1 foot deep, or high, whichever you choose call it, and 15 to 18 inches in diameter, one circular wire at the bottom is required; to this about four wires are fastened, which bend over to give the shape, and are secured on the opposite side to the circular wire. This number would provide ample space whereon to train the shoots, because after the foundation is laid subsequent growths can be tied down to the main stems themselves. Therefore the number of wires is a matter of convenience to the cultivator. There cannot be any harm in fixing two additional circular wires at about 4 inches from the bottom wire; these may be of a smaller size, ordinary knitting-needle size would do." It is no trouble whatever, but a pleasure, to us to publish this information.]

#### MR. FENN AT HOME AND THE MAGNUM BONUM POTATO.

CHANCE had more to do with the raising of Magnum Bonum Potato than science. Mr. Clark was fond of his garden, and he read the *Cottage Gardener* at the time I was initiating the public through its pages in the first crossing of Potatoes. Clark had then Paterson's Victoria and the then newly imported American Rose growing in his garden. Eventually some fine ripe berries offered on the Victoria, and he tried his 'prentice hand by sowing the seed in the following spring. The season proved disastrous in regard to the disease, and whether the raiser gave the seedlings up in disgust or failed to strictly observe them is now past finding out. At any rate, the late Mr. Shirley Hibberd was poking about the New Forest and spied out some living Potatoes amongst the dead in Mr. Clarke's garden. The future growth of these seedlings in Mr. Hibberd's experimental garden at Stoke Newington was satisfactory, their inspection by Mr. M. J. Sutton also satisfactory, and Mr. Clark was commissioned to grow them into "stock." The variety was named Magnum Bonum and distributed by the Reading firm. Thus ends the eventful history so far as I know.

I believe I may have been a chief cause of inducing Mr. Clark to cross for some of the popular varieties that the Messrs. Suttons are now distributing. Thus I had occasion to visit a friend at Bournemouth. I accompanied our friend Mr. Jones on the way to Mr. Clark's ground. He was growing seedlings from American crosses largely. From what I had experienced from the description of interbreeding I tried to dissuade him from it. He was also crossing Woodstock Kidney with Paterson's Victoria. This I did not approve of, as W. K. was weak in constitution, and so unfortunately subject to take the disease. "Well then, what would you advise?" he asked, and I answered, "You must feel a greater interest in Magnum Bonum than any other Potato; cross it with some good old English variety such as Fox's Seedling, the old Cambridge Kidney, &c., &c." "How am I to get Fox's Seedling?" Here Mr.

Jones joined us again, and we learned that the Messrs. Suttons still retained it in their trial grounds. I ascertained only but the other day by Mr. Jones himself that Mr. Clark got the Fox's Seedlings through him. This is the finger I had in that pie.—ROBT. FENN.

[Either Mr. Fenn did not instruct his pupil properly, or, as is likely, the latter did not appreciate the point of his tutor's remarks. Perhaps the "old '52" absorbed attention.]

#### THE NATIONAL ROSE SOCIETY SCHEDULE.

"J. B." does not attempt to answer the argument of my last letter. I have no fault to find with him for this, for I think the task was beyond his power, but I do seriously complain of his misstatement of what I did write. He says, "'W. R. R.' still regards the matter from one point of view only—the possible disadvantage to the large grower. The argument that at all costs the man with the big stock must be provided for, and the smaller one left to suffer in the event of bad seasons, is a most unsound one, &c."

If anyone will turn to my letter in the issue of July 16th he will find I took first the case of the small grower, and showed that in any circumstances under the present rules he is not precluded from exhibiting, and then compared his position fairly with that of a large grower under such rules as he would apparently desire. It is evidently of no use my writing further in answer to "J. B." if not only my arguments are unanswered, but my letters misapprehended, and I must decline further controversy in the matter at present.

The Rose season has been one of the most disappointing in my recollection.—W. R. RAILLEM.

#### WOODBIDGE ROSE SHOW.

IN our report of this Show, on page 53, last week credit is given to Mr. Blant and Mr. Hart for winning the second and third prizes in the open class for twelve Teas. The names should have been written and printed Mr. B. R. Cant and Mr. Frank Cant, two celebrities that the Rev. A. Foster Melliar may feel more proud in defeating than two competitors unknown in the Rose world, Messrs. Blant and Hart. Reports of shows have often to be written very quickly, and names in consequence are sometimes a little obscure. The printers appear to have "followed copy" with as much fidelity as they could, and the names Blant and Hart appearing in a small class they might be regarded as new local exhibitors. The linking of the "B" to the "C," which was like a small "l," Bl, and the F with the C, also like a small "l," thus Fl, explains the error, and we now have pleasure in giving to Mr. B. R. Cant and Mr. Frank Cant the credit to which they are entitled.

#### WANDERINGS.

A BUNDLE of tourists' guides and a letter from a good friend remind of sundry wanderings over the water last year. Mention has been made of the "outing" and incidents by the way, but the story was not completed. Now that the minds of men are turned in the direction of travel, whether they can indulge in the desire or not, seems appropriate for a further recital of the experience of a pair of home-loving rustics who ventured to "go abroad."

As it is desirable as far as possible to combine prudence with pleasure, it occurred to me when taking tickets at Liverpool Street station for Antwerp to invest in two for insuring £1000 each, in case the ship should happen to be on her last voyage, as ships come to an end, and sometimes unexpectedly. The next bright idea was this, Of what use will he the tickets if we all go to the bottom together? Post them home of course. Yes, that is the thing to do, but the train would not wait. Very attentive was a smiling porter, who seemed as if he could not do enough to make us comfortable, would he do the posting? He beamed with delight at the suggestion, asking me to write the address on the back of one of them, and it was done. "Now look here, porter, the stamp will be a penny." "Yes, sir." "Then here's 2d., that's 100 per cent. profit, you know." "Yes, sir." "And you will get a good envelope for a halfpenny." "Yes, first-class, sir." "Then here's 2d. for that, or 150 per cent. for you." He thought he was doing well. "Now here's another 2d. for yourself, and an extra 6d. for completing the contract well and quickly." He gave thanks bountifully, and off we went—the train to Harwich and the porter to the post office, at least, so we expected, but the letter was never delivered. Was it posted? I have handed dozens of letters, postcards, or telegrams out of trains for posting, and in every case they have arrived at the intended destination. I have sometimes wondered if a bright idea did not occur to the G.E.R. porter, and led him to reason somewhat in this way. "Supposing the ship should happen to go down, nobody knows about these tickets, and couldn't I just hand them over the counter and say I had called

for Mr. and Mrs. Darby's £2000? That would be something like a tip, and if the rustics didn't manage their own affairs better that was their look out, not mine." If that was so, and I hope it was not, I am glad to say the event did not come off. The money remains at the insurance office, just as we hoped it would from the first, and the ship brought us safely home again. I have never been to Liverpool Street station since without looking for that porter. The moral of this episode is not to trust to others doing what you can do yourself by a little forethought, and thus keep the "tips" in your pocket. Working railway officials, however, as a body, are, in my experience, trustworthy men, and, perhaps, after all, my obliging porter lost the letter, or it may have gone astray on its journey, and I will now proceed on mine, or, more correctly, *we* will, because I have always somebody at my elbow trying her best to keep me right in my "manners," which is no easy task.

In my last "sereed," as some "rough diamond" of a gardener appears to describe articles which he reads, or are read to him, Mr. Charles Van Geert was described as my guide, philosopher, and friend in my wanderings about Antwerp. As a guide a long life spent there constitutes him one of the best, for he is acquainted with all that is best worth seeing and all who are best worth knowing. As a philosopher, if that term means, as it does, a person versed in the governing principles of Nature and the art of cultivation, it is in this case correctly applied. As a friend, if that means willingness to assist and bestow kindness, and enjoy doing so, as it does, then Mr. Van Geert was such a good friend to me that but for him not only must much have been missed that was seen, heard, and enjoyed, but I should more than once have been lost in my wanderings, as I was several years ago, when every narrow street I passed down led me just where I did not want to be, and the worst of it was, the further I got into the maze the heavier the rain poured down, giving me what plants like in summer, a "thorough good drenching." I find there are two things good for the memory, getting into a difficulty and getting out again, and if any of my readers find himself rushing up and down streets for an hour that lead to the wrong place, in a pouring rain, with nobody to understand a word he says, he will not soon forget the experience, nor will he the pleasure that follows on finding himself among friends again who greet him in his mother tongue, which sounds quite musical under the circumstances. During my first visit to Belgium many years ago I had as a companion as fine a type of "John Bull" as the continentals could imagine. He was quite a favourite with them, but was bothered by their language. Arriving at our Hotel in Brussels from Waterloo we heard above the babel of "clatter," as he called it, of the company, something that appeared to have the same effect on him that we are told the trumpet has on a war horse—aroused him to action, for he jumped with joy, exclaiming, "I hear some Englishmen, Darby, and must go and treat 'em." They were not slow to take in the situation, and one of them promptly said, "Make yourself comfortable, old man, we will protect you, as we are British volunteers." It was an amusing moment, and he was soon surrounded with patrons.

After seeing the sights of Antwerp last September—the splendid new museum and other attractions, and noting the improvements and extensions of the prosperous city—we had a delightful day in the country. Mr. Van Geert's estate at Calmpthout is just such as to afford pleasure to visitors who are interested in farming, and especially in trees and shrubs—not that the farming is superior to English models, but different, and it is that which invests it with interest. Mrs. Darby, as a *ci-devant* dairywoman, was acquainted with the uses of certain animals, but it was new to her to see them dragging home cartloads of Potatoes. This was not, however, on the land of our guide. His flock of sheep was different, and differently managed to those on her home farm. They are long-tailed animals, follow the shepherd lazily all the day, nibbling as they go, then he leads them home at night to their shelter and food—such large well-appointed buildings as are not seen in England devoted to the same purpose. We appeared to see here in reality the customs of the patriarchal shepherds of the East, as represented in pictures—shepherds who love their sheep, and are known by them because tended so kindly. How different seems this pastoral ease—these well-bedded, well-roofed buildings, with food racks all round, in which the animals are kept warm—from the harder routine business methods of British farmers, whose sheep were half buried in snow for weeks last winter (thermometer below zero) in the most exposed of Turnip fields. One of my friends has considerably over 1000 that know not what roof shelter means after they are a fortnight old to the end of their days. This procedure can scarcely be comprehended by our Belgian friends, who must presumably be content with less profits than those accruing to the sheep farmers of this country. The waste products, however, of the flock herded at night have a special value to Mr. Van Geert for his nursery, through which we next saunter admiringly.

This nursery differs from all others in Belgium, and it would be difficult to find its parallel elsewhere. It may be described as a museum of hardy trees and shrubs systematically arranged, and the whole forming a most enjoyable pleasure ground. It is disposed in a series of narrow avenues with neatly kept divisional Conifer hedges about 6 feet high, and here and there cross hedges which arch over the central path. Many kinds of Conifers are represented in these hedges. One of the best, perhaps, for the purpose is *Thuja gigantea*, often sold as *T. Lobbi*; but several others have an agreeable appearance, and might be preferred by some persons who desire ornamental and effectual screens in their gardens. The main avenue is remarkable for rows of purple Beeches.

which stand like prim dark-robed sentinels 20 or more feet high. The trees are, roughly speaking, 3 feet wide at the base, and taper to a point like the slender spire of a church. In square "bays" in front of them stands many a stately Conifer, and the collection of specimens would have been more complete but for the requirements of the king to whom they were readily supplied by one of the most loyal of his subjects; but they would have been yielded with great reluctance to anyone else, if supplied at all. Mr. Van Geert, sen., is a connoisseur and amateur-lover of trees, and has planted large numbers for his own pleasure and for purposes of comparison and instruction, not for sale. His son, Mr. Charles Van Geert, may be regarded as the business representative, and in this respect enjoys, as he deserves, an European reputation. There is no catchpenny habits of business about the Van Geerts, for these they are too high-minded and well circumstanced, like many of our good people at home.

To begin noticing what was noticeable in the great collection would of necessity lead to a difficulty—namely, where to stop. The contents of the nurseries require a catalogue of 130 pages, and descriptions of special trees, shrubs, and plants are given in concise footnotes, rendering the work instructive. An example of two or three may be given. For instance, the reference to *Acer Reitenbachii* (4), is "a Maple remarkable for its vigour and its beautiful purple foliage, which is darker in autumn." Then we pass on a few pages to *Robinia semperflorans* (64), "extremely floriferous notwithstanding its great vigour, producing from May to September without any break, beautiful clusters of white flowers, deliciously perfumed." Again, *Rhamnus immeritina* (129), "The most beautiful of all the *Rhamnus*; its dark green, honeycombed leaves are of very large size." In the collection of Osiers *Salix uralense* (134) is described as having very long growths, with clear green bark, and of extreme tenacity; it is perhaps the best species for Osier beds. Then going almost to the end of the work, to the fine collection of Hollies, the distinct hardy robust form that was so prominent, *Ilex Aquifolium camelliæfolia* (469), is said to have large shining, almost spineless leaves, and is considered one of the most beautiful of the green Hollies. It excels the familiar varieties *Hodginsi*, *Shepherdi*, and all others with large green leaves, by its dark glossy smooth foliage. Those are samples merely of what may be found in the well arranged and carefully prepared pages.

Leaving what was growing so well in the different sections, a pause may be made to notice the preparation of that which makes them grow. The natural soil is sandy, and could not therefore contain all that trees and shrubs need for their perfect health and root production, and especially are suitable additions to insure permanent fertility. For root production humus is the chief essential, and for sustaining growth phosphates and potash. All these are provided. Large, neatly made compost heaps, containing hundreds of loads, are seen in various stages of decomposition. The bulk consists of vegetable matter, leaves from Fir and other trees, obtained from forests and collected at home. They are turned at suitable intervals, and enriched with liquid manure, in which is conveyed the required constituents in proportions calculated to complete the fertility of the soil for the purpose in view. So valuable is this prepared compost found to be that large quantities are required at Laeken by Mr. H. Knight, His Majesty's highly skilled gardener, for general cultural work, and the various kinds of plants that are grown there show that they have what they need. At Calmthout the compost is used when Conifers, shrubs, and trees are planted, but in the case of those intended for removal it is not dug into the land, but the excavations for the roots are lined with it 2 or 3 inches thick, more or less, according to circumstances. This causes a great multiplication of fibrous roots in a prescribed area, and when the specimens are taken up they have a wig-like mass of roots of the right kind for their quick re-establishment. During the bright hot days of early September truck-loads were taken up, the roots surrounded with moist packing material, closely matted, and there they were, unshaded and unsprayed, awaiting removal to Germany, yet not a Conifer shoot displayed the least signs of drooping, though many of the well-furnished specimens were from 12 to 15 feet high. To the inquiry, "Are you not afraid of the sun injuring them?" the answer of Mr. Van Geert, jun., was smilingly but emphatically given, "Not the slightest, and every one will grow after the exposure and long journey; it would not do, you know, to send trees that would die." This is the great tree, shrub, and Conifer emporium of the Continent, and is highly worth a visit by arboriculturists who have a little time to spare when at Antwerp, and they would be certain to find much to admire, and probably come away a little wiser than they went.

The château is the commodious and well-appointed country home of the family, the presiding genius at the time of our visit being Madame Roosas, a daughter of the esteemed head, whose graceful kindness to her visitors will not soon be forgotten. Of the city nursery only a small portion remains attached to the family home as a sample ground, fine streets of stately houses standing where trees were raised in thousands a very few years ago. But even the streets are memorials of famous men connected with gardening—Dodoens Street, Linnaeus Street, Horticulture Street, Van Geert Street, if memory faileth not. Certainly the change has been great, and, it must be added, profitable. It is a case of the city eating up what was once cheap country land because outside the fortifications, but long since brought within the stupendous protecting lines. After an enjoyable rest with our friends, pleasant converse and good guidance, for which they are thanked, we passed to other good friends—the famous Belgian amateur gardeners, Mr. and Mrs. Jean Everaerts, who gave a hearty welcome to—DARBY AND JOAN.

### GERBERA JAMESONI.

At the recent meeting of the Royal Horticultural Society in the Chiswick Garden Messrs. J. Veitch & Sons of Chelsea exhibited a plant of a little known member of the family Compositæ, *Gerbera Jamesoni*. Possibly within the past year or two it may have attracted the attention of some visitors to the Royal Gardens, Kew, as plants have flowered several times in the Cape house, also in the cool house for Alpines, and very

FIG. 10.—GERBERA JAMESONI.

conspicuous they were. The flower heads are extremely bright orange scarlet, and have long narrow equally spreading florets, which give a distinct appearance to the plant, as the heads are borne on long slender stems, and have an erect pose that enables them to be seen to the best advantage. The leaves are clustered close to the base of the plant, irregularly undulated, and of a peculiar metallic green hue.

It appears to succeed in ordinary moderately light soil, and thrives in a cool house, but it has also been recommended for a warm position on a rockery where it can be protected from frost. This *Gerbera* is a native of the Transvaal, whence it was introduced about four years ago.

## GARDENERS' ORPHAN FUND.

## ROSE FAIR AND FLORAL FÊTE AT THE CRYSTAL PALACE.

LOVELY summer weather and a brilliant display of floral beauty rewarded visitors to the Crystal Palace on Wednesday, July 15th. Sunshine and Roses are a combination that appeals powerfully to everyone, and when to enjoy them is to help in the cause of charity the pleasure in them is doubled. It is fitting that any attempt to aid the good work of such a fund as this should be associated with flowers. Their influences are softening and sweetening, and if people can be encouraged to go a little beyond the enjoyment of the moment and give a thought to those, hard-worked and ill-paid, who are the main instruments in producing the exquisite blossoms in whose beauty and fragrance they find enjoyment, the chances are that the flood-gates of sympathy will be thrown open wider than they would otherwise be on behalf of the fatherless. Let a just tribute be paid to the tact and consideration with which the disposal of fruit and flowers for the augmentation of the Fund was accomplished on this occasion. With recollections of various "fancy fairs" crowded with stalls presided over by titled dames at which our representative had found himself seized and held up to ransom, he felt somewhat apprehensive for his safety at the Palace, but all was considerate and unobtrusive. Mr. Barron's fair assistants secured their ends by gentle offerings and appealing glances, which, after all, are woman's best armament. A basket of Strawberries better than he could buy at a fruiterer's shop was offered to him at a lower price, and glorious clusters of Roses fresh from the great nurseries were proffered just as cheaply. There was value, and more than value, for money, but a refusal to buy was not followed by importunity, while a purchase was rewarded with the sweetest of smiles in addition to the fruit or flowers that were bought. There was no cream to the Strawberries, but—however, the subject may be left, or the Editor may regret not having sent a more staid and less impressionable representative for the occasion.

Roses were, of course, the attraction of the day. They were there in thousands, and they had been given by generous helpers in various parts of the kingdom. In the auditorium there was a veritable feast of Roses. A huge square had been formed of staging 5 feet broad, ample space being left in the centre for a group of graceful Palms and Tree Ferns. The staging was covered with Roses, not arranged in any formal way, but laid close together on a carpet of moss. They were represented in wondrous beauty and diversity, and in all shades of colour that the Queen of Flowers boasts. Lustrous Hybrid Perpetuals lay side by side with delicate Teas. One recognised the familiar shell-like petals of *La France*—beautiful queenly *La France*—the brilliant garb of A. K. Williams, the warm glow of *Xavier Olibo*, the rosy sheen of *Marquise de Castellane*, the pearly whiteness of *The Bride*, and the rich golden brightness of *Maréchal Niel*. No wonder that visitors thronged around and exhausted their adjectives in admiration. This magnificent collection was the contribution of many growers. Mr. Turner of Slough had sent a large number, and others had come from Mr. W. Rumsey of Waltham Cross; Messrs. G. W. Piper & Sons of Uckfield; Mr. W. H. Dwyers, Ketton Hall, Stamford; Messrs. Carter & Co., High Holborn; Messrs. Keynes, Williams, & Co., Salisbury; Messrs. Peed & Sons, West Norwood; Mr. Maurice Young, Godalming; Messrs. Jefferies and Sons, Cirencester; Mr. Frank Cant, Colchester; Mr. J. Smith, Mentmore; Messrs. Cannell & Sons, Swanley; Mr. H. B. May, Edmonton; Messrs. W. Paul & Son, Waltham Cross; Mr. Such, Maidenhead; Mr. Wythes, Syon House; Mr. Cummins, Hackbridge; Messrs. Cheal and Sons, Crawley; Messrs. J. Laing & Sons, Forest Hill; Messrs. Fromow & Sons, Turnham Green; Messrs. Dickson, Limited, Chester; Mr. J. Rose, Lockinge Park; Mr. G. Prince, Oxford; and Mr. Smale. It was a royal display, and to every participant therein the thanks of the orphans are due. These flowers were on sale after six o'clock, but there were ten stalls in the nave, admirably and tastefully furnished, where fruit and flowers were being sold during the afternoon.

Apart from the great Rose display and the stalls alluded to several nurserymen had sent special collections of plants, which were arranged in the great nave and auditorium, and greatly enhanced the beauty of the "fair." Mr. H. B. May had one of his delightful displays of Ferns, cool and inviting in the hot weather. Mr. Chard of Stoke Newington had what he termed "Arcadian floral decorations," consisting of wire arches intertwined with crimson Roses and yellow Columbines, nestling amongst Ferns and other foliage. Messrs. Laing & Sons had a splendid stand of their famous Begonias, double and single prize varieties beautifully arranged, and it excited great admiration. Messrs. B. S. Williams and Son supplied a welcome feature in a group of flowering and foliage plants. Messrs. Cannell & Sons had provided a stall furnished with Roses, Begonias, and small succulent and other plants in pots for sale, a practical and admirable idea, carried out also by Messrs. Reid & Bornemann. Messrs. Peed & Son had a lovely bank of Gloxinias and Ferns, also a group of flowering and foliage plants. Mr. J. R. Box, Croydon, had an attractive group of Begonias, Caladiums, and Gloxinias; and Messrs. Carter & Co. had a beautiful stand of their choice Petunias in various colours, also Cacti, a most pleasing and unique display. Besides these there was a collection of cut flowers, comprising Roses, Canterbury Bells, Potentillas, Sweet Williams, Gaillardias, Iris Kämpferi, and others from Messrs. J. Veitch & Sons, Chelsea, stands of Roses and herbaceous flowers from Messrs. Cheal & Sons, and an extensive display of herbaceous plants by Messrs. Barr & Son, Covent Garden. There was also a very large and beautiful collection of cut flowers sent from various parts of the country for sale. Messrs. Bunyard, Cannell, and Williams had generously given supplies of Strawberries.

For visitors of an athletic turn a novel attraction was provided in the form of a cricket match between teams of gardeners and seedsmen, the former led by the stalwart Mr. E. Molyneux, and the latter by the equally stalwart Mr. C. H. Sharman. When our representative visited the scene of action he found the blue aprons getting slighter the better of the black ditto, and they eventually won somewhat decisively on the first innings, although the seedsmen got on much better when they started the second, which was unfinished. Without wishing the Journal to depart from its recognised province and intrude upon that of its sporting contemporaries our representative thought it might be of interest to give the respective scores, as the circumstances of the match were so exceptional and its motives so praiseworthy.

**Seedsmen:**—Pugh, b Agate, 0; E. Pollard, b Agate, 17; Sampson, b Floyd, 16; Cannell, c Rowbottom, b Agate, 10; Hurst, b Agate, 3; A. S. Young, st Rose, b Agate, 19; Ainsworth, b Floyd, 0; F. Pollard, b Floyd, 15; Ellis, b Agate, 1; C. H. Sharman, jun., b Floyd, 1; H. Young, b Floyd, 0; Parr, c Agate, b Floyd, 0; Pearson, b Floyd, 2; C. H. Sharman (Captain), not out, 3; Extras 5.—Total 92.

**Gardeners:**—Battell, c Sampson, b E. Pollard, 11; Cripps, c F. Pollard, b Hurst, 2; Hathaway, l b w, b Hurst, 3; Cower, run out, 0; Doe, b Pugh, 14; Agate, l b w, b Ellis, 2; Record, b Pugh, 5; Rowbottom, c H. Young, b Sampson, 11; Floyd, c Cannell, b F. Pollard, 20; Allman, c Sampson, b F. Pollard, 28; Rose, c Sampson, b C. H. Sharman, 1; Fassum, not out, 9; Dines, b F. Pollard, 0; Molyneux, b F. Pollard, 11; Extras 13.—Total, 130. In their second innings the seedmen had scored 68 for 2 wickets, Pugh making 25, E. Pollard 12, Sampson (not out) 23, and Cannell (not out) 5, with 3 extras.

Both indoors and out Rose day at the Palace was one of quiet enjoyment. It was not crowded, but the attendance was good, and it is to be hoped that the proceeds will prove satisfactory to the Fund. Mr. Barron, Mr. Head, and all their assistants worked so well that any other result would be a great disappointment. If the fixture became an annual one it would increase in popularity as it became better known. Should it do so may the sun ever smile as brightly on Roses and Charity as in 1891.

**EVENTS OF THE WEEK.**—The Rose shows are now rapidly drawing to a close. Two are announced for to-day (Thursday), Halifax and Worksop, and the last one we have on our list is Ripley (Derby) on Saturday, August 1st. On Thursday, July 30th, the St. Ives Society (Hunts) will hold their sixteenth annual Show, while in the first and second weeks of August there will be important Exhibitions at Southampton, Northampton, and Cardiff. For Friday, July 24th, Messrs. Protheroe and Morris announce a sale of Orchids at Cheapside from Messrs. Charlesworth, Shuttleworth & Co., *Cattleya aurea* and *Laelia præstans* being the chief features. On Tuesday, July 28th, there will also be a sale of Orchids in flower in the same rooms.

— **THE WEATHER.**—Friday last, the 17th inst., was the hottest day of the year in the metropolitan district, 85° being registered in the shade by the Astronomer Royal at Greenwich. Very heavy thunder showers fell on the two following days, making the roads like rivers in some localities.

— **THE POTATO DISEASE.**—We have found several diseased tubers among Potatoes obtained in the market, and hear that the murrain is serious in some parts of Ireland. If wet and dull weather happen to prevail for a week, accompanied with a high temperature, the devastating fungus will be almost certain to appear in many gardens. "Anti-Blights," composed of preparations of copper and lime, are said, if applied in time, to prevent the germination of the *Peronospora* spores and to destroy the fungus if attacked in its earliest stages. The Royal Horticultural Society has, in the opinion of practical men lost a great opportunity in not giving a full and fair trial to the different preparations of the nature indicated at Chiswick. The objection to their being trade products cannot be a strong one, seeing that nearly all the articles tried in the gardens this year came within that category. We think it a pity that a trial of fungicides has not been made at Chiswick, which may be described as one of the seats of the Potato disease in this country.

— **POTATOES.**—These at present are very healthy. I have had a large portion of our crops dressed with a preparation of copper in powder as used in France. We are now passing through the critical time when the disease usually appears. I will report the result of the application.—R. M., Newbury.

— WE regret to have to announce the death of Mr. FRANK MILES, a gentleman well known in the horticultural world, and who, during a portion of his too short life, did much to diffuse and foster the returning taste for the cultivation of the hardy perennial flowers of the garden, and especially for bulbous rooted plants. Mr. Miles was born at Bingham Rectory, near Nottingham, where his father, Canon Miles, was for many years rector, and in the same house which gave birth to Lord Sherbrooke, better known as Mr. Robert Lowe, the distinguished parliamentary debater. From his youth he was an ardent florist. When we first met him at his father's rectory we found him driving a wheelbarrow, doing the work with as great, if not greater, zest as any hired workman, and his father humorously introduced him as "the head gardener." Inheriting the genius of his gifted and accomplished mother, he mingled with his love of gardening a passion for art. After finishing his school career he was articled to Mr. Butterfield, the eminent architect, in whose office he spent some time; but architecture was not his forte, and having relinquished any intention of making it his profession, he devoted himself to the art of design. About this time he made a happy hit when he published that series of drawings which seemed to charm the public as if by magic. Go where one would there were "The Gardener's Daughter" and the accompanying series of Frank Miles' sketches. In barristers' chambers and in the rooms of the Universities as well as in those of refined households Frank Miles' name was familiar through his pictorial sketches. In conjunction with his friend, Mr. Oskar Wilde, he for a time acquired some notoriety in connection with the æsthetic movement in art when it was thought the right thing to glorify Sunflowers, to dress oddly, and to eschew all that had before been considered beautiful as a remnant of barbarism and bad taste. But it was at the shrines of Art and Horticulture that Mr. Miles worshipped. Mr. Frank Miles was born on the 22nd April, 1852. He died at the Manor House Abbots Leigh, near Bristol, on Wednesday, the 15th inst., and was buried at Almondsbury, near Bristol, where his brother is vicar, on Saturday last. He had been in weak health for some time, and the immediate cause of his death was paralysis. He was one of the most lovable and loving of men, and all who had the privilege of his friendship will long regret his early death.

— PRESERVING FLOWERS.—The following ancient method which comes from America as new may be worth repeating and trying:—Take very fine sand, wash it perfectly clean, and when dry sift it through a fine sieve into a pan. When the sand is deep enough to hold the flowers in an upright position, take some more sifted sand and carefully cover them. A spoon is a good thing to take for this, as it fills in every chink and cranny without breaking or bending the leaves. When the pan is filled solidly leave the flowers to dry for several days. It is a good plan to warm the sand in the oven before using it, as the flowers will then dry more thoroughly. In taking the sand off great care must be taken not to break the leaves, as they are now dry and brittle. Pansies preserved in this way will keep their shape and brilliancy of colour all winter, and many other flowers can be equally successfully treated—anything, in fact, where the full pressure of the sand comes on both sides of the leaf; otherwise they will shrivel. To fill in flowers with cup-like shapes it is better to lay them on the sand, and with a small spoon fill in and around each flower. Ferns when preserved in this way have a more natural look than when pressed, and the Maiden-hair Fern looks almost as well as when it is freshly gathered.

— BOTHWELL BANK AND DR. LIVINGSTONE STRAWBERRY.—There is within half a mile of my place, at the seat of J. C. Burns, Esq., of Glenlee, a plantation of Strawberries which were sent from Castle Wemyss as pure Bothwell Bank. There are, however, a few plants of Keens' Seedling and one or two others. The main body of them, however, are distinct, and in habit, fruitfulness, and fruit, &c., identical with Dr. Livingstone Strawberry. That does not justify me saying it is Dr. Livingstone, as I have frequently raised seedlings that could not be distinguished from previous existing varieties; besides mistakes may occur in the execution of orders and the exact variety wanted not be obtained. Dr. Livingstone was extensively grown within a few yards of that distinguished traveller's birthplace, as well as on the opposite side of the Clyde, close to where the Bothwell Bank was said to be found growing beneath a Gooseberry bush. New Strawberry plants growing out of the plantation may or may not be seedlings. Jackdaws are numerous in the district, Bothwell Castle being one of their retreats. These birds are proverbial for carrying things from one place to another, and it is not unlikely that a plant of Dr. Livingstone was dropped by them at Bothwell Bank, and taking root might be thought a seedling.—W. T., *Blantyre*.

— ROYAL COUNTIES AGRICULTURAL SOCIETY'S SHOW AT PORTSMOUTH.—We are informed that the Council of the Royal Counties Agricultural Society accepted the offer made by Messrs. Sutton & Sons, Reading, to gratuitously undertake the floral decorations of the Royal box in the grand stand, and the whole interior of the box was tastefully decorated with flowers consisting of Calendulas, Canterbury Bells, annual Chrysanthemums, Clarkias, Delphiniums, Hawkweeds, Linarias, Sweet Peas, and Sweet Williams, from Messrs. Sutton's Seed Trial Farm at Reading. In front of the Royal visitors was a charming display of new Begonia raised by the firm, named the Duchess of Edinburgh, colour white suffused with pink, this being the first time of its exhibition.

— FRUIT PROSPECTS.—The promise of spring was most hopeful of abundant crops of all kinds of hardy fruit. The Whitsuntide frosts did us a little damage, but not much. It thinned the Gooseberries, but still left a good crop on the bushes, which are free from caterpillars. Currants are a heavy crop of all kinds; Strawberries are, and have been, a fine crop, not so large as usual owing to the absence of June rains, but of excellent flavour. The rains seem to have been very partial. We had only 0.89 inch for the month of June, and up to this (20th of July) barely an inch in the twenty days. Cherries are a very good crop; Morellos on walls abundant. Raspberries are very good, Plums most abundant, some trees of Victoria Winesap and Damsons we are having staked and tied to prevent the trees breaking. Apples are only a moderate crop. They generally set well, but many fell in the June drought. Pears a moderate crop, trees fairly healthy, sprayed with quassia and softsoap. The flavour of the new Strawberries—Noble, John Ruskin, and A. F. Barron—with me is most disappointing.—R. MAHER, *Yattendon Court, Newbury*.

— EALING HORTICULTURAL SOCIETY.—The twenty-seventh annual Exhibition of this Society took place on 15th inst. in the beautiful grounds of Hanger Hill House, by kind permission of E. M. Nelson, Esq., J.P., whose gardens, under the able management of Mr. E. Chadwick, are just now in grand order. Some pretty groups of plants, arranged for effect, were displayed. The most successful exhibitors in this department were Mr. Denison, gardener to T. A. Gledstanes, Esq., Old Manor House; Mr. H. Viner, gardener to R. Dawes, Esq., Edmondscote, &c. Mr. E. Chadwick, as usual, came well to the front in the cut flower section, whilst Miss Lilian Hudson, Gunnersbury, was simply invincible in the stands of flowers and foliage for dinner table decorations. In this department very beautiful were the bouquets, showing much taste in composition, contributed by Mrs. H. B. Smith, Court florist, Broadway, Ealing, not for competition. The cottagers, as is always the case here, made a good display of flowers, fruit, and vegetables. Non-competitive groups of plants and flowers, forming distinct and attractive features, were sent by Messrs. C. Lee & Son, Hammersmith, the cut Roses from their Ealing branch being universally admired; Mr. Reynolds, gardener to the Messrs. de Rothschild, Gunnersbury Park; Mr. G. Weeden, St. John's Nursery, Ealing; and Mr. Holden, florist, &c., Acton. The management of the Show reflected the highest credit on the courteous Hon. Secretaries, Messrs. Cannon and Dawes, who worked hard to render the Exhibition a great success, as it undoubtedly was, both horticulturally and financially.

— PINKS AND PEAS AT CHISWICK.—On the occasion of the Chiswick Conference in July a sub-committee selected from the Floral Committee examined the collection of border Pinks growing in the garden, and awarded three marks (xxx) to each of the following varieties:—Her Majesty (Hooper), Beauty of Bath (Hooper), Modesty (Turner), Hettie Dean (Dean), Charmer (Dean), Mrs. Dark (Dean). The Fruit and Vegetable Committee examined the collection of Peas growing in the garden, and awarded three marks (xxx) to the following sorts:—Ameer (Harrison & Sons), Early Green Marrow, Sutton's Empress of India (Sutton & Sons), Early Green Wrinkled. This Committee met again on 14th inst., when three marks (xxx) were awarded to the following varieties of Peas, as representing the best types in the collection:—Duke of Albany (Veitch), tall Green Marrow; Telephone (Veitch), tall Green Marrow; Chelsonian (Veitch), tall Green Marrow; Extra Dwarf Daisy (Carter & Co.), Green Marrow; Critic (Eckford), tall; Essential (Eckford), tall; Epieure (Eckford), tall; The Echo (Eckford), dwarf; Alderman (Laxton), tall; The Marquis (Laxton), tall. Two marks (xx) were awarded to the following varieties:—Sutton's Early Marrow-fat (Sutton & Sons), dwarf; Optimum (Laxton), tall. A first class certificate was awarded to Potato Early Short Top, provisionally named "Laxton," a remarkably fine and early variety. Tubers large, fully grown, greatly in advance of any other variety.

— WE deeply regret to have to announce the death of MRS. PEARSON of the Chilwell Nurseries, Notts, widow of the late Mr. J. R. Pearson. For a considerable length of time Mrs. Pearson had been suffering from a painful malady which terminated her life on the 13th inst. at the age of sixty-six. Mrs. Pearson was buried in the churchyard of Attenborough by the side of her husband.

— READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—The members of this flourishing Society had their annual excursion last week, Blenheim being chosen as the rendezvous. According to a lengthy newspaper report which has been sent to us, they were delighted with the gardens and the reception accorded by Mr. T. Whillans.

— OLIVE CULTURE.—I have a rather large order from the United States for young Olive trees (one to two years old) of the best Spanish oil-yielding variety. Can any of your readers inform me from what part these can best be obtained, or put me in correspondence with a firm likely to supply them.—STEPHEN MENZIES, *Liverpool*.

— MESSRS. WEBB & SONS' EXCURSION.—We are informed that the employes of Messrs. Edward Webb & Sons, Stourbridge, visited the beautiful gardens of the Earl of Dudley at Witley Court last week. Major Webb, one of the principals of the firm, accompanied them, and a most enjoyable day was spent.

— DELPHINIUMS.—Messrs. Kelway & Sons have sent us individual flowers of a number of seedling Delphiniums. They appeared fresh in the box, but when taken out the petals fell from all but three—namely, King of Delphiniums, large, purple, very fine; Irene, pale lavender blue, full and attractive; and Britannia, the richest blue we have seen, and very beautiful. We regard Delphiniums as amongst the most stately and beautiful of summer garden flowers, and have them resembling pillars of beauty 8 feet high.

— THE MIDLAND COUNTIES CARNATION AND PICOTEE SOCIETY.—We are desired to remind intending exhibitors that the first Exhibition of this Society will be held at the Botanic Gardens, Birmingham, on Saturday, August 8th, and nearly £70 is offered in prizes. There is every reason to believe that a very fine display of blooms will be seen, especially as there are from six to seven prizes in a class. Notice of entries must reach the Secretary, Mr. W. Dean, Dolphin Road, Sparkhill, Birmingham, not later than the morning of Tuesday, August 4th. No entry will be received after that date. There is a special class for border Carnations.

— TOURIST'S GUIDE AND HOLIDAY HANDBOOKS.—We have received the illustrated Tourist Guide to the Continent, also notes on towns in Holland, Switzerland, &c., well prepared and attractively presented by Mr. Percy Lindley for the Great Eastern Railway Company, and published at 125, Fleet Street. The Continental route to which attention is invited has won a wide reputation, and the scenes depicted in other lands and interesting matter pertaining thereto may well be consulted by persons who are anticipating a holiday trip beyond the confines of the kingdom.

— THE WEATHER LAST MONTH.—June was dull on the whole. We only had three bright days during the month, and no rain fell for a period of seventeen consecutive days—viz., 7th to 22nd inclusive. Wind was in an easterly direction seventeen days. Barometer was highest on the 12th at noon, 30.43; lowest on 29th at 9 P.M., 29.77. Highest shade temperature was 80°, on the 24th; lowest 38°, on 13th; lowest on grass 35°, on 11th. Mean maximum temperature, 68.06°; mean minimum, 49.03°; mean temperature of the month, 58.54°. Total rainfall 2.10 inches, which fell on ten days, the greatest daily fall being 0.70, on the 2nd. The garden spring ran 15 gallons per minute on the 30th.—W. H. DIVERS, *Ketton Hall, Stamford*.

— THE LEICESTER AND MIDLAND CHRYSANTHEMUM SOCIETY.—We have received the schedule of the Show that is to be held on November 13th and 14th. Instead of a great forty-eight bloom class of incurved and Japanese blooms, two classes are provided with a first prize of £5 in each for twenty-four incurved and twenty-four Japanese blooms respectively, and we trust the change will be as satisfactory to exhibitors and the public as it is certain to be to the Judges. A silver cup for twenty-four blooms, twelve incurved and twelve Japanese, grown in Leicestershire is offered by the tradesmen of Leicester. Substantial prizes, to be competed for by working men (not tradesmen nor professionals) are thoughtfully provided by Thomas Brooks, Esq., Barkby Hall.

— TEA ROSES AT REIGATE.—We find that the beautiful bloom of The Bride, which was described as perhaps the finest Rose in the Reigate Show, was in the first prize stand of nine Teas exhibited by Rev. F. Page Roberts, and not by Mr. Bethune as inadvertently stated in our report on page 53 last week.

— PRODUCTIVE TOMATOES.—I read with great interest the letter of Mr. Buchanan in your issue of 9th inst., and if he could find time to give us a little more information on Tomato growing I think many of your readers would be pleased. I should like to know what variety of Tomatoes were grown? The size and form of houses? What distance apart were the plants? How did he treat them as regards manure, water, and heat? and was the price named realised by salesmen in the open market?—A.

— MR. SYMONS' "METEOROLOGICAL MAGAZINE" for June contains an account of producing rain artificially by violent explosions of balloons filled with hydrogen and oxygen gas. It appears the United States Congress had voted a sum of £1800 for defraying the cost of experiments. We are reminded that the idea is not new, but was proposed several years ago, after considering the circumstance of rain falling after great battles in which artillery played a prominent part. A recent experiment in America is said to have had the desired results. When our enterprising friends have accomplished their object of producing rain it may be desirable for them to devise methods for stopping it when too much falls in fruit time, hay time, and harvest, and spoils the crops.

— NATIONAL PINK SOCIETY'S SHOW AT MANCHESTER.—This Exhibition was held in connection with the Rose Show, and the following prizes were awarded:—Twelve laced Pinks.—First, Mr. A. R. Brown, Birmingham. Second, Mr. S. Barlow. Third, Mr. W. Taylor. Six bloom laced Pinks, six varieties.—First, Mr. C. F. Thurstan, Wolverhampton. Second, Mr. A. R. Brown. Third, Mr. S. Barlow. Six blooms, three varieties.—First, Mr. A. R. Brown. Second, Mr. W. Taylor. Third, Mr. S. Barlow, Mr. Brown taking an extra prize for the best red-laced and purple-laced Pink in the Show. Mr. Walkden, Sale, had a miscellaneous collection, and was awarded a prize for a new variety named Souvenir de Sale. The charming flowers were greatly admired.

## NATIONAL CARNATION AND PICOTEE SOCIETY.

### SOUTHERN SECTION.

THE annual Exhibition of this Society was held in conjunction with the Committee meetings of the R.H.S. at the Drill Hall, Westminster, on Tuesday, July 21st. As anticipated from the lateness of the season it was hardly up to the usual point of excellence. A fortnight, or even a week longer, would have made a great difference. Mr. Rowan was quite unable to do himself justice, and Mr. Sydenham and others were unable to compete at all. However, a good display of flowers was obtained, and the Show proved to be an interesting one.

### CARNATIONS.

As on many previous occasions the struggle for first place with twenty-four Carnations resolved itself into a duel between Mr. C. Turner, Royal Nurseries, Slough, and Mr. J. Douglas, gardener to Mrs. Whitbourn, Great Gearies, Ilford. The blooms are late this year, and will be seen in better condition later on. Nevertheless both were excellent stands. Mr. Turner was first with fresh clean flowers, comprising the following varieties:—Back row: Jupiter, Dr. Foster, Hutchinson's Rose, Juno (two), Clementine, Mrs. Payne, and Squire Potts. Middle row: Jas. Taylor, Dr. Hogg, Jupiter, Robt. Houlgrave, E. Adams, Charles Turner (two), and Squire Trow. Front row: Robt. Houlgrave, Dr. Foster, Saturn, E. S. Dodwell (two), Teresa (two), and Dr. Hogg. Mr. Douglas's flowers were much smaller, but his Thalia, Mrs. Gorton, John Keet, and Mayor of Nottingham were very good.

There were four stands of twelve, Mr. Douglas winning with Sarah Payne, Thalia, James Douglas, William Skirving, Squire Potts, Alisemond, Wm. Wardill, Master Stanley, and four seedlings, one (203) a charming purple flake. Mr. C. Phillips, 18, Hamilton Road, Reading, was second with fresh, bright but small blooms; James Douglas and Mayor of Nottingham were the best. Mr. H. W. Headland, The Firs, Leyton, was third with larger but somewhat rough flowers, and the Rev. L. R. Flood (gardener, Mr. Gilbert), Merrow, Guildford, was fourth. Mr. F. Nutt, 15, Rose Road, Southampton, won with six, Sarah Payne, Crista-galli, John Keet, Jas. Douglas, Joseph Lakin, and Alisemond representing him admirably, though one or two were hardly filled. Crista-galli was a capital example. Mr. J. J. Keen, 15, Castle Street, Bevois Town, Southampton, was second with equally large but rather rough flowers. Mr. T. H. Catley, 16, Claverton Buildings, Bath, was third; Mr. G. Chaundy, William Street, Marston Road, Oxford, fourth; Mr. Rowan, 36, Manor Street, Clapham, fifth; and Mr. Sanders, gardener to Viscountess Chewton, Bookham Lodge, Cobham, sixth.

*Single Specimens.*—In the scarlet bizarres Mr. J. Keen was first with Squire Potts, Mr. Douglas second with Robert Houlgrave, and third

with Master Stanley; Mr. Lakin fourth with Mars, and Mr. Chaundy fifth with Admiral Curzon. In the crimson bizarres Mr. Douglas was first with a seedling, and third with Wm. Skirving; Mr. Hooper second with Squire Dodwell, Mr. Phillips fourth with Harrison Weir, and Mr. Headland fifth with J. D. Hextall. In the pink and purple bizarres Mr. Nutt was first with Sarah Payne, Mr. Douglas second with the same variety, Mr. Headland third with Squire Llewelyn, and Mr. Turner fourth with James Taylor. In the purple flakes Mr. Douglas was first with his seedling before referred to (203), Mr. Sanders second with James Douglas, Mr. Rowan third with the same variety, Mr. Hooper fourth with a seedling, and Mr. Turner fifth with Squire Trow. In the scarlet flakes Mr. Douglas was first with Cannell, jun., and third with Alismond; Mr. Keen second with Matador, Mr. Headland fourth with Henry Cannell, and Mr. Phillips fifth with Sportsman. In the rose flakes Mr. Lakin was first with Mrs. Gibson and third with Lovely Mary, Mr. Douglas second and fifth with Thalia, and Mr. Hooper fourth with Mrs. George Cooling.

#### PICOTEES.

The leading class for Picotees was a repetition of that for Carnations, only Mr. Turner and Mr. Douglas being able to muster a presentable twenty-four stand. They were first and second as before, Mr. Turner winning with the following:—Back row: Madeline (two), Favourite (two), Clara Penson, and three seedlings. Middle row: Miss Flowdy, Clara Penson, Lucy, Mrs. Rudd, and four seedlings. Front row: Mrs. Sharp, Mrs. Rudd, and six seedlings. These were a clean and well finished collection. Mr. Douglas's flowers were somewhat uneven in point of size, but they were in capital condition. The best of the three stands of twelve came from the Ilford grower, and it was a charming collection, the varieties being Liddington's Favourite, Brunette, Muriel, Thomas William, Miss Flowdy, Mrs. Sharp (two), Clara Penson, Violet M. Douglas, Mrs. Chancellor, John Smith, and a seedling. Mr. Phillips was a fair second, his flowers, though small, being very fresh and good in colour. Mr. Headland was third. There were five stands of six, Mr. Chaundy winning with Amelia (very good indeed), Annot Lyle, Winifred Esther, Mrs. Rudd, Juliette, and a seedling. Mr. Nutt was a close second, Mr. Sanders third, Mr. Catley fourth, and Mr. Flood fifth.

*Single Specimens.*—In the heavy red edge class Mr. Lakin was first and second with Isabel Lakin, Mr. Douglas third with Brunette and fourth with a seedling, and Mr. Phillips, judging by his bloom, fifth with Brunette, although a fourth card was affixed. In the light red edge Mr. Phillips was first and fifth with Thomas William, Mr. Douglas second with Violet Douglas and third with Thomas William, and Mr. Headland fourth with Mrs. Gorton. In the heavy purple edge Mr. Lakin was first and third with Amelia, Mr. Chaundy second and fourth with the same variety, and Mr. Douglas fifth with Muriel. In the light purple edge Mr. Turner was first and second with Clara Penson, Mr. Douglas third with Silvia, Mr. Phillips fourth with Clara Penson, and Mr. Headland fifth with Pride of Leyton. In the heavy rose edge Mr. Phillips was first with Mrs. Ricardo and third with Mrs. Sharp, Mr. Douglas second with the latter variety and fifth with Constance Heron, and Mr. W. Nicholls fourth with Lady Holmesdale. In the light rose edge Mr. Turner was first and third with Liddington's Favourite, Mr. Douglas second and fifth with a seedling, and Mr. Phillips fourth with Mrs. Ricardo. In the yellow grounds Mr. Douglas was first and second with a seedling, Mr. Turner third and fourth with Annie Douglas, and Mr. Headland fifth with a seedling.

Mr. Douglas had a charming box of twelve yellow grounds, all seedlings, unnamed, and Mr. Headland was second, also with seedlings. Mr. Chaundy won with six, showing Peter Barr, Stadtrath Bail, and four seedlings. Mr. Hooper, Vine Nursery, Bath, was a very good second, and Mr. Phillips third.

#### SELFS AND FANCIES.

Included in this section are some of the most beautiful and valued of Carnations and Picotees. The class for twenty-four brought out five stands, and Mr. Turner secured the first place with the following in charming condition. Back row: Almira (two), Victory (two), Hutchinson's Rose, Mrs. Reynolds Hole (two), and Alice Ayres, all the blooms being very fine. Middle row: Annie Douglas (two), Lord Rendlesham (two), Mrs. Maclaren, Ruby, and two seedlings. Front row: Ruby, Chas. Turner, Fimbriata alba (two), Germania, Duchess of Fife, Robt. Houlgrave, and Mrs. Maclaren. Mr. F. Hooper was second, also with a delightful stand, but some of the flowers were undersized and others imperfectly filled. Mr. Douglas was third with a large proportion of selfs, Mr. Catley fourth, and Mr. W. H. Divers, gardener to J. T. Hopwood, Esq., Ketton Hall, Stamford, fifth. There were eight stands of twelve, and they produced a lovely display. Mr. Rowan at last gained his old position of first, and he certainly had a splendid stand. The varieties were Purple Emperor (a grand bloom), Comtesse de Paris, Mrs. Reynolds Hole, Vice-President, Edith, Rose Celestial, President, Dodwell's 614, Mdlle. Darquille, Mrs. Du Croz, Prince of Wales, and Lady Agnes. Mr. Nutt was a good second with a very attractive stand, the blooms being large, fresh, and finely coloured. Mr. Phillips was third, Mr. Chaundy fourth, Mr. Headland fifth, and Mr. Sanders sixth.

The premier Carnation was H. Cannell, a scarlet flake in Mr. J. Keen's second prize stand of twelve, and the premier Picotee was Madeline, heavy rose edge, in Mr. Turner's first prize stand of twenty-four.

Specimens in pots were best shown by Mr. J. Douglas, the second prize going to Mr. Headland. The former had excellent examples.

A first-class certificate was awarded for Dr. Hogg, a scarlet bizarre Carnation in Mr. Turner's twenty-four stand; for Niphetos, a beautiful

white self of which flowering plants were shown by Mr. C. Blick, The Warren, Hayes Common; and for a scarlet seedling self, named Lady Gwendolen, apparently from the same exhibitor.

Mr. Martin Smith's prizes for border Carnations were withheld owing to lack of competition.

#### ROYAL HORTICULTURAL SOCIETY.

JULY 21st.

THE Drill Hall was again filled with exhibits. Four rows of tables the length of the Hall, besides some at the top, were occupied with plants, flowers, and fruits, the display of the last-named being very extensive and by far the best of the present season. A large portion of one row of tables was devoted to the Carnation and Picotee exhibition, while Orchids, hardy flowers, Roses, and miscellaneous exhibits were also represented by important contributions.

**FRUIT COMMITTEE.**—Present: P. Crowley, Esq., in the chair, with Dr. Hogg and Messrs. John Lee, T. F. Rivers, James H. Veitch, R. D. Blackmore, G. Norman, G. W. Cummins, J. Cheal, G. Bunyard, J. Willard, W. Denning, G. Wythes, H. Balderson, J. Hudson, J. Smith, T. J. Saltmarsh, F. Q. Lane, and J. Wright.

This was one of the most interesting meetings yet seen in the Hall. The Cherries, especially from Messrs. T. Rivers & Son, were marvellous, and the collection of Gooseberries and other small fruits from Messrs. James Veitch & Sons remarkable. The Ketton Hall Peaches and Gunton Park Strawberries were features of the day, and Messrs. James Carter & Co. contributed effectively to the vegetable department with a great assortment of Peas.

The first dishes placed on the table for examination were the Peaches just referred to from Mr. W. H. Divers, gardener to J. T. Hopwood, Esq., Ketton Hall, Derby. The six dishes consisted of Royal George, Sea Eagle, Barrington, the Nectarine Peach, Prince of Wales, and Princess of Wales. The five Sea Eagle fruits weighed 4 lbs. 9 ozs., the largest 12½ inches in circumference and weighed 16½ ozs. No such fruits have been previously submitted, and a silver medal was unanimously recommended. Mr. A. H. Rickwood, gardener to the Dowager Lady Freake, Fulwell Park, Twickenham, sent dishes of Dr. Hogg and Grosse Mignonne Peaches, large but pale, and a cultural commendation was awarded.

A new and oval shaped Melon was sent by Mr. B. Ashton, gardener to Lord Howard of Glossop, named Pride of Glossop, but distinctly over-ripe, also a very large ribbed fruit, but the flesh was too soft, and not of high quality. Two Melons were also sent by Mr. G. H. Mould, The Gardens, Frampton Court, Dorchester, but not in condition to merit any award.

F. Crisp, Esq. (Mr. H. A. Page, gardener), White House, New Southgate, sent a good dish of Lord Napier Nectarines, also excellent Cannon Hall Muscat Grapes, and a vote of thanks was unanimously awarded. Mr. T. H. Crisp sent from Canford Manor a small fruiting bush of what he described as a "new" White Currant. This was recognised as the old Cut-leaved or Shilling's White; somewhat small, but the fruits sweet. Mr. Crisp also sent a dish of Figs Ursule d'Avignon, but not equal in quality to many other varieties.

Mr. Allan, gardener to Lord Suffield, sent from Gunton Park his seedling Strawberries, one a large dark firm fruit of excellent quality being certificated under the name of Lord Suffield. A still larger variety named Gunton Park was also similarly honoured, the fruits being of huge size and of good colour and quality. Empress of India was richly flavoured, but considered somewhat too small. Plants of the varieties were also exhibited for showing their vigour and productiveness. Mr. Allan also sent magnificent fruits of Dr. Hogg Strawberry, for which a cultural commendation was unanimously awarded.

Mr. Crook, Ford Abbey, Chard, sent dishes of two seedling Tomatoes, a bunch of fifteen fruits of one weighing 4 lbs. The fruits were corrugated, and received no award.

Mr. W. A. Cook, gardener to Major Heneage, The Gardens, Compton Bassett, sent six dishes of Peas, the best being The Duchess, and a vote of thanks was awarded.

Dr. Hogg brought a fruiting branch of the Early Julyan Apple to show the character of the variety in the Weald of Sussex. There were forty-six fruits in a length of 3 feet, most of them being highly coloured. In most districts they are pale. It is a very early and useful Apple, much grown in some of the London market gardens. A vote of thanks was accorded.

Some very large Apples were sent through the Secretary of the Wellington Horticultural Society, New Zealand. They had been packed in charcoal, and been forty-two days in transit. They were all more or less decayed and worthless. The thanks of the Committee were recorded for the endeavour that had been made in sending the specimens to arrive in good condition.

Mr. Rivers had dishes of his new Plums Heron and Curlew placed on the table. They are medium size purple Plums with very firm flesh, and it was thought they would be suitable for drying. For this purpose they will be tried at Chiswick later in the season. Some of his new Nectarines were also tried, and their splendid flavour, imparted by the Stanwick, promptly admitted.

The Sawbridgeworth collection of fruit on the side table was next examined. There were sixteen boxes of such Cherries as have, perhaps, not been seen before, gathered from trees in a cool orchard house. There were also twelve dishes of Peaches, as well as several of Nectarines and Plums. A large silver-gilt Banksian medal was unanimously recommended for the collection. The Black Cherries

comprised Bigarreau Noir de Gueben, D'Espagne, Bedford Prolific, Large Black Bigarreau, Early Rivers, Black Hawk, and Turkey Black Heart; Reds: Griotte Imperiale, May Duke, and Emperor Francis; Amber Coloured: Bigarreau, Monstreuse de Mezel, Ludwig's Bigarreau, and White Bigarreau.

Messrs. J. Veitch & Sons had no less than 250 dishes of fruits in the Hall, also dozens of eordon branches of Gooseberries densely laden with their crop. A number of these were tied upright to a trellis for showing the adaptability of the Gooseberry to that method of culture, and in no other way could an equal weight of fruit be obtained on the same space of ground. Among the Raspberries in the collection Superlative was the finest, followed by Northumberland Fillbasket, Magnum Bonum, and Carter's Keighley Queen. Waterloo was conspicuous among the Strawberries, and among Currants, Red Versailles, White Transparent, and Lee's Black Prolific. A large silver-gilt Banksian medal was unanimously recommended for this great display.

Messrs. James Carter & Co. exhibited a fine representative collection of Peas, comprising eighty varieties, all sown on April 3rd, so that the relative earliness of the varieties was apparent. Some were ripe and ready for sowing again, others with huge full pods, and the later sorts still swelling to maturity. A silver medal was proposed for the collection, and not a hand was held up against it.

At the close of the ordinary duties of the Committee Mr. Rivers stated he had a resolution to propose bearing on the subject of fruit culture, which was now commanding attention. He said the Minister of Agriculture, in speaking at the Guildhall last week, did not appear to know the Royal Horticultural Society had a special Committee of the most competent men, and he thought the Society ought to take a more prominent position, and lead the way instead of being left behind, as an authority on the subject of fruit, especially as they possessed such a great collection of trees and varieties in their gardens. Mr. Rivers concluded his remarks by proposing the following resolution:—

"That it is desirable that the Royal Horticultural Society, acting through its Fruit Committee, should endeavour to guide farmers and others, who are intending to plant, in the choice of the best and most profitable sorts of fruits, and that a leaflet should be prepared by the Committee with the necessary information, and that such leaflets be distributed by the Royal Horticultural Society in the widest possible manner."

Mr. J. Wright, in seconding the resolution, said he had sometimes thought the Council were waiting for some expression of the views of their Fruit Committee on this question. It was most desirable and appropriate that the Society should, as they could, give good advice to all who need it on the subject of useful fruit production, and he was sure the Council would give the best consideration to the resolution. Mr. Bunyard and Mr. Crowley gave their strong approval to the object in view, and the resolution was passed unanimously. Dr. Hogg remarking he thought the Committee had done a good day's work.

FLORAL COMMITTEE.—Present: W. Marshall, Esq., in the chair; B. Wynne, W. Goldring, H. Herbst, H. B. May, F. Ross, G. Phippen, C. E. Pearson, J. T. Bennett, Pöe, T. W. Girdlestone, H. Turner, C. Noble, R. Dean, G. Ingram, G. Paul, and Dr. M. T. Masters.

Lilies were admirably shown by Mr. T. S. Ware, Tottenham, many beautiful varieties as well as the more distinct species being included. Veing notable was L. Humboldti with large rich orange dark spotted flowers, and with it was a hybrid named Amos Perry, said to be the result of a cross between L. pardalinum and L. Humboldti, partaking largely of the floral characters of the latter, but with rather smaller and more yellowish flowers. The exceedingly dark L. Martagon dalmaticum was noticeable in contrast with the lighter varieties. The brilliant scarlet L. chalcidonicum, the buff L. testaceum, the graceful L. canadense, and the stately L. giganteum were also well shown (silver Banksian medal).

A large group of Lilies similar to the above also came from Messrs. Paul & Son of Cheshunt, but with them were numerous choice hardy plants, and seven boxes of fresh bright and beautiful Roses, as well as some of the varied Cannas noted at a previous meeting. Especially welcome were the Roses, and many of the blooms would have occupied an important position in a competitive stand (silver Flora medal).

Too seldom are hardy ornamental trees and shrubs seen at these meetings, and the collection of cut branches from Messrs. J. Veitch and Sons, Chelsea, was therefore all the more attractive. Maples, Oaks, Nuts, and many other types were represented in golden, red, and variegated forms, showing much diversity in tints and foliage forms (silver Flora medal).

Verbenas are among the plants that were at one time frequently shown at the meetings of this Society, but are now rarely seen. On Tuesday last, however, Mr. W. Stacey, Dunmow, exhibited a box of about thirty-six trusses, including a selection from a large number of varieties raised during many years' attention to these plants. Some of the best were Arntillo, large flowers of a peculiarly bright pink colour, most handsome and effective; Acquisition, bright rosy salmon; Distinction, white flaked scarlet; Dr. Feyerlin, deep purple shaded; Falstaff, purple, white centre; Imperial Blue, blue, white centre; Lady Brooke, brilliant pink, dark centre; Maud, crimson with bluish centre; Purity, white; Rising Sun, extremely bright scarlet; and Rosy Morn, clear rose (silver Banksian medal).

Hardy flowers were capitally shown by Messrs. Kelway & Son, Langport, Gaillardias and Delphiniums being the chief features in an extensive display, and of both the varieties were of remarkable merit (silver Flora medal). Though not occupying so much space the group of hardy flowers from Messrs. Laing & Sons, Forest Hill, were equally as interesting, as it comprised many useful border plants. Gaillardias, Alstroemerias, Lilies, Pansies, Stocks, and innumerable other popular plants were included. Two fine double Tuberos Begonias were also

shown, named respectively Madame Tolpin, salmon pink; and Felix Margot, brilliant scarlet (silver Banksian medal).

From Mr. H. Eekford, Wem, Salop, came a pleasing collection of Sweet Peas, both new and recent varieties, several of the former being selected for certificates. Mr. William Rumsey, Waltham Cross, had nine boxes of Rose blooms as fresh and bright as could be wished, and far more than could have been expected after such heavy rains (silver Banksian medal). Messrs. W. Paul & Son, Waltham Cross, showed several boxes of new Roses; the pink Hybrid Perpetual Spenser and the Tea Corinna, both fine varieties that have been repeatedly noted before, were the most conspicuous.

From Messrs. J. Carter & Co., High Holborn, came plants of the dwarf yellow African Marigold named Carters' Golden Ball, with large well-developed blooms, and of very compact habit. Mr. A. Rawlings, Old Church, Romford, sent blooms of Dahlia Mrs. Ocock, the florets yellow tipped with red. M. V. Lemoine, Nancy, France, showed a large double Fuchsia, the petals pink, and the sepals bright red. From Mr. Munro, Milborne Port, Somerset, came a pink Vallota named Mrs. Hector Munro, which had pale blush tinted flowers, a most interesting departure from the ordinary type. E. H. Preston, Esq., The Hollies, Woking, sent a large plant named "the African Dandelion," with large yellow flower-heads in terminal clusters, and long sinuated leaves (vote of thanks).

Two collections of Carnations that seemed to form part of the Carnation Show, but which came under the notice of the Floral Committee, were the following. A grand exhibit of Souvenir de la Malmaison Carnations in the different types from Messrs. Laing & Mather, Kelso, N.B., well deserved the silver Banksian medal awarded for them. The red variety, Madame A. Warocqué, the pink striped Lady Middleton, the "Pink Malmaison," and the "Blush Malmaison," were equally beautiful, the blooms of good size, clean, and fresh, and being shown with their foliage they had a charming appearance. The yellow Carnation Germania was also admirably shown. Messrs. J. Veitch & Sons also exhibited four boxes of Carnation and Picotee blooms cut from the open ground, and representing a selection of the most effective border varieties, as well as the best of those in the chief show classes (bronze Banksian medal).

ORCHID COMMITTEE.—Present: Harry J. Veitch, Esq., in the chair, and Messrs. J. O. Brien, S. Courtauld, T. B. Haywood, H. Williams, J. Douglas, E. Hill, C. Pileher, H. Ballantine, H. M. Pollett, A. H. Smee, and Dr. M. T. Masters.

Saccolabiums are regarded by many as unpopular Orchids, but their beauty when well grown cannot be denied. Seldom, however, do visitors to public displays have an opportunity of seeing Saccolabium Blumei in such condition as it was shown by the Marquis of Salisbury, Hatfield (gardener, Mr. G. Norman), at the meeting on Tuesday. About thirty long racemes were sent cut from the plants, and placed in bottles of water. Some of the racemes were 18 and 20 inches long, and the fragrance filled a good portion of the hall (silver Flora medal).

Disa grandiflora, from the Duke of Devonshire, Chatsworth (gardener, Mr. O. Thomas), formed another important group, and afforded an opportunity to many of seeing how well these Orchids are grown at Chatsworth, and also how handsome they are when in good condition. Twenty plants were exhibited, some with seven or eight spikes each, and the latter bearing from five to seven flowers, large and of brilliant colour (silver Flora medal).

A group of Cattleya gigas from J. W. Temple, Esq., Tunbridge Wells (gardener, Mr. E. Bristow), made a capital display, the flowers being abundant and brightly coloured. Several especially fine varieties were included, and a late C. Mendeli, together with Trichopilia tortilis alba (silver Banksian medal).

An exceedingly fine group of Orchids and foliage plants came from Messrs. B. S. Williams & Son, Upper Holloway, in which Cypripediums largely predominated, and the handsome C. Morganæ was remarkably well shown, the plants healthy, and the flowers numerous. Vandas formed the background, well developed healthy plants bearing numerous spikes of flowers, the yellow and brown Oncidium Curtisi and the white Calanthe veratrifolia were also notable (silver Flora medal). Messrs. Sander & Co., St. Albans, sent several fine varieties of Odontoglossum crispum and freely flowered Masdevallias. Messrs. Seeger & Tropp, Dulwich, exhibited a good plant of the white flowered Dendrobium Deari, and Aerides maculosum Prewett's variety, having a large raceme of flowers with deep crimson lips. Messrs. Pitcher & Manda, Swanley, sent a hybrid Cypripedium, named C. Browni, the result of a cross between C. magniflorum and C. leucorrhodum. It has soft pink petals with a light dorsal sepal and lip.

#### CERTIFICATED PLANTS.

*Cattleya Hardyana Hamar Bass variety* (Mr. Hamilton, gardener to Hamar Bass, Esq., Byrkley, Burton-on-Trent).—A grand variety, the flowers of good size and shape, the sepals and petals broad and very dark crimson, with a few lighter veins in the petals. The lip was magnificent, rich red in the throat, the apical half an intense magenta, broad and undulated at the margin (first-class certificate).

*Allamanda Williamsi* (B. S. Williams & Son).—This beautiful stove plant is said to be a hybrid, but the parentage was not stated. The flowers are of moderate size, but produced very freely near the points of the branches, and are of a bright golden tint, very effective. The leaves are narrow and tapering, and the habit appears to be compact. It is a decided acquisition (first-class certificate).

*Cochlidia Noezbiana* (B. S. Williams & Son).—A neat little Orchid with bright red flowers in slender racemes. The lip is distinctly three-lobed, with a yellow crest at the base (botanical certificate).

*Ivy-leaf Pelargonium Beauty of Castle Hill* (R. Owen).—A very effective variety, with large double brilliant pink flowers in good trusses. The leaf is bright green, Ivy shape, and without the zone (award of merit).

*Rudbeckia californica* (Paul & Son).—A show Composite with bright gold ray florets, long and drooping. The disk is dark, and  $1\frac{1}{2}$  to 2 inches high (award of merit).

*Sweet Peas* (Eckford).—*Venus*, a peculiar soft buff tint, very

#### MR. EDWARD MAWLEY.

WITH much pleasure we present our readers with a portrait of Mr. Edward Mawley, one of the Honorary Secretaries of the National Rose Society, and an earnest amateur horticulturist. To rosarians Mr. Mawley is well known throughout Great Britain, and his close association with the Rose Society for over twelve years has enabled

FIG. 11.—MR. EDWARD MAWLEY.

distinct; *Lady Penzance*, bright rose, standard darker, flowers large; *Mrs. Eckford*, creamy yellow, a soft pleasing tint (awards of merit).

*Pteris serrulata pendula* (Mr. F. Lane, gardener to G. Standford, Esq., Horsham).—A most graceful variety, the pinnae long and narrow, terminating in finely cut crests (award of merit).

*Spiraea Bumalda* var. *Beauty of Knap Hill* (A. Waterer).—This was shown as a variety of *S. callosa*, but was decided to be a form of *S. Bumalda*, having large heads of pale pink flowers (award of merit).

*Delphinium Zalil* (Kelway & Sons).—A peculiar Larkspur with small yellowish flowers in a short dense spike (botanical certificate).

him to help very materially in promoting the general interest in his favourite flower. As a cultivator, too, he has had no small degree of success, and although he has usually confined his exhibits to the smaller classes, most creditable blooms have been contributed from his gardens—first at Croydon and now at Berkhamstead—that have taken a good position in sharp competition, for his record comprises 200 first prizes, besides at least 100 others. The Chrysanthemum has also had a good share of his attention, and he has proved in many ways how broad are his horticultural tastes and sympathies.

To our readers Mr. Mawley's work is familiar in the carefully tabulated lists of exhibition Roses, Dahlias, and Chrysanthemums which have appeared from time to time, and which have been rendered additionally interesting by the comparisons with previous years' lists. The advance or decline in popularity of certain varieties can thus be watched, and the rise of worthy novelties noted.

As a meteorologist Mr. Mawley has also gained considerable fame, for he has devoted many years to extensive observations and accurate records, a summary of which in their special relation to Roses has appeared annually in the "Rosarian's Year Book." He has contributed to the Royal Meteorological Society's work in many departments, and besides being a member of the Council of that body has also undertaken the charge of the Phenological section. This was recently referred to in these pages, and dealing as it does with the natural phenomena which came especially under the observation of horticulturists, it is a matter well worth the attention of gardeners. Mr. Mawley is a Fellow of the Royal Horticultural Society, a member of the Floral Committee, and a frequent attendant at the Drill Hall and other meetings.

### NATIONAL PINK SOCIETY.

#### MIDLAND SECTION.

THE first Exhibition was held in connection with the Wolverhampton Great Exhibition, July 14th, 15th, and 16th.

In Class 1, twelve blooms of laced Pinks, dissimilar, the first prize went to Mr. M. Campbell, Blantyre, N.B., with Modesty, very fine; Boiard, Mary Anderson, Devise, Lowlander, Emmeline, George Kennedy, Princess of Wales, Empress of India, Elizabeth, Samuel Barlow, and Sensation. Second, Mr. Thurstan, Cardiff.

Class 2, twelve blooms of laced Pinks in not less than six varieties.—First, Mr. A. R. Brown, Crompton Road, Handsworth, Birmingham, with Fred Hooper, Boiard, Zoe, Amy, very fine; Empress of India (2), fine; Modesty (3), fine; Rosy Morn, George White, and Victory. Second, Mr. M. Campbell.

Class 3, six blooms of laced Pinks, dissimilar.—First, Mr. Brown, with Rosy Morn, Amy, Boiard, Modesty, George White, and Empress of India. Second, Mr. Thurstan, who had a fine bloom of John Dorrington in his stand. Third, Mr. F. Morton, Wolverhampton. Fourth, Mr. Bason, Wolverhampton. Fifth, Mr. Campbell.

Class 4, six blooms of laced Pinks in not less than three varieties.—First, Mr. Brown, with Amy (2), Modesty (2), Eurydice, and Victory. Second, Mr. C. F. Thurstan, Penn Fields, Wolverhampton, who had two good blooms of George Hodgkinson in his stand. Third, Mr. Morton. Fourth, Mr. Bason. Fifth, Mr. James Thurstan.

Class 5, three blooms of laced Pinks, dissimilar.—First Mr. Brown, with three very fine blooms of Amy, Modesty, and Rosy Morn. Second, Mr. C. F. Thurstan.

Class 6, single bloom, purple laced.—First, Mr. Brown, with Modesty. Second, Mr. C. F. Thurstan. Third, Mr. Brown. Fourth and fifth, Mr. Campbell, with Modesty.

Class 7, single bloom, red laced.—First and second, Mr. Brown, with Empress of India. Third, fourth, and fifth, Mr. James Thurstan, with seedlings.

Premiers, purple laced.—Mr. A. R. Brown, with his grand seedling Amy, a wonderful fine bloom in his first prize stand of twelve red laced; also to Mr. Brown for Empress of India in the same stand.

For six bunches of miscellaneous Pinks, border varieties.—First, Messrs. Thomson, Birmingham, who also set up a collection of leading kinds, including their beautiful light rose-ground laced seedling, "Mrs. Thomson," which well deserved a certificate.

Non-competing collections were also exhibited by Mr. C. Turner, Slough, to whom a certificate of merit was awarded, and this stand contained blooms of The Rector (Fellowes) a flower of good quality. A certificate of merit was awarded to Mr. Robert Sydenham, Birmingham, for three fine blooms of his fine variety, The Rector; also for three blooms of Mr. Lakin, white self with faint pink markings in the centre.

### ROSE SHOWS.

#### ELTHAM.—JULY 11TH.

AMONGST the many Rose Shows it has been my pleasure to attend during the past twenty years, there is none where the surroundings (I hate the modern cant term environment) are so charming as this. Only eight miles from the huge metropolis with all its din and clatter; the quaint old house, with the adjoining rooms of the banqueting hall where some of our kings feasted,

"And it was merry in the hall  
When the beards wagged all;"

the moat (now dry) which once surrounded the Palace; the wooden bridge across it clothed with Virginian Creeper, which must in autumn be very lovely; the beautiful trees, the house clothed in "greenery," and the rich pasture land, all tend to make a scene of perfect loveliness unique almost in its character, and certainly so as far as the neighbourhood of London is concerned. The moat has been converted into a Rose garden, and here it is that my good friend Mr. Bloxam cultivates his favourites, and as one walks round and sees the alterations made—

here, for instance, is a bed of Viscountess Folkestone—now since I was last here there is a very pretty tender rose-coloured flower which I have not seen anywhere else, and which I believe is only to be found in Ketten's list, Julie Gaulain. I do not know any Rose quite of the shade of colour, and it is a well formed and good Rose. Then there is a climbing Rose, Alice Gray, very sweet and pretty in colour, and an especial favourite for decorative purposes. Here, too, are L'Idéale and William Allen Richardson, both charming for the same purpose. I have said that the evergreens thrive well, but I think the most wonderful evergreen is my friend himself. Coming to a plot where there are stocks ready for budding. "There," said he, "I must soon begin at those 500 to bud them." I stared. The speaker was eighty-two years of age. One knows what sharpness of sight, steadiness of hand, and physical endurance is required for the operation, and that anyone at that age should undertake it seemed to take away one's breath; and then he added, with a quiet twinkle of his eye, "The doctor tells me I must not stoop!" Take note of this, you young sparks, some of you, who are always complaining of the "beastly work," to use your own elegant phraseology, of having to bud your Roses (these were dwarfs remember), and keep away from such murmurings for the future.

But now for the Exhibition; it was not a large one, it never is, and this year the fixtures of Reigate and Bexley for the same day much interfered with it, the former detaining Mr. West, and the latter Mr. Fuller. Here were the Roses, there was a nice collection of plants well grown, and healthy, some Fuchsias being especially good. There was a very nice exhibition of cottagers' productions, widening the interest in the Exhibition.

In the class for eighteen Roses, amateurs only, Mr. Shea was first with Ulrich Brunner, François Michelon, Madame G. Luizet, Countess of Rosebery, Mrs. John Laing, Heinrich Schultheis, Pride of Waltham, Captain Christy, Reynolds Hole, Duke of Edinburgh, Marie Verdier, Marie Baumann, Marie Finger, Etienne Levet, Duchesse de Morny, and Prince Arthur. Mr. Harris was second. In the class for twelve Mr. A. Bryant was first with Viscountess Folkestone, Heinrich Schultheis, Madame G. Luizet, Madame Isaac Pereire, La France, Countess of Rosebery, Baroness Rothschild, Alfred Colomb, Ulrich Brunner, Camille de Rohan. Mr. Shea was second, and Mr. Teesdale third. In the class for four trebles Mr. Bloxam was first with Madame G. Luizet, Eugène Verdier, Général Jacqueminot, and Victor Hugo. Mr. Harris was second. In the class for six varieties, distinct, Mr. Bryant was first with Captain Christy, Madame Isaac Pereire, Abel Carrière, Madame G. Luizet, La France, and Ulrich Brunner. Second, Miss Bryant. Third, Mr. Sumner. In the class for six Teas Mr. Teesdale was first with Souvenir d'un Ami, Souvenir de Thérèse Levet, Madame de Watteville, William Allen Richardson, Rêve d'Or, and Marie Van Houtte. Mr. Kebbel was second. In the class for six of any one sort Mr. Shea was first with Madame G. Luizet, and Mr. Bloxam was second with Viscountess Folkestone. In the nurserymen's classes, in the class for twenty-four distinct Roses, Mr. Frank Cant was first. His Roses were Ulrich Brunner, Mrs. J. Laing, Prince Camille de Rohan, Heinrich Schultheis, Général Jacqueminot, La France, Alfred Dumesnil, Lady Mary Fitzwilliam, Madame G. Luizet, Victor Hugo, The Bride, Lady Helen Stewart, Maréchal Niel, Susanne Radocanachi, Merveille de Lyon, Countess of Rosebery, Duke of Edinburgh, Mrs. Dickson, Dupuy Jamain, Mrs. Bennett, Prince Arthur, Madame Montet, Duchess of Bedford, and Catherine Mermet. Messrs. Paul & Son were second, and Mr. B. R. Cant was third. For twelve varieties Mr. B. R. Cant was first with Général Jacqueminot, Ulrich Brunner, Baroness Rothschild, Annie Wood, Abel Carrière, Mrs. John Laing, Duke of Edinburgh, Madame G. Luizet, Prince Arthur, Heinrich Schultheis, Merveille de Lyon, and Earl of Pembroke. Mr. Frank Cant was second, and Messrs. Paul and Son third. In the class for twelve Teas Mr. B. R. Cant was first with Catherine Mermet, Souvenir de Sarah Prince, Jules Finger, The Bride, Niphotos, Madame Cusin, Rubens, Comtesse de Nadaillac, Madame de Watteville, Devoniensis, Hon. Edith Gifford, and Innocente Pirola.

The silver medal for the best Tea Rose in the Show (amateur) was awarded to Mr. R. Bloxam for Marie Van Houtte. There were a number of very pretty vases and baskets arranged with Roses, also table decorations, some of which were very pretty. The day was fine, and a large number of persons visited the Show.—D. Deal.

#### NATIONAL ROSE SOCIETY.—HEREFORD, JULY 16TH.

WHEN the Committee of the National Rose Society received an invitation from the Hereford and West of England Rose Society to hold their provincial Show for 1891 in the ancient Cathedral City of the West it was felt that there was a peculiar fitness in holding an exhibition there, for it was some thirty years ago at the hospitable board of Mr. John Cranston that the idea of a National Society for the Rose was first started. It bore fruit in the first National Show, which the Dean of Rochester, then Reynolds Hole, energetically and successfully carried out. But it was not until more than fifteen years after that the National Society was established; and although frequently the idea of holding its Show at Hereford was mooted, it was not until the removal of the Rev. F. R. Burnside to the neighbourhood that any serious steps were taken. He had already been the originator and moving spirit of Rose shows at Farningham, Moreton-in-the-Marsh, and Gloucester; and when he became the Secretary of the Hereford Society all who knew him felt that it would not be long before the National would find itself there. There were many who shook their heads. It was so out of the way, the train accommodation was so indifferent, the city was so small, and the neighbouring places so thinly populated, they felt sure it would

not be a success; but it was, and I have the pleasure of recording that, taking it all in all, it was the most successful provincial show the National has ever held. Birmingham was last year looked upon as our greatest success, but now it is exceeded by Hereford; a larger number of Roses were exhibited, and the gate money greatly exceeded that taken at the big city. Then exhibits came from all parts of the kingdom. Not only were the western counties represented, but Kent, Surrey, Essex, Sussex, Suffolk, Norfolk, Hertfordshire, and the midlands were represented but Yorkshire. Scotland sent her contingent, and so the Green Isle, while a hearty welcome was provided by the chief magistrate for the Judges, exhibitors, and officials connected with the Show. The Society have received many a warm welcome, but perhaps we may say never one so hearty and so generous as that received here. The difficulty of railway communication was overcome by the Great Western Railway consenting to run a special train from Gloucester, so as to enable those who left London by the 9.15 to travel on the same night and reach Hereford in the small hours of the morning. All the arrangements were excellently carried out by Mr. Burnside, on whom the chief burden rested; and from first to last no hitch occurred, and the meeting was an unqualified success.

The Exhibition was held in the Castle grounds, and as the day was all that could be desired it was a most charming scene. The exhibition tent was one of noble proportions, being 280 feet in length. There was a double row of stands down the centre and stages all round the sides, and yet there was not room enough for all. A little crowding in some places occurred.

#### NURSERYMEN.

In the Jubilee class (nurserymen), for which there were eight entries Mr. F. Cant of Colchester was first with Comtesse d'Oxford, Jeannie Dickson, Marie Baumann, Mrs. John Laing, Victor Hugo, Eugène Verdier, Catherine Mermet, Crown Prince, La France, Duke of Teck, François Michelin, Etienne Levet, Star of Waltham, Lady Mary Fitzwilliam, Alfred Colomb, Prince Arthur, Hon. Edith Gifford, Camille Bernardin, Madame Susanne Rodocanachi, Pride of Waltham, Duke of Edinburgh, Her Majesty, Ulrich Brunner, Merveille de Lyon, Pride of Reigate, Charles Lefebvre, Maréchal Niel, Duke of Wellington, Duchesse de Vallombrosa, A. K. Williams, E. Y. Teas, Ernest Metz, Madame Cusin, Horace Vernet, and Madame de Watteville. Mr. Baker was second, Mr. B. R. Cant third, and Messrs. Harkness & Son fourth.

In the class for seventy-two Mr. Frank Cant was again first with Her Majesty, Prince Arthur, Souvenir d'un Ami, Madame Victor Verdier, Heinrich Schultheis, Lady Mary Fitzwilliam, Lady Sheffield, Jeannie Dickson, Pierre Notting, Marie Van Houtte, Louis Van Houtte, Merveille de Lyon, Duke of Edinburgh (Tea), Alfred Colomb, Madame Ducher, François Michelin, Abel Carrière, Cheshunt Hybrid, Gustave Piganeau, Catherine Mermet, Beauty of Waltham, Marie Cointet, Susanne Rodocanachi, E. Y. Teas, Ernest Metz, Charles Darwin, Madame de Watteville, Star of Waltham, La France, Duke of Teck, Comtesse de Nadaillac, Earl of Pembroke, Madame Hoste, Victor Hugo, Pride of Waltham, A. K. Williams, The Bride, Prince Camille de Rohan, Innocente Pirola, Camille Bernardin, Marie Verdier, Countess of Rosebery, Rubens, Duke of Wellington, Viscountess Folkestone, Marie Baumann, Mrs. John Laing, Duke of Connaught, Marquise de Castellane, Dr. Sewell, Niphetos, Etienne Levet, Marie Finger, Mrs. Harry Turner, Duchesse de Morny, Fisher Holmes, Madame Cusin, Charles Lefebvre, Baroness Rothschild, Anna Ollivier, Rosieriste Jacobs, Ulrich Brunner, Jean Ducher, Pride of Reigate, Hon. Edith Gifford, François Levet, Marquise de St. Amand, Countess of Oxford, Duke of Vallombrosa, Dupuy Jamain. Messrs. Paul & Son were second, Mr. B. R. Cant was third, and British Fruit and Rose Company fourth.

In the class for thirty-six trebles Mr. B. R. Cant was first with Duke of Edinburgh, Her Majesty, Charles Lefebvre, Marguerite de St. Amand, Camille Bernardin, Baroness Rothschild, Souvenir d'un Ami, Exposition de Brie, Fisher Holmes, Alfred Dumesnil, Dupuy Jamain, Auguste Guinoiseau, Alfred Colomb, Madame Gabriel Luizet, Marie Cointet, Susanne Rodocanachi, Jeannie Dickson, Earl of Dufferin, Annie Laxton, Duke of Wellington, Madame de Watteville, Prince Arthur, Mrs. John Laing, Etienne Levet, Marie Verdier, Marie Baumann, Violette Bouyer, A. K. Williams, Gustave Piganeau, Heinrich Schultheis, Beauty of Waltham, Merveille de Lyon, Général Jacqueminot, La France, Ulrich Brunner, and Madame Clemence Joigneux. Messrs. Paul & Son were second, and the British Fruit and Rose Company third.

In the class for thirty-six singles Mr. Geo. Prince was first with Madame Clemence Joigneux, Sénateur Vaisse, Lady Mary Fitzwilliam, Etienne Levet, Her Majesty, Marie Baumann, Innocente Pirola, Pride of Waltham, Viscountess Folkestone, C. Darwin, Princess of Wales, Marie Rady, Madame Caillot, Susanne Rodocanachi, Souvenir de S. A. Prince, Sultan of Zanzibar, La France, Exposition de Brie, Marie Finger, A. K. Williams, Mrs. J. Laing, Annie Wood, Comtesse de Nadaillac, Prince Camille de Rohan, Anna Ollivier, François Michelin, Souvenir d'un Ami, Dr. Andry, Merveille de Lyon, Earl of Pembroke, Captain Christy, Victor Hugo, Maréchal Niel, Jeannie Dickson, The Bride, Baronne Adolphe de Rothschild. Curtis, Sanford & Co. of Torquay were second; Mr. S. G. Ramsey, third; and Messrs. Jefferies & Son, Cirencester, fourth.

In the class for eighteen trebles Messrs. Jefferies & Son of Cirencester were first with Comtesse d'Oxford, Her Majesty, Viscountess Folkestone, Baroness Rothschild, Duke of Edinburgh, Mrs. John Laing, Général Jacqueminot, Madame Gabriel Luizet, Ulrich Brunner, Rubens, A. K. Williams, Merveille de Lyon, Beauty of Waltham, Etienne Levet, Lady Mary Fitzwilliam, Le Havre, and Marie Van Houtte. Mr. George Prince was second; and Messrs. Curtis, Sanford & Co., third.

#### AMATEURS.

In the Jubilee class for twenty-four single varieties, distinct, open to all amateurs, the Rev. J. H. Pemberton was first with Etienne Levet, Magna Charta, Marie Finger, Comte Raimbaud, Ulrich Brunner, A. K. Williams, François Michelin, Charles Darwin, Mrs. John Laing, Marie Baumann, William Warden, Comtesse d'Oxford, Duke of Edinburgh, Charles Lefebvre, Merveille de Lyon, E. Y. Teas, Earl of Dufferin, Beauty of Waltham, Catherine Mermet, Exposition de Brie, and Madame Cusin; Mr. A. Slaughter was second; Mr. R. G. Baker was third; and Mr. E. B. Lindsell fourth. Thus Mr. Pemberton again becomes possessor of the trophy.

In the class for thirty-six singles, Mr. S. P. Budd of Bath was first with Susanne Rodocanachi, Sir Garnet Wolseley, François Michelin, Charles Lefebvre, Merveille de Lyon, Etienne Levet, La Duchesse de Morny, Ella Gordon, A. K. Williams, Ulrich Brunner, Star of Waltham, Marie Verdier, Her Majesty, Duchess of Bedford, Comtesse de Nadaillac, E. Y. Teas, Abel Carrière, Comtesse Raimbaud, Mrs. John Laing, Louis Van Houtte, Mlle. Eugénie Verdier, Alfred Colomb, Innocente Pirola, Earl of Dufferin, Madame Charles Crapelet, Charles Darwin, Catherine Mermet, Pierre Cârôt, The Bride, Duke of Wellington, Dupuy Jamain, Victor Hugo, Caroline Kuster, Eclair, Madame Gabriel Luizet, and Xavier Olibo. The Rev. J. H. Pemberton was second; and Mr. T. B. Haywood third, and Mr. E. B. Lindsell fourth. In the class for twelve varieties Mr. S. P. Budd was again first with Alfred Colomb, Her Majesty, Marie Rady, Merveille de Lyon, Madame Eugène Verdier, Etienne Levet, Victor Hugo, The Bride, Duchess of Bedford, Mrs. J. Laing, Marie Baumann, and François Michelin. The Rev. J. H. Pemberton was second; Mr. R. G. Baker third, and Mr. E. B. Lindsell fourth. In the class for twenty-four singles, Mr. E. Mawley was first with Charles Lefebvre, François Michelin, Le Havre, Etienne Levet, Her Majesty, Madame Gabriel Luizet, Ulrich Brunner, Niphetos, Dupuy Jamain, Comtesse de Nadaillac, Comtesse d'Oxford, Captain Christy, Souvenir d'Elise Vardon, Horace Vernet, Marie Finger, Sultan of Zanzibar, E. Y. Teas, Mrs. John Laing, Duke of Wellington, Catherine Mermet, Abel Carrière, Caroline Kuster, Camille Bernardin. Mr. M. Whittle, Leicester, was second; Mr. A. Slaughter third; and Mr. W. Narrowing, Oxford, fourth.

In the class for twelve singles Lieut.-Col. Standish Hore was first with Horace Vernet, Marie Finger, Prince Arthur, Camille Bernardin, Beauty of Waltham, Xavier Olibo, Mrs. John Laing, Fisher Holmes, Heinrich Schultheis, Louis Van Houtte, Le Havre, and La France. An excellent box of blooms. The Rev. F. Page Roberts was second; Mr. James Parker, Headington, was third; and Mr. W. Boyes of Derby was fourth. In six distinct single trusses Mr. C. E. Cuthell was first with Mrs. Baker, Baroness Rothschild, Mrs. John Laing, A. K. Williams, Camille Bernardin, and La France. Mr. T. A. Washbourne of Hucclecote, Gloucester, was second; Mr. C. Graham of Croydon third; and Mr. Rawlings of Cirencester fourth.

In the class for Herefordshire nurserymen, for twenty-four singles, Mr. C. Whiting of Hereford was first, and Mr. James Davis of Bodenham second. For twenty-four singles (amateurs) Mr. Walter Drew of Ledbury was first, also winning the silver medal for the best box amongst local amateurs. Mr. J. Pulley was second; Miss Baker was third. Twelve singles.—The Rev. C. H. Bulmer of Credenhill was first, Mr. F. Ecroyd was second, and the Rev. Sir George Cornwall, Bart., third. In six singles Mr. G. V. Bankes of Bath was first, Rev. C. H. Bulmer second, and Mrs. E. H. Landon third. For six Teas or Noisettes Mr. Walter Drew was the only prizetaker.

In the class for six new Roses the Rev. J. H. Pemberton was the only exhibitor. Roses were Maid of the Mist, Jeannie Dickson, Souvenir de Sarah A. Prince, T. W. Girdlestone, Lady Arthur Hill, and Cleopatra. There was a very beautiful display of garden Roses, which attracted general admiration, showing the increased popularity of these flowers. Mr. C. E. Cuthell was first, Mr. Julius Sladden of Evesham second, and Miss Mellish third.

#### TEA AND NOISETTE DIVISION.

In the open class for twelve trebles there was perhaps one of the most perfect boxes of these lovely flowers ever set up by the Rev. F. R. Burnside, of Bank Vicarage, Hereford; it contained lovely examples of Catherine Mermet, The Bride, Madame de Watteville, Rubens, Madame Cusin, Madame Bravy, Francisca Kruger, Souvenir d'Elise Vardon, Comtesse de Nadaillac, Anna Ollivier, Princess of Wales, and Innocente Pirola. Mr. Frank Cant was second, Mr. A. H. Gray third, and Mr. Geo. Prince of Oxford fourth.

#### NURSERYMEN.

In the class for eighteen, distinct, Mr. Geo. Prince was first with Comtesse de Nadaillac, Niphetos, Madame de Watteville, Innocente Pirola, Ernest Metz, Alba Rosea, Madame Berard, Rubens, Madame Cusin, The Bride, Souvenir d'un Ami, Souvenir de S. A. Prince, Catherine Mermet, Hon. Edith Gifford, Princess of Wales, Devoniansis, Adam, and Souvenir d'Elise Vardon. Mr. Frank Cant of Colchester was second, and Mr. B. R. Cant third. In twelve Teas Messrs. Jefferies and Sons of Cirencester were first with Niphetos, Madame Berard, Souvenir d'un Ami, Jean Ducher, Madame de Watteville, Marie Van Houtte, Souvenir de Paul Neyron, Catherine Mermet, Hon. Edith Gifford, Madame Cusin, The Queen, and Madame Lambard. Cranston (Limited) second, Curtis & Sanford third, and S. G. Ramsey fourth.

#### AMATEURS.

In the class for four singles the Rev. F. R. Burnside was first with a fine box of blooms, containing Catherine Mermet (this flower also obtained the medal for the best Tea in the Show), The Bride, Souvenir

d'Elise Vardon, Madame Cusin, Comtesse de Nadaillac, Hon. Edith Gifford, Madame de Watteville, Madame Bravy, Princess of Wales, Anna Ollivier, Baron de Bonstettin, and Cleopatra. Mr. A. H. Gray was second, Mr. S. P. Budd third, and Rev. H. A. Berners fourth. In six singles Lieut.-Col. Standish Hore first with Anna Ollivier, Souvenir d'Elise Vardon, The Bride, Hon. Edith Gifford, Catherine Kuster, and Jean Ducher. Mr. E. Mawley was second; and Mr. Conway Jones of Hucclecote, Gloucester, third; and the Rev. F. Page Roberts fourth.

#### OPEN CLASSES.

In the class for twelve new Roses Messrs. Paul & Son were first with Auguste Guinoiseau, Jeanne Ducher, Ernest Metz, Comtesse de Blacas, Danemaarck, Marie Margot, Souvenir de S. A. Prince, Mrs. Trevoz, Mrs. Paul, Gustave Piganeau, and Kaiser Frederick. Messrs. Curtis, Sanford and Co., second. In the class for twelve yellow Roses Mr. G. Prince was first with Comtesse de Nadaillac, the Rev. F. R. Burnside second with Caroline Kuster. In the class for twelve white Roses Mr. F. Cant was first with Merville de Lyon, Mr. B. R. Cant second with same variety. For twelve crimson Roses Mr. S. P. Budd was first with Alfred Colomb; Mr. B. R. Cant second with A. K. Williams; Cranston, Limited, third. For twelve dark crimson Roses Mr. B. R. Cant was first with Prince Arthur; Cranston, Limited, second with Abel Carrière; Paul and Son third, with Duke of Edinburgh. For twelve singles, six of any one H.P., and six of any one Tea, Messrs. Paul & Son were first, Her Majesty and Catherine Mermet; Mr. B. R. Cant was second with Madame de Watteville and Gustave Piganeau, and Cranston (Limited), third with Général Jacqueminot and Rubens.

There were several Roses set up for the National Society's gold medal, and it was awarded to Messrs. Alex. Dickson & Son of Newtownards, Co. Down, Ireland, for their beautiful new Rose Marchioness of Dufferin. They were also given a special award for a box of twelve blooms, their lovely white H.P., Margaret Dickson, which obtained the gold medal last year; and they also showed a couple of blooms of a very beautiful Rose, called Duchess of Fife, a seedling between La France and Lady Mary Fitzwilliam, a beautiful rosy pink with most delicious fragrance.

It will be seen that the National Society's silver medal was awarded for the best Tea to Mr. Burnside for Catherine Mermet, and that for the best H.P. to the Rev. J. H. Pemberton for a small but very perfect bloom of Lady Helen Stewart. The challenge Jubilee trophy for nurserymen has passed away from the Messrs. Harkness, who have held it for four years in succession, to Mr. Frank Cant, who holds it for the first time, while that for amateurs also travels back to Essex, for it has again been won by the Rev. J. H. Pemberton.

Thus ends the record for what I cannot but regard as the most successful provincial Exhibition, taking it all in all, that the Society has ever held, and had the season not been so unfavourable a one it would doubtless have been still more extensive, and I am sure of this, that none of us who had the good fortune of being there but will look back with most pleasurable feelings to the visit paid by the Society to the ancient city of Hereford.—D., Deal.

#### NORTH LONSDALE.—JULY 17TH.

THE eighth annual Exhibition under the auspices of the above flourishing Society was held on Friday last in the Drill Hall, Ulverston, and, as on former occasions, was a great success. The capital list of subscribers, and the large number of special prize donors have enabled the Committee this year to increase the prizes, in addition to which four medals of the National Rose Society and a silver medal for Pansies were offered for competition.

In the nurserymen's section for Roses £26 was offered in prize money, and this attracted entries from such champion growers as Messrs. B. R. Cant, Colchester; A. Dickson & Sons, Belfast; Harkness & Sons, Bedale; and G. and W. H. Burch, Peterborough. The total number of exhibitors, seventy, was in excess of any previous year, and the number of blooms staged was likewise much larger than usual and the quality splendid. The atmosphere of the room was fragrant with the sweet perfume of the "Queen of Flowers." In order to prevent any crowding of the exhibits, it was found necessary this year to set apart the platform at the top of the room for the display of Pansies, and which were really superb. The Judge, the champion Scotch Pansy grower, Mr. A. Irvine, Tighnabruach, Bute, spoke of them in the highest terms, and stated that the competition was considerably keener than he had experienced at any previous Show attended by him this season.

The Roses in the nurserymen's section were the great centre of attraction, and the two leading classes alone were good enough to form a capital Show, whether from a spectator's or connoisseur's point of view. Mr. B. R. Cant, Messrs. A. Dickson & Sons, and Messrs. Dicksons, Limited, Chester, made a tough fight in the class for twenty-four Roses, distinct, three trusses of each, the Colchester champion being deservedly awarded first prize for a superb collection, the representatives of the sister isle being a very close second, while their namesakes from Chester were a creditable third. In the large class for forty-eight blooms, distinct, the Irish representatives were to the front with a truly magnificent display, Mr. Cant being second, and Dicksons, Limited, third. For twenty-four distinct: First, Messrs. A. Dickson & Sons. Second, Mr. B. R. Cant. Third, Messrs. Harkness & Sons, Bedale. Twelve Teas or Noisettes: First, Mr. B. R. Cant. Second, Messrs. A. Dickson & Sons. Third, Mr. Jas. Crombie, Barrow. Twelve single trusses any dark H.P. Rose: First, Mr. B. R. Cant. Second, A. Dickson & Sons. Twelve single trusses any light H.P. Rose: First, A. Dickson & Sons. Second, Mr. B. R. Cant. Twelve new Roses, distinct: First, Messrs. A. Dickson and

Sons. Second, Mr. B. R. Cant. For the best Rose in the nurserymen's division Messrs. A. Dickson & Sons secured the premier position with a glorious bloom of Margaret Dickson, the same Rose securing for this firm the coveted position of holding the premier Rose in the Show. For this Rose there is undoubtedly a great future, and Messrs. Dickson and Sons are to be complimented on their success in raising such an acquisition.

Amateurs made an excellent show, the Herefordshire representative (Mr. Wm. Drew of Ledbury) carrying nearly all before him, being first for eighteen, twelve, six, six Teas, four H.P.'s, three trusses of each. Best light bloom with Mrs. John Laing, best Tea or Noisette, and the best buttonhole for gentlemen, to consist of one Rose only; and he also secured two medals. Local exhibitors were in good force, the competition being very close in some of the classes, Mr. H. Crousdale securing six out of eight exhibits and a medal, the other medal being awarded to Mr. R. Dilworth. In addition there was also a charming show of table and hand bouquets, ladies' sprays, &c. The nurserymen's exhibits were judged by amateurs, and amateurs' by nurserymen. The immense success of the Exhibition was in a great measure due to the untiring energy of Mr. G. H. Mackeratt, the Hon. Sec., well supported by the Hon. Treasurer and members of the Committee.

#### MANCHESTER.—JULY 18TH.

THIS was held at Old Trafford on Saturday last, and proved a great success in every respect. To say that the Show has never been excelled might perhaps be straining a point, but the exhibits were remarkably good, although when the Judges entered on their duties many of the blooms had suffered to some extent. The great interest of the Exhibition naturally centred in the large class of seventy-two blooms, Messrs. John Cranston & Co., Hereford, taking premier position with a very fine collection, the best blooms being Marie Baumann, Duke of Connaught, Abel Carrière, Thomas Mills, Violet Bouyer, Duchesse de Vallambrosa, Duke of Wellington, Charles Darwin, and Victor Hugo. The second prize was awarded to Mr. Frank Cant, Colchester, for a very meritorious collection. Third, Mr. H. Merryweather, Southwell, Notts. For thirty-six, distinct, Mr. Frank Cant turned the tables on his opponent of the previous class with a superb lot of blooms, the third position being again occupied by Mr. H. Merryweather. For eighteen and twelve Teas or Noisettes Mr. Cant was again placed first, being in each case followed by Mr. G. Prince, Oxford. Twelve single trusses, any yellow Rose, the latter exhibitor had Comtesse Nadaillac very fine. For twelve trusses, any white Rose, Messrs. Cranston had grand Duchesse de Vallambrosa, whilst Mr. S. G. Rumsey had Général Jacqueminot, superb, in the class for twelve crimsons. In the two latter classes Messrs. Paul & Son were placed second. Three bouquets of Roses—First, Mr. J. Mason, Manchester; second, Perkins & Sons, Coventry.

Amateurs came up in strong force, and their exhibits were greatly admired. In the classes for thirty-six single trusses and twelve distinct, three trusses each, the Rev. J. H. Pemberton, Romford, Essex, was the chief prizetaker, being closely followed by Mr. S. P. Budd, Bath. Mr. Pemberton's box contained fine blooms of Madame Lambard and John Stuart Mill. For twelve Teas or Noisettes, three trusses, twelve Teas or Noisettes, and twelve single trusses any yellow Rose, the Rev. F. R. Burnside practically swept the decks with grandly formed blooms, rich in colour, the most noticeable being Comtesse de Nadaillac and The Bride. Mr. S. P. Budd followed closely as second in the two former classes, the third positions being filled by Revs. A. Foster Melliar and J. H. Pemberton. Twelve singles any white Rose.—First, Mr. S. P. Budd; second, Rev. F. R. Burnside; third, Rev. J. H. Pemberton. Twelve singles any crimson.—First, Mr. C. Burgess, Plumley, Cheshire; second, Mr. S. P. Budd; third, Mr. S. Barlow, Llandudno. For Roses grown within twenty miles of Manchester, Mr. T. Tatham, Wilmslow, secured the first prize for twenty-four and twelve, Mr. C. Burgess taking second honours, and first for six. Miss Lord, Ashton-on-Mersey, was first for bouquet of Roses.

A noble bank of Disa grandiflora superba was sent from the gardens at Chatsworth House. It was a splendid exhibit, and secured a gold medal. Extra prizes were awarded to Mr. S. Barlow for thirty-two varieties of garden Roses; to Mr. Eckford, Wem, Salop, for charming variety of Sweet Peas; and to Mr. Campbell, Blantyre, for Pansies. Nurserymen made a fine display of miscellaneous plants—viz., Messrs. Clibran & Sons, Dickson, Brown & Tait, Dickson & Robinson, Paul and Son, T. Smith, Newry; and Dobbie & Co., Rothesay.

## HORTICULTURAL SHOWS.

#### TRENTHAM.—JULY 16TH.

THE famous North Stafford Hotel, Stoke-on-Trent, was the rendezvous of some notable horticulturists last week on the occasion of the Show at Trentham. No more appropriate place could be found for a horticultural exhibition than the site chosen contiguous to the beautiful pleasure grounds, to which visitors to the Show had free access through the kindness of the Duke of Sutherland. The day was beautifully fine, and the populations from the adjacent towns, a most orderly and highly respectable multitude, came in thousands to enjoy the display. It was well worthy of their patronage, and in all respects a gratifying success.

The Trentham and Hanford Horticultural Society was originally established to widen the interest in and improve the cultivation of cottage gardens. This is what it does, and will continue to do; but

with the object of providing additional attractions on the Show day a number of classes were provided open to gardeners from everywhere, and the liberal prizes offered had the usual result—splendid competition.

The special features of the Show to be briefly noticed were the groups of miscellaneous plants, Roses, and fruit, though vegetables were good, while the cottagers' tent was, as it deserved, a chief point of interest. Large specimen plants were not invited, and the event proved that an excellent, diversified, and most enjoyable Show could be provided without them. Of primary import was the competition in the open class for miscellaneous groups of plants arranged for effect, each occupying space not exceeding 300 square feet. The first prize was £15 and a work of art value 10 guineas, the second prize £14, third £10, and fourth £8. This is the way to bring out the best efforts of the best men. It should be said that Mr. P. Blair did not compete, but left the field open to others. There was a splendid response, and when Mr. Bruce Findlay and Mr. F. Sander proceeded to adjudicate none of the many experienced gardeners and judges who were present envied them of their task. They proved, however, equal to the occasion, and though their verdict at first took some by surprise, all on closer examination freely admitted the decisions were correct. The fortunate winner of the great prize, value £25, was Mr. G. J. Edmunds, gardener to the Duke of St. Albans, Bestwood Park, Notts. The group is difficult to describe, but an idea may perhaps be given of its character. It comprised a series of floral mounds, supporting elegant Palms and other appropriate fine-foliaged plants, with intervening curving mossy dells, in which dwarf flowering and foliage plants were disposed with great judgment and taste. The taller back plants were Palms in mounds of *Selaginella caesia*, *Caladium argyrites*, and other suitable plants. As front elevations two corner plants of *Cordyline indivisa variegata* were conspicuously attractive, with a centre plant of *Pandanus Veitchi*, and a base of dark *Caladiums*, small *Crotons*, and a *Begonia* of the Rex type. The intermediate tall plants comprised narrow-leaved red *Dracenas* and single-stemmed *Crotons* about 4 feet high, *C. volutus* being particularly effective. The groundwork was of living, not dead, moss, and in it were dotted in the most informal manner small *Crotons* and *Dracenas*, bright *Masdevallias*, with variegated *Ophiopogons*, *Eulalias*, and the slenderest of *Sedges*, *Carex variegata*. The group also contained a few tall plants of *Lilium Harrisii*, and a pair of *Humeas* in the background. The charm of the arrangement consisted in its freedom, yet total absence of weediness. Every plant could be seen, each appearing to lend a charm to the other. It was a masterpiece in its way, and if it had not been must have lost the position against the formidable competitor Mr. J. McIntyre, gardener to Mrs. Gurney Pease, Darlington, who was an excellent second with a charming association of bright and healthy plants, which the brown dead moss did not display to the best advantage. Mr. A. Webb, gardener to J. H. Manners Sutton, Esq., Kelham Hall, Newark, was third with a heavier yet rich arrangement; and Mr. J. Currie, gardener to Lieut.-Col. Pepper, Salisbury, fourth. It was a great and noteworthy contest, and the next of the same nature may be expected at Shrewsbury on the 18th of next month. The prizes for the local groups at Trentham, which were too smooth and packed, were awarded to Messrs. W. W. Dobson, Tittensor; R. Clark, Stone; and F. Williamson, Normacott.

**ROSES.**—Considering that the National Provincial Show was being held at Hereford the display was surprising—six lots of forty-eight and eight of thirty-six blooms being placed in competition, and it was much the same throughout the classes. Mr. H. Turner of Slough, a guest of the Duke, was one of the Judges, and it was apparent by the awards that freshness, quality, and uniformity of excellence were not overlooked. In the class for forty-eight blooms the contest was exceedingly close, and, as after a critical examination, the least number of faults could be found in the stands of Mr. H. Merryweather, he was accorded first honours, though the second and third prize stands were decidedly heavier, yet several of the blooms too advanced. Mr. Merryweather's varieties were—*Madame G. Luizet*, *Le Havre*, *Marie Baumann*, *Harrison Weir*, very fine; *Madame Montet*, *Due de Rohan*, *Captain Christy*, *Lady A. Hill*, *Lady Mary Fitzwilliam*, *Alphonse Soupert*, *Mrs. J. Laing*, very fine; *Mons. E. Y. Teas*, *Baroness Rothschild*, *Susanne Marie de Rodocanachi*, *La France*, *Ulrich Brunner*, very fine; *Xavier Olibo*, *Marguerite Boudet*, *A. Carrière*, *Souvenir de S. A. Prince*, fine; *Baron N. de Rothschild*, *The Bride*, very fine; *Dupuy Jamain*, *Dr. Andry*, *Fisher Holmes*, *Madame Hoste*, very good; *Catherine Mermet*, *E. Levet*, *Princess Beatrice*, *Earl of Dufferin*, *A. Rigotard*, *Violette Bouyer*, *Charles Lefebvre*, *Miss E. Gifford*, *Countess of Rosebery*, *Comtesse de Nadaillac*, *Marie Rady*, very fine; *Marguerite de St. Amand*, *Sir G. Wolesey*, *Madame Lacharme*, *Francisque Revé*, *Viscountess Folkestone*, *Duchess of Bedford*, *Madame Cusin*, *Général Jacqueminot*, and *Victor Verdier*. Messrs. Cooling and Son, Bath, were awarded the second prize; and Mr. F. Cant, Colchester, the third.

For thirty-six distinct, single blooms, Mr. Hy. Merryweather was distinctly ahead of all, and was awarded the first prize for a fine box of Roses, comprising *La France*, *Comte Raimband*, very fine; *Violette Bouyer*, *E. Levet*, *Merveille de Lyon*, *Gustave Piganeau*, a splendid bloom; *Mrs. J. Laing*, very fine; *Ulrich Brunner*, *Baroness Rothschild*, *Horace Vernet*, *Marguerite de St. Amand*, *Louis Van Houtte*, very fine; *Marie Finger*, *Madame Hausmann*, fine; *Madame Hoste*, very fine; *Marie Baumann*, *Madame G. Luizet*, *Camille Bernardin*, *Marie Van Houtte*, *Dupuy Jamain*, *Countess of Nadaillac*, *Due de Wellington*, fine; *Catherine Mermet*, very fine; *Mons. A. Dumesnil*, *Miss E. Gifford*, *Marie Rady*, *Lady M. Fitzwilliam*, *Dr. Andry*, *The Bride*, very fine; *Earl of Dufferin*, *Duchesse de Vallombrosa*, *Duke of Edinburgh*, *Silver Queen*,

*Sir Rowland Hill*, *Susanne M. de Rodocanachi*, and *Charles Lefebvre*. Messrs. Perkins & Son, Coventry, were second; and Messrs. Cooling and Son, Bath, were third with very good collections.

In the class for twenty-four distinct triplets Messrs. Perkins & Son, Coventry, were decidedly first with fine blooms of *Mrs. J. Laing*, *Duchess of Bedford*, *Heinrich Schultheis*, *Annie Wood*, *Capt. Christy*, *E. Y. Teas*, *Due de Wellington*, *Lady Mary Fitzwilliam*, *Pride of Waltham*, *Catherine Mermet*, *Victor Hugo*, *Miss E. Gifford*, *La France*, *Mrs. Laxton*, *Madame E. Verdier*, *Ulrich Brunner*, *François Michelin*, *Emilie Laxton*, *Etienne Levet*, *Pride of Waltham*, *Horace Vernet*, *Viscountess Folkestone*, *A. K. Williams*, and *Merveille de Lyon*. Messrs. Harkness and Sons were awarded the second; and Dicksons, Limited, the third prize.

The first prize for twelve Teas and Noisettes was well won by Mr. Frank Cant with charming examples of *Francisca Kruger*, *Innocente Pirola*, *Catherine Mermet*, *Madame Cusin*, *Souvenir de S. A. Prince*, *Hon. E. Gifford*, *Countess de Nadaillac*, *Niphetos*, *Jean Ducher*, and *Marie Van Houtte*. Messrs. Burch were second; and Cooling and Sons third in this class.

For twelve blooms of any Tea or Noisette, Messrs. Burch were first with *Innocente Pirola*; Mr. Frank Cant second, with *Madame de Watteville*; and Messrs. Cooling & Sons third, with *Devoniensis*. For twelve blooms of any dark Rose, Messrs. Perkins & Son were first with *Charles Lefebvre*; Messrs. Cooling & Sons second, with *A. K. Williams*; and Dicksons, Limited, third, with *Rosicriste Jacobs*. Messrs. Perkins & Son were first for twelve white or light Roses, with *Mrs. J. Laing*, very fresh; Messrs. Cooling & Sons second, with *Lady Mary Fitzwilliam*; and Messrs. Burch third, with *Niphetos*. In the class for twelve blooms of any colour, Mr. Frank Cant was first with *Her Majesty*; Messrs. H. Merryweather and Cooling & Sons following in that order, both staging *Mrs. John Laing*. Messrs. Perkins & Sons secured the chief prize for a basket of Roses, also for bridal and buttonhole bouquets. Exhibited with the Roses was a stand of beautiful Carnations from Mr. Turner of Slough, which were greatly admired by the visitors.

**FRUIT.**—Of this the display was both extensive and excellent, probably the best of the year up to date. The prizes of £10, £6, and £3, for a collection of nine dishes were well contested for by five exhibitors. The first prize fell to Mrs. Meynell Ingram, Temple Newsam (gardener, Mr. Dawes), who showed a fine Queen Pine, *Bellegarde Peaches*, *Negro Largo Figs*, *Madresfield Court* and *Foster's Seedling Grapes*, *Lord Napier Nectarines*, a Melon, and *White Marseilles Figs*. The second prize was awarded to Mr. J. Thorpe, Coddington Hall, Newark, in whose collection were fine *Foster's Seedling Grapes* and *James Veitch Strawberries*. The third prize went to the Duke of St. Albans (gardener, Mr. J. Edmonds), who, as usual, showed very fine *Peaches* and *Nectarines*. In the class for six dishes of fruit, Pines excluded, only two collections were staged, the first prize being won by Lord Bagot, Blythfield (Mr. T. Bannerman, gardener), who showed fine *Black Hamburg Grapes* and *Lord Napier Nectarines*. The second prize went to Lord Carnarvon, Bretby Park (Mr. Read, gardener), whose best dish was high-coloured *Buckland Sweetwater Grapes*.

The class for four bunches of Grapes, two varieties, the prizes given by Mr. Wm. Thomson, Clovenfords, was keenly contested for by seven exhibitors. The first prize went to Edward Miller Mundy, Esq., Shipley Hall (Mr. W. Elphinstone, gardener), who showed *Madresfield Court* and *Black Hamburg Grapes* in admirable condition. Second, Lord Hotham, Dalton Hall, Hull (Mr. J. Allsop, gardener), *Muscats* fine, and *Alicantes* not quite ripe. Third, Lord Carnarvon, Bretby Park, for *Black Hamburg* and *Buckland Sweetwater*. Three bunches of *Black Hamburg Grapes*: First, Mr. T. Bannerman, excellent berries and finish. Second, Mr. A. Webb, gardener, Kelham Hall. Third, J. T. Harris, Esq., Stone (gardener, Mr. J. Bates); nine exhibitors. Three bunches of any other black Grape: First, Mr. W. Elphinstone, with *Madresfield Court* superbly finished, perfect models of this fine Grape. Second, Lord Carnarvon, Bretby, with the same variety. Third, Mr. Bannerman; eight exhibitors. Three bunches of any white Grape: First, Lord Hotham, for *Buckland Sweetwater*, magnificently finished. Second, Mr. J. T. Harris, Stone, with two green *Foster's Seedling*. Third, Mr. Bannerman.

With a dish of six Peaches Mr. Gilman, gardener to Lord Shrewsbury, *Ingestrie Hall*, was first with very fine *Violette Hâtives*. Second, Mr. Dawes with *Bellegardes*. Third, Mr. Basil Herbert. Eight exhibitors. **TOMATOES.**—First, Lord Hotham. Second, Lord Shrewsbury. Third, Mrs. Meynell Ingram. **Melons, Green Flesh.**—First, Mr. Gilman with *Hero of Lockinge*. Second, Mr. Webb, Kelham Hall. Third, Mr. J. Edmunds, Bestwood Park. **Scarlet Flesh Melon.**—First, Mr. J. Edmunds with *Read's*. **Dish of Cherries.**—First, Mr. Gilman with very fine *Black Tartarian*. Second, Mr. Dawes. **Strawberries.**—First, Lord Aylesford, Packington (Mr. A. Elphinstone, gardener), with remarkably high coloured *Sir Joseph Paxton*. Second, Mr. J. Thorpe. Third, Mr. Gilman.

Of the vegetables we can only say that both produce and competition was good, that the prizes offered by the Society for nine dishes were won by Mr. Thorpe, Lord Carnarvon's gardener, and Mr. Gilman; that Messrs. Sutton's prizes were adjudged to Lord Carnarvon and Messrs. Harris and Fitzherbert; and that Messrs. Webb's prizes were won by Messrs. Harris and Meakin. Many other exhibits must be passed, but a strong word of approval must be recorded for the cottagers' produce both in respect to vegetables and flowers.

The Show was opened by the Duke of Sutherland, who, with the Duchess and guests, closely examined the exhibits. A largely attended luncheon was held on the ground, at which speeches were delivered

that met with good acceptance by the company. Mr. Taylor, the indefatigable Secretary, Mr. Blair, and all the officials, are to be congratulated on the success achieved, upwards of £400 being taken for admission during the afternoon.

The Trentham gardens are in admirable condition—Orchids, Grapes, Peaches, Chrysanthemums, &c., showing that they are in charge of a master in the art of cultivation, and it is impossible to speak too highly of the efforts of Mrs. Blair in making her numerous guests happy and at home on the interesting occasion.

#### HIGHGATE.—JULY 16TH.

FAVOURER with splendid weather, and the grounds of the Baroness Burdett Coutts for the venue, the thirty-second annual Exhibition of this vigorous Society proved to be one of the most successful ever held, the exhibits, both in quantity and quality, being considerably above the average.

The whole of one side of the largest tent, 140 feet by 50 feet, was occupied with the flowering and foliage groups, which formed a fine exhibition in themselves. The first prize for a collection of flowering plants was well won by Mr. J. Brooks, gardener to W. Reynolds, Esq., J.P., followed closely by Messrs. H. Eason and J. Britain.

For a collection of flowering and foliage plants Mr. H. Eason, gardener to B. Noakes, Esq., North Hill, was first, with Mr. J. Britain second. First prize for six stove plants (foliage) was won by Mr. J. Britain with exceptionally fine specimens. He was followed by Mr. H. Eason.

For six stove plants (flowering) Mr. H. Eason took first place with half a dozen of the greatest merit, conspicuous among which were an Allamanda splendidly flowered and a very fine Eucharis.

Cut Roses were staged largely and in very fine form. The Hon. Secretary has been working hard to increase the interest in the Queen of Flowers, getting special prizes offered, &c., and his efforts were rewarded by excellent competition. Mr. J. Bateman, Rosevale, Archway Road, was *facile princeps*, taking first prizes in all the open classes—namely, twelve varieties, three of each, and two classes of twelve, distinct. He was closely followed in the latter two classes by his pupil, Mr. Hugh White, and in the former by Mr. G. Page.

In the class for dinner-table decorations a great improvement in style was noticeable, the heavy crowded exhibits having given place to those of the light and graceful character, so much more agreeable to the eye. The Hon. Sec., Mr. D. B. Crane, was placed first with three epergne vases, containing Iceland Poppies, Grasses and Ferns. The exhibits of buttonhole bouquets were of a very fine stamp, the prizes being taken by Messrs. H. G. Russell, H. Eason, and E. Elcock in the order named.

The Baroness Burdett Coutts takes the greatest possible interest in the cottagers' division of this Society, valuable prizes being offered by her and other subscribers for collections of fruit, vegetables, cut flowers, &c., &c., and the result is keen competition every season, and a degree of excellence which would do credit to much larger shows. The principal prizewinners in this section were Messrs. R. Sower, C. Halsey, H. Bass, G. Collins, A. Sedgwick, and H. White.

The Show was visited and critically inspected during the afternoon by the Baroness Burdett Coutts and some friends, who all expressed the greatest pleasure with the exhibits. A handsome bouquet was afterwards presented to the Baroness on behalf of the Society. The fine weather continued throughout the day, and the attendance was very good, about £150 being taken at the gates.

#### PRESCOT AND DISTRICT.

THE seventh annual Exhibition of the Prescott and District Horticultural Society was held on Thursday last in a field at Parkside, kindly lent by James Whittaker, Esq. Although the weather did not look very promising early in the morning the threatening clouds dispersed, and the sun shone out in great brilliancy the whole of the day. The attendance was great—in fact, after the time for the cheaper rate of admission the ground became crowded, and the field presented a very gay appearance. Considering the lateness of the season the exhibits were very little behind other years, but the groups were well ahead of all previous efforts, as were the stove and greenhouse plants; whilst vegetables, especially Celery, were very good. The Society has made rapid progress during the last two or three years, and £120 was this year offered in prizes as against £90 last year. For six stove and greenhouse plants, three in flower, Mr. R. Pinnington, gardener to Edward Banner, Esq., Blacklow House, Roby, was first, in his collection being a good *Statice profusa* *Hydrangea hortensis* with forty heads of bloom perfectly blue, and *Plumbago capensis*, whilst foliage plants were represented by a good *Phoenix*, *Alocasia macrorrhiza* variegata, and *Croton Carrieri*. Mr. Edward Blythian, gardener to Mrs. Baxter, Rainhill, was second, in this collection being a capital *Statice Holfordi* and a fine *Plumbago capensis*. Four greenhouse plants in flower.—First, Mr. E. Blythian. Third, Mr. H. McFall, gardener to E. C. Leventon, Esq., Oakfield, Roby. One greenhouse plant in flower.—First, Mr. E. Blythian. Second, Mr. Ratray, gardener to G. G. Musson, Esq., Roby. For six stove and greenhouse Ferns, Mr. R. Pinnington took first honours, his best plants being *Davallia Mooreana*, *Dicksonia antactica*, and *Goniophlebium subauriculatum*. Second, Mr. E. Blythian, who had good plants of *Adiantum excisum* and *Adiantum decorum*.

Gloxinias, Begonias, Pelargoniums, Cockscombs, Fuchsias, and Petunias were well represented, Messrs. Learmont, Gray, McFall, Blythian, Pennington, Price, and Eaton being the chief prizetakers.

The collection of plants arranged for effect brought out seven competitors. The first and second places were warmly contested, the chief honour ultimately falling to Mr. J. Bounds, gardener to A. L. Jones, Esq., Aigburth, for an arrangement lightly put together. A well-coloured *Croton* formed the centre, Maidenhair Fern was judiciously used, whilst peeping out were just enough Orchids to give the right balance. Mr. McFall was a very close second, only losing by not having such choice Orchids as the winning group. Mr. Gray was a good third, and Mr. T. Eaton was considered worthy of an extra prize.

Roses were fairly well shown. For eighteen Mr. Wharton, gardener to Dr. Royston, The Orchard, Huyton, was a good first; second, Mr. W. Rigby. For twelve and six Mr. J. Beesley, Prescott, took both honours. Six Roses in pots Mr. J. Bounds, the same exhibitor winning with cut flowers grown outdoors.

Fruit was well shown. Collections of four dishes.—First, Mr. R. Pennington, who had fair Black Hamburg Grapes, fine Hero of Lockinge Melon, capital Dagmar Peaches, and Lord Napier Nectarines. Second, Mr. J. Bounds. Third, Mr. T. Eaton. Mr. Pennington was also successful for green and scarlet flesh Melons, dish of Strawberries, three dishes Tomatoes, and second for Peaches. Mr. Middleton, gardener to Lieut.-Col. Pilkington, Rainford Hall, carried all before him with Grapes, winning with glorious Black Hamburg, Muscat of Alexandria, and superb Madresfield Court. In the Black Hamburgs Mr. T. Eaton exhibited well grown bunches a little short of colour.

Mr. McFall was first with Bouquet, and third with a collection of vegetables. Mr. Learmont came in first with Turnips, Broad Beans, and Cauliflowers. The class for Nectarines was won by Mr. J. Mather, gardener to W. H. Evans, Esq., Huyton. Cottagers exhibited in fine form, and the Show was a thorough success, thanks to the hardworking Secretary and Treasurer and the able Committee.

#### BEDFORD AND BEDFORDSHIRE.

At the annual Exhibition of this Society held on Thursday last Roses and cut herbaceous flowers were a well sustained feature. In the open class of forty-eight distinct Roses, Messrs. Burch of Peterborough led with some fine and well-coloured, although not large blooms, having Victor Hugo, Le Havre, Star of Waltham, Duchess of Bedford, Etienne Levet, and perhaps the best bloom of Elie Morel which has appeared in a winning stand for some years. Messrs. D. Prior & Son, Colchester, were second, and Messrs. Burrell & Co., Cambridge, third. For eighteen Teas (open), Messrs. Burrell & Co. in the first prize box had charming flowers of Ernest Metz, Souvenir d'Elise, Comtesse de Nadaillac, Souvenir d'un Ami, David Pradel, and a remarkable fine flower of Madame Margottin. Mr. J. Mattock, New Headington, Oxon, came second, and Messrs. Burch third. In the open amateurs' class for twenty-four distinct Roses, the champion, Mr. E. B. Lindsell, was in his full strength, showing a well matched box of finely coloured blooms Mrs. Jno. Laing, Rosieriste Jacobs, Comtesse de Nadaillac, J. S. Mill, Victor Hugo, Baroness Rothschild, Grand Mogul, and Captain Christy being prominent. The Rev. E. Foster-Melliar, Sproughton Rectory, Ipswich, was second, and the Rev. W. H. Jackson, Stagsden Vicarage, Bedford, third. For twelve Teas, open to amateurs, Mr. Jackson led, Mr. Foster-Melliar following, and Mr. Lindsell as third, all having very fine and clean flowers. For six cut Roses (amateurs' open class), Mr. G. Moules and Mr. W. O. Times, Hitchin, were first and second, and Miss Bailey-Denton, Stevenage, third. The hottest day of the season told greatly against the Roses, which had mostly been grown in cooler and shady weather, and after judging, some winning stands of blooms, which before noon were bright and bold, could hardly then compare with stands placed below them, but which had evidently been "boxed" only the same morning.

A brighter show of cut hardy herbaceous and bulbous flowers has rarely been seen. For thirty-six bunches (open) Messrs. Burrell & Co. and Messrs. Laxton Brothers, Bedford, had large and very glowing masses of the most attractive sorts, both were admirably staged; perhaps the credit is due to Messrs. Laxton for the most striking exhibit, but Messrs. Burrell had a few more choice varieties, but ultimately the Judges gave the palm to Messrs. Burrell. In Messrs. Laxton's collection *Scabiosa caucasica* var. *amena*, deep tinted and large flower, was very conspicuous. *Lychnis Haageana*, not often so well done, and *Dianthus Napoleon III.*, a brilliant mass. Mr. J. C. Sheppard, Bedford, was third with a very good and choice collection. Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, exhibited, not for competition, a large and attractive collection of upwards of seventy varieties, including *Heuchera sanguinea*, *Lilium pardalinum californicum*, *Colchicum dalmaticum* testaceum and *Martagon album*, all very attractive; *Triteleia Murrayana*, *Helianthus occidentalis* and *Campanula persicifolia alba grandiflora*. Messrs. Laxton also staged a grand lot of the newest varieties of Sweet Peas not for competition. Both these collections were highly commended.

The plant department at this Show, not usually a strong one, on this occasion gave evidence of increasing spirit on the part of local exhibitors. Mr. Ellis, gardener to Mrs. Orr, Pemberley, Bedford, taking first for a group; Mr. Empson, gardener to C. Franklin, Esq., Bedford, leading for foliage plants; Mr. Robinson, gardener to F. Howard, Esq., Bedford, leading for tender and hardy Ferns and Fuchsias; Mr. Hermon, gardener to Griffith Jones, Esq., Goldington, for some well grown Zonal Pelargoniums; and Mr. R. Day, gardener to J. Hawkins, Esq., Mayor of Bedford, for Gloxinias; and Mr. Stewart, gardener to R. Greenfield, Esq., Haynes Park, Beds, for table plants.

Fruit was a weak department, and except for the really choice

examples from the Mayor's garden, and from which came worthy exhibits, enabling Mr. Day deservedly to come first for a collection of six varieties for very fine Black Hamburgh Grapes and Peaches, comment would not be necessary. Mr. Allis, gardener to Major Shuttleworth, Old Warden Park, was first for a splendid dish of Waterloo Strawberry; the flavour, however, was disappointing. Mr. T. Bradshaw, Houghton Regis, taking first for a collection of Strawberries, including Noble, Sir J. Paxton, and Forman's Excelsior.

Vegetables were, for the season, well shown. In the competition for Messrs. Sutton's prize Mr. Robinson was successful. Potatoes were all round poor, but Peas were remarkably well shown, Mr. Waller, Clapham Park Gardens, securing first for prizes offered by Messrs. Laxton with very fine examples of Evolution, Autocrat, Duke of Albany, and Ne Plus Ultra. Messrs. M. Coleman, Bedford, was first for a bouquet with a very light and effective arrangement of *Erigeron speciosus*, Ox-eye Daisies, and Grasses; Miss Maude Blake for sprays, and Miss M. T. Godfrey for table decorations.

The competition for wild flowers and Grasses, chiefly amongst children attending the Bedford schools, was spirited and highly interesting, evidencing an increasing taste in this department amongst the rising generation so largely represented in Bedford.

#### WOLVERHAMPTON.

WITH fine weather, an excellent Show, and a large number of well filled tents the third annual Exhibition at Wolverhampton was an unquestionable success. The People's Park is a grand place in which to hold an exhibition on a large scale, as it occupies fully 80 acres, admirably laid out and planted, with plenty of broad grassy spaces for tents and promenading. There are large sheets of ornamental water, some charming carpet bedding, and a very large number of beds of other plants, with miles of borderings of *Violas*, and *Campanula pumila alba*; and the admirable order kept by the able Superintendent, Mr. Thomas, lifts the Park to the level of the pleasure grounds of our most noted private gardens. The price of admission on the first day was 2s. 6d. until five o'clock, afterward 1s, and from 15,000 to 20,000 persons must have been present. The excellent military band from London was a great attraction. At night thousands of variegated lamps and Chinese lanterns were used in illuminating the grounds, and the effect was most charming. The lakes were studded with boats rigged with masts, and cordage hung with lamps and lanterns, and kept constantly moving, with a band in one of them, the margin of the lakes being distinctly marked out with lamps and lanterns. Too much praise cannot be given to the executive for this magnificent attraction, which entailed considerable expense and labour, but was eminently gratifying to the visitors.

One long tent was devoted to groups of a circular form not exceeding an area of 450 square feet, and seven were staged. Mr. Cypher, Cheltenham, obtained the first prize with a delightful group, having a central Palm and *Oncidium flexuosum* and *O. maeranthum* lightly arranged with it. There were Orchids in profusion, and well coloured Crotons and other plants arranged in a groundwork of Ferns. Second, Mr. Currey, gardener to Colonel Pepper, Salisbury. Third, Mr. W. H. Dyer, gardener to Mrs. Marigold, Edgbaston, Birmingham.

A tent over 200 feet in length was devoted to the stove and greenhouse and ornamental plants. In the class for sixteen flowering or fine-foliage plants, Mr. Cypher was first with grand Palms, *Ixoras Williamsi* and *salicifolia*, Crotons Sunset and *angustifolius*, *Stephanotis floribunda*, Croton Queen Victoria, *Erica obbata*, and other plants. Mr. Finch, gardener to Mr. Alderman Marriott, Coventry, was second with fine plants, amongst which was a grand Croton Mortei. Third, Mr. W. H. Dyer. In the class for six stove and greenhouse plants in flower Mr. Cypher was first with superb plants of *Erica Parmenteriana rosea*, *Bougainvillea glabra*, *Allamanda nobilis*, *Stephanotis floribunda*, *Ixora salicifolia*, and *I. Regina*. Mr. Finch was an excellent second, and had one of the finest examples of *Allamanda grandiflora* we have ever seen. Third, Mr. Currey. Mr. Cypher was first respectively for six Tree Ferns and six Palms; and Mr. Sharp, gardener to — Lovatt, Esq., Wolverhampton, was first for six exotic Ferns. Second, Mr. Finch; third, Mr. Cypher.

For eight Orchids Mr. Cypher was first with large specimens, consisting of *Anguloa Clowesi*, *Cattleya gigas*, *Lælia purpurata Brysiana*, *Cypripedium Lawrenceanum*, *C. barbatum*, a fine *Cattleya gigas Sanderiana*, *Lælia purpurata*, and a large specimen *Thunia Marshalli delicata*. Second Mr. Alderman Marriott; third, Mr. C. Raffill, gardener to Henry Smith, Esq., Kingswinford.

Some fine exhibits of six ornamental foliage plants were staged. First, Mr. Cypher, with good examples of Croton Sunset and *angustifolius*, and *Cordyline indivisa*. Second, Mr. Alderman Marriott, who had a *Dion edule* in excellent condition. Third, Colonel Pepper.

In the open class for Roses, seventy-two blooms, there were six exhibitors. Mr. Frank Cant, Colchester, was first, and he had fine blooms of Comtesse de Nadaillac, Lady Helen Stewart, Mary Bennett, Susanne Marie Rodocanachi, Her Majesty, The Bride, Ulrich Brunner, Etienne Levet, and Pride of Waltham. Second, Mr. B. R. Cant, Colchester, his most noticeable blooms being Alphonse Soupert, Duke of Edinburgh, Etienne Levet, Madame Gabriel Luizet, Her Majesty, Ulrich Brunner, and Captain Christy. Third, Messrs. Paul & Son, Cheshunt.

With forty-eight Roses there were six exhibitors. Mr. B. R. Cant was first, and in his stand were fine blooms of Viscountess Folkestone, Souvenir d'Elise, Pride of Waltham, Duke of Edinburgh, Ulrich Brunner,

Madame Eugène Verdier, Innocente Pirola, and Baroness Rothschild. Second, Mr. F. Cant, with Etienne Levet, Lady Helen Stewart, Susanne Marie Rodocanachi, Mrs. John Laing, Merveille de Lyon, Her Majesty, and La France (very fine). Third, Messrs. Dicksons, Limited, Chester. Fourth, Messrs. Burch, Peterborough. Messrs. Burch won with thirty-six, and in their stand were fine blooms of Ulrich Brunner, Madame Gabriel Luizet, Madame C. Wood, Marie Verdier, Earl of Dufferin, Captain Christy, Merveille de Lyon, Anna Ollivier, John Stuart Mill, François Michelin, Xavier Olibo, Mrs. John Laing, Duchesse de Morny, Abel Carrière, and Lord Wolseley. Second, Mr. B. R. Cant, with fine blooms of Marguerite de St. Amand, Madame Gabriel Luizet, Susanne Marie Rodocanachi, a grand example of Her Majesty, Viscountess Folkestone, and Marie Verdier. Third, Messrs. Perkins & Sons. Fourth, the Cranston Nursery Company. With twenty-four Roses, Mr. F. Cant was first, Mr. B. R. Cant second, Messrs. Perkins & Sons third.

Twelve blooms of one variety, dark.—First, Mr. B. R. Cant, with Duke of Edinburgh. Second, Messrs. Prior & Son, with A. K. Williams. Third, Mr. F. Cant, with Victor Hugo. Twelve blooms, one variety, light.—First, Messrs. Perkins & Sons, with Mrs. John Laing. Second, Mr. B. R. Cant, with Merveille de Lyon. Third, Rev. F. Burnside, with Marie Van Houtte. Twelve Tea Roses, distinct.—First, Rev. F. Burnside. Second, Mr. F. Cant. Third, Messrs. Prior & Son. The following classes were for amateurs and gentlemen's gardeners only:—Thirty-six distinct Roses.—First, the Rev. A. Foster-Melliar, with a first-rate lot: Germain Caillet, Alphonse Soupert, Marie Finger, Madame Gabriel Luizet, Jeannie Dickson, Ulrich Brunner, Marie Verdier, Duke of Wellington, Madame Eugène Verdier, Mrs. John Laing, Merveille de Lyon, and Comtesse de Nadaillac (especially fine). Second, Mr. W. Bolton, Wolverhampton. Third, the Rev. H. Pemberton. Twenty-four distinct varieties.—First, the Rev. H. Pemberton. Second, the Rev. A. Foster-Melliar. The display of Roses throughout was extensive, and a marked feature of the Exhibition.

Fruit was tolerably well represented, and in some cases of good quality. For four bunches of Grapes, distinct, Mr. C. Frowd, gardener to the Rev. Canon Coventry, Worcester, was first with well-finished fine Black Hamburgh and Gros Colman, and Buckland Sweetwater, and Muscat of Alexandria. Second, Mr. J. Wilkes, gardener to G. Meakin, Esq., Cresswell Hall, Stafford, a well-finished bunch of Madresfield Court being in this stand. Third, Mr. Blair, Trentham, with a well finished bunch of Alnwick Seedling amongst his clusters. Two bunches of white Grapes.—First, the Rev. Canon Coventry, with Muscat of Alexandria. Two bunches of black Grapes.—First, the Rev. Canon Coventry with excellent Black Hamburgs. Second, Mrs. Marigold, with Black Hamburgh. Third, R. Lovatt, Esq., with small bunches of Madresfield Court. Peaches.—First, Mr. Gilman, Ingestrie, for large handsome Violette Hâtives. Second, Mr. Blair, with the same variety. For six Nectarines Mr. Blair was first with highly coloured Lord Napier, and Mr. Gilman second. With a collection of fruits, ten varieties, Mr. Blair was first, his Black Tartarian and Bigarreau Napoleon Cherries being especially fine, Lord Napier Nectarine and Waterloo Strawberries excellent. One exhibitor included Tomatoes in his collection, and was disqualified.

There were restricted classes for gentlemen's gardeners in Staffordshire, Worcestershire, Warwickshire, and Salop. For six stove and greenhouse plants Mr. Finch was first with *Lælia purpurata*, *Dasyliroon acrotrichum*, Croton Queen Victoria, *Allamanda magnifica*, and two other plants. Second Mrs. Marigold. Some excellent pyramidal Coleuses were staged, and Mr. J. E. Underhill's first prize eighteen Gloxinias were beautifully grown. For six Exotic Ferns Mr. Powell, gardener to G. H. Kenrick, Esq., Birmingham, was first, a very fine *Cibotium spectabile* being in this exhibit. For groups, limited to 400 square feet, Mr. S. Horton, gardener to — Fowler, Esq., was first; Mr. W. H. Dyer second; and Mr. Powell, gardener to G. H. Kendrick, Esq., third; these being beautiful exhibits. The amateurs' and cottagers' classes were abundantly filled. Messrs. Perkins & Sons, Coventry, were first in each of the three classes for their well-known style of bouquets. For Messrs. Carter & Co.'s vegetable prizes for collection there were two exhibits. First, Mr. Thomas Wilkins, gardener to Lady Theodore Guest, with a very fine lot; second, Mr. Waite, gardener to the Hon. W. E. Talbot. For Messrs. Webb & Sons' prizes for collection—first, Mr. Wilkins; second, Mr. Waite. Four exhibitors.

For Messrs. Suttons' prizes for collection—first, Mr. Waite, with a very fine lot; and there were three other competitors. All were meritorious, Mr. Wilkins and Mr. Waite having especially fine collections. Mr. W. Farr, The Gardens, Patshull, sent three handsome large Queen Pines, and very fine Mushrooms and Tomatoes.

Mr. F. Smith, nurseryman, Newry, contributed a large display of choice herbaceous cut blooms; Messrs. Hewitt & Co., Solihull, cut herbaceous blooms; Mr. Davis, Yeovil, a fine display of cut double and single Begonias; Messrs. Clibran & Son, Altrincham, choice Ferns and cut herbaceous flowers; Messrs. Webb & Sons, a collection of vegetables; and Messrs. B. S. Williams & Son, Holloway Nurseries, London, a quantity of new and rare plants, the following receiving certificates:—*Cypripedium Morganæ*, *Draeena indivisa variegata*, *Begonia Arthur Malet*, *Dicksonia Lathamii*, *Pteris tremula Smithiana*, and *Draeena versallensis*. Messrs. Birkenhead, Sale Nurseries, Manchester, set up a very extensive collection of new and rare Ferns, and certificates were awarded to the following:—*Athyrium cristatum*, *F.-f. kalothrix*, *Pteris Victoria*, *Davallia Griffithiana*, *Athyrium Friselliae coronaria*, and the beautiful and distinctly spotted *Gymnogramma Mulleri*.

On the second and third days there was an enormous attendance, as

the Wolverhampton Show has now become so popular, and Mr. Green, sen., who has so much to do with the supervision, and his son, the courteous Secretary, with the Committee are to be congratulated on their success.

#### FRUIT FORCING.

**FIGS.—Trees in Pots for Early Forcing.**—These must be kept free from red spider by syringing at least once a day, in hot weather twice, directing the force of the water against the under side of the leaves, and if this is not sufficient an insecticide must be employed, as it is important that the foliage be kept clean and perform its functions to the last. Afford liquid manure to the roots, not to the extent of causing exuberance, but to insure a due supply of nutriment, and the storing of assimilated matter in the wood. Pinching to induce a neat habit in young plants with fruitfulness must be attended to, regulating the stopping by the vigour of the plants and varieties. Strong-growing sorts will need to be more closely pinched than those of moderate growth; but in all cases avoid crowding the shoots, for fruitfulness is not so much dependant on ample foliage as on a legitimate proportion duly exposed to light. The trees must not be huddled together, but each must have space essential to the proper development of the tree under all the light possible, and free ventilation to solidify the growth as it is made.

**Second Crops.**—Planted-out trees started about the new year will have the second crop in an advanced state, and it must have a final thinning, if not already effected, reserving those fruits near the base of the growths, which finish better than those near the points. Thinning is of vital importance, because fruit-bearing is an exhausting process, and the first crop next year having to be borne on the well-ripened points of the growths of the preceding year that part must not be enfeebled by carrying a heavy load of fruit. First crops are the most valuable. Any cultivator can grow second crops, and the chief cause of the failure of the first is imperfect ripening of the wood. Nor must the energies of the trees be taxed too severely by the second crop if they are intended to afford early fruit next season. Attend regularly to training and stopping the shoots, keeping the points well exposed to light. Train thinly, tie loosely, and leave plenty of space in the ligatures for the shoots to swell. Stop side shoots at the fifth leaf, and rub off those not required, for spur growths to the extent of crowding is fatal to fruitfulness. Afford water copiously through a light mulching of short lumpy manure, none surpassing horse droppings duly sweetened. If used fresh and too abundantly there is danger of injury to the young growths. The dressing is light, admits air, and contains ammoniacal elements, which greatly benefit the trees. Liquid manure will be necessary according to the vigour of the trees and the extent of the rooting area. Trees in narrow borders may need it every day, others at longer intervals. They can hardly have too much water in hot weather, and they store more matter in a week of fine weather than in a month of dull. The border, however, must be of sound material, and the roots active. Forebly dislodge red spider by syringing twice a day, which, with proper feeding, will occasion little need of insecticides; but scale must be removed with a brush and a soapy solution. Admit a little air constantly, increase it early; close early with plenty of atmospheric moisture, allowing the heat to rise to 90°, and the fruit will swell to a good size. Then a circulation of air constantly will enable the grower to produce Figs of the highest quality, which are wholesome, nutritious, and much appreciated at dessert.

**PEACHES AND NECTARINES.—Early Forced Trees.**—Trees of Alexander, Hale's Early, Early Alfred, A Bee, Stirling Castle, Crimson Ga'ande, and Royal George varieties, started from early December to the new year, have been cleared of fruit, and the wood on which it was borne removed. This and the taking out of any superfluous growths admits light and air, so that the wood retained becomes hard and brown, and the buds attain perfect formation, but this is contingent upon clean foliage and proper supplies of nutriment. The trees, therefore, must be syringed, and, if necessary, have an approved insecticide promptly applied, supplying water, and in the case of weakly trees liquid manure to the roots so as to keep the soil healthfully moist. Mulching with light rather lumpy manure a couple of inches thick will keep the surface moist, the roots active, prevent the soil cracking, and assist in the retention of the foliage in health. The buds will be sufficiently advanced and the wood matured to allow the roof lights to be removed, and this should not be further delayed. This secures a sort of rest, has a most beneficial effect on the trees, while the soil becomes well moistened by the autumn rains.

**Succession Houses.**—The crops are ripening on trees that were started in February; indeed very early varieties have been cleared of their crops. Crimson Galande is remarkably brilliant in colour, Stirling Castle large and good in colour, Grosse Mignonne still larger and more highly coloured, whilst Royal George leaves nothing to be desired as regards size, form, colour, and quality. All points considered, it is, perhaps, the best of Peaches grown under glass. Lord Napier Nectarine attains a good size, bears freely, has a most refreshing

piquant flavour, and when ripe to the extent of shrivelling is remarkably rich without cloying. Its colour, however, is its weak point, but in Dryden is found size, high colour, and fine flavour. It is probably the best Nectarine for all round purposes. Pine Apple is richer, a pleasing orange and crimson, and as a midseason variety excellent. Victoria is of good size and quality, and if well exposed to the light has a fine crimson cheek. Those are the cream of Nectarines, and all raised by Mr. Rivers. As the fruit is cleared off the trees cut out the wood that has borne it, thinning the growths where they are so close that the foliage cannot have exposure to light and air. Cleanse the growths by means of the syringe or engine with water of dust and red spider or other insects, using an insecticide if necessary. Keep the borders moist, not soddened, using liquid manure if the trees are weak, have borne heavily, and the buds are not developing well, but keep it from those inclined to over-luxuriance. Stop all laterals to one joint, but where the buds are in an advanced condition allow a little lateral extension, which prevents premature ripening of the foliage by continuing the root action with at the same time growth on which to expend it without danger of starting the principal buds. When the buds are well formed, the fruit having been cleared off the trees, remove the roof lights. If under fixed roofs ventilate to the fullest possible extent.

**Trees Swelling their Crops.**—Those started in March have passed the stoning process satisfactorily, as usually happens when the trees are not too luxuriant, not hurried in the early stages, and have not been overcropped or neglected in thinning the fruit, with a genial condition of the atmosphere so as to ensure steady progressive growth. Border constituents, however, exert an influence on the stoning. Light, loose, rich soil rarely grows Peaches and Nectarines satisfactorily. Rather strong loam with some clay or elay marl, so as to afford and store potash, old mortar rubbish or chalk to supply calcareous matter, seem to suit these fruits best. Draw the leaves aside and raise the fruit by means of laths with its apex to the light. Water the inside border and outside if inclined to dryness, affording liquid manure and a mulch of lumpy manure. Avoid a close surface, for it excludes air, and that it be open is as essential for the assimilation of plant food for taking up by the root hairs as its elaboration by healthy foliage. Ventilate early, in fact leave a little air on all night, syringe by 7 P.M., and through the early part of the day ventilate freely. When the sun loses power in the afternoon reduce the ventilation and raise the temperature to 85° or 90° about 4 P.M., with a good syringing and damping of surfaces, but it must be done with judgment, for when water hangs for any length of time on the fruit during the last swelling it is liable to damage the skin, causing it to crack, and imparting a musty flavour; therefore have the fruit dry before night, and when the day is dull omit the morning syringing. Directly the fruit commences ripening cease syringing, but afford air moisture by damping available surfaces, especially the border whenever it becomes dry, ventilating rather freely, and admit a little air throughout the night.

**Late Houses.**—If it is desired to accelerate the ripening ventilate rather freely in the early part of the day and up to one o'clock, then keep the heat obtained by reducing the temperature so as to secure 80° to 85°, and about 4 P.M. close, syringing well, and no harm will come if the temperature rises to 90° or 95°, ventilating a little about six o'clock so as to let the pent up moisture escape and the temperature gradually cool down. Regulate and tie down the shoots as they advance, allowing no more than are necessary for next year's fruiting, or for furnishing the trees. Let all have space for development, keeping laterals stopped to one leaf, and retain growth to attract the sap to the fruit. Any gross shoots pushing laterals from the leaf buds may be cut back to where the buds remain intact, or, if likely to disarrange the equilibrium of the trees, cut them out altogether. They only tend to promote gumming, imperfect setting, and certain easting of the fruit in stoning. Draw the leaves away from the fruits, which raise from the under side of the trellis and expose them to the sun. If the fruit is required retarded ventilate freely day and night, but do not, as a rule, have recourse to shading, though a slight shade obtained by drawing herring netting over the roof lights is beneficial than otherwise where the panes of glass are large. Observe the conditions laid down in the preceding paragraph after the fruit commences ripening, also as to assisting the swelling.

**Wall Cases.**—Secure the growths to the trellis as they advance, being careful to allow space in the ties for the swelling of the shoots; neglect of this is a frequent precursor of gum. Keep the growths so thin that every leaf has full space for development and exposure. Syringe about 7 A.M., the house having a little ventilation constantly, increasing this with the advancing temperature to 75°, or if it is desired to accelerate the ripening maintain a temperature of 80° to 85° at day, but always with ventilation, and close sufficiently early to maintain that temperature but not to raise it above 90°. Syringe again about 5 P.M. Red spider will not make much headway provided the syringing is thorough and the trees are well supplied with water at the roots. Afford liquid manure to weak and heavily cropped trees. Thin finally directly the fruit is stoned. Neglect of early thinning results in thin-fleshed, flavourless fruits.

#### THE KITCHEN GARDEN.

**SOWING CABBAGE SEED.**—A good breadth of spring Cabbage is of the first importance, a fact brought home to many gardeners in a very forcible manner this year—a general scarcity prevailing. The first step towards succeeding with this crop is to raise abundance of sturdy plants, being too sparing with either the seed or ground being the reverse of

economical. There are several very excellent varieties available, nearly every seedsman of repute having one or more that can be depended upon to do well; and without recommending unlimited collections, it is yet advisable to sow at least three varieties. In some seasons all may do well, but more often than not what suits one variety does not agree with another, too early hearting, premature seeding, or death by frost resulting. By sowing two or three varieties all the eggs are not in one basket. It is also advisable, for somewhat similar reasons, to make more than one sowing. What may be the correct date one season may be either too early or too late in the next, and an equal number of plants put out from two sowings should meet all contingencies, and in any case provide a good succession. In late localities the first sowing may well be made during the third week in July, more seed being sown a fortnight later. A week later all round answers well in warmer districts, these differences not necessarily being confined to either the north or the south, and in most cases there is a particular and long recognised date for sowing. Thin sowing, so as to do away with the necessity for pricking out the plants, answers best, the transplanting being more simply and surely carried out. Therefore select a good open border, fine this down thoroughly, water through a coarse rose if at all dry, and then sow the seeds broadcast, well covering with sifted soil from the frame ground. If sowing in drills is preferred, water these prior to distributing the seed thinly among them. Net over if birds are troublesome, and keep off flea and slugs by means of slaked lime and soot dusted over the tiny seedlings when the dew is on them.

**CELERY.**—If properly prepared, the plants being pricked out in a thin bed of manure and soil on a hard bottom, they can be transplanted to the trenches in the hottest weather without experiencing a severe check. They ought to be put out too before they crowd and spoil each other, waiting therefore for a showery time being a great mistake. If the soil in the trenches has been exposed long enough to become hard and dry well water it a few hours prior to planting, and the plants ought also to have a thorough soaking before being moved with a good square of soil and roots. Late Celery especially usually succeeds best one row of plants in a trench, the latter being about 18 inches wide, and somewhat shallow on cold wet ground, with 4 feet spaces between them. Being put out 8 inches apart nearly as many plants can be grown in a trench as would be the case if double lines were planted, and they can be more expeditiously and carefully moulded up. In any case deep trenches with hard, dry, and shrinking sides are objectionable, a moderate amount of well-decayed manure lightly forked into the trenches, from which the roots can readily escape into the surrounding soil producing the best though not necessarily the largest Celery. Rows well established should have an occasional thorough soaking of water or liquid manure, the more advanced having their small lower leaves and any suckers and weeds there are cleared away, a little fine mould being then chopped down from the sides of the trenches. Use soot and lime freely about the plants if slugs are troublesome, and if extra clean early stalks are required closely bandage up the stems with several deep folds of brown paper, perfect blanching being then insured, whether or not they are further moulded up.

**CELERIAC.**—Where there is a demand for roots of Celeriac no time ought to be lost in getting them finally planted out. The crop pays for good culture, but should be grown on the surface of tolerably rich ground and not in trenches, a space heavily manured for and newly cleared of Cauliflowers answering well. In this case the only preparation needed is to heavily hoe the surface of the ground and to rake off all rubbish, but if ground has been specially manured and dug for this crop make it very firm, stout Turnip-like roots and not gross foliage being the aim of the cultivator to produce. The plants having been duly pricked out in a shallow bed of manure and soil, similar to ordinary Celery, will move well and should be put out about 18 inches apart each way, though 15 inches suffice for the newer French varieties, these being of more compact growth, also forming superior roots to the variety principally cultivated in this country. The plants will need watering occasionally in dry weather; the ground being kept clean and the surface loose between them, is all the further trouble needed.

**LATE PEAS.**—William I., Chelsea Gem, and William Hurst are among the best that can be sown for giving extra late dishes of Peas, the two last named being particularly suitable, as these can be easily protected whenever severe frosts are imminent. All being of quick early maturing growth, are frequently sown too early, the crops being fit to gather before the regular late Peas are over. It is a good rule to save seed on the earliest rows of one or more of the varieties named and to sow this directly it is ripe. There is then little likelihood of being too early, especially this season, while new seed always germinates more strongly than any that is older, this being no small advantage at a time when mildew and other evils have to be contended with. Open rather deep drills, well moisten these, then sow the seed rather thinly and level over the soil. Later on mulch between the rows and water frequently, the aim being to keep the plants growing strongly, otherwise they will crop prematurely.

**COLEWORTS.**—Some imagine this to be a very distinct vegetable, but it is really only a form of Cabbage, and Cabbages planted in July may often be used for Coleworts in November, but they are not so hardy as the Rosette Colewort, and this is the variety that should be grown. To be serviceable they should be planted out before July is over. They do not grow to a large size, and may be planted at a distance of 15 inches apart. They are equally as hardy, and more delicate on the table than Savoy in winter.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### FOREIGN BEES.

We had hoped to have put several varieties of bees on trial for the purpose of testing which was the best, but fear we have been frustrated, unless the Heather gives a chance. By far the best hives in the neighbourhood belong to a relative of my own. Every hive has one cover of supers filled. The bees are first-crossed Syrians. It is true, however, his hives are in a better situation than mine, although only half a mile distant. Ninety per cent. of my hives have superseded their laying queen with a young one.

#### PROLIFICACY IN BEES.

If it was not for the fact of my knowing something of human nature I should be completely puzzled to know why foreign queens being prolific, and the bees good nurses, bringing many young ones forward, making strong hives should be a fault, when the same condemnatory writers of prolificacy in bees recommend the joining of one or more swarms together. On similar grounds it may be said that good honey gatherers is also a fault. As I previously reported, my Punic bees during the spring months gathered honey when the rest of the bees were comparatively idle, resulting in the hives of the former being too full of honey to allow full development of the laying powers of the queen. Of course there is a remedy for that in having larger hives, or depriving sooner than we are accustomed; but in spite all that can be said against prolificacy, it is the key to having large yields of honey.

#### PURE PUNICS.

I have not as yet had a chance to know the honey gathering qualities of these, but on the twenty-fifth day after queens began laying I saw young bees airing, and on the 31st many were carrying pollen and honey. They are extremely active, and if the smallness of the blacks is not against them, everything else is in their favour as good bees.

#### SUPERS.

These are being filled only upon unswarmed hives, and that but slowly. At the present there is little surplus honey. But should the weather clear up for a few days a large yield may be expected from both stocks and swarms. Some of the former have an extra supply in their upper stock box. Should the weather be unpropitious that will be taken, and the bees fed. Swarming has given two-thirds more than will be wanted as stocks, but what will be done with the surplus bees I have not decided. I do not approve of the brimstone pit, but when the bees are not required, and can do no good to already strong stocks, what else can be done with them? Some of the Eastern people eat bees; if it become fashionable here then it will be a ready way of disposing of the surplus, and a new article of diet introduced.

#### SWARMING.

I have had two or three busy days hiving swarms, most of them from hives that were weeks ago enlarged both above and below. The nature of bees must be altered before swarming can be prevented, but after all when hives can be induced to swarm early it is the best and most profitable system of bee-keeping. Young queens and new combs are ensured, both essential to profit; for say what we will in favour of combs many years old new ones far outstrip them, and the present year will demonstrate to many the folly of keeping other than young queens for stocks. By this system with large hives the surplus bees minus the most exhausted queens are joined to the young ones, and with plenty of stores for keeping them through the winter success is certain, and early swarms with profit insured.

## SHAKING BEES.

I have often warned your readers against shaking swarms into, or in front of, their permanent hive and site when brought immediately a little distance from where they were first hived. Before shaking them they should be located some time in the hive they were placed in and upon the site they are to occupy. If that precaution is not taken there is a great risk of the bees flying back to the original place, and if the queen is young, or perhaps several of them in the swarm, queen and bees are apt to fly back. This gives extra trouble and annoyance to the bee-keeper; and, what is worse, if several swarms are on the wing at the same time the bees get mixed, and when hived fly off, in many cases the queen being killed. In hiving bees everything should be done expeditiously, and with caution and judgment.

## PATENT FRAMES.

A correspondent sends me two bars, which he says were made from patterns he had from me twenty years ago, and which appear to be similar to Meadows' patent frame. I herewith enclose two pieces from the bars sent. You will observe they are grooved, but not cut through. In the one case they were jammed into notches, and in the other two screw nails closed the bar. The tongue on the end of one piece was for sliding into the frame, or could be used in supers for the purpose of interchangeability, and, as will be seen, it is concave on the upper side, which gave the under the desired pitch for the cells. This frame was fully described in a contemporary about fifteen years ago by a neutral correspondent. Any person has full liberty to make, use, or sell frames like those which I have described, but they have no metal ends.—A LANARKSHIRE BEE-KEEPER.

## MR. J. M. HOOKER AND THE STANDARD FRAME.

MR. J. M. HOOKER, page 56, takes the "British Bee Journal" as his authority in replying to "A Lanarkshire Bee-keeper," but he touches on a matter I am interested in when he says, "After a good many meetings a frame of a certain size was adopted, and has not since been altered." That is by the British Bee-keepers' Association. Mr. Hooker was one of the Committee appointed to recommend the best size of frame to be advocated as the best, and this Committee had one meeting on March 16th, 1882 at the Langham Hotel, at which the Woodbury frame, first published in this *Journal*, was adopted, and has since been called "The British Bee-keepers' Association Standard Frame;" but this "one" meeting did not define the top bar, so they had another meeting on August 4th, 1882, at which the top bar was defined to be 17 inches long—making two meetings in all. In the report drawn up by this Committee, published in the "British Bee Journal" for September, page 94, it distinctly says "that two meetings had been held." Now, if "two" meetings means "a good many," and it is right to take credit for another man's invention, "A. L. B. K." and myself cannot see things in the same way that Mr. Hooker and his friends do.—A HALLAMSHIRE BEE-KEEPER.

THE JUDGES OF THE CALEDONIAN APIARIAN SOCIETY'S SHOW IN 1875.—In view of the conflicting statements which have appeared on this subject, we think it right to state that the official schedule of the Show held at Glasgow on 8th September contains the names of the Judges in large type in the following order:—Messrs. Abbott, Lauchland, Shearer, Walker, and Anderson. The schedule is before us. Mr. Abbott's name appears to have been omitted from the list in the "British Bee Journal," as cited by Mr. Hooker on page 55 last week.

## SCOTTISH BEE-KEEPERS' ASSOCIATION.

AN Exhibition of bees, hives, and honey will be held at Stirling on July 28th, 29th, 30th, and 31st, in connection with the Highland Agricultural Society's annual Exhibition. A liberal schedule of prizes of the value of £50 is offered. Classes open to all comers for hive appliances, comb honey, extracted honey, granulated honey, &c., and special classes open to residents of Scotland only. A meeting was held in Glasgow in April last of persons interested in bee-keeping in Scotland, at which there was a good attendance. The late Secretary of the Caledonian Apiarian Society, Mr. R. J. Bennet, explained that for the last two years this Society had practically ceased to exist, and that the meeting had been called to consider whether an attempt should be made to resuscitate the old Society, or whether the interest of bee-keepers in Scotland would not be better served by starting an entirely fresh society under a new name. It was unanimously resolved to take the latter course. It was agreed that the new Association should endeavour to carry out the same work in Scotland as the British Bee-keepers' Association did in England, and that local bee-keepers' societies should be invited to affiliate themselves with it.

It must be most gratifying to Scottish bee-keepers that they were at once able to find a gentleman of position and energy willing to undertake the duties of Honorary Secretary in the person of Thos. D. Gibson Carmichael, Esq., of Cheefswood, Melrose, N.B., who suggested that the Society should be called the "Scottish Bee-keepers' Association." Rules have since been drawn up, members enrolled, and satisfactory arrangements made for holding the above Show, which it is to be hoped will be well supported.—JOHN M. HOOKER.

**TO CORRESPONDENTS**

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**The Sultan Strawberry (J. R. B.).**—We think the Strawberries are correctly named. They are full-sized well-grown fruits of good quality. We have tasted the Sultan more richly flavoured, soils and seasons exerting an influence on the quality of fruits. There was not the slightest need to apologise for your very creditable letter.

**Tomatoes (Sussex).**—You will probably err in keeping the house so close as you indicate, especially if the atmosphere is moist at the same time. Intelligence must be exercised in carrying out instructions. Avoid a close damp atmosphere if there are symptoms of disease in your plants.—P.S.—After the preceding lines were in type we received the diseased fruits, and can only refer you to page 57, where the disease is figured.

**Brugmansia Planted Out (H. F. E.).**—Brugmansias are planted out every year in the London parks, and there grow freely and flower profusely. They are cut round a week or two before they are taken up in the autumn. They are potted very firmly. When most of the leaves fall the stems are cut back to hard wood, pruning them as closely as Fuchsias and Pelargoniums are pruned, kept cool and dry, but not dust dry, through the winter, and started steadily into growth in the spring in a very light position. Cutting round the roots checks luxuriance, and facilitates the ripening of the wood, which is essential for the production of flowers another year. But the work must be done with judgment, and not regardless of the condition of the plants and the weather. Firm, healthy growth should be the object of the cultivator.

**Azaleas Dying (Kentish Subscriber).**—The most common cause of Indian Azaleas dying is through decay at the neck or collar of the plants. This may arise from their having been kept underpotted, the ball a hard mass of roots, and the growths stunted so that little beyond flower buds and a very few leaf growths are made. This occasions excessive waterings, the keeping of the collar constantly wet, which affects the bark tissues and causes the plants to collapse. It is a very common occurrence, and usually follows in plants that have been grown quickly and freely in their early years, then given a check so as to induce floriferousness. These plants require very careful management, for the enfeeblement consequent on the great strain put upon them in flowering is often so great that they make very little growth, and some die, not immediately, but within the ensuing few years, generally before the third; in fact, they become so exhausted by their first efforts as to for the most part succumb. Several plants also fail from occasional over-dryness at the roots, causing the fine silk-like fibres to shrivel, the result being precisely the same as that from excessive waterings. Active root action is essential to healthy growth. Enfeebled plants exhausted by the first profuse crop of flowers should not be allowed to produce any the following year. The splendid plants grown in Belgium have the flower buds removed in alternate years for encouraging vigorous growth, but many persons who purchase Azaleas are apt to flower them to death and expect the plants to do more than they can accomplish. Many Azaleas are also made worse rather than better through repotting, and subsequently errors in watering. They are often sunk too low in the pots, and the new soil not made half so firm as it should be. Again the old balls of soil are not infrequently too dry when the work is done, and water too lavishly applied immediately afterwards. All mistakes of the nature indicated act prejudicially on the plants. The chief causes of Azaleas dying are extremes—drought is fatal—a plant neglected seldom recovering, and an excessive amount of water is equally as fatal as is excessive dryness. Syringing in winter is unnecessary, and in summer must be governed by the weather. Syringing twice a day regardless of circumstances would be calculated to injure your plants.

GRADUAL changes have been noticeable for some years in the style of summer flower bedding, and the tendency to introduce greater freedom and variety has become more marked every season. Several causes can easily be found for this. In the first place, what is generally termed the Pelargonium style was, no doubt, for a considerable time carried to the extreme. The idea seemed to prevail that it was almost impossible to have too many brilliant scarlet, crimson, or pink masses of flowers in formal oblong, square, or circular beds, and the result was that public and private gardens of all sizes were almost overwhelmed with these plants. The public taste became surfeited, a change was needed, and the system of carpet bedding was speedily developed to share the flower garden with the Pelargoniums, Calceolarias, and Lobelias. Here, again, excess has brought about another change, carpet beds have for several years been steadily decreasing in numbers, and many amateur and professional gardeners have awakened to the fact that hundreds of beautiful hardy and half-hardy plants, much more easily and cheaply raised or grown, have been neglected for the sake of their delicate but less interesting rivals.

Pelargoniums of all sections are unquestionably useful plants, and the moderate employment of the Zonal section in summer bedding must be commended because they furnish rich colours that are always welcome in our usually sombre gardens. For small suburban and town gardens, where the supply of plants is renewed annually, they are also valuable, and the trade in such plants constitutes quite an important industry around the metropolis and large towns. In large gardens and parks, too, where bold, distant effects are required, they serve an equally useful purpose. It is, therefore, apparent that no wholesale condemnation of Pelargoniums should be attempted, and it is only against their excessive employment that reasonable arguments can be urged when considering their characters and qualities as bedding plants. But another matter has militated against them and similar plants, and that is the expense and care requisite in producing or preserving the necessary stock. When so many thousands were needed to fill the scores of large beds in extensive flower gardens, numbers of heated propagating houses or pits and frames became indispensable. The labour at the time of propagating and bedding out became a serious question in the annual expense of a garden, and when reductions were rendered indispensable in private establishments this was the department which had to suffer first, and cheaper substitutes had to be found. Beyond all these, in many places bedding plants had to be provided for with but little additional accommodation, so that other plant and fruit houses had to be pressed into the service, often to the unavoidable detriment of their legitimate occupants. It is not surprising, therefore, considering all these difficulties and disadvantages, that Zonal Pelargoniums have declined somewhat in popularity.

Similar remarks apply to the foliage plants principally employed in carpet bedding, with the additional point against them that much more time and trouble were requisite in the preparation of elaborate designs, the planting, and the subsequent attention. Then, too, there were fewer positions where this style could be employed to advantage. The tendency to render the designs intricate and fantastic rather than simple and effective was also

opposed to its continued popularity, while foliage colouring alone can never possess the same interest as floral pictures with a due foil. Wherever carpets are retained, and they are perfectly appropriate and even desirable in some situations, they cannot be too clearly, boldly, or simply designed, and attention to this has been the secret of the success at Hampton Court and in other public parks.

The mixed style has received more attention in recent years; notwithstanding some obvious faults there has been a steady improvement, and it appears destined in good hands to be the favourite method for years to come, as it admits of many distinct developments. In Hyde Park much has been done to lead the public taste in this direction, and we have had occasion to repeatedly notice the pleasing changes introduced and the resulting effects. This season a still greater departure from conventional methods has been adopted with proportionate success, for while giving examples of different styles for their respective admirers, a combination of qualities has been effected in a more natural and free method of planting, which gives a distinctive character to the whole. It has attracted the notice and admiration of many critical observers, and a few notes on the subject are given as hints to those who are unable to visit the London parks.

The bedding display in Hyde Park during the summer months is mainly confined to that portion which extends from the Marble Arch to Piccadilly, between the carriage drive and Park Lane, the principal beds being in the centre of this somewhat narrow tract. For a portion of the distance the beds are on one side only, then there is a central raised lawn with the beds in similar pairs, and then again a third division has the beds on one side, the left coming from the Marble Arch. The last named is an innovation and a decided improvement, for in the place of a narrow grass strip, which was chiefly occupied with beds, we have a fine turf slope from the outer walk towards the railings, which is utilised for the ordinary beds and for large plants plunged in groups as a background. The carpet beds are here seen to much greater advantage, as they invariably are on a moderate slope. Throughout the beds are cut in the dense bright green turf, and the plants in every case thus have a natural and pleasing foil.

For many years it has been the custom to plunge large specimen Palms, Phormiums, Bamboos, and other plants between the beds or in the centre of the raised turf. This season several large flowering plants are employed in a similar way for the side slopes and with admirable results. Fuchsias are especially prominent either as scattered plants or in groups, and well-grown specimens 4 or 5 feet high, abundantly clothed with foliage and loaded with flowers, have a charming appearance, the season having evidently suited them. The favourite varieties are Annetti, Mrs. Marshall, Tower of London, Henry Brooks, Madame Cornelissen, Earl of Beaconsfield, Elegans, and Empress of Germany. Specimen Zonal Pelargoniums are planted in the same way, but mostly in groups, as also are Erythrinas, Clematises, Ivy-leaved Pelargoniums, and Plumbago capensis, these being chiefly confined to the new turf slope at the Stanhope Gate end of the Park Lane series of beds.

Mixed beds are very numerous, and a few of the more distinct may be noted to indicate the general style. Fuchsias are employed in many instances as the tallest plants; thus we note the following arrangements:—Mrs. Russell and gracilis variegata, with a ground of Coleuses and Violas, and an edging of Iresine Herbsti and Lobelia Emperor William; Madame Cornelissen is planted with Abutilons in a ground of Violas; Mrs. Marshall and Carnations have a base of Violas; Empress of Germany and Sunrise, with a ground of Viola Mrs. Turner, edged with Pelargonium Queen of Queens and Lobelias; Empress of Germany is also planted amongst Vitis heterophylla and Violas; Tower of London with Viola Mrs. Turner; Mrs. Marshall with Coleuses and Viola lilacina; Madame Cornelissen with Viola Holyrood; Golden Treasure with Melianthus major or Violas, and gracilis variegata, Dracæna congesta, and Funkias or Alternantheras. In all these

examples the Fuchsias are well developed plants, they are allowed plenty of space and have a good appearance, the marginal lines being dark or light to contrast with the central plants.

Amongst the other mixed beds Ivy Pelargoniums and Heliotropes are employed with excellent taste, as the taller plants amongst Violas and other dwarf plants, with an edging of Iresines, Coleuses, Pelargoniums, Lobelias, or Pyrethrum. One example of Heliotropes with Carnations on yellow Violas margined with Iresine Lindenii and Pyrethrum Golden Feather is effective, as also is another of the same plants on a ground of Snowflake Violas, and Heliotrope President Garfield on yellow Violas margined with Coleus splendens. Iresine Herbstii and Lobelia Blue King provide a good combination; while tall Heliotropes with Chrysanthemum frutescens or Viola Snowflake is scarcely less noteworthy. Ivy-leaved Pelargoniums with Sweet Peas or blue Violas edged with Coleuses and Fuchsia Cloth of Gold make a beautiful bed, as do also Ivy-leaved Pelargoniums with Liliun auratum or Viola Blue Bell edged with Coleus Verschaffeltii and Lobelia Blue King.

Single Petunias look well in several instances as the leading plants associated with various others distinct in the colouring of the flowers or foliage. In one bed Coleuses and yellow Violas formed the ground, edged with Iresine Herbstii, Lobelia Ebor, and Fuchsia Cloth of Gold, pegged down. In another Amaranthus and Abutilons constitute the basis. Selecting from the other mixtures some of the most conspicuous the following are worthy of attention—*Dracæna congesta* and Tuberous Begonias on a base of *Dactylis glomerata variegata*; blue Verbenas with white double Petunias on dark blue Violas; scarlet Tuberous Begonias on a ground of *Mesembryanthemum cordifolium variegatum*, edged with *Echeverias*, most effective; *Erythrina crista-galli*, vigorous plants bearing abundant large bright red flowers on a base of Violas; Cannas, *Liliun auratum*, and Canterbury Bells on a base of Violas edged with Iresine Lindenii, Lobelias, and *Mesembryanthemums*; Stocks and Violas, edged with Pelargonium Queen of Queens and Viola Blue Bell; *Dracæna congesta* and *Ficus elastica* on *Oxalis floribunda rosea* and *Alternantheras*, and various dwarf Roses on a dense base of common Musk, edged with purple Verbenas, a pleasing combination of colour and perfume.

There are also good examples of the ordinary Pelargonium beds, with marginal lines of Lobelias and other plants; the few carpet beds, too, are effectively designed, but we need not refer to these now, as the object of these remarks is to draw attention to the more special features of the Hyde Park gardening as indicated in the preceding notes.

### WET WEATHER STRAWBERRIES.

HAD the wet weather experienced during the first few days in July lasted much longer the Strawberry prospects would have been completely marred, and as it was large quantities of fruit rotted on the ground. Fortunately the second week in the month finished better, and we have since been favoured with glorious weather to the no small benefit of the Strawberry and various other crops. While the dull, showery weather lasted I was disposed to congratulate myself upon superior forethought, especially with regard to preparing Strawberries for a wet season, this conceit not being taken out of me by a remembrance of the severe handling I had several years ago over the trenching question. Latterly I have had opportunities of inspecting several large and well managed kitchen gardens, and in nearly every case manure had been very freely used and trenching resorted to in the preparation of the beds. The natural consequence of this was a remarkably strong, leafy growth—it was never stronger, in fact—and a great abundance of fruit on the ground under it. Where good space had been allowed, the rows being not less than 3 feet apart, the fruit ripened fairly well, but in several instances the plants met all round the leaves, quite smothering the crops. When I returned and contrasted the state of the crops in the garden under my charge with that I had just seen I felt, as before stated, very comfortable indeed. Who in the southern or home counties has not seen one or

more of the immense tracts of ground devoted to the cultivation of Strawberries for the market without also noting the sturdiness of the plants and the great prominence of the fruit? The field-grown plants are well clear of each other and wholly surrounded by fruit, a band of colour being plainly observable at a considerable distance from the rows. Not only are the field crops exceptionally heavy, but the fruits attain a good size and are of superior quality let the weather be what it may; I had almost added let the varieties be what they may, but this would be going too far, unless in comparison with the same sorts grown in private gardens. Given plenty of light and air there is little likelihood of the fruit rotting, and I hold that it is wiser to prepare Strawberries for withstanding all weathers than to fit them for a dry season only. That they are hungry and thirsty plants I readily admit, but that is no reason why they should be made toppers and gluttons. On the contrary, all such bad habits should be combated, to a reasonable extent at any rate.

The market growers have the advantage of a good open position, this, let the culture be what it may, favouring sturdy productive growth; but it is possible for private gardeners to succeed equally as well, if not better, if only they would go the right way to work. In very hot and dry positions something ought to be done to increase the depth, richness, and moisture-holding properties of the soil, looseness, however, being guarded against; but in the majority of gardens heavily manured, newly and deeply trenched ground is quite unsuited for Strawberries unless grand masses of foliage and not the fruit are of primary importance. Strawberries succeed well on ground trenched for preceding crops, this having settled down considerably and not again manured, and I have known trenching specially for them answering remarkably well when the plants are fruited for one year only. It is during the second and third seasons that the leafy growth is most troublesome, and owing to the closeness of the plants much fruit is spoilt. In my case all the preparation attempted, or sometimes possible, is to manure, deeply dig (not trench), and otherwise well prepare the intended Strawberry site for Ashleaf Potatoes, and directly the latter are cleared off the surface is levelled, fined down and firmed, and the Strawberries put out. The latter are usually layered in soil or manure among the rows of established young plants, and being firmly fixed and well attended to soon become established and strong enough to give a valuable early crop the following season. Naturally they require to be well fed from the surface, heavy and early mulchings of strawy manure being also needed for preserving the moisture, but no amount of surface-feeding causes a superabundance of leafy growth, this being principally brought about by a loose root run and much manure deeply buried. Three crops are ample from the main and late breadths of plants; in fact, they pay well if only fruited once, this being the extent of the duration of plantations intended to furnish the earliest crops. In any case there ought always to be a fresh bed made every summer, and the sooner it is planted after these lines appear in print the better. Both the earliest and finest fruits are produced by strong plants, and they are therefore of good service in lengthening out the supply of dessert Strawberries.

Much in all instances depends upon the selection of varieties, and with so many recent additions to the list no great difficulty ought to be experienced in selecting five or six, and fully that number ought to be grown to suit all soils and localities. Extra strong growers, including Vicomtesse Héricart de Thury, Sir J. Paxton, Sir Harry, and The Captain, are scarcely suitable for rich and deeply cultivated soils, but succeed admirably as I cultivate them. So also do President, James Veitch, Sir C. Napier, Souvenir de Kieff, Duke of Edinburgh, John Powell, Eleanor, and others of moderately strong growth. The best wet weather Strawberries, though, are those of sturdier compact growth, of which the good old Princess Alice Maud is a noteworthy type. Owing probably to its unsuitability for pot culture this variety is now seldom met with in private gardens, and in the open fields has been ousted by earlier sorts, as a rule much inferior in point of flavour. With us it is a sure and heavy bearer, ripening at the same time as Sir J. Paxton; the fruits of good size, bright in colour, firm, and briskly flavoured. It never fails, and is particularly serviceable during a wet season. The newer and earlier King of the Earlies also does well in a wet season; the flavour being perhaps a little too acid, a "good fault" though; and if only a little larger it would become popular. Noble, if fruited once—and it does not pay to keep it on the ground more than one year—ripens well in wet weather, and though second rate as regards quality, it is yet, on account of its earliness and great size, the most profitable Strawberry in cultivation. We gathered 1 cwt. of fruit of this variety at a time when they were worth 1s. and upwards per pound in the market, but no old plants contributed towards this success. Dr. Hogg, again, never makes too much foliage, and the fruit ripens surely in all weathers. It is a

moderately late variety. Loxford Hall Seedling, a still later Strawberry, is somewhat fickle and very liable to red spider, but it ought to be given a trial everywhere. Where it succeeds well it will be found of very compact productive growth, the fruit being large, firm, and briskly flavoured; and this again is a grand wet weather Strawberry, though the plants ought not to be preserved more than two clear seasons, the two-year-old stock giving a good succession to those fruited for the first time. Laxton's Latest of All in many respects much resembles Loxford Hall, and in all probability would succeed where the latter fails. It is of compact growth, very fruitful, and altogether a very desirable late variety. Jubilee I cannot persuade to grow sufficiently strong, the start being made with very weakly runners.

In arranging the rows of plants in new beds the habits of the different varieties ought to be taken into consideration. Many gardeners allow good space between the rows, but fail to do so with the plants in the row. They ought not to touch each other anywhere, and if this rule was adhered to there would be fewer failures in wet weather and superior crops generally. On rich deeply cultivated ground the rows of the strongest and moderately strong growers should be 3 feet apart, and the plants 2 feet asunder in the rows. If this is more space than can well be afforded, grow quick growing vegetables between them this autumn. On our strong, yet firm, and not much-manured ground, 30 inches is sufficient for strong, or moderately strong growers, 18 inches dividing the plants in the rows, and they are cleared off before they overlap each other. This is more space than the sturdy growers alluded to require, the rows of these being 2 feet apart and the plants 18 inches asunder in the rows, 3 inches less space being enough if they are to fruit once only.—W. IGGULDEN.

### FLORAL ARRANGEMENTS.

THOSE who have a good selection of herbaceous plants, annuals, and hardy shrubs will during the next few months find plenty of materials for working out effective and showy arrangements, but care and judgment, as well as good taste, must be exercised. The abundance of material in some cases induces an inclination to overcrowd, which not only prevents the individual flowers being seen to advantage, but is also fatal to the production of that artistic lightness and finish which all well-executed arrangements exhibit. Another point connected with this matter, which in my opinion does not receive sufficient attention, is to provide a constant succession of change in the combinations, for however much admired certain arrangements may be when first carried out, if repeated often they become monotonous. I hold, therefore, that ingenuity in creating varying designs is quite as essential to those who would become proficient in this branch of the gardener's art as taste and skill in executing those designs in the best possible way.

In order to enable the decorator to carry out these ideas the common mistake of using too many colours, or too many kinds of flowers in one vase or other arrangement, must be avoided. It is really surprising what can be effected by associating two kinds of flowers with suitable greenery in some cases, and in others arranging one variety in each glass or group of glasses, and by frequently varying the materials for each group and mixing other suitable flowers together. Given the same materials to begin with, if mixed in each glass without any definite idea, although the colours might be well blended and the flowers lightly arranged, there would be a want of distinctness and character.

At the present time Roses are abundant and good, and they are such general favourites that they may always be largely used without any doubts as to their giving satisfaction, provided they are well arranged, but they are not by any means the easiest flower to arrange. They look exceedingly well when placed singly in specimen glasses with a few of their own leaves added, these glasses being placed at intervals, or grouped upon the breakfast or dinner table, or in any other position where they are required. It is, however, often desirable to have good masses of them placed together, and it is in such cases that they repay extra care in their arrangement. So as to avoid overcrowding, baskets filled with damp moss, with a few pieces of *Lygodium scandens*, *Asparagus tenuissimus*, or shoots of Honeysuckle trailing around them, form a suitable groundwork on which to arrange Roses; but instead of placing them closely together for the purpose of covering up every particle of moss, let each flower stand well clear of the other, and a few of their own verdant leaves be placed under and around them in such a way as to avoid flatness, taking care that the leaves point in various directions. A few half-opened buds should also be mingled with flowers in a more advanced state. Some of these may be wired, not to give them a greater length of stem, because the stem must be inserted in the moss to keep the flowers fresh,

but to retain them in the exact position required, as it is important in all floral arrangements that the flowers point in various directions, and that some be elevated above the others. The only objection that I know to arranging Roses in this way is that they do not last quite so long as when placed in water; but with moss thoroughly wetted in the first place, and the superfluous water wrung out, there is not much to complain of on that point. Where they are arranged in water in flat dishes, a light wirework frame placed over the top enables the operator to use the flowers to the best advantage, and plenty of leaves or a few Fern fronds can easily be placed so as to hide the wire without giving a crowded appearance.

Pæonies, which are now fast fading, have this season made a fine show, and for arranging in large trumpet-shaped glasses, with shoots of Syringa and a feathery branch of *Prunus Pissardi* for the centre, few flowers can excel them. For smaller glasses of various descriptions the numerous varieties of Shirley Poppies, when associated with field Grasses, Ferns, or shoots of the variegated Honeysuckle, form charming combinations which are always admired, and a few Marguerites arranged with them form another pleasing effect, care always being taken to have the scarlet varieties placed in glasses removed from the pink or rose-coloured ones.

The many showy types of both annual and biennial *Dianthus* are now yielding a good supply of their charming flowers, which are especially useful for cutting purposes, and are well adapted for filling the tops of trumpet shaped glasses, while for the dish-like vase, Rose, Clematis, single flowers of *Liliums*, *Petunias*, and Pansies make a fine show.

The purple and yellow varieties of *Aquilegias* placed together with a little of their own foliage and a few fronds of some kind of *Pteris* form a striking mixture, while the white form shows to advantage when mixed with pink and rose coloured *Dianthus*. Canterbury Bells, Larkspurs, Delphiniums, Irises all lend their varied forms and bright colours to floral embellishments in their many distinct features, while later on Phloxes, Dahlias, *Gladiolus* and summer flowering *Chrysanthemums* will supply a wealth of blossoms which are worthy, and indeed indispensable for the adornment of the homes of the wealthy, and which are also within the reach of the cottager.—D. W. C.

### SEASONABLE NOTES ON PEACHES AND NECTARINES.

WHEN Peach and Nectarine trees are grown in cool houses the fruit from which is required to ripen by the end of August or early in September, special attention ought to be given them during the next few weeks in order to secure large well finished fruits. It is surprising how much may be done towards the attainment of this object by watering, feeding, and good general management during the later stages of growth. Where the trees are in good condition by this date the roots will be in a thoroughly active state, and therefore able to appropriate large quantities of stimulating food if it is applied with judgment. Much depends upon the material of which the borders are made as to the amount of water required. Where the soil is heavy and not particularly well drained much less water will be required than in the case of well drained borders of an open nature. In all instances the only safe course to pursue is to examine the soil by thrusting a pointed stick or iron rod into it to the depth of a couple of feet, the surface soil being often misleading, continual syringing keeping it in a fairly moist state when the roots below may be in need of water. On the other hand such is not always the case, and it is bad practice to get into the custom of watering borders at regular intervals without first ascertaining their true state, especially when the rod test is so simple and so sure a guide. These are points in connection with successful culture which require continual repetition as each season comes round.

Another important point where trees are planted near walls, either in houses or in the open air, is to see that the roots near the stems are well supplied with water, for there is often a great quantity of fibrous roots at that point, and the walls absorb much moisture, so that it becomes necessary to give the trees double the quantity of water there that they require in other parts of the border. All who are not satisfied with the health of their Peach trees or the size of their fruits when the trees are not overcropped should see that the roots are not starved around the stem of the tree. The best of all stimulants that I have tried for Peach trees is to sprinkle guano on the surface of the border at the rate of 3 ozs. to the square yard, and water it in with liquid manure obtained from the drainings of a manure heap composed principally of horse manure. If the liquid manure is of a very dark colour dilute with an equal quantity of water.

Exposing the fruits is often deferred too long, with the result

that they are pale in colour, or the colour comes in patches in consequence of the leaves having shaded them. The trees should now receive their final tying down, all laterals (where not wanted to cover blank spaces) be removed, and the fruits be fully exposed to the sun. In many cases it will be necessary to tie the shoots a little on one side, and even to remove a few leaves. Any shoots which are not situated well above the trellis, if carrying fruits, should be raised by placing a stick underneath them, the ends resting on the trellis. This will bring the fruits well up to the light, and by performing the operation thus early the fruits will colour evenly. In the case of Nectarines that are trained rather close to the glass a light shade ought to be given in bright weather, otherwise many kinds, such as Pine Apple, Humboldt, and Lord Napier will become spotted instead of assuming their naturally rich colour. If Nectarines were trained 2 feet from the glass we should hear less complaints about red spider attacking them. Where it is necessary to hurry on the fruits to have them ripe by a given date the houses must be closed early and thoroughly syringed, allowing the temperature to run up to 90° or 95°. This treatment is perfectly safe so long as plenty of water is used at closing time. In cases where it is necessary to retard keep the ventilators open constantly, but syringe the trees morning and afternoon whenever the weather is bright until colouring is well advanced, when syringing must be discontinued by degrees and a light shade given.—H. DUNKIN.

### THE BRITISH FRUIT GROWERS' ASSOCIATION. CONFERENCE IN BEDDINGTON PARK.

At a meeting of this Association held on Thursday last, the following was adopted as the programme for the Conference in Beddington Park on Monday, August 3rd. Sir James Whitehead, Bart., one of the Vice-Presidents of the Association and Master of the Fruiterers' Company, will take the chair at 4 P.M., and will deliver an opening address, to be followed by Mr. T. Francis Rivers. The next subject is "Object Lessons in Fruit Growing for Cottagers and Allotment Holders," illustrated by diagrams, by Mr. John Wright. Mr. G. Hammond will follow with some hints on "How to Encourage Fruit Culture amongst Small Farmers and Cottagers." Mr. Joseph Cheal will deal with the "Preparation of the Soil for Fruit Trees," Mr. George Gordon will discuss the "Extension of Fruit Culture and the Work of the British Fruit Growers' Association," the Rev. T. W. Sharpe proposes to consider the best methods of including fruit culture in the technical education scheme, while several other members have promised to take part in the proceedings and to contribute hints likely to be of interest.

It was resolved early in the season to render the meeting as useful as possible to the numerous cottagers and allotment holders in the district; the programme has therefore been prepared with a special view to their requirements. The Exhibition held by the local Society is expected to be both large and interesting, and if the weather prove favourable a large attendance is anticipated.

I am also desirous to state that important papers and addresses on fruit subjects are promised for the Conferences at Cardiff on August 12th, the Crystal Palace on September 4th, and Edinburgh on September 10th.—LEWIS CASTLE, Hon. Sec., *Hotham House, Merton.*

### PRODUCTIVE TOMATOES.

At page 21 Mr. Buchanan gives the weight of fruit produced by 700 plants, also the number borne by several plants within 4 feet of the ground, both figures indicating good culture and a productive variety. A fruiterer here who saw their Tomatoes in the Glasgow market said they were superior to anything there; also a gardener who visited them last autumn, when describing what he saw, could compare the produce upon the plants to nothing more like them than ropes of Onions. They were grown in two span-roofed houses, 130 feet long by 14 feet wide, and about 3 feet to the eaves. I erected a small house, 50 feet by 12 feet, and 5½ feet to the eaves, last spring, and planted it with 240 plants out of 3-inch pots on April 24th, cut the first fruit July 11th (Ham Green). Upon one variety (Goldfinder) there are as many as twenty fruits swelling in one truss, besides what will eventually swell when these ripen. Many of the fruits are slightly corrugated, which detracts from their appearance and market value. I do not like either Perfection nor Hackwood Park Prolific so well as Ham Green Favourite; they both have a coarser appearance, though good fruit and appearance are everything in the market. The variety I like best is the produce of a fruit picked out of a basket which came from the Edinburgh market. Fruit very round, conical, terminating in a point; a free setter; colour very bright red; a strong grower; foliage rather lax. I am trying a new American variety, Thorburn's Long-keeper, said to keep longer than any other sort after being cut—more of that anon, when its keeping qualities will be tested. My plants will average 7 feet high, with foliage

grass green from the ground to the apex. The only disease yet seen was the fungus figured and described by Mr. W. G. Smith on page 57. Three fruits in one truss were found attacked by it, but when seen were cut off and consigned to the furnace. I attribute the success of my culture to the advice received from a gardener when I commenced to cultivate them. He said, "Be not afraid to use the coal and coke bing."—G. McDOUGALL, *Ravenna Cottage, Stirling.*

### MODES OF CHRYSANTHEMUM CULTURE, AND THE BEST VARIETIES.

[A paper read by Mr. Woodcock, Syston Nurseries, Leicester, at a recent meeting of the Sheffield Chrysanthemum Society.]

(Continued from page 507.)

#### PLANTS FOR EXHIBITION BLOOMS.

HAVING disposed of the semi-early flowering section we come now to what are known as midseason varieties, and which include most of the best exhibition sorts. The cultivation of these has so often been treated upon, and by some of the most able and experienced men of the day, that I think I can add little to what they have already said upon the subject; a few general remarks then may be more useful, if only to invoke discussion, than would be a detailed code of cultural rules.

First, then, as to the time for propagation. I have before given it as my opinion that the two best months for propagation are November and January—the first-named month for the majority of the Japanese varieties, and the second for a large section of the incurved, including the Queen family, and I have not as yet seen any reason to alter such opinion. Of course, there are no rules without exceptions, and December may well be selected as the best month for some of the earliest varieties of Japanese and the latest incurves.

Secondly, as to the most suitable compost. In this matter I think Sheffield cultivators are placed at a disadvantage as against cultivators from some other districts, notably Liverpool and Hull. There the loam is of a free sandy nature, such as encourages the formation of an abundance of roots from whatever plants may be growing therein. As a consequence, the turf when taken up contains a large amount of fibre. Most of the loam around Sheffield is of a much less suitable nature, being cold and heavy; not an unproductive soil for many crops when well treated, but not such as causes an abundant root production. Therefore, the turfy loam when obtained is very deficient in fibre as compared with loam from the districts named and many others, including that where I am now resident.

I believe Mr. Tunnington gave excellent advice when he recommended the Sheffield loam to be used fresh as cut, with the green grass still alive and growing upon it. The grass in such case would partially compensate for a lack of root fibre. Three important elements in which I believe the loam around this district to be much lacking are lime, potash, and silica. The first-named may be well supplied in the form of crushed oyster shells and dissolved bones; the second is best supplied in the form of wood ashes, charcoal, and charred refuse generally; the last in the form of sharp sand, river or sea sand by preference. If more of this were used by Sheffield cultivators than is the case I feel sure they would recognise a considerable benefit to their plants by the addition.

One of the reasons I especially recommend seasand is that it contains a small per-centage of salt, and which has ever, when properly used, been found beneficial to these plants. I have before expressed my opinion that it is salt in the atmosphere as well as in the soil which largely assists growers at Liverpool, Hull, Bristol, Southampton, and other like situated towns to obtain such bright colours in their flowers. A friend of mine, a Leicester cultivator and exhibitor, has for some years past mixed salt judiciously with his compost for the final potting, and considers his plants have derived marked benefit from the practice. His plants are always remarkable for their dwarf but robust habit with exceptionally large dark coloured foliage, which special characteristics he attributes to the salt.

A final recommendation in reference to the compost is to see that it is free and open and of a nature that will induce rapid and abundant root production. I believe the sooner the ball of earth can be thoroughly permeated with, and the pots so to speak "filled with roots," when the plants are in their flowering pots, the more likely are they to produce really fine flowers when required.

Another question which, though often discussed, still remains to a considerable extent a vexed question, is that of topping *versus* allowing the plants to make their natural break. I think that as regards the production of the finest exhibition flowers the cutting down system as advocated by Mr. Orchard now has no supporters, though undoubtedly it has its uses for the production of dwarf grouping and decorative plants, carrying respectable, although not really first quality flowers; but many of the advocates of topping say that as good or even better flowers may be by its means produced than by the natural break

system. Mr. Udale when at Shirecliffe commenced the practice of topping a few of the later and tall growing Japanese the second season that he grew flowers for exhibition, and was so far satisfied with the results that each year afterwards whilst he remained there he extended it to more and more varieties. I know that his opinions on the subject now are as strongly as ever in favour of the practice. I think it is a question which should be taken in conjunction with the following.

#### TIMING THE BLOOMS.

Every exhibitor knows what an important subject is the latter and how much depends thereon, and it is as an invaluable aid to success in this that topping at the right date becomes so important and valuable. It is not possible to lay down rules as to what are the best dates for topping each variety, so much depends upon collateral circumstances, such as the district, the weather, and the condition of the plants. Undoubtedly a few of the latest varieties, such as Boule d'Or, L. Canning, Mrs. Irving Clarke, and others may advisedly be topped about the last week in May, others at different dates in June according to their respective earliness, whilst those midseason varieties which are likely to be in about the right time from the natural break are best never topped at all. I will conclude my remarks upon this to the exhibitor, the most important of all modes of Chrysanthemum culture, by giving a list of what I consider are the best fifty Japanese and the best thirty incurved varieties for exhibition.

Japanese (fifty).—Avalanche, Beauty of Castlewood, Eynsford White, Etoile de Lyon, W. W. Coles, Mrs. A. H. Neve, W. H. Lincoln, Puritan, Stanstead White, Edwin Molyneux, Mrs. Wheeler, Sunflower, Volunteer, Mrs. Irving Clarke, Mrs. Falconer Jameson, Madame Baco, Boule d'Or, Jeanne Délaux, Carew Underwood, Comtesse de Beauregard, L. Canning, Criterion, Thomas Stevenson, Madame John Laing, Sarah Owen, Japonais, Lady T. Lawrence, Mr. H. Cannell, Ralph Brocklebank, Improved, Meg Merrilies, M. Bernard, M. Burnet, Marguerite Marrouch, Gloriosum, Comte de Germiny, Madame C. Audiguier, Belle Paule, Condor, Mons. Astorg, Mons. Freeman, Mrs. Frank Thompson, Mdle. Lacroix, Annie Clibran, Mrs. J. Wright, Maiden's Blush, Elaine, Val d'Andorre, Stanstead Surprise, Mdle. Blanche Pigny, and Fair Maid of Guernsey.

Incurved (thirty).—John Lambert, Lord Alcester, Empress of India, Queen of England, Golden Empress, John Doughty, Miss Haggas, Princess of Wales, John Salter, Violet Tomlin, Mrs. Heale, Alfred Salter, Lord Wolseley, Prince Alfred, Mrs. S. Coleman, Princess Beatrice, Lady Dorothy, Mr. Bunn, Beauty of Hull, Barbara, Hero of Stoke Newington, Princess Teck, Mrs. Norman Davis, Refulgence, Lady Hardinge, Jardin des Plantes, Empress Eugénie, Nil Desperandum, Alfred Lyne, and Charles Gibson.

#### SPECIMEN PLANTS.

The cultivation of specimen plants is a subject I need not, I think, dwell long upon. It is one which is certainly not held in much favour by exhibitors generally. There are now, I believe, few growers of them in or around Sheffield, and there are still fewer in or around Leicester; in fact, I do not know of one in that district, consequently no class is made, or prize offered, for them in the Leicester Chrysanthemum Society's schedule. Even those who would like to grow them find that they entail the expenditure of too much time and attention, and when the time arrives that it is necessary to house them, they take up too much valuable space to allow of their being made profitable. Their great value in filling and suitably furnishing the show tent cannot be denied, but it is seldom a show committee can see its way to offer such prizes for them as would reimburse the cultivator for the cost of their production. A dozen of the best varieties for trained specimens are—Bouquet Fait, Hiver Fleuri, Coquette de Castille, Massalia, La Nympe, Peter the Great, Madame Bertier Rendatler, Fleur de Marie, Jardin des Plantes, Mrs. Rundle, George Glenney, and Mrs. Dixon.

#### LATE PLANTS.

Much more remunerative than the culture of trained specimens is that of cultivating plants specially for the production of late blooms. The demand for good flowers at Christmastide and for a few subsequent weeks is each year greatly increasing, consequently the prices then to be obtained for them are satisfactory, the demand always being in excess of the supply. The difficulties attending their production at this season are not great, and the time and attention required in their culture is very small when compared with that required for trained specimens. Insert the cuttings any time in April, or not later than the first week in May. They should be stopped not more than twice, once when about 6 inches high, and again when the breaks are about 4 inches in length, be potted on as required, and be placed in their largest pots about the end of June. If large specimens are required three plants may be placed in a 10-inch pot, otherwise 9-inch pots are quite sufficiently large. Grow them in pots throughout the season. I am in favour of planting out some midseason varieties, to be lifted and flowered at midseason, when quantities of cut flowers are required, but this practice will not be found to answer well in the production of plants to flower in December and January.

The check and reaction necessitated in lifting the plants before the advent of severe frosts would either bring them into flower earlier than desirable, or spoil their chances of flowering at all satisfactorily. Place them in a cool portion of the garden, where they are not much shaded by trees, but where they have the sun directly upon them for a portion only of the day. Of course care and attention will be required in

watering and staking, same as for the others, but they will not need such copious supplies of liquid manure as is being given to those for producing exhibition flowers. Weak liquid manure given once a fortnight through August and once per week in September is as much feeding as they require, or as is beneficial to them.

Towards the end of September, at about the time the others are housed, place these in front of a south wall, or at least in a position fully exposed to the sun, and where they may readily receive a slight protection in case of frosty nights. The best possible protection is a light tiffany covering, so arranged as that it can be drawn over them at night and removed during the day. In such case they will be best to remain outside until the second week in November, unless unusually sharp frosts set in sooner. They should be all strictly disbudded, leaving one bud only to each branch, as at Christmas and afterwards one good flower will (even more so than in November) be found of more value than a bunch of inferior ones. The operation of taking the buds ought to be performed at about the time they are housed—early in November. When housed they will require all the light possible, with free ventilation; also care to avoid attacks from mildew, an occasional syringing on a bright dry morning with a solution of soft soap and sulphur I have found best for this, both as preventive and cure. At Barkby Hall, near to where I reside, the gardener, Mr. Lansdell, grows Chrysanthemums well, as standards, for exhibition blooms and in other ways. All through last December the large conservatory there was finely decorated with some twenty plants grown and treated as above, each

FIG. 13.—MR. W. K. WOODCOCK.

plant being a beautiful bush about 2 feet through, and carrying twelve to twenty flowers, large and deep, equal to many seen on the exhibition table.

The varieties best suited for this work are all the Teck family. Miss Maréchaux (a good white incurved, much grown in trade establishments for January flowers), Sarnia, Ethel, Yellow Ethel or Mrs. H. J. Jones, Mr. H. Cannell, L. Canning, Thunberg, Putney George, and Princess Blanche. The last named is, I believe, the latest variety in cultivation, very dwarf and compact in growth, and altogether a most excellent useful white Japanese.

Just a few words in conclusion re planting out of midseason varieties in May specially for lifting to provide cut flowers in November. I am quite sure it is a mode of culture deserving to be more generally adopted; especially does this plan answer well where the plants can be housed without a necessity for potting them. Mr. Angus, who is now proprietor of the Carlton Hotel, one of the best commercial houses in Leicester, but formerly head gardener at Warter Priory, recently told me that his principal supply of cut flowers was produced by plants so grown, and flowered in Cucumber and Melon houses, his plan being that when housing time came he would put two or three men to the work, one being inside with a spade making holes, and planting them, as others lifted them and carried them in, with all the ball which would lift with them. He said those plants flagged but little and flowered amazingly, giving little trouble from first to last. In potting them the ball has necessarily to be reduced by more than one-half, of course with the loss of the best feeding roots. The plant has then to practically start afresh, and before it can sufficiently recover to do so it inevitably loses a considerable portion of foliage. Although Chrysanthemums so quickly suffer if neglected in watering when grown in pots, it is surprising the amount of drying they will endure when planted out. I never water mine except at the last, when they are cut round preparatory to lifting; and although I have seen them flagging and drooping almost to the ground during hot drying days, they would recover their stiffness at night, and be apparently no worse for the drying they had received. Almost any varieties answer to this rough and ready treatment, but the best to grow thus are those which are most useful when cut, such as the Rundle family, Mdle. Lacroix and its sports, Mons. Astorg, also an English raised seedling named Old Gold, raised by

Mr. Cullingford three years since, which is little known at present, being of no use for exhibition, but is one of the very best in cultivation for supplying quantities of good flowers for cutting, and is a favourite colour with ladies, being just the colour its name indicates. I am also of opinion that the favourite new variety of last year, W. W. Coles, will prove an excellent one for this work. It is very free in producing good useful lateral flowers of good shape and build for decorative work and of a charming colour, lighter and brighter than are the big exhibition flowers of it, a bright terra-cotta red, a colour much sought after at the end of November.

[In recognition of the services of Mr. Woodeock as a cultivator, writer, and good gardener, we have pleasure in publishing his portrait, and wish him much success in his future business career.]

## ROYAL HORTICULTURAL SOCIETY.

JULY 21ST.

SCIENTIFIC COMMITTEE.—Present: Dr. M. T. Masters (in the chair), Mr. Morris, Mr. Blandford, Rev. W. Wilks, Rev. G. Henslow, Hon. Sec.

*Conifers Attacked by Chermes*.—With reference to this subject, brought before the Committee at the last meeting, Mr. Blandford remarked on the difficulty of destroying the insects with the paraffin spray, inasmuch as it was practically useless for large trees, and could be only applied to small ones; moreover, it will not remove them unless it be applied with force, and in that case water alone would answer the purpose. The only effectual method was to nip off the galls made by the chermes. From some observations of Dr. Masters it would seem that the gall-making species does not appear to attack the Larch, but only the Spruce Fir, though other species of chermes attack various members of the Coniferae.

*Microscopical Structure of Hybrids*.—Mr. McFarlane sent photographs illustrating the microscopical structures of *Lapageria*, *Philasia*, and of a hybrid between them, *Philageria*. In all cases the anatomical details of the hybrid were intermediate in character between those of the two parents.

*Primula sikkimensis Attacked by Slugs*.—Rev. C. Wolley Dod sent plants from which the cortical chlorophyllaceous tissue had been gnawed off by the common white slug. As a proof of their partiality he observed that stalks of *P. rosea* and of *Dodecatheon* growing side by side with the above were not touched. If the *P. sikkimensis* is barked soon after flowering it withers and develops no good seed.

*Loranthus (?) from Bechuanaland*.—Mr. Johnston forwarded a specimen of what appeared to be a species of *Loranthus*, on which he observes:—"It had a small berry not quite round, of a colour similar to red coral on a short stalk." It was referred to Kew for identification.

*Apple and Pear Twigs Barked*.—Mr. G. Lee of Clevedon sent some more specimens, but no new light could be thrown upon the injury. A method adopted by Mr. Bunyard, who is familiar with the fact, may be mentioned. In cases where nocturnal beetles or other insects attack young trees, he lays a sheet under the tree, and by violently shaking it, the insects fall upon it, are easily seen, and then dispatched.

*Strawberries Attacked by Beetles (?)*.—Messrs. Wood & Ingram of Huntingdon forwarded specimens of beetles of two species, *Harpalus ruficornis* and *Terrostichus madidus*, supposed to have been the depredators. They are nocturnal, but very exceptionally vegetable feeders, hence some suspicion was felt as to their being the right insects; and the question was raised as to whether they had been actually observed eating the seeds of the Strawberries as described. If the above beetles were the real enemies, hand-picking at night is the only method of destroying them, as they are nocturnal in their habits.

*Plants, &c., Exhibited*.—Dr. Masters showed a specimen of *Weigela sessilifolia*, with small scentless and yellowish flowers, a dimerous *Cypripedium*, a pelorian *Linaria vulgaris*, and a proliferous *Carnation*. Mr. Henslow exhibited a white *Iris* with two flowers, both being dimerous instead of trimerous. Members of the Scientific Committee may be reminded that the next meeting on August 11th will be the last of the session. The first meeting of the winter session will be held at Chiswick on October 6th.

## TUBEROUS BEGONIAS.

TUBEROUS Begonias are destined to occupy a very prominent position in all gardens where flowers are appreciated. Easy of culture, requiring only a warm greenhouse temperature as a maximum, and growing and flowering freely out of doors in beds and borders, vigorous in growth, bold and beautiful in foliage, producing large and gorgeously coloured flowers with the greatest freedom, the Tuberous Begonia will rapidly become one of the most popular flowers. Less than twenty years ago any further improvement upon such kinds as *Boliviensis*, *Chelsoni*, *Peareei*, and *Veitchi* was pronounced to be impossible. What was said to be impossible has been achieved by Messrs. John Laing & Sons of Forest Hill by careful selection, judicious crossing, and first-class cultivation, extending over a period of seventeen years, but unremitting attention, persistency, and study has obtained its reward. These plants appear to successfully adapt themselves to all purposes but one—viz., cutting purposes. As basket plants they are very useful; when massed in the conservatory or greenhouse they make a display of colour that it would be difficult to equal from June to October; it is valuable as a "bedding out" plant, two thousand of one colour having been sent for that

purpose this season to one private garden, and it is equally at home in the herbaceous border. As in purchasing Orchids and most other plants that vary considerably in the quality of flower, it is a good plan to inspect a collection of good repute and select the best varieties. Of course the first cost is greater, but as a rule it is the most satisfactory in the end.

The plants under glass at Forest Hill have been exceedingly fine this season, and where there are so many that are excellent it is difficult to particularise. The principal show house is a magnificent sight, a span-roofed structure about 100 feet by 24 feet, with central and side stages, containing hundreds of specimens and half-specimens, as well as smaller and more saleable plants. The specimens are 2 feet to 2½ feet in height and diameter, with strong stems and immense leaves, and correspondingly large and numerous brightly coloured flowers. Many of the latter are 6 inches in diameter, very regular in form, and of good substance. Some flowers have been as much as 7 inches, but this size is exceptional. Given flowers 4 to 6 inches across, circular or nearly circular in form, bright and decided in colour or shade of colour, and of thick velvety substance, there is little more to be desired in the flowers of the Tuberous Begonia, except that it shall be attached more firmly to the flower stalk.

Amongst the double varieties some of the best were *Alice Manning*, yellow, with long and pendulous panicles of bloom, and an excellent basket plant; *Mrs. French*, yellow or pale primrose, with full well shaped flowers, and petals well imbricated; *Stanstead Yellow*, a lovely soft clear yellow and of exquisite form, one of the best; *Duchess of Teck*, yellow, a large flower of good form, one of the best. Of Pinks which are clear in tint and are great acquisitions the best are *Sir William Wallace*, pale salmon pink; *Viscount Wolseley*, rich rose pink, superb; and *Elfride*, bright rose. In whites one of the best and perhaps the most useful in cultivation is *Alba floribunda*. This should be in every collection. *Vesta*, a superb and snowy-white flower, and *Lucy Closon*, beautiful ivory white, with just a tinge of yellow in the centre of the flower. The best of the crimson section are *Hollyhock*, a beautiful light crimson, large and full; and *Notaire Dubled*, a deep velvety scarlet.

The single varieties contain amongst them all shades, from the deepest crimson to the purest white, and at present this section is decidedly in advance of the doubles in point of variety and richness of tints. A bicolor or "fancy" race has also arisen amongst them, and at no distant date these will form a distinct section. We have in *Darkest Africa* the deepest crimson yet known amongst Tuberous Begonias. *Gigantea* is a rich rose pink, clear in colour, large, and of almost perfect form. *Her Majesty* is a soft blush pink, exquisite in form, and one of the largest in size. *Leviathan* is what its name implies, and of a rich rose colour, good in form; *Lady Whitehead*, a bright rose pink, large, and of excellent form; *Lady Brooke*, a fine flower, rich purplish rose in colour; *Miss E. F. Cooper*, a beautiful blush; *Miss Warren*, good dark rose, large size; *Torey Laing* is a very fine orange yellow; *Primrose Queen*, good primrose yellow; *Golden Gem*, a rich golden yellow; *Duchess of Edinburgh*, a deep yellow, slightly shaded with orange, a splendid variety; *Golden Queen*, one of the best of the yellows; and *Mrs. R. Ballantine*, a very bright yellow, and of excellent form and good substance. Of scarlets the best are *J. W. Wilkinson*, a very bright scarlet, and of good form; *Earl of Rosslyn*, brilliant orange-scarlet, and of good form; *Guardian*, bright vermilion, erect and circular flower; *Lady Cloncurry*, scarlet flushed with Indian red, a fine flower and of good form; and *Prince Albert Victor*, orange scarlet, of first rate form. Amongst crimsons *Comet* is one of the best, dark crimson in colour; *Duke of Edinburgh*, a splendid variety, rich crimson maroon; and *Mrs. Peteh* and *Mrs. Joseph Chamberlain* are excellent types of the "fancy" section alluded to. The best whites are *White Perfection*, *Mrs. Weekes*, *Princess Beatrice*, and *Princess Louise*.

The stock of Begonias is very large; a considerable area of land is planted with double and single varieties in a series of beds. There are over 120,000 so planted, and even these must be seen to realise what that number actually is. There are several large houses in addition filled with flowering plants, and numbers of pits and frames are also occupied. Hundreds of shallow boxes holding thousands of seedling plants were standing at the sides of the paths, and a large staff of men are solely occupied in attending to the requirements of these Begonias.

The culture of the Tuberous Begonia is very simple. At the beginning of 1890 I obtained seed of the single variety from a reliable source. This seed was sown on 25th February in a pan well crocked, and the crocks covered with moss and an inch and half of light soil, consisting of loam, leaf mould and sand in equal proportions passed through a fine sieve. The soil was levelled, the seed carefully sown, gently watered so as not to disturb the seed, and a piece of newspaper placed over it in contact with the soil and kept constantly damp, the pan being placed in a cool stove. The seedlings were pricked off—somewhat late owing to pressure of other work—on May 9th, and placed with *Primulas*, *Gloxinias*, and *Cyclamens* into a heated pit, and within a foot of the glass. These were potted into large 60's on June 20th in soil a little richer, and replaced in the frame. They were repotted into 48's on July 15th, the strongest being put into 32's and treated as before, and by the middle of August all but a few weak plants had been potted into 32's, and from that time until the end of October we had one side of a house a perfect mass of colour, and they were admired by all who saw them. As the leaves turn yellow or fall off and the stems separate from the tuber water should be more sparingly applied, and not entirely withheld until the tubers are

dormant so far as growth is concerned, when they may be either kept in their pots or shaken out and placed in cocoa-nut fibre, Buckwheat chaff, or cork dust, and stored in a cool place where frost cannot reach them until the following season, when they should be repotted before they shrink or start into growth; but in the case of old tubers much artificial heat is quite unnecessary; indeed, a buoyant genial temperature of 60° suits them admirably, and a free circulation of air encourages a robust growth.—J.

**EVENTS OF THE WEEK.**—The present week will be a rather busy one as regards horticultural exhibitions, for the following are announced. To-day, Thursday, St. Ives (Hunts); Saturday, August 1st, Ripley, near Derby (Roses); Southampton and Liverpool, August 1st and 3rd, both Shows of considerable importance, with substantial prize lists. Monday, August 3rd, and Tuesday, August 4th, Northampton, in Delapre Park, with a prize list amounting to £250. On Monday also the Beddington, Carshalton, and Walington Show will be held in Beddington Park, Surrey; and at 4 P.M. the British Fruit Growers' Conference, announced on another page, will take place. The Leicester Horticultural Show will be held as usual in the Abbey Park on August 4th. Messrs. Protheroe & Morris announce a sale of new and rare Orchids at their Cheapside rooms on Friday, July 31st.

— **THE WEATHER.**—During the past week much rain has fallen, accompanied in some districts by serious thunderstorms. A daily paper says that at Lady Green, near High Wycombe, Bucks, on Monday last, a storm occurred during the Flower Show and cricket match, when, in consequence of a sudden storm, the spectators and cricketers took refuge in tents and under trees. The lightning struck a tree under which five young men had gone for shelter, killing three instantaneously. The Rev. Mr. Wallace of Bromley, Kent, was delivering a lecture on "Bee-keeping" in a tent near a tree, some men being gathered under the tree watching the operation. Suddenly a flash of lightning was seen, and it was found that three of the men were dead, and others, including the Rev. Mr. Wallace, badly injured.

— **ELM BRANCHES FALLING.**—A peculiarly dangerous and well known character of the Elm is that of large branches suddenly falling in the summer without any apparent reason. At Castle Green, Hereford, an accident of this occurred last week, resulting in the death of two children.

— **WOLVERHAMPTON HORTICULTURAL SHOW.**—Permit me to call your attention to an error in your report of the Show held on July 14th, 15th, and 16th. In the Rose class for amateurs and gentlemen's gardeners the Rev. J. H. Pemberton was first for thirty-six and twenty-four; the Rev. A. Foster-Melliar was third for thirty-six Roses. —W. A. GREEN, JUN., *Hon. Sec.*

— **THE CARDIFF HORTICULTURAL SHOW.**—We are desirous to remind our readers that the entries for the above Show close on August 5th. About £300 are offered in prizes, and it is expected that the Show will be highly satisfactory. Schedules can be had from the Secretaries, 54, Woodville Road, Chester.

— **TROPÆOLUM MRS. CLIBRAN.**—Messrs. W. Clibran & Sons send us from Altrincham flowers of this new dwarf bedding Tropæolum, which they propose distributing next spring. They are rich orange yellow in colour without stripe or speck, and as the plants are said to grow only from 4 to 6 inches high, and to flower with great freedom, the variety must be regarded as an acquisition. If it were not both distinct and good we may be sure it would not be honoured with the name it bears.

— **HOP PROSPECTS IN SURREY.**—Encouraging reports are to hand respecting the prospects in the Hop gardens in Surrey and Hampshire. In the opinion of the oldest Hop planters they have never in all their experience seen the bine so free from vermin as they are at the present time. In most of the gardens there is a show for a good average crop. The only thing which planters have to all appearance to fear is mould, judging from the free application of the process of sulphuring. In places mould is developing rather fast. Old Hops are almost cleared, and the outlook this season for growers is a very hopeful one.

— WE are informed that MR. JAMES COLE, recently with Messrs. Standish & Co., Ascot, and previously with Messrs. Ireland & Thomson, Edinburgh, has been now engaged as manager to Messrs. John Laing and Sons, Forest Hill Nurseries, London, S.E.

— **GLADIOLUS RAMOSUS** is the first of an extensive family to flower in the open border, where its magenta blossoms are effective in strong clumps about 2 feet or so from the front of the border when associated with other plants. The foliage is dark green, which sets off the brightly coloured flowers, that expand during the month of June. It increases rapidly, and succeeds best when left undisturbed in the border.

— **THE Chinese Pink**—**DIANTHUS CHINENSIS HYBRIDUS**—is variable in colour, and the deep rose-tinted form is the best. This can be kept true by propagation from cuttings or by layers, choosing the stout growths. Cuttings inserted in sandy soil in a cold frame at the end of August make good plants by the following spring. In clumps on the rockery this Dianthus makes a good show, and deserves a place in every garden.—S.

— **DORONICUM AUSTRIACUM.**—The earliest flowering Leopard's Bane has been very showy in the herbaceous borders this season, and it is in some respects one of our best hardy plants. It is most useful for cutting from, as the old gold colour of the flowers is generally admired. When once a plant is established no difficulty need be experienced in increasing the stock, as every piece of growth with a root attached will grow if taken off and planted in showery weather.—S. P.

— **CANNELL'S ENGLISH WONDER PEA.**—For some years I have depended upon American Wonder for supplying us with the first Green Peas because of its good quality, though some other varieties are a few days earlier, and earliness is the first consideration with some people. This year I have given the English Wonder Pea a trial alongside the old favourite, American Wonder. The result is I find the new variety superior to the old one in every respect. The growth is similar, but the pods are larger and the peas superior in quality. The two sorts were sown February 13th and gathered June 23rd. They suffered much by the frost of Whit-Sunday, or would have been ready a week sooner.—E. MOLYNEUX.

— **GERBERA JAMESONI.**—It may be of interest if I supplement your remarks upon this plant, given with the illustration in the *Journal of Horticulture*, July 23rd, by saying that far the finest result is obtained by planting it out at the foot of a south wall, where it can be kept dry during winter by a cover of glass. Here I have two fine plants of luxuriant and handsome growth growing among the Opuntias, the treatment of which it receives. They were not injured in the slightest degree during last winter. The Opuntias, too, were quite unharmed, though the thermometer went down nearly to zero, and they are now making magnificent growth, and form a striking feature. All the protection these plants receive, in addition to that of the south wall, is glass overhead during winter to keep off wet.—R. IRWIN LYNCH, *Botanic Gardens, Cambridge.*

— **STRAWBERRIES.**—The long-continued cold spring and the severe frost of Whit-Sunday rendered the Strawberry crop exceptionally late here this year. Last year we gathered fine fruits of Noble on June 17th, while we did not gather any this year before June 29th. Noble was not our earliest variety either this season. Vicomtesse Héricart de Thury ripened its fruit first. I cannot speak in too high terms of this Strawberry either in point of crop or flavour, both being of the best, and for growing in strong soil it has no superior. The plants have carried a full crop of fruit, having recovered wonderfully since the frost, while the plants never looked better.—E. MOLYNEUX.

— **SUCCESSFUL VIOLET CULTURE.**—At Cricket St. Thomas, near Chard, Mr. Lyon grows Marie Louise and Comte de Brazza Violets remarkably well, a good start having been made this season. A range of pits with high backs, so as to give a rather sharp angle, is wholly devoted to Violets, being no sooner cleared of old plants than they are filled with young ones. A good loamy soil is prepared to replace that already exhausted, and in this newly rooted runners or cuttings are disposed about 10 inches apart each way. After they are established in their fresh quarters the lights are taken off and not replaced over the plants till frosts are imminent. During the summer they are kept well supplied with water, syringed occasionally, and all runners are pinched off. Thus treated extra strong plants are obtained, and which, not being checked by transplanting, flower grandly and continuously.—I.

— MRS. SINKINS PINK.—One more year proves the superiority of this Pink to other white varieties for cutting from. The flowers are so much more solid than any other variety; they also are borne on extra stout stalks, which enables them to be seen to the greatest advantage, those of the common type often dragging in the soil owing to the weakness of their stems. There are three easy ways of raising a stock of plants. Layering may be done at any time after the flowers have faded. The old roots may be broken up, every piece with a root being dibbled into sandy soil on a border early in September, or stout cuttings may be inserted in a cold frame at the end of August. Whichever mode is adopted the plants when ready should be set out on a border for a year, cutting off the first flowers directly they show, the object being to enable the plants to make better growth for flowering the following year in pots on the open border. Planted in a mass as an edging by the side of a path this Pink shows to great advantage. Its perfume is exceedingly powerful at times according to the state of the weather.—S.

— FRUIT CROPS IN YORKSHIRE.—We had a splendid show of blossom on all fruit trees, but the disastrous frost of May 17th made terrible havoc with Plums, Pears, and Currants. Gooseberries were well into leaf, and gave protection. Black Currants are a failure. Strawberries were very much damaged, but are a fair crop, rather small. Apricots are very scarce on the walls outside, but the open Apricot shed contains a fine crop of Apricots and Plums. There are crops of some kinds of Apples and Pears on standards, the Hesse Pears are loaded with fruit in this district. Early Potatoes are rather small from the effects of the frost in May; late ones are looking well, better than I have seen them for several years. Peas, Beans, and other vegetables are very luxuriant and good.—BAILEY WADDS, *Birdsall, York*.

— THE PRINCE OF WALES' VISIT TO BIRMINGHAM.—The very extensive floral display at the Council House was in the hands of Messrs. Hewitt & Co., Solihull Nurseries, and was on a very elaborate scale. The main entrance leading to the grand staircase was flanked with massive Palms and other plants, and the windows and grand staircase were superbly decorated. The windows and recesses of the banqueting room were draped with pale salmon tinted curtains, and only white flowering plants and foliage were used in this room. The luncheon table was decorated with blue Cornflower and Grasses, and sprays of Smilax on the cloth. The drawing-room and boudoir for the Princess of Wales and the Prince's rooms were exquisitely ornamented, as also were the corridors and other rooms. Messrs. Hewitt & Co. also supplied the floral decorations for the new Law Courts opened by Their Royal Highnesses.

— CROWN IMPERIALS are generally planted and left to take their chance whether the soil is suitable or not for giving the finest results. Heavy retentive soil, which must of necessity be cold during the winter, is not the best for Fritillarias; they prefer that of a sandy nature. In the former case remove the soil to a depth of 18 inches, filling the spaces with peat, leaf mould, and old potting refuse. When the foliage and flower stems have died is a good time to replant bulbs which do not succeed under their present method of treatment. By removing the old and adding new soil, planting the bulbs on a layer of sand an inch thick, 6 inches below the surface, mulching during the winter with partly decayed leaves, success may be assured. A short time ago I saw a clump 10 feet square of Fritillaria imperialis growing in a cottage garden. The effect of such a mass in bloom can readily be imagined, and in this way Crown Imperials show to the greatest advantage.—P. B. W.

— STRAWBERRY TROLLOPE'S VICTORIA.—In the list of Strawberries recently offered for sale by one of our leading nurserymen this old variety is described as being of fine flavour and in other respects highly satisfactory, than which description nothing could well be more misleading. A more soft flavourless fruit could not well be named, and this I maintain after having tested it in at least eight different counties. I would not recommend it under any circumstances, as it does not possess one single good quality, and the sooner it is blotted out of all lists the better. With so many superior forms to select from why cling to such worthless old favourites? Not that all the varieties of recent introduction are so much superior to the older and well tried favourites; and in order to prove that I am not prejudiced against the latter it is only necessary to state that another out of the same batch of seedlings as gave Mr. Trollope his Victoria is very extensively grown in the gardens under my charge, this being none other than the good old Alice Maud, with or without the prefix of Princess, just as the "fancy takes us."—W. I.

— BLACK CURRANT ENEMIES.—Our entomologist writes:—"The larvæ or grubs taken from the Black Currant, and sent by your correspondent "W. K.," did not develop the fly in sufficient numbers to enable its name to be determined. Doubtless this insect is identical with the one referred to by Mr. Thomson, evidently a two-winged fly of the Phora group. The caterpillar of *Incurvaria eapitella*, which bores into the shoots of the Black Currant, commences its attacks usually in the bud, where it may be found, but not till about this time, the moth depositing eggs in June. The caterpillar of a Tortrix, which visits Roses and various fruit trees, probably occurs sometimes in this shrub. There have been sensational paragraphs in some papers about a beetle that damages Currants at night, hiding during the day in the soil. *Otiorynchus tenebrius* (red-legged weevil) lurks at the roots of Currants, sometimes doing a certain amount of mischief. Gardeners in Kent who have a short crop of Black Currants do not attribute this to mite, caterpillar, or any insect in particular, but regard it as the result of an extremely sharp frost one April night." [No doubt the Kentish gardeners are right, but in some other districts not only crops of Currants, but hundreds of Currant bushes, have been ruined by the bud mite apart from other enemies.]

— BUDDLEA GLOBOSA.—Those requiring a distinct and beautiful flowering shrub for sheltered positions would do well to give this a trial. The plant is hardy enough to withstand ordinary English winters; and even after the last severe winter here, in Warwickshire, a plant growing against the walls of Warwick Castle escaped uninjured, though others in the open borders were killed after having withstood the frost of several previous years. If planted against south walls in the southern parts of England they will doubtless succeed well if the precaution is taken to plant in rather poor soil, and to provide good drainage. When trained to a wall the shoots should be allowed to ramble freely to secure plenty of their beautiful flowers, which are like little balls of a bright orange colour, and emit a peculiar yet pleasant perfume.

— ANOTHER distinct and beautiful shrub is *JASMINUM FLORIDUM*, and I feel sure that if it were more generally known many cultivators would grow a few plants and prize them highly. The flowers are of a very rich yellow colour, and are deliciously fragrant, and both the growth and leaves are much more vigorous than is the case with the majority of Jasminums. It succeeds well either when grown as a bush plant or trained against a wall.

— THE thoroughly hardy and showy *LILIUM ELEGANS*, which is synonymous with *L. aurantiacum* and *L. Thunbergianum*, should be grown by all who require plenty of flowers for cutting purposes. As it is so well adapted, too, for many kinds of decorative work, single blooms placed in specimen glasses, with a little Fern or a few trailing shoots of Sweet Peas, have a charming effect on a dinner table. When the whole stem is cut with several fully expanded flowers they are excellent for arranging in large vases, their attractive looking scarlet flowers give warmth and brightness when associated with a few white flowers and plenty of greenery. Although not in the least particular in regard to soil, like most other Lilliums, it repays well for liberal treatment, and is thoroughly suited to the wants of all classes of cultivators. A few clumps in the gardens of cottagers and amateurs are always telling, and large masses arranged in the front of shrubberies or disposed judiciously in mixed borders give a bright glow of colour to the grounds around many a stately English castle.

— THE recent rains have had a most beneficial effect on all kinds of BEDDING PLANTS, which are now growing rapidly, and with continued favourable weather will soon present an imposing appearance. Those who have to deal with light soils which are somewhat poor will find their plants derive great benefit from the practice of placing a layer of leaf soil over the surface of the beds after planting is completed, as it not only prevents the soil drying rapidly, but is also a great root-producing medium, as the majority of plants have a special liking for good leaf soil, and during wet weather much nutritious plant food is washed downwards to enrich the natural soil and sustain the plants during periods of protracted drought.—D.

— VINES AT AMPHILL HOUSE.—The proprietor of the above house—G. Wingfield, Esq.—has of late years devoted much of his attention to horticulture, and has been rewarded with much success. The plants grown here under the direction of Mr. W. Empson, the head gardener, proclaim by their vigorous, healthy appearance the care bestowed upon them. A vinery some 60 feet in length is worthy of

mention. This was planted with young Vines twelve months ago last March, and the amount of wood made and the quantity of fruit which the Vines are now bearing cannot fail to attract the attention of any observer. Several Vines of Madresfield Court are bearing enormous bunches, which when fully developed will not fall far short of 7 lbs. weight, the size and shape of the berries being admirable. Six plants of Black Hamburgh are bearing well, and many bunches have been removed. Three plants of Gros Colman are very fine, and are bearing well-shouldered bunches. Alicante is also well represented, and is bearing remarkable bunches. Lady Downe's are notable for the fine growth which the Vines have made, also for the bunches which are just swelling. Of white Grapes Mrs. Pearson is one of the best; the Vines are bearing large well-shaped berries and fine bunches. Fine Muscat of Alexandria are bearing well, and are just on the point of turning colour. Foster's Seedling, of which there are half a dozen fine Vines, is one of the best grown here, having large bunches with good berries. Of other plants may be noted a small but increasing collection of Orchids, amongst which are varieties of Cattleyas, Odontoglossums, the beautiful Phajus Humbloti, and other equally good plants.—P. W.

### PRUNES IN THE SOUTH OF FRANCE.

A RECENT issue of the "Kew Bulletin" was an unusually interesting one, containing important chapters upon "The Cultural Industries at the Gambia," "The Cultivation of Perfumery Plants in the Colonies," "The Banana Disease in Fiji," "Fibre Productions in the Caicos," and upon the subject named at the head of this article. Much valuable information is now given in the "Bulletin," but we cannot help thinking it desirable that a few chapters should be occasionally included on the gardens at Kew. Concerning the useful work there performed, and the extensive collection of plants, the horticultural or botanical public hear but little, though much of an interesting character might be written respecting these subjects. The chapter upon the French Prunes is reproduced here as a subject of commercial importance.

The preparation of dried Prunes is a very considerable industry in several parts of Europe. In the valley of the Loire in France, especially about Bourgueil, a small town lying between Tours and Angers, the *Prunier de St. Julien* (*Prunus domestica*, L., var. *Juliana*, D.C.) is largely cultivated. This is one of the principal sources of supply of the ordinary grocers' Prunes.

According to Flückiger and Hanbury ("Pharmacographia," page 252), "The Prune in its fresh state is an ovoid drupe of a deep purple hue, not depressed at the insertion of the stalk, and with a scarcely visible suture, and no furrow. The pulp is greenish and rather austere unless the fruit is very ripe; it does not adhere to the stone. The stone is short (0.7 to 0.8 of an inch long, 0.5 to 0.6 broad), broadly rounded at the upper end.

The fruit is dried partly by solar and partly by fire heat—that is to say, it is exposed alternately to the heat of an oven and to the open air. Thus prepared it is about  $1\frac{1}{4}$  inch long, black, and shrivelled, but recovers its original size by digestion in warm water.

The production of a somewhat inferior kind of Prune is also an important industry in Germany. The following account is from Hanbury and Flückiger (pages 252, 253).

"When French Prunes are scarce, a very similar fruit, known in Germany as Zwetschen or Quetschen, is imported as a substitute. It is the produce of a tree which most botanists regard as a form of *Prunus domestica*, L., termed by De Candolle var. *Pruneauliana*. K. Koch, Dendrologie, part i. (1869), 94, however, is decidedly of opinion that it is a distinct species, and as such he has revived for it Borkhausen's name of *Prunus œconomica*. The tree is widely cultivated in Germany for the sake of its fruit, which is dried as an article of food, but is not grown in England.

"The dried fruit differs slightly from the ordinary Prune in being rather larger and more elongated, and having a thicker skin; also in the stone being flatter, narrower, pointed at either end, with the ventral suture much more strongly curved than the dorsal. The fruits seem rather prone to become covered with a saccharine efflorescence."

There is a third centre of the Prune industry in south-eastern Europe. This is of increasing importance.

The following account of it is taken from the General Review of the State of Trade in Servia during the year 1886, by Mr. Vansittart, Chargé d'Affaires at the time at Belgrade, (Consular and Diplomatic Reports on Trade and Finance, No. 176).

"The sum total of the value of the export of grain, fruit, and Prunes in 1886 is reckoned at £535,476; of this sum rather more than half represents the value of Prunes exported. In 1884 some 20,056,155 kilos, of a value of £274,441; and in 1885 about 23,228,777 kilos, of a value of £231,000 were despatched from Servia.

"It is reckoned that one-third is exported direct to Germany, via Regensburg, one-third direct to America, via Fiume, and one-third to Pesth, from which latter place Prunes are sent to the various European markets. The increase in the exportation of Prunes to North America via Fiume should be particularly noticed. Fiume is more advantageously situated than Trieste for this purpose; from the beginning of the season no less than 400 complete waggonloads were exported per sea, and chiefly to North America.

"The Prune harvest for 1886 yielded in Bosnia more than a third of the harvest of the previous year, and can be reckoned at about 170,000 centners; whereas Servia yielded a good average harvest of about 357,832 centners. Of this sum total more than three-fourths were exported. The quality of the new Servian ware was of a very satisfactory nature, the product being healthy, well dried, considerable in quantity, and of a durable nature. In 1885 a direct trade with Great Britain in Prunes was established, and it promises to attain considerable proportions in the future. Prunes are consumed in enormous quantities in Germany, and it is to that country that the great bulk is exported. In England Prunes are considered more an article of luxury, and the French "Prunes impériales," as sold in the English market, are the favourites, although, perhaps, the Servian Prunes, generally smaller than the French Plum, possess, if anything at all, a finer flavour, and can certainly be sold at a very much cheaper rate than at present demanded for the French production. The real reason is, probably, that as Prunes are more generally consumed among the richer classes in England, the superior packing, and what may be termed the general making-up of the French "Prunes impériales," render them more attractive to the eye, and, in spite of their higher prices, sell better.

"I am told that the export of Prunes in general might be benefited by exporters using for this purpose specially made barrels to contain 100 kilos, or 220 lb. casks."

The kind of Prunes more particularly distinguished as "French Plums" are a special industry of Southern France. Their mode of preparation and the extreme care bestowed upon it seem to be little known. These were very carefully studied on the spot by Mr. M. W. Colchester-Wemyss of Westbury Court, Westbury-on-Severn. His object was to ascertain if there was any possibility of starting a similar industry in England. He has very kindly permitted the result of his inquiries to be published in the "Kew Bulletin."\* Though there seems to be little prospect of success in the preparation of Prunes or French Plums in this country, there seems no reason why it should not be attempted in colonies, the climate of which is not dissimilar to that of Southern France. Fruit growing would be doubtless stimulated in the colonies in proportion to the existence of practicable modes of preserving the crops for commercial purposes.

About sixty miles above Bordeaux there falls into the Garonne a fine river which, taking its rise among the mountains of Cevennes, follows a course of some 150 miles until its junction with the Garonne. This river is called the Lot, and the two rivers together confer the name of the Department known as Lot and Garonne. For several miles along the lower reaches of the Lot, and in the country immediately adjacent to the spot where it enters the Garonne, is produced the fruit known, when it has been specially prepared, as "French Plums." For over one hundred years the industry has been fixed in this locality, and still with the sole exception of a valley in Servia there is no other place where the same trees are cultivated. The tree is called *Prunier d'ente*; "enter" is an old French word meaning to graft, and it is simply so called because this particular species was formerly the only Plum in this district that ever was grafted. Now there are, practically, no Plums other than the *Prunes d'ente* grown in the neighbourhood. Higher up the Garonne, round the old town of Agen and in other parts of Southern France, another Plum, the *Prunier commun*, is largely grown, and its fruit treated similarly to that of the *Prunier d'ente*, but the produce is very inferior and only suitable for stewing; but I believe that nowhere, except in the Servian valley, is the true *Prune d'ente* at present grown; and though many experiments have been made with other varieties no others have yet been discovered that will yield the established qualities of the "French Plums." It is rather capricious in its growth, for its area of cultivation does not extend very far from the river bank. It appears to delight in a rich alluvial soil of a rather sandy nature, but which contains a sufficiency of clay to make it very retentive of moisture. The centre of the "French Plum" district may be said to be at Clairac, a quaint little old-fashioned town built on a steep hill side overlooking the Lot, almost more Spanish looking than French, its houses shaded from the fierce southern sun with wide outspreading eaves and flower-clad balconies. Here, during a recent stay, I was most hospitably entertained by M. Gajac, one of the most leading merchants connected with the Plum trade, with whom I had accidentally become acquainted.

In this and the neighbouring Communes the Metayer system is in full operation, and it appears to work well and harmoniously. The owner of the land engages the Metayer, and supplies all the implements and stock required for the holding; he also keeps the buildings in repair, including the house used by the Metayer. The latter finds the whole of the labour except such extra labour as is needed during harvest time. The Metayer during the year has entire control of the farm, and buys and sells, subject, if required, to the consent of the owner. He renders account of all produce from the holding consumed by himself and family, and at the end of the year the balance of profit is divided equally between the owner and the Metayer. During the last few years the Metayers have fared badly, for the phylloxera has devastated the vineyards, and sad it is to see acres and acres of land excellent for the growth of Grapes, but fit for little else, now deprived of those crops which formerly so well repaid the cost of cultivation. The holdings vary

\* A somewhat similar account is given by Mr. George W. Roosevelt, United States Consul at Bordeaux ("Reports from the Consuls of the United States," September, 1888, pages 441-443). There is an abstract in the "Journal of the Society of Arts," March, 1889, pages 323-329.

in extent from 10 acres to sometimes 50 and 60, and on every holding in the lowlands are to be seen rows of the *Prunier d'ente*. The rows are separated from each other by long strips of cultivated land where the mild fawn-coloured oxen lazily drag the most old-fashioned and primitive implements over the easily broken soil. The Plums are long shaped, the end to which the stalk is attached being very much the more pointed; colour red, deepening into a rich violet as the Plum ripens; the skin is extremely tough, without being very thick or hard; the flesh very firm, containing a large amount of saccharine; the specific gravity much less than that of several varieties of English Plums with which I made comparison.

(To be continued.)

### PEACH TREES IN POTS.

IN a heated orchard house I have at this time Peach trees in 15-inch pots of Nectarine (Rivers) and Princess of Wales (Rivers), Sea Eagle (Rivers) bearing on trees from 6 to 8 feet high thirty to forty fruit, from 9 to 12 inches in circumference, and 9 to 12 ozs. in weight. The aliment given to the roots twice per week is fish manure (Jensen's), soot, and liquid manure; at other times the trees are contented with pure water. I should like to know what amount of nourishment may be apportioned to the leaves, as it is absurd to suppose that the spongioles can supply all that is required to develop and sustain the extraordinary weight of fruit, the soil in the pots being no more than a healthy man can take up in one hand. The fruit will be on the trees for a few days, and can be seen by those who care to verify my statement by a personal examination.—T. FRANCIS RIVERS, *Sawbridgeworth*.

### THE FLOWER TRADE IN PARIS.

[Notes of a Conference held at the hall of the "Association Française pour l'Avancement des Sciences, by M. H. L. de Vilmorin.]

A PARISIAN of the present time can remember that a few years ago flowers did not play so conspicuous a part in commercial horticulture as they do now. They undoubtedly have always had an important place in the home life of the individuals and the symbolical accompaniment of the great events of life, but never until recent years have they assumed such an important position. A large quantity of flowers is every day of the year brought together in Paris, to be re-forwarded to distant parts or distributed throughout the city.

Whence comes that graceful harvest, renewed every day of the year in spite of storms and frosts? By whom are these flowers produced, despatched, received, preserved and placed in all quarters of the City within the reach of the buyers? How many people live by that industry, and sometimes acquire a competence for themselves and their families? These are useful and interesting matters, and the French Association has selected an important subject.

The central flower market (Les Halles) is between the fish and the vegetable markets, under a broad and spacious passage, and there fully open to the winds the flowers land in Paris. The carts of the horticulturists and market gardeners bring them in the evening from the suburbs of the city. At the same time and during the whole night the heavy railway trucks convey in osier and reed baskets flowers from more distant sources. At eleven o'clock, in all seasons, begins the distribution of the places and the ranging of the packing on the footpath; the centre is left free for the latest arrivals and the buyers. At 3 A.M. in summer and 4 A.M. in winter the wholesale market begins, but there are certain festivals (St. Charles, St. Louis, &c.) which give exceptional briskness to the transactions, when the sales open at 11 P.M. and last the whole night.

The importance of the supplies of flowers varies considerably according to the season, the temperature, and accidental circumstances. Last winter the relaxation brought about by the epidemic influenza greatly affected the flower trade. On an average about 2000 baskets arrive every day at the central market. Of that number some 800 are brought by 200 to 300 horticulturists and market gardeners, these being more numerous in summer than in winter. Forty commission agents receive and sell daily from 1000 to 1200 baskets, which during winter mainly consist of supplies from the South of France. These commission agents, through whose hands pass a large part of the flowers which arrive here, perform a very useful office. They assort the flowers, which are usually sent in a hurry by the producers. The choicest, which often pay for the whole consignment alone, are delivered to the large florists or re-forwarded to the provinces or to foreign countries; the remainder is disposed of at a low rate to the sellers in the central market or to the street vendors, and this explains the fact, at first sight surprising, that southern flowers are often sold in the Parisian streets for less than the price they fetch at Nice or Cannes.

Just as a floral clock has been composed of flowers which open at the different hours of the day and night, one might establish the calendar of the flowers in Paris by noting the arrivals in the different seasons. I will give a sketch of this when speaking of the street vendors, who, running after cheap articles, or, in fewer words, hunting a bargain, hawk each kind at the time of its greatest abundance.

Let us return to the wholesale trade at the central market. Whether it is held in its usual "passage" or in the cellars (in bad weather) the

sale lasts in summer until 8 A.M., and in winter until 9 A.M. The usual buyers are the retailing florists, either those occupying stalls in the special markets or keeping stands at the stations established by authority in hundreds of parts of Paris, or the numerous individuals who are permitted by the Prefecture of Police to drive small carts with which they introduce fresh products of the season. There are also the florists who have shops, but who mostly receive their supplies direct from the producers; and lastly, the forwarding agents, who send to the provinces or to foreign countries large quantities of flowers. We can safely estimate that from 300 to 400 persons are daily engaged with the cut-flower trade at the central market alone.

The special flower markets or shows in Paris, eleven in number, are not counterparts of the central market. Although a good quantity of ready-made bouquets or of cut flowers are sold in the former, their main object is the sale of living plants in pots. Some of these markets are very old. That of the "Cité," near the Hôtel Dieu, which has occupied since 1809 the site called "Quai aux Fleurs," existed last century on the Quai de la Mégisserie. It was regularly constituted for the first time in 1799. The market of the Madeleine dates from 1834; that of the Château d'Eau, now the Place de la République, dates from 1836; that of the Place Saint-Sulpice from 1845; the seven others have been opened since 1870. An essentially Parisian picture is afforded by the assemblage of coverts or temporary booths, open on all sides or partially sheltered against the wind and rain, gaily decorated with pot plants wrapped in sheets of white paper. With some variation the scene is repeated every day of the week, and in various parts of the central quarters and suburb, according to the annexed table:—

Name of the markets.	Date at which they were opened.	Number of places.	Superfices of the places.	Rent for market day.	Days of the week when the markets are held.
Marché de la Cité ..	19 Frimaire of the year VII. of the Republic (autumn, 1799)	About	Meters.	Centimes.	
„ de la Madeleine ..	May 2, 1834	300	6 & 2	30 and 15 per meter	Wed. & Saturday. Tuesday & Friday.
„ de la Place de la République ....	April 14, 1836	182	6	15	
„ de la Place de la Saint Sulpice ..	May 1, 1845	139	5.61	70 per place	Mon. & Thursday.
„ du Boulevard Clichy .....	Nov. 1, 1873	73	6	10 per meter	„ „
„ de l'Avenue des Ternes .....	Aug. 1, 1874	84	6	10 „ „	„ „
„ de la Place Voltaire .....	Aug. 1, 1874	93	6	10 „ „	Wed. & Saturday.
„ de Passy .....	Aug. 1, 1874	97	6	10 „ „	Tues., Fri., & Sun.
„ des Batignolles ..	April 30, 1877	20	4	10 „ „	
„ de la Chapelle ..	April 2, 1879	50	4	10 „ „	Wed. & Saturday.
„ du Boulevard Raspail .....	April 4, 1888	40	5	10 „ „	Wed. & Sunday.
	June 30, 1890	40	4	10 „ „	

These markets are in all their beauty during the fine spring days, before Paris becomes empty, and the amateurs, then numerous and eager, are rather puzzled as to a selection between the bulbous plants, spring Roses, *Deutzia gracilis*, favourite ornament of the *mois de Marie*; the first Carnations, Chinese Primulas, and the Cinerarias; the innumerable Stocks, *Myosotis alpestris*, the Indian Azaleas; the *Spiræas*, *Gardenias*, *Pinks*, and a hundred other plants. At the same time armfuls of Lilac flowers, *Mignonette*, and *Narcissus poeticus* attract notice by their perfume and the small hampers (French, *bourriches*) of Pansies, double Daisies, Anemones, and *Ranunculus* are prepared for the city gardens and window cases.

In the height of the summer season Asters take the lead with Carnations of every shade; the *Gladiolus* embracing such a variation of colouring; the *Agapanthus*, *Gaura Lindheimeri*, similar to white butterflies; the dark brown leaved *Perilla nankinensis*, *Lilium speciosum*, with their white and red varieties; the golden Japanese Lilies, the Tuberoses, not less fragrant; *Plumbago capensis*, *Rhodanthes*, *Vincas*, the *Gypsophila* and *Stevia*, which combine so gracefully with other flowers and give such a lightness to bouquets. Then in the small hampers we find *Mimulus*, *Verbenas*, *Balsams*, *Ageratum*, *Lobelias*, and *Nemophilas*; all annual charming open ground flowers.

The autumn is devoted to the *Chrysanthemums*. Either grown in pots or offered in clumps or as cut b'ooms they come everywhere to the front, and nobody thinks of complaining, so beautiful and pleasingly varied are they. From the small flowered Pompons or Liliputians to the large Japanese they provide a grand display of varied forms. They adapt themselves to every use and present a great range of the freshest colours. They are dwarf or tall, slender or bushy, from 12 inches to 6 feet high. They may be grouped in mixed borders, in flower beds, or planted in masses or singly, and lend themselves to every combination with the great merit of lasting very long. No wonder the *Chrysanthemum* is the queen of the autumn. Some Asters may, however, still be seen, charming miniature plants; then some *Laurustinus*, Christmas Roses, soon followed by *Cyclamens*, which commences the series of the winter flowering greenhouse plants. Towards Christmas appear the foliage and winter berries, the bronzed *Mahonia*, the red-berried *Holly*, the spring *Ruscus aculeatus*, clusters of *Mistletoe*, sprays of Japanese *Euonymus*, and of *Schinus Molle* with their bunches of rosy seeds. The sharpest cold does not deter the vendors in the open air markets, for we may see some closing their shops with thick cloth, and by means of a stove maintain a sufficient temperature to preserve the flowers and plants from injury.—EUG. SCHÆTTEL, *Paris*.

## ALLAMANDA WILLIAMSI.

COMPARATIVELY few additions have been made to the list of cultivated Allamandas in recent years, and those we already have are so

employed judiciously they have a beautiful appearance. Judging by the plant of Allamanda Williamsi (fig. 14) shown at the last meeting of the Royal Horticultural Society, and for which a first-class certificate was awarded by the Floral Committee, it will be especially

FIG. 14.—ALLAMANDA WILLIAMSI.

handsome that it is difficult to see how they could be surpassed. As climbing plants for covering the roofs of stoves they are most valuable, and yield a wealth of golden blooms during a good portion of the year. Of late, too, the flowers have come into favour with many decorators for the base of dinner-table stands, and when

adapted for culture in pots, as the habit is compact and bushy, and though the flowers are not so large as some of the others in general cultivation, they are of excellent shape, and a very clear bright shade of yellow, and produced in great freedom. We have no information respecting the origin of the plant.

## THE QUEEN OF FLOWERS.

IN the pleasing and graceful leading article on page 15, July 9th, Mr. Arnott seems to imply that the Lily may possibly contest this title with the Rose, and he quotes Cowper very happily as allowing such rivalry. He goes even further. "If rosarians will forgive, Cowper seems to have had a partiality for the Lily." I, for one, cannot for a moment "forgive," especially at such a season, when Roses are the most regal of all. In November my allegiance wavers a little, and I admit there is something to be said for Chrysanthemums. Every visit to an Orchid house impresses me with respect for that all-the-year-round flower. But in July admit a rival to the Rose! Not for a moment!

When there is a lull in the rush of Rose show reporting perhaps there may be found room for my reference to English poets. I will not go back beyond them, which will, I think, clear the case in poetical judgments. I will quote Cowper against himself, and then subjoin a garland of other Rose poets' sayings.

"Flowers by that name promiscuously we call,  
But, one, the Rose, the regent of them all."—  
(COWPER.—"Retirement").

I will begin with that little known poet Daniel, 1562-1619.

"Fair is Lily, fair  
The Rose, of flowers the eye!  
Both wither in the air;  
Their beauteous colours die."

Hughes represents Flora as absolutely installing the Rose in this position.

"Ye flowers, at my command attendant here,  
Pay homage, and your sovereign Rose revere!  
No sorrow on your drooping leaves be seen;  
Let all be proud of such a queen,  
So fit the floral crown to wear,  
To glorify the day, and grace the youthful year."

Broome, again, pays his homage thus:—

"Queen of fragrance! lovely Rose!  
The beauties of thy leaves disclose!  
The winter's past, the tempests fly,  
Soft gales breathe gently through the sky:  
Then haste thy beauties to disclose,  
Queen of fragrance! lovely Rose!"

Cunningham says the same.

"Yes, every flower that blows  
I pass unheeded by,  
Till this enchanted Rose  
Has fixed my wandering eye."

Cunningham also imitates Anacreon—

"Thee, ever gentle Rose, we greet!  
We worship thee, delicious sweet!  
For, though by mighty gods caressed,  
You deign to make us mortal blest."  
"Go, Flora," (said the impatient queen  
Who shares great Jove's eternal reign),  
Go breathe on yonder garden thorn!  
Wake into bloom the emerging Rose,  
And let the fairest flower that blows,  
The fairest month adorn."—(WHITEHEAD).

Similar lines were quoted in the Journal (February 5th, 1891). I have not been able to ascertain their author.

"What garden grace can be compared to thine,  
So sweet, so silent, and with face so fine;  
So fair a presence, lips that open with morn,  
Proclaim thee queen. Thy beauty hides the thorn!"

Two of the poets, it is true, waver in their allegiance, but then under very excusable circumstances.

"Sweet as the flowers that deck the field,  
And sweet the smell the blossoms yield;  
Sweet is the summer gale that blows,  
And sweet—though sweeter you! the Rose!"—(E. MOORE).  
"See, see, how the Rose there adorns that gay bush;  
And proud of its colours would vie with her blush;  
Vain boaster! thy beauties shall quickly decay:  
She blushes—and see how it withers away."—(DODSLEY).

Dr. Watts in his moral lessons rather reverses this statement. I conclude with his homely and excellent moral.

"The Rose has one powerful virtue to boast,  
Above all the flowers of the field;  
When its leaves are all gone, and fine flowers are lost,  
Still how sweet a perfume it will yield!"

Upon which he makes the young lady remark—

"Then I'll not be proud of my youth and my beauty,  
Since both of them wither and fade;  
But will gain a good name by well doing my duty,  
That shall scent like the Rose when I'm dead."

—A. C.

## ROSES IN AMERICA.

ON a gentle slope stretching away to the southward just beyond Mt. Hope reservoir and Highland Park, lies the greatest plantation of Roses in America. Many residents of Rochester know of this delightful spot, which has been visited by hundreds from a distance, but there are many who do not know of the treat within their reach.

Everyone is aware that one of the chief industries of Rochester, and the one which has caused it to be known the world over as the Flower City, is its culture of plants and trees. At the head of the list of horticulturists and florists is the long-established firm of Ellwanger and Barry. Their extensive grounds in the southern part of the city, laid out as they are in the most artistic manner and cared for in accordance with most approved methods, form a park, the beauty and attractiveness of which can seldom, if ever, be equalled by a public park.

Much might be said of each of the departments into which this extensive business is divided, but undoubtedly the greatest interest at this season will be taken in the display of growing Roses for which Messrs. Ellwanger & Barry have attained so enviable a reputation. For a number of years this firm has made a speciality of the Rose, and they have gathered from all quarters of the globe varieties which are best adapted for cultivation. As one approaches the field of eight acres from the top of the slope, there extends before him a grand sight. In this field are over 80,000 plants, embracing 150 varieties, while in another field near by are 20,000 plants. Mr. Barry said the varieties could be distinguished without difficulty when they are not in blossom by their foliage and peculiarities of growth.

"We do not grow the plants for the blossoms," said Mr. Barry in reply to the reporter's remark that it seemed a pity to see so many blossoms apparently going to waste. "We grow the plants to sell at wholesale and retail. We supply florists in large and small quantities, and sell a great many to persons who wish to decorate their grounds either extensively or in a simple manner. We have here the choicest old standard varieties as well as all the more recent introductions, and the newest Roses of 1891. Everyone loves the Rose, and most people, we think, will declare that it is the finest of all flowers."

Among the firm's recent additions are the Japanese Roses, remarkable for their robust, vigorous growth, great hardiness, and remarkable blooming qualities. These varieties are not only ornamental by reason of the beautiful flowers which they produce, but also on account of their handsome foliage and the showy fruit with which the plants are covered in autumn. The Japanese Rose will prove valuable, especially for regions where Rose culture has been unsuccessful heretofore, owing to the severity of the climate. Madame George Bruant, of the last type, is a striking representative, producing large white flowers, highly fragrant, and in every way charming.—(*Post Express*.)

## CHRISTLETON ROSE SHOW, JULY 21ST.

It would be difficult to find among the country Rose Shows a prettier or a better one than that which has been held now for a good many years in the park-like rectory field at Christleton, near Chester. The Show was held on the date named, and was unanimously pronounced to be better than any of its predecessors. A well-known rosarian, now, alas! no longer an exhibitor, on being asked his opinion, said at once, "You cannot possibly speak too highly of it." Tibshelf probably drew off the nurserymen, for there were only two exhibitors in their class. The open classes for amateurs were well filled, and with such adversaries as Dr. Budd and Mr. Drew it was no small credit to the rector of Christleton to carry off the principal prize. His winning box of twenty-four was a really fine one, strong all through. The quality of the Teas may be understood from these facts—that the Rev. F. R. Burnside was showing in fine form, yet he was beaten in two out of three classes by Dr. Budd, whose boxes of twelve distinct and six Ethel Brownlows were really charming.

Herbaceous flowers were as usual a great feature in the Show. Messrs. Dickson of Chester staged a fine collection of twenty-four varieties, but it was justly remarked that several had evidently been grown under protection, and therefore could hardly be called hardy. The amateurs showed strongly. There were two collections of thirty-six varieties, five of twenty-four, and two of twelve; and in all of them the flowers and arrangement were remarkably good. The best collection was undoubtedly that of thirty-six varieties staged by the Rev. L. Garnett, the notable flowers in which were *Scabiosa caucasica*, *Senecio japonicus*, *Lilium testaceum* and *pardalinum*, *Eryngium Oliverianum*, *Centaurea macrocephala* and *dealbata*, *Helenium Bolanderi*, *Hypericum coris*, *Lychnis chalcidonica* and *Haageana*, *Amaryllis longifolia* alba, *Hemerocallis Thunbergi* and *fulva*, *Chrysanthemum maximum*, *Gail-lardia grandiflora*, *Phlox Lady Napier*, *Gladiolus "The Bride"*, *Bupthalmum salicifolium*, *Sidalcea oregana*, *Lychnis coronaria hybrida* (A. O. Walker), *Campanula lactiflora* and *persicifolia* (pallida and alba p'ona), *Galega alba*, and *Catananche cœrulea*. Mrs. Ince's winning collection of twenty-four was striking, and well set up with good flowers of *Iris Kœmpferi*, *Delphinium*, and *Phlox*.

Roses, nurserymen's classes, thirty-six distinct.—Messrs. Dicksons (Limited) were first with good blooms of *Horace Vernet*, Mrs. J. Laing, Alfred Colomb, Her Majesty, A. K. Williams, Beauty of Waltham, and Marie Rady. Mr. Rumsey was second with good specimens of Mrs. J. Laing, Duke of Edinburgh, Star of Waltham, Dupuy Jamain, Duke of Teck, and Victor Hugo. In twelve triplets these exhibitors were placed in the same order.

Amateurs' classes, twenty-four distinct varieties.—A hard fight for first place decided in favour of the Rev. L. Garnett, whose box contained

Marie Finger, Louis Van Houtte, Duke of Teck, La France, Alfred Colomb, Susanne Rodocanachi, Her Majesty, Charles Lefebvre, Comte Raimbaud, Marquise de Castellane, Xavier Olibo, Comtesse d'Oxford, Merveille de Lyon, Duchess of Bedford, J. S. Mill, Mad. G. Luizet, Comtesse de Camando, Ulrich Brunner, Mrs. J. Laing, Marie Baumann, François Michelin, Marie Cointet, Camille Bernardin, Duchesse de Morny. Mr. W. Drew of Ledbury was second, having very fine blooms of Horace Vernet, Pride of Waltham, Victor Hugo, Duchesse de Morny, Marie Baumann. Dr. Budd of Bath was third, Mr. J. A. Hodgson of Higher Bebington fourth. There were seven boxes shown. In the class for twelve distinct there were eight boxes, and the first prize was won by the Misses Squarry of Bebington, their best flowers being Marie Finger, François Michelin, Etienne Levet, Le Havre, and Dr. Andry. Second, Lieut.-Colonel Standish Hore of St. Asaph. Third, Mr. D. Walford of Spital. Fourth, Mr. C. Burgess of Plumley. There were seven boxes of six distinct. Lieut.-Colonel Standish Hore was here first. Second, Mr. T. R. Fleming of Rowton. Third, Mr. C. Burgess. Fourth, Mr. D. Walford.

Six of any one pink Rose, nine boxes were shown.—First, Mr. H. G. Roberts of Mould with Madame G. Luizet. Second, Mr. T. R. Fleming with La France. Six of any one red Rose, six boxes were shown.—First, Mr. H. G. Roberts with Marie Baumann. Second, Rev. L. Garnett with Alfred Colomb. Six of any one dark Rose, five boxes were shown.—First, Rev. L. Garnett with Louis Van Houtte. Second, Mr. C. Burgess with Prince Arthur. Six any white Rose, four boxes.—First, Rev. L. Garnett with Merveille de Lyon, and second, Mr. C. Burgess with the same. Six of any one Tea, three boxes were shown.—First, Dr. S. P. Budd with Ethel Brownlow. Second, Rev. F. R. Burnside with The Bride, very fine.

Teas, twelve distinct, three boxes shown.—First, Dr. S. P. Budd, best blooms being The Bride, Comtesse de Nadaillac, Innocente Pirola, Ethel Brownlow, Catherine Mermet, and Caroline Kuster. Second the Rev. F. R. Burnside, his best being Souvenir d'Elise, Catherine Mermet, Bride, Madame de Watteville, Caroline Kuster, all the above were very fine. Third, Rev. L. Garnett. Six distinct, five boxes were shown.—First, Mr. W. Drew. Second, Lieut.-Col. Standish Hore. Third, Mr. H. G. Roberts. Triplets, four distinct.—First, Rev. F. R. Burnside; second, Dr. S. P. Budd, both very fine boxes.

Herbaceous flowers, amateurs, thirty-six varieties.—First, Rev. L. Garnett; second, Mr. C. W. Townshend, Trevallyn. Twenty-four varieties.—First, Mrs. Townsend Ince, Christleton Hall; second, Mr. D. Large, Christleton; third, Mr. D. Walford. Twelve varieties.—First, Mr. J. Wynne; second, Mr. J. Major, both of Waverton.

### NEW PEAS AND STRAWBERRIES.

CALLING a few days ago upon Mr. Lansdell, the skilled and very successful gardener at Barkby Hall, near Leicester, I was shown through the collection of the above raised during the last several years from seed obtained by artificially crossing some of the best and most popular standard varieties. The work has been conducted in a most systematic manner, selecting in the first instance two varieties from which he thought, when intercrossed, a useful progeny might be obtained, and then proceeding to cross them both ways; as, for instance, Duke of Albany  $\times$  Dwarf Mammoth, and Dwarf Mammoth  $\times$  Duke of Albany. A strict record is kept of all these crosses, so that the parentage of any variety under notice can be given at once. As he has been quietly but persistently working in this manner now for the past five or six years, the result is an interesting and apparently valuable collection of new and distinct varieties, many of them showing some characteristics of both parents, and especially is this the case amongst the Peas.

One or two interesting points in connection with this subject have been noted and recorded, and may be here mentioned. First, that each pea contained in the pod resultant from the artificially fertilised blossom produced a plant of entirely different habit and character, peas from the same pod producing a tall robust Pea growing 6 feet or more in height, and a dwarf not more than 2 feet 6 inches to 3 feet in height. Secondly, he finds that it takes three or four seasons for a new variety raised in this manner from cross-fertilisation to become settled and fixed in character. During the first two or three seasons of a new Pea's career, although the larger portion come true to the type first shown, yet others of a different type are constantly appearing amongst them.

A few of those I noticed as especially promising are—No. 1, Dwarf Mammoth Marrow  $\times$  Duke of Albany. This is a remarkable Pea. Of strong robust habit, height 5 to 6 feet high, immensely productive, bearing large well-filled pods in pairs almost from the ground to the summit, its singularity consisting in the small size of its foliage. Its leaflets are so small as to be scarcely noticeable, and at a short distance away it appears to be carrying a heavy crop of peas upon stems quite bare of leaves. This is evidently an advantage from the gatherer's point of view, as every pod stands out in bold relief, and may be seen at a glance without any necessity for turning aside any portion of haulm to find them. This is, I think, likely to become a useful market sort.

No. 2, Matchless Marrow  $\times$  Telegraph.—A tall growing robust Pea with large leafage, possessing a large amount of the characteristics of Telegraph, but having a larger and more handsome pod.

No. 3, Matchless Marrow  $\times$  Dwarf Mammoth.—This is a fine type of dwarf Pea, growing about 3 feet in height, and is densely covered with large pods. This will be adapted for small gardens, or where long Pea sticks are difficult to obtain.

No. 3, Prince of Wales  $\times$  Telegraph.—This grows 3 feet high, and is very prolific with fine large pods. An improved Prince of Wales, which is saying a good deal in its favour. Three others from the same cross all differ from it and from each other considerably.

No. 4, Prince of Wales  $\times$  Ne Plus Ultra.—This has the habit of growth and general appearance of the latter, but with much larger and more handsome pods.

No. 5, Dwarf Mammoth  $\times$  Duchess of Albany.—A dwarf growing variety, having very large pods, most of which contain eleven large peas; suitable for exhibition.

No. 6, the same cross reversed, has produced a tall strong growing Pea closely resembling The Duchess in most points, but with larger pods.

Of new Strawberries Mr. Lansdell has a large number raised from various crosses; many of them are most promising varieties, but time and space will not now allow of my going into details concerning them. One which appeared likely to be the best, was a strong grower, producing large dark green foliage splashed and striped with white; the fruit is very large, of a deep rich colour and good flavour. Parentage—Loxford Hall Seedling  $\times$  La Grosse Sucrée. The fruit resembles the former variety in shape, but is much earlier, being a midseason variety.—W. K. W.

### THE PRIORY, HORNSEY.

THIS is the residence of H. R. Williams, Esq., whose name is familiar as that of one of the Past Masters of the Fruiterers' Company, who gave twenty-five guineas for an essay on hardy fruit culture. Mr. Williams is a great city wine merchant, and his cellars in Lime Street constitute one of the astonishing sights of underground London. He is wealthy, and dispenses his wealth wisely, having been engaged for forty-six years in the rescue of the waifs and strays of the city, feeding, clothing, and educating them in industrial schools, finding them positions in life, and making them useful and respected members of the community. Other gentlemen co-operate with him, his partner, Mr. Lloyd, being the Secretary of and a most sympathetic and energetic worker in this truly admirable enterprise. It is found that eighty-five per cent. of the children so rescued and "brought up" so well (and they must be numbered by thousands) have become worthy citizens, while some have been lost sight of through emigration, and there is reason to believe that at least ten per cent. of these have succeeded in attaining creditable positions in life. It may be added that a scholar of one of these industrial schools designed the beautiful certificate for the Fruiterers' Company that was presented by Sir James Whitehead at the recent Mansion House meeting to some of the chief exhibitors of fruit, not for competition, at the Guildhall Show last year. It is a chaste production, and in its way unique. Mr. Williams is probably never more happy than in seeing that his guests—his invited friends and the regiments of children—are also happy at the different garden parties that he gives at The Priory during the summer months. One of these pleasant "At homes" was held last Thursday, the Cambridge Heath school children, about 150 girls, being entertained, as happy, healthy, and bright an assemblage as one could wish to see. But this is not gardening. It is not, though the work referred to is as good as gardening, and such as must commend itself to the gardening community. They are engaged in cultivating plants and crops for making the world brighter and better. Mr. Williams is also making the world better by training and cultivating those who, but for the effort, would mostly remain among the weeds of humanity. But he cultivates flowers and fruits too, giving much encouragement to his gardener, Mr. Rowbottom, who is not unknown in the Chrysanthemum world, and will, perhaps, be better known in future.

Mr. Williams is President of both the Hornsey and Highgate Chrysanthemum Societies, and has undoubtedly one of the finest collections of Chrysanthemums in the kingdom. The plants number 700, and every one appears to be in the best of condition, sturdy in habit, with thick brown stems and stout foliage down to the pots. His gardener has endeavoured to manage the different varieties so that the buds will come "right," and the promise of success in that respect is very satisfactory. All the best established varieties are grown as well as most of the new sorts of repute, and he has also several home-raised seedlings. Perhaps some Chrysanthemumite may be interested in hearing that good buds are set in this collection of Mrs. Alpheus Hardy, and fine blooms may be expected. Louis Boehmer is also showing, the plant being of sturdier growth. The plants of both the "bristly yanks" are looking remarkably well, and are wisely assigned a warm and dry position on the south side of one of the glass structures. There is certain to be a fine display of Chrysanthemums here in the autumn, and some of them may possibly find their way into prize stands. Mr. Rowbottom exhibited last year and won £12. Like a prudent man he told Mr. Williams (who of course had a legal right to the money), and asked him what he had better do with it. "Put it in the bank for yourself," was the reply, "and try and double it another year." So now as the gardener says he has a clear understanding, and knows what to do, but as Mr. Williams is such a good master he would have given the prize money up without a murmur.

Fruit trees are grown in the old fashioned garden, and it seems they grew too well. After reading the essay Mr. Williams had some of them root-pruned, and has now more fruit than he has had for six years. Some of the trees are bearing too well, and would be benefited by having the crops thinned. Grapes and Peaches are grown under glass, but one of the houses has to be kept too close, in advancing the late Grapes, for the well being of the Peaches; moving the hot-

water pipes from under the back path to the front would be of advantage to both.

The Priory grounds are park-like and well wooded. They adjoin the Alexandria Palace. The flower beds are bright, especially those of the best of all tricolor Pelargoniums, Mrs. Henry Cox, the foliage being all aglow with bright colours. Among other specimens on the lawn is a fine "Smoke Tree," *Rhus cotinus*, covered with its gauzy cloud-like inflorescence. The mansion is quaint, the garden enjoyable, and children, old and young, spend many happy hours with their hospitable friends, Mr. and Mrs. Williams.—A VISITOR.

### THE FRUIT CROPS NEAR LIVERPOOL.

#### CALDERSTONES, AIGBURTH.

CHERRIES May Duke, Elton, and all early and midseason varieties have carried a good crop. Morellos are not so good. Plums and Damsons nil, the fruit falling owing to the cold winds. Raspberries are abundant, the same remark applying to Gooseberries, also Black, Red, and White Currants.

Apples are a good general crop. In many cases thinning has had to be resorted to, the fruit being so small. The varieties that are doing best this, as well as former years, are Warner's King, Lord Suffield, Hawthornden, Jolly Beggar, Stirling Castle, Keswick Codlin, Dumelow's Seedling, Golden Noble, Tower of Glamis, Ecklinville, Ribston Pippin, and Annie Elizabeth. The latter Mr. Tunnington informed me is a splendid Apple, and ought to be more grown.

Pears are a good crop. The fruit is small and has had to be thinned, and unless we have a very fine autumn the crops will be nearly useless. The varieties bearing the best are Williams' Bon Chrétien, Louise Bonne of Jersey, Jargonelle, Souvenir du Congrès, Beurré Diel, Beurré Rance, Doyenné du Comice, Winter Nelis, Pitmaston Duchess, Uvedale's St. Germain, and Vear of Winkfield.

Peaches on open walls are a fair crop. Early Beatrice is just changing colour, Grosse Mignonne a full crop, Walburton Admirable a sprinkling; the same remark applies to the remaining varieties grown. Lord Napier Nectarine has a full crop and is always good.

Strawberries.—An abundant crop, but owing to so much rain many have been spoiled. King of the Earlies has been the first to ripen; it is a few days earlier than Vicomtesse Hericart de Thury. The fruit is small but good in colour. Mr. Tunnington considers it most useful to succeed the forced crop, but Vicomtesse is a greater cropper, and being bright in colour, is useful for preserving. Auguste Nicaise, good for forcing and in the open. Laxton's Noble produces fine fruit from the first gathering, then the later being small and badly formed. Laxton's Commander showed plenty of fruit on strong footstalks, but did not swell off and had the appearance of being sealded. It is to be discarded, as are Jubilee and A. F. Barron. President, Sir J. Paxton, and Sir Charles Napier are excellent in every respect, and not surpassed by the new varieties grown here. The best late varieties are Stirling Castle, Oxonian, and Waterloo.

#### RAINFORD HALL, NEAR ST. HELENS.

Apples a fair crop, quantities fell after setting owing to the late frosts.

Pears are a good crop, Plums very good, and Cherries abundant. Strawberries, early crops suffered from the late frosts when in bloom, but President, Vicomtesse Hericart de Thury, and later varieties have been very good, but late. Bush fruits, with the exception of Black Currants, are heavily cropped. In addition Mr. Middleton stated that the early sorts of Potatoes are fully three weeks later in the lifting, but second earlies and late varieties promise good crops, and vegetables of all kinds are excellent, but late.

#### BLACKLOW HOUSE, ROBY.

Apples are an average crop. The trees when in bloom were perfect pictures, but late frosts were destructive. The varieties bearing the heaviest crops are Lord Suffield, Stirling Castle, Ecklinville, Golden Noble, New Hawthornden, Blenheim Pippin, Ribston Pippin, King of the Pippins, Nelson's Glory, Alfriston, Brabant Bellefleur, Flanders Pippin and Rose of Sharon (Rose de Chine).

Pears a good crop, but fruit very small. Particularly good on espaliers and standards are Marie Louise, Citron des Carmes (enormous crop), Beurré Diel, Easter Beurré, Beurré Rance, Beurré d'Amanlis, Hacon's Incomparable, Grosse Calabasse, Fondante d'Automne, Prince Consort, Winter Nelis, and Crassanne. Strawberries an excellent crop, the best being Noble, Vicomtesse Hericart de Thury, James Veitch, President, Sir C. Napier, Sir J. Paxton, and Waterloo. Raspberries and Gooseberries, with Red, Black, and White Currants, are all good. Early Cherries fair, but Morellos laden. Plums, with the exception of a local variety, quite a failure.—R. P. R.

### THE DOUGLAS FIR.

THE Douglas Fir, from many points of view, is one of the most interesting trees of the American forest. Its monotypic character, its probably recent development in its distinct existing form, for the record of the ages has not divulged the secrets of its ancestry, the vastness of the region it occupies, its size and value to man, its beauty and capacity of adapting itself to new surroundings, all make this Fir an important inhabitant of the forests of Western America—forests remarkable for the variety, size, and value of the cone-bearing trees of which they are

principally composed. The Douglas Fir is distinguished from the true Firs or Abies by its petioled leaves, which, in falling, leave oval scars, by its pendulous cones with persistent scales, and by its seeds, which are not furnished with resin vesicles. It looks, moreover, in general appearance, more like a Hemlock than a Fir; it differs from the Hemlock, however, in the absence of the permanent, persistent bases of the fallen leaves which roughen the branchlets of all Hemlock trees, and in its much larger cones, which may be always recognised by the large acutely two-lobed and long-pointed bracts extended beyond the scales. It can be readily known, too, by the flat, distinctly stalked leaves which are somewhat two-ranked by a slight twist at their base.

Where climatic conditions favour the growth of large trees, as they do in the humid region of western Washington and Oregon, or on the middle western slopes of the northern Sierra Nevada, the Douglas Fir often rises, in the course of 500 or 600 years, to the height of 300 feet, and forms a trunk 10 or 12 feet in diameter above its enlarged base. The bark, which, like that of the Hemlocks, contains a considerable amount of tannin, is thick, deeply furrowed, and dark brown or red, or sometimes grey in certain situations. Young trees, like young Spruces and Firs, are pyramidal in form, and retain their lower branches for a considerable time, sometimes even for 200 or 300 years, when the individual finds sufficient space for their lateral growth, as it does occasionally when it has stood on the margin of the forest or on the steep slopes of some mountain canon. Usually, however, the trees stand close together, especially in those parts of the country in which, under the favouring influences of a heavy rainfall, they grow to the largest size, and then their great trunks tower upward, for 100 feet or more, without a branch. The leaves are linear and generally obtuse, an inch or 1½ inch long, dark green, and very abundant, covering the long, slender, graceful branchlets. The flowers of the Douglas Fir are produced from the axils of the leaves of the previous year, the males surrounded by conspicuous bud-scales, the females much shorter than their narrow bracts. The cones, which are subcylindrical, ripen the first year, and vary in length from 2 to 4 inches. The seeds are triangular, convex, and red on the upper side, flat and nearly white on the lower side, with short wings, broad at the base and acute at the apex.

This Abies extends from latitude 55° north, where it is found in the coast ranges and on the interior plateau of British Columbia, southward through all the region west of the Cascade and the Sierra Nevada Mountains to Southern California. It is abundant in the Rocky Mountains from British Columbia far into Mexico, extending eastward to their eastern slopes in Montana, Wyoming, Colorado, and Texas; it is common on the Wahsatch and Uintah Mountains in Utah, but is unknown on the ranges of the great basin and on the eastern slopes of the Sierra Nevada. It is most abundant, and reaches its greatest size on the low glacial plain which surrounds the shores of Puget Sound. Here the Douglas Fir can be seen in all its majesty. It is the most common tree in a forest in which trees stand so close together that the traveller can barely push his way between their mighty trunks which support far above his head a canopy so dense that the rays of the sun never pierce it. Through these dark and awful shades the most thoughtless man cannot pass without experiencing that sense of solemnity and awe with which the human mind is impressed when confronted by Nature in her grandest manifestations.

The Douglas Fir grows almost as large on some of the California mountain slopes as on the shores of Puget Sound, and it is one of the remarkable things about this tree that it flourishes at the sea level and on high mountains. In California it often grows to a great size at elevations varying from 6000 to 8000 feet above the sea, and sometimes ascends on the Rocky Mountains of Colorado to even higher altitudes, although it is always smaller and less valuable as a timber tree in the dry interior portions of the Continent than in the moist coast region. Other trees of the Pacific Forest produce more valuable wood than the Douglas Fir—the Port Orford Cedar, the Sugar Pine, and the Redwood. These trees are confined to a comparatively small region, however, and the Douglas Fir, in view of the great territory over which it has spread, must be considered the most important timber tree of Western America, and of no other tree is there now standing such a body of valuable and available timber. The wood of the Douglas Fir is hard, strong, and durable; it may be recognised by the numerous spirally marked wood cells which distinguish it from the wood of allied Conifers. The small cells which are developed in the wood of Conifers at the end of the growing season are very numerous, and form broad bands which often occupy half the width of the layers of annual growth. These bands of small cells are dark coloured and conspicuous, and become hard and flinty with exposure, making the wood of this tree difficult to work except when it is freshly cut. Some trees produce light red and some yellow wood, and individuals vary to a much greater degree than those of most other trees in the time required for their sap-wood to turn into heart-wood. The yellow wood is closer-grained, and is considered much more valuable than the red wood. Lumbermen recognise these two varieties and pretend to be able to distinguish the trees which produce them, an assumption which still needs demonstration. The conditions which lead to the formation by the same species of such different wood are not well understood; in the case of the Douglas Fir they are probably due to soil and elevation, and, in part at least, to the age of the individual. The wood of the Douglas Fir is known in commerce as red fir, yellow fir, and Oregon pine, the last name belonging, however, more properly to the wood of the Yellow Pine (*Pinus ponderosa*) of Western America. It furnishes the principal product of the immense saw-mills situated on Puget Sound, and is manufactured, besides,

wherever forests of this tree exist; it is used for all sorts of building purposes, and for construction, railway ties, and fuel.

*Abies Douglasi* was discovered late in the last century by Archibald Menzies, Vancouver's surgeon and naturalist, on his voyage of discovery; and a few years later Lewis and Clark found it in Montana during their transcontinental journey. David Douglas rediscovered it on the Columbia River in 1825 and introduced it into England; and it is the name of this bold and enterprising botanist which has become associated with this tree, although, unhappily, it cannot bear it in the language of science. No tree is more unfortunate in its name; and there are few instances where the application of the rules which govern botanical nomenclature has produced a more unsatisfactory result. Lambert, who first named the tree, called it *Pinus taxifolia*, from the fancied resemblance of the leaves to those of the Yew tree; then Lindley, disregarding Lambert's specific name, named it *Abies Douglasi* in honour of its rediscoverer. Carrière, recognising the characters which separate this tree from the true Fir, coined for his genus a bastard word, half Greek and half Japanese, and called it *Pseudo-tsuga*, a perfectly improper name, as it has little in common with *Tsuga*, the Japanese name for the Hemlock. Carrière retained, however, Lindley's *Douglasi*, calling the tree *Pseudo-tsuga Douglasi*, but as Lambert's specific name is the oldest, the Douglas Fir must be known as *Pseudo-tsuga taxifolia*, a name bad in every way, and especially bad in its failure to recognise the name of Douglas, which, more than that of any other man, should be associated with it.

It has proved itself in cultivation to be an ornamental tree of great value. The largest specimen in England is already more than 110 feet high, with a stout trunk furnished with branches from ground to tip, and showing no signs of diminishing vigour or beauty. The earliest attempts at cultivating the Douglas Fir in the Eastern States were not successful; the trees raised from seed, gathered in the mild and humid climate of the north-west or in England, first planted here were unable, except in exceptional positions, to support our climate for any length of time. The late Dr. Parry, however, in 1862 discovered the Douglas Fir growing on the eastern slopes of the Rocky Mountains of Colorado in a climate distinguished by the severity of the cold of winter and by the drought of summer; he sent seed to the Botanic Garden at Cambridge, and the plants raised from this seed have proved hardy in the most trying situations in New England. Some of these trees are now more than 20 feet high, and although it is too soon to speak with anything like certainty in the matter, there is reason to hope that they will grow to a large size and retain their beauty for many years.

Much attention has been given to the Douglas Fir of late years as a subject for forest planting in Europe, although the best authorities on such matters do not yet agree as to its value for this purpose. Large experimental forest plantations are made every year, especially in some parts of Germany, where some forest experts believe that the Douglas Fir is to rival and finally replace the Larch in Europe as a timber tree. It has the merit of growing with surprising rapidity and of producing a large amount of timber in a comparatively short time. Few coniferous trees grow as rapidly as this Fir, and it is not uncommon to see self-sown seedlings in Washington and Oregon producing, when they stand very close together in good soil, annual shoots 12 feet long. A remarkable form, distinguished by its large cones, occurs on the San Bernardino Mountains in California. It has been considered a variety of the typical tree, and by some botanists a second species—a view supported by the fact that no intermediate forms connecting it with the type have been found, while in the region north and south of that occupied by this large fruited tree the typical Douglas Fir abounds.—(*American Garden and Forest.*)

## NATIONAL PINK SOCIETY.

### NORTHERN SECTION.

IN our last issue a brief notice of the annual exhibition of Pinks at Manchester was given, and a full list of the awards is now supplied. For twelve blooms, six at least dissimilar.—First, Mr. A. R. Brown, Handsworth, Birmingham, with Boiard, Amy (Brown), a very fine bloom; Bertram, Maud (Brown), Ethel (Brown), Minerva, Mr. J. Cronk, and Modesty; a very fine stand of blooms. Second, Mr. Samuel Barlow, Chadderton, Manchester, with Boiard, John Dorrington, Campbell's Nothing Better, Hooper's No. 1, Mrs. Barlow, George Hodgkinson, and Defiance. Third, Mr. William Taylor, Middleton. Fourth, Mr. Campbell, Blantyre. Fifth, Mr. C. H. Thurstan. For six blooms, dissimilar.—First, Mr. C. H. Thurstan, Wolverhampton, with John Dorrington, Boiard, Mrs. Thurstan, and three seedlings, one of them (No. 4) a very promising flower. Second, Mr. A. R. Brown, with Mrs. Dark, Bertram, Ethel, Amy, Modesty, and George White. Third, Mr. S. Barlow. Fourth, Mr. J. Edwards, Blackley. Fifth, Mr. F. Morton, Wolverhampton.

For six blooms, not less than three dissimilar.—First, Mr. A. R. Brown, with Bertram, Amy, Minerva, The Rector, and Mrs. J. Cronk. Second, Mr. W. Taylor. Third, Mr. S. Barlow. Fourth, Mr. Burgess. Fifth, Mr. Thurstan. For three blooms, one red-laced, one purple-laced, and one black-and-white.—First, Mr. Taylor. Second, Mr. Barlow. Third, Mr. Thurstan. Fourth, Mr. Burgess.

Single blooms, purple-laced.—First, Mr. Brown, with Bertha. Second and third, Mr. Barlow, with Boiard. Fourth, Mr. Taylor, with Samuel Barlow, and fifth with a seedling. Single bloom, red laced.—First and third, Mr. Brown, with Empress of India, and second with Amy. Fourth and fifth, Mr. Taylor, with seedlings.

Collection of Pinks set up in bunches as cut from the borders.—First, Mr. T. Walkden, Sale, near Manchester, his most noteworthy kinds being Souvenir de Sale, William Brownhill, and Mr. Walkden. The premier red-laced was a fine bloom of Empress of India; and the premier purple-laced a grand bloom of Boiard, both belonging to Mr. A. R. Brown and in his winning stand of twelve.

First-class certificates were awarded to Mr. A. Brown for Amy (seedling), a large flower with broad smooth petals and of first-rate quality; to Bertha (Paul), exhibited by Mr. Brown, a smooth finely formed flower with dark purple lacing; and to Mr. J. Edwards for seedling James Percival, red laced, good petal, and clean lacing. A third-class certificate was also awarded to a very fine self white variety, with broad petal and smooth edge, named Mrs. Walkden, exhibited in Mr. Walkden's collection.

## BAPTISIA EXALTATA.

OCCASIONALLY in old borders of herbaceous plants specimens are seen of *Baptisia exaltata* (fig. 15) and a few other forms, but they can scarcely be said to be common, though in good soil and with ordinary attention

FIG. 15.—BAPTISIA EXALTATA.

they are much more effective than many occupants of our gardens. Good clumps, with stems 3 or 4 feet high, and bearing large racemes of bright blue flowers, produce a fine display, and are useful as a background to dwarfer plants.

*Baptisia exaltata* was described by Robert Sweet in his "British Flower Garden" in 1825, and he there gives the following history of the plant:—"The present stately perennial plant is a native of North America, and was introduced from thence in the year 1812 by the late Mr. John Lyons, at the sale of whose plants it was sold by the name of *Podalyria exaltata*; we were afraid that it was again lost to our collections until we were agreeably surprised, the year before last (1824), in seeing it growing very strong, and flowering luxuriantly, in the Apothecaries' Garden at Chelsea. It is readily distinguished from *B. australis* by its much stronger and upright growth. The latter species was growing beside it in the same collection, so that the difference was readily perceptible; we do not know that the present species exists in

any other collection. It succeeds well in the open air in the common garden soil, and we have no doubt but it might be increased by dividing at the root, in the same manner as *B. australis*; we also believe it would produce perfect seeds if pains were taken to fertilise the stigmas with the pollen when in bloom."

## HORTICULTURAL SHOWS.

### THE THAMES DITTON HORTICULTURAL AND INDUSTRIAL SOCIETY.

THE fourth annual Exhibition of this Society took place on July 22nd in a meadow attached to The Cedars, Portsmouth Road, by the kind permission of H. Cooper, Esq. The Show under notice was a distinct advance upon its predecessors, and this was very observable in the groups of plants arranged for effect. First honours were awarded in this section to a beautiful arrangement contributed by Mr. J. Plowman, gardener to L. Smith, Esq., Woodstock, Long Ditton. He was very closely followed by Mr. William Palmer, gardener to the Right Hon. W. F. Hume Dick, Thames Ditton House, whose efforts were worthy of all praise. The third prize went to Mr. H. Farr, gardener to Hannibal Speer, Esq., Manor House, Thames Ditton, who showed a creditable group. The latter exhibitor secured the premier honour for six stove or greenhouse plants with well-developed examples. The second prize plants were from Mr. W. Palmer, and very good. Third, Mr. W. Mearning, Cock Crow Hill, Long Ditton. Messrs. Sutton & Sons offered special prizes for a collection of vegetables. The leading position was taken by Mr. W. Palmer with some grand samples. Second, Mr. J. Plowman. The cottagers made a first-rate show of flowers, fruit, and vegetables.

Non-competitive groups added much to the beauty, interest, and attractiveness of the Show. Messrs. Barr & Son, Covent Garden, whose well-known trial grounds are at Long Ditton, staged a splendid collection of hardy flowers. Mr. Robert Lambert, Thames Ditton, fine Poppies, Roses, and Stocks. Messrs. John Laing & Sons, Forest Hill, contributed a beautiful and well arranged group of hardy flowers; whilst Gloxinias were well shown by Messrs. Peed & Sons, Streatham. Messrs. Lewis & Williams, Ember Nurseries, made an attractive display of bouquets and other cut flowers.

Very interesting was the industrial part of the Exhibition. In this section prizes were offered and awarded for needlework and other handicraft executed at home—a most deserving innovation and worthy of every encouragement. Much credit is due to Mr. William Palmer, the energetic Hon. Secretary, and Mr. A. W. Cousins, the courteous Hon. Treasurer, for their successful endeavours to render the Exhibition a success and a source of pleasure to the numerous visitors.

### WALTHAM ABBEY AND DISTRICT.

THE sixth annual Exhibition of this Society was held at Waltham Cross, in a field near the railway station, on Thursday, July 23rd. The entries in the open classes showed a decided advance on former years, though there was a slight falling off in the amateur section. This was especially noticeable in the vegetable classes. The principal classes devoted to all comers brought out some splendid plants. The groups arranged for effect occupied one side of a large marquee. Mr. Ayling, gardener to A. J. Hollington, Esq., secured first position. The grand Orchids used were *Cattleya Dowiana*, *Sanderiana*, *Mossiae*, and *gigas*, with *Oncidiums*, *Odontoglossums*, and *Cypripediums*. They were associated with *Tuberous Begonias*, *Ferns*, and *Cocos Weddelliana*. Mr. J. Nicholsson, gardener to W. Melles, Esq., was second. His group was lightly arranged, and contained a fine specimen of *Brassia verrucosa*; Mr. J. Langlands, gardener to J. W. Melles, Esq., taking the third position. For a miscellaneous group, Orchids excluded, Mr. Nicholsson was first; Mr. J. Turk, gardener to P. Bosanquet, Esq., a close second. His *Crotons* were beautifully coloured; and Mr. J. Watt, gardener to J. Reid, Esq., was third with a heavier display. There was close competition with six miscellaneous plants. Mr. Nicholsson was first, and his plant of *Acalypha Macaefcana* was very showy. Mr. Ayling and Mr. A. West, gardener to A. H. Lancaster, Esq., secured the other honours in the order named. The Palms from the latter were grand. *Caladiums* were not represented by the large plants we usually see at shows, but they were good varieties well coloured. The class for stove and greenhouse plants was as usual very attractive, Mr. Ayling's plant of *Clerodendron Balfourianum* attracting great attention. For *Ferns*, six distinct, Mr. Ayling led with some fine specimens. Mr. Green, gardener to Sir T. F. Buxton, second. Mr. West third. The class for *Tuberous Begonias* was well filled, Messrs. Ayling, Watt, and Jupp winning the prizes in the order named. The best single specimen Orchid from Mr. Ayling was a grand *Cattleya Sanderiana*. Single specimen *Ferns* were very fine. Mr. Green was first with a magnificent *Gymnogramma chrysophylla Lauehcana*; Mr. Ayling second with *Gleichenia Mendelli*; and Mr. W. Clarke, gardener to W. Gibbs, Esq., with *Adiantum formosum*. Single specimen plants were well represented. First was a fine specimen of the *Screw Pine*, *P. utilis*, exhibited by Mr. West. *Fuchsias* were good, though the competition was not strong. First, Mr. Ayling; second, Mr. Nicholsson. The leading *Coleuses* from Mr. West were well coloured plants. Second, Mr. Langlands; third, Mr. Nicholsson. The competition for table stands was keen, and brought numerous entries, Mr. May, gardener to H. J. Adams, Esq., taking the first place. His best plants were *Aralias elegantissima* and *Veitchi gracillima*. Second, Mr. Langlands; third, Mr. Nicholsson.

Roses were rather strong, and did not appear to have suffered by the recent storms. The competition for Teas was weak, though the prize-

winning stand was beautifully fresh. The competition for Carnations, Pinks, and Picotees was poor. The flowers are backward in the district, consequently many growers were not represented. The chief prizes for twelve bunches cut, stove, and greenhouse flowers went to Mr. Ayling, his Orchids being invincible. Mr. Nicholsson was second, and Mr. May third. Hand bouquets (five entries) were ordinary. The first prize bouquet from Mr. Ayling was far ahead of the others. Mr. Nicholsson was second, and Mr. Clarke third.

Grapes were not largely represented. Melons made a greater show, while Peaches and Nectarines were fine. Cucumbers brought out a good competition. Mr. T. Hamilton was first, and Mr. Poyser second. Of Tomatoes a large and representative display was provided, and the collections of vegetables attracted great notice, Mr. Clarke securing first prize and Mr. Langlands the second. The ladies' classes were certainly the best ever seen at this Show, and great improvement was manifested. The premier winner in both classes was Miss Ellen Vincent, with light and graceful arrangements. Amateurs and cottagers compete together, and are allotted forty-three classes. The cut flowers in this department were good, especially Mr. W. Rigg's Roses and Mr. S. Fear's Carnations and Picotees. The plants were also good; Mr. Gregory's *Fuchsias* were excellent. Their fruit was also fine. Vegetables do not appear to attract much competition. The Committee would do well to spur these classes up, for there is plenty of material in the district.

The exhibits not for competition were a show themselves, Messrs. Paul & Son, Cheshunt, staging Roses, herbaceous flowers, a beautiful collection of Cannas, *Disa grandiflora*, Peas, Strawberries, and Gooseberries. Mr. Rumsey had a very fine collection of Roses and Palms. Mr. T. Rochford filled all available space, as well as two fine groups with Palms in all the popular species. Mr. T. Hamilton had a group of Maidenhair Fern; A. J. Edwards, Esq., showed a large miscellaneous group. Mr. J. B. Riding sent a collection of spotted Gloxinias. Mr. Poyser showed fine Tomatoes and Cucumbers. Mr. T. Rochford also contributed a grand display of Cucumbers, Tomatoes, and Melons. The Exhibition is certainly the finest seen in the district, and great praise is due to the energetic Secretary, Mr. John Eve, for the ability displayed in his task.

### HARDY FRUIT GARDEN.

**PLANTING STRAWBERRIES.**—As soon as the runners are well rooted they must be planted without delay, as this is the main point in order to ensure a good crop next season, therefore prepare the ground at once. Strawberries succeed best in a rich, deep, and moist soil, and it is desirable these conditions be secured as far as possible by heavily manuring and deep digging or trenching if it can be done. Mix the greater part of the manure in the top spit. Deep cultivation is chiefly necessary in order to prevent damage while the fruit is swelling in dry seasons. The Strawberry is chiefly a surface rooter, and it is not possible to dig in manure among the plants after they are planted without doing considerable injury. A good supply of manure is, therefore, given before planting to support the plants for three years, at the end of which time it is best in most instances to destroy the beds and form new ones. Under this system a third part of the beds can be cut up every year after fruiting, and a similar quantity planted in order to maintain a good supply.

In planting turn the Strawberries out of the pots without disturbing the roots. Plant them with a trowel, and then ram the earth around them firmly with a wooden rammer in order that the soil may close up to the young roots and fresh root growth may commence at once. Do not proceed with planting if the soil is wet and likely to bind too closely, and care must be taken not to bury the crown of the plants. The distance apart depends on the character of the soil and the consequent growth of the plants. Where the Strawberry reaches its perfection 3 feet apart each way is not too much for such varieties as British Queen, Sir Charles Napier, and President ripening their fruit in a dull wet season; but even in the best of soils some varieties do not grow so strong as the above, and among those which make the least growth are King of the Earlies, A. F. Barron, Elton Pine, Latest of All, Waterloo, and others, and in field culture the growth of all the varieties is much smaller than it is in a kitchen garden.

The following are twelve of the best varieties in their order of ripening, but Strawberries are capricious, and one cannot always be sure a good variety in one place will turn out well in another until it has been tried on a small scale. King of the Earlies, rather small, but useful for a few early fruits, and of good flavour. Noble is worthy of a place for its heavy cropping and fine appearance. Grow Vicomtesse H. de Thury wherever a large quantity of preserving fruit is wanted. President is well known and good. British Queen is still the finest flavoured Strawberry in cultivation, but will not succeed in some soils, and where it fails Dr. Hogg should be tried; it is a similar variety. Sir Joseph Paxton is a useful market kind, of large size and good quality. Sir Charles Napier is a heavy cropper where the soil suits it, and a good firm fruit, but rather too acid for some tastes; the plant is

somewhat tender. Latest of All gives some very fine fruits, but not of the highest flavour. Waterloo is a large dark red Strawberry of excellent flavour, but too often a shy cropper. Elton Pine, a good old late variety, fine in colour, but rather too acid. Oxonian is the latest variety, a fine large fruit and a heavy cropper. The true form is said to be distinct from Eleanor and better.

The early varieties should be planted in warm sunny positions, and the late ones on north borders, which will prolong the season considerably.

After planting mulch the surface of the bed with strawy litter to keep the soil moist and encourage root action. This point is important in order to secure a good start, and if the weather is dry the plants may have a good soaking of water occasionally until they are well started into growth; a good watch must also be kept for runners, which can be pinched off as soon as they appear to prevent any waste of energy in the plants.

#### FRUIT FORCING.

**VINES.**—*Pot Vines for Early Forcing.*—Vines for starting in November to ripen Grapes in March or April ought now to have the wood thoroughly ripe and the buds plump. If not, keep the house rather warmer by day, 80° to 85°, closing early so as to raise the temperature to 90° or 95°, and throw the house open at night. The foliage must be well exposed to light, and as near the glass as possible without touching. Supply water or tepid liquid manure in the case of Vines not inclined to luxuriance in sufficient quantity to prevent the foliage becoming limp, but do not give it until the soil is getting dry.

Lateral growths must be kept in check, leaving no more than are absolutely necessary to appropriate any excess of sap, and so prevent the principal eyes starting. When sufficiently ripened, as they are when the wood becomes brown and hard and the buds are prominent, they should be removed to a position outdoors in the full sun, standing on a board or slates in front of a south wall, fence, or building, securing the canes to the face of the wall, only giving water to prevent the leaves falling prematurely, and having some waterproof material at hand to throw the rain from the pots in case of heavy showers occurring. In this position they will rest even if the leaves are not actually shed, provided they are not kept too moist. When the leaves turn yellow commence reducing the laterals, and when the leaves have all fallen prune, cutting the laterals close to the cane, but without injury to the buds, and cut the cane back to the length required, or from 6 to 8 feet. Dress all the cuts with patent knotting. The Vines should be placed in any cool, airy, dry place until required for forcing. Though dryness at the roots is desirable, the soil must not be allowed to become dust dry, and the pots must be protected from frost by some dry material placed round and over them. It will not of course be necessary if frost has not access to the structure.

*Earliest House.*—A dry atmosphere is now necessary, not so much to ripen the wood as to induce rest. All laterals must be kept stopped and the house cool, with moderate dryness at the roots. The inside border may require water, for it is essential that the roots be kept healthy and the soil not allowed to crack, but if the border has been mulched watering may not be required. Outside borders may need covering with dry straw or bracken in order to throw off heavy rains. This is essential to ensure complete rest, an absolute necessity for Vines long subjected to early forcing, saturated outside borders tending to late growth, but there should be sufficient moisture in the border to maintain growth in the laterals in order to prevent the premature ripening of the foliage. A moderate extension in the laterals will be sufficient to keep the principal foliage in health. Where the Vines are in an unsatisfactory condition preparation should be made for lifting, getting fresh loam and clean drainage, so that the work can be done quickly when begun. One part of the border only ought to be operated on at once, the inside one year and outside the next. This prevents loss of crop. The roots should be lifted and laid in fresh soil nearer the surface whilst there is foliage on the Vines; therefore work of this description ought not to be delayed beyond the early part of September in the case of Vines that ought to be started early in December. The Vines will need pruning by the middle of September or when lifted a little later.

*Houses Required for Early Forcing.*—Vines that have not been started early will need as soon as the crop is off to be thoroughly cleansed by syringing or the application of an insecticide, and if there is any doubt about the ripeness of the wood or the plumpness of the buds it will be necessary to keep the house rather close by day, but with sufficient ventilation to cause evaporation and allow the moisture to escape. Give no more water to the border than will prevent the foliage becoming limp. If the weather prove cold and wet employ fire heat in the daytime to maintain a temperature of 70° to 75° with moderate ventilation, and turn the heat off at night to allow the pipes to cool, increasing the ventilation so as to induce a thorough draught, and this will soon cause the wood to harden and the buds to plump, ensuring rest, which for Vines to be started in December should be complete from the middle to the end of September. When the wood is ripe ventilate fully day and night.

*Vines Cleared of Crops.*—Through Grapes hanging the Vines often become infested with red spider, and by growing plants in the house they are attacked by scale and mealy bug, the dry atmosphere also encouraging thrips. Thoroughly cleanse the Vines, fumigate on two consecutive evenings for the thrips, repeating it in a week or ten days; and syringing forcibly two or three times to eject red spider. Mealy bug and scale may be eradicated by syringing with the following

mixture:—One-third gill of petroleum to 4 gallons of water, in which 8 ozs. softsoap and 1 oz. washing soda have been dissolved, keeping it agitated whilst being applied by stirring briskly with a broom handle or alternating squirts from the syringe into the vessel, thoroughly wetting the Vines in every part. It is best done on a calm evening or dull afternoon, and should be repeated at intervals of three or four days two or three times. If there be any plan's remove them, and to keep the oil from the border it may be covered with dry material. Have the laterals fairly in hand, not closely pinched, unless the Vines are very vigorous and not ripening the wood kindly, when keeping the house rather dry at night, with all the ventilation possible, and somewhat warm and close by day, will promote the maturity of the wood and buds. In stopping vigorous Vines regard must be had to the principal buds, for when all growth is removed as made it may cause them to start, which must be avoided by allowing a little lateral growth, and keeping the soil dry at their roots to the extent of causing the foliage to become rather limp. Weakly Vines should be fed with liquid manure and the laterals allowed to extend, but whatever extension is permitted the extraneous foliage must not in any way interfere with the free access of light and air to the principal leaves, which must be kept healthy, and thus appropriate some of the food and store it in the buds and adjacent wood. Free ventilation will be necessary day and night.

*Grapes Ripening.*—Whilst ripening many Grapes swell considerably, therefore do not allow any deficiency of moisture in the border. Give if needed a good supply of water or liquid manure, and in the early part of the day, so that superfluous moisture may be dissipated before night. Heavily cropped Vines should be allowed time, and supplied with tepid liquid manure, which, if it does not help the current crop, will prevent the exhaustion of the Vines. A good rest at night in a temperature of 60° to 65° with air is a great aid to Vines taxed to the utmost by weight of Grapes. A moderate amount of air moisture also is essential to the health of the Vines, sprinkling available surfaces occasionally, and if possible allow the laterals to extend, but full or overcropped Vines rarely can cater for more than the principal leaves and Grapes. Admit air constantly, enough with a gentle heat in the pipes to insure a circulation, and maintain a temperature by day of 70° to 75°, keeping through the day at 80° to 85° or 90° with sun, and full ventilation.

**MELONS.**—*Late Fruit.*—A sowing should now be made to afford very late Melons. The plants will be fit to plant out in about a month, they will set fruit in September, and that will be ripe in November. A light well heated structure is necessary for this crop, and high culture essential to the fruit attaining good size and high quality. Bottom heat is necessary, and is best afforded by hot-water pipes, but if it is afforded by fermenting materials they must be thrown into a heap, watered, and turned, so as to ensure the needful fermentation, and escape of rank steam.

*Early Autumn Fruit.*—Whatever the quality of Melons may be, good looking fruit is always esteemed if only from a decorative point of view, and some consider Melons unique that possess flavour of a high order in October. The plants to afford fruit at that time must be planted at once, giving them about a couple of barrowloads each of soil made into a flattened cone or ridge, about 12 inches deep in the centre. Good, rather strong loam is most suitable, and if not over fermenting material add a fifth of fresh horse droppings, and in any case a sixth of old mortar rubbish. Make the compost very firm, and have it in a moist state before planting. Turn the plants out carefully, watering them overnight, so that the roots will come away freely from the sides of the pots, and make the soil firm about the ball. Keep the stem slightly raised, and water to settle the soil about the roots. The plants must be encouraged to make a free growth by syringing at closing, and damping available surfaces in the morning and in the evening of hot days. Ventilate between 70° and 75°, and keep the temperature through the day at those degrees by artificial means, 85° to 90° from sun heat, and close so as to raise it to 95° to 100°. Through the night the temperature may fall to 65°.

*Fruit Swelling.*—One of the great causes of indifferent flavour and bad finish is overcropping, therefore the plants must not be overburdened with fruit. It is well, however, to wait until the fruit is fairly swelling, then reduce the number to two on a weak, three on a moderately vigorous, and four on a strong plant. Large and very strong plants may be allowed to carry six fruits. Overcropping is highly prejudicial to the health of the plants, and unless the foliage is kept in good condition to the finish high quality, which depends on solidity, cannot be expected; therefore keep the foliage fairly thin, all having full exposure to light. Earth the plants, giving copious supplies of water and liquid manure, and damp available surfaces with liquid manure twice a week; but it is best to give it often and weak. The drainings of stables, not containing washings, should be diluted with five times the bulk of water.

*Fruit Ripening.*—The atmosphere should be kept dry, and a top heat maintained of 70° to 75° by artificial means, admitting a little air constantly, a circulation of rather dry warm air greatly improving the quality and finish when the fruit is ripening. Water should be withheld from the house unless there is fruit advanced in swelling, when an occasional damping will be necessary for the benefit of the foliage.

*Plants in Pits and Frames.*—The latest plants will be setting their fruit, it being important that the fruit be set at the close of July or early in August to allow time for its swelling and ripening. Give a good watering before the flowers open, and line the sides of the frame and bed with hot dung or the mowings of lawns, and give a little ventilation constantly at the top until the fruit is set and commences swelling.

This prevents the deposition of moisture on the blossoms and insures a good set. Fertilise the flowers daily, and when sufficient are set and the fruits swelling of about equal size remove all flowers, and keep the growths thin and well stopped, maintaining a warm moist atmosphere, but not stagnant, by early closing with sun heat; sprinkle the foliage on fine afternoons, and afford water in bright weather about twice a week.

#### THE FLOWER GARDEN.

*Staking Border Plants.*—Asters and Stocks of tall growth, miniature Sunflowers, Shirley Poppies, and a few other border plants are liable to fall about and much of their beauty be destroyed unless they are staked in some way. In some instances light straight stakes of well-preserved winter prunings from Apple and Pear trees answer, one being placed to the centre of each plant, and the latter secured to it by means of raffia ties. Much-spreading plants can, however, be effectively staked by means of either birch or hazel spray, much as Kidney Beans are often supported in pots. This plan answers particularly well in the case of spreading Carnations, and if done neatly there will be no breaking away of the flower stems. Bundling the stems of border plants, including herbaceous Sunflowers and Michaelmas Daisies, together gives them a very unsightly appearance, and this can be obviated by a judicious use of short pea stakes. Much depends upon when this important work is done, as should the plants once be allowed to fall about they are not easily straightened again and staked.

*Sweet Peas.*—These must be kept well together by means of good ordinary pea stakes, and if properly attended to should continue to flower freely until severe frosts intervene. One principal cause of early collapse is allowing the plants to produce a heavy crop of seeds. Not only is it a good plan to cut the flowers freely for house decoration, but the seed pods ought also to be kept closely gathered. If it is necessary to save seed, then reserve a few clumps in separate colours if possible expressly for the purpose, no early flowers being cut from them, and net closely to save the seeds when ripening. Birds have a great weakness for Sweet Peas, and in many gardens they cannot be saved without the aid of a double fold of light fish netting. The rows and clumps generally ought to be heavily mulched with strawy manure, or if this unsightly with shorter manure faced with garden soil, an occasional thorough soaking of water or liquid also doing much good in dry weather. Sweet Peas are such a beautiful and serviceable class of plants that they merit all the trouble taken with them.

*Dahlias.*—These are somewhat late in flowering, the first flowers, as a rule, only just showing colour. Plants confined to one strong single stem are the most effective, and are also to be preferred for producing exhibition blooms. Place a strong, tall stake to each plant, secure the central stem to this and allow it to branch freely. If exhibition blooms are desired thin out the side branches, and also remove the buds and flowering shoots from around the central buds on each reserved branch, stakes also being placed to some of the strongest of the latter. The plants require abundance of water and liquid manure, thorough soakings and not mere dribblets being necessary. Some contrivance for shading the blooms is needed, otherwise the colours will not stand till the centre is well "up." Earwigs are frequently very destructive among double Dahlias, and in order to entrap these either adopt the old fashioned plan of placing dry moss in flower pots, inverting these on the stakes just over the plants, or else place lengths of Broad Bean stalks among the branches. The earwigs will collect in these dry places, and can then be destroyed.

*Gladioli.*—Seldom have these started more strongly than they have done this season, and fine flower spikes should be plentiful. Each should be early staked, the ties being so arranged as not to cramp the leaves or check the straight growth of the stem. If not required for exhibition allow the spikes to branch and flower as much as they will, but should exhibition spikes be wanted early remove side shoots, carefully stake, and shade the lower flowers on the spike. If two boards, 18 inches long and 5 inches in width, are nailed together V-shaped fashion, and attached to a fairly stout stake, and one of these made to enclose each spike, a good face will be given to the flowers, and a ready means of shading afforded. Unless the lower flowers are shaded they will fade before many of the upper ones open, a short poor spike being the consequence. Pass a sheet of newspaper round the boards, and gradually raise this according as the flowers open. Should the weather be hot or dry the plants to produce show spikes must be mulched and freely watered, liquid manure further improving the size and colour of the flowers.

*Campanulas.*—If the plants of *C. medium calycanthema* are not soon put out on a sheltered border they will not flower very strongly next summer. Crowding them in any stage of growth is a great mistake. Those to flower in the open may be arranged 18 inches apart each way, but double the number of rows and plants in the rows may well be put out, many being potted up late in the autumn or early next spring, and the rest of the thinnings be transplanted to other borders or beds. They are remarkably attractive either in pots or in the open ground. Old plants that have flowered strongly will give yet another display this summer, soaking rains having benefited them, but they must have all the old flowers and seed pods picked off at once.

*Violets.*—Those put out on fresh ground this season ought now to be growing strongly, and on moisture-holding soils will require no further assistance from the watering pot. On quickly drying ground with perhaps a gravelly subsoil they are very liable to red spider, and the plants in this case may require to be frequently syringed in the evenings of sunny days, a little flowers of sulphur being mixed with the syringing

water being a good preventive of red spider. A mulching of leaf soil, spent tan, or decayed manure is of the greatest assistance to Violets on hot soils, a thin surfacing of either nitrate of soda, common salt applied in showery weather doing much to keep the ground cool, and also acting as a fertiliser. The ground about Violets generally should be kept free of weeds, that unmulched being occasionally stirred with a Dutch hoe. None ought to be allowed to form runners, as these will quickly smother the parent plants and produce but few flowers. The strong clumps of old plants should be trimmed round and cleared of runners the same as Strawberries are treated, much stronger flowering crowns inevitably resulting.

#### PLANT HOUSES.

*Chrysanthemums.*—Cuttings taken from tops may be rooted at once in cold frames. The large flowering varieties are invaluable for decoration in 3-inch pots with one bloom each. Small free flowering varieties are best inserted a number together in 5-inch pots. When rooted harden and stand them outside, and treat them the same as the general stock. Bush plants are producing buds and branching freely, but those not required should be removed, and the shoots disbudded at once. The number of blooms required must be decided as the work proceeds. If good blooms on bush plants are needed it will be necessary to take the next bud that forms on the shoots that lengthen after this date. Free flowering varieties of any section that are required for decoration and cutting may be allowed to branch naturally from the present time. These give a bountiful supply of useful flowers. Feeding will need attention, and strong applications must not be given; they do more harm than good. Strong stimulants burn the roots, and the blooms lack depth, that is so essential in a well formed flower. Keep standards growing on single stems well tied to their supports, all buds that form after the first week of August being taken for yielding blooms. It will be necessary to "take" any that are missed on the terminal bud.

*Salvias.*—Where these are grown in pots place them in their largest size at once and pinch all shoots that need it, allowing them to grow naturally afterwards. From this time these plants will grow rapidly, and the main shoots must be secured to stakes as they extend. For late flowering *S. gesneriflora* is decidedly the best. Its blooms are of the brightest colour, they last on the plants a long time, and also in a cut state.

*Deutzias.*—These will have lengthened out their shoots where they have been assisted indoors by gentle heat. Select an open sunny position outside where they can ripen and harden their wood. If possible plunge the pots to save watering.

*Solanums.*—Be careful to keep these liberally supplied with water, or the foliage will turn yellow. Soot water in a clear state is beneficial. Where the plants are grown in frames admit abundance of air, and berries will form freely.

*Libonias.*—Plants that have been kept under glass until now and are as large as may be desired, may be stood outside fully exposed to the sun. This will harden and ripen their wood, without which they will not flower freely. Do not pinch their shoots again, as they branch freely under cool treatment.

*Bouvardias.*—Strong shoots that are springing up from the base of those raised from portions of root must be stopped. These will soon break again, and other shoots will be induced to spring from the base. Plants required for early flowering must not be stopped again. Late plants may have their shoots pinched for the last time.

*Roses.*—All Hybrid Perpetuals in pots needed for forcing should be potted at once. Those that have made good growth in small pots may be placed into larger without disturbing them further than is necessary to remove the drainage. The fresh pots should be clean and carefully drained, and the soil pressed firmly into them. All plants that are in pots as large as are required may be turned out, the roots reduced by one-third, and replace them in the same sized pots. Use for a compost good fibry loam, one-seventh of manure, one 6-inch potful of bone meal, and the same quantity of soot to each barrowful of loam. Sand should be added freely if the loam is heavy; if light one-seventh of clay may be dried and reduced to powder and mixed with the loam. After potting stand the plants in a shady position for a fortnight. When they have commenced forming roots afresh plunge them in an open sunny position. Water with care, but syringe freely to keep the foliage fresh. Tea varieties may also be potted, but add one-third of leaf mould to the compost for these.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### BEEES AND THE WEATHER.

THE week ending July 20th was to northern bee-keepers one of expectancy and disappointment. The temperature was all right, being 62½° mean, but the drought was by far too great for the secretion of honey, although flowers are in great profusion.

#### WORK FOR THE WEEK.

Hives were dressed as they are to stand at the Heather to avoid bees mistaking their own, and thus preventing the loss of bees as

well as of queens, which is sure to take place when stranger bees enter the hive. While I was manipulating, destroying queen cells, and dividing swarmed hives, combs amongst those hives not filled with comb contained many queen cells built horizontally, and numerous sealed-out combs of honey in the under division. This arose through the great loss of bees during spring and up to June 8th. By that time their stores of honey became nearly exhausted. The bees confined their breeding to the upper storeys, so that when the honey came they were compelled to store it beneath—a sufficient explanation of the inverted state of matters. The crossed Punics had double the quantity of newly gathered honey of any other variety. With several swarms joining we had a number of queens killed, but with the exception of a swarm from a neighbouring apiary I managed to get the bees to return to their original site, and kept them there by supplying them with a frame of brood containing a ripe queen cell. The loss of an aged queen under these circumstances is rather a gain than otherwise.

#### EXPERIENCE.

In case any of your readers may think I write theoretically and without practical knowledge, I may tell them that my experience covers fifty years. At that time I was a mere lad, and kept a hive as other people did, and for ten years made little progress further than making wooden in lieu of straw hives. About that time I made my first frame hive, although I had neither heard of one, nor as yet had I read a work on bees, the first bee literature being found in the *Cottage Gardener*.

#### SUPERING.

Keeping bees out of supers was never any trouble to us. Scotch bee-keepers know how to do that very well, but how to produce the spotless and rounded combs that did not run up the Stewarton bee-keepers was a puzzle and a study. My first attempt to effect this was by making horizontal passages in the crown of the hive, bringing the bees out from the regular openings to the outer edges where they entered the super. This contrivance not only prevented the queen ascending, but the combs were built and rounded off without being attached to the hive. With the introduction of the frame and single bars to my hives I effected the same results as with the horizontal tunnels.

#### COMB FOUNDATION.

In the autumn of 1862 I paid my first visit to Stewarton and all the leading bee-keepers of the district. There I introduced a piece of the first Scotch made foundation, and learned that the principle I had been working my hives on was similar to the Stewarton, and that I, like "A Renfrewshire Bee-keeper," discovered they had the top bars of their hives wider than the bees naturally build their combs, and that we both were ahead of the Stewarton people in that respect. As comb foundation was of greater importance to me than anything I saw or learned at Stewarton, I confined myself to the various methods of fixing it to bars in hives and supers, interchanging ideas on the subject with the late Mr. Alfred Neighbour. Being a tradesman in the joinery, cabinet making, and smith business, I never considered I had invented anything very meritorious, but what I did came handy to me. Had I patented what is now patented by others, or advertised as being the "first to make foundation in Britain," I think it would have had more effect than being "the first to import a machine" about fifteen years after they had been made and successfully used in this country. In 1874 or 1875 leading members of the B.B.K.A. appealed to me for instructions how to make foundations. I gave the desired information, but when two of them visited me in 1875 they pronounced them a failure. At that time I had several hives standing upon two cross pieces of wood notched into each other, being part of a model engine and lift. Not long afterwards it was proclaimed as an idea of another, and the best stand in use.

#### EXCLUDER ZINC.

This has been in use since about 1872 to my certain knowledge, but I cannot say who was the first to use it. Shortly after that

date I had sent me from Mr. A. Neighbour a round-holed excluder. For several years I gave both the round and long-holed a fair trial. The bees with it did not enter the supers freely, and sometimes the honey flow was past before they did. The work of propolis-ing I considered was equal to the loss of from 10 to 15 lbs. of honey-comb, and the comb bereft of its purity; besides by opening up the whole crown of the hive fewer bees went to work outside. These are some of my objections to excluder zinc. Heavily laden bees have a difficulty in getting through the narrow perforations, and if wide enough queens enter also, and when drones are bred the supers become objectionable. The following is what Mr. Abbott wrote in 1875:—"We do not advocate the use of narrow slits or perforations, because sometimes queens get through them into the supers and breed drones, which die and rot there." Then speaking of whether the brood nest shall be filled with brood or honey and pollen, he said, "If honey the queen's power will be restrained; if brood the perforations will be unnecessary.—A LANARKSHIRE BEE-KEEPER."

JUDGES AT THE CALEDONIAN APIARIAN SOCIETY'S SHOW, 1875.—My contention was, and is, that the statement of "Lanarkshire Bee-keeper" on page 32, that I was one of the Judges at the above Show was incorrect, and the list of judges you gave from the schedule before you bears out my assertions. In the report of this Show, from which I cited on page 55, Mr. Abbott was given as the referee. If he acted as one of the Judges it would be in the honey classes, as he did in 1876.—JOHN M. HOOKER.

[We are glad that Mr. Hooker is satisfied with the schedule. His name is not mentioned in it, but Mr. Abbott's is, as one of the Judges, and there is no allusion to a "referee." We are bound to regard an official schedule as more authoritative than a newspaper report.]

#### TRADE CATALOGUES RECEIVED.

Vilmorin, Andrieux, et Cie., 4, Quai de la Mégisserie, Paris.—*Catalogue of Plants and Strawberries*.

John Peed & Sons, Roupell Park Nurseries, Norwood Road, S.W., and Mitcham Road, Streatham.—*Catalogue of Bulbs, 1891*.

W. Cutbush & Sons, Highgate.—*Catalogue of Bulbs for 1891*.

G. Bunyard & Co., Maidstone.—*Catalogue of Roses, Strawberries, and Summer Fruits*.

\*\*\* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Treatment of Nepenthes (G. W.).**—The plants are probably becoming old and somewhat exhausted, and the best plan at the present time would be to remove the sour compost, supplying fresh, and give the plants stove treatment. Continue this during the winter, and in early spring cut the plants down, as the upper parts of the stems will root quickly in light compost of peat and sphagnum if shaded and syringed frequently.

**Eucharises Unhealthy (B.).**—The bulbs sent are undoubtedly infested with the Eueharis mite, and the only course is to remove all the plants that appear to be attacked and subject them to a thorough cleansing process. All the soil must be cleared away, the diseased portions and loose pieces of skin cut off, and then wash the bulbs thoroughly in warm water, softsoap, Fir tree oil, or petroleum. Clibran's Eueharis mite killer, advertised in this Journal, is also said to be useful for the same purpose. Be careful to remove all the old soil to a distance or burn it, and obtain fresh when the bulbs are repotted.

**Manure for Pea-sick Soil (S. Y.).**—To your "black soil of a sandy and stony nature, with marl added in places, on gravel," apply, in addition to the usual dressing of stable manure, say 20 tons per acre, superphosphate of lime 2 lbs., kainit 1 lb., mixed, per rod, at the time, or a little in advance of sowing the Peas. When fairly up dress

the ground with  $\frac{1}{2}$  lb. nitrate of soda per rod, repeat in about six weeks, and again when flower buds first appear on the haulm. If the Peas are sown in autumn apply the kainit and use steamed bonemeal instead of the superphosphate, but do not use the nitrate of soda earlier than March. You may also try the following: Sulphate of potash 2 lbs., sulphate of ammonia 1 lb., mixed, per rod, applying it early in April. We presume the summer crops are mulched and well watered in dry weather, and that late crops are sown in trenches prepared as for Celery.

**Peas Withering (D. W.).**—The dead haulm you have sent is seriously infested with fungus, and this no doubt first attacked the lower part of the stems. We have previously said that neither the cause of the visitation nor a reliable preventive of it, or remedy for it, appears to be generally known. At the same time we do not know to what extent those fungicides of which copper and lime are the active agents have been tried, and with what results. Different forms of anti-blight of the nature indicated have been recently alluded to in our columns, and at least one of them advertised which we believe is good. It is, however, only by applying them in good time that they have a fair chance of accomplishing the object in view. We suspect your soil is deficient in some requisite for healthy growth. Potash is a necessity of Peas. Moreover, some varieties are more prone to fail in some soils than others, and we have seen productive and worthless rows side by side. In gardens where early crops succeed and later fail, it is prudent to sow in trenches for the latter, prepared as if for Celery, using wood ashes or burnt vegetable refuse with the manure employed. In some ground the trench system is not requisite, but we know of gardens in which there would be no good crops of Peas after June by sowing in the ordinary way and earthing up the rows. See a reply to another correspondent.

**Enriching Soil for Strawberries (J. F.).**—As you cannot obtain good stable manure, and have no sewage which you can apply to your light soil, perhaps the simplest method will be to procure some guano, guaranteed to contain not less than 8 per cent. of ammonia and 20 per cent. of phosphates. The light soil should be compressed after digging, and the guano may be used in solution at the rate of a pound to 20 gallons of water, and half a gallon poured on each square foot of surface where the plants are to be grown, also subsequently at weekly or other intervals as the state of the plants and weather suggest. One good watering is more effectual than ten mere sprinklings. Liquid manure should not be applied to very dry soil, but this should always be previously moistened with pure water, then the virtues of the liquid that follows will be better retained for the support of the plants. The surface of the ground should be mulched with whatever you can find to cover it with in dry hot weather. Soapsuds are good for Strawberry beds. We have seen hundreds of gallons used with the best results.

**Peach Leaves Spotted (D. H.).**—There is nothing in your letter that suggests to us the cause of the misfortune in question. You do not, however, say whether the house has been recently fumigated. Much injury is done to Peaches every year either by injudicious fumigation or inferior materials. The best kinds are advertised. The leaves before us are thin in texture and covered with specks, suggestive of the house having been kept too close and the sun shining on the leaves while they were wet, before the moisture was dissipated. When the spots occur fungus is almost certain to take possession of the injured parts, as in the case before us. You might try dusting with sulphur or anti-blight, and at the same time afford the trees support with liquid manure. In the autumn new fibrous roots should be induced to form abundantly, as they will if some of the old soil is removed, the strong roots cut, and good turfy loam, with a liberal admixture of lime rubbish and wood ashes used in its stead, and made firm and kept moist. Trees in perfect health (and many trees that make strong growth are not) resist various attacks to which weaker succumb, but in your case we suspect the condition of the leaves has been brought about either by fumigation or syringing too late, then keeping the house closed all night, and not admitting air soon enough in the morning. One mistake of this nature is sufficient to cause the spots, though they would be obscure at the first, and perhaps unobserved for some time. They increase with the growth of the fungus that follows, and often destroys the leaves.

**Thrips on Plants (T. F.).**—The specimens of *Torenia* were quite shrivelled, and the insects presumably shrivelled with them. There is only one way of extirpating insect pests, and that is by perseverance in fumigating, syringing with insecticides, and cleanliness. Early action is a golden rule to follow. It is better to prevent than destroy. Too often when only a few insects are seen it appears to be thought they are "not worth wasting tobacco or insecticides over," and therefore more insects are waited for with the object of having a great slaughter. It is a great and costly mistake. A small invading army is obviously more easily conquered than a large one. We do not think you ought to have let your *Gloxinias* be ruined. Had the pots been plunged in a damp medium or stood on a moist base, and the house lightly fumigated at intervals without waiting for the insects, the plants if grown in a genial atmosphere and somewhat shaded position might have been kept clean. On admiring the cleanliness and luxuriance of *Gloxinias* and other plants in the nurseries of Messrs. Sutton & Sons, Reading, recently the attendant was asked how he dealt with insects. His reply was significant and full of sound sense—namely, "We just burn a Lethorian cone now and then in the houses for keeping insects out of them." If the insects had been admitted first and allowed to increase perhaps ten times more cones would have to be used for destroying them, and at the same time the plants must have been seriously injured. Your former letter was not received.

**Selling Lavender (A. W.).**—Where Lavender is grown in small quantities it is difficult to find a market for it in any form. Distillers prefer to purchase from the large growers, as they obtain a more uniform sample. The only chance would be to sell the flowers in local markets or shops, and then the price would necessarily be moderate. It is always difficult to sell products of this kind in small quantities except in districts where the culture is made a specialty and which is known to dealers. In the neighbourhood of stills small quantities can also be disposed of to better advantage, as pointed out in the article you refer to, which also gives the size of the market bunches as dispatched from the Surrey districts.

**Mushroom Spawn Bricks (J. R. A.).**—There are some things that cannot be taught on paper, making a watch, for instance, but can only be learned by experience. We print your questions—namely, "How to know when a Mushroom brick is full of spawn all through instead of on the surface without breaking the brick, also when to take a heap down when inoculated to prevent it spoiling?" If any of our readers can make the information you need intelligible we shall have a very high opinion of their teaching power. For ourselves we may admit that we only ascertained the internal condition of the "bricks" by breaking a few in our experimental days, and if you have a "heap" of them surely you can afford to test the condition of the bulk by breaking one or two as samples. We have more than once said that the bricks should not lie flat one on the other when covered with fermenting material for spreading the mycelium, or most of it will be on the outside. You had better describe the manner in which your heap has been packed, and how long it has been covered, then we shall better understand the case, which is at present somewhat obscure.

**New Zealand Apple (F. Cooper, Wellington).**—The outline and description of your Apple suggest the possibility of its being Adams's Pearmain, and in order to enable you to judge for yourself Dr. Hogg's description and opinion of this Apple is cited from the "Fruit Manual":—"Fruit varying from 2½ inches to 3 inches high, and about the same in breadth at the widest part; pearmain-shaped, very even, and regularly formed. Skin, pale yellow, tinged with green, and covered with delicate russet on the shaded side; but deep yellow tinged with red, and delicately streaked with livelier red, on the side next the sun. Eye, small and open, with acute erect divergent segments, set in a narrow, round, and plaited basin. Stamens, median; tube, funnel-shaped, sometimes conical. Stalk, varying from half an inch to 1 inch long, obliquely inserted in a shallow cavity, and generally with a fleshy protuberance on one side of it. Flesh, yellowish, crisp, juicy, rich, and sugary, with an agreeable and pleasantly perfumed flavour. Cells, obovate; abaxile. A dessert Apple of first-rate quality; in use from December to February. It is a very handsome variety, and worthy of general cultivation. The tree is a free and healthy grower, producing long slender shoots, by which, and its spoon-shaped ovate leaves, it is easily distinguished. It is an excellent bearer, even in a young state, particularly on the Paradise or Doucin stock, and succeeds well as an espalier." It is also known as the Hanging Pearman, Norfolk Pippin, and Lady's Finger. The fruit may possibly be brighter in colour in New Zealand than in English gardens and orchards. Your pleasant references are appreciated, and in fancy we stretch our "hand across the sea" for a friendly grip with yours in the land of your adoption.

**Manufacture of Superphosphate of Lime from Bones (Wellington, New Zealand).**—In making superphosphate the bones are often broken into quarter or half-inch portions. This is because the user wishes to see for himself that bones have been employed in the manufacture. That practice, however, is not best, for the calcium phosphate is only partially acted upon by the sulphuric acid, and the soluble phosphate diminishes in the superphosphate by keeping. Superphosphate is best made from ground bones by placing the meal in a tub along with water and sulphuric acid in the following proportions by weight:—1 lb. bone meal,  $\frac{3}{4}$  lb. water, and  $\frac{3}{4}$  lb. sulphuric acid. Place the meal in the tub, add the water, mix, then add the sulphuric acid, and stir. Perhaps you wish to dissolve ordinary bones. In that case let them be dry, and if broken up roughly all the better. Place them on a hard earthen floor, having taken an account of their weight, and surround them with a rim of ashes, which must be fine. Sprinkle with water, or if a large quantity, pour on the bones as much water as they will suck up, then pour on two parts of sulphuric acid to five parts of bones. It will boil violently for a while, and when this has subsided the mass will get tolerably solid. The ashes may then be mixed with the dissolved bone, shovelling all up together, and in two or three days it will be dry enough for use. The proportions are 5 lbs., or cwt., of bones, soaked with as much water as they will absorb, and 2 lbs., or cwt., of sulphuric acid. This is an excellent preparation. Another, but slower, is to take a large hoghead, quite watertight, and cover the bottom with 6 inches of dry earth, and on this place a layer of bones 6 inches thick, and cover them entirely with wood ashes; on these another 6 inches of bones, then ashes, and so on until full. Leave the hoghead or barrel all summer and winter exposed to the rains, and in twelve months the bones will crumble to powder under a slight pressure and form a valuable manure, especially for fruit trees. Fermented bones are easily prepared by mixing raw bones with clay, forming into a heap, using about equal proportions of clay and bones, watering the mixture with urine or stable drainings, protecting the heap from rain by a covering of damp clay, but otherwise exposed to the atmosphere, the stable drainings being poured in through holes at the top. In a few months they will be sufficiently cooked. This forms an excellent top-dressing.

WHEN held in conjunction with local or other horticultural shows it is evident that conferences and discussions upon appropriate topics afford additional attractions of considerable interest, and can also be rendered the means of disseminating much useful information. If any doubt existed upon this point it would have been effectually dispelled by a visit to the Conference, arranged by the British Fruit Growers' Association, to be held in conjunction with the Beddington, Carshalton, and Wallington Horticultural Society's annual Show in Beddington Park on Monday last, August 3rd. More unfavourable weather could scarcely have prevailed, heavy thunderstorms, with torrents of rain, continued throughout the afternoon, yet a large and appreciative audience was secured, and the tent was crowded until the termination of the proceedings. In this respect, in the temperate and generous tone of the speeches, the practical character of the advice tendered, and the local interest awakened in the matter, the gathering must be chronicled as fully successful, and the promoters achieved the objects they had in view.

The special intention was to bring the subject of fruit culture before the numerous cottagers and allotment holders in the district, to point out to them the advantages that would result from due attention to the matter, the best modes of proceeding in the work, and the difficulties to be expected. It is obviously impossible to teach all that is requisite to success in one meeting of this kind, but when once the interest is awakened, and desirability of advancing is perceived, progress becomes comparatively easy, and plenty of willing helpers can be found to aid those in need of advice. In many rural districts the condition of the cottagers and labourers has been materially improved by the encouragement extended to their efforts in fruit and vegetable culture. Plenty of instances could be given where the fruit produce alone is made to pay the annual rent of the cottage, besides yielding a supply of fruit for home use, either fresh or preserved. Several speakers at the Conference in question touched upon this aspect of the subject, and its importance is fully recognised by all who are concerned in the welfare of the working population of rural districts.

Referring briefly to the proceedings at Beddington Park, it must be said that the Chairman, Sir James Whitehead, Bart., dealt in his opening address with the subject of fruit culture most fairly and thoroughly. Special reference was made to the efforts of the Royal Horticultural Society, the Fruiterers' Company, and the British Fruit Growers' Association in the direction of inducing greater interest in the matter. A letter was read from the President of the first-named Society expressing approval of the active work of the Fruiterers' Company. The Chairman also pointed to the fact of his presiding at that meeting as a sufficient indication of his own goodwill towards the British Fruit Growers' Association, and he considered that they could all work in harmony for a common cause, either in combination or separately. He complimented the Association upon the work they had accomplished for so small an expenditure, and expressed good hopes for the future.

Turning to other matters, special emphasis was placed upon the desirability of avoiding anything of a political tendency in purely social questions of such a character. Much help could undoubtedly be rendered by landlords in planting fruit trees them-

selves, or in providing trees for their cottagers to plant, and by encouraging the latter they would also be improving the value of their estates. The cost of carriage to markets was also touched upon, and several serious anomalies were mentioned, notably in the heavy charges of cartage from terminal railway stations to the markets as compared with the rates per ton from station to station. Instances were given where the cartage rates by the railway companies are four or five times in excess of the ordinary carriers' rates, and it was mentioned that the recent re-arrangement of railway rates did not include cartage, so that much remained to be done in that respect.

So wide a scope did the Chairman cover in his address that some subsequent speakers confessed that he had left little for them to say on general topics, and Mr. T. Francis Rivers, who followed, confined his remarks to a brief consideration of the aspects of foreign competition in relation to home growers.

Then came Mr. J. Wright with "Object Lessons for Cottagers and Allotment Holders," upon which he discoursed in a lucid and practical manner, and, illustrated as it was by diagrams, the subject was brought before the audience in the best possible way. Time only permitted reference to Strawberries, Raspberries, and Gooseberries; but defective and correct methods of planting, pruning, and general culture were clearly indicated, and many useful hints given for the guidance of the inexperienced. In concluding he read a letter from a tenant, in which a simple method of dealing with the difficulties arising from planting fruit trees was mentioned, the custom being for the incoming tenant to pay a valuation for trees planted by the former occupier, or for the landlord to take them in the same way and then charge it to the new tenant. The plan had answered so well that it had raised the value of the land enormously.

"How to Encourage Fruit Culture amongst Small Farmers and Cottagers" was the next subject, which was taken up by Mr. G. Hammond, an extensive fruit farmer in Essex, and treated in a very thorough manner. The difficulties in relation to land tenure were pointed out, the necessity of securing the landlord's co-operation and consent was dwelt upon, also the desirability of adopting the custom of valuation for tenants' improvements for work of this kind. Continuing, Mr. Hammond said:—

"As to the amount of profit to be made by growing fruit, many wild and extravagant statements have appeared, which only tend to mislead and disappoint. I would not like to say that these statements were untrue, but I do say that it is not fair to draw inferences and make calculations based upon what must be manifestly abnormal results. What this Association has said and what it still maintains is this, 'That with a proper selection of sorts suitable for each district, together with careful and attentive culture, a reasonable return may be confidently expected, quite sufficient to justify many in incurring the necessary expense of planting.'

"Another obstacle seems to be the want of information amongst farmers and cottagers generally upon this subject. Some say, 'We would grow fruit if we only knew what sorts to grow, and how to plant and prune the trees.' I am glad to know that much has been done by this Association during the last three years, and also by the Fruiterers' Company to disseminate this information amongst these classes, but much still remains to be done, and it seems to be that one of the best means of doing this, by holding exhibitions similar to that held here to-day, and by taking advantage of these shows to hold conferences for the purpose of spreading reliable information respecting fruit culture.

"We are greatly indebted to A. H. Smee, Esq., and others for the promotion of this Show and Conference, and if many more occupying similar positions would manifest the same interest and arrange for holding conferences and discussions upon this subject in connection with local shows throughout the country much would very soon be accomplished. It would also be well if landowners and agents, stewards and bailiffs, gave more attention to fruit culture, and possessed themselves of information respecting it, that they might be able to advise such of their tenants as were desirous of entering upon it as to proper kinds to plant in their particular districts, and I am fully persuaded that landowners will find it to be distinctly to their advantage thus to encourage the growth of

fruit; and that whilst helping the tenants to hold their own in these times of agricultural depression, they are also increasing the value of their property. In the case of small holdings it has been often found that the fruit orchard practically secures the rent."

Concerning technical education the Rev. T. W. Sharpe, Her Majesty's Inspector of Training Colleges, said he felt certain that the introduction of a system of agricultural and horticultural training in schools in rural districts would readily be taken up by the Education Department. He rejoiced in the fact that the Surrey County Council could devote £15,000 per annum to purposes of technical education, and was sorry that the London County Council did not do something in the same direction. Sir James Whitehead said he had for some years advocated technical instruction in regard to agricultural and horticultural pursuits in rate and State supported schools. No doubt the Government would give certificates and prizes in these branches of instruction, in the same way as in the Science and Art Department.

A practical address on the preparation of the soil for fruit trees was delivered by Mr. Joseph Cheal, which cannot now be referred to at length. Mr. A. H. Smee followed with a few suggestions upon the renewal of old orchards and fruit plantations, and the business concluded with a hearty vote of thanks to the Chairman, proposed by Mr. Granville Leveson-Gower and seconded by Mr. Halsey of the Surrey County Council.

The Show in connection with which the Conference was held was remarkable for splendid collections of vegetables, fruit not being sufficiently grown in the district to make a display; but a few excellent collections and individual dishes demonstrated what could be done in that direction.—HON. SEC.

### HARDY FLOWER NOTES.

BRIGHTLY gleams the sun, parching are the winds, and dry as dust the sandy soil. Water is failing all round, and as we gaze upon the Solway at full tide we can to some small extent realise the feelings of Coleridge's "Ancient Mariner." The cool and showery period soon passed away, and the soil presents no trace of moisture. In a season such as this the grower of hardy flowers will realise how wisely given is the counsel to disturb as seldom as possible herbaceous plants in poor and light soils. Autumn planted flowers can barely hold their own, spring planted ones droop and languish, while those established for some years show their hardships but little.

How difficult a task have hardy perennials before them just now. The Rose scatters her charms in wildest profusion in garden and hedgerow. Hybrid Perpetuals, massive blooms of perfect beauty; Teas with buds of the most elegant form; Climbers covering walls and trees with sprays of bloom; Cabbage Roses and old-fashioned Roses of all kinds delight our eyes and load the air with perfume. The other day I visited an old garden where grow in lavish plenty great masses of old Roses, which must have been there for many long years, and which are prized and cherished no less than the newer flowers which also find there a congenial home. Little wonder is it that the Rose possesses so many legends and poetical associations. Some of these legends are so beautiful that it is hard to forego the pleasure of quoting them; but when flowers are few and far between and days are short some excursions into the legendary lore of the flowers may be more acceptable than at present when the garden is full of brightness. We hardy plantsmen are oftentimes accused of indifference to such flowers as these, but few of us are, I think, so wedded to our favourites that we cannot join in admiration for this regal flower. Indeed, we might all say as did George Eliot:—

"You love the Roses—so do I. I wish  
The sky would rain down Roses, as they rain  
From off the shaken bush. Why will it not?  
Then all the valley would be pink and white  
And soft to tread on. They would fall as light  
As feathers, smelling sweet; and it would be  
Like sleeping and yet waking, all at once!"

There are at present few finer or more beautiful flowers than a clump of the little *Erythraea diffusa*, a dwarf alpine or border plant, which is literally covered with its charming little bright rosy purple flowers, which seem to close about four o'clock every after-

noon. This is a beautiful little plant, having small bright glossy green leaves. It has been for a long time in flower, and has every appearance of remaining in bloom for a considerable time yet. It has been advised that this plant should have a moist position. This does not seem at all necessary, as it is growing freely with me in dry soil. One of my plants about 9 inches across has at least 160 fully expanded flowers open to-day. The flowers are small, but are of a fine colour.

The exquisite little *Mimulus cupreus* Prince Bismarck which I flowered last year is well worthy of the award of merit it received at the recent meeting of the Royal Horticultural Society. It has been in bloom with me for some three months this season, and has been much admired, especially by those who are sufficiently acquainted with flowers to appreciate the distinct advance in colour achieved by the production of this little plant. I grow it in a half-shaded position, and endeavour to give it a soaking with water now and again. It stood last winter without any protection, and is one of the best of our recent acquisitions among hardy flowers. Seed can be obtained, and I have found it come almost true, very few "rogues" coming among the seedlings.

*Iris juncea*, the Rush-leaved Iris, is still in flower, and can well hold its own with the Spanish and English Irises now so plentiful in our gardens. It lacks their varied hues and markings, but has a beauty of its own in its fine yellow flowers with a few narrow streaks of brown on the falls. I have seen this catalogued as synonymous with *I. lusitanica*, but this is an error, as they are quite distinct. *I. juncea* is a native of Algeria, and was introduced in 1869.

There are few more graceful plants in our gardens than the perennial Campanulas, many of which are now in full flower. The weather is not very suitable, however, as the strong sun soon destroys the bell-like blooms. There can hardly be a finer object in the garden than a well-grown plant of *C. grandis alba*. This year it is dwarfed by the absence of moisture, but in former years this Campanula has been most beautiful. It has fallen into comparative neglect from its habit of spreading freely and giving but few spikes of bloom for the space it occupies. The obvious remedy is to reduce the size of the plant. Like the biennial Canterbury Bells *C. grandis* will produce a second crop of bloom if the first flowers are picked off when past. Few of our garden Bellflowers have been so prolific of varieties as *C. persicifolia*, the Peach-leaved Bellflower, and numerous as are the varieties we can hardly have too many. Although it is nearly 300 years since its introduction it seems to be more popular than ever. It will be found that there is considerable variation among plants of the ordinary blue or white single varieties. Some are broader at the base or more open than others, and several minor differences may be seen by careful observation. There is no doubt that *C. p. alba grandiflora* is a grand plant, and I should not like to be without it, but it is not of such good form as the typical *C. p. alba*, and seems to me to be more like a hybrid than a pure form of *C. persicifolia*. I am writing this without precise knowledge of the origin of the plant, but I think the subject worthy of discussion. The foliage is certainly that of *C. persicifolia*, but to me the flowers seem to possess a different character. There are some large varieties of *C. persicifolia*, two of which are mentioned in the "Cottage Gardeners' Dictionary," and one of these I have in my garden. This has quite the character of *C. persicifolia*, but the flowers are much larger; *C. Hendersoni* is very fine just now, and *C. Van Houttei*, *C. soldanellaeflora*, *C. urticæfolia*, *C. u. alba plena*, *C. macrantha*, and a number of others are also well in flower. A half-shaded situation seems to suit most of these Campanulas much better than a sunny one.

One of the finest plants I observed last week in a very good collection of hardy flowers was a very superior form of *Aquilegia chrysantha*. It is well known that the Aquilegias are very inconstant from seed, and most of the plants of *A. chrysantha* in gardens have been raised in this manner, and are very inferior to the one I saw, which was a most beautiful plant with large flowers. It had come from a garden in Kirkcudbrightshire, where it had been grown for a long time. It is one of the good plants we see now and again which are difficult to obtain.

The Alstroemerias are coming well into flower, and are valuable for the garden and for cutting purposes. The following prove hardy with me if planted deeply, and with the ground well prepared:—*A. aurantiaca*, *A. aurea*, *A. peruviana*, *A. chilensis*, *A. violacea*, *A. Errebaulti*, *A. brasiliensis*, *A. psittacina*, and *A. sulphurea tigrina*. There seems a great deal of confusion in the nomenclature of the Alstroemerias, and it is difficult to separate the species from the varieties. Mr. Baker's monograph does not seem in entire agreement with the names I have for those in my garden, but they are distinct enough for garden purposes. Some varieties of *A. chilensis* and *A. peruviana* are offered under distinctive names, and some of these are sufficiently distinct to

grow by themselves. I think no one with a moderately light soil need fear to grow the *Alstroemerias* provided deep planting is practised.

Some of the *Spiræas* are at present attractive, and none is more so than *S. Aruncus*, which, when in full flower, is most beautiful and effective with its feathery plumes of flowers and bright foliage. There seems to be some slight variation in this *Spiræa*. In a good garden the other day I saw plants which were nearly past, and which the gardener assured me always flowered about a fortnight earlier than the others, which were in a similar position. There was also a larger *Spiræa*, which seems like a form of *S. Aruncus*, but not so white nor so feathery. This had come from an old garden in the same neighbourhood, where it had been for many years, and where I saw it the same day. Can these be the two named in the "Cottage Gardeners' Dictionary" as *S. Aruncus*, introduced from Siberia in 1633, and *S. a. americana*, introduced from North America?

But I must now draw to a close, not through lack of flowers to treat of, but lest the Editor should deem these notes too long, for Shirley Poppies of lovely colours, golden *Oenotheras*, stately *Verbascums*, and many others, withstand the drought, delight the eye with their beauty, and tempt me to write in their praise. Through a printer's error the last word of the first line of the quotation from Thomson's "Seasons," on page 16, was printed "swells" instead of "smells."—S. ARNOTT.

### GOLDEN SHRUBS.

THE present is the "golden prime" of the shrubbery now that its colouring is at its brightest, and the delicate contrast between the old and new growth most apparent. It is therefore a good time to look around and make notes for the next planting season. My remarks were first inspired by the sight of a glorious mass of Golden Yews lighted up by a gleam of bright sunshine, and backed by the rich dark green of the common Yews growing behind them; the sight confirmed an opinion which has been growing for years, that our old friend is still the finest Golden Conifer we possess, in spite of the numerous introductions of recent years.

Some of our golden novelties are, no doubt, very beautiful, especially in the young state, but the tendency of *Cupressus*, *Retinosporas*, and others is to grow scraggy as they become older, and instead of improving, to become blemishes in the garden and require replacement. Then, again, in point of hardiness our native is far more dependable than the delicate foreigners, which, though they may stand a moderately low winter temperature fairly well, show unmistakeable signs after a bad spring that they do not agree with Kingsley in his affection for a north-easter. Another point in favour of the Yew is the impunity with which it may be transplanted up to almost any size, in which respect it has a great advantage over many other Conifers, notably *Cupressus Lawsoniana lutea*, which, though splendid in other ways, is a "terror" to move, and unless well prepared is almost sure to resent it by dying. I grant our old favourite is sometimes formal in shape, and owing to its slow growth in the earlier stages, somewhat expensive to buy. The first fault, however, lies with those most misused of all gardening implements, the shears; as because the tree will bear it without remonstrance all its beauty is in many places shorn off annually; while as to the second, well, all things go by comparison, and a good specimen Golden Yew, which is an ornament to any garden, and will perhaps go on improving a hundred years after the purchaser has left the scene, is a better investment than many rare plants costing perhaps ten times the money, requiring costly houses and men to grow them, and which the least error in treatment may cause to disappear altogether.—CHAS. E. PEARSON, *Chilwell Nurseries, Notts.*

### LILIES.

AN ordinary meeting of the Dewsbury and District Paxton Society took place on Wednesday evening, July 8th, Mr. Thomas Overthorpe, in the chair. The minutes of the previous meeting having been confirmed, Mr. Hepworth, gardener to E. T. Ingham, Esq., Blake Hall, read the following essay on "Liliums and their Culture."

"Fair as a Lily," "pure as a Lily," "beautiful as a Lily." Who has not often heard or used terms such as these to express their admiration for some beautiful objects? and who amongst us can gaze upon the newly opened flowers of many varieties of Lilies without confessing them both fair, pure, and beautiful? The Lily has been the theme of poets and historians from time immemorial, and if there has been one flower to compare with the Rose in popular favour it has surely been the Lily. It has long been associated with both the joys and sorrows of humanity, and at no period more

so than the present, when its chaste and fragrant flowers are eagerly sought for. Of exquisite beauty, delicious fragrance, stately habit, the colours ranging from the purest white through many shades to the most brilliant scarlet, crimson, orange, and purple, banded with gold or with ruby-like spots, in height from 1 to 10 feet, with flowers from 2 to 12 inches across, and in season from spring till late in the autumn, such is the flower, the merits of which we have to discuss, and on the culture of which it is my privilege to offer a few hints.

Lilies prevail throughout central and southern Europe, in the Alpine districts, the Caucasus, Asia Minor, through Siberia to

FIG. 16.—LILIUM WASHINGTONIANUM.

Northern China and Japan. A few fine species come from the mountains of India, whilst the United States, east and west, also contribute handsomely to the list. Botanists divide them into three groups—viz, the Archelirion, which includes all those with horizontal or drooping flowers, such as *L. auratum* and *L. speciosum*; the Eulirion, those with trumpet-shaped flowers, such as *L. longiflorum*; and the Isolirion, those with erect bell-shaped flowers, such as *L. croceum*, the old Orange Lily. For the purpose of this paper I propose to treat them under the two heads of hardy and half-hardy—those adapted for outdoor cultivation, and those best grown in pots, because although the majority are said to be hardy, and may be so in well sheltered places in the south and west of England, yet we can scarcely expect to grow many of the best varieties out of doors in this district.

#### LILIES OUT OF DOORS.

The hardy Lilies are pre-eminent amongst herbaceous perennials, and when planted under proper conditions none gives less trouble to the grower. The best possible place for most of them is in the

borders amongst shrubs where these are not too thick. The shrubs being mostly surface-rooting afford just the shade and shelter needful for the Lilies, without exhausting the soil beneath them, and their noble flowers are seen to grand advantage against the dark green leaves of the shrubs. They can also be grown in any ordinary flower border, and almost in any position if the soil is good, and if arranged according to their height—dwarf ones in front, tall ones behind—are very effective. Although the Lily naturally likes the shade yet it must not be planted under the drip of trees, and wherever they are planted they require good soil, so that their flowers may attain due size and substance. A cool, moist, and shaded soil in summer is highly beneficial, and it should be well prepared to the depth of at least 2 feet. Most garden soils if dug to this depth, and given a liberal dressing of good manure from an old Cucumber or Mushroom bed, along with well decayed leaves—real leaf mould—will suit nearly all the hardy Lilies. Good preparation of the ground in the first instance is essential, and should on no account be neglected, because most Lilies are impatient of being often disturbed, and do far better when left alone for years together. The bulbs must be planted three or more together, and 6 or 8 inches deep, and if the early part of the season is dry supply them occasionally with water.

All Lilies may be propagated by seed; some seed freely, others scantily, and the seedlings retain their specific characters, though they may differ in variety. Hybrid Lilies are almost unknown. Many persons have endeavoured to secure new Lilies by hybridisation, but nearly all have failed; in fact, the *Lilium* most stubbornly resists the intermixing of its species. To two Boston cultivators—Mr. Francis Parkman and Mr. P. Brown Hovey—belongs the honour of having raised the two finest hybrid Lilies extant, which they have named after themselves. Both are hybrids between *L. auratum* and *L. speciosum*; the first is like a deep red *L. auratum*, and the second like a deep red-banded *L. auratum*, and each one when expanded measures 1 foot across. I have not yet seen either of these Lilies in any English catalogue.

As it takes from five to eight years to grow a flowering bulb from seed it is not very much practised. The mode practised by Dutch growers, and also by our own nurserymen, is to take a large bulb and strip off a few of the outer scales; these are planted separately in small pots in good light soil, and the pots are plunged in slight bottom heat. They are sparingly supplied with water, and in the course of time small bulbs form round the base of each scale or clove. When these are about the size of peas they are carefully removed, potted separately in small pots, and commence life on their own account. This is only necessary with some sorts, as many of the varieties form small bulbs at the base of the stems, whilst in others, such as the Tiger Lily and *L. bulbiferum* they form in the axils of their leaves.

The hardest for outdoor cultivation is *L. candidum*, the Madonna Lily; this is an evergreen, and likes a rather heavier soil than most of the others, and not to be often disturbed. Another good one is *L. croceum*—the old Orange Lily. This is well known to everyone, and there are few plants which bear such a wealth of bloom as this with the same amount of trouble. *L. elegans*, or Thunbergianum, and its many varieties of scarlet, crimson, orange, and yellow; *L. davuricum* and its varieties; *L. chalcedonicum* or Turk's Cap, and its varieties; and above all *L. tigrinum*—the Tiger Lilies—these are amongst the most showy of the family. *L. tigrinum splendens*, when well grown, is a gorgeous flower, and seen at a distance looks almost like a ball of fire. There are other suitable varieties which can be had from any catalogue, and which I need not stop to specify here; in fact, the varieties are so numerous that an interesting and beautiful border may be formed of Lilies alone.

#### CULTURE IN POTS.

The requirements of Lilies growing in pots are neither numerous nor costly; in fact, there are few, if any, plants with flowers of equal value to these that can be grown so easily. Nevertheless, I am of opinion that they are not so generally, nor, on the whole, so well grown as they used to be years ago. It was almost impossible at one time to enter an autumn flower show and not find some well grown pots of the three or four varieties of *L. speciosum*, and sometimes of one or two other species. An old gardener of my acquaintance, nearing threescore years and ten, tells me that we do not know how to grow Lilies as they were grown in his young days. After making allowance for what they did in "the good old times," I think we must confess that Lilies have been neglected and pushed on one side of late years, with the exception of perhaps one or two varieties. If this is so, I am sure the fact only needs bringing under the notice of this and kindred societies, to have justice done to such a noble flower.

The most successful way of growing the majority of Lilies in pots is to treat them in as hardy a manner as possible in a cool

greenhouse or cold frame, merely keeping them at all times free from frost. The growth will be stronger, sturdier, and the flowers more lasting than if grown in heat, and the bulbs will suffer less deterioration. Some Lilies have a tendency to split, notably the new *L. Harrisii*, and where this is the case growing them in too much heat helps to aggravate the evil.

Amongst the best for pot culture are *L. auratum*, well known to all; *L. giganteum*, the king of Lilies; *L. longiflorum*, and its varieties *eximium* and *Harrisii*. Three or four varieties of *L. speciosum* are old pot favourites, and amongst newer varieties is *L. Browni*, white inside, striped purple outside; and *L. Wallichianum*, with white trumpet-shaped flowers, called the prince of the *L. longiflorum* section; *L. Humboldtii* (reddish orange) and *L. pardalinum* (orange red), two splendid Californian Lilies, and many others to be found in any good list. Take great care in the selection of the bulbs when purchasing, and particularly if they are imported ones. It used to be said that not more than one in six of imported *auratums* ever came to anything after arriving in this country, the reason given being that the Japanese growers, in their haste to catch the first sale in our markets, sent over immature and unripened bulbs. Whether this is still so I cannot say, but it would be well in the first place to buy from a reliable source; and in the second place not to buy too early in the season, as the later shipments will probably contain better and more matured bulbs. Having obtained the bulbs they must be potted forthwith, and must on no account be left exposed to the drying influence of the air in drawers or cupboards. They are scale bulbs of a soft and spongy nature, not solid like Hyacinths and Tulips, and suffer very much by exposure to the air.

They may be potted one, or three or six bulbs in 6, 9, or 12-inch pots respectively, according to fancy or accommodation. The month of January is a good time for potting them, and they should not be delayed later if it can be avoided. The time here stated for potting is for summer and autumn blooming. Those who want earlier flowers, say from spring onwards, must pot proportionally earlier, and grow the plants through the winter. The soil should consist principally of well decayed turf two parts, leaf mould one part, thoroughly decomposed horse manure one part, with a little rough sand and charcoal. For *L. auratum* and a few other species which require a lighter soil, two parts of peat to one part loam, or two parts thoroughly decayed leaf soil with a larger quantity of sand is generally recommended. The pots must be well drained, then cover the crocks with some of the roughest lumps of turf, following with finer soil, filling the pot about half full. On this place the bulbs, covering them slightly. When finished the soil should be left far enough below the top of the pot to allow for a good top-dressing later on. The pots may then be placed in any cool position under a stage, or plunged in ashes or tan or leaves in a cold frame, being careful to exclude frost. No water must be given them till the points of the shoots are seen pushing through the soil. Many Lilies are ruined by inattention to this matter, for if the soil becomes too wet before the bulbs have started growing they will most certainly decay, and time, money, and labour will be thrown away. On the other hand, when they have begun growing they must not be allowed to suffer for want of water, and must have plenty of light and ventilation. When the stems are a foot high the pots must be filled nearly to the rim with some good rich soil. This will cover the bulbs to a proper depth, and will also serve as a top-dressing, and for the roots which are emitted at the base of the stems to work in. It is a peculiarity of some Lilies that besides the fleshy roots which the bulbs send downwards in the pots, roots are also sent out by the stems just over the top of the bulbs; hence the reason why room should be left when first potting for the addition of more soil later on.

The system I have just sketched will be suitable to the majority of pot-grown Lilies, and most of them will start without further trouble; but *L. auratum* is sometimes difficult to start, particularly imported bulbs, and for them I should recommend a little different treatment. Plant the bulbs singly in 5 or 6-inch pots, using sandy peat or leaf mould, leaving the apex of the bulb slightly bare so that it can be easily seen when growth commences. They may be placed in a shady corner of the greenhouse or frame, giving them a gentle dewing with the syringe when absolutely necessary to prevent dryness, but on no account allow them to become wet. What there is to fear most is a species of fungus, which forms between the scales, causing them to decay; if the bulb is left slightly bare when potting this can be looked after and exterminated. A good preventive is a little powdered charcoal placed beneath the base of the bulbs, and also scattered amongst the scales when potting. When the shoots have grown a few inches they must be transferred to larger pots either singly or otherwise, and the roots buried in the same way as the others.

The more tender varieties may be grown and flowered under glass if required, but the hardier kinds may be hardened and stood

in a well sheltered place out of doors as soon as all danger of frost is past. The pots should stand on slates or ashes to keep out worms, and as the stems grow they will require tying to neat stakes to prevent them being broken by the wind. When the flower buds appear a little weak liquid manure given occasionally will assist them to swell, and so increase the size of the flowers. When they reach this stage some may go under glass again to forward their flowers, and for indoor decoration; others may be plunged in borders or beds outside, as is done in many of our parks and gardens, when they have the appearance of having grown there, and are very effective in flower garden arrangements.

When the plants have flowered water must be gradually withheld, and when the leaves turn yellow and begin to fall, lay the pots on their sides in any cool place free from frost till potting time comes again, when the old soil must be shaken away, the bulbs repotted and proceeded with as before.

Such in a short and simple way is the culture of Lilies in pots. Another way of indoor growing for those who have the means is to plant them in clumps amongst Camellias where these are planted out, and there let them remain from year to year, giving a rest as far as possible in winter by withholding water. This, of course, is only possible in cool houses, where the exclusion of frost is all that is aimed at.

The Lily can scarcely be said to have any distinct disease. There is a grub known as the Lily grub, which feeds on the leaves, and which requires to be destroyed by hand-picking. The cause and cure of "rot" have already been dealt with. The chief thing to avoid with those growing in pots is overwatering before the bulbs have begun to grow, and with those out of doors, to see that they have a moist but not stagnant bottom, as either condition induces decay of the bulb, and is fatal.

The introduction of many varieties into this country is interesting, and a knowledge of the parts of the world they come from is useful to remember in trying to cultivate any variety that is new to one. As we have already seen, Lilies are gathered from many parts of the world; but it must be remembered that they come invariably from the more temperate parts of the various regions, those from India coming from the mountains, and those from Siberia from the sheltered valleys. The oldest imported Lily I have been able to find is *Lilium candidum*, which came from southern Europe in 1596, nearly 300 years ago; *L. auratum* came in 1862, *L. speciosum* in 1832, *L. giganteum* in 1855; *L. canadense* in 1829; *L. davuricum* in 1745; *L. longiflorum* in 1862; and *L. Washingtonianum* in 1812. We have only to think of the great number of varieties now to be had, and then count how many are generally grown, to come to the conclusion that this beautiful flower has of late years suffered neglect. Now that Sunflowers and single Dahlias are on the wane, and most other popular flowers have had their day, and much further improvement in them seems uncertain, it is not too much to hope, that a larger share of the attention and love of florists may be bestowed upon these splendid and useful flowers. "He that has lost the love of flowers," says an old German writer, "has lost all fear and love of God;" and seeing that it is the love of flowers which has made us, and which keeps us members of this Paxton Society, I submit, in conclusion, that there are few which better deserve our care, or are more worthy of our love, than this king among flowers—"the Lily."

Mr. Hepworth resumed his seat amid applause, and a discussion on the subject took place, which was initiated by the Chairman, and continued by Messrs. Gledhill, Tranmer Goodall, Thompson, Bullock, and others, after which, on the motion of Mr. Thompson, seconded by Mr. Bullock, a hearty vote of thanks was accorded to Mr. Hepworth for his paper. Some fine specimens of *Lilium auratum* had been kindly furnished by Mr. McGowan, and were much admired.

[*Lilium Washingtonianum*, of which an engraving is given in fig. 16, is a native of California, attaining a height of about 4 or 5 feet, and bearing well formed flowers, white or purple tinted, spotted with purplish crimson. It is a beautiful species, and succeeds admirably in positions that are not too exposed to sun or wind.]

#### A VISIT TO NANCY.

WRITING this as I do in the heart of the Jura Mountains, 3800 feet above sea level, where warm underclothing is necessary, and a great coat is often found comfortable, I have by contrast a most vivid impression of the two sweltering days I passed in Nancy. Certainly it is a very hot place, or we were favoured at that time with unusual weather. I heard some talk of 100° in the shade, and it may have been something like it to judge by results. Paris was supposed to be hot at the time, but it was cool by comparison. Nancy is an easy place to reach if you keep the direct route, but wishing to visit Chaumont as well as Nancy, en route for Switzerland, I left the train at the latter place and

took the cross country line to Nancy via Mirecourt. The first result was a delay of four hours before a train left, and as those four hours happened to be from 12 midnight to 4 A.M., and the only accommodation to be had was a sofa in the *salle d'attente*, they naturally proved most uncomfortable. Troubles were aggravated by the amazing sounds emitted by the nose of an unconscious Frenchman who occupied the other sofa, and who slept, and snored, and choked himself, half awake, groaned, turned, went off again into the snoring and choking condition, until I found myself almost tormented into the wicked thought as a more awful sound than usual proceeded from him, "Well, now, I really think he is dead at last, and I shall have some peace." However he survived, and so did I, and four o'clock came at last, a lovely morning, hazy at sunrise, but clearing into brilliant sunshine by 8 A.M. Very pleasant and reviving was that early journey through the beautiful valley of the Moselle. All Nature was looking her very best, the corn just turning colour, one or two fields cut, hay saved but not ricked as with us, but mostly left in the fields in large "pooks." This was in the valley itself. The sides of the hills, which are bold and lofty, from 300 to 700 feet or more in height, were mostly clothed with the Vines from which the famous Moselle wine is made. Each plant about 3 feet high, and the plants themselves about 3 feet apart every way. I was struck with the thriving condition of all the crops as a rule. There were some weedy patches, but as a whole weeds were well kept under, and the Vines especially seemed to be well cared for in every way.

Nancy is a large, well built, thriving town; the streets wide, the shops and hotels good, the public buildings and gardens interesting and attractive. In such a climate in summer the population live mostly in the open air, cafés and restaurants abound; but although there was plenty of drinking (and who can wonder at it in such a temperature?) no cases of excess came to my notice. But my visit to Nancy was a visit in search of Begonias. Everyone who knows something of the history of the Begonia since its introduction knows also that the two leading horticulturists of Nancy have done their full share towards developing this favourite flower into its now magnificent condition. Giant strides in this direction were made in the early days of its history, when Nancy sent forth Gloire de Nancy, Blanche Paupierre, Comtesse H. de Choiseul, Antoinette Guerin, Gabrielle Legros, Mons. de Dumont, Madame Comesu, &c. Some of these even now hold their own. Gabrielle Legros I saw was being largely grown by Mons. Crousse as a market plant, but although useful in this way the flowers are too small to compete with the magnificent varieties since raised in this and other localities. A few of the most telling ones growing in quantities were Felix Crousse, dazzling scarlet; Mistress French, a noble flower, very double, and of a yellowish white colour; Notaire Dubbled, brilliant red, very free; La France, lovely delicate pink with silvery shade; Jeanne d'Are, a very good white; Triomphe de Nancy, straw yellow; Dr. Felty, rich scarlet crimson; Albert Crousse, carmine; Felix Mascotte, large, rich scarlet. I also had the pleasure of seeing several seedlings not yet named of sterling excellence—one a very large rich double yellow; another a pale blush, the colour of Malmaison Rose; another, blush white flushed with rose towards the centre. All these will in due course be put into the market with others, which space will not allow me to mention, and all will, I am sure, prove great additions to the collections of those who grow Begonias. Monsieur Crousse not being able to speak a word of English, and my French being not of the first order, Mlle. Crousse kindly acted as guide and interpreter; and in spite of the excessive heat a very interesting and pleasant tour was spent in passing up and down the numerous long beds filled with thousands of Begonias. All are growing in the open air, but every bed is protected from the sun either with a close lattice of woodwork nailed together on frames or canvas supported on stakes. The plants are all mulched with decayed manure and are kept well watered overhead. This is needful no doubt in a place where the sun is so ardent as at Nancy, but Begonias can be well grown in most parts of England treated as ordinary bedding plants. I should not like to say how many thousands of unbloomed seedlings of the year were planted out in nursery beds; very few of these were showing flower at the time of my visit (July 17th and 18th), but all were being treated as above and looked very promising. Besides Begonias Monsieur Crousse grows largely Ivy-leaf Pelargoniums, Zonal Pelargoniums, and Cannas.

The next morning I paid a visit to Monsieur V. Lemoine, whose grounds are situated just outside the town. A drive of a quarter of an hour brought me to the gate of a pleasant-looking villa surrounded with shrubs and flowers. Monsieur was at home, also his son, who speaks English well. Begonias here also are a speciality, and among the first things that attracted my attention was a large bed of Begonia Lafayette, a dwarf-growing variety with upright stout stalks and brilliant scarlet double flowers. As a bedding variety none surpasses this. The most interesting of all was a bed of Begonia Baumannii, a dwarf-growing species with rosy crimson flowers of fair size, single, and borne on rather long flower stalks; but the chief feature of this species is that it is scented, the perfume being something like that of a Tea Rose, very delicious. No doubt this variety is destined to be the parent of a race of scented Begonias, and thus the only thing lacking in the Tuberous Begonia will be supplied. Already Monsieur Lemoine has a large number of seedlings from this variety crossed with others, and considerable variation in colour is already manifested, while the scent is retained. Many beautiful double and single varieties similar to those previously described were found here also, the cultivation being conducted on the same principles as at Mons. Crousse's.

I hoped to be able to see Mons. Lemoine's grand and unique collection

of Gladioli raised by himself; but my visit was, I am sorry to say, too early in the season to permit of my seeing them in bloom. Many thousands of plants were being carefully cultivated and looked remarkably healthy. One of Mons. Lemoine's specialities is the Fuchsia. Many distinct and beautiful varieties have been sent out by this firm, among them La France, Nancy, Mrs. G. G. Hill, President Grévy, &c. Several thousands of seedling plants, unproved as yet, were just coming into bloom; all are planted in long nursery beds in the open air, a mulching of dung being placed over the roots of the plants and plenty of water being constantly supplied. Fuchsias treated in this way appear to do remarkably well in France. Not only here but in the gardens and parks of Paris and elsewhere standard and dwarf bush Fuchsias are used with great effect in combination with other plants. Although the sun was so hot, the foliage was green and the flowers most abundant. Zonal Pe'argoniums also constitute a feature at these nurseries; but, as Mons. Lemoine remarked, it is very difficult to get anything really new and distinct in this line except the name. Beds of Montbretias, Lantanas, Primula species, all claimed far more time and attention from me than I had at disposal, as after a hasty look round for the few minutes that remained before starting to catch the train I bid a reluctant farewell to my kindly French friends and made for beautiful Switzerland. Another long drawn out but pleasant railway journey *viâ* Epinal and Port d'Atiluri, through Vine-clad hills and smiling valleys, with a view here and there of the Saone River, brought me at length to the main line of the Chemin de Fer de l'Est at Vesoul, and a few more hours through the grand scenery which lies between the above town and Belfort onwards, landed me at Bale.—R. G. BEACHY.

### VIOLAS.

MESSRS. DOBBIE & Co., florists, Rothsay, have for some years past taken the Violas in hand in Scotland, and grown them well, their exhibits at Birmingham, London, and other places proving this clearly enough. I recently received from them a box of Viola blooms consisting chiefly of the more recently introduced varieties, and the size of the blooms and clearness of colours bore testimony to the suitability of the west of Scotland for the cultivation of these lovely flowers, and which are daily becoming more and more popular. I have been much pleased this year to see them grown in gardens where hitherto they were not allowed a place, and the cooler weather than usual of June and July has suited them admirably. In some places late planted-out Violas are dying off very much, and I wish again to urge the desirability of early autumn planting. The Viola will stand much hard weather if well established, and by placing young plants in their flowering quarters in October or early in November they get good root-hold before winter sets in.

Messrs. Dobbie & Co. have the sending out year after year of Mr. Baxter's new varieties, and have ample opportunities for picking up other new varieties worthy of note, so that their collection is really an extensive one of the best varieties. Amongst the blooms they recently sent to me were in whites, Countess of Hopetoun, a well known variety of dwarf habit, and our best white; Snowflake, thin in substance and of inferior form, but a showy bedder; Lady Dundonald, pure white with rayed centre, and a good bedder; Marchioness of Tweedale, a pure white with a tendency in hot weather to flush a little in colour; Blue Cloud is white with an edging of ultramarine blue, resembling Skylark in every way, but with a greater depth of margin; Joy is thin in substance and inferior in form, but very showy, white bordered and flushed with soft pale lavender; Annie King is a charming new light coloured variety, which will be sent out in the autumn, and this new variety received a certificate at the Midland Counties Pansy Show; Gipsy Queen is shaded and veined white and pale lavender, deficient in substance and form, but it is a flower which will have many admirers; Dawn of Day is a large flowered distinct variety, white with greyish lavender markings.

In yellows Bullion is one of the best yellows, deep in colour, bright, and an excellent bedder. Wonder is a light yellow with a deeper tinted centre, a really useful fine variety. Goldfinch is light yellow with an irregular margin of deep lilac, a beautiful variety. Duchess of Fife resembles Goldfinch, but with a brighter tint of colour in the margin and with white and yellow body colour. This is a new and lovely variety.

In blues Archie Grant was the leading one, a very fine variety. Of purple shades there were Pytho, the lower petals rich violet purple with lilac shading in the top petals, very fine form. Mrs. Bellamy, rich violet purple lower petals with a white margin to the top petals, of fine form and good substance. John Burns, rich rose-tinted violet charmingly blotched with white, distinct and of fine form. Cottage Maid, a lighter coloured flower than John Burns with more white in the blotches, a distinct and fine variety. Neptune, a superb variety in form and substance, and rich in colour, greyish white top petals, and the lower petals are of a rich violet tinted purple colour with a small light blotch in each. Lady Gertrude resembles Neptune in the markings and colour, but the body colour has more of a rose tint in it; a very fine variety. Queen of Scots is a Countess of Kintore style of flower, a white self with rich blue violet central blotch; a lovely variety. Evelyn is a Duchess of Albany style of flower, shaded mauve lilac centre, the lower petals bordered with grey, and greyish white top petals; fine form. Sunrise is a lovely variety of fine form and substance, shaded rosy plum colour, and veined with a lighter shade of colour. Ada Adair, shaded lilac tinted rose with a dark blotch and lighter top petals; a distinct pretty variety of good form. Beauty, deeper in colour than Ada Adair; a

bright charming flower. Mrs. Grant is a distinct variety, purple tinted rose coloured centre, the side petals grey tinted, and almost white top petals; a distinct variety of good form. William Neil is a distinct variety of a new shade of colour in Violas, soft lilac tinted rose, and very pretty. Columbine is white, with pale pink top petals and the same coloured margin to the lower petals; attractive and distinct.

In addition to the varieties I have enumerated from Messrs. Dobbie and Co.'s consignment of blues, York and Lancaster, Ethel Baxter, Spotted Gem, and others of their introduction should be in all collections. Lady Amory and The Mearns are both very beautiful, and Dean's True Blue is far away the best blue Viola known. Amongst yellows, Queen of Spring and Golden Queen of Spring are two very excellent sorts, and Golden Gem (Dean's) is a beautiful variety. Bridesmaid, another of Dean's seedlings, is of the habit of Countess of Hopetoun, and of a creamy white colour; and Dean's Mrs. John Pope is a very beautiful new variety. On the 20th inst. I received a box of shoots with blooms of several kinds of Violas, sent from Mr. J. McLeod, Chingford, Essex, to show that Violas can be grown easily and well near to London. The flowers were quite as fine as those from Scotland, and as fine as we can grow them in the Midlands. Violas can be bought now at such very cheap prices as to be within the reach of everyone, and I cannot too strongly recommend them for very early garden decoration, blooming as they do with early Tulips and Hyacinths, and continuing in beauty until late in the summer.—W. DEAN, *Sparkhill, Birmingham*.

### CATTLEYA DOWIANA AUREA (YOUNG'S VARIETY).

THE most recent issue of Messrs. B. S. Williams & Son's "Orchid Album" (part 108, vol. ix.) contains beautiful plates of *Odontoglossum Mulus Holfordianum*, *Cymbidium elegans*, *Masdevallia macrura*, and the handsome *Cattleya* named at the head of this note. Concerning this fine Orchid the following interesting particulars are given:—

*Cattleya Dowiana aurea* was first sent home by Gustav Wallis from New Grenada about twenty-three years ago, and Roezl, who afterwards found it, fixes the locality in which it grows some 600 miles distant from that of the typical *C. Dowiana*, which had been introduced to our gardens a few years previously from Costa Rica, by Mr. Skinner; but it was originally found about 1850 by the veteran Polish traveller and collector, Warscewicz, whose consignment of plants, however, arrived in this country dead. It had been the intention of Warscewicz to dedicate this fine *Cattleya* to the famous Mrs. Lawrence of Ealing, the most enthusiastic patroness of horticulture in her day; but in the *C. Lawrenceana* since discovered in British Guiana we have a very beautiful and distinct plant. This is dedicated to her equally interested son, Sir Trevor Lawrence, Bart., M.P., Burford Lodge, Dorking, Surrey, the President of the Royal Horticultural Society of England. *Cattleya Dowiana aurea*, although separated by so long a distance from the typical plant, with no intermediate station between, as far as is known, cannot lay claim to be anything but a geographical variety of it; but yet it is a superior form, and the one here figured must be allowed to claim first rank in the way of varieties. Its principal differences are in the rich clear golden yellow of its sepals and petals, and the amount of the same rich colour upon its lip. This variety originated with Reginald Young, Esq., Fringilla, Linnet Lane, Liverpool, who, when it flowered again last season, kindly sent it to us for depicting in the Album. We recently saw the plant, which was looking in the best possible order, and we have much pleasure in recording the fact that Mr. Young's plants are in the very best of health and condition.

This plant belongs to the Labiata section of the *Cattleya* family; it is an evergreen, of strong growth, with clavate stems and large, oblong, deep green leaves. The flowers appear soon after growth is completed in the autumn, and remain some few weeks in full perfection if they are kept from sprinklings from the syringe, or from damp of any kind. It grows naturally near Frontino, in the company of *Cattleya gigas*, and several apparent hybrid forms have appeared from amongst the plants imported from that neighbourhood; the best of these are *C. Hardyana* and *C. Maszaiana*. Several plants having similar markings have from time to time appeared, but none can equal *C. Hardyana* in the richness of colour or in the undulations of its crisp lip. *C. Dowiana aurea* requires to be kept dry and cool immediately after its growth is completed, and it should not be allowed to stand in strong heat until growth starts again, as we recently observed had been the case with one grower of these plants, who had half made growths

in the middle of winter. Such growths never can flower, and by such treatment it gets the character of being a shy bloomer, but which it does not deserve if the plant is carefully handled in the autumn and the winter growth is avoided. It enjoys an abundance of sun and light, and to obtain this we grow it in a basket, so that it may be hung up near the roof-glass, the basket being thoroughly well drained. The soil should be good fibrous peat and a little chopped sphagnum moss, mixing a few medium-sized nodules of charcoal with the soil during potting for the purpose of keeping it open; during the growing season it is a plant which likes a liberal supply of water, hence the necessity of providing ample drainage, for although *Cattleyas* like water they cannot long survive or keep in a healthy condition if it remains in a stagnant state about their roots. Propagation may be effected by division and by cutting through the woody rhizome, but this we advise growers to be cautious about doing, because more value is attached to a fine plant all of one piece than of several small plants which have been obtained by propagation; and these small plants so obtained oftentimes do not flower for years, as they cannot obtain the nourishment they had when on the old plant.

#### CYPRIPEDIUM ENGELHARDTÆ.

In part 6 of the English edition of the "*Lindenia*" plates and descriptions are given of the *Cypripedium* named above; *Odontoglossum Bergmanii*, one of the *O. crispum* group with heavily spotted flowers, and similar to *O. luteo-purpureum* in habit; *Aganisia ionoptera*, a graceful little plant originally described under *Koelensteinia*, but that genus is now sunk in *Aganisia*; it has long erect racemes of purplish blue and creamy flowers. The last plate is of *Phalenopsis speciosa*, which represents a fine variety, with deep coloured flowers of good size and form.

Concerning *Cypripedium Engelhardtæ* the following remarks are given: "We announced recently to the readers of the '*Lindenia*' the appearance of this new hybrid, and we are happy to be able to give them to-day the presentation, because we doubt not that they will share the opinion of those amateurs who had the opportunity of seeing it in flower in the month of May, and who have deemed it worthy to be placed in the front rank of this genus."

"That which gives a particular interest to the subject of hybridisation in the family of Orchids, the importance of which is not yet sufficiently recognised, is that the differences in the varieties employed as parents reproduces itself to a considerable extent in the offspring, creating very different forms conformably to the varieties chosen. The peculiarity promises to furnish an infinite variety among the hybrids, and particularly those of the genus *Cypripedium*, in which the varieties are so numerous that the Monograph recently published by M. Angiolo Pucci of Florence enumerates up to seventy for a single species—namely, *C. insigne*. It is precisely from this species that *C. × Engelhardtæ* has arisen, and the variety which has served as the seed parent is very probably the variety *Maulei*. The other parent is one of the best known and most appreciated species of the genus *C. Spicerianum*. This new hybrid is the third issue from this excellent cross, which has already produced *C. × Leeanaum* and *C. × Leeanaum* var. *superbum*."

"The character which clearly separates it from the other forms in the group, and which gives it a particular charm, is the brilliant golden yellow colour which covers the petals and the lip, and gives to the flower an exceptional splendour. The large dorsal sepal, which is reflexed at the base, as in *C. Spicerianum*, is finely speckled with violet-purple and traversed from base to summit by a median band of the same colour; it bears at its base an extensive area of clear green. The rest of the flower recalls rather *C. insigne Maulei*, except the colour, which is unique. *C. × Engelhardtæ*, like the majority of hybrids, is very robust and floriferous. We may also add that the flowers attain a superior size to the average of those in the *Leeanaum* group. We have dedicated this remarkable novelty to Madame Constantin d'Engelhardt, the wife of one of the principal amateurs of Orchids in Russia."

#### BRITISH FERNS AND WHERE FOUND (THE YOUNG COLLECTOR SERIES).

ONE might suppose from the title of this little work, by Mr. E. J. Lowe, that it would be plain reading, and adapted to the capacity of the young in the Fern school, but from what I can gather from its contents it is not so. To change the long-existing system of nomenclature, not only of individual plants, but also to do away with several of the old class names, appears to be its leading object. Although at page 12 it is stated that it is always undesirable to change familiar names, yet in the fourth and fifth lines on the same page the names of two classes are changed, substituting *Aspidium* for *Polystichum*, and *Asplenium* for *Athyrium*. The aim is said to be to correct the unpalatable names that exist without destroying their identity; but I would ask, What is there that can

be said to be unpalatable about the names of the four classes, I ought to say five classes, changed? I, for one, say Nothing, but I do feel that there is something very objectionable about the names introduced, and I shall never use them.

The next thing I would refer to is the fault-finding with descriptive and compound names, such as are and have been used by the most noted pteridologists of the past and present day, such men as Messrs. Barnes, Jones, Moore, Stansfield, Wollaston, and others. The above gentlemen have established a descriptive and intelligible nomenclature that is not likely to be superseded, and especially when we find such names as the following in this book. At page 50, *cladodesteron* (Lowe); page 51, *echnomocladon* (Lowe); page 52, *kephalobares* (Lowe), I think the above are not to be accepted as preferable to the descriptive system, and what young collector could understand them? A word next about the classes. Suppose a young collector to become possessed of the works of Messrs. J. Smith, T. Moore, T. L. Drury, or others we might name, and in looking over the classes of our native Ferns he found there are nineteen referred to, but in his young collector's series he can only find seventeen. He will be puzzled; and further, when he finds that in his "*Young Collector*" the *Aspleniums* are said to number eleven, while the other works he has consulted give nine, I think it will be likely many will proceed no further.

At page 50 of this work the reason for change is thus given, as it refers to the *Athyrium*. Mr. Lowe says:—"It is most nearly allied to the *Asplenium fontanum*, only the curved sori seems to be the main distinction between *Athyrium* and *Asplenium*." The above is against the change, and nothing else is produced in favour of it. Now what does *Asplenium* derive its name from? If we are correctly informed it is from the supposed virtue it possessed when used for the affection of spleen, and from this the class were called Spleenworts. Now who ever heard of the *Athyrium* being possessed of such virtue, or supposed virtue? Further, the *Athyrium* is a deciduous Fern, while all our nine *Aspleniums* are evergreen, and most of them are found on limestone or in the mortar of old walls, while the *Athyrium* could not exist under such conditions. All our *Aspleniums*, too, are of dwarf habit, while the *Athyrium* grows from 30 to 50 inches high according to the situation in which it is found, and it must take a stretch of imagination to see anything in common between the two classes of plants any nearer than that they are both Ferns. Distinct they are and must remain both in class and character. There is another reason, and a very forcible one, why they should be kept separate. The *Aspleniums* with their varieties number thirty or more, while the *Athyrium* with its varieties is supposed to reach 500 or more; therefore I think the *Athyrium* class is a very important one, and should not be merged into another, for it is strong enough to stand on its own merits.

There are other classes the names of which are changed which needed no change, nor will the change be accepted, for long before the author took pen in hand the names he is trying to do away with were firmly established—such as the names of *Athyrium F.-f.*, *Roth*; *Ceterach*, *Linnaeus*; *Lastrea F.-m.*, *Presl*; *Polystichum*, *Presl* and *Roth*; and also *Blechnum spicant*, *Smith*. I know many persons who do not approve of this change, which they consider needless.—J. EADON, *Sheffield*.

EVENTS OF THE WEEK.—The Royal Horticultural Society's Fruit, Floral, and Orchid Committees will meet at the Drill Hall, James Street, Victoria Street, at 12 noon, on Tuesday, August 11th. On Wednesday, August 12th, the Cardiff Horticultural Society's Show will take place, and in conjunction with it the British Fruit Growers' Association will hold a Conference at 4 P.M., at which several important papers will be read, including one by Mr. E. J. Baillie on "Fruit Growing as an Industry," and another by Mr. A. Pettigrew on "Hardy Fruits for South Wales." The Maidenhead Horticultural Society's Show will be held at Curtisfield on August 13th.

— THE WEATHER IN THE METROPOLITAN DISTRICT during the past week has been distinguished by frequent severe thunderstorms and torrents of rain, which in some cases have done much damage to garden and field crops. On several nights the temperature has been unusually low, resulting in a marked check to vegetables and fruit.

— GARDENERS' ORPHAN FUND.—At the Committee meeting, held last Friday evening, the following sums were announced:—Miss Ford Richmond, flower stall at the Show, £6 10s. 6d.; Mr. G. W. Cummins, by sale of flowers at Croydon Show, £11 5s. 6d.; Mr. R. Dean, by sale of Roses at Westminster Aquarium, £13 15s. 6d.; the Secretary, for flowers sold at the Wimbledon Show, £11 0s. 6d. Amongst amounts from collecting boxes were £1 from Mr. H. Cannell, £1 11s. 6d. from Ware Show (per Mr. Dean), and 12s. 1d. from Mr. H. W. Divers. Mr. D. T.

Fish sent £11 15s. as the result of opening the Hardwick Hall Gardens to the public; and the general collecting cards distributed a few weeks ago have brought in a sum of about £280. The result of the Crystal Palace fête had not been exactly ascertained, the railway receipts not having passed the clearing house, but the Committee were satisfied the Fund would benefit by the effort, and that their anticipations would be realised.

— **THE FINEST VINE IN BRITAIN.**—Mr. Barron in his excellent work, "Vines and Vine Culture," gives particulars of some of the largest Vines in Britain, including the remarkable example at Manresa House, Roehampton. Judging by the dimensions of the houses given in the work in question the Vine at Kinnell House, Bredalbane, Scotland, would appear to be the largest; but a Scottish gardener who is intimately acquainted with it, and who has closely examined the Manresa Vine, declares this to be the finer and in all respects superior. It is truly a marvellous Vine, trained and managed by the present gardener, Mr. M. Davis. It now completely fills the house 224 feet long, with seven rods as straight as Vine rods can be, stretching from end to end. Each rod resembles a vigorous young Vine, and bunches averaging 1½ lb. each with fine berries are hanging in the greatest regularity. Last year 607 bunches were cut from the Vine, weighing 956 lbs. This year the number is 642 bunches, the weight of which exceeds 1000 lbs. There are other unusual Vines at Manresa. Remarkable also are the espalier wires affixed along the tops of garden walls laden with Plums and Pears, much more fruit being borne on the branches above the walls than on those trained to them. Unusually fine young standard Apples are to be seen, and all the trees in the garden are laden with fruit. Manresa House is near the centre of the village of Roehampton, and about half a mile from Putney Railway Station. The garden is just now particularly worth a visit, but as cutting has commenced from the big Vine the sooner it is seen the better. It is a grand example of patience and culture by one of the most genial and courteous of men to be found in the gardening ranks.

— **CARDIFF PARKS.**—The prosperous town of Cardiff is famed for its parks and open spaces that have been provided for the inhabitants. At the last meeting of the Parks Committee the only business was the consideration of testimonials received from the ten applicants for the post of head gardener of the parks and open spaces under the control of the Corporation. On the proposition of Councillor Ramsdale, seconded by Mr. Andrews, Mr. William W. Pettigrew, son of Mr. A. Pettigrew, of the Cardiff Castle Gardens, was appointed. The successful candidate is twenty-four years of age, and presented testimonials from the Director and Curator of the Royal Gardens, Kew. The salary is fixed to commence at £120 a year, with £10 a year increases to £180. We know Mr. W. Pettigrew to be thoroughly well trained, and as he is intelligent and persevering, we have not a doubt he will ably discharge the duties of the position to which he has been elected, and do credit to the name he bears.

— **MODES OF CHRYSANTHEMUM CULTURE.**—I have read with more than ordinary interest that portion of Mr. Woodcock's paper which treats of plants for exhibition blooms, more especially the paragraph wherein he speaks of Hull cultivators having the advantage of free sandy loam. Would Mr. Woodcock be so kind as to say where in the neighbourhood of Hull such loam can be had? as hitherto I have been unable to obtain it, and I cannot help thinking he must be mistaken in his information. Though the briny ocean doubtless contributes to brightness of colour in flowers grown in its neighbourhood, still as Hull is about twelve miles from the sea as the crow flies, some other reason must be sought for here to account for such brightness. In proof of this it may be mentioned that at the last Hull Show there was a marked difference between the brightness of some stands of blooms from Grimsby and those grown locally. I think salt in the atmosphere has more to do with it than salt at the roots; but this would be a good subject for Mr. Briscoe-Ironsides to experiment upon.—R. FALCONER JAMESON, *Hessle, near Hull.*

— **THE BEDDINGTON, CARSHALTON, AND WALLINGTON SHOW,** held in Beddington Park on Monday last, was very satisfactory as regards the quantity and quality of vegetables staged by cottagers and allotment holders; there were also some tasteful baskets of flowers. The non-competing exhibits from nurserymen occupied much space, and were of a most interesting character. Messrs. J. Laing & Sons, Forest Hill, had a handsome group of Tuberous Begonias with miscellaneous stove and greenhouse plants, a large collection of hardy flowers, and several boxes of fresh bright Roses. Messrs. J. Peed & Sons, Tulse Hill,

contributed a well arranged group of choice flowering and fine-foliage plants, and Mr. J. R. Box, Croydon, had a group of Caladiums, Begonias, and other plants.

— **A WORK ON ROOM AND WINDOW PLANTS,** by Mons. D. Bois, has been received from the publishers, M. M. J. B. Baillière et Fils, 19, Rue Hautefeuille, près du Boulevard Saint-Germain, Paris. It is practically written and freely illustrated, therefore would be found useful by those who are interested in this branch of plant culture and are familiar with the French language.

— **THE TOTAL RAINFALL AT CUCKFIELD,** Sussex, for July was 2.99 inches, being 0.33 inch above the average. The heaviest fall was 1.04 inch, the result of a thunderstorm on the morning of the 27th. Rain fell on seventeen days. The highest temperature was 77°, on the 17th; the lowest 42°, on the 28th and 29th. Mean maximum, 68°; mean minimum, 47.1°; mean temperature, 57.5°. Partial shade readings 2° below the average.—R. I.

— **WEATHER AT RIPLEY, YORKS, DURING JULY, 1891.**—July was with us a good growing month. Up to that time the rainfall had been deficient, but I am glad to say we have during the month had several good penetrating showers, which have been of great benefit to all fruit and vegetable crops, especially so as regards Strawberries and Peas. Only on one day could the heat be said to be oppressive (the 17th), when we registered 79° in the shade. Rain fell upon thirteen days. Total fall for the month 3.08 inches, of which 0.54 inch fell upon the 7th. Mean reading of barometer, 29.95. Maximum temperature, 68.9°; minimum temperature, 46.3°. Temperature of month, 57.9°. Highest maximum temperature, 79°, on 17th, shade; lowest minimum temperature, 38°, on 28th, shade. Hay is a light crop hereabouts, and there is still much to be harvested. Potatoes look healthy so far.—J. TUNNINGTON, *Ripley Castle Gardens.*

— **WARWICK FLOWER SHOW.**—The annual Exhibition of the Warwick Amateurs' and Cottagers' Horticultural Society was held in the Castle grounds, which were generously placed at the disposal of the Society by the Earl of Warwick last week. No more delightful situation could have been found for holding a show. The long stretch of green sward set apart for the purpose descends gradually to the banks of the winding Avon, and is backed up on either side by noble specimens of Cedars, Limes, and Planes. The prizes were distributed by the Countess of Warwick, and during the afternoon both the Earl and Countess, accompanied by Lady Louisa Wells, closely inspected the exhibits in the show tents, and evinced great interest in all matters connected with the Show. Many of the productions staged by the cottagers were of great merit, and the Show as a whole was very effective. Many well known business firms sent non-competing exhibits, which were in all instances greatly admired.

— **NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).**—The series of prizes offered by Martin R. Smith, Esq., on July 21st were not competed for, owing to the season of the year being too late for Carnations. Mr. Smith is anxious that the prizes should be again offered on the date of the Exhibition of Ornamental Stove and Greenhouse Plants, in the Drill Hall, St. James' Street, Westminster, August 11th, 1891. The Council of the Royal Horticultural Society has kindly offered every facility for exhibitors. Notice of entry must be given to Mr. Barron, Royal Horticultural Society, Chiswick, W., three clear days before the day of exhibition. The Carnation Society will provide bottles if desired. The prizes are as follows:—Class A, The best border variety of self-coloured Carnation, not less than twelve trusses. Three prizes: £3 3s., £2 2s., £1 15s. Class B, Twelve varieties of self-coloured border Carnations, not less than six trusses of each variety. Three prizes: £3 3s., £2 2s., £1 15s. Class C, Eighteen varieties of flake, bizarre, or fancy Carnations or Picotees, not less than six trusses of each variety. Three prizes: £3 3s., £2 2s., £1 15s. These conditions must be observed.—1, Each exhibitor must sign the following declaration:—"I certify that all trusses shown by me for the prizes offered by Mr. Martin R. Smith have been cut from plants which have been wintered without protection in the open garden, and that they are staged without 'dressing,' and exactly as they were cut from the plants;" 2, Each truss to have not less than three flowers or buds; 3, Each truss to be cut with stems not less than 9 inches in length; 4, To be shown with Carnation foliage and buds; 5, A specimen of the foliage of each variety to be shown with the flowers; 6, The trusses to be staged in bottles, tins, or glasses; 7, No bands or ties round the calyx, and no paper collars or wire supports to be used; 8, A burst calyx to be a disqualification.—JAMES DOUGLAS, *Hon. Sec., Barking Side, Ilford.*

— THE SCIENTIFIC COMMITTEE AND STRAWBERRY BEETLES. — An entomologist writes: — "I note that at the meeting of the Scientific Committee of the R.H.S. as reported, some surprise or scepticism seems to have been excited by a statement as to beetles attacking Strawberries. It is now some years since the fact was fully set forth in the *Journal of Horticulture* that several species of the carnivorous ground beetles (I think we succeeded in identifying three) attack the Strawberry, though at first some doubt was felt as to whether the beetles were the real offenders. The report remarks that only hand-picking can be attempted as a remedy; but correspondents have stated that quantities may be successfully trapped either by putting down boards and slates on the soil, or, better still, by drain pipes loosely filled with hay, into which they crowd during the day."

— LYCHNIS VISCARIA FL.-PL. has been affording a bright display on the rockery or at the front of the herbaceous borders, and its bright rose-magenta coloured flowers are especially attractive when produced in masses. We plant several together, which is better than "dotting" the roots about singly. Although this *Lychnis* is hardy it is a good plan to divide old roots in the autumn, planting them in a cold frame in sandy soil, choosing small pieces with a root attached. By the early part of April well rooted plants will be available, and which will commence flowering freely in June of the same year.

— ONE of the best of the dwarf herbaceous *Spiræas* of a dwarf habit is *SPIRÆA FILIPENDULA* FL.-PL. For the front of a border or in a position on the rockery not too exposed to drought this Dropwort is very showy. The flower spikes are freely produced; not grow more than 18 inches high under the best of treatment. The flowers are pure white, but in very hot dry weather they quickly assume a dingy colour. No variety in the whole of the *Spiræa* family increases so rapidly as this, as seedlings spring up in the border when once a plant has become established.

— STENACTIS SPECIOSUS, or as it should perhaps be more properly called *Erigeron speciosus*, is one of the most useful in cultivation, for the flowers last a long time on the plant as well as continuing to throw up fresh flowers, that a few roots will make a show in the borders for at least a couple of months, sometimes more. The ordinary type grows from 2 feet to 3 feet high, but another which was sent me grows only 18 inches high; the flowers are smaller and a trifle deeper in colour than the ordinary one, but on the whole is the better of the two as a border plant. It is more compact, needs less support, but in a cut state I prefer the older sort, as the flowers make a finer display, and although, being larger, they have a light appearance. *Stenactis*, like most other perennials, does not succeed nearly so well if allowed to remain in one place for several years; it appears to lose vigour, especially in the centre of the root, which is an indication that they need renewal. We divide some of the roots every year, pulling them into pieces, planting them in sandy soil in a cold frame at the end of September, where they remain until the following April, when they will be useful little tufts, and will throw up several spikes of bloom. The following year they will make handsome bushes, large enough for anything. It is a mistake to have too large roots of such a perennial in a mixed border, as they entail so much labour in staking and never look so well.

— THE ST. BRUNO'S LILY (*ANTHERICUM LILIASTRUM*) has flowered better this year than I remember seeing it before. It is charming for the mixed border. When strong clumps are obtained a wonderful profusion of flowers is produced. It delights in a strong soil, mixing a little sand and old potting soil with the natural soil at planting time. Our clumps have not been disturbed for five years, and they never fail to flower well, and the pure white flowers are appreciated. They look well in a tall vase when cut with long spikes. No greenery shows them off better than their own grassy-like leaves of a glaucous hue.

— THE COMMON MONKEY FLOWER, *MIMULUS LUTEUS*, makes bright patches of yellow in the borders just now. The growth varies according to the treatment it receives and position in which it is planted. From 1 to 2 feet is the general height. Like all varieties of this family this is the better for dividing the roots annually; fresh vigour is imparted in consequence. No plant that I know can be increased more rapidly, so numerous are the rhizome-like offsets sent out from the base of an original plant. Every piece taken off with a root will quickly make a flowering plant. This plant is more often seen in cottage gardens than elsewhere.—E.

— SAXIFRAGA CYMBALARIA is a low-growing plant, suitable for the rockery, or even in clumps at the front of the herbaceous border. Among stones it may be grown to give a pleasing effect; the yellow flowers are freely produced.

— IRIS COMTE DE ST. CLAIR is one of the best varieties in the section of Flag or Bearded Irises. The three standards are white and the three drooping falls deep violet, reticulated and margined white. It is certainly one of the best small flowered kinds for the herbaceous border, and ought to be grown in quantity.

— HARDINESS OF *NICOTIANA AFFINIS*.—I was agreeably surprised to find that a number of old stools of this sweetly scented flowering Tobacco passed safely through the late severe winter uninjured. Several, and perhaps all of those not forked out of the borders last autumn, pushed up a number of shoots after the manner of various hardy herbaceous plants, and these, at the present time, are flowering beautifully. The same thing has happened elsewhere, but no one that I have discussed the matter with had previous to this season any idea that *Nicotiana affinis* is a hardy plant in the truest sense of the word. A few plants of it ought to be grown in every mixed border if only for its fragrance.—W. I.

— AMONG the plants shown at the last meeting of the ROYAL BOTANIC SOCIETY was a museum specimen of one which had lately died in the Gardens—a victim to the late severe winter. This was one of several specimens of the East Indian or white Mangrove, *Avicennia nivea*, sent to the Gardens by the late Duke of Buckingham when Governor of Madras. For some years past these plants had flourished amazingly, thanks to the near approximation to their natural condition attained by keeping them in a very wet state and watering only with sea water. Under these circumstances they threw up from the roots a number of offsets, or upright adventitious roots, of from 10 inches to 12 inches high, and half an inch thick. In a space of 2 feet square as many as eighty appeared, looking like so many rakes standing up out of the water, and keeping as near as possible the same height above the surface. The only explanation so far has been that offered by the Secretary, Mr. Sowerby. In its native state the trees form a fringe along the sea-shore and estuaries of great tropical rivers, lining the banks with a dense and impenetrable mass of vegetation, pushing itself further and further into the river or sea, and leaving behind the dry land it has reclaimed. In such a position these curious rootlets must be an immense advantage to the plant, enabling it to retain all the *débris* washed to the sides, and at the same time preventing the soil between the roots from being carried away by floods, &c. The plants of this species now growing in the Gardens are the only ones alive in this country.—(Nature.)

— VISIT OF THE HORTICULTURAL CLUB TO CRAWLEY.—The annual excursion of this Club took place on Wednesday, 29th ult., when Crawley and the neighbourhood were selected for a visit. The weather proved somewhat unfavourable, but the party, to the number of twenty-four, including several ladies, alighted at Three Bridges Station, and drove through Crawley to the extensive nurseries of Messrs. J. Cheal and Sons. They were there received by the members of the firm and staff, and immediately commenced a tour of inspection through the grounds, and, as far as time would allow, examined the numerous subjects of interest in the various departments. Worth Park, the palatial residence of Mrs. Montefiore, was next visited, the party being received by Mr. Glen, the gardener, and conducted through the gardens and grounds. The terraces and Italian gardens adjoining the mansion were next inspected, and a tour of the park was commenced, and the party were led by winding paths through woodlands and shrubberies surrounding the beautiful lake to the farmstead, where they were met and subsequently entertained to luncheon by Mr. Mare, the courteous steward. A long drive through Tilgate Forest followed to Handers Park, the residence of Mr. Warren, and Mr. Offer, the able steward, showed the visitors through the gardens; these contain a rich collection of Japanese and other dwarf Conifers, which have passed through the late severe winter unhurt. Handers Park is also famous for specimen stove and greenhouse plants. Returning through Holmbush Park, the charming residence of Col. Clifton Brown, most of the party walked through the pleasure grounds, over which they were conducted by Mr. Paterson, the gardener. After dinner at the "George" Hotel, Crawley, the members expressed themselves as highly gratified with what they had seen, and with the courteous way in which they had been received at the various places visited. The cordial thanks of the Club were given to Mr. D'Ombrian and Mr. Cheal for carrying out the arrangements for such an enjoyable day.

## WANDERINGS.

AMONG the pleasant remembrances of our visit to Antwerp was a call from one of its chief citizens, Mr. Everaerts, who gave such a strong, kind, take-no-denial sort of invitation to his beautiful home that it was irresistible. 'It was not kind of you when in Belgium before not to come and stay with us, and you must come now and remain a very long time. Our pleasure will be very great to send the carriage at your convenience and drive you to our residence at Vieux Dieu. It will be a great treat to us to have you with us, as we like the English, and especially those of them who love gardens as we do. Our garden is our great delight, our constant home pleasure, and is made the greater to us when it is shared by our friends.' That was the spirit of the invitation, and so far as can be remembered the form, to the country

on this? Does it not show what Shakespeare knew, and immortalised the truth in words that cannot die,

"One touch of nature makes the whole world kin?"

Here were workers in the hive of horticulture for subsistence on the one hand, and for mind-refreshing, health-giving, heart-loving exercise on the other—people of three nationalities but with common sympathies, and therefore common friends. It shows what gardening does for those who love it truly—unites all, of whatever rank, in the brotherhood of humanity, and makes happier through the union rich and poor alike.

"Very fine preaching," perhaps some of my readers may say, "but this does not happen in England." But it does. When was our great florist, the Rev. F. D. Horner, happier than in the plain little cottage of

FIG. 17.—THE ROCKERY IN MR. EVERAERTS' GARDEN.

home—the garden home it may be appropriately termed—of one of the truest garden lovers that can be found in Europe.

Mr. Everaerts is a great international banker and financier, also an ex-senator, and one of the most trusted and esteemed of the citizens of Antwerp; and Mrs. Everaerts is like her husband in her love for everything that grows, in her transparent kindness, her pleasing affability, and the frank and homelike welcome she gives to those who, as she says, are so kind as to visit them. I rather think that the sharer of my fate for more than thirty years—most of them years of labour not of luxury, but all of them years on which we can look back with as much satisfaction as can the most wealthy on their past career—yes, I almost think that, to quote the old English song, "My dear wife Joan" was really a little nervous over this visit to those who were strangers to her but not to me, and I well knew how soon she would be happy and at home with them. And so it was. She could not and did not feel a stranger a moment after her genuine welcome by Mrs. Everaerts, but quickly appeared as settled as if "the place was all her own." But why dwell

the working cutler florist's—the Simonite's—on that veritable "Rough Bank" at Sheffield? Not often probably except when he had "Ben" as his drawing-room guest at home. When is Mr. S. Barlow, J.P., more contented than when his flower-loving "mill hands" share with him the pleasures that his Tulips and Carnations afford, and discuss their points in the native vernacular? It is said that this "touch of nature," this mutual sympathy that flowers create, is so active with him that he sends his carriage for an aged workman who can no longer walk to see "th' owd gaffer" (old master), and the flowers that make them friends. Surely the world is not made worse for these pleasant associations, but better, as brought about by the good influences that are born in the garden, therefore let them be nurtured. Tired of all this are you? Well, we will change the matter; but it is all the same appropriate to the text—"Wanderings," mental wanderings; and now those of our young men who aspire to write a few pages for the *Journal*, and know not what to say that will be readable, may take a lesson from this example in choosing a text—short yet expansive, and around which the thoughts

have room to play, and memory to yield from its stores of material garnered in past days.

We will now, if you please, go back to Belgium. It has been suggested that Mr. and Mrs. Everaerts are "workers" in their garden, and it is true. They are workers both in it and for it. Their holidays have been spent for years past in searching for treasures abroad that they could establish at home; and nowhere have I seen the equal of the

and running stream below, through leafy tangle at the base, up stepping stones, then creeping in tortuous course along the mountain side to the resting chalet at the summit.

A few years ago an artist endeavoured to portray this fine example of taste and labour in this Journal, and although he conveyed an idea of the nature of the work, he could not adequately represent either its magnitude or charms. Still as it is the best representation available, I shall

FIG. 18.—MR. JEAN EVERAERTS.

work that has been done by two amateurs. It seems incredible that the huge alpine rockery could have been built by one pair of hands in spare morning and evening hours. Hundreds of tons of material must have been employed in its construction, and the stones were brought from a distance of several miles; while the plants that clothe it so richly were collected and placed in their positions by the steady untiring perseverance of the owners over a period of a quarter of a century. In design, as well as magnitude, the rockery is remarkable. It must be a replica in miniature of some natural scenes—of precipice and rugged knolls, of spurs and peaks, with narrow paths leading from the gorge

ask that it be reproduced, as it seems fitting that the worker and his work should be seen together in the pages which have afforded him pleasure and helped him in his various cultures during his gardening career. They could not teach him how to make and furnish a rockery, for in that art he is a Master; but in the production of fruit and flowers under glass and outdoors, also in the vegetable supply for his two establishments, they have been useful. It has been previously said, and I have had conclusive evidence of the fact from the tongue of his gardener, that he, through the liberality of his employer, was taught the English language for the purpose of reading the *Journal of Horticulture*. The

garden of about thirty acres may be said to be conducted on Journal lines; it is cropped with English seeds, contains plants from our various nurseries, and is without any doubt a credit to master, mistress, and man, for they all join happily together in the work. As bearing on the English connection, an event of the dinner table may be mentioned, as it caused a little amusement. Among the letters brought in was one containing the portrait of an English florist: no, there was no letter, but only a smiling face, "with compliments." It was handed to me for recognition, with the remark, "This is one of the pleasant ways of the English; your friend does not say one word about the bill I have not yet paid, but sends me this; he is very kind and thoughtful, and shall have his money." I could not help thinking there was a thoughtful man in Belgium, too, who thus expressed his appreciation of the pictorial presentation.

And now, lest it should be supposed I am making too much of the Belgian garden, saying more about it than it deserves, I will adduce supporting testimony. Some persons who travel beyond their own country are said to view everything abroad through rose-coloured spectacles of considerable magnifying power, and therefore are prone to disparage home work, manners, and customs accordingly. No doubt many persons can remember how greatly they were impressed on a first inspection of something "abroad" they had longed to see; how on a second visit the object was less striking, and on a third was only of an ordinary character. They then began to feel there is something worth seeing at home after all. In gardening there undoubtedly is, indeed, broadly speaking, and taking a wide survey of all branches of the art, there are not many persons who can see things as they are, and who know what they see, who will refuse to concede that there are no better cultivators in the world than the best British gardeners. The farther I go and the more gardens I visit the greater is my pride in the cultural capacity of my countrymen. But this must not prevent a just and fair description, however "rosy" it may seem, of the work of others wherever it may be found, and by whomsoever conducted and accomplished. Mr. Everaerts' garden is not to me of diminishing but increasing interest on each recurring visit, including the last, and possibly to remain so, though the thought is not one of the most pleasant on which to dwell.

Here is the confirmatory evidence I am able to adduce from a gentleman who has seen many gardens both in Belgium and in Britain that the garden in question is distinctly noteworthy:—"One mass of *Cypripedium* spectabile more than 3 feet across with bright green foliage, from which emerge fifty-three fine blooms; standard Roses, 12 feet high and as much through, covered with hundreds of flowers; and a border of *Gnaphalium Leontopodium* (Edelweiss) in full bloom, and measuring 150 feet long by 5 feet wide, are features seldom met with, and which I had the pleasure of admiring last week at our friend, Mr. J. Everaerts', beautiful seat at Vieux-Dieu.

"No place in this country is richer in plants, and I daresay that in very few is the culture of plants so well understood as it is here. Collections of deciduous trees and shrubs, Conifers, Rhododendrons, and evergreens generally, herbaceous, and especially of alpine plants, are very complete. Such things as the rarer *Gentianas*, *Primulas*, &c., *Rhododendrons ferrugineum*, *hirsutum*, and their red and white varieties, and many other scarce plants are represented by grand specimens, and skilfully distributed on the large rockery which you know so well. Most of the alpine plants grown on the rockery were collected by Mr. and Mrs. Everaerts themselves on their different tours on the Alps. Mr. Everaerts rises early in the morning and remains with his plants until business calls him to town—in fact, he spends all his spare time with them. The watering of the plants deserves special mention. It is done in a peculiar manner—for instance, plants requiring constant moisture at the roots are flanked with a good sized flower pot made to hold water, a band of cloth hangs out of it, supplying the moisture drip by drip in the way of a syphon. Mr. Everaerts found out several other combinations, speaking highly in favour of his inventive character; the consequence is that plants do remarkably well. I never saw, for instance, such masses of *Linnæa borealis* creeping on the rockery. They are a yard across and in great luxuriance.

"Mrs. Everaerts is as great an amateur as her distinguished husband. She is very fond of Roses and Ferns. The leaves of the latter are dried with care, pressed between sheets of silky paper and used as elegant lamp screens, which she makes with great taste, and distributes to her friends as souvenirs of their visit to her country residence.

"Among fine trees may be mentioned several examples of *Gleditsia inermis* and *triacanthos*, and a very fine Tulip Tree (*Liriodendron*). Among Conifers really grand specimens of *Abies Gordoniana*, *lasiocarpa*, *Menziesi*, *Douglasi*, and *Nordmanniana*. Of each of the two latter there are about a dozen splendid trees from 30 to 40 feet high. The newer species are also all represented in good-sized specimens. *Tsuga Hookeriana*, two plants of the largest known in this country. *Cryptomeria Lobbi* deserves special mention. This noble tree is about 30 feet high and of a perfect pyramidal form. At a distance I took it for a fine *Wellingtonia*, of which it has the habit. It has not suffered in the least by frost.

"Japanese *Acers*, especially the purple-leaved varieties, do well here and have proved quite hardy. I admired a bed of *Kalmia latifolia* surrounded by *Kalmia nana rubra*. It was covered with flowers, and most effective. I need not to speak of the fine border of herbaceous and bulbous plants, which you know very well, and are, I think, unsurpassed in Belgium.

"There are a good many orchard and plant houses, one of which has now been converted into a fernery by Mrs. Everaerts, and filled with the choicest and finest sorts.

"The soil being of a sandy loam fruit trees do well. We find all the leading sorts of Grape Vines, including the English varieties, numerous, and well grown pyramid Pears, standard Apples, Apricots, Plums, and Cherries in quantity, and all of choice quality. Vegetables and small fruits are fine and abundant.

"The gardener, Mr. Jean Borré, has been now some twenty-eight years in his situation, and is as much liked by his master and mistress as he respects them. The farm premises have been rebuilt, all being exceedingly well kept, and as clean as I ever saw any in Holland (celebrated for its cleanliness). Mr. Everaerts procured a farmer from Switzerland, who evidently knows his business well."

The above letter was spontaneous and unexpected. It is a simple record of the impressions made by a recent visit. It is a fair, just, and true description of what is unquestionably a well furnished, well kept, and much-loved garden, which all true garden lovers are welcome to inspect.

The drives in the surrounding country with Mr. Borré as guide and interpreter were full of interest. A call was made at Mr. Havenith's establishment, where Grapes and bullocks are grown extensively for market; also on Mr. Sels, who has thirty or forty vineries in a village, the name of which cannot be remembered. He crops his Vines enormously; the prices for Grapes being lower than in England, only heavy crops are found to "pay," but the quality is below the English standard of excellence.

The villages passed through appeared nearly deserted, as all the people, men, women, and children, seem to work on the land, and certainly ten times more were observed thus employed than are seen on an equal area in England, except in Strawberry fields in July. Let us hope they are all as happy as they appear to be.

To Mr. and Mrs. Everaerts and their excellent gardener thanks may be permitted to be here most cordially rendered for manifold kindnesses received by—I had nearly said John Bull and his wife, but mean—a typical pair of natives—DARBY AND JOAN.

## INSECTS OF THE FLOWER GARDEN.

(Continued from page 384, last Vol.)

My experiences amongst gardeners generally have convinced me that they are intelligent men, not simply in their special department, but in other matters that may call forth their powers; but I must own that some of them seem to have a difficulty in grasping what are really easy entomological distinctions. This is the more remarkable, because they are frequently called upon to discriminate between species and varieties of plants, and are therefore, for the most part, quick observers. Here is a point which I have noticed cause perplexity, the difference between the true caterpillars which produce butterflies or moths, and the false or pseudo-caterpillars which develop finally into sawflies. It is not so much a question of name, that of caterpillar may be as fitting for one as for the other, both being devourers of vegetable substances and strippers of foliage, but successful measures for the suppression of hurtful insects depend largely on a full acquaintance with the habits or economy of the species that are to be guarded against. Still, it must be allowed that some of the mock caterpillars of sawflies appear, at first sight, very similar to those of the *Lepidoptera*, yet they belong to the primary division of the *Hymenopterous* order, which though it contains so many troublesome foes, also enrolls a host of insects that are the friends or helpers of the gardener.

The flower garden offers special attractions to a large number of the insects of this division. Some are drawn to it by the flowers, which supply them with honey and pollen; some seek it because it furnishes them with insects they prey upon; and some, like the sawflies, visit it in order to attack the leaves or stems of plants. A very comprehensive order of insects this, embracing the ants, wasps, and bees, which rank as the most intelligent of the race, and also comprehending, besides the sawfly group, the remarkable brotherhood of the *ichneumon* flies, so destructive to other insects, through their habit of depositing eggs in or upon the bodies of their victims while in the early stage of existence. A portion also of these four-winged insects are makers of galls, but the two-winged flies produce some of them.

We begin with the species to which allusion was made at the commencement, those which, as larvæ, consume the buds, leaves, or occasionally the flowers of plants; and which, from their frequently feeding in companies, are very observable. Exceptions there are, as in the case of the sawfly larva, which sometimes swarms upon hedges of Hawthorn and Bramble; this conceals itself during the day within the bushes and comes forth to feed at dusk, probably thus escaping insectivorous birds. But I rather think that some of them, from their exposed manner of feeding, are not apprehensive of any danger, and are shunned by birds, which have their fancies in the matter of insect food. The abundant species infesting the Gooseberry is an example, as it is stated to be eaten only by the cuckoo. This sawfly caterpillar is often confused with that of the Gooseberry moth, and such caterpillars have certainly

many of the habits of true caterpillars, and somewhat of their appearance. But a sawfly larva possesses a larger number of legs than do larvæ of butterflies and moths; theirs never exceed sixteen, a sawfly may have eighteen or twenty, and in some species there are but six, which is never the case with the true caterpillars, which have at least ten. Some caterpillars are a trifle eccentric in posture; they double themselves round or elevate the head or tail occasionally, but I never saw a true caterpillar curl up its tail, yet this is done by several of these sawfly mock caterpillars. The head also will be observed to be fitted on the body much more rigidly in them, allowing very little play. In some species these larvæ unite to construct a sort of silken tent, under which they can feed, sheltered from the weather. There have been a few curious instances of some being discovered in the interior of fruits.

The sawflies, or Tenthredinidæ, are small eaters when in the fly condition, feeding chiefly on fruits. Their general appearance separates them readily from all other insects. The body is rather short and nearly equal throughout, the wings large, and the legs longish; their colours vary, but black, yellow, and red occur frequently. No part of a sawfly, however, is more interesting than the implement which suggested the name, and by which the work of egg-placing is effected. It is a double saw, and the female fly, when using it, first slides out one, and as this is returning pushes forward the other; the double movement is continued till a suitable hole has been cut. Each tooth of the saw is studded with smaller teeth, and in the different species the strength of each saw is suited to the task it has to perform, because some twigs and leaves require very different treatment in making a cut to what others do, as their thickness or toughness vary. It is also supposed that a minute drop of acrid fluid is thrown into the wound by most, if not all the flies, whereby it is prevented from healing up.

Just now the second or summer brood of the sawfly of the Rose (*Hylotoma Rosæ*) is actively employed in oviposition about gardens where this favourite flower is cultivated, and it is a species affording us a good illustration of the tribe. This fly is about half an inch in length, the body is glossy and of an orange tint, the head and legs blackish. The mother fly may be watched and caught in the act as she passes from twig to twig; sometimes three or four eggs only are placed near together, at others there may be a dozen on a single twig. This is a tiring task, and the parent does not complete it in a day, several being occupied by it before all her eggs are disposed of. Should we cut open an infested twig before the larvæ have emerged we see that round every egg is a small vacant space; the vegetable cells do not press upon it—in fact, after the egg is laid its shell expands, and the size of it is increased. When the larvæ have hatched they feed on the leaves of the Rose till these are beginning to decay, and their growth being completed enter the soil at the roots, where each constructs a separate cocoon. In colour these larvæ are yellowish green, dotted over with numerous black and hairy tubercles. While eating it is a favourite fashion of theirs to assume the figure of the letter S. Evidently a most effectual way of dealing with them is to remove or kill these winter cocoons, and thus reduce the number of flies that appear in early summer to start the new brood. The eggs of this brood are laid about May, and of course a much greater amount of mischief is done by the first emerging larvæ, as the Rose's development of both leaves and flowers is seriously checked. When adult in June all the larvæ do not descend to the earth. Some make cocoons of silk upon walls or trunks; these are yellow, very elastic, and the outer fibres cross in a way which reminds us of a racquet. Less frequently noticed is another enemy of the Rose (*Tenthredo agilis*), which hides itself within some twig to undergo its change, and, according to some observers, also feeds on the pith while it is growing to maturity.

The dusky brown sawfly called *Tenthredo Lucorum*, which is nearly the size of a queen wasp, is frequently to be seen careering over our garden walks, and the supposition is natural that this insect has some evil designs upon our flowers, but I do not think it touches them. To the larvæ the Hawthorn and Sloe afford food, and these creamy white rather unpleasant looking creatures have been plentiful on many hedges during this summer. The cocoon is a conspicuous object upon the twigs in the winter months, the larvæ remaining unchanged till the spring; instinct, however, has taught some birds to open these and devour their contents when other food is scarce. We often see in gardens the large sawflies of the genus *Cimbex*, with clubbed antennæ, which fly slowly with a buzzing noise. Their chief food is the leaves of such trees as the Aspen, Birch, Alder, Pine, and Elm, most of them being green marked with black. It is observable that the sawflies show no inclination to attack the exotic plants, which are common in our beds and borders during the summer, though the characteristics of some of these might seem to be tempting, but they have appetites restricted to particular species, and less variable than those of many of the true caterpillars.—ENTOMOLOGIST.

#### ROSES ON HOUSE WALLS.

THE past summer has been a favourable one for Roses in this immediate neighbourhood, abundance of clean healthy blooms being seen in many of the gardens. One specimen of the Gloire de Dijon called forth a comment in the local paper as being "A sight worth seeing and worthy of being photographed." The owner took the hint and had some photographs taken, of which I send you one. The tree in question is on the front of the house of T. A. Lodge, Esq., of Dogmersfield, and was budded by himself. The whole tree shows only two years' growth, and extends round the corner of the house, over the greenhouse, where the blossoms are quite as profuse. The photograph scarcely does justice to it, as it was not taken till the blooms were going off and many of the lower ones had been cut. They were not only numerous but very fine.

At Itchel Manor also, the residence of C. Maxwell Lefroy, Esq., some remarkably good Roses have been grown. In these gardens Roses are rather a speciality, and they are extremely fine both as regards size and colour.—H. W. AUSTIN, *Fir Cottage, Church Crookham, Hants.*

[The photograph shows the Gloire de Dijon Rose mentioned by our correspondent covering nearly half the front of the house, and bearing abundant flowers at the upper parts of the stems.]

#### ROSE LAMARQUE.

FOR producing blooms in quantity in a greenhouse early in the season there is no Rose to equal this one. The growth is free, each shoot terminating in a cluster of pure white Roses. From the bud stage to a half-expanded state this is perhaps the whitest of Roses; afterwards the centre of each is tinged with faint yellow.

As a climber Lamarque has few equals, either with glass protection or on the open wall. It strikes freely from cuttings 3 inches long, inserted early in May, taken from a plant which bore a crop of flowers during April. We use a sandy soil, plunge the pots in a gentle bottom heat, and shading the leaves from bright sun. Plants so raised quickly become established, and give excellent results if a few essential points in the culture are attended to. Climbing Roses like this do not succeed when growing in pots; they need more root space than that system affords. A free growth after flowering is important, and is most easily obtained by first removing any weakly growths and others to prevent crowding the branches. Abundance of water, both at the roots and over the foliage, is necessary to keep down red spider, to which the foliage of this Rose is much subject, and if allowed to increase must damage the next season's flower crop. A thorough drenching with the garden engine occasionally is in favour of a clean growth.—E. M.

### HORTICULTURAL SHOWS.

#### HAYWARDS HEATH.

THE third annual summer Show of the above Society took place by the kind permission of Mr. Pennett in his meadow, South Road, on Wednesday last the 29th ult. The Show was in every way a great success, and a decided advance on its predecessors. The entries were 1200 in number, making an average of eight per class. Unfortunately the weather again proved most unfortunate, for it rained nearly the whole afternoon.

The best features among the plants were the groups. There were five entries for a miscellaneous group. The first prize was awarded to Mr. George Stringer, gardener to R. A. Bevan, Esq., Cuckfield, with bright, well grown, and artistically arranged plants. Mr. W. Jupp, gardener to G. Boulton, Esq., Eastbourne, followed with a light arrangement. Third, Mr. H. Townsend, gardener to E. J. Arbour, Esq., Lindfield. Fourth, Mr. S. Horscroft, gardener to T. Potter, Esq., Ardingley. Mr. Jupp was placed first for both the groups of Ferns and foliage plants, followed in the first-named by Mr. H. Townsend and in the latter by Mr. G. F. Wickham, gardener to Mr. Humphrey of Keymer. The stove and greenhouse plants were rather disappointing once more. Mr. A. Stamp, gardener to Mr. Knight, Haywards Heath, was first. For four fine-foliage plants, Mr. H. Townsend and Mr. J. Hodges, gardener to S. Gibbons, Esq., Lindfield, gained the premier awards. Bright groups of Gloxinias were shown, Mr. D. Smith, Wivelsfield, winning the first prize. The first place for six Ferns was given to Mr. G. F. Wickham for large bush plants. Begonias were very bright, Mr. J. W. Long, gardener to General Adams, Haywards Heath, having the best singles, with very fine flowers. Mr. G. F. Wickham was second with good doubles. The last-named was first for a single specimen plant in bloom with a fine Bougainvillea; Mr. S. Horscroft taking first place for a specimen foliage plant with a fine Croton.

The season has been rather backward for a good show of Dahlias and Asters. There was, however, a good show of Roses in the various classes, Mr. P. Marsh, Lindfield, and Mr. R. Inglis, Cuckfield, coming in first and second for twelve blooms. The class for hardy herbaceous flowers

from the open border and hardy annuals formed quite a fine display. Mr. W. Manton, gardener to Mrs. C. Borrer, Bolney, was first in the former two classes, and Mr. G. F. Wickham in the latter with fine collections. The bouquets were not very grand, Mr. G. F. Wickham being an easy first. In consequence of the ladies taking up the table decorations—a centrepiece—there was a good competition in this class, and to see the amount of materials drawn from the open borders by the most successful exhibitors gave a good illustration of what your correspondent "D. W. C." said on this subject in this Journal (page 83). Miss A. Godby, Haywards Heath, was first in the open class with a light arrangement, chiefly bright Poppies, Cornflowers, Sultans, &c., and Grasses. Mr. W. Brookway, Burgess Hill, was second, also with a light tasteful exhibit. For the class for ladies only Miss E. Packham, Haywards Heath, had the premier place, closely followed by Miss A. Godby. Had these, with the bouquets, been all properly arranged on one table on a white cloth or paper, as is generally done at large shows, instead of being placed in different parts of the tents, they would have been a very charming feature.

Black Grapes was a fair show, Mr. J. Hodges was first for both black and white Grapes with finely coloured fruit, and Mr. Geo. Warrin, Balcombe Place, Balcombe, was second in both classes. Mr. J. Holman, gardener to Mr. Good, Burgess Hill, was first for six Peaches, Grosse Mignonne, splendid fruit, Mr. J. Hodges being first for six Nectarines, well coloured. Messrs. P. Marsh and W. Manton were the successful exhibitors of scarlet and green fleshed Melons. The latter was also to the fore with Tomatoes. There were large entries of small fruits, the successful exhibitors being Messrs. J. Sands, C. J. Warren, A. Scutt, W. Manton, Geo. Warren, J. Linghy, and others.

In the special classes open to the county, Mr. Geo. Stringer was the only exhibitor for the collections of fruits, flowers, and vegetables. Mr. W. Manton was well to the fore in vegetables, winning the Societies' first prize for nine dishes, and the Messrs. Sutton's prize for a collection of six in a good competition. Mr. J. S. Cottingham, Haywards Heath, took the premier place in Messrs. Carter's class, and Mr. Geo. Stringer won Messrs. Cheal's prize for similar collections. Mr. T. S. Ware's prize for twelve herbaceous flowers was awarded to Mr. W. Sanders, gardener to Mrs. Bannister, Cuckfield, and a similar prize offered by Messrs. Norman of Burgess Hill was won by Mr. W. Manton. Mr. S. G. Ramsey's (Worham, Kent) prize for twelve cut Roses to Mr. P. Anscombe, Lindfield, and the Messrs. Woolard's (Lewes) prize for twenty-four cut Roses was given to Mr. A. Slaughter, Steyning, for splendid blooms.

The trade contributed, not for competition, largely to the Show. Messrs. W. Wood of Mansfield, A. Stoughton of Steyning, W. Balchin and Sons, Hassocks; W. Piper, Uckfield; J. Cheal & Sons, Crawley; Mrs. Woolard of Lewes; and W. Knight, Hailsham, all sent fine collections of cut Roses, which was a great attraction. Messrs. Cheal had also fine Cactus, Pompon, and single Dahlias; and Messrs. Peed & Son had a group of decorative plants. Messrs. Grimsdick of Haywards Heath had a miscellaneous exhibit; and Mr. Haslitt, Bolney, had a large collection of British Ferns, showing the almost endless variety of forms assumed by a very interesting class of plants.

Mr. A. Willmot, Hon. Secretary, and his excellent assistant, Mr. Jolly, carried out their arduous duties in good style. There was some delay, and the necessary consequences were hurried judging and a waiting public. It would facilitate matters very much in this respect were a small tent set aside for those who have cut flowers to arrange, so that they do not interfere with the staging arrangements of plants.

#### LIVERPOOL SHOW.—AUGUST 1ST AND 3RD.

LAST Saturday the above Association opened their twelfth grand summer Exhibition in Sefton Park, and on no previous occasion has such a display of plants been provided there. The tent was of enormous proportions, and in the centre the visitor's attention was immediately arrested by the groups of stove and greenhouse plants. Up the centre of the marquee were magnificent Palms and Tree Ferns, with foliage and flowering plants, Ferns, &c., blending and harmonising in the best possible manner, and on each side were arranged Zonal Pelargoniums, Caladiums, and all kinds of greenhouse flowering plants. The top end to the left of the entrance was a continuation of the tent cross-ways containing the fruit, vegetables, amateurs' groups, &c., while the corresponding end was filled with nurserymen's groups, Roses, Orchids, cut flowers, Gloxinias and Cockscombs. Coming to the principal prize winners it will perhaps be as well to follow the schedule:—

*Stove, Greenhouse, and Foliaged Plants.*—Very fine indeed were these. The first prize for ten was deservedly awarded to Mr. B. Cromwell, gardener to T. Sutton Timmis, Esq., Cleveley, Allerton, for an excellent collection, comprising a splendid Anthurium Scheitzerianum, 100 spathes; Ixora Williamsi, superb; Clerodendron Balfourianum; Croton Queen Victoria, 7 feet 6 inches through, well grown and beautifully coloured, the same remark applying equally to Croton Countess; and a splendid Gleichenia dichotoma was 7 feet 6 inches in diameter. The second position was taken by Mr. Finch, gardener to J. Marriott, Esq., Coventry, who fell short in the flowering plants, the best being Erica Parmenteriana rosea, Statice Pattersoni, Crotons Queen Victoria and Warreni, very good, about 7 feet in diameter; and excellent Palms. Mr. A. R. Cox was a good third with a fine Croton Queen Victoria, 7 feet; a capital Erica Maroccaniana, and Kalosanthes Dr. Regel; also a choice example of Calamus ciliaris. There was only one exhibitor with the six stove and greenhouse plants—viz., Mr. Jellicoe, gardener to F. H. Gossage, Esq., Camp Hill, Woolton, who had well-flowered examples of Stephanotis, Allamanda nobilis, and Clerodendron Balfourianum. Mr. Jellicoe was

also accorded chief honours in the class for three stove and greenhouse plants in bloom, having in it a fine Anthurium Andreanum. Second, Mr. T. Wilson, gardener to O. H. Williams, Esq., Fulwood Park, Aigburth. For four stove and greenhouse plants in bloom Mr. A. R. Cox was a good first, having a beautifully flowered Clerodendron, Statice Holfordi, and Erica amula. Second, Mr. Cromwell. In other classes the prizewinners were Messrs. Finch; R. Pinnington, gardener to Edward Banner, Esq., Blacklow House, Roby; Thos. Gowen, gardener to J. A. Bartlett, Esq., Mossley Hill; A. R. Cox; Heany, gardener to H. G. Schintz, Esq.; Jellicoe; T. Gowen; and J. J. Craven, gardener to J. Grant Morris, Esq., Allerton Priory, Woolton.

*Ferns.*—The chief prize for six was taken by Mr. Cromwell with specimens ranging from 7 feet 6 inches down to 5 feet in diameter, conspicuous being Nephrolepis davallioides furcans, N. rufescens tripinnatifida, Davallia fijiensis plumosa, and Gleichenias Mendeli and dichotoma. Second, Mr. T. Gower, with a remarkable Davallia Mooreana. Third, Mr. A. R. Cox, who had excellent Cibotium Schiedei and Adiantum farleyense. For three Mr. J. Bounds, gardener to A. L. Jones, Esq., Oaklands, Aigburth, was first, having a splendid Adiantum scutum. Second, Mr. Jones, gardener to W. C. Clark, Esq., Orleans House, Sefton Park, and third, Mr. G. Eaton, gardener to W. H. Shirley, Esq., Allerton House. The latter was first in the single class, having Davallia Mooreana, about 8 feet across, in the best condition. Second, Mr. Jellicoe. The Tree Fern class was taken by Mr. T. Gower. Mr. T. Foster, gardener to J. Brancher, Esq., Greenbank, Wavertree, taking first for hardy and Filmy Ferns.

*Orchids* were much below the average, and call for little comment. For four Mr. J. Bounds was first, who had a capital variety of Oncidium crispum grandiflorum in his collection. In the class for one, first Mr. T. Gower, with Saccolabium Blumei majus. One greenhouse Erica, first, Mr. Finch. Second, Mr. Cromwell. Three Fuchsias, first, Mr. Cromwell, with beautiful specimens, 6 feet high; and for one, Mr. T. Winkworth, gardener to R. Brocklebank, Esq., Childwall Hall. Mr. Winkworth also secured the premier position with six Zonal Pelargoniums, trained, well flowered, and greatly admired. Mr. T. Gower second. The latter was first for one, Mr. G. Eaton leading with four Ivyleaf varieties trained as pyramids. Tuberous Begonias have been seen to better advantage. For six Mr. A. R. Cox was first, and for one Mr. Wm. Lyon, gardener to A. Mackenzie Smith, Esq., Bolton Hey, Roby. Coleuses and Caladiums were everything to be desired. In the former Mr. Hitchman, gardener to A. Earle, Esq., Childwall Lodge, led the way, closely followed by Mr. G. Eaton. In the latter Mr. J. Warrington, gardener to Tyndall Bright, Esq., Brierley, Aigburth, exhibited six, which it would be difficult to surpass. Second, Mr. T. Carling, gardener to Mrs. Cope, Dove Park, Woolton, who had attractive varieties. In the class for Cockscombs Mr. Gower was first. Gloxinias Mr. C. Osborne, gardener to H. J. Robinson, Esq., Aymestry Court, Woolton. The same exhibitor was first for single Liliun, a magnificent auratum, with over forty flowers.

*Groups.*—These formed one of the most pleasing features in the Show. Ample space was provided, so that there was no crowding, either to those exhibiting them or to the public who viewed them. In the amateurs' class for a group in a space not exceeding 150 square feet in a circle, Mr. A. R. Cox was deservedly first. From the centre arose a light Kentia Fosteriana draped with Panicum and furnished to the ground with Maidenhair Fern. The four rising outside mounds contained four Dracenas furnished at the base with Maidenhair Fern. Midway between these were single-stemmed Crotons well coloured, and small plants of Cyperus. The plants used to give the requisite colour were single Petunias, Zonal and other Pelargoniums, with a few Cattleyas. Mr. Jellicoe's second prize group was also a capital one, and contained many choice plants, but not quite enough foliage. Third, Mr. T. Wilson; fourth, Mr. Heany. In the nurserymen's groups Messrs. R. P. Ker & Sons were first with an admirable arrangement. Mr. T. Jones was an excellent second, and displayed much taste. Third, Mr. T. Coulton, nurseryman, Aigburth.

*Roses.*—The competition in the nurserymen's class was equal, both in numbers and quality, to any former years, but in the amateurs' class there was a considerable falling off. In the class for forty-eight, distinct, Messrs. Perkins & Sons, Coventry, secured the post of honour with remarkably fresh blooms. Messrs. Harkness & Son, Bedale, Yorkshire, were good seconds; and Messrs. A. Dickson & Sons, Newtownards, County Down, were third. For eighteen cut Roses, Teas, H. Teas, and Noisettes, Messrs. Harkness were first. Second, the English Fruit and Rose Company. Third, Messrs. D. & W. Croll, Dundee. In the class for twenty-four blooms, Mr. T. Leadbetter, gardener to T. B. Hall, Esq., Rock Ferry, had a splendid stand, good in every point, and gained the first prize. Second, Mr. C. Osborne. Third, Mr. Thomas, gardener to J. P. Brunner, Esq., Sefton Park. With twelve cut Roses, first, Mr. Brownhill, gardener to George Fowler, Esq., Rock Ferry. For twelve cut Roses, two light and two dark, Messrs. A. Dickson & Sons, were first. The most tastefully arranged box of Roses came from Mr. T. R. Bulley, Liskeard. Second, Mr. Greene, gardener to L. H. Macintyre, Esq., Aigburth.

Cut flowers were well shown. For twelve varieties, stove and greenhouse flowers, Mr. Jellicoe was first, and in the corresponding class for twelve bunches of herbaceous flowers, Mr. Harrison, gardener to Mrs. W. G. Bateson, Allerton, was first; whilst the two collections of twenty-four, staged by Mr. G. Eaton and Mr. Edwards, gardener to H. Tate, Esq., jun., Allerton Beeches, were splendid.

*Fruit.*—The fruit exhibited was of the highest quality, and the competition good. In the open class for eight dishes Mr. Goodacre gardener to the Earl of Harrington, Elvaston Castle, Derby, took the leading position. He had good Madresfield and Muscat Grapes, a fair Queen Pine, splendid Royal George and Lord Napier Nectarines, Monarch Melon, fine Musch-Musch Apriots, and Kirke's Plum. The second position was worthily accorded Mr. J. Bennett, gardener to Hon. C. H. Wynn, Rûg, Corwen, North Wales, who had grand Hero of Lockinge Melons, Princess of Wales Peaches, Oxonian Strawberries, and capital Muscat Grapes. Third, Mr. P. Blair, gardener to Duke of Sutherland, Trentham, who showed Violette Hâtive Peaches, Waterloo Strawberries, and Queen Pine (very good). Mr. Goodacre was also first for a dish of Circassian Cherries, Mr. Bennett securing first place for dish of Strawberries and Hero of Lockinge Melon. In the class for six dishes of fruit Mr. Elsworthy, gardener to A. R. Gladstone, Esq., Court Hey, Broadgreen, was first, and the collection was excellent in every respect. Madresfield Court Grapes, Bellegarde Peaches, and Elruge Nectarines were especially fine. Second, Mr. Coates, gardener to W. H. Verdin, Esq., Darnhall Hall, Cheshire, who had grand Muscats. Third, Mr. Stoney. For one Pine Apple Mr. Harris, gardener to Mrs. Banks, Winstanley Hall, Wigan, was first.

Grapes were of high merit, and Mr. G. Middleton, gardener to R. Pilkington, Esq., Rainford Hall, secured no fewer than four first prizes in the five classes—viz., for four bunches (two black and two white), two bunches Black Hamburgs, two bunches Muscats, and two bunches of any other white, all well finished. Mr. Elsworthy was second in the four bunch class; Mr. Coates in the Muscat class; Mr. Barker, gardener to J. W. Raynes, Esq., Rockferry, in the Black Hamburgs; and Mr. Fergusson, gardener to Mrs. Paterson, Rockferry, in the white Grape class. For two bunches (black) Mr. W. Wilson, gardener to H. Cunningham, Esq., Gateacre, was first, and Mr. Bennett second, both showing Madresfield Court. Seldom have Peaches and Nectarines been so well shown, and the judging must have been extremely difficult. In the former, Mr. Stoney defeated Mr. Elsworthy, the winning fruits being a little the riper. The prizetakers for Nectarines were Mr. W. Allmann, gardener to Mrs. Grundy, Warrington, and Mr. Elsworthy, who were first and second. Mr. Stoney was first with a scarlet-flesh Melon, and also for a basket of miscellaneous fruits arranged for effect, and second for six dishes of hardy fruits, the chief place in the latter being accorded to Mr. Hannagan, gardener to R. C. Naylor, Esq., Hooton Hall.

Vegetables were not quite so numerous, but the collections were equal to those of former years. In the classes for twelve varieties and six Mr. J. Hathaway, gardener to the Earl of Lathom, was the chief prizetaker. Mr. Stoney was an excellent second, and secured first honours for eight varieties. Mr. Jno. Pownall was second in this class, and Mr. Craven in the class for six. Peas produced a keen competition, the prize for four dishes going to Mr. W. Mackarell, Formby, for two to Mr. Edwards. Four dishes of Potatoes Mr. Hathaway; two dishes, Mr. J. Norris, Formby. Tomatoes made a good display, the prizes for three dishes and one dish falling to Mr. J. Wilson and Mr. Hannagan respectively.

*Nurserymen's Exhibits.*—One of the features in the nurserymen's exhibits was that of Messrs. Clibran of Altrincham, who had two large stands of blooms of seedling Tuberous Begonias and a large table of hardy herbaceous cut flowers. The Begonia blooms were remarkable for the size, excellent form, and varied colouring. Selfs, whites, yellows, Picotee edged, and salmon colours were especially fine. A certificate of merit was awarded. The Liverpool Horticultural Company had a circular bed of Tea Roses in pots and Grape Vines, all in the best of health (certificate). Mr. Eckford of Wem, Salop, had delightful varieties of Sweet Peas (certificate). Mr. Lindsey, gardener to Sir J. Edwards Moss, Bart., Otterspool, exhibited a fine basket of his new bedding Pelargonium, Clara Lindsey, a sport from Happy Thought. It is a dwarf grower, the zone in the leaf well defined, and flowers freely; the colour of the flowers blush (certificate). Messrs. R. P. Ker & Sons, Aigburth, had the same honours conferred for Croton Golden Ring, Pteris Victoriae, and Dracæna argentea striata, all new plants, as had also Mr. John Forbes, Hawick, for Pansies, Pentstemons, Begonias, and Dianthus Napoleon III.; Messrs. Alexander Dickson & Sons for a new Rose, Duchess of Fife; Messrs. Harkness for a new Rose, Alice Perkins; Messrs. James Cocker & Sons, Aberdeen, for a new Rose, Duke of Fife; Mr. Smout, Hastings, for Seaweed flowers; Wm. Kneale, Woolton, Verbena Hill Cliff Scarlet; M. Hodgkins, Manchester, skeleton leaves; Isaac Davies & Son, Ormskirk, var. Lilium auratum; R. Ashcroft, West Derby, seedling Ferns; H. C. Stott, Co. Manchester; A. Mason, Shipley; and John Webster, Wavertree, for greenhouses; P. M. Row, heating apparatus; and T. P. Bethell, cardboard boxes. The Chairman, Mr. White; Vice-Chairman, Mr. Powell; Mr. Bridge, Sec., and the Committee deserve all praise for the completeness of the arrangements.

#### SOUTHAMPTON.—AUGUST 1ST AND 3RD.

In some respects the Show held on Saturday and Monday last by the Royal Southampton Horticultural Society was superior to any hitherto seen in their grounds at Westwood Park. A great improvement was noticeable in the miscellaneous groups, and the seven groups arranged presented a charming appearance. Specimen stove and greenhouse were excellent, while fruit, vegetables, and flowers were of superior quality. Mr. C. S. Fudge and his Assistant Secretary, Mr. H. Dallison, deserve

a word of praise for the admirable manner in which all the details of the Show were carried out.

*Specimen stove and greenhouse plants.*—The principal class was that for six flowering and six foliage plants, distinct, which brought five competitors. Mr. Jennings, gardener to W. Garton, Esq., Roselands, Southampton, made a most successful *débüt* by defeating that veteran Mr. J. Cypher in a fairly easy manner. The premier plants were particularly fresh. A huge *Latania borbonica*, in perfect health; *Cycas revoluta*, *Kentia Fosteriana*, *Crotons Warreni* and *Disraeli*, *Ixora Williamsi*, *Stephanotis floribunda*, freely flowered; and a magnificent specimen of *Allamanda Hendersoni*, bearing fully 300 blooms, were especially noteworthy. Mr. Cypher, Cheltenham, was second; Mr. E. Wills, Shirley, third; and to Mr. F. Mould an extra prize was awarded. For ten stove and greenhouse specimens the competition was confined to gardeners only. Mr. Blandford, gardener to Mrs. Haselfoot, Moor Hill, Bitterne, was the most successful, having admirable examples of *Bougainvillea glabra*, *Allamanda Hendersoni*, *Ixora Fraseri*, *Erica æmula*, and *Latania borbonica*. Mr. J. Amys, gardener to the Hon. Mrs. Elliott Yorke, Hamble Cliff, Netley, was a good second; Mr. W. Peel, gardener to Miss Todd, Shirley, third. For six specimens (open), Mr. J. Cypher easily led, showing *Erica Parmenteriana*, *Ixora Williamsi*, *I. Pilgrimi*, *Cycas undulata* and *C. revoluta*. Mr. J. Currey, gardener to Colonel Pepper, Milford Hall, Salisbury, was second; and Mr. Blandford third. There was still another class confined to gardeners, for six specimens, not less than three flowering. Mr. Currey won premier honours, followed by Mr. Innes, gardener to Miss Buchan, Wilton House, Southampton.

The best Orchids arranged with small Ferns came from Mr. Blandford, who staged among others *Odontoglossum Harryanum*, *O. Alexandræ*, *Dendrobium moschatum*, *D. Deari*, *Lycaste aromatica*, and *Cattleya gigas Sanderiana*. Mr. Carr, gardener to W. A. Gillett, Esq., Fair Oak Lodge, Bishops' Cleeve, was second. The best single specimen Orchid (not to be a made-up plant) was *Cattleya crispata*, with seven spikes, from Mr. J. Evans, gardener to Lady Ashburton, Melchet Court, Romsey, Mr. Cypher being second with *Cattleya Gaskelliana*. Stove and greenhouse Ferns were well represented, Messrs. Peel, Jennings, and Amys securing the prizes in the order named. Tuberous Begonias, both double and single, from Messrs. Berry, Wills, and Innes, made an extremely bright display. Some capital plants of *Celosia pyramidalis* won for Mr. West, gardener, Northlands, Salisbury, the leading position. They were 4 feet high and 3 feet across, the colours very rich. There was strong competition in the class for plants for dinner-table decoration. Mr. Waite, gardener to Colonel the Hon. Mr. Talbot, Glenhurst, Esher, took leading honours, and Mr. Wills was second, both staging plants well suited for the purpose.

Groups of miscellaneous plants, arranged for effect in a space of 120 square feet, were, as previously stated, a grand feature of the Show. Seven competed. Mr. Wills was a good first, the base of his groups being the usual groundwork of Maidenhair Fern arranged in mounds, from which arose Palms, Crotons, Caladiums, *Eulalia japonica*, *Franea ramosa*, Orchids, and Lilliums. The chief point about this group was its entire freedom from "packing," which is so often objectionable. Without a doubt this group was the best ever seen in Southampton. Mr. Carr was a capital second. Many choice Orchids added to the beauty of the arrangement. Mr. Peel followed closely for third place. Mr. Ladham, Shirley, was fourth, who employed with good effect many hardy plants in his arrangement.

Cut flowers were numerous staged. For twenty-four Roses, distinct, Mr. S. G. Rumsey, Waltham Cross, was first; and for half that number Mr. Neville, gardener to F. W. Flight, Esq., Twyford, Winchester, was first. Leading honours were conferred upon Messrs. Perkins & Sons for both ball and bridal bouquets, Messrs. W. & G. Drover, Fareham, being second in each class.

Fruit made an extensive display. For six dishes (Pine excluded) there were eight entries. Mr. Inglefield, gardener to Sir J. Kelk, Bart., Tedworth, Marlborough, was an easy first with very fine Black Hamburg and fairly good Muscat of Alexandria Grapes, Tedworth Favourite Melon, a large highly coloured fruit; Lord Napier Nectarines rich in colour, and Walburton Admirable Peaches and Brown Turkey Figs. Mr. W. Iggulden, gardener to the Earl of Cork, Marston House, Frome, Somerset, was second; and Mr. H. W. Ward, gardener to the Earl of Radnor, Longford Castle, third. For six dishes of outdoor fruit eight competed, the best coming from Mr. R. West, consisting of very fine Gooseberries, Raspberries, Cherries, Currants, and Rivers' Early Plums. With three bunches of any black Grapes Mr. Inglefield was easily first with Black Hamburg good in every respect; Mr. T. Hall, gardener to the President, S. Montagu, Esq., South Stoneham House, Southampton, second with Madresfield Court, large bunches, highly coloured but somewhat uneven; Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Wickham, third. For the same number of white bunches the last-named exhibitor was placed first with Muscat of Alexandria, fine in the berry, and nearly perfect in colour; Mr. J. Budd, gardener to F. Dalgety, Esq., Lockerby Hall, Romsey, second, and Mr. Inglefield third. Mr. Iggulden succeeded in taking the first prize for two bunches of black Grapes with Madresfield Court, small, but perfect, Mr. Allen second. In the corresponding white class Mr. Evans was first with good Muscats, followed by Mr. S. Wilkin, gardener to Lady Theodora Guest, Inwood House, Henstridge, with Golden Champion, Mr. Allen third. Single bunches of black Grapes were contributed by seven persons; the best was Black Hamburg from Mr. Inglefield, the second the same variety from Mr. Iggulden; third, Madresfield Court from Mr. Hall.

In the corresponding class for white Grapes Mr. Inglefield was first with a solid, well finished bunch of Muscat of Alexandria, Mr. N. Molyneux second, and Mr. Budd third.

For one Pine Apple Mr. G. H. Sage, gardener to the Earl of Dysart, Ham House, Richmond, was first with a well ripened Queen, Mr. Ward second with the same variety. Peaches were a strong class, fourteen dishes being staged, the best highly coloured fruit of Royal George from Mr. G. Garner, gardener to Mrs. Braddyll, Amberwood, Christchurch. Second, Mr. Inglefield, with Walburton Admirable; third, Mr. Allen. Mr. Ward had the best Nectarines, a very fine Pineapple; Mr. Waite followed with Elruge; and Mr. Amys with Pineapple.

Vegetables were very fine indeed. For ten distinct varieties Messrs. Pope, Waite, and Wilkins were adjudged the prizes in the order named. Mr. Inglefield took the lead with eight varieties, having very fine produce; Mr. N. Molyneux second; Mr. Allen third. Space forbids mention of many other exhibits in the vegetable section, which were of high quality.

Messrs. Keynes, Williams & Co., Salisbury, besides an extensive show of Roses and Dahlias of the florist type, had an attractive box of Cactus Dahlias, of which the following three received first-class certificates:—Baron Schröder, Lady Pembroke, and Dr. Masters.

#### FRUIT FORCING.

**PINES.**—*Cleaning Houses and Beds.*—These are essential to high produce, therefore clean all houses as they become vacant before being occupied again with plants. Bottom heat is essential to speedy and certain work in Pine culture, hence the first thing to be seen to is the bed. If bottom heat be afforded by hot-water pipes the material forming the bed, whether of tan or leaves, should be removed at least once a year, or insects, particularly woodlice, rapidly increase; the material also harbours other predatory vermin. All brickwork may be scalded and brushed with hot limewash, the wood and iron work with soap and water thoroughly cleansed, using a brush, keeping the soapy water as much as possible from the glass, which should be cleaned inside and outside with water only. If necessary the wood and iron work may be painted, and the roof made as watertight as practicable. Beds that are chambered, having the hot-water pipes covered with slate or other material, are much in advance of those surrounded or passing through beds of rubble. Those composed of the latter should be turned over, and any dirt or small parts removed to allow the heat given off by the hot-water pipes to penetrate evenly through the whole to the bed. Provide fresh tan in other cases, and if wet turn it occasionally on fine sunny days. With hot-water pipes beneath about 3 feet depth of tan is ample, more will be needed where such aid is not obtained.

*Potting.*—Suckers started in June will soon fill their pots with roots, and must be shifted into a larger size before the roots become closely matted together. Queens should have 9 or 10-inch pots, and those of stronger growth 11-inch pots. Water the plants immediately after potting, and plunge them in a bed having a temperature of 90° to 95°. There is no greater mistake in growing Pines than crowding young plants, as they become drawn and weakly instead of having a sturdy base. Attend to the bottom heat of beds that have been recently disturbed or upset by the removal or replacing of plants, not allowing the heat to exceed 90° at the base of the pots without immediately raising them, as too much heat will disastrously affect Pines bearing fruit or those having the pots filled with roots.

*Routine.*—Examine the plants for watering about twice a week, and maintain a moist, genial, well-ventilated atmosphere. The climatic conditions are now so favourable that Pine plants grow vigorously; therefore discontinue shading, admitting air plentifully when the temperature ranges from 85° to 95°, affording to fruiting plants a night temperature of 70° to 75°, and to succession 65° to 70° at night. Reserve, if possible, more for starting at the commencement of September.

**FIGS.**—*Early Forced Trees in Pots.*—Immediately the second crop of fruit is gathered examine the trees for red spider and scale, as keeping the soil somewhat drier at the roots and the drier condition of the atmosphere consequent on a free circulation of air encourages these pests. They are almost certain infestors of Fig trees in heated structures, and however alert the cultivator may be, these enemies get ahead during the ripening of the fruit; therefore, when that is cleared off the trees, recourse must be had to cleansing, and as the foliage and wood is far advanced in ripening, destructive agents may be employed at a strength which would not be safe at an earlier stage. If, therefore, these pests have made undesirable progress, it will be advisable to syringe the trees with a petroleum mixture, one-third half-pint or wineglassful of petroleum to four gallons of water, in which 8 ozs. softsoap has been dissolved, with 1 oz. soda, whilst boiling, one person stirring the mixture briskly with a broom-handle whilst another applies it to the trees with a syringe, so as to thoroughly wet every part of the tree, the under as well as the upper side of the leaves and all the wood. To prevent the mixture soaking into the soil a little dry moss may be tied round the stem, and

then a sort of pyramid of the same placed about the plants. If the wood is badly infested employ a somewhat stiff brush for freeing it of the scale whilst wet. In bad cases repeat this in the course of a day or two, afterwards syringing thoroughly with tepid water. The trees will only need water to prevent the foliage becoming limp, ventilating to the fullest extent day and night; but protect the trees from heavy rains, which have a tendency to keep the growth active instead of securing that rest so essential for those subjected to early forcing.

*Early Forced Planted out Trees.*—The second crop is ripening and will need a circulation of air constantly, more of course by day than at night. If dull, wet weather prevail, a gentle heat in the pipes makes all the difference between well ripened and insipid fruit. Watering at the roots must be diminished, and syringing discontinued, but a moderate air moisture may be maintained for the benefit of the foliage. If red spider is present and there is heat in the pipes coat these thinly with sulphur, or a good syringing may be given after the fruits have been closely picked, choosing a time when there is a prospect of the moisture not remaining long upon the trees. As soon as the fruits are all gathered the trees may have a good washing with the syringe or garden engine to free the foliage of dust and red spider, otherwise a free circulation of dry warm air should be maintained in the house until the foliage commences falling naturally, and which must not be accelerated by allowing the soil to become dust dry at the roots.

*Unheated Houses.*—Fig trees grown against walls are not always satisfactory, especially in a wet season; but Figs of the highest excellence are grown under glass. To insure a crop with certainty the structures should have a south aspect. The trees must have the roots restricted to narrow borders, one-third the width of the trellis is ample, well drained, and not more than 2 feet deep, composed of good loam of a calcareous nature, rather strong, adding one-fifth of old mortar rubbish, or chalk pulverised by frost, and a sixth of road scrapings. The carboniferous matter is essential to the formation of nitrates in the soil, and sand is an important constituent in building up the structure of the trees. If the loam be light add a fourth of clay marl broken up and intermixed, putting the materials together rather firmly to induce a short-jointed sturdy habit. With unobstructed light and provision for free ventilation the finest Figs may be obtained if the usual attention is given to watering through a light mulch of partially decayed manure, and feeding with liquid manure as required. It is also necessary that the growths be thin, acting on the extension system, but securing by judicious management in stopping a fair amount of spurs, and in no case allow more growths to be made than can have full exposure to light. The fruit is now advanced in swelling, and every pains must be taken to keep the foliage free from red spider. This may be effected by forcible syringing early in the afternoon, but do not syringe if there is no prospect of the foliage becoming dry before night. Under such circumstances damp the border, especially in the afternoon, and occasionally with liquid manure. Admit a little air early, increasing it with the sun heat, maintaining through the day a temperature of 80° to 85° with free ventilation, closing early so as to run up to 90° or 95°, even 100°; and when the sun power is declining a little air may be admitted at the top so as to allow the pent-up moisture to escape, the temperature gradually cooling down. Water or liquid manure, according to circumstances, will be required once a week or oftener in order to keep the soil thoroughly moist. When the fruit begins to ripen lessen the supply of water and discontinue syringing, securing a circulation of air constantly, and freely ventilate when favourable; but sun heat should be husbanded, and will do no harm if the atmosphere is not confined, a little ventilation being given so as to allow of the moisture escaping instead of condensing on the fruit and causing it to crack.

**CHERRY HOUSE.**—The trees are now ripe in wood and plump in bud. The leaves, too, will not be capable of much further effort in elaborating the sap and storing it in the buds and adjacent wood; therefore any undue excitement will cause the trees to start into growth, which must be guarded against by exposing the trees to atmospheric influences as far as the house will admit, which is the best means of averting premature growth, to which the Cherry is liable when forced year after year successively. The border must not be allowed to become parchingly dry, but must have a copious supply of water, and if the trees are weak afford liquid manure. To subdue red spider give an occasional washing with the garden engine or syringe; but by all means remove the roof lights, the cleansing influence of rain and invigorating tendency of dew with the thorough moistening of the border having a very beneficial effect. Black aphides can scarcely be kept long from Cherry trees, but the leaves and wood at this season, from their hard texture, are not inviting to them, yet if they appear promptly use tobacco water or dust the affected parts with snuff or tobacco powder. The narcotic is fatal to these hard-to-be-killed insects. Cherry trees in pots are the most interesting of all fruits grown that way. They offer such a variety and afford fruits over so long a period that it is remarkable they are not more commonly seen. With very slight forcing they ripen in May and afford a succession of fruits up to August. In a house without heat, but light and well ventilated, ripe Cherries can be had early in June, and a succession may be maintained, with proper care, up to late September. Early Rivers, Empress Eugénie, May Duke, Archduke, Governor Wood, Royal Duke, Duchesse de Pallau, Gloire de France, and Late Duke are admirable varieties for pots, and succeed on the Mahaleb. Black Tartarian, Elton, and Large Black Bigarreau are best planted out. Trees in pots must be regularly watered and syringed to maintain the foliage in health as long as possible.

## THE KITCHEN GARDEN.

**LIFTING POTATOES.**—Potatoes generally have made good progress this season, and if disease does not damage them the crops will be exceptionally good. Many of the earliest varieties, notably the Ashleafs, are in most localities fit to lift and store, it being altogether unnecessary, and frequently unwise, to wait till the haulm has died before digging the crops. The tubers being fully grown and the skins fairly well set, draw the haulm and take the first opportunity of lifting, sorting, and storing. Leaving them longer with the haulm intact may be the means of the best portion of the crop being spoilt by disease. If the weather is unfavourable or much other work pressing, merely draw the haulm and wheel away, the feet of the operator being placed on the ridges to prevent any tubers being drawn out, completing the lifting any time before the tubers are required either for use or planting. Never leave newly dug tubers on the ground for several hours, as this, which many consider an indispensable proceeding, is a frequent cause of the tubers becoming diseased, the moist tender skins offering a good home for the disease spores. Nor ought the smallest Potatoes to be saved for planting purposes, the proper course to pursue being to save abundance of medium sized tubers of good form, storing these thinly at once in cool, airy, and light sheds.

**CROPS TO SUCCEED POTATOES.**—When the ground is duly cleared of haulm and rubbish, levelled, and firmed, it is in capital condition for either Strawberries, Lettuces and Endive, Broccoli, Savoys, Chou de Burghley, Winter Spinach, Carrots, or Turnips, and an early clearance of Potatoes admits of any or all of these being secured seasonably. A good supply of late Lettuces is always serviceable, and if such varieties as Golden Queen, Perfect Gem, All the Year Round, Black Seed, Brown Cos, and Paris White Cos are sown at once, a long succession of medium sized hearts will most probably be obtained. None of them will attain their full size, and the seed may, therefore, be sown thinly in drills 10 inches apart, thinnings from the same being transplanted elsewhere. Endive ought already to have been sown, but if the plants obtained are few in number more seed should be sown at once. If the supply must be maintained throughout the winter a second sowing ought always to be made early in August. When large enough thin freely and dibble out the thinnings on good ground. Land newly cleared of Potatoes is frequently too loose to grow hardy Broccoli, but much may be done towards promoting the requisite sturdy growth by heavily trampling the ground prior to planting the Broccoli. Give the latter good room, the rows being not less than 30 inches apart, a distance of 2 feet dividing the plants in the rows. When put out earlier the distances should have been 3 feet and 30 inches respectively. Savoys are very hardy and much appreciated, therefore grow as many as possible. Dibble out the Tom Thumb and other similarly small varieties 12 inches apart each way, 15 inches all round being allowed Early Ulm and Dwarf Green Curled, Drumhead being put out 18 inches apart each way. Chou de Burghley grown to its full size is coarse and far too large to be appreciated. The most serviceable hearts can be obtained by planting now on a firm moderately rich ground, allowing the plants not more than 18 inches each way.

Young Carrots are always preferable to those fully grown, and a supply of these may be had without very much trouble all the year round. Sow more seed of any of the Horn varieties on a warm border at once, in well moistened drills drawn 8 inches apart. The roots may attain a serviceable size without any protection, but would be more likely to do so if afforded shelter later on in the shape of shallow frames or boards and pit lights. If young Carrots must be had constantly, then sow seed in frames on raised beds of old heating materials, not covering these with glass till cold weather sets in. Winter Turnips, of which the best are Veitch's Red Globe, Chirk Castle Black Stone, and Orange Jelly, are also indispensable. Seed of those named, or any other varieties, may well be largely sown in succession to second early varieties of Potatoes. Draw the drills 15 inches apart, and if at all dry water them prior to sowing the seed. The latter being small, and almost certain to germinate, is frequently sown too thickly, the plants greatly weakening each other before they can be thinned out. Dust over the seedlings frequently, and while the dew is on them, with soot and lime in order to preserve them from flea, caterpillars, and slugs. It is somewhat late now to put out Leeks, but during mild winters they rarely cease growing, and a useful crop might result from late planting. They will succeed very well after Potatoes, or on any well-manured, deeply dug, and not very lumpy ground. Form deep wide holes 12 inches apart each way with a blunt dibber, and drop a plant into each, watering them in being all the fixing the roots require. The plants will either fill out the holes or the soil will gradually close in round them, perfect blanching resulting without any further trouble.

**WINTER SPINACH.**—This crop is of such primary importance that it well merits a separate paragraph. Spinach proved of great value last winter, good gatherings frequently being available when no other green vegetable could be had from the open garden. What it requires is a freely manured well pulverised root-run, the preference being given to rather high and not very heavy ground. In many gardens it is absolutely necessary to commence preparing the site for Winter Spinach early in the summer, frequently forking and surface hoeing, adding soot and lime dressings, if the latter has not been used lately, towards sowing time. This extra trouble, in addition to well sweetening the ground, also gets rid of many troublesome insect pests, one very frequent cause of failure being thereby obviated. Either the round-seeded Summer or prickly-seeded Winter Spinach may be sown; both, however, being

much inferior to the Victoria and Monstrous Viroplay for present sowing; the two latter giving the finest leaves, and holding out much longer than the others; the seed being sown not later than the first week in August. Arrange the drills 15 inches apart, 12 inches apart being sufficient for later sowings, and which may well be made once or twice during the month. Sow the seed thinly in well-moistened drills, and cover with fine soil.

**HARDEST BROCCOLI.**—The hardest Broccoli can be had by planting on a newly cleared Strawberry bed, this not being dug. Put out with either a dibber or crowbar, and well fixed at the roots, the solid, yet rich root-run, is bound to promote a sturdy growth, and it is only the short-stemmed plants on somewhat high ground that survive severe winters. Those planted on looser rich ground should be arranged in rows 3 feet apart, and not less than 30 inches asunder in the rows. The stem being the most vital part of the plants, those much drawn up among Potatoes should have their stems heavily earthed, this being better done directly the Potatoes are dug rather than attempting it later on.

## PLANT HOUSES.

**Tree Carnations.**—All the earliest rooted Carnations are growing rapidly and fast filling their pots with roots. They must have weak stimulants every time they need water, clear soot water, or that made from cow manure being good for them; or, better still, artificial manure applied to the surface of the soil at intervals of two or three weeks. If neglected in this respect growth comes to a standstill, and flower spikes appear before they are wanted. Plants that are allowed to become root-bound early in the season are almost certain to come into flower in early autumn long before they are wanted. We have found it a good plan to place into larger pots any that are likely to become root-bound too early. Every care is needed afterwards for a time in watering until the roots are working freely amongst the fresh soil. Later plants may be placed into their largest size, those 6 inches in diameter being suitable. Such varieties as Gloire de Nancy, Souvenir de la Malmaison, and others that are intended for flowering early indoors in 6-inch pots next season should be rooted at once, either by layering or by taking off the cuttings and insert them singly in small pots, placing them under handlights in a cool shady position. The former is the more certain method, and the one we generally adopt, except the plants from which the cuttings are to be obtained are in pots; then they are rooted under handlights. Plants of these varieties that flowered in 6-inch pots and have been well cared for since are now in 8-inch pots, and may be transferred into others 2 inches larger. In this size they will make grand plants, and produce six to eight flower stems each, that will prove either useful for cutting or be objects of beauty in the conservatory. If given greenhouse treatment during the winter they will commence producing their flower stems early, and will be in full flower towards the end of April and throughout the following month without unduly forcing them.

**French and Fancy Pelargoniums.**—Young plants raised from cuttings that were pinched and hardened to cool frame treatment directly they were rooted may now be placed in 5-inch pots. The soil, which should consist of good loam and one-seventh of manure, should be pressed firmly into the pots to insure a firm sturdy growth. These plants may be kept close for ten days or a fortnight, and afterwards grown perfectly cool in frames with the lights off. Pinch the shoots when they have made two or three leaves to ensure their remaining dwarf. The shoots should be pinched when they need it until the last week in August or the first week of the following month, but not afterwards. By this treatment they will have broken into growth again by the time they are in their winter quarters. Old plants that were pruned back early and started again into growth in a frame may now have the old soil shaken from their roots and the plants repotted in fresh soil, placing them in much smaller pots, repotting them as growth extends. These must be kept close for a time until they are rooting freely in the new soil, when they may be hardened and grown under airy treatment. Prune plants that have been well ripened, and start them in a frame until they break into growth. Those that are now going out of flower must be stood for two or three weeks in a sunny position to ripen them before they are pruned back. Harden all young plants raised from cuttings, and then grow them in a cool house, but fully exposed to the sun. Good cuttings may still be rooted, and for this purpose it is better to top the earliest plants than to insert old flower stems.

**Zonal Pelargoniums.**—Those for autumn and winter flowering need liberal supplies of water at their roots, and liquid manure two or three times weekly, or every time water is needed, according to the condition of their roots. The pots in every case should be well crammed, the wood short-jointed and firm. Decaying leaves and flowers as they appear should be removed. Plants that have grown tall may be cut close back, and a good batch of cuttings inserted for early spring flowering. Double varieties should also be inserted for the same purpose, and for yielding a good supply of trusses for cuttings during next May, June, and July, or longer if needed. Insert them singly into 3-inch pots, in which they will pass the winter safely. Cuttings at this season root well either outside or in a cold frame.

**Adiantum cuneatum.**—Where these are grown expressly for cutting they must not be in a close atmosphere, or they will wither directly they have been severed from the plants or exposed to more air conditions. A deep green colour of the fronds indicates too much shade and heat, and will not last. The young fronds on plants well prepared

should have a reddish hue, and those fully developed a light green appearance. This is the result of light airy treatment. Plants that have been grown soft may be prepared to stand well if they are carefully and gradually exposed to light and more air, but they are never so good as those grown under these conditions from the first. The development of the fronds is slower and the plants are longer before they attain a large size, but the main object is attained, and the fronds are fit for use directly they are well developed. In the end it is economy to prepare the plants well for this purpose, for less than half will give greater satisfaction and less trouble than double the number grown under close treatment. Young plants raised from spores in spring and now in 3-inch pots may be placed into 5-inch pots, in which they will develop a good number of fronds before winter, and make large plants another year.

*Davallias*.—For many purposes the fronds of these Ferns are valuable, because they last fresh for a long time. For cutting to travel long distances and last well after they reach their journey's end, no other Ferns are equal to them. These, like *Adiantums*, should not be grown too warm. The majority of kinds suitable for this purpose will do well in the greenhouse during the summer months, but require a temperature of 50° during the winter. *D. bullata*, *D. dissecta*, and some others are not injured in the least by remaining in a cool house the whole of the winter. Although many do well in the greenhouse they will make more rapid progress under intermediate conditions until the plants attain a fair size, or for starting them into growth in spring.

*Pteris serrulata*.—This is a handsome and useful Fern for decoration in small pots, and lasts well in rooms and other positions during the winter. A good number of seedlings now in pans and boxes should be placed singly in 2 and 3-inch pots according to the size most suitable. For grouping purposes we find them serviceable in various sizes from 2 to 5-inch pots; for the latter size two or three seedlings grown together are better than single plants, because they are thicker and better furnished at the base. This will grow in almost any soil and position, provided it is liberally supplied with water. We have usually started them in gentle heat, and when sufficiently developed removed them to cool quarters.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### THE WEATHER.

FROM the middle of July to the end of the month the weather has been of a very unpleasant nature, cold north-westerly winds prevailing, the sky either clear or obscured with leaden clouds. Bees were lying about chilled to death, while the cold winds and burning sun threatened the life of many plants. Of Strawberry runners, for example, on light soil not a single one is rooted. Little rain has fallen, and there is a threatened dearth of that essential. The most disagreeable thing for pedestrians is the blinding dust and small stones forced into the mouth and nostrils by the wind—the result, no doubt, of distant thunderstorms.

#### THE APIARY—SWARMING.

In a number of cases where two queen cells had been left for the purpose of insuring one queen all have swarmed or attempted it. In many instances where the queens of prime swarms were destroyed several ripe queen cells were given them, and although less than a week had elapsed and the hives were not nearly full of comb every one of them swarmed, and the others that had two cells given them were upon a similar footing. Extra room will not prevent swarms issuing. If young bees could be induced to alter their nature and cease raising royal cells swarming might be prevented, but that will never take place so long as bees are bees.

#### EVOLUTION OF THE QUEEN.

Some writers say seventeen days and others fifteen are required, but as far as I have witnessed it takes sixteen full days from the time the egg is laid till the queen is matured and creeps out of the cell. The seal of the cell at that time, after the bees remove the wax covering it, loses its adhesiveness and toughness, and is easily forced open when the queen almost to a minute may be expected to appear on her completion of 384 hours. That is if there be one queen only; if more, the bees, after the queen protrudes her tongue and is fed, seal her up again for some time, as long as eight or ten days more. Then the queen may be liberated on the

expiry of the fourteenth and live, so that it is no rule to judge by, by the time a queen creeps out of the cell; for at one time they are sealed in longer than their natural time of creeping out, and at others are liberated by the bees before the expiry of the 384 hours. I had several of that nature this year, and they are proving themselves prolific.

#### WORKERS IN QUEEN CELLS.

I discovered a number of queen cells when opened to contain workers, at least they could not be recognised to have partaken any formation of the queen; but as they appeared to have come quicker to maturity than workers do when reared in worker cells, in all probability they would have been confirmed drone breeders, or in other words fertile workers. In previous cases they were so, the cells they were reared in might have been a little less in size than those containing queens, but otherwise no difference could be detected.

#### SETTING BEES AT THE HEATHER.

It sometimes happens that the space for setting the hives at the moors is limited, and the bee-keeper is puzzled how to get all his hives accommodated. That, as well as the position, is of great importance to the well-being of the hives and the safety of the bee-keeper when manipulating from infuriated bees. The wedge or cuneiform is a good way to set hives for the above purposes. Set one looking south-east, then flank it on both sides with another, then repeat with the next, and if a coloured device is used seven hives may stand in one clump. The bees flying straight from the entrance leave the manipulator free in the hollow between the two lines of hives. Thus—

It will be observed by the above plan a return may be made at the angles *a*, provided the situation is favourable, the bees in these two lines looking east by north and west by south, leaving the centre free to the bee-keeper to manipulate all the hives behind the entrances.—A LANARKSHIRE BEE-KEEPER.

### PUNIC BEES—STINGS AND REMEDIES.

As a constant reader of your Journal I have often seen letters from "A. L. B. K." concerning Punic bees, but I do not remember to have seen any notice of any being for sale or disposal in any way for trial. May I ask the writer if he can give any information concerning their temper? Are they as quiet as the generality of other bees when the hives containing them are placed on a garden path, as I do not like to have my work stopped by a horde of savages.

I find that within the last three years, if I am unfortunate enough to receive a sting, the part swells so much that if a hand or arm happens to be the unfortunate part I can scarcely hold a knife or fork, and dressing myself becomes a task indeed. Can you suggest any remedy for it? I invariably rub a small quantity of oil of wintergreen on my hands and arms when manipulating; but occasionally, one bee more spiteful than the rest, will inflict punishment on me; in that case I have applied some chloroform with only partial success. On Monday last I took eighteen 1 lb. sections of beautiful honey from one hive.—G. E. B.

[The temper of my Punic bees seems very mild—so much so, that although I have frequently lifted the frames out without any precaution I have never received a sting; nor have I been able to induce them to sting when using the means that would rouse other varieties into little furies.

Crossed Punics, unlike other crosses, do not partake of the spitefulness of some sorts. When the above letter came to hand

I was examining a tumbler containing eight queen cells of pure Punic, partly raised by Carniolians, then transferred to a crossed Punic hive. When I lifted it up the bees flew about and ran over me, but not one offered to sting. These cells are close upon the time for the queens to creep out, and as I wish to save some of them they must be watched.

There is a great deal in the way of moving near bees, also in the way of handling them, so as to keep them peaceable. The right method must be acquired by experience. A quiet but firm demeanour should be maintained. No part of the dress should be loose or dangling, nor should bees have access to any honey or other sweets outside their hives. Weeding or stirring the ground near them is very irritating to bees; even cutting flowers has to be performed with caution. When manipulating, if the bees are subdued before any fly out, there will be no stinging, and carbolic acid is the safest and best quieter in my apiary, but I do not touch the bees with it.

Carniolians are mild tempered, and with ordinary care do not sting; but unfortunately it appears to be difficult to secure the pure race, and then they are savage.

The best remedy for stings is to induce strong perspiration, inhale sal volatile, also rub the part stung with it, or camphorated olive oil, this being better if heated. It is cheering to hear of honey being obtained. In this quarter it is almost nil, but in some parts of Scotland large yields have been secured. There is only one importer of Punic bees, and from the inquiries I have about them I think he should advertise them.—A LANARKSHIRE BEE-KEEPER.]

#### TRADE CATALOGUES RECEIVED.

G. E. Elliott, 97, Bradford Road, Huddersfield.—*Select List of Bulbs, Roses, &c., 1891.*

Little & Ballantyne, Carlisle.—*Bulb List, 1891.*

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**The Tomato Disease** (*S. T. D.*).—There is reason to suppose that the resting spores of the fungus may be retained by and conveyed with the seed. This we have no doubt has been so in your case, and it is most imprudent to save and distribute seed from disease-stricken plants.

**Seedling Begonias** (*R. B., Wakefield*).—The larger of the two blooms is very good and the smaller attractive. The varieties are worthy of preservation for home cultivation. You can name them if you like, but as superior forms are in commerce, even the best of your seedlings, judging it by the bloom before us, does not possess commercial value.

**Name of Insect** (*E. B.*).—What you forward is the pupa or chrysalis of one of the soldier flies (*Stratiomys chameleon*), an insect allied to the gad and breeze flies, not uncommon in some districts. The larva or grub lives in shallow waters, and there floats head downwards, taking in air by means of a curious telescope tail or appendage. When it becomes transformed into a pupa this still remains attached to the insect, though somewhat altered in form.

**Insects on Torenia** (*T. F.*).—You ask us to reply under your initials, and we do so as near as they can be deciphered. We think we know to what insect you refer. If you can send us specimens to arrive in good condition they shall be examined. The others were totally shrivelled. Mr. W. Bardney, we think, has had much trouble with a similar pest, and his experience in subduing it might be useful. We will communicate with him on the subject. There is no certainty

that the article to which you refer will accomplish the object you have in view.

**New Chrysanthemums** (*Contributor*).—We cannot approve of the practice that appears to be growing of possessors of new Chrysanthemums, or anything else, sending examples to their friends who are contributors to horticultural journals, and thus, in that roundabout way, getting the varieties introduced to the public. Meetings of the Royal Horticultural Society are held at intervals throughout the season, to which new or notable varieties can be sent direct; and they can also be sent direct to the editors of gardening journals, who exercise their discretion in dealing with them. For the reasons indicated the notes on flowers you have not grown cannot be inserted.

**Abnormal Foxglove** (*C. L. M.*).—The photograph which you have obligingly sent represents a variety of Foxglove, the terminal flower of which is unusually large and of campanulate form. We have seen many

FIG. 19.—A PECULIAR FOXGLOVE.

similar examples, one of the best of which we had engraved, and it is correctly shown in the illustration (fig. 19). We do not know whether your flower was as large and well marked as this one, the photograph being too small for displaying its characters.

**Repotting Roses** (*F. E. G.*).—As you do not describe the plants we simply tell you what Mr. William Paul says in his useful little work on the cultivation of Roses in pots. "This operation may be performed at any season of the year. When the pot becomes crowded with roots the plants should be repotted. It is our practice to glance over the stock occasionally in the summer months, and whenever a plant is observed growing vigorously it is at once removed to a larger pot. But it is of the general repotting that we would now more especially speak. Every plant should be repotted at least once a year, and the most advantageous time is perhaps September. A good portion of the old soil should be shaken away in the operation; all wild suckers should be eradicated, worms withdrawn, and such plants as require it placed in larger pots."

**Name of Caterpillar** (*G. S.*).—What you send is the caterpillar of the puss moth (*Dicranura vinula*) which is found not uncommonly upon

the Willow, Poplar, and occasionally the Ash, during the summer months. It is a curious creature, for in its position of repose it assumes a menacing attitude, lifting the front segments of the body, and it has the power of ejecting, from a slit below the mouth, an acid fluid, which it directs towards any object by which it is annoyed or alarmed. Also the tail is furnished, as you may have noticed, with two menacing (in appearance) horns, containing inner horns or tentacula, but these have not any ability to inflict a wound, though seemingly barbed. During the winter this insect is in the chrysalis or pupa state; the moth, which is fat-bodied, white, and downy, emerges in May and June. The popular name was probably suggested by the resemblance of this to a white cat, but the young caterpillars have a singular likeness to a miniature black kitten.

**Pruning Fruit Trees** (*J. W. Sutton*).—Not only Apple and Plum, but also all other fruit trees, should be relieved of superfluous growths at once. Overcrowding fruit trees and bushes, which too often resemble a wild thicket of growths in summer, then pruning them severely in the winter only, is the best method that can be adopted for preventing good crops of fruit. If Vines were treated in that thoughtless manner what sort of Grapes do you think would follow? Hardy fruits must be managed on the same principles that Vines are by the best growers—in the full exposure of the leaves towards the base of the laterals to light all through their career to render the trees the most productive. Branches may be safely and beneficially cut from overcrowded fruit trees now, and the summer shoots shortened except where required for extension and furnishing the trees. The precise extent of shortening cannot be stated in the absence of exact knowledge on the condition of the trees.

**Soot Water** (*H. J.*).—Gardeners make this by tying soot in an old sack or a piece of rough canvas and suspend it in a tub of water, with the aid of a stone at first if the soot does not sink so quickly as they wish. The water soon becomes discoloured, and is dark or light according to the relative proportions of the soot and the water. Usually about a peck of soot is placed in a 40 or 50 gallon tub, and as the liquid is taken out more water is added, until the virtues of the soot are extracted, the bag being eventually shaken or squeezed to aid the extraction if necessary. Soot water should be perfectly clear, and may be clarified by adding some lumps of lime, stirring well, then allowing all particles to settle to the bottom, and scum to form on the surface, and this skimmed off the soot water is clear. We have often used it much diluted for syringing purposes beneficially, and it has left no sediment. As a liquid manure it should be diluted to about the colour of pale ale, for syringing it should be paler still. Insects do not like it, while it is beneficial to many plants and trees.

**Cucumber Plants Diseased** (*S. G. R.*).—The leaves are poor and thin, the shoots weak, otherwise healthy looking, but the collar of the plant is contorted, swollen, and slightly cankered, which the application of sulphur may have arrested, drying and hardening the surface. This part of the stem contains granular matter, due to stem "eelworm," probably *Gleetus granulosus* of Dr. C. Bastian, but there is evidence of the acuter form of eelworm in all parts of the plant—namely, *Tylenchus (vibrio) devastatrix*, *Kuhn*, delineated by Dr. J. Ritzema Bos, State Agricultural College, Wageningen, Netherlands, but the late Rev. M. J. Berkeley originally described these nematoid worms (vibrios), and they are portrayed by Mr. W. G. Smith in the *Journal of Horticulture*, vol. xxxiii., new series, page 74. It is the identical species which causes Clover "sickness," but the commoner form of attack is on the roots, as seen in the nodules or galls in those of your plant, and faithfully represented in the figure before alluded to. These nodosities are of doubtful origin. They are produced by all nitrogen gatherers, as the Pea, Bean, &c., and are common on Gardenia, Cucumber, and Melon roots. Some fungi, such as *Ustilago*, produce similar protuberances, and one of these, *Ustilago cucumis*, is believed to be the cause of the Cucumber disease for which sulphates are said by experimentalists to be an excellent remedy. Those taking the fungoid view (and they are sometimes present together, but the fungus generally has priority, so far as we have observed) recommend 2 cwt. sulphate of iron per acre, which is about 1½ lb. per rod, or ¾ oz. per square yard. This is best applied mixed with dry powdered clay, say 8 ozs., thoroughly mixed, and disposed on the surface when the soil is wet. Half quantity is less effectual, or the full quantity applied at twice, therefore apply it as one dressing. It may be used for mixing with the soil before putting in the plants, the quantity named per yard being mixed with three bushels of soil. We have never known heating the turf to 212° to fail in destroying parasitic germs, the turf being cooked in an oven or over a wood fire, in the latter case mixing one-twelfth of wood ashes with the turf. Mr. Willis, at Rothamstead, Herts, found a mixture of sulphate of potash, 3 cwt., and sulphate of ammonia, 1 cwt., per acre [about 3 lbs. per rod, or 1½ oz. per square yard] had a good effect on "stem-sick" Clover. We recommend the following mixture:—Steamed bonemeal, 5 parts, sulphate of potash, 3 parts, and sulphate of ammonia, 2 parts; mix, and apply at the rate of 5 cwt. per acre, 3½ lbs. per rod, or 2 ozs. per square yard. Apply to outdoor crops or Clover, and cereals subject to "tulip-root," which is caused by an identical species—namely, *Tylenchus devastatrix*, during moist weather in late March or early April. For "disease" in Cucumbers the mixture may be used at the time of planting, using the 2 ozs. on every square yard of surface, and 1 foot deep in the soil, repeating when the plants are showing fruit. Preferably double the quantity may be mixed with soil at the time of chopping up the turf, say 4 ozs. to each

barrowful of soil. We use, however, steamed bonemeal 1 pint, soot 1 pint, wood ashes 1 quart, to a bushel of soil, and find the mixture beneficial; less being used when the soil is rich and there is no fear of grubs or wireworm, for which a tenth of quicklime mixed with soil a few weeks in advance of using is preferable. The lime is essential to nitrification, and that produces ammonia from organic matter, the ammonia is oxidised and becomes nitric acid, which combines with potash, soda, and lime to form nitrates of those substances, and these are soluble and become plant foods, in which your soil, although turf, and containing nitrogen, is manifestly deficient. Try the dressing of steamed bonemeal, sulphate of potash, and sulphate of ammonia as a top-dressing, and let us know the result. We have known a good top-dressing of dissolved bones (effected by wood ashes) completely cure Cucumbers of "stem sickness" or "eelworm;" also Melons that would not set their fruit did so freely when treated with superphosphate.

**Diseased Tomato Plants** (*Idem*).—The plants are perfectly clean and healthy at the roots, free from tubercles and distortion, as the results of attack by "eelworms" (*Tylenchus* or *Vibrio devastator*); but the stem is of a black-green colour, and the foliage of a dark leaden hue, so indicative of predisposition to attack by the Potato and Tomato disease, *Phytophthora infestans*; indeed, some of the older leaves have had their juices abstracted by the mycelium of the fungus. There is no remedy but to remove the leaves showing grey or brownish specks and burn them, and at once dress the plants thoroughly with the following mixture:—Dissolve 1½ ounce precipitated carbonate of copper in a pint of liquid ammonia; of this one fluid ounce should be mixed in a gallon of rain water and sprayed on the plants, thoroughly moistening them in every part—stems and leaves, particularly on the under side of the latter, taking care to have the foliage dry, and to keep it dry afterwards, maintaining moisture by damping available surfaces in the morning and at closing time, using liquid manure occasionally in the evening, say the drainage of stables diluted with five times the bulk of water, or urine also mixed with water, or guano may be used, 1 lb. to 20 gallons of water, for damping surfaces other than the plants, using about 3 gallons to a square rod of surface (30¼ square yards). This will encourage growth in the plants, prove inimical to red spider, and the soft genial glow of moisture will cause the spores of the fungus to germinate, and the ammoniacal carbonate of copper, as a thin film on the foliage and stems, will speedily effect their destruction, preventing their tubes pushing through the stomata of the leaves into the tissues. The ammoniacal carbonate of copper solution is equally effective against *Cladosporium lycopersici*, or Tomato "scald," figured in the *Journal of Horticulture* July 16th, 1891, page 57. This fungus also attacks the leaves and stems as well as the fruit, the latter represented in the engraving alluded to. The fungus (*Phytophthora infestans*) ought to have been attacked sooner, the house being kept moderately dry and freely ventilated. The carbonate of copper (precipitated) is prepared from sulphate of copper, a formula for its preparation being given in the *Journal of Horticulture*, June 18th, 1891, page 493. If the solution is syringed on it must be done very lightly, but spraying is much better, repeating it in twelve to fifteen days, and spraying all fresh growths as a preventive, for it must be distinctly understood that the remedy, so called, is altogether preventive. Once the mycelial threads have passed and become seated beneath the epidermis of the plants, nothing short of the destruction of the affected parts will destroy the fungus. The dark metallic hue of the leaves and plants and the appearance of minute grey specks on their surfaces is the latest time at which the remedial measures can be used effectively, and they ought to precede rather than follow infestation. If inconvenient to use ammoniacal carbonate of copper solution you may employ the anti-blight, which has been advertised, as it is equally efficacious, and does not injure the foliage when used discreetly, and in accordance with the directions. It is a powder, and distributed by means of bellows, the "Malbec" being the most useful and handiest for applying the powder to the under side of the leaves, which is an absolute necessity in the case of plants, as the Potato and Tomato, liable to attack by the fungus *Phytophthora infestans*. To prevent its attacks the plants should be dusted not later than when the flowers show, but the Potato and Tomato disease does not generally infest those plants before early July, beyond which time it is not safe to leave them undressed. Potato haulm—all the plant—should be dusted on the under side of the leaves as well as the upper surface, but more particularly the under side, and preferably whilst damp, as in the early morning, or after rain with a prospect of fine weather. Anti-blight is a remedy for mildew (*oidium*), also *cladosporium* or "scald," and it does not injure the tender foliage of Vines, cause Grapes to rust or spot, and it is a preventive of *Peronospora viticola* (the downy mildew, grey rot, and brown rot), so injurious to the Grape Vine in the American vineyards, also on the continent, and making its appearance in this country. Anti-blight, like all copper remedies, requires to be used in advance of fungoid infestation, for its work is wholly preventive as regards *Phytophthora infestans* and *Peronospora viticola*, for these work within the host (Potato and Tomato), and must be destroyed (if at all, or without killing the plants infested) before or when their germinal tubes are piercing the epidermal tissues. The "mildews" are external, and can, therefore, be reached by the ammoniacal solution of copper carbonate or anti-blight, and at once destroyed. The plants are very weak. Dress them with superphosphate 5 parts, nitrate of potash 2 parts, mix, and apply at the rate of 2 ozs. per square yard, and work in lightly. Repeat the superphosphate (2 ozs.) only in three weeks, and if vigour is wanted use along with it nitrate of soda, 1 oz. per square yard.

## STAGING FRUITS AT EXHIBITIONS.

ALTHOUGH a few of the early fruit shows are over the real campaign amongst fruit growers has just begun, and during the next two months many a valuable prize will be fought for, and perhaps won by growers already known to fame unless some new aspirant to honours succeeds in snatching victory from their grasp. Many beside those actually engaged in the contests will eagerly read the reports of shows to see how their old friends or opponents pass through the ordeal. I for one shall watch with a keen interest the fortunes of many of my gardening friends, who are readers of and writers to the *Journal*, and whom I have been wont to meet each year at shows. I shall watch with the hope that they will still retain their position of prominence in the prize list, and I also hope that the hints given below will prove useful to many who require information on the subject.

Valuable prizes are often offered for collections, which form important features at shows. It is important, therefore, that in addition to growing the fruits well they should be placed before the judges in such a way as to show off their good qualities to the best advantage. Judges in these classes often have great difficulty in awarding the prizes on account of one or two exhibits being exceedingly close in point of merit; in such cases superior staging is enough to turn the balance. The first thing to be attended to is to see that plenty of leaves are in readiness. Nothing answers better for this purpose than medium-sized Vine leaves for the majority of fruits, there being a few exceptions where coloured leaves are an advantage, and Strawberries should always be arranged on their own foliage. Where Vine leaves cannot be obtained good in colour or of sufficient texture, Sycamore, Plane, or Mulberry leaves answer very well. Having placed the leaves ready to hand and secured the requisite number of plates on which to arrange all kinds of fruits with the exception of Grapes and Pines, the whole number of plates should then be prepared. Those intended for Peaches, Nectarines, Figs, Apricots, Plums, and similar fruits will require some soft material such as paper shavings, moss, or cotton wool, but I prefer the first-named, as it is soft without being springy. Place a handful of this in the centre of each plate so as to bring it up slightly above the outer rim and gradually slope toward it, then cover the plate with leaves, letting each overlap the other slightly so as to form a fringe round the edge of the plate. Proceed with the others in the same way till the whole are ready, and as each dish is finished place it on the top of the last; this will economise space and keep the leaves in position.

For Cherries and Strawberries, unless an unlimited number is allowed, only a small quantity of material should be placed in centre of the plate, so that when covered with leaves the centre will be slightly below the inner rim; this will prevent the outer row of fruits at the base slipping out of position as the work proceeds, as it is anything but pleasing when a fine shapely dish of Cherries is almost completed to find it suddenly collapse. I have seen many ways of building up fine even cones of Cherries (which when well done are always effective in collections), but the simplest and best of all methods in my opinion is to fill the centre with slightly withered Cauliflower or Strawberry leaves as the work proceeds. The Cauliflower leaves should, of course, be pulled into small pieces. Begin by placing a ring of fruits close round by the inner edge of the plate with the stalks pointing inwards,

a layer of leaves then placed over the stems in the centre keeps them in position and brings the centre up to the right height for the next ring of Cherries, and so on, making each ring a little smaller in circumference than the last, taking care to keep each row even and correct in outline as the work proceeds. By following these directions handsome cones may be built up. Where large dishes of unlimited quantity are admissible the centre of the plate should be filled up much higher to begin with, and the first row of fruits placed near the outer edge of the plate. When one has the pleasant task of dishing up large well-coloured fruits of Peaches and Nectarines, after the plates are prepared as directed, it is an easy matter to place the finest in the centre, and the others forming a ring around it, taking care to let each fruit stand quite clear of its neighbour, as a perfect specimen never looks so well as when seen all around. Sometimes good fruits have portions near the base which are not well coloured. The damaging effect this might have in the eyes of the judges may often be prevented by rolling up a small piece of leaf and placing it under the fruit, so as to show up the greatest portion of the best side of the fruit, and by skilfully arranging a few leaves around it.

Pine Apples look well when placed in tins specially made for the purpose, and painted green; but an ordinary flower pot 6 or 7 inches in depth, with the drainage aperture made about double the usual size, answers almost as well. The pot should be neatly covered with a double thickness of tissue paper, be inverted, and the Pine cut with an inch of stem placed on the top of the pot, the stem fitting into the hole, keeps the fruit in position.

Figs, if not highly coloured, are improved in appearance by placing a few tinted leaves around them—leaves of *Ampelopsis Veitchi* or *Gros Guillaume* Vine answer the purpose admirably. When Figs are of good form and colour, with short footstalks, they should be placed quite apart from each other on the plates, so as to show off each fruit to advantage; but when, as is often the case with large fruits of some varieties, the footstalks are long, arrange them in a circle so that they meet each other in the centre, a few leaves can then be placed over them, and one or two fruits, according to their size, placed on the top of the footstalks the stems of these central fruits pointing downwards and being covered with leaves gives to the dish a finished appearance.

Plums, Apples, and Pears staged with collections of fruits are generally of superior quality, as large a portion of them as is possible should therefore be fully exposed to view. They can be arranged in the same way as Peaches, with the exception that the distance apart must be regulated by the size of the fruits. Melons, if round in form, may be placed in an upright position with the stem uppermost, but oval shaped fruits should be laid lengthwise on the plates, and their appearance is often improved by placing cotton wool covered with leaves underneath, so as to raise one end enough for the fruit to form an angle of 45°, the best portion of the fruit then “catches the eye.”

After all the small dishes have been arranged they must be carried to their respective classes. I will here explain what I should have mentioned previously, that whenever single dishes of fruit are exhibited as well as collections they should be dished up at the place reserved for the collections. This enables the exhibitor to keep them all under his eye, and he can the better select the best dishes where he has duplicates for the strongest classes. Having placed the single dishes in their respective places the work of arranging the separate dishes to form the collections into an effective group must be pushed on. The last dishes that old showmen generally bring out are their Grapes, and many anxious eyes are often fixed upon them when they are staged, as it is well known that high class Grapes deservedly have great weight with the Judges. When collections of eight or ten dishes are shown, black and white Grapes on either side with the Pine in the centre

usually forms an effective background, and no fixed rules can be laid down as to where the other dishes should be placed, so much depends upon taste. When taking the last look round, count carefully the number of dishes and see that each dish contains the right number of fruits. I have known more than one fine collection of fruit disqualified for not having the right number of fruits in one dish when there was every prospect of its securing the premier position, and others who have fallen into the same error have sometimes narrowly escaped the same calamity.—H. DUNKIN.

### TUBEROSES (POLIANTHES TUBEROSA).

THE above sweet-scented flower is a general favourite for nearly all purposes. It is suitable for buttonholes, sprays, bouquets, wreaths, &c., either as single-wired flowers or in its natural condition if the spikes of flowers are not too large; but the custom is to wire each flower, and then use them either singly or in greater number as required. The flowers nearly always being carried on stems 2 or 3 feet above the foliage, the plant as a single specimen is not a great success, but it lends itself to arrangement in groups, its tall flower stems assisting to relieve any stiffness or formality. If three or more bulbs or tubers are placed together either in the first instance or turned out of small pots into pots 6 or 8 inches in diameter, the Tuberose then becomes an object not at all despicable as a specimen plant, and may be so used in rooms where such sweet flowers are desired and their stiff appearance mitigated. When nearly all the flowers on a spike are expanded, the spike may be cut with a considerable length of stem and so used as cut flowers amongst other flowers if so desired, the stalk being cut to any length to suit the respective glasses. When several hundreds of tubers are grown and successfully flowered, a few spikes may be cut in their entirety and used for the above purpose without being much misused; but, of course, if only a dozen or so tubers are potted the proprietor, as a rule, does not like to so cut them, but prefers to retain the flowers for the greatest possible length of time.

The Polianthes, commonly called Tuberose, is allied to the Hemerocallis, Funkia, Aloe, and Haworthia, the two latter being frequently, though erroneously, called Cactus. It was originally introduced into this country from the East Indies in 1629, both the single and the double forms, the latter being the one generally cultivated and the subject of this note. Another species, *P. gracilis*, was introduced at the same time. It is now (*P. tuberosa*) extensively cultivated in fields in various parts of the world where the climate and soil is suitable; and many hundreds of thousands are annually imported into this country for cultivation in pots. Its cultivation under glass is frequently supposed to be difficult, but I have never found it so, and think that any failures, or partial failures, that occur are generally the result of slight misunderstanding as to their requirements. Growing naturally in a warm or hot climate it is a common thing for these plants to be potted and placed into a high atmospheric temperature—and in some instances into a still higher bottom heat—under the impression that this proceeding is absolutely necessary for their welfare, whereas it is very inimical to them. These tubers when received in this country are in a practical dormant condition. They contain within themselves the elements for the first and early sustenance of the leaves, flower stem, and flowers, which every well-matured and perfect tuber also at the same time contains perfectly formed within itself, and which are ready to complete their full development on exposure to the proper amount of heat, light, and moisture. A large number of the tubers imported are not too well matured. When placed together in large quantities they heat, and their own moisture, in addition to that of the atmosphere surrounding them, soon sets in a process of decay. This incipient decay may be either accelerated or arrested by the treatment accorded by the cultivator. If he places them, when potted, into a hot and moist atmosphere, and keeps the soil constantly moist, all that are not absolutely perfect tubers will quickly succumb; and those that are perfect will not be so good as they would have been under rational and proper treatment. On the other hand, decay may be checked by a careful mode of treatment.

When the tubers are potted they ought to be placed in a house where the temperature is as airy and dry as a greenhouse or conservatory, but about 10° warmer. Water must only be applied to the soil when it has become quite dry, and this system must be continued until the too moist condition of the tubers has been counteracted, the tubers plumped up, and root growth commenced, when water may be applied a little sooner, but still not until the soil is dryer than would be advisable with most plants, and this rule applies throughout their period of growth and flowering. By

this procedure the vital functions of the tubers do not receive any undue check or excitement during their resting period other than is incidental to lifting and transportation, and their development proceeds slowly and safely. I think that two of the most frequent causes of failure are undue excitement by attempting to force them prematurely by means of too much heat in the early stages, and keeping the soil constantly too wet.

An excellent cultivator has recommended that the tubers be potted singly into small pots and to be again placed into larger pots. I have never found it necessary to adopt the twice potting system, but at once place them into the pots in which they are to flower. Pots 6 inches in diameter is the size used, and three or four tubers, according to their size, are placed in a pot. The tubers are planted half their depth in soil consisting of three parts loam, one part leaf mould, and one part sharp sand; and they afterwards receive the treatment previously described, with the addition that when in vigorous growth of foliage, and the flower stems appearing, they receive more heat and the foliage is frequently syringed. Last spring I obtained five hundred medium-sized tubers which were in a damp condition; they were treated as above, and there are now over three hundred spikes of flowers, and we have gathered considerably over one hundred dozen single flowers besides spikes of flowers since the beginning of June. I think the failure of tubers to grow has been under 2 per cent., and the failure to flower under 4 per cent., results that are not entirely unsatisfactory, considering that all the tubers were not expected to either grow or flower.

When placing more than one tuber in a pot it is as well to select them as nearly equal in size as possible, there will then be a greater likelihood of the tubers in one pot flowering at one time. If it is *very* desirable that they should do so then it would be better to place the tubers singly in small pots and then to mass them together when the flower stems appear.—J. UDALE.

### FRUIT-GROWING AS AN INDUSTRY.

[A paper read by E. J. BAILLIE, Esq., F.L.S., at the Cardiff Conference of the British Fruit Growers' Association, Aug. 12th, 1891.]

SOMETIMES I think the surface facts connected with the idea of British fruit growing must begin to appear wearisome, but on reflection it will at once become apparent that persistent repetition of fact is needful until practical effect is given to statistical report and to theoretical argument. In any department of social morality or national economy persistent repetition is needful to gain public attention, and to urge the public mind first into sympathy and then into active support. Now that is precisely our position in the matter of the subject we are called together to consider and discuss this afternoon. Is there a fair demand for fruits that can be grown at home? My best answer for this occasion (partly because it is a recent utterance, and partly because it is the utterance of a responsible member of the Government, whose official duties bring him into direct contact with the subject)—my best answer may be found in some remarks made by Mr. Chaplin, M.P., President of the Board of Agriculture, at a meeting held in the Mansion House, London, a few weeks ago, under the auspices of the Fruiterers' Company, when he pointed out that the future of agriculture would extend considerably in the direction of fruit culture, and from the tone of his remarks he was evidently inclined to regard these supplemental conditions hopefully, as likely to prove satisfactory and successful. He dealt with some extraordinary facts and figures concerning dairy products, and the prices we pay for importations of these. In his opinion £1,200,000 of the money paid for imported fruits might have been saved by the replacement by home-grown produce of the hardy fruits represented by that amount. This sum represented but a portion of what had been handed over to the foreign grower for what he had sent us to help to supply the demand. It was gratifying to Mr. Chaplin to find that considerable movement in a right direction had already been made, as last year over 2400 acres had been added to our orchards. *The Manchester City News*, a reliable authority, stated in its issue of the 18th July last that in June of the present year no fewer than 64,034 bushels of Apples were imported into the United Kingdom, of the value of £37,854—last year only 8798 bushels, valued at £6237, were imported. The increase was largely due to Tasmania. It is my intention, if time permits, to come back to this matter again, but the facts are so readily admitted and the correctness of these so readily obtained that this brief reference may suffice in the meantime. As long as we pay, I will not say millions, but even thousands of British money for the importation of fruits that are essentially, for us, British fruits, the desirability for extension need not be questioned.

Fruit and fruit growing we find very much in the air just now,

and there are various reasons for this. There is the fact of increased population, of better facilities for intercommunication, the emigration of our sons and daughters across the seas, taking with them the home knowledge, and with sinews and muscle bringing the forest and prairie lands of the West into cultivation and productiveness, and sending the result of their labours into our home markets as an incentive to the freer use of fruits as food. Then there is the congested state of the towns, forcing some at least of the workers to the fringe of the city to seek a garden patch, and all that this means under conditions of this nature. Another feature is the evident return in many directions to the simpler methods of life, and a recognition on the part of science that if the dietetic practices of the past have not been decidedly wrong they have at least been far from right. Then we have had, and have still, the great advantage of the assistance of philanthropic and economic societies and associations. In fact we find political, moral, social, and sentimental currents are all set in this direction. And we are perfectly safe, inasmuch as we yet take our millions out of the purses of the public and put them into the money bags of the foreigner.

The idea of fruit growing opens out in many directions, any one of which might be profitably followed, but the subject of my paper is "Fruit Growing as an Industry." It is working for a living, not riding a hobby or playing with a fad. It is one thing to grow fruit for household consumption where the garden expenses are merged with the other details of domestic outlay, or for presents to friends; but when you regard the question as an industry it then assumes the more practical aspect suggested by a title one often sees nowadays, "Fruit Growing for Profit." I claim for the industry that it cannot fail to give a satisfactory solution to the enigma couched in the prosaic phrase, "Will it pay?" I claim for it further that it ought to be one of the most important features in our national economy, for it faces and grapples with some of the most pressing problems of the times—the land question and the labour question. Nay, more, it affects materially the health and happiness of the people, and the true wealth of the nation.

But if I may again draw your attention to the precise title of my paper I would venture to emphasise the word "industry." My point is that it is not an employment or occupation that can run itself, or that can be run under the so-called superintendence of a lazy fellow, or of one who lacks method or lacks knowledge of a particular order. In these days there is a great deal of seeking for things that require but little attention, and that little not of a constant character. Spasms of speculation as against sustained occupation. A nibble at some commission in the morning, a juggle with a share list at noon, a manipulation of some mining venture or a transfer of some stocks, in the whole of which there has been nothing produced—may characterise rather than caricature phases of what has come to be called (for show of respectability) modern commerce. Call it or mis-call it what you like, that will not do for an industry. There must be work. That is a splendid feature of commendation—that is, permit me to enforce, one of its most hopeful aspects, it provides a healthy field for happy employment. There must be patient perseverance, untiring application, a timely seizure of offered opportunities, a thrifty regard for occasions upon which available resources should be called into united co-operative activity.

It will, perhaps, assist to make my meaning clear if I assume for the moment that I am myself to make a start in this industry. Let me, then, survey myself. I must, in horticultural parlance, be somewhat of a hybrid; I must, so to speak, contain within myself three or four elements not usually found or required in a single personality. We will come to this presently. Mr. Gladstone and other leaders, in taking up this question at the outset, spoke of fruit farming and the fruit farmer, and ever since there has been a hazy kind of notion that the movement was in the hands of the present-day agriculturist as we find him. The adoption of the title to which I have referred seems to have given colour to this erroneous notion. Fruit farming seemed to imply that the farmer is to leave his cereals and his root crops and to give his care to fruits. That is not so. The farmer, as he is familiar to most of us, can have but little part in this business as an industry. The matter comes much nearer to horticulture than to agriculture. The spade (or should I say the fork?) and the pruning knife are the emblems of the cult rather than the plough and the slashing hook. This brings me to the qualifications at which I hinted a little while ago. The fruit cultivator for our industry must have something of the farmer, but a good bit of the gardener, and the good gardener. He must have business tact, commercial enterprise, the spirit of the student, the suavity of the salesman, the sense of the Nature-lover with the instinct and method of the naturalist—the art-faculty, so to speak, which gives a sense and an appreciation of neatness with the power of its accomplishment, which suggests what is attractive and proper, and supplies the graceful, natural adornment

which is no insignificant element of success in market methods. Where is such a man? He does not exist in large numbers. I could put hands on a dozen or a score, but they are not abundant. Yet it seems to me we must have such possessing these features educationally, and each of a temperament enthusiastic and optimistic; an eye that sees the bit of blue sky above the grey cloud—"a stout heart for a stiff brae," as they say beyond the border.

The educational process by which such knowledge is best to be gained, such a character to be moulded, and such qualifications most likely to be obtained must claim attention. With that I do not propose just now to deal, but the Technical Education Act which has now appeared above the legislative horizon seems to have about it some aspects of helpfulness, and county councillors in their respective localities seem inclined to aid already existing methods and institutions in a right direction. At any rate I am glad to find it is likely to be so in our own county, and in other counties from which I have had particulars.

Having thus hastily sketched the character that should represent the central figure in our industry the next necessity is land. Land and locality might be considered together. As fruit can be grown in any county in England or Wales we need not now discuss locality from a geographical point of view. The limits of my paper, too, forbid that I should enter upon details as to the character of the land itself, but it is clear it should be of good quality. Consideration should be carefully bestowed on soil, shelter, and situation. In this matter it should be borne in mind that in the case of purchase mere cheapness may prove but a false economy. You must of course go beneath the surface. Nature quickly clothes even the waste with weeds, so that a green surface may conceal a subsoil of clinkers and brickbats. A patch of this character is not suitable. It costs as much to plant a sterile wilderness as a fertile valley—perhaps more—maintenance and other expenses are more in proportion, and there is no margin for waste effort or delayed result and final disappointment as a possibility. The best is the best, and within ordinary limits of fair dealing in fixing the purchase money the best is the cheapest.

After the land the trees must be considered, and the scheme of planting generally. What shall I plant and in what variety? That is a question that must be largely regulated by the market requirements and surroundings as to climate and other matters which are applicable to each case respectively. In a paper of this character—a suggestive sketch merely and covering as much of the ground as time and circumstances will allow—it is not expected that I should name absolute kinds, though this I shall at any time be happy to do either by correspondence or otherwise. Speaking generally, I would say decidedly plant only the best trees, and I am always of opinion that it is not the best plan for the grower to select maiden trees because the first cost is lighter to some trifling extent, but he secures his purpose and serves his interest better by procuring trees of more matured growth, and such as have, therefore, had the advantage of nursery cultivation over that important period of tree life, when, shall I say, the future character of the tree is in process of formation, for trees, like human beings, have the abiding elements of their after character fixed in their earlier years. The nursery is, or ought to be, the best place for the due development of the earlier period of tree growth when the future possibilities as to productive power are largely in the hands of the cultivator. It always seems to me that it is better then to trust the knowledge of the specialist than the idea of the amateur. I should mention, however, that in an ideal orchard old trees will find no place. When a tree is past productiveness it is also past the power of bringing forth even its meagre crop of anything like good quality. Young trees of few sorts of good kinds then is what we should aim at.

In the matter of the choice of kinds it seems necessary to utter a word of warning against the practice generally followed of choosing a great number of different varieties for the mere sake of multiplying sorts. It is much better to select such few good sorts as will meet the possible demands you are called upon to satisfy. Avoid, then, needless multiplication of kinds. The imported fruits, as received both from America and Tasmania as well as from other Edens over the sea, teach us this lesson emphatically. Having named half a dozen kinds you have nearly exhausted the types of the splendid American fruits which reach us, and though I would not wish to suggest a strict limit or to define it I would certainly say it would be better in making out a list to be nearer six than sixty, that is of a given kind of any particular fruit, for I am not now suggesting that a fruit grower should grow nothing else but Apples. I would strongly urge that he should go in for general cultivation of Apples, Pears, stone fruits, berries, and some of the choicer vegetables, including Mushrooms and Tomatoes, for all of which there is a constant and increasingly heavy demand.

It is desirable to have plans so arranged that no particular

season is so overcrowded with pressing work as to necessitate neglect of some other department calling for labour and immediate supervision. In cases of this kind it is usual that after this over-pressure there may come a period of prolonged feeble activity until the return of the time when a renewed outburst is needed to put matters upon a clear basis again. This may be said in another way by exhorting the fruit grower, in the language of the familiar proverb, "not to carry all his eggs in one basket." He should be able to spread his resources with tolerable evenness over the longer period of the working days of the year, or in the busy time the preparation for the market and the attendance there will constitute such a crowded day as will render attention to home duties—to the necessary demands of special growing crops—an irksome toil, an attempted futility, and must mean loss of money and repose of mind, of pleasure, of peace, and of profit—pleasure, which every man's calling ought to give him, or he is better out of it; of peace, which every man's life must have in some measure, and might have in fulness and of profit, without which we are unable to provide for the stern necessities of an existence demanding at least food, clothes, and shelter. With everything properly balanced, and with due regard to daily duty, there should follow that best of all rewards on the earthly plane—health and contentment. It is not every industry that can offer such advantages.

It will be remembered that the grand Carlylean maxim was, "Produce! produce! produce!" This is a splendid utterance of the wonderful old rugged prophet and sage philosopher, whose writings are rightly counted amongst the most precious treasures of our literature and philosophy. Carlyle's maxim is timely. Its counsel is greatly needed in our present age. It is a healthy tonic for the present day lassitude—a stimulus for the weary languor which seems to be creeping into the labour ethics of the end of the century. My brief remarks find focus in the same idea. The fruit growing idea is "Produce! produce! produce!" We are aiming at production. And this opens out the next phase of the subject to which I must briefly allude. Production includes at least two phases—quantity and quality. Whilst we aim for both we must insist upon quality. Let me write this out in capitals—insist upon quality. There is little room now for, and less profit upon, anything in the way of fruit that is not up to the mark as to quality. Soon there will be no ready market for anything but that which can be branded "A1," and I believe the day will never come when good fruit, well grown and carefully packed, will not find an eager market demand and a ready sale at profitable prices, but we have to make steady and great advancement in this respect. I hope the day may come when fruits can be offered and bought by sample, when the fruit grower need not stand idle in the market place behind his hampers waiting the whim of the purchaser, who in his turn is likely waiting for the decline of the day and the corresponding decline of prices, a process which often goes on to save the necessity of carting home the unsold produce. Why not sell fruit by sample as grain and other produce of the earth can be sold? Why can I not buy British fruits of a certain brand and a certain quality? This must come together with improved market methods, central agencies, increased railway facilities, and other blessings for which we are waiting, and which a future organisation connected closely with this industry must take in hand with determination.

There are other questions, such as fruit preservation, upon which I should have liked to have touched, but in a subject so wide we must leave certain tracts of interesting territory marked like the maps of the world, "unexplored." Fruit as food might be favourably and profitably discussed—in a double sense, if you like—but this must wait another opportunity. There are other points, too, connected with the industry from a Government point of view—as, for instance, the fact, that whilst the fishery industry receives State aid, no such helpfulness is rendered to this, I venture to urge, more important industry of fruit growing. Another interesting and peculiar fact is, that whilst in some countries there is Government supervision of orchards, and an insect-infested fruit grove has to be reported to Government officials, so that the plague may be stamped out before its harmful influence is extended, our own Government at home limits such precautionary measures to swine fever and foot-and-mouth disease.

But upon these and other points such associations as the British Fruit Growers' Association, under the auspices of which I am permitted to-day to address you, are always ready to seize, and from this Association and other similar societies whose record of past work, though necessarily brief, as the history of the movement is brief, is yet a noble testimony to good service actively rendered with most satisfactory results—from this Association and other organisations I look, with a full hope, for the better day which I am persuaded is about to dawn. There are pessimistic growers who see puzzles and problems everywhere, men who have neither peace nor

patience, who never get to the tops of the mountains, but mope and maunder in the mist at the foot of the hills, and say solemnly and drearily that the sun is always obscured by the rain cloud, and the breath of the wind is full of a blight curse. The Book of Job is believed to be one of the oldest books in earth's library, and you find Job's comforters were children of yesterday. They are with us to-day, and they are likely to be here to-morrow. We can pity them, but we can also afford largely to ignore them. To the right minded and the right hearted this industry—this movement is a splendid fact in the world's welfare. We do not consider the matter entirely from a pounds, shillings, and pence point of view. In speaking of an industry it is necessary to keep this in view, but there is another side to the question, a most important one. The future happiness of the nation, and of other nations, for the subject is too large even for a nation—it is international in its best, its highest aspects—the future happiness and welfare can be, must be, largely influenced by an extended practice of fruit growing, involving of course an implied effect of this system, a largely increased use of fruits as the food of the people. There are weary eyes aching over the needle night after night, to these there is little to look at of this beautiful world—only the dull dim street; there are heavy hearts which hear no semblance to music, save the dinner bell at the factory; there are languishing spirits in close crowded courts fainting for the breath of the breeze. Toilers these in the towns whose lives are almost without hope. Open the gates of Arcadia! Lead the children out into a peopled paradise! How grandly then would everything go in the way which those who had eyes to see know must be right? Coming face to face with the fair freshness of Nature, how we can strike off the chains that bind humanity down to the dull routine of a mechanical existence of a sunless life, when smoke and chimneys take the place of sunlight and trees, and the hissing of steam and the fumes of chemicals torment and stifle those who might find freedom and fulness of life in work of the orchard and the garden or rest in the shelter of the grove.—EDMUND J. BAILLIE.

## SUBURBAN FLOWER GARDENS.

To those whose business lives are passed within the confines of a great city, but who love to taste the sweetness of blossom-scented air in their leisure hours, suburban gardens are a source of endless interest and pleasure. The Hawthorn in its snowy springtide mantle, and the Roses that we often see clothing trellises and gables, have a charm for them that few country dwellers can appreciate. In many suburban byways near busy main thoroughfares delightful pictures of flower and tree beauty may be found, and if one wanders somewhat farther afield, where the houses are more scattered, the gardens larger, and interspersed, perhaps, with stretches of meadow land, such scenes are still more numerous. Not a tithe, of course, of the inhabitants of great towns trouble to search for them; but those who can shake off languor and lassitude and escape into the sweeter atmosphere and brighter surroundings of the city's outskirts will find much that is inspiring and health-giving.

Suburban flower gardens are many sided. So far as London alone is concerned they are to be found in all sorts and conditions within the sound of Big Ben. My own ramblings have been chiefly confined to the Surrey side of the Thames, but "within that limit is relief enough." It has not the lion's share of the great parks, nor, perhaps, of imposing private gardens, but it has a wealth of natural effect and unpretentious garden beauty, which it would be almost a platitude to say is immeasurably more gardenesque. I have never quarrelled with those who tell me that this county or that is the most beautiful in the land (and one knows in particular the Devonian's pride), but if events have favoured I have led them down leafy lanes where there is a glory of wayside gardens, and asked if they can show me where Nature and man have combined to paint a scene more fair, but the answer has never come. If it were not for the infinite variety to be met with suburban wanderings would begin to pall, but the picture is ever changing. True garden beauty must ever be that in which the effects, like Nature's own, are diversified and fleeting. As flower gives place to flower by the woodland and the wayside, so in the perfect garden there must be new features as the cycle of the seasons pursues its unresting course. It is too much to look for this in one small enclosure, especially where business cares are so pressing as to afford scanty leisure, but as many pass under the eye one by one it is found that different ideas and methods have unconsciously combined to provide a complete and delightful whole. One garden is at its best in the spring time, and before Daffodils, Primroses, Scillas, and other blossoms of the opening year have faded the hitherto bare ground of its neighbour teems with life.

In another the eye may find relief from the flowerless aspect of beds and borders in the blossom-laden limbs that Apple and Almond stretch above them, while where fruit trees are absent flower-clothed Weigelas, Berberises, Ribes, Viburnums, and other shrubs replace and succeed them. Then as the spring wanes Irises commence to open, and one sees stately masses of them here and there, while treading on their heels are the Pinks and early flowering perennials, that carry us on until glorious masses of Roses precede the full flush of summer beauty, and warn us to extract the fullest enjoyment from the garden before the Dahlias and Michaelmas Daisies close the display.

Apart, too, from the charm which this successional aspect of suburban gardens gives to them, it is interesting, and not without instruction, to note with what varied materials they are adorned at the same season. Every system of flower gardening that has any following at all, and some, one would think, that are the evolution of local circumstances alone and may be looked for vainly elsewhere, is represented. Evening rambles in July have recently revived old impressions of suburban gardening at the approach of midsummer. In one were found the familiar features of "bedding out;" in another the now almost equally familiar mixed borders; in a third the grace and irregularity of the wild garden; and in a fourth the one-plant idea carried out modestly with Pinks, brightly with Carnations or Pelargoniums, or gorgeously with Roses. But there are other gardens still which arrest the steps of the passer-by, gardens wherein bold flowers are used lavishly but with judgment, and these perhaps are the most beautiful of all. There is one but a mile or two from a great thoroughfare which one never finds without brightness and fragrance from April to October, and is with me the goal of a weekly—sometimes daily—pilgrimage. In spring there are often evil odours from the market gardens near at hand, when forlorn stumps of Cabbages and Brussels Sprouts, robbers of the land and a danger to the public health, are saturated with a moisture-laden atmosphere, but the rich fragrance of the groups of Wallflowers cause them to be forgotten. And as one sense is gratified by these rich brown masses, so is another by the Hyacinths and Tulips in their brilliant raiment, softened by Forget-me-nots, Silenes, and Violas. In June there are broad patches, and even one or two full beds, of Pinks and Stocks, vying with each other in beauty and sweetness. There are, too, stately lines of Delphiniums, dwarfer, by reason of the soil perhaps, than they are usually seen, but with huge spikes of azure and indigo and cobalt. These are not confined to one group or line, but are planted almost everywhere, even amongst the Roses, and it is a lesson to note how beautifully they harmonise with the pink and white clusters of La France and Merveille de Lyon. This is a cottage garden of barely half an acre, and vegetables are grown in it as well as flowers. The western wall of the dwelling is covered by a huge Gloire de Dijon, and it is rarely passed without the owner being found busy cutting and selling flowers to cyclists and pedestrians.

As the materials employed in the decoration of suburban flower gardens vary, so do the skill and taste that are displayed in utilising them. There is one that might be missed entirely, the garden being almost hidden, but that the corner of a trellis erection some 7 feet high and almost smothered in Roses is caught sight of, and a closer inspection of it reveals other beauties within. Again, one may find the customary "Geranium" border skirting the short semi-circular drive of a villa, and find nothing fresh there; but in the centre of the little lawn before the door there is a rustic basket, from which hang the flower-furnished sprays of Ivy-leaved Pelargoniums and Petunias in graceful profusion. In another case one finds a meagre strip of garden ground containing nothing noteworthy, and the front is a mere forecourt; but the wall supports a magnificent Honeysuckle, and within a stone's throw is another, which is covered with a dense mass of *Ceanothus rigidus*. In suburban, as in other, gardens are to be found the formal and the informal, the simple and the ornate. In some a satisfying effect has been secured, but bearing the traces of such thought and trouble; in others a happy inspiration speaks for itself.

Of the scores, I might indeed say hundreds, of suburban gardens which I have admired of late, one remarkable example of original treatment is worth referring to specially. A valued friend whetted an appetite that had already been bountifully ministered to by suggesting a visit to "the most beautiful garden in London." The least curious would be aroused by such a description, which carries more weight, let me say, than many would give to it who have only seen desolate backyards—a disgrace to the name of gardens—from the windows of local trains. In such a connection comparisons are "odorous" indeed, and yet it is hard to imagine a garden more beautiful than that at Adon Mount, the residence of a well-known proprietor of newspapers in London. But that my theme is gardens, not men, I should be tempted to dwell on the

wonderful enterprise, business sagacity, and success of Mr. James Henderson, who began business life more liberally endowed with common sense and courage than worldly goods, but is to-day the owner of almost as many newspapers as can be counted on the fingers of both hands; still what he has done with flowers may interest gardening readers more. To attempt any stereotyped description of his garden would be absolutely useless, for there is not a shred of conventionality about it. All is freshness and originality. The house stands on an eminence overlooking Dulwich Park, and the garden slopes down on every side. It is one of broken lines and curves, of banks and slopes, of irregular borders and rock beds, of arches and trellises, of winding walks and shady nooks. It is a garden that one cannot survey at a glance, but must wander and ramble in to find out the treasures that are there. There is a coign of vantage from which one can admire the beauty of the surrounding country, but none from which every lovely nook and corner of the garden can be seen. Its boundaries are marked by trellises festooned with Roses, and long borders in which Roses were recently flowering in wonderful profusion and beauty, embrace a wealth of the choicest and most useful of hardy flowers. These are all on grass, not on gravel. Foxgloves from seed mixed with soil, and thrown here and there at the backs of the borders, rear their tall spikes in colonies, while Delphiniums and Hollyhocks complete a stately trio. Carnations, Picotees and Pinks, Irises in great variety, Columbines, Campanulas, Lilliums, Gladioli, and numbers of other valuable flowers are strikingly effective in masses. Above all, too, there are Poppies—Poppies in such numbers and diversity as one rarely sees. One broad mass clothes what was formerly a bare unsightly bank in a shimmering mass of colour, and there are some large beds full of them in every imaginable shade of colour. There are Poppies of all kinds, Poppies annual and Poppies perennial, Poppies of the French school, Poppies of the English (clerical these) and quaint Japanese. There are individual varieties of great beauty, some recognised forms, such as the Mikado, other seedlings rejoicing in no cognomen, but whatever they may be individually the collective display of these brilliant flowers at Adon Mount is one of the floral sights of London.

This is not merely a summer garden. In the spring time Hyacinths, Tulips, Scillas, Daffodils, Primroses, Lilies of the Valley, and other flowers rear their heads in thousands in beds and borders, on banks and slopes, in nooks and corners; and there is abundance of material for carrying on the display after the summer flowers have waned. Everywhere there is the same diversity and graceful effect. To use Miss Jekyll's significant words, "Things seem to have happened and not been done." The flowers grow as nearly under natural surroundings as flowers can. No hoe is allowed amongst them, and weeds have so little chance of making headway that the hand suffices to keep them down. There was a time when Mr. Henderson's beautiful garden drew visitors from far and near. He threw it open to them to teach a love for flowers and new views of flower gardening. On one occasion it was crowded with 6000 of them—a truly remarkable fact in a London suburban garden—but the privilege was abused and had to be withdrawn. The orderly and careful have to suffer for the misdeeds of the disorderly and careless—a regrettable fact, for the garden is essentially one that must be seen to be understood. It is noteworthy that the transformation from bare land to one of the most beautiful flower homes that can be conceived has been brought about entirely by the owner himself. Everything has been carried out by unskilled labour under his personal direction. He nursed ideas of flower gardening thirty years ago that are even now ahead of the times, and has carried them into effect with a success that is nothing short of remarkable, when it is remembered that it has been accomplished with such little time and attention as have been spared by a vast business undertaking.

The flower garden at Adon Mount is a triumph of artistic work, and teaches valuable lessons to any thoughtful observer. It has what many others lack, a striking individuality, and it is, of course, out of the common rank of the suburban gardens to which reference has been made in these notes, but these, as I have said, form a great field for collective study. I would that countless persons penned within the city walls could be induced to stretch sluggish limbs and go forth to seek their pleasures. When once the trees and flowers become familiar friends they teach many a lesson of happiness and contentment. Great journals may open their columns to give vent to the bitter cry of dullness and weariness of spirit as one of them is doing now, but I urge with the love and sympathy of one who has covered many hundreds of miles in suburban byways, that the remedy is there, and not in cramming the already suffocating city with new temples of amusement. Nature offers antidotes to the ills that attend coercing her with a forgiving and generous hand, and those who seek her in her own domains, leaving the depression of the gloomy town behind,

will find that of which Von Fallersleben, as admirers of German poetic literature will remember, has so sweetly sung, "Spring within the heart."—W. P. WRIGHT.

### THE PREPARATION OF SOIL FOR FRUIT CULTURE.

THE nature and condition of the soil is of the greatest possible importance in relation to fruit culture, as the soil is the principal medium through which the building up of the tree and the formation of fruit takes place. The soil serves not only as a basis upon which the tree fixes itself and maintains its position, but it is the medium through which it draws its food supply, as well as that wherein many of the chemical changes take place in the preparation of the various elements of plant food.

Before determining what preparation may be required it will be needful to ascertain the present condition of the soil. To do this it must be noted in the first place what is the natural condition or strength of the land; that is, what are its component parts; how much does it contain of the elements of the food required; or what ingredients may be deficient. A chemical analysis is the only means of ascertaining this accurately; but where only small quantities of trees are to be planted by a cottager, allotment holder, or small farmer, this might entail too great an expense, but a fairly accurate estimate of the quality of various soils may be formed by any practical man, and the elements that are likely to be deficient may be artificially supplied.

But the object of this paper is not to deal with the composition of soils so much as to give a few practical hints as to the cultivation required to render the land fit for planting. The present state of the land to be planted must first be considered; as to whether it is freshly broken up pasture, whether ordinary arable land, or whether it may have received any better treatment than that given in ordinary husbandry. The first consideration should be that of drainage. Nothing can be worse for fruit trees than to be planted in land the subsoil of which is close and water-logged. There are, of course, many soils that do not require draining. A test as to its nature in this respect may be made in the following way. If, on digging to the subsoil, you find it porous and perforated by worms, you may conclude that there is sufficient circulation of water and air through it. If, on the contrary, you find the soil close and retentive, with no worm holes, you may conclude that it ought to be drained; and let me here emphasise the importance of proper draining. If the land be water-logged, it is impossible for the trees to thrive and maintain a healthy condition upon it, or for it to perform its proper functions in preparing plant food. The fruit trees will consequently become moss-covered and subject to canker and many other diseases, and instead of producing good profitable crops, will become so stunted and unhealthy, that what fruit may be produced it will be comparatively worthless.

The next consideration is the breaking up of the land. If it has been used for ordinary husbandry it should, in the first place, be broken up to a greater depth than has hitherto been the case. Where there is no great extent to be planted this would probably have to be performed by hand. This should be done by what is ordinarily known as bastard trenching, or the breaking up of the land two spits deep; but in doing this, on no account must the subsoil be brought to the surface, but merely broken up and turned over, turning the next spit of surface soil on to the top of the subsoil thus broken up.

Where large breadths are to be prepared a steam cultivator may be used to advantage, or it may also be prepared with the subsoil plough. These implements should be used in dry weather only, and if possible used in two opposite directions to ensure the whole of the subsoil being moved. If the land can be thus prepared a few months before planting so much the better, as the constant moving of the land in dry weather, and fully exposing it to the action of the sun and air is highly beneficial, and it enables the soil to absorb from the atmosphere many fertilising elements. In the case of planting standard trees upon grass land in the old style of farm orchards it will be needful to dig holes for each of the trees. In these single holes, however, there is always a great danger of water lodging and becoming stagnant, which will be greatly to the detriment of the tree. Where, therefore, it becomes necessary to dig these single holes always be careful to provide some proper means of drainage from each hole, or disappointment will probably ensue to the planter.

As to the condition of the land best suited to planting probably that from which a root crop has been taken will be found one of the best. The land will then of necessity have been well worked in preparation for the roots, and well manured, much of the strength of which will still remain in the soil in the best condition for the newly forming roots to feed upon. If planting is to

succeed a corn crop the land will be in a more exhausted condition, and will require more manure applying at the time of planting. It is most desirable to select land that is clean and free from weeds. Otherwise if the trees are planted where the land is at all encumbered with them, and they should become buried amongst the roots of the trees great annoyance and expense will ensue for many years, and some of the more tenacious weeds cannot be afterwards extracted without injury to the roots of the tree.

If the land to be planted is naturally good and has been well cultivated for any considerable time it will not require much cultivation before planting, but if the land is not naturally so good and is in a poor condition it will be better to defer planting for a time in order to thoroughly clean and give good preparation. In some cases it will pay well to take a clear summer fallow and to break up the land, and thoroughly clean and pulverise it through the summer, applying a good coat of manure in the autumn before planting. This will really be no loss of time but a saving in the end, and the endeavour in planting should always be to put the tree into the soil under such conditions that it will have a fair opportunity of growing and thriving after it is planted.—JOSEPH CHEAL.

[Read at the Beddington Park Conference of the British Fruit Growers' Association, August 3rd, 1891.]

### PINKS AT HANDSWORTH, BIRMINGHAM.

I SAW Mr. A. R. Brown's Pinks in the middle of June, and the plants had suffered so much from the severe winter that I was somewhat surprised at his success at the Midland section of the National Pink Society at Wolverhampton and at Manchester as the leading prize-winner. The day after the Wolverhampton Show I again saw his plants, and was much gratified with his blooms, and I found him at work polishing up his best blooms from Wolverhampton; and they needed it, for the three days' exposure there had given the flowers a coating of dust, and yet they stood so well, and some of them were in his winning stands at Manchester on the Saturday in the same week.

Mr. Brown's garden in the Crompton Road, Handsworth, where his father first started a florist's business many years ago, was then and for some years after a suburban district, but now it is surrounded by bricks and mortar, and the district is densely populated. The late Mr. Brown, father of the present proprietor, was a well known, much respected florist, and everybody in the Midlands knew Sam Brown, a genial, true florist, and a good grower of Tulips, Carnations, Picotees, Auriculas, Pinks, and other flowers. The hybridisation of sub-shrubby Calceolarias also engaged his attention. The Pink was one of his special favourites, and it is fully ten or more years since he raised a number of seedlings, of which Amy, Mr. Dark, Mrs. Brown, Mary Ann, Clipper, a flower which Mr. Samuel Barlow esteems highly, and was originally called Heavy Red, and is still an excellent variety. Mr. C. F. Thurstans of Wolverhampton also grows this variety, and considers it one of the best. There is another which I think is destined to make its mark by-and-by, a variety named Maud, which last year only existed in one weakly plant, and it was nursed through the winter, and now has a few strong pieces of "grass" for future stock.

The only one yet sent out is Mrs. Dark, and it seems hard to understand why Amy, Ethel, and Maud have not been distributed long since. Sam Brown, as he was familiarly called, was somewhat conservative in his floral leanings, and would only part with his pets to a very particular friend, and this but seldom, and no great effort was made to increase the stock to any extent. Last winter terribly crippled Mr. Brown's stock as well as that of others, and both Amy and Ethel cannot be sent out until the autumn of 1892. Mrs. Brown and Mary Ann, two fine varieties, are altogether lost. Amy is making its mark as a fine flower of good size, a good petal, and refined in its marking and quality. Fellows' Rector, so admirably shown by Mr. R. Sydenham at Wolverhampton, is another fine flower, which will be welcomed by all growers. Brown's Ethel, light red laced, has a fine petal, regularly laced, and a good pod, and is an A1 flower. Mr. Dark, light red laced, is a good flower, always lacing well, and a good pod. Ethel is a seedling from it and finer. Cronk's Mrs. J. Cronk, sent out by Mr. J. G. Paul, Bridge of Weir, bright reddish purple laced, has a pure white ground and fine petal, which is regularly laced. Paul's Chastity, bright red laced, is fine in petal and lacing but small. Paul's Bertha has a very small lacing, almost a wire edging of dark purple, which runs clean on the margin of a very pure white ground, and is a most promising flower. After making these notes this flower, shown by Mr. Brown, was certificated at Manchester, was regarded as a coming flower, and took the first prize in the class for purple laced Pinks.

Hooper's Ranger Johnson, heavy red lacing, is large and full, the lacing rather irregular, with a roughness about the flower; but seeing this flower later, quite at the end of July, it came better, and is well worth growing. Hooper's Richard Dean, heavy red lacing, bears some resemblance to Ranger Johnson, and Mr. Hooper considers it to be one of his finest. It is not so at Handsworth; it is small in petal, somewhat irregular in the lacing, and is too full of small petals. Hooper's Mrs. Fred Hooper, bright rosy purple lacing, is a promising flower, with a good petal, a well-built fine flower. Fellowes' Eurydice is fine in colour, but with a confused centre, and Mr. Brown intends discarding it. Fellowes'

Hebe has a heavy dark red lacing, which is irregular and rather rough, but is a useful back row flower. Fellowes' Zoe, bright heavy red lacing, has fine guard petals, and is also good in lacing, but the centre petals were irregularly marked early, but came better later, and may evidently be caught occasionally. Jones' John Love, light purple lacing, is a promising flower, with good petal and form. Paul's George White, light purple lacing, a well-known flower, with good petal, is still amongst the best; and Dr. Maclean is also a good old variety. Bertram, heavy red lacing, is a telling corner flower; and Fellowes' Minerva, dark red lacing, is better than Bertram, finer in every way. Hooper's Emerald, very heavy red laced, is very large and full, but small in petal. Hooper's Henry Hooper, dark purple lacing, which is rather feathery, is both good and useful. Turner's Godfrey, deep bright red lacing, which is regular, has a good petal, and is a good old variety. Turner's Galopin, heavy purple laced, is beautiful in form and lacing, and has a good petal. Boiard, red laced, is still one of our best Pinks, although having a narrow petal, and it tells well in a stand. Of Modesty too much cannot be said in its favour. It is in every way a grand flower, and was very much to the front at Wolverhampton and elsewhere. It has a light rosy purple lacing, with broad fine regularly laced petal, and requires scarcely any dressing. Empress of India has a grand petal and brilliant colour, and if it possessed another tier of petals would be almost unsurpassable. It took the premiers as a red laced both at Wolverhampton and Manchester. Paul's William Paul, clear red lacing, is very large and full, with good petal and form, and is one of the best in cultivation. Maclean's Ernest, heavy red lacing, large and fine. Fellowes' Lustre, large, but with small centre petals, of the colour of William Paul, but inferior to it. Turner's Blondin is one of the older sorts, dark red laced, and still a fine flower. Hooper's Reliance large, and a good old variety. Fellowes' Rosy Morn, bright red lacing, full and fine. Maclean's Devise, another old variety, bright purple laced, and still one of the best grown. Turner's Dr. Masters, very heavily laced with rich dark red, and broad petal, which is smooth on the edge, is a very large and full flower. Hooper's Fred Hooper, pale rose lacing, large, smooth, and extra fine. Cronk's Noble Grand, very dark lacing, and a promising flower. Paul's Ada Louise, dark purple lacing, large and full, a fine back row flower.

These notes must be taken as referring to the blooms in Mr. Brown's collection at Handsworth. Other growers' experience may be different, but these remarks were written after careful examinations. With regard to the propagation of the Pink Mr. Brown adopts layering instead of piping, and finds they make strong plants very much earlier; and Mr. C. H. Herbert adopts the same plan, and I do not know any others who do, except Mr. Coeker of Aberdeen, and I think he does, as I know that layered plants are sent out by him.

A question arises out of my notes, Where do the purples end and the reds begin? Truly they are running so closely into each other as to be getting very much "mixed," and it is only experts in Pink lore who can be looked to now to define the two classes; and can they always do so satisfactorily to others? I know of some curious decisions in the single classes when a flower at one exhibition is classed as a red laced and in another exhibition as a purple laced. We are also getting so many degrees of lacing that it is a question in my mind whether a classification, as with Pieotees, light, medium, and heavy, should not be adopted. I know that I am not alone in this opinion, and these remarks may bring out the opinion of growers on the subject.—WILLIAM DEAN.

### TUBEROUS BEGONIAS.

THAT these are grand plants in any form no one will for an instant dispute I am certain, but I fear that the hankering after size in the blooms is not conducive to the best results for the future of this plant when considered in a decorative point of view, whether it be for the adornment of the conservatory, greenhouse, or the flower beds. Raisers appear to pay much attention to mere size of flowers, whether of double or single varieties, which they have in hand. I am aware also that they do consider the habit of growth of the plants, endeavouring to render it as dwarf as possible, which may suit their point, showing to the best advantage the few blooms which the majority of the plants are furnished with. To those who love size and compactness in the double blooms it is all very well, but as decorative plants in the broad sense too few blooms are produced.

I prefer varieties which are remarkable for their floriferousness, compact habit of growth, and still maintaining the blooms of a somewhat circular form, and characterised also by solidity, devoid of "flimsiness." Plants of either double or single varieties which can be grown in a 7-inch pot for instance, with perfect foliage and fairly covered with medium-sized blooms, are far more creditable, interesting, and satisfactory to the bulk of cultivators than those carrying perhaps a dozen huge blooms. The extra free-flowered varieties are more often semi-erect in habit of growth, just the style to render a well-grown plant appreciated on the dinner table for instance, where it would show to the greatest advantage without the aid of separate stakes to support the prodigious blossoms now becoming so common at exhibitions from the leading trade growers. In private gardens seldom do we see these large flowered sorts in the same state of perfection in that respect as we do at the metropolitan shows for instance. For flower gardens the varieties with medium-sized flowers are distinctly preferable to the huge flowered sorts, and more especially is this noticeable when growing in vases on the terrace wall, where the erect large bloomed sorts appear far too stiff in growth ever to "shine" highly as a decorative subject. For filling small vases for the house

capital plants can be had in 4-inch pots of the free-flowered section, which are just the things for this aim.

The appearance of Tuberous Begonias in flower beds may be very much improved when of the drooping or semi-drooping character by supporting their blooms with the aid of small fork-like sticks thrust into the soil amongst the foliage upon which the blooms rest. Nothing answers better for this purpose than the remains of an old birch broom, the twigs of which through being dry are rendered stiff, although of small size; therefore they will support the blossoms easily and effectually, rendering the inspection to be carried out considerably easier than when the flowers are, or nearly, touching the ground: and besides, the blooms are prevented being splashed with the soil from the beds.—E. M.

### LILIUM CONCOLOR.

A GRACEFUL plant is *Lilium concolor* when flowering as it has been in the last week or two in gardens and nurseries where Lilies

FIG. 20.—LILIUM CONCOLOR.

are prized. The flowers are of moderate size, the petals narrow and recurving, but the colour is a peculiarly bright orange red, and the whole appearance is light and elegant. Variations from seed are not uncommon, and they differ chiefly in the depth of the colouring on the prominence of the spots. One variety, shown by Mr. T. S. Ware of Tottenham at a recent meeting of the Royal Horticultural Society was noticeable for its soft tint, all clearly defined spots, and from this a sketch was prepared, which is reproduced in the accompanying woodcut (fig. 20).

In some old works this Lily is referred to as a greenhouse plant, and in the early part of the present century it was so grown. Long

since, however, it was proved to be hardy, and is now the occupant of many borders. It succeeds wherever the soil is not excessively heavy, cold, or waterlogged, but is also adapted for culture in pots.

### COMPTON VERNEY.

WITHIN the radius of a few miles of Warwick many noble English mansions are situated, and it would be difficult to find within a given area of any other town in the British Isles so many stately homes which are rendered memorable in history. In addition to the associations connected with them, some of the mansions around Warwick are also notable on account of the magnitude and grandeur of their architectural features, or by the delightful views and rural scenes that surround them. Although Compton Verney cannot boast of being so rich in historical associations as many other places in the district, it yields the palm to none in the beauty of its surroundings. In whatever direction we look features of great interest meet the eye. In some parts the flowing undulating surface of a distant scene rivets the attention; in another a stately tree stands boldly out, while the glimpses of a lake beyond show that the whole is so skilfully laid out as to leave no trace of the point at which the natural finishes and the artificial begins. Compton Verney belongs to Lord Willoughby de Broke, but is now in the occupancy of E. Cassell, Esq. It is about eight miles from Warwick, and is reached by a pleasant drive along good roads, bounded by fertile fields of corn and pastures, diversified by scattered hamlets, isolated farmsteads, and well wooded hills. The entrance to the park is through massive iron gates, from which the road is lined on one side by a long belt of large Elm trees. A sharp curve in the drive brings us in sight of the mansion, which is a well built and commodious structure, designed with an object of securing well proportioned and well lighted rooms, rather than the display of architectural adornments. The front entrance with its finely sculptured colonnade is, however, imposing and beautiful.

The lawns and pleasure grounds are very extensive, and must entail much labour to keep so large an area of lawn in good condition. Near the south front of the mansion a great feature is the splendid clump of Lime trees, supposed to have been planted on the site of the old chapel. They now form a fine shady bower some 30 yards long and nearly as much broad, the leafy canopy above quite shutting out the sunlight. Not far from this spot stand two remarkable Cedars of Lebanon, which must have been amongst the first examples planted in this country. One is 25 feet in girth near the ground line, and the other 18 feet, but unfortunately from that point they break into numerous large branches, but for all that they are grand trees. Another interesting feature at Compton Verney are the fine young Wellingtonias, which thrive remarkably well there. The largest tree near the mansion is about 45 feet high, but there are many more handsome specimens, an avenue being planted near the entrance to the pleasure grounds, every tree of which is doing wonderfully well.

From every part of the grounds we catch glimpses of the beautiful lake which is so well designed and so naturally adapted to the surroundings as to give it the appearance of a broad running river wending its way among trees and groups of shrubs, diverted from its course in some places by a bold and irregular sweep in the rising ground, then curving inwards for a distance, only to turn again till the farthest extremity sweeps gracefully round by a clump of trees. From a point opposite the front of the mansion while standing on a bridge which spans the lake at a narrow part a good view is obtained of the broadest part of the lake backed up on the further side by the fine group of Limes already mentioned, and the front entrance to the mansion partly in sight, while all along the water's edge in large masses, small clumps, and irregular bands forming a continuous fringe. The golden yellow flowers of the Water Flag (*Iris pseudo-acorus*) sparkle in the sunlight as they rear their heads above their own glaucous leaves.

Following a narrow winding walk we come suddenly upon the flower garden, which is not extensive, but bright with the glow of summer bedding, the picture of neatness and good keeping, and in addition commands one of the prettiest views of the lake, the lawn, and the Cedars. Begonias are effectively used here, some of the beds containing them being edged with *Alyssum variegatum*. On one bed in the centre, which is raised in tiers, the drooping flowers of the Begonias are shown to advantage, and just at the time of my visit the yellow Saxifrage with which they were carpeted was in full flower. Other beds were filled with scarlet Pelargoniums and Mrs. Pollock, the latter looking particularly distinct. A small grotto on one side gives an air of coolness and repose, and the water in the centre proves a useful place for Nymphæas and Lilies.

The kitchen garden and glass structures are situated on a sharp incline to the north-west of the mansion, and so steep is the ground that the upper part of the garden seems to be on a level with the roof of the mansion, and, as may be imagined, entails considerable labour. Cut flowers and plants for decorative purposes are largely in demand, and consequently the plant houses are filled with a fine stock of useful material for that purpose. *Isolepis gracilis*, *Panicum variegatum*, *Eulalias*, *Curculigos*, *Acacias*, *Grevilleas*, *Palms*, *Dracænas*, and *Ferns* are all represented in numbers by healthy plants in various sized pots; and in the centre of the stove a large plant of *Strelitzia regina* was thriving well. Another good-sized house was filled with a mixed collection of Orchids, which have been obtained recently, and as the plants are standing close together at present Mr. Garner intends to devote a couple of houses to them shortly. The vineries are four in number, the

earliest house being filled principally with Black Hamburgs. The Vines were young, and this being the first year of cropping, the fruit was cut as soon as possible to give the Vines a long season of rest. The other houses are filled with Black Hamburgs, Alicantes, Muscats, Madresfield Court, and Foster's Seedling—a rather difficult mixture to manage successfully when grown together; but by extending some of the Vines and cutting out others Mr. Garner is gradually reducing the number of varieties in each house, so as to retain only those that are known to succeed together. One house it is intended to devote entirely to Alicante, and another to Black Hamburg, Madresfield Court, and Foster's Seedling—a trio which I know from experience do well together. A good type of Foster's Seedling is growing here, the berries being of large size, and the bunches well shaped and fairly large. Many of the Alicantes were very good. Though the bunches were not particularly large they had that sturdy compact appearance which exhibitors so much admire, the berries being large, and even showing evidences of good thinning, and judging from their appearance seem likely to colour well. Tomatoes, which had been bearing a good crop for some weeks, had still a fine show of fruits, the variety being Earliest of All, of which Mr. Garner speaks very highly.

Melons are largely and well grown. The remains of a good crop was represented by well netted, highly coloured fruits of Hero of Lockinge and the less attractive but highly flavoured Sutton's Imperial Green Flesh, while in other houses were healthy plants to form a succession. A row of pits also contained a large number of plants, with fine crops of fruits, nearly full grown, which were netting beautifully. Sutton's Triumph and the two varieties previously mentioned were the principal varieties here. A capital plan adopted in these pits is to train the plants to a trellis fixed about a foot from the soil, there is then little danger from damp, and the fruits resting on the trellis need no other support; and I was much pleased to find such excellent Melons here. A single hot-water pipe runs round these pits, which proves useful in cold, wet weather.

The kitchen garden in which the vineries are situated is one in which the ornamental is combined with the useful, a wide herbaceous border running the length of it in front of the houses, and planted in such a way as to secure plenty of flowers for cutting purposes throughout the spring and summer. The whole of the garden was well and closely cropped with such vegetables as are in constant demand, but some exceptionally fine rows of Peas deserve special mention, the variety being St. Duthus, which is an improvement upon Stratagem, and is even more prolific than that fine variety, the pods also being larger, and, all points considered, it would be difficult to surpass for general use.

Excellent Chrysanthemums in pots were growing near here, a portion of them being set apart for the production of large blooms, the others being grown in bush form. All were looking well. I had almost forgotten to notice the contents of the old conservatory, which is now used for growing Camellias and large Palms. The former showed by their green shining foliage that they were well cared for, and the Palms were in good condition, among them being handsome specimens of *Phoenix rupicola* and *P. reclinata*. Before concluding these notes, I must, on behalf of myself and a friend, tender our hearty thanks to Mr. Garner for his attention.—H. D.

### ROYAL HORTICULTURAL SOCIETY.

AUGUST 5TH, 1891.

THE Floral Committee met at Chiswick on the above date. Present—W. Marshall, Esq., in the chair; Messrs. Dean, May, Paul, Furze, Herbst, Leach, Jefferies, Gordon, Watson, Fraser, Goldring, Noble, Baines, and Phippen. The Committee examined the collections of Carnations, Violas, Pansies, Fuchsias, &c., growing in the gardens, when the following awards were made:—

#### Three Marks.

CARNATIONS.—White Queen (Fisher, Son, & Sibray) white self.  
Snowdrift (Fisher, Son, & Sibray) white self.  
Edith (Fisher, Son, & Sibray) pale pink, spotted scarlet.  
Penelope (Hooper) white self.  
Dante (Hooper) rose flaked.  
Maggie Laurie (Dicksons & Co) delicate blush self.  
Guiding Star (Ware) scarlet self.  
Rowena (Dean) bright scarlet.  
The Moor (Dean) dark crimson.  
Mrs. Reynolds Holc (Veitch) terra cotta.  
Alice Ayres (Veitch) white, rose edge.  
Achilles (Novelty Seed Company) deep red streaked.  
Hoffgartner Schaffner (Benary) scarlet striped.  
Albrecht Duesser (Benary) deep rose, crimson flake.  
Madame Van Houtte (Benary) yellow ground.  
Professor Virchow (Benary) rose flaked.  
Dan Godfrey (Turner) scarlet flake.  
Agnes Chambers (Turner) yellow ground, lilac edge.  
No. 97 (Douglas) yellow, faintly striped.  
No. 62 (Paul & Son) crimson flaked.  
Grandiflora (Veitch) deep rose.  
PICOTEES.—Margaret Rueder (Benary)  
Redbraes (Benary).  
Romeo (Paul & Son).  
Mr. Rudd (Turner).  
Favourite (Turner).  
Mary (Turner).

*Two Marks.*

CARNATIONS.—Rosy Morn (Douglas) pink.  
J. R. Allinson (Ware) rose self.  
Feureball (Benary) deep scarlet self.  
Horace (Dau) scarlet self.  
Beatrix (Fisher, Son, & Sibray) buff self.  
Terra Cotta (Turner) streaked.  
Van Dyck (Benary) slate and crimson flaked.

*Three Marks.*

Godetia Duchess of Fife (Daniels Bros.) blush with large carmine blotches.  
Chrysanthemum (annual) Sibthorpi (Dean) bright yellow, very free flowering.  
Chrysanthemum (annual) multicaule aureum (Dean) yellow, dwarf.  
Viola The Mearns (Dobbie & Co.) lower petals dark purple, top pale lilac.  
Viola Croft House (Dobbie & Co.) white, fine habit.  
Pansies for strain (Dobbie & Co.).  
Pansies for strain (Hooper).

*Two Marks.*

Viola virginalis (Dobbie & Co.).—Large pure white.

*Three Marks.*

SWEET PEAS.—Mrs. Sankey (Eckford).—Pure white, fine.  
Mrs. Gladstone.—Delicate pink standards, wings blush, edged with pink.  
Captain of the Blues.—Standards bright purple blue, wings pale blue.  
Princess of Wales.—Shaded and striped mauve, on white ground.  
Isa Eckford.—Creamy white, suffused with rosy pink.  
Senator.—Shaded and striped chocolate on creamy ground, fine.  
Countess of Radnor.—Pale mauve standards, wings pale lilac.  
Monarch.—Bronzy crimson standards, rich deep blue wings, fine.  
FUCHSIAS.—Single white corolla, Flecon de Neige (Cannell).  
Double White.—Berlines Kind, Gustave Doré (Cannell).  
Single Red.—First of the Day, Adolphe Legour (Cannell).  
Salmon.—Earl of Beaconsfield, Aurora superba (Cannell).  
Fancy.—President Grévy (Lemoine).  
Pentstemon La Foudre (Lemoine) fine scarlet.

## FRUIT AND VEGETABLE COMMITTEE.

A meeting was held at Chiswick on this date. Present: P. Crowley, Esq., in the chair; Dr. Hogg, Messrs. Lee, Rivers, Warren, Dean, Bates, Balderson, Willard, Cliffe, Denning, Reynolds, Hudson, and Wythes.

The Committee inspected the collections of Runner and Dwarf French Beans, &c., growing in the gardens, and made the following awards:—

*Three Marks.*

DWARF FRENCH BEANS.—Mohawk, Smyth's Speckled Hybrid, Fulmer's Forcing, Sion House, Ne Plus Ultra, Dark Dun, Ne Plus Ultra (Veitch).

Ne Plus Ultra (Harrison).

Wax Mont d'Or, yellow-podded Butter Bean, found to be of excellent quality (Vilmorin).

PEA.—Sequel (Laxton), dwarf, deep green Marrow.

## AUGUST 11TH.

CARNATIONS and Picotees were again the chief features at the Drill Hall on Tuesday, and many expressions of approval were heard respecting the unconventional mode of arrangement adopted. Groups of Caladiums, hardy flowers, Crotons, Bouvardias, and Ferns also occupied considerable space, together with the exhibits before the Fruit Committee.

FRUIT COMMITTEE.—Present: P. Crowley, Esq., in the chair, with Rev. W. Wilks, Dr. Hogg, and Messrs. John Lee, R. D. Blackmore, James H. Veitch, J. Cheal, G. Bunyard, A. H. Pearson, J. T. Saltmarsh, G. Wythes, A. Dean, C. Ross, G. Norman, H. Balderson, G. Reynolds, G. W. Cummins, J. Hudson, F. Q. Lane, and J. Wright. Mr. E. Chadwick, gardener to E. M. Nelson, Esq., Hanger Hill House, Ealing, sent a dish of Rivers' Prolific Plums, from a wall tree; they were large, quite ripe, and very fine. Also a dish of splendid Humboldt Nectarines, as well as a number of dishes of Gooseberries. A cultural commendation was adjudged for the Nectarine, and a bronze medal recommended for the collection.

Mr. R. Nicholas, The Gardens, Castle Hill, South Molton, sent a dish of a very fine Cherry, a seedling. It resembled the St. Margaret (Tradescant's Heart), and more information was desired about the parentage and culture. Mr. R. Mayer, Yattendon Court, Newbury, sent a seedling Grape from the Sweetwater and Alicante. The berries were reddish, rather small, sweet, but had suffered in transit. No award was made.

Mr. S. Mortimer Rowledge, Farnham, sent fruits of his Cucumber Matchless, the result of a cross between Express and Lockie's Perfection. They were extremely uniform, smaller, and smoother than Express, and a first-class certificate was awarded.

A new Melon was placed on the table from Mr. C. Ross, Welford Park. The fruit very large, roundish, well netted, scarlet flesh, very sweet. Award of merit. Mr. G. Wythes sent three new Melons, which were passed. Messrs. H. Cannell & Sons also sent new Melons, but much over-ripe, and no opinion could be formed of their merits.

Mr. R. D. Blackmore sent from Teddington a dish of dark coloured Peaches, grown from a standard tree, not against a wall. Trees were obtained from America of Amsden, Alexander, and Waterloo, but Mr. Blackmore finds them similar, if not identical. An unanimous vote of thanks was awarded. St. Etienne Plum, a small early yellow cooking Plum, was sent from Chiswick, and awarded an award of merit. A few dishes of new Peas were placed on the table, and one from Mr. H. Balderson, resembling a very fine form of Ne Plus Ultra, was recommended to be tried at Chiswick.

Mr. T. Burton, Bexley Heath, sent eight boxes of Peaches and Nectarines, the fruits of Alexandra Noblesse having been gathered from a standard tree from under glass, bearing fifty dozen of similar fruits. They were very good, as were the others in the collection, and a silver medal was recommended. Messrs. James Veitch & Sons exhibited seventy-five dishes of Gooseberries, twenty-five of Apples, four of Pears, four of Cherries, two of Plums, and seven of Currants—a valuable and imposing collection, for which a vote of thanks was unanimously accorded, a silver medal having been granted for their fine collections at the last meeting. The finest culinary Apples were Dutch Codlin, Potts's Seedling, Grenadier, Lord Grosvenor, and Frogmore Prolific. Dessert.—Early Red Margaret, Mr. Gladstone, Irish Peach, Red Astrachan, and Devonshire Quarrenden.

FRUIT FOR COTTAGERS.—A number of forms had been sent out by the Secretary with a request that the recipients fill in the names of the most suitable varieties of fruit for growing by cottagers and farmers. A number of varieties were named and put to the vote, with the following result:—

Dessert Apples.—Cox's Orange Pippin, King of the Pippins, Worcester Pearmain, Devonshire Quarrenden, Sturmer Pippin, Irish Peach, Duchess of Oldenburg, and Braddick's Nonpareil.

Culinary Apples.—Warner's King, Ecklinville, Stirling Castle, Lane's Prince Albert, New Hawthornden, Keswick Codlin, Lord Suffield, Lord Grosvenor, Blenheim Pippin, Bramley's Seedling, Potts's Seedling, and New Northern Greening.

Plums for Cooking.—Rivers' Prolific, Victoria, Czar, Gisborne's Cox's Emperor, and Monarch. The names of the dessert Plums were not obtained. A list of Pears was not produced because, the Secretary said, of the inability of several persons to fill in the form indicating the period of use of the varieties. The Strawberries chosen were Sir Joseph Paxton, President, and Vicomtesse Héricart de Thury. Of other fruits returns were not presented. Some very careful revision is needed by competent men to render the lists in the highest degree satisfactory for the purpose intended. Four or five experts, such as Messrs. Bunyard and Paul (on the Council), and Messrs. Rivers, A. H. Pearson, and Barron, would produce a more useful list than could be evolved by a large body of advisers.

FLORAL COMMITTEE.—Present: W. Marshall, Esq., in the chair, and Messrs. W. Goldring, H. Herbst, R. Dean, F. Ross, G. Phippen, G. Paul, H. Turner, C. Noole, T. W. Girdlestone, T. Baines, H. Cannell, J. Fraser, J. Laing, B. Wynne, G. Gordon, and Dr. M. T. Masters.

Messrs. J. Veitch & Sons, Chelsea, exhibited a beautiful group of plants suitable for table and decorative purposes generally, Palms, Ferns, Crotons, Dracaenas, and many others being represented similar to those of which a list was given last year. The Committee signified their appreciation of the exhibit by awarding a silver-gilt Banksian medal. Messrs. H. Cannell & Sons, Swanley, had collections of Cactus Dahlias in many bright varieties, also of double Tuberous Begonias, excellent alike in form and colour. Mr. H. Rawlings, Old Church, Romford, showed a box of new Dahlias, some unnamed, and three others—Mrs. McIntosh, orange buff; George Hurst, deep scarlet; and Mrs. Ocock, yellow-tipped pink. Messrs. Pitcher & Manda, Hextable, sent a large double variety of Achillea ptarmica, named The Pearl, the flower heads pure white and slightly fringed.

Caladiums were excellently shown by Mr. C. F. Bause, Morland Nursery, South Norwood. The plants of moderate size, the leaves large, and the colours most varied and rich (silver-gilt Banksian medal). Messrs. Paul & Son, Cheshunt, had a collection of hardy flowers and Roses; amongst the latter T. B. Haywood, Paul's Cheshunt, Scarlet, and Kaiserin Friedrich being especially noteworthy.

From the Society's Gardens, Chiswick, a collection of Carnations was sent representing many varieties. Six boxes of Gloxinia flowers from Messrs. J. Peed & Sons, Roupell Park Nurseries, formed an important exhibit, the strain being an excellent one (vote of thanks). Messrs. Hurst & Son, 152, Houndsditch, showed a collection of double annual Chrysanthemums curiously varied in tints (vote of thanks).

A beautiful group of Campanulas was shown by Mr. G. Wythes, chiefly blue and white varieties of C. pyramidalis, which are well adapted for arranging in this way (silver Banksian medal). Mr. G. Wythes also showed flowers of the Giant Cereus hexagonus, and Mr. J. Hudson, Gunnersbury House Gardens, had a collection of stove plants in several pots. Messrs. Stuart & Co., Covent Garden, sent flowers of Pompon and other Zinnias. Messrs. James & Son, Farnham Royal, had some fine Pentstemons. Mr. C. Leeson, Melton Road, Wrawby, showed some seedling Begonias; and Mr. Cheksfield, Tenterden, sent a seedling decorative Dahlia. D. Larnach, Esq., East Grinstead (gardener, Mr. Glen), showed Lobelias Emperor William and Duchess of Fife, the latter bright blue with a white eye. Messrs. Dobbie and Co., Rothesay, contributed interesting collections of French and African Marigolds and Pansies (silver Banksian medal). Mr. H. B. May, Upper Edmonton, had extensive groups of Crotons, Ferns, Bouvardias, healthy plants in the usual market style (silver-gilt Flora medal).

A class was provided for twelve stove and greenhouse plants, and Mr. Chadwick, gardener to E. M. Nelson, Esq., Hanger Hill House, Ealing, was awarded the first prize with Palms, Ferns, Crotons, and *Sobralia macrantha*—well-grown plants.

Mr. Martin R. Smith's liberal prizes for Carnations and Picotees brought a capital competition, the flowers being shown as cut from the plants with foliage in bottles, vases, or metal stands had a charming appearance.

In class A for twelve trusses of border Carnations Mr. W. H. Divers, Ketton Hall Gardens, was first, followed by Mr. Blick, The Warren, Hayes, Kent, and Mr. W. A. Gearing, The Gardens, Oak Lodge, Sevenoaks, was third in a good competition. In class B for twelve varieties of self coloured border Carnations Mr. Blick was first, showing Mrs. Muir, Clovis, Dr. Hood, Tona, Dainty Dick, Roma, Marion, Albatross, and Mary Morris, with several seedlings, all of excellent size and substance. Mr. H. Horrington, Shrubland Park Gardens, Suffolk, was second, and Mr. J. Walker, Thame, third. In class C, for eighteen varieties of flake, bizarre, or fancy Carnations or Picotees, Mr. Blick was again first with fresh and beautiful blooms, many being seedlings. Mr. J. Douglas, The Gardens, Great Gearies, was second, and Mr. J. Walker third.

Messrs. J. Veitch & Sons had a collection of Carnation and Picotee blooms (vote of thanks). Mr. M. Rowan, Clapham, showed six boxes of Carnations and Picotees with foliage (silver Flora medal). Mr. E. C. Gobb, Walcot, Ryde, showed border Carnations with foliage and without dressing (vote of thanks). Mr. Charles Turner, Slough, had a wonderful collection of Carnation plants and cut blooms, comprising many novelties, for which awards were granted (silver Banksian medal).

ORCHID COMMITTEE.—Present: A. H. Smee, Esq., in the chair; Dr. M. T. Masters, and Messrs. H. M. Pollett, H. Ballantine, E. Hill, Henry Williams, J. Douglas, and Lewis Castle.

Orchids were not numerous, but there were a few novelties of merit, for which awards and certificates were granted. The Duke of Devonshire, Chatsworth (gardener, Mr. O. Thomas), contributed a group of *Disa grandiflora*, strong plants, bearing numerous flowers (vote of thanks). Messrs. J. Veitch & Son, Chelsea, sent several new Orchids, for which certificates were awarded; and a hybrid *Cypripedium*, named *Cicola*, from *C. Schlumi* album and *C. reticulatum*, with white sepals and petals, and a faintly pink-tinted lip.

F. Wigan, Esq., Clare Lawn, East Sheen (gardener, Mr. W. H. Young), sent a plant of the peculiar *Lycaste tetragona* with brownish streaked purple lipped flowers. The white *Dendrobium longicornu* with orange striped lip was also shown. C. J. Lucas, Esq., Warnham Court, Horsham, exhibited a strong plant of *Angraecum Ellisi* bearing a long raceme of twenty-two pure white flowers (cultural commendation). The small creamy white flowered *Thrixspermum Berkleyi* was also sent by the same exhibitor. T. Statter, Esq., Stand Hall, Whitefield, Manchester, sent plants of *Phaius Humbloti rubescens*, the flowers deeply tinged with red; *Bollea coelestis superba*, dark purple; the rich *Laelia elegans Turneri*, and *Dendrobium Statterianum* (award of merit).

#### CERTIFICATED PLANTS.

*Cypripedium Corningianum* (J. Veitch & Sons).—A hybrid from *C. superbiens* and *C. phillipense* with distinct and handsome flowers, the dorsal sepal veined with purple on a white ground, the long broad drooping sepals having numerous dark purplish dots and margin of dark hairs. The lip is neat and greenish (first-class certificate).

*Cypripedium macrochilum* (J. Veitch & Sons).—A hybrid from *C. longiflorum* and *Uropedium Lindeni*, the colour resembling the latter parent, the sepals, petals, and lip being very long. A most interesting cross, distinct in character (first-class certificate).

*Dendrobium Statterianum* (T. Statter, Esq.).—An imported plant, with slender straight pseudo-bulbs and abundant flowers of medium size, somewhat suggestive of several species in the *D. crassinode* section. The sepals and petals white, tipped with deep purple. The lips round, shallow, yellow in the centre, margined with white, and tipped with purple. The same plant flowered at this time last year, and the flowers lasted about a month.

*Cattleya Gaskelliana*, var. *speciosa* (Segger & Tropp, Dulwich).—A beautiful variety, with pure white sepals and petals, faint golden at the base, crimson in the centre, and edged with white.

*Caladium M. Leon Say* (C. F. Bause).—A strong variety, with bright glossy red leaves and a few lighter spots.

*Caladium Louis Van Houtte* (C. F. Bause).—Leaves of great size, very dark red with a metallic gloss.

*Rose Charles Gater* (Paul & Son).—A Hybrid Perpetual, with dark crimson substantial flowers of great substance, and extremely fragrant.

*Carnation Edith M. Wynne* (C. Turner).—Yellow ground, heavily edged with dark red running into the petals.

*Carnation Countess of Jersey* (C. Turner).—Paler yellow, light rose edge, very pretty.

*Carnation Madeline* (C. Turner).—Pure white, delicate pale rose edge, very fine.

*Mrs. Walford* (C. Turner).—Sulphur yellow with few red streaks.

*Carnation Queen of Bedders* (C. Turner).—An excellent variety, extremely floriferous, of good habit and capital colour, a bright shade of red, the petals fringed at the margins.

*Carnation Ruby* (C. Turner).—A brilliant rosy crimson self, of fine form and substance.

*Carnation Victory* (C. Turner).—Buff streaked with bright red, most distinct.

*Carnation Mrs. Robert Sydenham* (J. Douglas).—A fancy variety with pale yellow; ground colour edged with light rose.

EVENTS OF THE WEEK.—On Saturday, August 15th, the National Co-operative Horticultural Exhibition will be held in the Crystal Palace, Sydenham. The General Committee of the National Chrysanthemum Society will hold a meeting in Anderton's Hotel, Fleet Street, at 7 P.M. The great annual Show at Shrewsbury takes place on Wednesday, August 19th.

— THE WEATHER.—This has been extremely unsettled of late: Thunderstorms, with drizzling rains between them, and now and then a fine day, have been the prevailing features. Lawns are as green as in spring, and weeds can scarcely be subdued. The temperature has not ruled high, or the Potato disease would have been more prevalent than it is. Bright settled weather is much needed in gardens and fields.

— A GIGANTIC FLOWER SHOW.—Great preparations are being made for the Sixth National Co-operative Flower Show, to be held at the Crystal Palace on Saturday, August 15th, in connection with the Annual Co-operative Festival of 1891. This show of flowers, fruit, vegetables, and honey, the produce of working men's gardens and allotments, has grown to such dimensions that it is now probably the greatest of the kind. Last year there were over 4500 entries, from all parts of the kingdom, the produce filling one side of the great transept from end to end. The exhibits were of such a high order that the fourteen judges who awarded the prizes declared that nothing better had been seen at any exhibition of the year than the vegetables shown by these working-class cultivators.

— THE YORK GALA.—The last duty of the Council and life members of the Grand Yorkshire Gala was performed recently. Their work must have been of a highly pleasant nature, as it showed that, as a result of the hard work and worry which they had voluntarily undertaken, they were able to hand over £200 to local charitable institutions. The sum was apportioned as follows:—York County Hospital, £50; York Dispensary, £50; Wilberforce School for the Blind, £25; York Industrial School for Boys, £20; York Industrial School for Girls, £20; Blue Coat Boys' School, £12 10s.; Grey Coat Girls' School, £12 10s.; York Girls' Friendly Society, £10; total £200. As the profits of the Gala amounted to £290, there will be £90 to carry forward towards next year's Gala, which we trust may be even more successful than the former ones.

— ROSES AT KING'S NORTON.—We have received a newspaper report of the King's Norton Horticultural Show. Such reports are rarely suitable for our columns. We observe some Roses exhibited by Mr. H. Bloomer are highly spoken of, and a correspondent informs us the following are the varieties that attracted attention in his stands:—Madame Eugène Verdier, Madame Marie Verdier, Dupuy Jamain, Souvenir de la Malmaison, Ulrich Brunner, La France, Earl Dufferin, Henry William Eaton, Alfred Colomb.

— REFERRING to your report of THE SOUTHAMPTON SHOW, August 6th, page 117, there is an error in the address. My son, Mr. S. G. Rumsey, is at Wrotham, Kent, not Waltham Cross. Kindly note this in future to prevent confusion and delay of letters.—W. RUMSEY, Waltham Cross.

— FLOWER SHOW IN RAGLEY PARK.—A successful Cottagers' Show was held in the extensive and well-wooded park of the Marquis of Hertford on the 3rd of August. Peas, Carrots, and Gooseberries were exceptionally good. Of the first-named forty dishes were put up in the single dish class, the first prize being awarded to Sharpe's Queen. Mr. A. D. Christy, the gardener at Ragley, put up a fine collection of fruit not for competition, which included good black and white Grapes, a splendid dish of Sir J. Paxton Strawberry, Barrington Peaches, and Violette Hâtive Nectarines. The same exhibitor also secured the premier position for a group of foliage plants in the division for gentlemen's gardeners, but flowers were well shown by several trade firms. Both the Marquis and Marchioness of Hertford made a prolonged inspection of the show tents, and by their kindness in throwing open their extensive, beautiful, and well-kept flower and pleasure gardens added greatly to the attractions of the day, and, as might be supposed, was thoroughly appreciated and taken advantage of by the large number of visitors who attended the Show.

— GARDENING APPOINTMENT.—Mr. William Parks, who has been gardener at Fernside, Bickley, for seven years, has been appointed gardener to William Parker, Esq., Whittington Hall, Chesterfield.

— ANCIENT SOCIETY OF YORK FLORISTS.—Under the auspices of this Society services were held in the church of St. Michael-le-Belfrey, York, on Sunday last, £10 being collected in aid of the county hospital and dispensary, making a total sum of £30 which the Society has obtained for charitable purposes within the last three years.

— WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—A meeting was held by this Society on the 4th inst., when a paper was read by Mr. E. Wallis, The Gardens, Hamels Park, on "Tuberous Begonias." The subject was ably treated, and a long discussion followed. Some good Melons were shown by Mr. Smith, Presdales, and Mr. King, and Begonias by Mr. Brown and Mr. Smith. A hearty vote of thanks was accorded to Mr. Wallis for his paper.

— FRUIT AT COURT HEY, LIVERPOOL.—Apples of many kinds are good. The most reliable dessert varieties are Cox's Orange and Ribston Pippins, Irish Peach and King of Pippins. These seldom fail. Kitchen varieties are Keswick Codlin, Lord Suffield, Eeklinville, Cellini, Hawthornden, Lady Henniker, and Alfriston. Pears are a good crop, the best being Beurré Diel, Jargonelle, Marie Louise, Williams' Bon Chrétien, and Louise Bonne of Jersey. Cherries are a fine crop as regards dessert varieties. Black Eagle, Bigarreau, May Duke, White Heart, and Waterloo are all good, and have fine fruits. Morellos are only moderate, the same remark applying to Strawberries and all bush fruits with the exception of Red Currants, which are extremely fine. Peaches and Nectarines Mr. Elsworthy does not grow outside.—P.

— MR. MAJOR'S CACTACEOUS PLANTS.—As has been previously stated, probably the finest private collection of Cactuses and succulent plants in the kingdom is to be found at Cromwell House, Croydon. Grotesquely interesting are many of the plants, while others are remarkable for the beauty of their flowers. Blooms of different forms of the Night-flowering Cereus have been plentiful, causing Mr. Major, his family, and friends to sit up "late o' nights" to admire them, the owner further being up with the lark to photograph them as soon daylight appeared. There are numbers of seedling Phyllocacti, many having flowered, and are charming in colour. These are mainly the result of crossing by a late gardener at Cromwell House—Mr. W. Wright, now of Talygarn, South Wales. Among the many curious plants is an Opuntia with a rugged spiny stem some 6 feet high, and an extraordinarily contorted head. It is flowering freely, but is not satisfied to do so in the ordinary way. Last year it flowered and formed seed pods, and now directly from the ends of these pods, which are still green, two or three flowers are produced. In this garden there is a great deal that is interesting in a small space, and Mr. Frost, who was previously foreman in the gardens of Mr. Smee at Hackbridge, discharges his duties well, and is treated well in turn by a good and appreciative master.

— THE employés, numbering eighty, of the firm of MESSRS. JOHN LAING & SONS, Forest Hill, had their annual beanfeast on Friday, August 7th. Journeying from Forest Hill Station they reached Eastbourne shortly after 10 A.M., when each one amused himself according to his own fancy until one o'clock, when all assembled at the "Lamb Hotel," where an excellent dinner was provided. After dinner, the usual loyal toasts being honoured, Mr. Sykes in a few chosen words proposed the health of the firm, which was heartily received, the toast being responded to by Mr. Laing. All again went their own way, meeting at Eastbourne Station at 8.30 P.M. for the return journey, reaching Forest Hill about 10 P.M., all being thoroughly satisfied with the day's outing.

— ALL readers of the Journal who are interested in Rose-growing will be pleased to hear that the well-known and most successful amateur, MR. W. J. GRANT, has obtained a position for which he is eminently qualified. The County Council of Monmouthshire have created a Department of Agriculture, Horticulture, and Forestry, with other technical education, and have placed him at the head of it. His management of the large estate at Hope End, Ledbury, with its many branches of farming and stock-keeping, his knowledge of horticulture in its various branches, and his business education have, no doubt, led to this appointment, and it will be the earnest wish of his many friends that he may long be spared to carry out the duties of his important and responsible position.

— TROLLOPE'S VICTORIA STRAWBERRY.—In reference to the disparaging statements of "W. I." in your last issue (page 88), we have known this variety for thirty years, and (with all due respect to the experience of "W. I.") it has always proved a favourite in this locality; and in enclosed gardens is the only one that succeeds. It has given great satisfaction to our customers, coming invariably good even in wet years, such as the present, and in dry seasons is quite first-rate, and we should think the true variety has not been grown by "W. I." It is a soft fruit, and should be gathered into the dish, but for home consumption is invaluable, and we must adhere to the description in our catalogue.—GEORGE BUNYARD & Co., Maidstone.

— PEACH WATERLOO.—Those who have trees of this variety in a bearing state will perhaps agree with me that it is of the greatest value not only for house culture but also for planting against sunny open walls. It ripens very early under glass, even if not forced, and in the open we commenced gathering ripe fruit on August 1st. The tree is of free yet not rank growth, the fruit sets well, and attains a moderately large size. The colour is a rich red, and the quality of the fruit, if not kept too long, decidedly good. Under precisely the same treatment Hale's Early is fully a fortnight later, but there is not much difference in the time of ripening between Waterloo and that other valuable early variety Early Alexander.—W. I.

— WADDON HOUSE GARDENS.—The gardens of P. Crowley, Esq., near Croydon, have long been famed for specimen and other plants, which are well grown by Mr. King, the gardener. Within the past two or three years great additions have been made to the hardy fruit department, and the collection is now both choice and extensive. A feature under glass is a fine Citron growing against the back wall of a lean-to house and informally trained down the roof, the large fruits being like a heavy crop of Melons, some of them weighing 6 lbs. to 7 lbs. each. They are preserved, both green and ripe, by Mrs. Crowley, and are very delicious. The popular Chairman of the Fruit Committee of the R.H.S. might appropriately and usefully place examples of the fruit thus prepared, with hints on the method of preparation, before his colleagues, as probably few of them or the public are aware that Citrons can be made to form such an agreeable table delicacy. Mr. Crowley provides every requisite for the successful management of his garden, and his gardener proves himself worthy of the encouragement he receives. Mr. Crowley's collections of insects and birds' eggs are amongst the richest in the kingdom, specimens having been obtained from all parts of the world.

— DANIELS & BROS.' OUTING.—The employés of this firm in the seed department, offices, and farm at Norwich, to the number of sixty, held their annual outing on Monday, July 27th, when, although the weather was rather unfavourable, the success was assured. As the hands in the nursery department had a fortnight previous taken their leave of absence, selecting the Crystal Palace as their rendezvous, they did not accompany the party. The partners, Messrs. George and Charles Daniels, were present, and greatly conduced to the success of the day. Starting from the retail establishment in Exchange Street, Norwich, they journeyed in three waggonettes to Cromer, via Coltishall, where they breakfasted, thence proceeding to North Walsham, where another stop was made, eventually arriving at Cromer at 12.30 P.M. Here they were met by several gardeners in the neighbourhood, who partook of dinner with the company at the "Red Lion Hotel." A section then proceeded to Cromer Hall, others journeyed to Cliff House, the residence of S. Hoare, Esq., M.P., whilst some were content with a stroll along the beach or cliffs. A start was made for the return journey at 4.45, and on arriving at Aylsham a substantial tea was in readiness, after which the health of the firm was proposed, thanks were returned to them for a generous release from business, and eventually Norwich Market Place was reached at 11.30 P.M.

— SUMMARY OF METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, WORKSOP, NOTTS, for July, 1891.—Mean temperature of month, 59.1°. Maximum on the 16th, 77.8°; minimum on the 5th, 42.4°. Maximum in sun on 21st, 128.3°. Minimum on grass on 5th and 25th, 36.1°. Mean temperature of air at 9 A.M., 60.5°. Mean temperature of soil 1 foot deep, 59.7°. Sunshine, total duration in month, 139 hours, or 28 per cent. of possible duration. We had one sunless day. Total rainfall, 2.42 inches. Rain fell on fifteen days. Wind, average velocity, 8.5 miles per hour; did not exceed 400 miles on any day, and fell short of 100 miles on three days. Approximate averages for July.—Mean temperature, 61.2°; sunshine, 160 hours; rainfall, 2.36 inches. A dull and cool month without any warm summer weather.—J. MALLENDER.

— THE WEATHER DURING JULY.—The weather here during the past month was not just what we on this cold, heavy soil should like it to have been. But it has been the driest July since Jubilee year, and on the whole vegetable crops have done well, also trees and shrubs that were planted last spring. There has been a continuance of thunderstorms, but none of them of a very severe nature here. Rain fell upon eighteen days, the maximum in any twenty-four hours being 0.43 inch on the 7th, minimum 0.01 inch on the 27th; total for the month, 2.48, against 4.81 in 1890.—E. WALLIS, *The Gardens, Hamels Park, Buntingford, Herts.*

— I WONDER gardeners do not use POTS GLAZED ON THE OUTSIDE. I have had them in use some three or four years—in fact, am gradually weeding the old sort out by buying all new ones glazed. The advantages claimed for the glazed pot are, 1, appearance; 2, the plants do not require watering so often; 3, if the soil becomes dry it does not crack away from the side of the pots as in the ordinary ones, and consequently the roots are not dried in one pot more than another; 4, the plants look better; by this I mean they do not lose their leaves at the bottom as in the ordinary pots; 5, the pots never want washing, but always look well. Now for the disadvantage, and there is only one, viz., that they are slightly more expensive. Gardeners and nurserymen have all admired the growth of the plants in my houses and outdoors as well. For table decoration, &c., they require no ornamentation; they do as they are.—J.

— HARDINESS OF NICOTIANA AFFINIS.—In a recent issue "W. I." appeared to be surprised to find that the above plant had passed through the last severe and trying winter unhurt, but here *Nicotiana affinis* is one of the hardiest plants we have; every piece of its fleshy roots that is left in the ground in the autumn will grow in the following spring. I have a spot in this garden where some seed was sown six or seven years ago, and plants have come up and flowered annually ever since. Last year I planted a border with early *Chrysanthemums*, *Mignonette*, and the *Nicotiana*, and this summer they have come up thickly and strong, and are just coming into bloom. I have taken some two dozen of these plants up and placed them in pots behind a north wall, they will come in useful for the greenhouse in the autumn. These, with *Mignonette* and *Heliotrope*, will sweeten the air of the house most agreeably.—T. A., *Cirencester.*

— STRAWBERRIES.—I am not quite sure that all your readers will be entirely in touch with the views your correspondent "W. I." holds regarding Trollope's Victory Strawberry, as it has been in years past valued much by many market growers as well as private cultivators. In the Bath district it was at one time held in high favour. When I lived in that district I have seen it at Longleat, Rood Ashton, and other places grown extensively for forcing. My objection to it for that purpose was that it did not carry well, and had to be put under exceptional treatment to get it hardened before being packed. Mr. Sheppard, Wolverstone Park, a most successful Strawberry grower, forced that variety extensively, and I have heard him speak highly of it. Princess Alice Maud was also grown extensively in the Bath district, and for heavy cropping and also forcing I have never yet seen a Strawberry which could surpass that old favourite. I had thought it was out of cultivation, and I am pleased to learn that your correspondent has favour for it. I have some hopes that it may be procured. I have tried many here which I know to be excellent in northern latitudes, as well as in the South-East and West of England, but I have had to discard many of them. The best I have seen (answering all purposes) are President and Vicomtesse Héricart de Thury. The latter, under the name of Garibaldi, is found in most Scotch collections.—M. TEMPLE, *Carronhouse, Stirlingshire.*

### CARNATIONS AT SLOUGH.

A GLANCE at the headline will be sufficient for most readers of garden literature to recognise the "location," as our American friends say, of the Slough Carnations—the flowers of the month—which so many admirers of them go out to see and be satisfied. But all are not satisfied with what they see in the Royal Nurseries, which have so long been associated with a great name in the floricultural world, Charles Turner, for they want to see many of the varieties elsewhere. To this the present "Charles Turner" (and it takes two good men to make him) appears to have no objection; at least half of him was caught quietly booking orders, while the other half, with the florists' fire burning brightly within him, pointed out with warm appreciation the gems of the collection. The veteran John Ball was at hand, and in his quiet way hit off their characteristics, while Mr. "Joe" Lakin of Oxford was evolving from his floral head apt and appropriate names for the seedlings. An

oldish man from the city was taking all in he could, and a youngish man from the country appeared to be helping him. It was a happy day among the flowers. Let us look at a few of them.

Large light houses were filled with plants in 8 or 9-inch pots, healthy in growth, and bearing the most charming flowers imaginable in all the richness, delicacy, and diversity that is to be found in a great collection of Carnations and Picotees. Numbers of plants in pots were growing in the open, numbers more were planted out, and layers were being tongued and pegged down by the thousand. Slough is evidently a great emporium of these flowers, and the world appears to know it, or surely such a great provision would not be needed to meet its wants. Some, indeed many, of the outdoor flowers of the florists' type were undeniably beautiful, and some masses of the border varieties, rich in their profusion; but in the search for smoothness, refinement, also purity with brilliancy, the florists turned instinctively to the forest of blooms under glass, and there found plenty to see.

In glancing over the scarlet bizarres very fine blooms were admired of Robert Houlgrave (Barlow), one of the brightest and best, while two of Mr. Dodwell's varieties, James McIntosh and Robert Lord, were worthy associates and beautiful in their markings. In crimson bizarres the new and recently certificated variety, Dr. Hogg, commanded attention by the richness and clearness of its colours and the general high character of its blooms. E. S. Dodwell (Hewitt) shone brightly in this section, and will continue to shine for many a year, and the same may be said of Mrs. Maclaren (Fitch), one of the most clearly marked in the collection, while Rifleman (Wood) maintained its position for brightness and general good quality. The new variety, Harmony (Turner) is destined to take a high position among the pink and purple bizarres, being large, smooth, and distinctly attractive by its elateness and harmony of colours. Sarah Payne (Ward) was in superb condition, as was William Skirving (Gorton), two of the best of the established varieties.

Among the flake varieties there were many that compelled a pause, but only a few can be noted. Dr. Foster (Foster) was a striking purple flake, remarkable for its richness of colour and clearness, as was Charles Henwood (Turner). James Douglas (Simonite) was also in admirable condition, and Earl of Wilton very good. In the scarlet flakes there appeared to be an unanimity of opinion that the new variety, Charles Turner, was the king of the collection and worthy of its name. It impressed all by its breadth of petal, smoothness, clearness, and brightness, a splendid acquisition. Matador (Turner) broad petals and bright; Henry Cannell, John Ball, and Scarlet Keet, all Mr. Dodwell's, were represented by flowers of which the veteran might be proud, and Jupiter (Abercrombie) was very good indeed. In rose flakes Miss Erskine Wemyss (Dodwell) was extremely beautiful, and the same may be said of Thalia (Douglas) and Jessica (Turner), as charming a trio as one could wish to see.

Among the "self" varieties there were many so meritorious that it was no easy task to choose, and the youngish man from the country seemed as if he would like to grow them all. Duchess of Fife, soft delicate pink, smooth and free, won prompt approval. So did Rose Unique, the name of which is the first time printed, remarkable for smoothness and substance—a model bloom. Ruby, rosy crimson, was also of high merit, as was a variety of soft amber yellow, Lady Walker. Mrs. Muir, Annie Lakin, Emma Lakin, and Boule de Neige were among the purest whites. As a scarlet variety Dazzle is well named, and King of the Scarlets (Douglas) has probably a great future before it. Salamander, soft rose, large and smooth, was also very charming. Mrs. Clements, a pure clear yellow self, also Germania, of the same character, compelled admiration. Among the fancy varieties, Victory, buff, edged and marbled with crimson, was remarkable for its handsome blooms, and Romulus, similar in character, was also distinctly attractive.

Picotees were in great force. Amongst the red edged varieties John Smith (Bower), J. B. Bryant (Ingram), Mrs. Brown (Payne), Thomas William (Flowdy), and Dr. Epps were in superb condition. Purple edged, Clara Penson (Willmer), Juliette (Fellowes), Mrs. A. Chancellor (Turner), and Zerlina (Lord) were particularly fine; as were in the rose edged section, Favourite (Liddington), Louisa and Lucy (Addis), Edith Dombrain (Turner) very delicate, also Duchess, Mrs. Payne, and Mrs. Turner (Fellowes). Last to be mentioned, but not least in attractiveness, is the charming new variety Mrs. Henwood, soft yellow, with a clearly defined edge of scarlet, destined, probably, to become a great favourite in many gardens. And now we take a stroll outdoors, pausing to admire floriferous masses of such border Carnations as Queen of the Bedders, rosy scarlet, vigorous and free; Hotspur, rose, robust, and effective; Catherine, warm rose; Ne Plus Ultra, pure white, fringed, sweet; and Mrs. Aspley Smith, soft pleasing scarlet. We next look over a huge breadth of Pinks, pass through a few acres of Dahlias, peep into the frames of Auriculas, glance at housefuls of Tea Roses and show and fancy Pelargoniums (specimens cut down), then take a rest in the pretty embowered home in which the widow of the late great florist, Mrs. Charles Turner, has welcomed floral friends for years, and it is hoped will continue her pleasant greetings for many years to come. The Wistaria which covers the house is historic. It is one of the three plants first brought from China by the late Lord Grenville, the others being planted at Dropmore and Kew. The "old house," against which the Slough specimen was planted, was burnt down, but the trunk of the tree escaped destruction. It is now about 6 feet in circumference, and its growths spread far, flowering in profusion in the spring. This is all that can be said about the agreeable day spent with pleasant friends among beautiful flowers in the proverbially good nursery—"Turner's of Slough."—CITY MAN.

## HARDY FRUIT CULTURE IN SOUTH WALES.

[A paper read by Mr. A. PETTIGREW at the Cardiff Conference of the British Fruit Growers' Association, August 12th, 1891.]

THE climate and the soil and situation in many places in South Wales are admirably adapted for the cultivation of all kinds of hardy fruits. With these natural advantages, and the increasing

proper care be taken in selecting and cultivating the most suitable varieties.

There are few orchards in Glamorgan, and what few I have seen are (and have been) much neglected. To judge from the stunted sickly appearance of some of the trees, and the bushy mass of branches in others, nothing has been done to them in the way of pruning and manuring the soil since they were planted. The

FIG. 21.—MR. A. PETTIGREW.

demand for fruits of all kinds in our large towns and populous mining districts, it is surprising that some of our intelligent and energetic market gardeners have not long since made fruit growing a speciality on a large scale in the neighbourhood of Cardiff. After eighteen years' experience of growing fruit in this district I am thoroughly convinced that as fine Apples, Pears, and Plums, and other kinds can be grown here in the vales of Glamorgan, and in many other places all over the country, as those produced in the best fruit-growing counties in England if

planting, no doubt, in the majority of cases, was crude, and consisted simply of digging a hole without any previous preparation of the soil, putting the roots into it and covering them with earth, after which the tree was left to its own resources—nothing being done to it afterwards.

To be successful in the cultivation of fruits of any kind the best sites should be chosen, and the ground thoroughly prepared, when necessary, by draining, trenching, digging, and manuring before planting the trees. In orchards, Apple and Pear trees

should not be less than 30 feet apart each way, and none but the best trees—worked on the free stock—with straight clean stems of 6 feet before branching, and not more than three years old from the time of budding, should be planted.

I may say here that I remember an intelligent farmer telling me in all earnestness that his father was a successful cultivator of the Apple in this district, that he grafted his own trees, and those he grafted on the Grey Willow stock—which I take to be *Salix caprea*—succeeded the best on his heavy soil—the lias clay. It is needless for me to tell the members of the British Fruit Growers' Association that I have had no experience of that stock. Plants that have stood in nursery rows for years, and have been pruned repeatedly to keep their heads within bounds, seldom make good trees. When lifted they have scarcely any fibrous roots, and after replanting become stunted, and fail to make much growth for several years. On the other hand, young vigorous trees planted at the age mentioned start into growth at once, and soon become large and fruitful. In planting the varieties must be kept by themselves as much as possible for the sake of uniformity of growth and convenience in gathering and storing the fruit. Make the pit large enough to hold the roots without being cramped, and a strong stake driven into it to tie the tree to. After which, place the tree close to the stake, spread the roots out on all sides before filling in the soil, which should be made firm, but care must be taken not to plant it deeper than it was when growing in the nursery row. When planted secure the tree to the stake, prune it, and mulch the surface with manure to exclude air and to keep down evaporation. All that is required now is to protect it from cattle, sheep, and horses. Barbed wire guards I find the best; they are cheap, durable, and answer the purpose better than any other kind of protection that I know. The principal culture of orchard trees is during the first few years when they are young. It consists of pruning and cutting out all weak useless branches and those that cross each other, keeping the trees clean and free of insect pests, and top-dressing the ground with good manure to keep them in a vigorous and fruitful state.

#### FRUIT GARDENS.

The cultivation in the fruit garden is different from that of an orchard. Apple and Pear trees may be planted here a little closer, say from 18 to 20 feet apart, and trained in pyramidal form, and the ground worked and cropped between them with Gooseberry, Raspberry, Currant, and Strawberries, or vegetable crops, until they have filled their allotted space. I have recommended that the orchard trees be three years old from the time of budding; but for planting in the garden I prefer maidens or plants of one year's growth from the bud to those of four or five years' growth. They soon establish themselves, and grow faster than older trees, and can be trained to the form desired much easier. I repeat that too much care and attention cannot be taken in planting, and none but the very best trees should be planted to ensure successful cultivation.

There are several fine Apple and Pear trees in the castle gardens here, both on walls and in the open quarters of the garden, which are much admired by gardeners and others visiting the place. They were all planted, pruned, and trained under my supervision, and perhaps I could not do better than describe the mode adopted in growing and training them. To avoid repetition I may say the most of the trees were planted when maidens of one year's growth. The Pear trees on the walls are planted at the distance of 21 feet apart, and trained in fan-shape with a leader up the centre. When planting them they were kept away 6 inches from the bottom of the wall to allow room for the stem to swell, the roots were spread out carefully and covered, the ground made firm, and mulched with manure afterwards. The leaders were then cut back to within 18 inches from the ground and fastened loosely to the wall. In the following year they produced from three to five shoots each, which were carefully but loosely nailed to the wall as required during the growing season, and allowed to grow their full length without being stopped. At pruning time the centre shoot of each tree was cut back to within 18 or 20 inches from where it started, according to the strength of the growth, and the two or four remaining shoots, as the case might be, were nailed to the wall their full length; the two lower shoots horizontally, one on each side of the main stem, and the others at a slight angle up the wall. From this time on, until the trees had occupied their full space, they were examined regularly every spring shortly after starting into growth, and all the superfluous buds rubbed off the leading shoots, and a few of the buds near the ends of the permanent branches picked off to strengthen the terminal bud. I never shorten the points of the permanent branches until they have grown their full length, unless they have met with an accident, or the wood happens not to be sufficiently ripe to remain. The breastwood is taken off two or three times during the season, but I never pinch and stop the growths during the summer, as recommended by some writers.

To build up young trees and furnish the wall with them in the shortest time possible I have stopped the leading shoot of the current year's growth after it had grown about 2 feet in length, which caused it to send out lateral branches. These in good seasons ripened well, and a year's growth was gained by adopting this method; but I do not recommend it in a general way, as the success mainly depends on the seasons being good to ripen the wood thoroughly.

#### PRUNING.

The trees are pruned as soon after the leaves fall as possible, and the roots mulched with enough stable litter for a breadth of 3 feet from the bottom of the wall, after which the branches are syringed with a wineglassful of petroleum to a gallon of water. All is thoroughly mixed by the syringe, continually churning it up during the operation. The petroleum thus applied kills scale and all insects it comes in contact with, and it gives the bark of the trees a smooth and healthy appearance. This finished, the branches are then secured in their proper position for the year.

#### PYRAMIDAL TREES.

These, though differently trained, are built up much in the same way as wall trees. When newly planted they are cut down to within 18 inches from the ground, and the following year they produce from three to five shoots each. One of the strongest of these is selected for a leader, which ultimately becomes the stem of the tree, and all the others are rubbed off except three of the best placed, which are retained to form the base and framework of the tree. The shoots are allowed to finish the season's growth without being stopped in any way. When they are being pruned in the autumn the leading shoot is left from 18 inches to 2 feet long, according to the strength and ripeness of the wood (but as the trees get older the leading shoots may be left even longer) and the side branches a little shorter. This system is practised year after year, cutting out all cross and superfluous wood, and training and furnishing the tree with well arranged branches until it has filled its space, after which the growth is spurred in the usual way close to the permanent wood every season to form fruit buds. I do not believe that stopping and pinching the young shoots during summer adds to the productiveness of the tree; besides, it is impossible in large fruit gardens, where there is a great number of trees, to find time to do so.

I do not advise root-pruning to be practised except in cases where the roots have penetrated a cold wet subsoil, in which the trees produce strong rank unfruitful wood. When such is the case, and the trees are young, they should be lifted entirely, the strong roots cut back, and the fibrous roots spread out near the surface; but when the trees are large it is advisable to dig a trench 3 or 4 feet distant from the trunk all round, cut back the strong roots, and add some good soil to encourage fibrous roots to grow near the surface.

The Apple is more liable to the attacks of insect pests and disease than the Pear. The canker is the most difficult to deal with, and some varieties are more subject to it than others. When planted in low, damp situations the trees get covered with moss and lichen. They are also subject to the attacks of American blight, and this, in my opinion, is one of the principal causes of canker, but there is a great diversity of opinion about this. When once a tree is attacked with canker it is almost impossible to cure it, and the sooner it is grubbed out and a new one planted in its place the better. I think it is a mistake to lose time and valuable space with a sickly tree from any cause whatever when trees can be bought so cheaply from our nurserymen. Moss and lichen can be destroyed by dusting the trees with newly slacked lime on damp mornings during the winter months, and American blight by scrubbing the bark of the affected trees with a hard brush and soapsuds, and by frequent syringings of petroleum mixed in water as previously described.

Of Apples there are more than forty varieties, and of Pears about the same, grown in the Castle gardens. But the following twenty-four of each are amongst the most useful, both culinary and dessert. Apple: Devonshire Quarrenden, Irish Peach, Lord Suffield, Keswick Codlin, Lord Grosvenor, Potts' Seedling, Blenheim Pippin, Beauty of Hants, Cox's Orange Pippin, Ecklinville, Emperor Alexander, Gloria Mundi, Golden Noble, Hawthornden, Annie Elizabeth, Sturmer Pippin, Alfriston, Beauty of Kent, Dumelow's Seedling (Wellington), Lane's Prince Albert, Rymer, Warner's King, and Rushock Pearmain.

Of Pears the following twenty-four varieties are grown successfully, both on walls and pyramidal trees in the open. Duchesse d'Angoulême, Jargonelle, Summer Bergamot, Beurré Magnifique, Beurré d'Amanlis, Beurré Diel, Beurré Rance, Beurré d'Esperen, Durondeau, Louise Bonne of Jersey, Pitmaston Duchess, Uvedale's St. Germain, Thompson's, Brown Beurré, General Todtleben, Doyenné du Comice, Glou Morceau, Winter Nelis, Marie Louise,

Beurré Bosc, Beurré Clairgeau, Williams' Bon Chrétien, Vicar of Winkfield, and Gansel's Bergamot.

#### PLUMS.

The trees in the open quarters here are treated much in the same way as the pyramidal Apple and Pear trees, and those on the walls are pruned and trained the same as the Pear trees in that position. The Plum, like most of the stone fruits, is subject to the attacks of aphides, red spider, honeydew, mildew, gum, and canker. The aphides generally show themselves first on the points of the young vigorous shoots, which they cause to curl. As soon as they are observed the points of the shoots should be nipped off, to keep them from spreading over the tree, except in the case of the main shoots of wall trees, when the affected leaves should be picked off to preserve them entire. Syringing the trees with soap-suds and tobacco water keeps them in check, but once the trees are badly affected—the way they are in some places this season—it is not easy to get rid of them by any means. Honeydew is the effect of aphides' attacks. Red spider is difficult to master in dry seasons, and some districts are worse for it than others. All kinds of deciduous trees are subject to it in warm close confined situations like the Castle Gardens here. If once they get a strong footing it is almost impossible to eradicate them by any means. Mildew may be destroyed by sulphur in some form or other. Gum and canker cause the leaves of the affected trees to silver, and the branches to die back. When such is the case I know of no remedy except taking the trees out and planting young ones in their place.

There are many varieties of Plums to choose from, culinary and dessert. The following are what are chiefly grown in the Castle gardens:—Victoria, Denniston's Superb, Nectarine, Prince Engelhart, Bryanston Gage, Transparent Gage, Kirke's Purple, and Coe's Golden Drop. I have thus endeavoured, in as plain and practical a way as I could, to deal with the subject I was invited to speak upon; and I trust the remarks I have offered may have the effect of causing more attention to be paid to the culture of our hardy fruits.

[We have pleasure in publishing a portrait of Mr. Pettigrew in recognition of his long and able services in horticulture. He has made the gardens at Cardiff Castle what they are to-day, and the fruit trees in them are amongst the finest and most productive in the kingdom. He has also established vineyards in the district, and the Castle Coch wine has won the approval of connoisseurs. Mr. Pettigrew is a man of mark in gardening.]

#### AURICULAS AT NORWOOD GREEN.

A GOOD many years ago, when I was "free and unappropriated," I set off one very doubtful morning to visit a nursery some miles distant from the house of the brother parson with whom I was staying at the time, and when I came back in a very "druket" condition nothing would persuade him but that there had been a lady in the case. I don't suppose that he, or anyone else, would have laid to my charge anything of the kind if they had seen me stumping up from the Hipperholme station, near Halifax, one threatening day in the latter part of July that there was a lady in the case now. My brow is wrinkled now, "my locks are like the snaw"—i.e., the very few I have left, and yet in both cases there was a lady in the case. It was Lady Flora to whose charms I fell a victim in my early days, and who has cast her spell over me ever since.

It is now eleven years—so does time fly—since I gave in the Journal an account of my visit to Shobden Head, where the late Mr. Woodhead cultivated with so much success his favourite flower, the Auricula. Those eleven years had made some considerable difference to me. I should have been very sorry to have attempted that climb now, but my love for the Auricula had in no way changed, and probably had I been put on my mettle I should have made the attempt. I think my love for it would not have been questioned had anyone seen me in the midst of a thunderstorm, rushing for shelter in a friendly "pub."

Miss Woodhead carries on with, as we all know, her brother's culture of the Auricula, and under the management of her able gardener, Mr. McDonald, the collection maintains the character which I gave it years ago, as being one of the healthiest and best grown that I had ever seen. It is not often that one sees a collection kept up. Generally at the owner's death it is dispersed in one way or other, but here it has been fully maintained, and the houses in which they were grown at Shobden are still their home here.

Norwood Green is about a mile and a half from Hipperholme Station; the country was all new to me, and I had to inquire my way. I was amused by one answer, "Oh, yes, I kens now; it's next house to 'Little Dick's'"—I being, of course, in utter ignorance of who that illustrious party was. However, I found my way without any mishap, and found a pretty little cottage with a small garden, the greater portion of which was occupied by the old Shobden houses and others added to them, for Miss Woodhead's love for gardening extends beyond the Auricula. Her greenhouses were full of excellently bloomed plants of various kinds; the small garden which faces south on the slope of one of those many hills in which this part of Yorkshire abounds, was equally

full. Laced Pinks and Roses were in good condition and spreading a delightful fragrance around; but to me, of course, the Auriculas were the chief attraction. We can talk over them when there are only leaves to be seen; and although it is, of course, far more interesting to see them in flower, yet he who loves them delights to see them at any time when they are enjoying life and flourishing vigorously, and so as we there stood over the stages on which the Auriculas were reposing we had a pleasant chat about the plants. "What a pity," says Mr. McDonald, "that Mrs. Potts has such a slender stem, and that the truss is so loose owing to the footstalk of the flowers being of the same character." Its pips are exquisite in form, but this is a defect which detracts considerably from its claim to be the best self in cultivation. The old florists were very particular as to these characteristics, as well as to the flowers. It may be all very well to put sticks to them, although that was not permissible in former days; but for a plant not to be able to hold itself up without the aid of one is certainly a weak point. In this respect Mr. Woodhead's Black Bess contrasts favourably with it, although the quality of the flower is not equal to it. It, moreover requires not to be grown in too rich soil. Indeed upon this subject Mr. McDonald holds what I believe to be very orthodox views, contending that if we have a good strong loam the chief point is gained. Asking him about the complaints I had heard from other growers as to the failure of constitution in George Lightbody and Lancashire Hero—his plants of these were small—and he said that of late years he had found them much less vigorous than they used to be, while they are much more shy in producing offsets. It would be indeed a misfortune for lovers of the flower if this were to continue, for with all our seed raising in these later days, there are, in my opinion, no grey edges that can approach them, most of our modern greys running so much into white, and neither one thing nor the other. These two do, it is true, sometimes merge almost, if not quite, into green; but one can forgive this, for a green Lancashire. Conservative is of this character, sometimes a good white sometimes an indifferent grey, and very difficult to obtain in a large plant, as it is so given to throwing up offsets, and so takes off the strength of the parent plant. Acme has the same tendency, and it very often destroys the hope of the grower. This led us to the subject of white edges, and especially the fine seedling of which I had seen a pip this year, a decided white edge with a bright yellow eye; unhappily it is delicate in habit, and I fear that, like John Simonite, it will be a rarity, and that a good plant of it will not often be seen. Heap's Smiling Beauty is still in favour here, and is at times a very fine flower. Mr. McDonald agrees with me as to my estimate of Magpie, which I think is the best edged flower that Mr. Horner has raised. Of green edges the deficiency of good varieties was deplored, but few of the new ones exhibited being up to the mark. The Rev. F. D. Horner, bearing a name which is deservedly honoured by all Auricula growers, is regarded as the best green edge both for its beauty and vigour. There are points in which some of the older flowers may beat it, but taken as a whole there is not one of them equal to it. Colonel Taylor, as shown by Mr. Wilson of Halifax, who grows it better than anyone I know, sometimes shows it in fine condition, and then its green edge is unapproachable, but the tube is always more or less defective, and the same must be said of Prince of Greens, whose watery eye deadens the beauty of the plant. Of Heroine as a self Mr. McDonald has a high opinion, which is shared in by most people. Like most of the selfs too it is a good doer. I found here also some of the older flowers. Lord of Lorne is much appreciated for its brilliant colour, and as we know often holds a good place on the exhibition table.

Mr. Woodhead, like several more of us, was no great admirer of the Alpine section, and however beautiful they may be I cannot for one moment give them a place alongside their more refined and very charming sisters. We may regard them as the masculine development of the flowers, and the Show Auriculas as the ladies of the family. As I walked back to the station with Mr. McDonald we chatted of many subjects connected with our favourite, and I rejoiced to think that the fine collection was under such good care, and so lovingly watched over and enjoyed by the worthy sister of a worthy man.—D., Deal.

#### PRUNES IN THE SOUTH OF FRANCE.

(Continued from page 90.)

THE tree of the variety previously referred to is a very slow grower, requiring ten years to bring it into full bearing, though I saw some trees of six years old, very favourably situated, with a fair crop of fruit on them. The fruit also matures very slowly and is not ripe till all other fruits in the district, Apricots, Green Gages, Peaches, have ripened. The Plums are picked when just ripe, before the flesh has begun to soften, they are placed on *claires* or trays, one layer of Plums on each *claire*. The *claires* are made either of strips of wood or of wicker work, and are either triangular or round. They are a little deeper than the thickness of a Plum, so that when not in the ovens they can be safely placed upon each other. The *claires* when filled are arranged upon the bottom of the "fours" or inside the *étuves*, and the operation commences. Each homestead has a building in which are placed the "fours," and also the *étuve*, if the Metayer possesses one. The "fours" are simply like very large ordinary bread ovens; they are usually built in pairs, each one about 10 feet long, and 4 feet wide; they are heated by burning wood inside them; the ashes are cleared out and the *claires* placed inside.

The *étuves* are closets of variable dimensions with different appliances for holding the *claires*, they have a small furnace with pipes underneath the floor for heating. There seems to be a preference

for the "fours," though the *étuves* are simpler and more convenient in every way.

When the fresh fruit is put in the temperature should be about 100° F. When the Plums have been inside for about a couple of hours, they assume a peculiar puffy appearance; the *claires* are then withdrawn, the fruit turned by holding an empty *claire* upside down close over a full one, and then turning them both over. After cooling the *claires* are again put into the "four," this time at a temperature of 135°; again withdrawn, turned, cooled, and put in at a temperature of about 170°; and this operation is continued until the Plums have been dried. Some dry more rapidly than others, and they are picked out as they are ready. The more slowly the operation is performed, and the oftener the Plums are put into the "four," the better will be the result.

When they are ready the Plums are sorted out into various grades, according to the number (30, 35, 45, 50, 55 or more up to about 130) that it will take to make up the French pound, for curiously enough the old French measure is adhered to. They are put into sacks and carried to the markets. Here the merchants come and buy, paying prices varying according to the number of Plums required to weigh a pound; 30 to the pound would be worth about 120 francs the 100 pounds; 40 to the pound about 100 francs, and so on down to the very lowest grades, which are not worth more than 15 francs. The merchants convey the fruit to large, cool, airy warehouses, where it is thrown into bins; and women at long tables are employed sorting over again much more carefully than before. The various grades are then packed separately into casks and are sent to Bordeaux, where the finer qualities are packed carefully in bottles or boxes, the inferior are simply exported in bulk.

Round Agen and in the other districts another tree is cultivated, the *Prunier commun*. This is a round violet Plum grown on its own stock. The fruit is prepared in a similar manner to the *Prune d'ente*, but it is very inferior, and is only fit for stewing. Enormous quantities are consumed by the peasants in the north and east of France.

I think the deductions I have drawn from the observations and inquiries I have made may be briefly stated as follows:—

1, That we have no Plum at present cultivated in the Severn district that at all resembles the *Prune d'ente*.

2, That though I think we have plenty of suitable soil I think it most probable that we should never successfully cultivate the *Prune d'ente* on account of the lateness of our spring and the comparatively small amount of really hot sun that we usually enjoy.

3, That some of our Plums can be made to yield lower grades of the "Prunes" and *Pruneaux*, but with such produce only, a factory could hardly be maintained. The loss of weight in the process of drying even with the best *Prunes d'ente* amounts to two-thirds of the original weight; with our Plums it would probably be about three-quarters. In other words a pot of our Plums would probably yield about 25 lbs. of dried fruit.

If a factory were established, I should propose to adopt a class of kiln which I have in use for burning terra cotta at my brickworks. I should have a set of four of these kilns, each kept constantly at a regular temperature, but the heat in each one varying from that in the others. Such a set, in a suitable chamber and with the requisite heating arrangements, would probably cost about £200; not so much if placed in an existing building; and the daily output would amount to the produce of from thirty pots of fresh fruit, all of which would pass through all four kilns. There could not be more than about six weeks of work, and the gross output would, therefore, be about 250 pots of dried fruit during that time.

It will be seen that during the greater part of the year the factory would be idle unless development in other directions were adopted. I could indicate one such direction as to which I have obtained a considerable amount of information, and which appears to offer very great probabilities of success. It would make this report too lengthy were I to enter fully into the details of this scheme; and I will only mention that it is the manufacture of brandy from Plums, adding that:—

I. There appears to be an unlimited demand for brandy.

II. That Plum brandy appears to possess distinctive and valuable qualities.

III. That recent legislation in Germany, where most of the cheap brandy is made, has rendered its manufacture in England more advantageous.

IV. That such a manufacture would considerably extend the period during which the factory would be at work.

V. That the worst, soiled, and damaged fruit might be usefully employed.

Again, the manufacture of jam would enlarge the field of operations and extend the period of work; and not only of jam, but of fruit prepared in various ways.

I propose to try experiments in drying all the varieties of Plums grown in any quantity in the district, and can then form an idea of the quality of the product, and can ascertain the probable quantity available for such varieties as show fairly good results.

In using the word jam above I meant to include in the phrase the various products more or less included under the French term *confitures*, and in mentioning thirty pots as output from suggested "fours" I should say this is purely guess work, except that it would certainly be this amount, but it might be three or four times as much. I shall try the experiments as soon as any Plums are ripe with my kiln at the brickworks, and I can then form a reliable opinion.

(Signed) M. W. COLCHESTER-WEMYSS.

August, 1888.

In giving permission for the publication of his paper in the "Kew Bulletin" Mr. Colchester-Wemyss was good enough to send another paper which he prepared for a meeting of fruit growers at Gloucester, and in which he gave the following results of some experiments with English Plums:—

I determined on my return to make the best attempt I could with our Westbury Plums. Unfortunately it was a most unfavourable season (1888) for the experiment, for the fruit in England never ripened properly, and the continued absence of warm sunshine reduced to very small proportions the amount of saccharine, an ingredient most vitally necessary; so that the experiment was made under avowedly unfavourable auspices.

I have at my brickworks at Mitcheldean a special kiln for burning pottery and terra cotta. This kiln has some points of similarity with a French fruit *étuve*, only much better. It is fired with a special gas produced on the spot, the flame circulates in a hollow wall round the kiln, but never enters it. It can be cut off at any moment, and the temperature regulated at will. Of course, being made for terra cotta, its shape and form is not convenient for drying Plums; but it afforded ample evidence that kilns built on this principle, but specially modified, would answer admirably for fruit drying purposes. I tried several kinds of Plums, amongst others the Early Prolific, Blaisdon Red, Victoria, Black Apricot, and Black Diamond, but every Plum I tried as deficient in all the three characteristics of the *Prune d'ente*, toughness of skin, solidity of flesh, and abundance of saccharine. Some failed altogether, and even those which yielded a moderately fair result had to be treated with extraordinary care to avoid the bursting of the skin and the consequent escape of juice.

They had to be put many times into the kiln, and the finishing temperature had to be arrived at very gradually, and even then I unfortunately spoilt, from a too high temperature, several "claire"-fuls of Plums which I was preparing in an ordinary bread oven at Westbury. The Plum season was a short one this year, and unless picked quite green, so many rotted before they were really ripe, owing to the damp and rain, so that with the time and means at my disposal I was only able to produce a very limited number of Plums. Those giving the best results were the Blaisdon Red, the Black Diamond, and the Victoria.

\* \* \* \*

Though none of our existing Plums will yield the best French Plums, we can produce "Pruneaux," which are not without merit. Whether it would be a lucrative operation is not an easy question to answer. We have to bear in mind that it will require nearly 4 lbs. of our home varieties to make 1 lb. of "Pruneaux." In other words, assuming the value of raw fruit to be 1d. per pound, it would take four pennyworth of fruit to make a pound of "Pruneaux," and I think this would have to sell at 5d. per lb. to make the manufacture profitable.

A factory could not be started solely for the manufacture of "Pruneaux," because the busy time would only be so small a portion of the whole year that it could hardly be rendered remunerative; moreover, the raw fruit would bear but little travelling, and so could not well be brought from any great distance. It has to be quite ripe, and yet must not be at all bruised, and the skin must not be the least broken. A factory might encourage the erection and maintenance of ovens and kilns in different localities, and in fact the earlier stages of manufacture might be carried out in such localities themselves, and the process be subsequently completed at the factory. Such a plan would also have advantage of extending the annual period of life at the factory. It might also be possible to store the raw fruit in cool chambers at the factory and dry it at leisure, but I doubt this. A factory in fact to be successful must embrace other operations besides drying Plums.

#### THE MIDLAND COUNTIES CARNATION AND PICOTEE SOCIETY, BIRMINGHAM.—AUGUST 8TH.

THE first meeting of this new Society was held in the Botanic Gardens, and Mr. Latham had made excellent arrangements for the display in the great conservatory. There was a large gathering of growers, including Mr. Dodwell, who came from Oxford purposely to assist in establishing the new Society, and whose presence was affectionately welcomed. Mr. Lord and Mr. Henwood also came, and Mr. Samuel Barlow was a welcome visitor, and many others whose names do not appear as exhibitors. Slough was represented by genial John Ball, and Mrs. Douglas represented her famous husband, and I think I may safely say represented him admirably in setting up his blooms. Altogether it was a day of most pleasurable excitement, and all went off well, and Mr. Robert Sydenham and the Committee worked to insure success, and the general verdict was most favourable. There was a very large attendance, and note-taking was general; the luncheon tent was almost more than filled, and Mr. Barlow presided, and all went off well.

In the class for twelve Carnations, seven prizes, Messrs. Thomson, Sparkhill Nurseries, were first with clean fresh blooms of C. H. Herbert, James Merryweather, Thalia, T. B. Thomson, a fine new flower of good petal, and clear white ground colour; Prince George of Wales, good; Robert Morris, Sarah Payne, P.F.; also Sarah Payne, P.P.B.; Alismond, very bright in colour; George Melville, Lily Cannell, fine; and R. Houlgrave, very fine. Second, Mr. Charles Turner, Slough, with Sarah Payne, P.P.B.; Lady Mary Curric, James Taylor, George (Beardsley), large and good; Thalia, very fine; Prince George of Wales, H. K. Mayer, Charles Henwood, Mrs. Barlow, Charles Turner, John Simonite, and Robert Houlgrave, very fine. Third, Mr. M. Rowan, Clapham, with fine

blooms of George Melville, Fred, Rifleman, Gordon Lewis, and Robert Houlgrave in this stand. Fourth, Mr. Dodwell; fifth, Mr. Lakin; sixth, Mr. Makepeace; seventh, Mr. J. Douglas.

Twelve Picotees.—First, Mr. E. S. Dodwell, Oxford, with Norman Carr, large and fine; Favourite, Mrs. Coldridge, of very fine form and quality; Arnot Lyle, Little Phil, Imogene, Mrs. Payne, very fine; Mrs. Sharp, Nellie, fine; Royal Visit, and John Smith. Second, Mr. M. Rowan, with Mrs. Payne, fine; Mrs. Sharp, very bright and fine; Little Phil, Brunette, Alliance, fine in form; Mrs. Gorton, Clara Penson, Thomas William, Favourite, Mary, Amy Robsart, and Lady Louisa. Third, Mr. Charles Turner, Favourite, Mrs. Harford, Mrs. Payne, and Baroness Burdett Coutts, being fine. Fourth, Messrs. Thomson & Co., Sparkhill Nurseries; and in this stand were fine blooms of Mrs. Sharp, Lady Louisa, and Isabel Lakin. Fifth, Mr. J. Lakin. Sixth, Mr. J. Walker. Seventh, Mr. G. Chaundy.

In the class for six Carnations.—First, Mr. Robert Sydenham, Birmingham, with Thalia, Sarah Payne, J. Lakin, and three others. Second, Mr. Thomas Anstiss, Brill, his best blooms being George Melville, Sybil, and Robert Houlgrave. Third, Mr. William Ward, Leicester, who had good blooms of Robert Houlgrave and Sarah Payne.

For six Picotees.—First, Mr. Robert Sydenham, with good blooms of Norman Carr, Zerlina, Thomas William, Mrs. Ricards, Ethel, and Brunette. Second, Mr. A. W. Jones, Birmingham, his finest blooms being Mrs. Sharp, Thomas William, Mary, and Lady Louisa. Third, Mr. J. P. Sharp, Birmingham, in whose stand was a fine promising seedling, light purple edge. Fourth, Mr. T. Anstiss.

Twelve Yellow Ground or Fancy Carnation or Picotees.—First, Mr. Charles Turner, with a grand stand of blooms—viz., Romulus, fine; Mrs. Walford, Seedling, Edith, Mrs. Wynne, an improvement on Janira; Apollo, Victory, very fine; Almira, Lord Rendlesham, Madame Van Houtte, very fine; Countess of Jersey, a fine yellow-ground Picotee; Distinction, and Mrs. Henwood. Second, Mr. E. S. Dodwell, with Tournament, Almira, Terra Cotta, Stadthath Bain, and Seedlings 919, 184, 167, and others. Third, Mr. J. Douglas; and in this stand were fine blooms of Lily Henwood, Mrs. Robert Sydenham, and a very fine seedling yellow Picotee. Fourth, Mr. G. Chaundy.

Twelve Self Carnations.—First, Mr. E. S. Dodwell, with a very fine Germania, Queen of the West, and ten seedlings. Second, Mr. Charles Turner, with Catherine, The Governor, Mary Morris, Duchess of Fife, Golden Fleece, Cremorne, Rose Unique, very fine; Ruby, and Rose Wynne, both fine, the latter a beautiful deep scarlet approaching maroon; Germania, and two seedlings. Third, Mr. Rowan; fourth, Mr. G. Chaundy; fifth, Mr. Anstiss; sixth, Mr. Douglas.

In the class for six Fancy Carnations, Messrs. Thomson & Co. were first with a fine bloom of Blushing Bride, A. W. Jones, a fine yellow ground bizarre Picotee; Schleiben, A. Alegatière, Maud, and Lady Edwards. Second, Mr. M. Rowan with Janira, seedling, Terra Cotta, Dodwell's 614, 586, and 192. Third, Mr. J. Anstiss; fourth, Mr. J. Wynne Ffoulkes; fifth, Mr. J. Walker; sixth, Mr. S. Barlow.

Other classes were well filled, and a goodly number of flowers were staged in the classes for single blooms. Some of the finest were Mr. Sydenham's blooms of Annie Lord, Favourite, Mrs. Gorton, Norman Carr, heavy red edge with superb petal and substance; Polly Brasil, heavy purple edge; and Mr. C. Turner's Seedling No. 9, medium red edge, and Mrs. Coldridge, heavy rose edged, first in the heavy edged class; and also Premier, fine petal and substance.

Amongst the yellow ground varieties in the single classes, all very fine, were Countess of Jersey (Turner) deep yellow ground with carmine marking; Mrs. Henwood, light yellow with rosy carmine markings; and Lily Henwood, creamy buff with rosy carmine markings, a grand bright flower. Amongst the single blooms of selfs Germania was very fine; also Royalty, a very charming bright ruby-red self of exquisite form and good substance. No. 4 self of Mr. Hedderley's and Rose Unique (Turner) a very beautiful flower, soft shaded rose.

An important addition to the schedule were the classes for Border Carnations, and in that for twelve varieties, five blooms of each, Mr. John Walker, Thame, was first; Mr. Joseph Lakin, Oxford, second; Mr. G. Chaundy, Oxford, third. The midland and northern growers not being yet in bloom.

Prizes were offered for the best bouquets of Carnations and Picotees, and foliage. Messrs. Thomson & Co. were first with a superb arrangement of scarlet Carnations and their Blushing Bride self Carnation, and there were four other prizes awarded. There was also a goodly competition in the class for sprays of Carnations or Picotee blooms. The class for twelve plants in pots not exceeding 6 inches in diameter brought out only one exhibit, Messrs. Thomson's, the lateness of the season telling against further exhibits, and it taxed Mr. Herbert to get this lot into moderate bloom.

The premier blooms were as follows:—Bizarre Carnation, Robert Houlgrave, S.B., exhibited by Messrs. Thomson & Co.; Flake Carnation, Thalia, R.F., by Mr. Charles Turner; heavy-edge Picotee, Mrs. Coldridge, by Mr. Dodwell; light-edge Picotee, Baroness Burdett Coutts, P.E., by Mr. Charles Turner; yellow-ground Picotee, Countess of Jersey, by Mr. Charles Turner; Self Carnation, Germania, by Mr. Dodwell.

A certificate was awarded to Mr. J. Douglas, Ilford, for Fancy Picotees Lily Henwood and Mrs. Robert Sydenham. Certificates were also given to Mr. Hy. Eckford, Wem, Salop, for the following new Sweet Peas:—H. M. Stanley, Ovid, Lady Beaconsfield, Dorothy Tennant, Countess of Radnor, Imperial Blue, Delight, and Premier.

Non-competing exhibits were of considerable excellence. Messrs. Thomson & Co. contributing a handsome group of plants; A. H. Griffiths, Esq., a box of superb Roses; Mr. William Sydenham, Tamworth, Fancy Pansies; Mr. Wm. Campbell, florist, Blantyre, a fine display of Fancy Pansies, including seedlings, Wm. Adam, Dr. Gilchrist, and Duchess of Fife, all these very good; Messrs. Hewitt & Co., Solihull, for a fine plant of the lovely new Caladium Raymond Lemoine, also Begonia blooms, cut herbaceous plants, and an interesting collection of foliage of rare ornamental trees and shrubs. Mr. B. K. Davis, nurseryman, Yeovil, sent a fine lot of blooms of his double and single Begonias, nicely set up; Mr. James Forbes, Hawick, a good display of Violas, Pansies, and cut herbaceous plants; and Messrs. Dicksons, Chester, cut herbaceous plants and border Carnations.

### CODONOPSIS CLEMATIDEA.

THE genus Codonopsis is included in the Campanula family, and several of its members are very suggestive of the medium sized Bell-

FIG. 22.—CODONOPSIS CLEMATIDEA.

flowers of erect habit. The climbing annual Codonopsis, *C. rotundifolia*, is perhaps the best known together with its beautiful variety *grandiflora*, the yellowish flowers being veined with dark purple. *C. clematidea* is not too frequently seen, however, although it is an attractive plant of considerable merit as a hardy perennial. It is a native of elevated regions in Asia, and produces its neat bell-shaped pale blue flowers at the points of the slender stems, which rise to the height of 2 or 3 feet. The flowers have a charming appearance when cut and arranged with other flowers or foliage in vases. It has been well shown in London by Messrs. Paul & Son of Cheshunt.

## THE OXFORD CARNATION AND PICOTEE SHOW.

THE annual gathering of florists on this occasion was a large one, and Mr. Dodwell's health has fortunately enabled him to take his position as host and welcome all his friends, as he did most cordially. Everybody knows that 1891 has given a very sunless summer in the midland and northern counties, and that the season is a very late one, and Carnation and Picotee growers in those districts have felt it keenly. Mr. Lord, Mr. Ben Simonite, Mr. T. Bower, Mr. S. Barlow, and other well known Lancashire and Yorkshire growers could not send any flowers, as their plants were not in bloom; and the Birmingham growers could take but very few blooms for the same reason. Still, there was a very fine display, and the southern growers had the best of it; a great many very fine flowers were staged, Mr. Dodwell's gardener, Mr. Read, showing well, the blooms being so fine throughout; Mr. M. Rowan of Clapham was a strong opponent, as our report will show.

In the class for twelve Carnations, dissimilar, Mr. Read and Mr. Rowan were placed equal first; the former with William Bacon, Sybil, Dr. Symonds, Squire Potts, Gordon Lewis, Master Fred, George Mitchell, Mrs. May, a lovely rose flake; Thalia, Squire Whitbourn, Mrs. Bacon, and Seedling 746. Mr. Rowan's stand consisted of George Melville, Matador, Thalia, Robert Houlgrave, Alfred J. D. Hextall, Sportsman, Sarah Payne, Jessica, Gordon Lewis, Mars, and Rifleman. Third, Mr. Charles Phillips, a fine Prince George of Wales in his stand. Fourth, Mr. Joseph Lakin, fine blooms of Alismond S.F. and Duchess of Fife, a fine pale rose flake, in this stand. Fifth, Mr. Robert Sydenham; Sybil, and Lovely Mary, a very fine rose flake, were conspicuous in this stand. Sixth, Mr. George Chaundy, who had a promising seedling S.F. in his stand. Sixth, Mr. John Walker. In the class for six dissimilar Carnations Mr. T. G. Keen was first with William Skirving, Matador, James Douglas, Rifleman, Robert Houlgrave, and Lovely Mary. Second, Mr. T. Nutt with James Douglas, a fine Sybil, Rifleman, George Melville, William Skirving, and Alismond. Third, Mr. W. T. Walker, who had fine blooms of H. J. May and James Douglas. Fourth, Messrs. Thomsons; fine blooms of their new bizarre C. H. Herbert, and of Prince George of Wales in this stand. Fifth, Mr. Thomas Anstiss, including fine blooms of James Douglas and Sybil. Sixth, Mr. W. Bacon. Seventh, Mr. F. Hooper, who had a fine bloom of Joseph Lakin in his stand.

In the classes for Picotees many of the flowers were very fine and refined. For twelve blooms Mr. Read again scored first with a grand lot of blooms—viz., Norman Carr (a superb heavy scarlet edge with grand petal), Lyddington's Favourite, Gertrude, a grand flower of Amelia, Chaundy's 271, Novelty (a charming flower with a distinct shade of purple marking, unlike any other), Imogen, Mrs. Payne, Little Phil, a very fine bloom of John Smith, Mrs. Coldridge (a beautiful new variety), and a very fine Mrs. Sharp. Second, Mr. M. Rowan with a very fine stand of Dr. Epps, a very fine Favourite, Little Phil, Amy Robsart, Rose Mary (a beautiful flower), Muriel, Thomas William (very fine), Mrs. Sharp, Edith D'Ombra, Brunette, and another. Third, Mr. J. Lakin, a very promising seedling light rose edge, and fine blooms of Mrs. Niven and Juliette being noteworthy in this stand. Fourth, Mr. John Walker. Fifth, Mr. George Chaundy. Sixth, Mr. Chas. Phillips. Seventh, Mr. Thomas Anstiss, in whose stand was a distinct faint light-edged variety named Emma Rachel.

Six Picotees.—First, Messrs. Thomson & Co., Birmingham, with Gertrude, Campanini, Favourite, Thomas William, Mrs. Sharp, and Brunette. Second, Mr. W. Bacon with a fine Amelia, Lady Holmesdale, Mrs. Payne, Clara Penson, John Smith, and Mrs. Sharp. Third, Mr. Walker; fourth, Mr. Keen; fifth, Mr. Hooper, in whose stand was a fine and promising light purple edge seedling very like Mary, but larger; sixth, Mr. F. Nutt; seventh, Mr. Ribbeck; eighth, Mr. John Payne.

The twelve selfs, Fancies, or yellow ground classes were well filled, and some grand blooms were staged, these classes becoming more and more popular, and so many fine varieties have recently been added. Mr. Rowan achieved a triumph here in being first with a very fine stand of blooms—viz., Purple Emperor, Germania, Lady Agnes, shaded pale pink self and very fine; The Maestro, a rich dark crimson self; Gladys, Janira, Joe Willett, a very bright scarlet self; Emmie, a faint shade of salmon pink, distinct and fine; Lady Vernon Harcourt, shaded salmon scarlet, and seedlings. Mr. Read was a close second with fine blooms of Seedling 859, Gentle Jacky, blush pink, very fine; Sir Toby Bitch, rich scarlet with crimson flakes; Vandyke, very distinct and handsome, bright carmine with slate coloured stripes; Chaundy's Seedling 259, rich crimson scarlet, very fine, and some of Mr. Dodwell's seedlings. Third, Mr. George Chaundy, chiefly with seedlings, one of them an improvement on Mrs. Reynolds Hole; fourth, Mr. Walker; fifth, Mr. Anstiss; sixth, Mr. Phillips; seventh, Mr. Vesey.

In the class for six Selfs, Fancies or Yellow Grounds.—First, Mr. Nutt, with Germania (also the premier self) Gladys, Ruby May, Annie Lakin, very fine; Benary's Theodore, very distinct pale mauve, and very fine; and Joe Willett. Second, Mr. Walker, with Mrs. Reynolds Hole, Mrs. Fred, Seedling, Germania, Brilliant, and Terra Cotta. Third, Messrs. Thomson & Co., with Blushing Bride, and Mrs. Thomson, a beautiful bright salmon and carmine flower, both not yet sent out, and a very fine bloom of Mrs. Fred and others. Fourth, Mr. Ribbeck. Fifth, Mr. J. F. King, who had a fine bloom of Terra Cotta. Sixth, Mr. A. L. Brown. Seventh, Mr. Bacon. Eighth, Mr. Hooper. Ninth, Mr. R. Ellis.

In the class for the Kilmurry section of yellow ground Picotees.—First, Mr. Read, with superb blooms of Tournament (the premier yellow

ground in the Exhibition), Alfred Gray, Nancy, Gyle's No. 4, Rachel and Nora. Second, Mr. George Chaundy, a bloom of Rachel, very fine, and a distinct variety in this stand. Third, Mr. F. Nutt, with a grand Tournament, and others. Fourth, Mr. W. Bacon. Fifth, Mr. Thomas Anstiss.

In the class for six yellow ground flowers.—First, Mr. W. Read, with Seedling 167, very fine, also Seedling 1859, fine; a grand bloom of Tournament, Alfred Gray, a very fine variety of the Kilmurrys; Stadthall Bail, distinct and bright, and Patricia. Second, Mr. Chaundy, with Dodwell's 164, Mrs. Reynolds Hole, Dodwell's 154, a bright and lovely variety; the Seedling improved Mrs. Reynolds Hole, and Germania. Third, Mr. T. J. Keen. Fourth, Mr. F. Nutt. Fifth, Mr. Hooper. Sixth, Mr. Phillips. Seventh, Mr. Anstiss. Eighth, Mr. A. Spurling. Ninth, Mr. R. Ellis.

Single classes.—Heavy edged Picotees.—First, Mr. J. F. Sharp with Mrs. Sharp. Second and fourth, Mr. Read, with Little Phil, a beautiful heavy red edge flower. Third, Messrs. Thomson & Co., with Gertrude. Fifth, Messrs. Thomson & Co., with Constance Heron. Sixth, Mr. Read, with Mrs. Sharp, and seventh with Little Phil.

Medium edged Picotees.—First, Mr. Phillips, with Zerlina, and fifth with Muriel. Second, Messrs. Thomson & Co., with Alice. Third and fifth, Mr. Rowan, with Muriel. Fourth, Mr. A. R. Jones, with Miss Horner. Seventh, Mr. Hooper, with Mrs. Rudd.

Light edged Picotee.—First, Messrs. Thomson & Co., with Clara Penson. Second, Messrs. Thomson, with Juliet, and fourth with Mrs. Herbert. Third, Mr. Lakin, with Favourite. Fifth, Mr. Anstiss; sixth, Mr. Hooper; seventh, Messrs. Thomson, each with Favourite.

Carnations, Scarlet Bizarres.—First and second, Mr. Rowan, with Robert Houlgrave, and third with Mars. Third, Mr. Wynne Ffoulkes, with Robert Houlgrave. Fifth, Mr. Lakin, with Mars.

Crimson Bizarres.—First, Mr. Rowan, with J. D. Hextall, and third and fourth with Edward Rowan. Second and fifth, Mr. Read, with Seedlings.

Pink and Purple Bizarres.—First and second, Mr. W. Nutt, with William Skirving. Third, Mr. Read; fourth, Mr. Wynne Ffoulkes; fifth, Messrs. Thomson, with Sarah Payne.

Scarlet Flakes.—First and second, Mr. Rowan, with Sportsman. Third, Mr. Read, with Dodwell's 727. Fourth, Mr. Chaundy; and fifth, Mr. Lakin, with Sportsman.

Rose Flakes.—First, Mr. Read, with a very fine Mrs. May, and third with Seedling 833. Second, Mr. Lakin; fourth and fifth, Mr. Rowan, with Thalia and Jessica.

Purple Flake.—First and fifth, Mr. Read, with Mayor of Nottingham. Second and fourth, Mr. Lakin, with Sarah Payne and James Douglas; and third, Mr. Keen, with James Douglas.

Selfs.—First, Mr. Anstiss, with a very fine bloom of Mrs. Fred. Second, Mr. Read, with Chaundy's 155, a very fine rose purple. Third, Mr. Lakin, with Germania; and fourth with Nellie Hill, a pure white of fine form. Fifth, Mr. Chaundy, with Queen of the West, a lovely pale rose self.

Yellow Grounds.—First, Mr. Phillips, with Douglas's Almira. Second, Mr. Read, with Benary's Madame Van Houtte, distinct and fine. Third and fifth, Mr. Hooper, with seedlings; and fourth, with Agnes Chambers.

Fancy Picotees.—First, second, and third, Mr. Read, with a very fine Maud, Stadthall Bail, and Dodwell's 857 respectively. Fourth and fifth, Mr. Hooper, with a seedling in the style of Alfred Gray and bright.

The premier blooms in the Exhibition were: Carnation, George Melville, P.F., in Mr. Rowan's stand of twelve. Picotee, Mrs. Payne, medium rose edge, in Mr. Read's stand of twelve. Self Carnation, Germania, in Mr. Nutt's stand of six. Fancy, Tournament, in Mr. Read's stand of six.

To the following varieties certificates were awarded:—To Martin R. Smith, Esq., for Niphotos, white; Lady Gwendoline, not quite so bright as Mrs. Louisa Jamieson, bright scarlet; Abigail, warm rose; Royal George, rosy purple; and Athane, light purple.

To Mr. Charles Turner, Slough, for Carnations Dr. Hogg, bright scarlet bizarre; Charles Turner, a grand scarlet flake; Charles Henwood, a fine purple flake; and Lady Walker, a yellow self, very closely resembling Germania. Also to Mr. Turner for the following Picotees—viz., Mrs. Harford, medium rose edge, in the style of Mrs. Payne, and with a superb petal; Madeleine, heavy rose edge and a very fine flower; Lady Emily Van de Weyer, a very light purple rose edge, with beautiful petal and form; Lord Rendlesham, deep salmon ground, suffused with bright shaded maroon, a very fine flower; Apollo, creamy yellow ground with faint carmine markings, a fine flower; Sunset, pale salmon with lilac-tinted red markings, a fine flower; Romulus, creamy yellow ground with rich pale carmine markings, extra fine; and Mrs. Henwood, pale yellow ground with pale scarlet margin, fine. Mr. Turner also exhibited a superb self named Ruby; Rose Unique, soft rosy pink, fine form; and a pale P. and P.B. Carnation Harmony; and Lady Mary Currie, a fine rose flake flower.

In addition to this fine display of flowers there was Mr. Dodwell's grand collection in pots in flower, numbering several thousand blooms, and all in the most satisfactory state of cultivation; and what a wealth of beauty is to be seen in the very numerous and lovely varieties of selfs and Fancies he has raised, beautiful decorative flowers, some of which should be in every garden. Shades of colouring appear to be unlimited, and form is now a common thing in comparison with the ragged edges of a great many of the border decorative sorts. A

stronger constitution is also to be found in the many varieties raised by Mr. Dodwell and other growers, so that as border flowers they are the more acceptable.

## HORTICULTURAL SHOWS.

### LEICESTER.

THE annual Exhibition of the Leicester Horticultural Society took place on August 4th, and was a most decided success both as regards the exhibits and also in the attendance of visitors. The weather was somewhat threatening all day, but fortunately no rain came to spoil the pleasure of the public, and about 20,000 people visited the Show and grounds during the day. Leicester Show is always well patronised by the public, partly owing no doubt to the beautiful park and gardens in which it is held. The bedding-out is very extensive, and looks remarkably well. Two examples of carpet bedding deserve especial mention. They are worked from designs suggested by an old Roman pavement discovered in the town. The colours were subdued and well chosen, and the plants had filled up well considering how far north they are situated; in fact, it would be difficult to find two better beds. It was gratifying to hear the number of entries this year amounted to 1125, exceeding those of 1890 by nearly 300. This says a great deal for the good management of the able Secretary, Mr. Burn, who is also curator of the park and grounds. A large Show like this is a severe tax on the administrative ability of any person who undertakes it, but everything passed off smoothly and with credit to all concerned. We were glad to hear Mr. Burn's charge is likely to be greatly extended in the future.

The show of fruit was remarkably good, the competition in some classes being keen. For a collection of eight dishes, distinct, the first prize was awarded to Mr. Edmonds, gardener to the Duke of St. Albans, Bestwood, who showed Madresfield Grapes fine in berry and colour, Black Hamburgh of good colour, Muscat of Alexandria good in bunch and berry but scarcely ripe, a good Queen Pine, very fine Elruge Nectarines, Grosse Mignonne Peaches extra fine, Melon and Figs. Second, Mr. Goodacre, gardener to the Earl of Harrington, Elvaston, with similar dishes but not so fresh and clean in appearance, although not many points behind. Third, Mr. J. Read, gardener to the Earl of Carnarvon. For four dishes, distinct, Mr. Alex. McVinish, gardener to N. Curzon, Esq., Lockington Hall, Derby, was first, showing fine Hamburgh Grapes; the same exhibitor also took first for Hamburgh Grapes and first for Muscat of Alexandria. Two bunches of Hamburgh Grapes were shown marked "Not for Competition," and deserve especial mention for their fine berries and large bunches. Some good Peaches were staged, Mr. Divers of Ketton took the first prize, and also for Nectarines. Strawberries were good, Mr. Edmonds being first with Duke of Edinburgh. Mr. Elphinstone, gardener to the Earl of Aylesford, second with fine fruits of Dr. Hogg but too green for exhibition. For Figs, Mr. Divers was first and Mr. Edmonds second.

Currants, Apples, and Gooseberries made a good show and were very fine. A glass case containing twenty-five varieties of Gooseberries not for competition deserves especial mention. Some of the best were Long Barney, Thatcher, Princess Royal, Antagonist, Leveller, Careless. A stand of ornamental pottery exhibited in this tent by Mr. Edwards of Sherwood, Nottingham, was awarded a certificate of merit, and was especially noticeable, being made in rustie ware, coloured green, black and gold, and filled with Ferns. Mr. Smout of Hastings had a collection of coloured seaweeds, and Mr. Forbes of Hawick exhibited some stands containing eight dozen Pansies, bedding Violas, and cut flowers of Begonias, which were awarded a special prize, also a quantity of herbaceous flowers.

Collections of vegetables were a strong competition and included fine specimens. The soil around Leicester evidently suits vegetables very well indeed. The first prize for a collection went to Messrs. Hickling of Loughborough, whose Potatoes, Tomatoes, Peas, Tripoli Onions, and Carrots were very good. Second, Marquis de Salicto, who showed fine Potatoes, Peas and Turnips. Third, Mr. F. Faint, Hertford, a very clean lot. For six dishes Potatoes there were ten entries, and all the exhibits were good. First, Mr. W. Biddles, Loughborough. Second, Mr. J. Cox, Loughborough, with larger tubers but not so good. Peas made a great show, twenty-two dishes being staged, the majority very fine. The same may be said of the Carrots and Onions, both of which appeared in strong force.

The specimen plants exhibited a marked improvement on former years; the groups also made a capital show, Mr. J. Smith, gardener to S. Bennett, Esq., being first with clean specimens. *Areca lutescens* occupied the centre, surrounded with *Caladiums*, *Acalyphas*, *Marantas*, *Francoa*, *Clerodendron fallax*, variegated Grass, &c. This was well filled up, and yet light and pleasing. Second, Mr. G. Berry, gardener to H. Snow, Esq., a good lot, but much heavier in appearance.

Messrs. Williams of Holloway showed a fine group of plants not for competition, comprising *Dracenas*, *Palms*, *Marantas*, *Crotons*, *Sarracénias*, &c., of good useful size and clean healthy grown plants that made an important feature in the Show.

Roses were a show in themselves. For thirty-six, Messrs. Harkness of Bedale were easily first. They had Alfred Colomb, Comtesse d'Oxford, A. K. Williams, Pride of Waltham, Victor Hugo, Prince Arthur very fine. Second, Messrs. Perkins. For twenty-four the prizes went in the same order. For twelve of one kind Messrs. Harkness showed a beautiful box of Horace Vernet, the second prize going to Messrs. Perkins for Marie Baumann. A collection of *Pelargoniums* shown by Messrs. Pearson of Chilwell, Nottingham, were remarkably good, some of the best being Constance, pink; Mrs. Norman, salmon; Chas. Mason, very

bright scarlet; and seedlings No. 24, 1889; 20, 1890; and 22, 1889. Carnations were well represented, the chief prizes going to Mr. C. Turner of Slough, who also showed some new kinds not for competition, including *Romulus*, Lord Rendlesham, Mr. Henwood, Ruby, and Harmony. Wreaths and bouquets were grand, Messrs. Perkins taking all the first prizes as usual, their exhibits being far before all the others. In the cottagers' tent some good exhibits were staged, especially in vegetables, thirty-three plates of kidney Potatoes being shown, and several other classes were extremely well represented.

### HURSTPIERPOINT.

THIS Society was highly favoured with a beautiful day on the occasion of their fifth annual Show, held at the Chinese Gardens on Wednesday, the 5th inst. The entries this year show a steady increase on former efforts, and the result was a creditable collection of plants, flowers, fruits, and vegetables staged by the three classes of exhibitors. The gardeners' classes, which will be of most interest to readers of the Journal, are open to an eight-mile radius, and in most cases were well filled. The premier place for a miscellaneous group of plants was taken by Mr. M. Burehell, gardener to S. Hannington, Esq., Hurst; Mr. F. Faire, gardener to R. Clowes, Esq., Clayton, Wickham, being second with a pretty light arrangement, in which *Liliums* was the main feature, and though a little deficient in some respects, it seemed to "take" the popular eye more than first-named. It is much regretted that there is a slight falling off in this class, but it was in a great measure made up for in the numerous entries for six plants flowering or foliage. In this class Mr. A. Bish, gardener to Miss Fitzhaugh, was first, followed by Mr. G. F. Wickham, gardener to J. Humphreys, Esq., Rymer, and Mr. A. Scutt, gardener to Mrs. Jenkins, Burgess Hill. For a group of Ferns, G. F. Wickham was first, and P. Healey, gardener to S. Wilson, Esq., Kingsland, second, both showing neat fresh groups. For the best specimen plant Mr. Wickham was again placed first for a well-grown *Bougainvillea*, Mr. A. Bish being second with a splendid *Adiantum farleyense* 4 feet across, and Mr. Burchell was third with the same Fern nearly as large. Mr. Bish was first for *Begonias*, *Fuchsias*, and *Gloxinias* the latter being very fine indeed.

Cut flowers were well represented, notwithstanding the heavy rains experienced. Mr. Wickham had the best amongst several bouquets. There were a few good boxes of Roses, J. Peskett having the best. Mr. W. Manton, gardener to Mrs. Clifton Borrer, Boling, was strong in hardy herbaceous flowers, and Mr. G. Healey had a good stand of Dahlias.

In some of the fruit classes the entries were not so numerous as usual, but were of very good quality. The Apples placed upon the tables show that there is a fair crop in this district, and the same may be said of small fruits. The following are the names of the most successful exhibitors:—Messrs. Wickham, Collins, Manton, Godby, Scutt, Lingby, and Chandler. The ladies, as is usual here, made an interesting display of baskets of cut flowers, Mrs. Shorood taking the coveted blue ribbon, followed by Miss Fanny Wood and Mrs. A. Scutt. Mr. Manton was fortunate in carrying off first prizes given by Messrs. Balchin for hardy herbaceous flowers, and the Messrs. Sutton & Sons for a collection of vegetables. Messrs. Balchin, with their usual desire to promote local horticulture, staged a fine group of decorative plants, and also some fine cut Roses. The cottagers made a very good show of vegetables and small fruits.

This is one of the best conducted local Shows in Mid-Sussex, and their Show is only part of what the Society is doing for the cause. In addition to the many special prizes not here mentioned there are also prizes given for the best cultivated garden, for the best allotments, &c., the labours attending which are not seen nor much thought of on the Show day, but the good it does must not be lost sight of. Mr. Wood, their genial Chairman and Treasurer, succeeds in getting substantial subscriptions, and in having a balance on the right side, and his efforts are ably seconded by Mr. S. Bucking, two gentlemen at least at Hurst, not so much engrossed in agriculture as to have no time to think of the gardens and of gardeners. Mr. Bunny and Mr. Richardson ably superintended the arrangements of the Show, and Mr. A. Anseombe efficiently discharged the duties of Secretary.

### HARDY FRUIT GARDEN.

APPLES AND PEARS.—All summer pruning must now be completed at once, so as to give the fruit all the light and air possible, and to develop the fruit buds for next year. Be careful to leave four or five good leaves at the base of each shoot that is shortened, and all the points of the main branches must be left entire if any extension in the size of the tree is considered advisable. Trees that are habitually unfruitful should not be pruned in any way at present unless a few weak shoots are taken out to allow the others more light and air. As a full pruning now will only start more shoots into growth, all such trees should be left until the wood is well matured, and then be operated upon at the roots. While pruning see that all ties and fastenings are

secure, and add extra supports where there are heavy crops, so that all may be safe before the fruit becomes too heavy and breaks the branches.

**APRICOTS, NECTARINES, AND PEACHES.**—Fruits that are ripening must be carefully attended to, gathering them before they are likely to fall, and laying them in a dry and warm place to finish. See that no wall-nails are in the way of the fruit now it is swelling fast, and look out for woodlice and earwigs, which often do much damage by eating small holes in the fruit next to the wall. A piece of cotton wool placed behind the fruit is the best protector, and all the insects should be trapped by turning flower pots upside down and placing a little dry moss in the bottom for them to hide in. A can partially filled with water and a little petroleum swimming on the surface soon makes short work of such things if they are dropped into it. Keep the fruit well exposed to the light and sun by removing all young shoots as they appear, and assist the trees that have heavy crops by a thorough soaking of weak liquid manure at the roots occasionally. If red spider appears before the fruit commences ripening lose no time in checking its advance by repeated syringings of cold water after the heat of the day is over. The foliage must be kept perfectly clean and healthy if a good crop of fruit is required next season.

**STRAWBERRY BEDS.**—As soon as those layers are removed which are required for planting, the beds should be cleaned by hoeing up all weeds and young plants, trimming off the runners, and raking all away together with the mulching materials. Some persons still make a practice of cutting the old leaves off the plants as soon as fruiting is over, and in some instances no doubt good results are obtained under this system; at the same time it is just possible better results would have been obtained if the best of the foliage had been preserved. We find an old sickle or some similar instrument useful for cleaning Strawberry beds. By holding it almost perpendicular and working it round each plant the runners and oldest leaves are detached at the same time, and the best of the foliage in the centre of the plant is left entire. After this the beds must be hoed through about once every ten days to keep weeds in check and prevent the ground from becoming too much dried. In warm and dry localities defer cleaning the beds for another fortnight, merely pulling out the largest weeds, or another mulching may be applied in the place of that which is removed.

**THE FRUIT ROOM.**—This must now have a thorough cleansing and be prepared for the early fruits. A clean, sweet room is absolutely necessary in order to have good flavoured fruit, and all strong-smelling substances must be rigidly excluded. Apples, Pears, &c., soon become tainted if any strong-smelling substance is near them in a room, and are then spoiled. The fruit room should therefore be reserved for storing fruit only, and not made a receptacle for all kinds of odd things, as is often done; such things as petroleum, paint, tar, herbs of various kinds, Onions, Shallots, Garlic, often cause much mischief which cannot afterwards be rectified. It is important also that all windows be left open after the room is cleansed until fruit storing is commenced in order to keep the air sweet and pure. See that all holes are stopped where mice and rats are likely to enter. Broken glass finished off with Portland cement is the best substance for this purpose. Never store fruit on straw or paper, as these soon impart a musty flavour. Bare shelves are far better, and they should not be made of deal, but of some English wood, such as elm or ash, which has no odour. See that all ventilators are in good order and everything right before fruit gathering commences.

#### FRUIT FORCING.

**PEACHES AND NECTARINES.**—*Earliest Forced Houses.*—Although the foliage of trees started in December is now beginning to fall they must not lack moisture at the roots, affording water or liquid manure to weakly trees as necessary to maintain the soil in a moist but not saturated condition; as if too much water is given when the trees are at rest and they are not exposed excessive moisture and the warm weather are apt to cause premature growth, which must be guarded against. It does not much matter about rain, as with it the air is comparatively cool; indeed, rain has a beneficial and invigorating tendency. As a safeguard against starting the bloom buds, allow such laterals as are green and unripe to remain as an outlet for any excess of aliment, and they are equally effective in maintaining activity at the roots. Early forced trees do not, as a rule, make strong growth, having generally a larger proportion of single fruit buds than trees grown under more favourable circumstances, triple buds not being nearly so frequent; hence in pruning it is not desirable to cut back next year's bearing wood unless they are of great length. Very little pruning will be needed provided disbudding has been attended to, no more wood being trained in than is required to replace the bearing shoots of the current year, and to renew worn out growths, as well as provide for the extension of the trees. Trees that have long been subjected to early forcing are seldom vigorous, but not unfrequently become so enfeebled as to need the removal of the weak growths, which, though plentifully furnished with fruit buds, are undesirable from their affording much smaller fruit than is yielded by the moderately vigorous and well ripened growths. Some trees, however, make too vigorous or long-jointed wood, pushing laterals difficult to restrain, if they do not frustrate the formation of fruit buds and interfere with an equal distribution of the sap. Any trees which grow too vigorously must be lifted, whilst those which show symptoms of weakness may have the old soil carefully removed from amongst the roots, supplying fresh turfy loam with about one-fortieth part of bonemeal and a twentieth of wood ashes intermixed. Give a good watering both to the lifted trees and to those that have had the soil renewed about the roots. These operations require to be

performed as soon as the leaves are mature and before they fall from the trees.

*Succession Houses.*—Cut out the shoots that have borne fruit unless required for extension, and all the shoots where the growths are crowded should be thinned. This will allow the foliage to be more readily cleansed by syringing, repeating that as necessary, it being important that the foliage be kept clean and healthy as long as possible. With free access to light and air the buds will form perfectly, attention being given to a due supply of water to the roots. Where the fruit is ripening a free circulation of air will enhance the quality considerably, sufficient water only at the roots being given to prevent the foliage becoming limp, and secure air moisture by an occasional damping of available surfaces other than the trees for the benefit of the foliage, also fruit, which in an arid atmosphere is liable to become mealy, whilst it ripens prematurely if the trees suffer from an insufficient supply of moisture in the soil. Ants in some cases are very troublesome, eating into the choicest and best fruits. Wrapping a little cotton wool round the stem of the trees hinders their ascent, securing it with soft twine in the middle soaked in creosote or a saturated solution of camphor. If creosote be used it must be kept from the stem of the trees. Saucers sunk in the soil, level with their edges and as near their haunts as possible, and pouring some treacle or syrup into each, attracts them from the fruit.

*Late Houses.*—Attend to thinning and regulating the summer growths, and if they are laid in thinner than is customary with trees in early houses the wood will have a better chance of ripening, and the leaves will assimilate more food, storing it in the buds and wood for the support of the blossoms and embryonic fruit in the coming season. Gross growths tend to the impoverishment of the weaker, appropriate an undue amount of the sap, preventing an unequal distribution of the aliment, and favour nothing but unfruitfulness and gumming. They must be stopped, or better removed altogether. Endeavour to secure an even balance of moderately vigorous short jointed shoots, and to insure the wood ripening ventilate freely in the early part of the day, allowing a good heat through the day from sun, closing in good time so as to run up to 85° or 90°, for sun heat after evaporation has been going on for some time will not do any harm if only care is taken to admit a little air before nightfall to allow the pent-up heat and concomitant moisture to escape and the gradual cooling down of the atmosphere, thereby securing rest. The night and early day ventilation tends to the solidification of the growth and its ripening. Keep the trees free from red spider by forcible syringings until the fruit gives indications of ripening. The borders must be well supplied with water or liquid manure, and be mulched about an inch thick with short rather lumpy manure.

*VINES.*—*Early Houses.*—The earliest forced have the wood ripe and some of the leaves falling. Do not attempt to remove them forcibly nor cut the laterals close in, as that would probably cause the principal buds to start, therefore remove the laterals by degrees, and shorten some of the strong shoots, preserving, however, some growth, especially when the principal leaves are down, above the buds to which the Vines are to be pruned, deferring the final pruning until the early part of September. The old soil should be removed from the surface of the border, forking some of it from amongst the roots, taking advantage of the opportunity to raise any that are deep and laying them in fresh material nearer the surface. Good calcareous loam is the most suitable, with an admixture of bonemeal and wood ashes to the extent of a twentieth part equal proportions of those elements being taken. If the soil be light, add a sixth of clayey marl; if heavy, a sixth of old mortar rubbish. Charcoal may be used to the extent of one-tenth. Give a moderate watering, and the roots will push, especially adventitious ones from near the collar, into the new soil at once, and be in capital condition for a start when the time of starting comes round. When lifting or renovating the border is delayed until the leaves are all down the Vines do not start so freely, the break often being unsatisfactory.

*Midseason Houses.*—The Grapes upon the whole have been satisfactory as regards colour and bloom, and the season has favoured size and freedom from red spider. The Vine seems to delight in a good array of foliage fully exposed to light, as the wood is then stout, short-jointed, and the leaves thick, leathery, and deep green in colour, the Grapes well nourished, and the buds plumped for next year's bearing. Copious supplies of water through a mulching, not a thick soapy mass but light open material, along with surface dressing or liquid manure of a sustaining rather than a stimulating kind, contribute to a satisfactory result. Fire heat is often necessary to ripen midseason Grapes perfectly, but with ventilation day and night to insure a circulation of air it may often be dispensed with in warm weather. The nights, however, are now getting cold and fire heat may be necessary, though a good rest at night aids Vines wonderfully that are carrying heavy crops of Grapes. Enough fire heat should be given to maintain the temperature at 70° to 75° by day and 60° to 65° at night, allowing 5° more for Muscats.

*Late Houses.*—Afford full supplies of water through a good surface mulching, sweetened horse droppings, or stable litter freed of the straw answering well when not more than a couple of inches thick, continuing the supplies of nourishment until the Grapes are well advanced in colour, for most late Grapes take a long time to perfect thoroughly, and some, particularly Mrs. Pince, even after appearing finished, are not so up to the shank, which is often a consequence of too short supplies of food, and in some cases the consequence of too early stopping the supplies of nutrition are manifest in the Grapes shrinking, as not unfrequently occurs with Muscats. All late Grapes require time. They ought now

to be colouring, or advanced therein, and they must have a fair amount of air moisture with a circulation of warm air constantly, in which they will attain fulness of berry and perfection of finish, diminishing the air moisture as the Grapes advance in colouring. Poverty of finish is the chief cause of Grapes shrivelling, cracking resulting of a close atmosphere following a period of drought, or ventilating injudiciously and an arid atmosphere in the early stages of ripening render Grapes highly susceptible of atmospheric moisture after they are ripe, if, indeed, they do ripen without cracking. Afford a temperature of 70° to 75° by day artificially, 80° to 90° with sun, and close sufficiently early to increase to 90° or 95°. When the sun is losing power put on enough top and bottom air to insure a circulation of air; allow the temperature to gradually cool, which rests the Vines, and increase the ventilation early with the advancing temperature. The hot-water pipes should, if necessary, have a little warmth in them to prevent the night temperature falling below 65° at night.

#### THE FLOWER GARDEN.

*Spring Flowering Annuals.*—Much may be done towards brightening up the flower beds and borders next spring with the aid of annuals and biennials, the best among these being Sweet Alyssum, Candytuft, Corn Marigold, Clarkias, Collinsias bicolor and grandiflorum, Coreopsis tinctoria, Godetias in variety, dwarf Larkspurs, Leptosiphon androsaceus, Limnanthes Douglasi, Nemophila insignis, Pansies, Poppies, Saponaria calabrica, Scabious, Silene pendula and pendula compacta, Venus's Looking Glass, Virginian Stocks, and Viscaria cardinalis. The Silenes, Saponaria, Pansies, and Violas move well, and some of the others can occasionally be transplanted fairly well, but as a rule they are best sown thinly in beds, patches, or lines where they are to flower. In either case moisten the soil prior to sowing the seed and cover lightly with sifted soil. This being done not later than the middle of August, and the plants duly thinned, they will become stout and strong; and, being preserved from slugs, will pass safely through the winter. It is somewhat late to sow Violas and Pansies, but if the seed is sown in a sheltered position, and not disturbed till the spring, they can be transplanted and will flower well.

*Tuberous Begonias.*—Late raised seedlings of these should be taken good care of, as they will form small bulbs for storing, and be of a serviceable size next summer. If they are at all thick in the seed pans transplant carefully to either a frame or to boxes, using a fairly rich light soil, and disposing them 3 inches apart each way. Keep them in a moist state at the root while growing strongly, and when the tops die store them in a cool dry place, where severe frosts cannot reach them. Larger sizes, if not wanted for the flower beds, would have been best located in nursery beds. All that flower, in fact Tuberous Begonias generally, should be labelled according to their habit of growth and flowering, or whether the flowers are erect or pendulous, the former being the best for beds, and the latter for vases and hanging baskets. Note their respective colours, so as to be able next season to mass the colours, the most effective arrangement. Now is a good time to take cuttings of the best varieties. Trim off the lower leaves, cut to a joint, and then dibble them in at the foot of a sunny wall or on a raised south border, a little sharp sand only being added to the ordinary garden soil. Thus treated they will strike root as readily as Zonal Pelargoniums, and form small tubers before dying down.

*Verbenas.*—Though not so generally used as of old, these are yet among the most effective of the summer bedding plants. The greatest difficulty is usually experienced in getting clean, healthy cuttings both now and in the spring, but unless these are forthcoming a poor stock of plants will be raised. This season, being cool and showery, suits the Verbenas well in some respects, plenty of flowerless young shoots now springing up from the centre of most of the plants. No time should be lost in preparing plenty of these. Bottom heat is not needed at this early date, but would be necessary if the propagation is much longer deferred. Place a single light frame on a hard bottom, half fill with partially decayed leaves and manure, treading it down firmly, and on this spread 3 inches of fine light soil, finishing off with a surfacing of silver sand. Shorten quite young flowerless shoots to the third joint, removing the lower pair of leaves, and dibble them in one inch apart each way. Water gently, keep the frame close, shading heavily on bright days, and more lightly on duller days. Do not let them suffer for want of a dewing over occasionally, and it will benefit the cuttings by having the lights drawn off on fine nights. Thus treated they soon strike root, and before the roots become interlaced all the plants ought to be carefully raised and placed in pans of fairly rich soil, being returned to frames till re-established. In this manner a capital lot of sturdy stock plants will be prepared, these wintering best in a cool, airy house, only enough heat being turned on to keep out frosts.

#### PLANT HOUSES.

*Glorinias.*—Seedlings should be placed into 4 or 5-inch pots, according to their size. If they are not grown too warm they will flower freely at a time when outside flowers are scarce. Water carefully until they are rooting freely, and shade the plants from bright sunshine only. Plants that have flowered should be watered carefully, gradually diminishing the supply as they die away naturally. It is a mistake to ripen them prematurely. Do not place them under stages where the drip of other plants fall upon them and light is excluded. They ripen well on a shelf at the back of ainery where they enjoy subdued light.

*Stephanotis floribunda.*—Plants that have flowered and made good growth must be fully exposed to the sun. Admit air liberally to ripen and harden the wood. This is the secret of a good supply of flowers

another year. Syringe twice daily to keep the plants clean, and do not allow the ends of growing shoots to twist together. If they once get into this confused condition if mealy bug exists upon them it is impossible to keep them clean. In the end they also entail double the labour to remove them from the trellis than would be required to train the shoots properly as they grow. Plants that are root-bound and still growing freely should be supplied with weak stimulants every time water is needed. Where an increase in the number of plants is required it is a good time to insert cuttings. Growing shoots moderately soft, with the soft point removed, root freely in heat under handlights. If these are kept in a temperature of 60° they will, if potted, make good plants by the end of next season.

*Ixoras.*—It is a mistake to shade these plants, they ripen their wood and flower with greater freedom when fully exposed to the sun than when grown in mixed stoves and are shaded. Plenty of cuttings should be rooted, soft-growing ends being selected for this purpose. They should be inserted singly in small pots, as they root quickly in brisk heat. Once they are rooted and will bear full exposure place them on a shelf close to the glass, and transfer when ready into 4-inch pots. These plants, where plenty of heat is at command, are easily grown, and for general purposes they are more effective with one or two trusses of flower in 4-inch pots than plants of a larger size. Plenty of heat and careful watering are needed, but they are not particular about soil, although they do best in peat and sand. We have, however, succeeded in growing them well in equal proportions of loam and leaf mould that has not been heated, and coarse sand. During the winter the atmosphere should not be kept too moist or the syringe used over the foliage. The old *Ixora coccinea* requires the most careful watering perhaps of any.

*Begonia semperflorens carminea.*—This is one of the best Begonias that can be grown, and it would flower all the year round if allowed to do so. It will, however, flower profusely eight months out of the twelve. Those that commenced in January last have continued to flower up to the present time. These plants should be cut back, keeping them on the dry side until they break into growth, when they may be turned out of their pots and the roots partially reduced and replaced in the same size. They will soon commence growth in ainery or any structure where a little heat is maintained. Water carefully until they are rooting freely. Cuttings may be inserted singly in 2-inch pots, but it is necessary to select shoots that have an eye at the base. Any of the tops will root, but they only extend and flower, being useless after they are pruned back, unless by accident they force a growth bud at the base. If this is provided when the cuttings are inserted all will go well. This applies to many evergreen and semi-tuberous kinds.

*Allamandas.*—We saw a fine plant recently, and was told it had ceased flowering. It was growing luxuriantly, but had not a single flower. The reason for this was the plant was crowded with growths, and the house shaded. The growths of Allamandas should be evenly but thinly disposed over the roof of the house, and be fully exposed to the sun. At one time we shaded them during the hottest hours of the day, but have found this practice unnecessary, and they make short-jointed wood and flower more profusely without shade. From three plants not eighteen months old we shall gather before this is in print fully 500 blooms. Every shoot about 1 foot from where they branch should be full of flower buds. It is necessary after branching two or three times from the base to thin the shoots, and leave only those that are required to furnish the roof. Allamandas should under proper treatment begin flowering when the growths are 18 inches long, and continue as long as water and liquid manure is supplied if they are grown in pots.

*Gardenias.*—To grow large plants in one season root cuttings at once under handlights in brisk heat. It is a good plan to insert soft-growing shoots in small pots, and then give them a shift into a larger size. They must be kept growing slowly throughout the winter. All plants that are to flower during the winter and spring months must be fully exposed to the sun. Plants that were cut hard back late must be encouraged to make growth in brisk heat. Do not shade them, for healthy vigorous plants will grow strongly, and need full sun to ripen and harden the wood if they are to flower freely. Supply soot water and other weak stimulants to those that have been placed in their largest pots and have filled them with roots. Syringe freely to keep the foliage clean, and if scale is present dress with petroleum and water, one ounce to each gallon of water. Shade afterwards until the oil has evaporated. Although Gardenias will bear strong doses of petroleum it proves detrimental in the end if resorted to frequently. It is better to give the plants two or three applications of moderate strength than one strong dose.

#### APIARIAN NOTES.

##### THE WEATHER AND BEE FLOWERS.

AFTER about a quarter of an inch of rain on August 3rd and 4th, with one fine day on the 5th, dry winds have come, and the weather is unsettled again.

Moorland flowers, like those in the dales, are in great pro-

fusion, and with the recent welcome rain and two weeks settled weather the bees would be certain to gather much honey. I have been several weeks later this year taking my bees to the Heather than formerly, owing to the lateness of the season at home. I intend taking them on the 11th, and with ten days of honey gathering weather they will amply repay trouble and expense. Security against bees getting loose, and ample ventilation to insure their safety, are two essentials in taking bees long distances. It is advisable to give every colony as much empty space as they can occupy.

As most of our hives have been provided with young fertile queens I will not be troubled with swarming this year, at least until the beginning of September.

#### THE AGE OF BEES.

Some writers have stated that their life is limited to four to six weeks. Few bees were bred after July in 1890. I have two hives at present that became queenless before many bees were bred the past spring, and through stress of weather the young queens did not begin to lay till about the 1st of July, and yet in both of these hives there are a good many 1890 bred bees.

Bees are, generally speaking, from two to three weeks old before they begin to work outside (Punics are an exception to this rule), and I have witnessed bees return to their original stand after they had been returned from four to six weeks' stay at the Heather.

#### THE TIME QUEENS PIPE.

As interesting as the age of bees is the time that elapses between the depositing of the egg that is selected for a queen and the time she is allowed to creep out of the cell. Ten to fourteen days is generally believed to be the time occupied between prime and after swarms, and occasionally three weeks may elapse, but this is believed by a few only. To tell the same individuals that four weeks or more elapse in some cases between the first and last event would be met with incredulity. I have had cases of that nature frequently, and six have occurred in my own apiary this season. Twenty-eight days intervened between the laying of the egg and the emergence of the after swarms. To many the phenomenon would have been perplexing, but I was a sufferer through loss of valuable time. I ought to have excised every queen cell but one; twelve days would then have been saved, and the queens still unmated might have had brood ready to creep out and begin work at a season they would have been of great service.

There is no part of bee-keeping so important in a profitable point of view as the timely regulation of supernumerary queen cells, and getting a fertile queen at the head of every colony at the earliest possible moment after the issuing of the first swarm; and bee-keepers will study their own interest best if they plan so as to accomplish that, for queens are always not only more prolific but most profitable in the early months of their existence.

#### PUNIC QUEENS.

Another point of interest in their favour—they are lively, and venture out when other queens do not, and so become fertile sooner than queens of other varieties do. A few days' delay in some matters does not signify much; but with bees it is of the utmost importance that there be no delay, especially in providing every colony with a laying queen at the earliest, and without delay. Should the weather prove favourable during the next four weeks I shall have ample opportunity of watching and testing the qualities of these bees, which shall be laid before Journal readers. So far I can say nothing against them, but the main point—honey gathering by the pure race—is still to be proved, and what tends towards that is their prolificacy already proven, and if they attend as assiduously to their own business at the Heather as they seem to do at home their doings will surprise some, and the much-despised little working "niggers" will gain many friends. Although they

do not surpass but are equal to others, their other good qualities mentioned will make them favourites with—A LANARKSHIRE BEE-KEEPER.

#### SELLING PUNIC QUEENS.

IN the Journal for August 6th "A Lanarkshire Bee-keeper" thinks I ought to advertise these queens. I am very much obliged to him for his well meant advice, but unfortunately the season is now over. When I obtained the queens it was too late to advertise any, and apart from that I had no desire to sell any. Next year I hope things will be different, and that I shall be able to advertise imported, home-bred, and virgins. So far I have only been selling virgins. It is no use asking for orders if you are not sure of being able to supply them; besides, the public have been so bitten with foreign bees that they naturally fight shy of new ones at higher prices than ever. I may fairly ask as your correspondent has introduced the subject, Why cannot "A. L. B. K." advertise and sell these bees? He has plenty of imported breeding queens for the purpose.—A HALLAMSHIRE BEE-KEEPER.

#### TRADE CATALOGUES RECEIVED.

Dickson, Brown & Tait, 43 and 45, Corporation Street, Manchester.—*Catalogue of Bulbs.*

J. R. Pearson & Sons, Nottingham.—*Catalogue of Bulbs.*

J. R. Box, Croydon.—*Catalogue of Bulbs.*

\* \* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Newbury Show (W. Y.).**—We are much obliged, but unable to insert long newspaper reports of local shows. The Exhibition appears to have been comprehensive and good.

**Case for Ferns (S. G. R.).**—So far as we can understand the matter you desire to enclose some space next the back wall where you can grow Ferns. We do not see any reason why you should not do so, and the other plants named would grow in the house under suitable cultural conditions.

**Late Apple (J. B., Lincoln).**—There has been some mistake. The two Apples sent are distinct, and if both grew on one tree it has either been grafted at some time or sported. One is worthless, the other excellent. The good one is the Winter Pearmain, described in the "Fruit Manual" as "a valuable and beautiful Apple, suitable for dessert or culinary use from December to the end of April. The tree is very hardy and an excellent bearer."

**Chrysanthemum Shoots Eaten (J. D.).**—The shoots sent have the appearance of being eaten by carwigs, which if not caught frequently ruin both Chrysanthemums and Dahlias. The depredators as a rule rest in obscurity in the daytime and feed at night. They may be caught in hollow stems, such as beanstalks, also in flower pots with a little dry hay or moss placed lightly in them and inverted on the stakes that support the plants. The traps should be examined every morning without fail, and the earwigs blown or cast in water, and they can then be given to fowls if you have any as a change of diet, which they seem to enjoy; then if you eat the fowls you will have some compensation for the carwigs and your trouble.

**Offensive Cesspool (R. A. C.).**—The first cesspool was so offensive that a new one had to be built, and that has become so great a nuisance that the builder recommends the construction of a third. Does it not occur to you that the third must also fail as the former ones have done? The cesspool is all-sufficient for its purpose, and under ordinary circumstances would only require cleaning out occasionally, but the overflow water is expected to soak away in the sand, which it appears to do for

a time, then it becomes so choked with sediment that it oozes through the "bank." We do not see how a pipe having one end below the level of the "water" in the tank can possibly have any effect. The gases will ascend by the ventilating pipe. The fault is not there, nor in the tank, but in the overflow, and that can only be dealt with two ways. 1, By deodorisation, as with town sewage; 2, continue the overflow to a point where its outlet would not be offensive. There is one more plan. Empty the cesspool often enough to prevent overflowing.

**The Apricot Weevil** (*F. James*).—The name of the glossy black weevil is *Otiorynchus tenebrius*. It is an enemy to fruit trees that are trained against the wall, the Apricot being the greatest sufferer from its attacks. Vines also are much damaged by this beetle, the larva of which lurks at the roots, and does infinite damage, though unseen. The perfect insect is fond of hiding in the crevices found so commonly in old walls, and finds a congenial resting-place beneath the rough bark of the Grape Vine. Mr. Curtis, whose experience on such subjects is well known, advises that where the wall-fruit fails from no apparent cause, every chink in the wall should be stopped with cement, plaster of Paris, or mortar—the first-mentioned substance being most effectual—and that the rough bark of the Vine should be stripped off in the early spring. Whitewash, also, should be liberally used in the interior of hothouses and greenhouses; and in October the earth round the roots should be removed, and a diligent search made after the beetle, so as to prevent it from laying its eggs. These minutiae are somewhat tedious, but the gardener will be well rewarded by the improved condition of his fruit trees. If the beetle should be found lurking along the base of the wall, it will be advisable to lay salt thickly along the wall, as the insects are killed almost instantaneously when they come into contact with that substance. Strong tobacco water poured along the base of the wall will have the same effect, and infusions of aloes and quassia are useful.

**"Ockra"** (*General Hamley*).—The following extract from Dr. Hogg's "Vegetable Kingdom" has reference to the plant in question—"Hibiscus esculentus (*Abelmoschus esculentus*) is the Ochro or Okro of the West Indies, the Gombaud or Gombo of France, the Baudikai of Madras, and the Ram turai and Dhenroos of Bengal. This plant is cultivated as a potheb in the warm countries of Asia, Africa, and America, and also in some parts of the south of Europe and the Levant. The parts used are the long pyramidal young seed pods, gathered when green, which are filled with a large proportion of nutritious mucilage, and form a jelly with water. They are used for thickening soups, and when buttered and spiced make an excellent dish. The seeds are used in soups in the same way as we do barley, and they have also been recommended when roasted as a substitute for coffee. Besides as an ingredient in soups, the Ochro is thus employed: Before the pods have arrived at maturity, of whatever size that may be, they are first boiled in water, then dried a little, and allowed to cool; after which they are cut transversely into two equal parts, retaining the seeds. They are then placed in layers one over the other, and vinegar and oil poured over them, and seasoned with pepper and salt. After being boiled, they may also be eaten with the gravy of meat. These pods, which are from 2 to 6 inches long, are the chief ingredient in the celebrated pepper-pot of the West Indies, which is considered a rich dish, the other ingredients being either flesh, or dried fish and capscums. As a medicine Ochro is employed in all cases where emollients and lubricants are necessary. The bark of this plant abounds in fibre, which is of fine quality. H. (*Abelmoschus*) bammia is the African Ochro, which Dr. Royle seems to think does not differ materially from the preceding; but G. Don, who was acquainted with, and had partaken of both species in their native situation, regards them as distinct. Speaking of the Bammia, he says: 'We have seen it cultivated with the Okro, or H. esculentus; it is called the Autumnal Okro, and the young pods are used to make Okro soup. It differs from H. esculentus in the leaves not being so deeply lobed and in the pods being much longer.'"

**Mites on Torenia** (*J. L.*).—We have communicated with Mr. Bardney on this subject, and he says he sympathises with you in your endeavours to stamp out the pest that infests your plants. For some years the minute insect gave him much trouble, and this year it has appeared in force on a variety of plants. Many gardeners have suffered from its ravages, but as the insect is so minute they have overlooked it. It belongs to the same family as the "red spider," which, however, is not a spider, but a mite. No doubt the red form has received this name through weaving a fine web on the leaves of plants. The insect to which you have drawn attention is similar in shape to the "red spider," but considerably smaller and white. Like that insect it weaves a very fine web, which can only be seen under a strong magnifying glass. It belongs to the family of mites called Tetranychidae, and Mr. Bardney calls it *Tetranychus talarius alba*—that is, adding the last word to the name of the red spider—but thinks the means by which it can be eradicated is perhaps of more importance than its name. If you have one or two plants infested only he advises you to burn them. It is brought about, he says, by an attempt to grow plants too quickly—that is, by maintaining a too warm, too close, and too confined an atmosphere. A warm moist atmosphere favours its increase, especially when very little air is admitted. Frequently when plants are removed from atmospheric conditions of this nature to a cool, airy house they recover; indeed, he has never known a failure with such plants as Achimenes, Gloxinias, Begonias of sorts, Fuchsias, Celosias, and many others of a like nature when thus treated. It attacks Cucumbers and Melons, even the tips of Crotons. The only means of stamping it out is to use less moisture, give more air, and not

close the house with much sun heat in the afternoon. In addition to this treatment he places one handful of sulphur, or a 3-inch potful, into two gallons of water in which an ounce of softsoap has been dissolved, adding sufficient tobacco juice to turn the water the colour of ale and stout mixed in equal proportions. This he leaves on the plants three or four days, when, by the cooler treatment advised, he finds the insects vanish, and healthy growth commences. Mr. Bardney expects it is the same minute insect that causes the leaves of Vines to turn hard, brown, and crisp—at least, that is the effect it has on all plants which it attacks.

**Names of Fruits.**—The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (*A. O.*).—The Cherry is Florence. (*M. W. B.*).—It is most difficult to name Raspberries from fruits sent by post, and when crushed, as many were in this case, impossible. The long fruit resembles the Autumn-bearing or October Red. (*G. R. B.*).—The Peach is Lord Palmerston.

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*J. T.*).—1, Insufficient without flowers; 2, *Mimulus cardinalis*; 3, *Centranthus rubra*. (*T. V.*).—1, *Acer Negundo*; 2, *Ailantus glandulosa*; 3, *Populus alba*; 4, *Ulmus montana variegata*; 5, *Hedera Rægnieriana*; 6, *Cryptomeria elegans*. (*Nemo*).—1, *Adiantum Pacotti*; 2, *Spiraea arifolia*; 3, *Centranthus ruber*; 4, *Sedum ibericum*; 5, *Cornus mas variegatus*.

## STEPHEN'S BOOK OF THE FARM.

(Fourth edition, revised by JAMES MACDONALD. Division VI.)

THE completion of this great work is matter for congratulation by all classes interested in farming, or rather in the more comprehensive term of agriculture, for it is equally a landlord's and tenant's book, and its publication in three large volumes as well as in the six neatly bound parts ensures its admission into many a landlord's library as a handy work of reference upon all details of practical farming. The value of its clear, concise teaching is greatly enhanced by the paragraphic headings, and reference to any section or detail of practice is a very easy matter.

Now that the entire work is before us we are more than ever impressed with its utility. Its tone throughout is essentially practical, and whatever of theory there is in it consists of quotations of the sayings or writings of leading agriculturists, whose views are undoubtedly an expression of practical experience, tempered by just that amount of individuality which may be termed theoretical; but then it is very safe theory, for is it not tempered by experience? There is indeed very little of what is speculative about it, certainly nothing calculated to mislead, but rather everything to assist the beginner or pupil, as well as many a useful hint at possible improvement in the work to old practitioners.

Glad are we to find a full and exhaustive index in the last part. A glance through it shows how comprehensive the work really is. Take, for example, ensilage as a matter of much importance, concerning which farmers have still much to learn, and we find there are paragraphs on its advantages, the analysis of sweet and sour silage, chaffing for, choice of methods, Clover silage, crops for silage, its future, grain crops for silage, its history, its facility for storage, its introduction into Great Britain, meadow grass silage, methods of pressure, Oat silage and roots, its progress, rearing stock on it, silos, special silage crops, stacks v. silos, sweet and sour silage, making sweet silage, and the comparative value of silage and hay. The treatment of other subjects is equally exhaustive, and the paragraphs are all pithy and to the point.

Brief but very useful are the chapters on improving waste land, trench and subsoil ploughing, liming land, and irrigation. Especially noteworthy is the account of the reclaiming some poor land near the Pentland Hills by Mr. William Hamilton. When he began the once-cultivated land was producing coarse herbage of poor feeding quality, while the other portions were in their natural state, growing bent, other coarse grasses, rushes, Heather, &c. The improvements consisted of tile-draining and liming, the nature and condition of the land being the guide as to distance apart and depth of drains, which varied from 6 to 16 yards apart, and from 3 to 5 feet deep, the naturally dry land not being drained at all, only limed. On all land that was dry enough lime was applied at the rate of 6 tons per acre; but the liming of the wet land was delayed about a year after the draining, so as to allow the soil to get rid of its excess of water. The average cost per acre for the draining was £5 10s., and for liming £4 4s. Three hundred acres have been treated, and the investment has proved a good one. The character of the pasture has been entirely changed, and a growth of fine nutritious grasses has come up in place of the coarse and wiry herbage. We have had equally satisfactory results in our own practice in the treatment of poor and wet pasture, and call particular attention to Mr. Hamilton's success, as calculated to inspire those of our correspondents with confidence who occasionally seek our assistance in the treatment of similar pasture.

The plans and descriptive notes of farm buildings are especially valuable, and will doubtless be turned to account in the

construction of many a homestead. It by no means follows that any of the plans given are to be closely copied. Each farm has its special requirements, and such plans afford many a valuable hint which may readily be turned to account.

Breeds of farm live stock are treated of in brief descriptive notes, followed by others on the ailments of live stock under the three headings of Symptoms, Cause, and Treatment, which is really a reprint of the treatise on this subject published by the proprietor of the "Farming World," and though exception has been taken to such a proceeding, we really do not see how Mr. Macdonald could have done better, as he says his aim was to enable the farmer to recognise the symptoms of such ailments, and to treat those of the more simple kind; and as the treatise was compiled, edited, and revised by men of high ability, what could be more suitable for his purpose?

We can only mention in addition some excellent examples of and advice on farm book-keeping, and conclude our notice by cordially commending the work to the notice of every practical farmer who, in the words of the reviser, requires "a work which he can with profit make the subject of general study, and which he can with confidence refer to at any moment when he is in want of advice."

## WORK ON THE HOME FARM.

For a corn harvest of exceptionally general abundance a change to fine settled weather is much to be desired. The haymaking has been sadly prolonged, and surely now if ever the true value of ensilage must obtain general recognition. Even in the exceptionally dry climate of East Anglia it was not an easy matter to make good hay between the showers of rain which fell so frequently even there, and in the midlands there is still some grass unmown. Caution has been the order of the day with all the Stilton cheese men. They have only mown a few acres at a time, and got it into "cob" as quickly as possible. The usual cheery greeting of "good morning" has almost invariably been followed by sympathetic remarks about the "catchy" weather. It is a serious matter to them, dependant as they are upon the hay supply for the cows and store cattle in winter, with no straw, roots, or corn to fall back upon, which shows how great is the mistake to have all the land of any farm in grass. The excellence of much of the midland pasture is undoubted, but a fair proportion of arable land under really good cultivation would prove a great boon. It by no means points to corn-growing other than would be useful for cattle or sheep food; rather would it afford most useful crops of Oats, Sainfoin, Tares, Lucerne, Rye Grass, mixed seeds, Clover, Maize, Cattle Cabbage, and Thousand-headed Kale. Many a midland farmer has none of these crops, and has to trust entirely to permanent pasture—excellent in quality, but often sadly deficient in quantity, for there is little or no systematic application of manure. There are no cow or cattle yards, and any mention of chemical manures is received with an incredulous smile, the outcome of positive ignorance and its concomitant of prejudice.

All the catch crops mentioned are exceedingly good this summer, for the dripping weather has given an abundant growth of aftermath, and of all forage crops. Roots, too, are an exceedingly good crop, notwithstanding alarming accounts of Turnip beetles. As usual, the early-sown Mangolds and Swedes are much the best, and the crop must now be a heavy one. Carrots, too, are very good. This crop is one requiring more pains in its young state than most others, but it well repays all care, and we regard it as quite indispensable for every home farm.

## REMARKS.

2nd.—Bright till 11 A.M.; heavy rain 11.20 to noon, then bright to 1.30 P.M., overcast after with heavy showers; heavy rain with thunder and lightning 2.50 to 3.15 P.M., and again at 7.30 P.M.; frequent thunder all afternoon.  
 3rd.—Slight showers at 8.3 A.M., 11 A.M., and 4 P.M., otherwise bright throughout; thunder about 2.30 P.M.; much distant lightning at night.  
 4th.—Bright morning; almost continuous heavy rain with frequent thunder from noon to 3 P.M.; then fine again, and shower at 9.15 P.M.; lightning at night.  
 5th.—Fine, and generally bright.  
 6th.—Rain early, dull and damp all day; fair evening.  
 7th.—Alternate spells of cloud and bright sunshine throughout.  
 8th.—Fine and generally bright day; rain at night.  
 An unsettled and rainy week, with a good deal of thunder and lightning. Temperature nearly 5° below the average.—G. J. SYMONS.

## FRUIT AT SAWBRIDGEWORTH

IT would be difficult to find a day in the year when home-grown fruit could not be found in abundance in the great nurseries of Messrs. T. Rivers & Son. Before Apples and Pears are over Peaches and Nectarines are in, then follow Cherries, Plums, and Grapes, while Oranges appear to be ready for gathering always, and all other fruits in their season. There were several sights in the way of fruit to be seen last week, and some if not most of them astonished not a little a gentleman who has seen a great deal in town and country, Mr. Eagleton, clerk to the Fruiterers' Company. Never before had he seen such collections of Pears, Apples, and Plums plunged to their rims in pots outdoors, the trees laden with splendid fruit, giving rise to a sense of wonder how they and the crops could be so well supported from such a small bulk of soil. This feeling was perhaps intensified on entering the simple but in all respects efficient orchard houses—the sides of posts and boards—the roofs of glass—in which magnificent Apples, Pears, Plums, Peaches, and Nectarines were approaching the ripening stage—trees from 6 to 12 feet high carrying from a dozen to four times as many fruits, and making the healthiest of growths as well, showing not the faintest signs of exhaustion. "Rooted through I suppose," was the remark of one of the visitors, as if to display his knowledge of the "way things are done;" but he was met with a prompt "Oh, no! lift up the pots." As this was done it was clear that all the roots were strictly confined in them, and in fact several were elevated on other pots, and the "rooting through" notion was banished. Heavy top-dressings of kiln dust and manure, rising an inch or two above the rims of the pots, no doubt gave much support, but all the same the splendid condition of the trees in wood, foliage, and fruit teach a lesson in cultivation, and set the mind a thinking whether many fruit tree borders are not made needlessly large and deep. With a mass of fibres within a short radius of the stems and adequate support of the right kind the healthiest of growth is produced and the finest of fruit.

Though the Sawbridgeworth soil, calcareous loam of sound texture, is naturally good for fruit, Peach trees planted out bear no comparison in respect to health and the value of their crops with those grown in pots. It may be expected that liquid manure, such as soot water, is applied to the potted trees, and this being so the atmosphere must be more liberally charged with ammonia and carbonic dioxide than would otherwise be the case, and the trees derive nourishment accordingly through the foliage. It was noticed that the atmosphere was genial, with the suspicion of a pleasant pungency, and the ashes on which the pots stand were damp. In such case, however free the ventilation, the atmosphere of the house is genial, for vapour rises the more freely in consequence of the ventilation when the external air is dry. The circulation of air in the houses in question is full and free, the light has full and free action on the leaves, and the evaporation rising from the damp but not saturated base, charged as it is with more than the ordinary quantity of gases that are nourishing to vegetation, must be absorbed by the leaves to the benefit of the trees.

As he has indicated by a recent note in the *Journal of Horticulture*, Mr. Rivers is clearly of opinion that his trees receive nourishment through the foliage. There cannot be a doubt on the point. Leaves absorb liquids freely, by their under surfaces especially, and both ammonia and carbonic dioxide are appropriated,

and from the ammonia at least some part of the essential nitrogen that plants obtain is thus derived, as ammonia consists of one equivalent of nitrogen to three of hydrogen. Carbonic dioxide (one equivalent of carbon to two of oxygen) is absorbed freely by leaves, as Boussingault proved by experiment, the air coming in contact with Vine leaves being speedily deprived of the whole of that gas. It is undoubtedly of benefit to them in larger quantities than is contained in the atmosphere, and only in excess is it injurious, as in the case of close frames on hotbeds when the manure has not been sufficiently purified. Ammonia in excess is also injurious, as has been often discovered by introducing too fresh and strong manure for mulching in fruit houses, whereas smaller quantities are decidedly beneficial.

Mr. Davis attributes the healthy condition of the splendid Vine at Manresa House in part to the judicious use of fresh horse manure frequently scattered in small quantities on the narrow border over which the quarter of a mile in length of rods are trained to the roof, but thick dressings at one time proved injurious. The leaves are dark, thick, and entirely free from insects. The cleanliness and remarkable health and crops of fruit on Mr. Rivers' fruit trees in pots must be to a material extent due to the nourishment they derive from the atmosphere, and they could not be in anything like the same satisfactory state if the floors of the houses were as dry as are those in many vineries, Peach and Melon houses, in which Vines, trees, and plants bear better crops of insects than fruit.

Many of the Peach and Nectarine trees in the Sawbridgeworth houses are models in training—perfectly formed pyramids 12 or 14 feet high, with the branches a foot apart, or thereabouts, from base to summit, and these laden with fruit. The trainer has good reason to be proud of them, but, as Mr. Rivers points out, naturally grown standard trees, with their heads near the glass, are the most profitable, as they need no training, but merely thinning to prevent overcrowding. Such trees were bearing heavily well coloured and excellent fruit, as were Apricots grown in the same easy way. The large house of posts and boards for sides and ends has been built nearly forty years, and is still in sound and good condition. It must have been an extremely profitable house, as though not heated, the trees in it have never failed to bear full crops of fruit. Hundreds of Peaches and Nectarines in 8 and 9-inch pots have long since been deprived of their crops, and are now in the open air ripening their wood, or, rather, it is thoroughly ripe. From these two or three-year-old trees fruits were gathered and sold for 48s. a dozen early in the season. Of course they were forced, but that is not all, for the varieties are much earlier than any in commerce, and one of the Nectarines especially, Early Rivers, leaves Lord Napier and all others a long way behind in ripening, as well as in size and colour. It will perhaps be distributed before very long, or when it has given a recompense by the fruit sold for the years that must elapse in raising fruit trees, weeding out, and proving the merits of those retained. Mr. Rivers can write books, and the law prevents others from increasing them, but when his new fruits are placed in the market those who purchase may increase them as fast as they like or can. Naturally he does not think the law consistent, but there it is, and as it is not very likely to be altered very soon, he shapes his course accordingly.

The engraving (fig. 24, page 159) of the Nectarine referred to exactly corresponds in size and form with a fine fruit from which it was prepared, and is a correct representation, as is the tree on which it was grown. The fruit is even in outline, with a distinct though shallow suture, terminating at the apex in a blunt pointed nipple. Skin bright red, except at the base and near the stalk. Flesh greenish yellow, succulent, briskly and richly flavoured. This fine Nectarine ripens three weeks before Lord Napier.

Some of the Plums in pots are beautiful objects. Monarch (Rivers) vertical cordons are roped with large bluish purple fruit. This is a Plum of the future—a Plum with "money in it" for

commercial culture. A number of low standard trees in the nursery display the free growth, splendid habit, and great productiveness of the variety, and as the crops do not ripen till towards the end of September they come in after the glut is over. When Mr. Rivers makes plantations of fruits for bearing it is good evidence that there is something in them that is sure to come out of them in due time. Another Plum laden with fruit in pots and outdoors is the Early Transparent of his own raising. This is certainly one of the best dessert Plums known, and as such is being "found out." It is more than a week earlier than the Green Gage, quite as good, and far more prolific. Then as a successor, indeed later than the Green Gage, is another Sawbridgeworth Plum for every garden—the Late Transparent, a purplish Plum, a dwarf, sturdy, stubby grower, abundant bearer, and most delicious. Fruits on trees in pots were ripe, and when divided were like cups of honey. The stone is very small, and the flesh separates from it freely.

In the large Plum plantations Early Rivers or Early Prolific are wonderful to see. There are hundreds of trees bearing tons of fruit. Gathering has been going on for some time, and men, women, and boys are continually engaged in the work. Being so early the fruit is clamoured for, and the order from fruit brokers is "Send all you can and as soon as possible." The branches are bent down with purple clusters, and how they will be all gathered seems somewhat of a mystery. The original tree, about fifty years old, is also bearing heavily, but the fruit is smaller than on the younger trees now in full profit, and this must be very considerable. Similarly laden are the trees which form a large plantation of Oullins Golden, and splendid trees they are of a beautiful greenish yellow Gage. As soon as the pickers have cleared the early purple just mentioned they will have to commence and gather this enormous crop. A young plantation of The Czar (Rivers) is also full of fruit nearly ready for gathering—a valuable market Plum. The Stint (Rivers) a reddish purple Plum of good quality, was bearing prodigiously, the bush not being much larger than a good sized Gooseberry bush, and the fruit ripe in the open—a garden Plum.

Turning to the Pears, the two greatest bearers are Beacon and Fertility. No matter on what stock or in what position, the crops are prodigious and always have been. They have not yet failed. It is almost certain that more fruit of Beacon may be had from a given space of ground than can be produced by any variety in cultivation, as the trees can be closely planted, growing upright like Lombardy Poplars. It is the most productive early market Pear, of good but not large size, colour, and quality. Fertility follows, the trees being crowded with fruit. These are Pears for the million, and will be seen on costermongers' barrows by-and-by. Mr. Gladstone is the best Apple now ripe, both in colour and quality. It is a rich crimson, tender, juicy, and pleasantly flavoured. The trees appear to be the reverse of vigorous, and though it will bear quickly on the French Paradise stock the trees are not likely to last long in usefulness. They will in all probability be better on the free stock or the valuable broad-leaved Paradise, which imparts vigour with productiveness. Duchess of Oldenburg is one of Mr. Rivers' favourite Apples for profit, and The Cardinal or Peter the Great is likely to be an excellent early culinary fruit. The trees are laden with firm, rosy-cheeked Apples, ready for gathering and would sell freely. What may be described as a new Lord Suffield will probably be heard of in future. The fruit is very large, resembling the variety named, but the character of growth is quite distinct, being as free, vigorous, yet sturdy as that of any variety in the collection. A number of young trees are fruiting of a new Irish Peach, raised from the old favourite. This, as is known, is not a great bearer, but the new one manifestly is, every tree being clustered with fruit in a way never seen in the parent variety. Several other seedling fruits of considerable promise are being tested, and only by the long trials to which they are subjected can their true character be determined.

Mr. Rivers is about to make a practical declaration of faith in

the future of hardy fruit culture by planting 200 acres of his agricultural land with trees and bushes. The plan which he most approves is to plant Apples, Pears, and Plums with clean stems of 3 or 4 feet to grow into natural bushes, 12 feet asunder, with plenty of space between the branches. These trees require little pruning, bear fruit abundantly, and the crops are more quickly gathered, and consequently at less cost than when tall ladders have to be used. The trees are not fancifully trained garden trees, but useful fruit producers, easily managed. Great care is taken in working varieties on appropriate stocks. The growth of strong Apples for instance is subdued and fruitfulness induced by grafting on Nonesuch stocks, weaker growers being established on either the broad-leaved Paradise or the free stock according to relative suitability. The uniformity in growth in the fruiting plantations is very noticeable, and these arranged on the plan suggested, profitable. Small bush fruits are grown between the larger trees.

There is a very great deal more to see at Sawbridgeworth than is here narrated, including beautiful paintings of fruit by Miss May Rivers. Some of these have been admired by the Fruit Committee of the Royal Horticultural Society, and others will not presumably always remain in the portfolios of the artist. An example of the talents of this young lady in another direction ought also to be seen in the Hall in Westminster.—FRUITERER.

## HARDY FLOWER NOTES.

AUGUST was ushered in by heavy showers alternating with bright sunshine. Welcome is the change to the lover of flowers, but less welcome is it to the haymaker. The good soaking the thirsty earth has now received came too late for many things, especially for dwarf and other annuals planted over bulbs. These have never become properly established, and their welcome brightness in the garden is missed at this time. Attached as we are to hardy perennials, it is what in other pursuits would be called bigotry not to avail ourselves of the use of these short-lived beauties in covering some bare spot which forms the couch on which Crocuses or Snowdrops are enjoying the summer's repose. Still, whatever the weather may be, the hardy plant garden unfolds some object of interest. *Lilium candidum*, the Madonna Lily, is not yet quite past, and looking upon its purity of colour and its noble habit one can surely feel touched with some of the passion with which the liliophilist regards his favourite flower. We hardy plantmen have too many attachments to make us fitting partisans. We are subjects of a polyarchy, and thus I must leave to another pen to cross swords with the champions of the Rose in the contest for regal honours. The claims of the Rose have been ably urged by "A. C." in a recent issue of the Journal, that some lover of the Lily might well follow suit, apart from Mr. Hepworth's very practical paper a fortnight ago. A word or two on the subject may, however, not be out of place. The rivalry is of old date, for, according to Ellacombe's "Plant Lore of Shakespeare," which may well be studied for information as to this, Walter de Bibbesworth sung of it in the thirteenth century; and while Cowper seems to waver in his opinions, Spenser in his "Faerie Queene" speaks of it as—

"The Lily, lady of the flowering field."

While our greatest English bard (Shakespeare), while speaking of the Rose more frequently perhaps than any other flower, says of the Lily—

"Like the Lily,  
That once was mistress of the field and flourished,  
I'll hang my head and perish."

—(*Henry VIII.*, act iii., sc. 5, 61.)

It will thus be seen that this flower has powerful support in its pretensions, but I cannot at present follow the question further, but would recommend those interested to study Canon Ellacombe's work, which I have often been indebted to, and which will be found a perfect storehouse of information relating to many flowers.

If the poets of old thus spoke of the beautiful—nay exquisite—Madonna Lily, what would they have said of the best forms of *Lilium auratum* or of the noble giganteum? The latter has surely received a most unfortunate specific name. It seems inseparably associated with the idea of clumsiness and ungainliness of form, and neither of these defects can be alleged against

this Lily. The large, glossy, heart-shaped leaves, looking at times as if they had been covered with some special polish or varnish of Flora's handiwork, are objects of beauty whenever seen in health, while the tall leafy stem surmounted by the noble trumpet-shaped flowers is most graceful, and one is tempted to apply to the plant an imperial title. I flowered it last season, but my bulbs have not been large enough to flower this year. This Lily has suffered considerably in this neighbourhood from the late spring frosts. In some gardens the foliage has been nearly destroyed, but my plants, which are in the angle of a hedge protecting them from the north and east, have suffered very little. I have never given my plants the slightest protection. *L. candidum* has done much better this year than last, when many plants never opened their buds at all. I must say, however, that I am not very successful with this flower, which does well in a small garden close at hand. There is still some disease to be seen among the plants, but it is not nearly so virulent as in former years.

Several of the *Verbascums* seem to be coming into favour again. *V. Thapsus*, the Great Mullein, known also in some places as Jupiter's Staff, is plentiful along the coast in this locality, where I have heard it called Aaron's Rod and Shepherd's Gourd. I have a much superior variety in my garden, closely resembling the type, but branching near the top of the stem. I saw this in the Edinburgh Botanic Gardens last year, but I had not the opportunity of ascertaining its name. I afterwards saw it in Dumbartonshire in the garden of Mr. James Lindsay of Alexandria, who kindly gave me a plant which he informed me was grown in Edinburgh as *V. Thapsus compacta*. It is, of course, only a biennial, but I hope it may establish itself with me, as it has been very showy for a long time, and forms a stately object, having attained, in a dry border, a height of 6 feet. The yellow flowers are of a good size. *V. phoeniceum*, a true perennial, is fairly well known, and hybrids of this of various shades from white to purple can now be obtained. It is a fair border plant, but after it has been in bloom for a time becomes a little unsightly from the number of seed pods on the lower part of the stems. It will be found better to cut off the stems after, say, half of the flowers are past. A succession of stems will be produced and the flowering season thus prolonged. I saw a very good yellow Mullein some days ago which I was unable to identify. It was a neat compact plant, about 3 feet high, with green leaves and large yellow flowers, not much inferior to those of *Celsia cretica*. The finest I have seen was a white one, grown as *V. variegatum*—a name which I have been unable to discover anywhere. It seemed by far the choicest of the genus, and was of good, compact habit, and about 2½ feet in height. I hope to be able to obtain a plant for another season, and may then be able to ascertain the true name.

It is always interesting to notice the names of the herbaceous plants exhibited at the meetings of the Royal Horticultural Society and the various flower shows, and among these I observed that *Crucianella stylosa* was exhibited recently by a well-known firm. This long-styled Crosswort is very pretty, and the projecting styles from which it derives its specific name are extremely prominent, and add much to the beauty of the pale rose or pink flowers which are produced in dense terminal heads. The leaves, which are arranged in whorls of eight or nine, are produced on stems from 9 to 12 inches in length. The stems are procumbent, and, like the leaves, are covered with stiff hairs. When out of flower this *Crucianella* bears some resemblance to the common Woodruff, and is frequently mistaken for this by the casual observer. Indeed, a plant I once gave to a friend was mistaken for this by that much-abused personage, the jobbing gardener, and was removed by him to a shady position, as being best suited to the plant. *C. stylosa* prefers a sunny position, and does best in rather light soil. It is not often met with in this locality; indeed, I have seen none near here with the exception of plants I have given from my stock, which I raised from seed some five years ago. This *Crucianella* has, like most other flowers, one or two drawbacks. The first is, its habit of running under stones and encroaching on other plants; and the second, the peculiar and rather unpleasant smell of the roots. This odour seems also to proceed from the leaves and stems towards evening and after rain. On one of my rockeries, which is near the garden gate, this peculiar smell, closely akin to that of the roots of most of the *Acacias*, has been observed by visitors, who were unable to account for its presence. It has no other defects with me, and is perfectly hardy here, although a native of rocky places in Persia and some parts of the Caucasus. Notwithstanding the defects noticed above, it is well worth growing, and is one of the prettiest plants in the natural order of *Stellates* (*Galiaceæ*) to which it belongs, and the lengthened period over which it blooms is an additional recommendation. It begins with me in June, and flowers till well into September. There are several other plants of the genus which are classed as hardy herbaceous, but I

have not seen any others, nor have I seen them named in any catalogues.

The yellow flowered shrubby *Linums* frequently bear a bad character as to hardiness, and they are thus too seldom met with in gardens. Although I believe my garden to be situated in a favoured spot so far as mild winters and pure air are concerned, I have been much struck with the way in which my plants of *L. flavum* have survived the severe weather of the past winter. Even young seedlings not an inch high and totally unprotected started in spring as fresh as ever, and older plants were quite uninjured, and are now flowering freely. This pretty yellow Flax is well worth growing in the border or on rockwork, the glaucous character of the foliage adding much to the attraction of the bright yellow flowers. The leaves, which are acute, narrowly lance-shaped, glaucous, and thickish, are smooth and stalkless. The flowers are at their best in the morning, are produced in leafy corymbs, and appear in June, July, and August. There is another species, *L. campanulatum*, which grows about the same height (1 foot), and is distinguished by the more campanulate shape of the flowers and less glaucous appearance of the leaves. This with some others were grouped by De Candolle under the name of *L. glandulosum*, *L. flavum* is a native of mountainous places in Germany and Switzerland, and is said to be plentiful by the sides of hedges and among shrubs. It was introduced from Austria in 1793. *L. flavum* ripens seed freely, and may be increased readily by this means—viz., division in autumn or by cuttings.

Its pretty little congener, *L. alpinum*, I have been less successful with, as it has failed to flower with me this season. I am inclined to think it has suffered from lack of moisture, and purpose transferring it to a new rockery I have at present in course of construction, and on which I shall be better able to suit the requirements of many of my flowers. Last year it flowered very well, which strengthens my opinion that insufficient moisture has made me unsuccessful this season. It is a very pleasing little flower, much resembling in general appearance the better known *L. perenne*, but much smaller in all its parts. It grows only to 6 or 8 inches in height, and has exquisite little blue flowers of the most pleasing tone. These are freely produced on the very slender stems in July and part of August. I do not know that I can describe the plant in better terms than as a miniature *L. perenne*, with more awl-shaped leaves, and the flowers of a slightly different shade. So far as I have seen it likes a light sandy moist soil. *L. alpinum* is a native of most of the mountainous parts of Europe, and was introduced in 1739. It is increased by seeds or division. There is also a white variety, which seems far from common. Even at the risk of speaking of things which are "common," I must mention our native *L. perenne*, which is not nearly often enough met with. A good plant I saw the other day brought to my recollection some lines on "Flax Flowers" by Margaret Deland, which appeared in "Harper's Magazine" for October, 1888:—

"Blue as heaven, light as air,  
All their slender stems can bear."

"Nodding, swaying, as they float,  
Each one like a restless boat."

"One would think they'd anchored there,  
Just to wait till winds were fair.  
On their stems they tug and strain,  
Longing to be off again."

But now reluctantly I must lay down my pen, for as lovers are said never to weary of praising the objects of their admiration, so those who seek "the purest of human pleasures" tire not of speaking of their flowers.—S. ARNOTT.

## HOP GROWING IN COLORADO.

It has been well said that Colorado very much resembles the enterprising storekeeper who placed a notice on the outside of his establishment as follows:—"If you do not see in the window what you require, please come inside and ask for it, as I keep it in stock." Within the last ten years, by means of artificial irrigation and practical cultivation, Colorado has come rapidly to the front as a first-class farming and fruit growing State. Year after year the great development and phenomenal results of field and orchard and garden have astonished even citizens of Colorado, and are not by any means realised by people at a distance. I came to Denver from Manchester, England, nearly eight years ago, during which time I have endeavoured to keep informed on the details of the annual development of the State; but notwithstanding all efforts to keep track of what was going on, last week furnished me with a

genuine surprise in the discovery of a Hop garden, thirty acres in extent, within two and a half miles of the city limits of Denver, in a district which is generally regarded as dry Cactus land, and which in its natural state an English farmer, in his inexperience of local conditions and possibilities, would decline to purchase at a shilling an acre.

On Saturday, 18th July, a party of Denver citizens, including myself, visited the Hop garden in question, and as you have many readers in the Hop growing districts of England, the following account of what we learned and actually saw will probably be interesting to them. Driving out towards the north end of the city we passed the new workshops, covering some acres, of the Union Pacific Railroad Company, and the works of the Omaha and Grant Smelting and Refining Company (which turn out annually over four millions (£4,000,000) sterling of gold, silver, copper, and lead), and emerged into a flat, treeless, undulating plain country, dotted over with "dairy ranches," or, as you would say in England, "milk farms," and soon came in sight of the Hop garden, a unique oasis of tall green columns, the beau ideal of health and vigorous growth, and looking as if a bit of Kent had floated west and lodged here. The owner of the garden is a Mr. Van Buren, who has had considerable experience in Hop growing in the State of New York. He obtained his first purchase of this land at a ridiculously low figure five years ago, trading a horse and buggy for twenty acres of it (the then owner thinking the land no good), and four years ago planted twelve acres in Hop vines obtained from the State of New York, consisting of three varieties—viz., the Bavarian, the English Cluster, and the Humphries.

His methods of planting and cultivation are as follows. The land having been deeply and thoroughly ploughed, the Vines are planted 7 feet apart, so as to admit of future cultivation by means of horse and "cultivator," the garden being kept strictly free from weeds. The next operation is "grubbing," i.e., taking away from the Vines the runners or suckers which are used for planting new land. He usually puts two poles and several plants to a hill. The poles are from 16 feet to 25 feet high, and are obtained from the foot hills of the Rocky Mountains, about twenty miles from Denver, being brought by railroad. Many of the Vines reach the tops of the highest poles and wave in the air a number of feet beyond. In April a staff of men and women are employed to train the Vines around the poles and to trim off all Vines that are not going up the poles. This work continues for about a month. After this is over there is nothing to do but to cultivate and irrigate the ground and keep the weeds down, experience teaching that continuous and thorough cultivation is more important even than irrigation. The picking generally commences about the middle or end of August, when any number of pickers can be obtained from Denver, the rate of wages being 1s. 3d. per box of 7 bushels and board, a good hand being able to pick from three to five boxes per day. On the premises is a drying kiln where the Hops are cured and afterwards pressed and marketed.

Mr. Van Buren says that from the 12 acres of Hop vines planted in 1887 he obtained in 1888 about 1000 lbs. of Hops, which sold for 1s. 3d. per lb.; in 1889 about 3000 lbs., which sold for 8d. per lb.; in 1890 (a very dry season) about 8000 lbs., which sold for 1s. 5½d. per lb.; while this year he expects to obtain from the same 12 acres about 2000 lbs. per acre. From an adjoining 10 acres more recently planted from 500 lbs. to 600 lbs. per acre; in addition to which he has another tract of 8 acres planted last year, which he does not reckon on particularly. All this land is what is called here "under ditch"—that is, it lies below an irrigating canal, from which water is obtained for irrigation purposes. The rainfall near Denver is only 14 inches per annum, and we have over 300 sunny days every year. The supply of irrigating water from this particular ditch in a dry season is not absolutely certain, so Mr. Van Buren sunk an artesian well, which at 757 feet struck a large body of water. The season of 1890 proving dry, he attached a pumping engine to this well, and from the 27th June, 1890, when the engine was in place, he pumped night and day for thirty days without any appreciable effect on the subterranean supply of water, and so saved his Hop crop as above shown. This year there has been no water difficulty, and as every year's cultivation and irrigation lessens the quantity of water required, his artesian well can now water the whole garden sufficiently were there no water in the canal. He reckons that it costs from 4d. to 5d. per lb. to grow the Hops. The advantages for Hop growing in the vicinity of Denver may be summarised as follows:—The four breweries of Denver, according to official statistics, turn out 150,000 barrels of beer per annum, while nearly twenty other breweries in the State turn out at least 35,000 barrels per annum, so that the consumption of Hops in Colorado breweries is at the very least already considerably over 200,000 lbs. per annum. There is, therefore, already a good home market, and the

brewers give the preference to locally grown Barley and Hops, in order to encourage home enterprises.

The soil of Colorado and in the neighbourhood of Denver is especially rich and deep, only needing water. The dry sunny climate is especially adapted to the growth of Hops by irrigation, mildew from damp being impossible and Hop insect pests unknown. With almost continuous sunshine above and the ability by means of artificial irrigation to keep the roots and ground sufficiently moist the growth of plant life is reduced to a science and a certainty.

The proximity to Denver gives access to any amount of fertiliser in the shape of stable, shippin, and other manures, which can be obtained gratis for hauling away. Then again the system of irrigation in itself is a continuous fertilisation, on the same principle that the annual overflow of the Nile fertilises Lower Egypt. The proximity to Denver also gives any amount of cheap labour at "training" and "picking" seasons.

Hops are also cultivated in America in parts of New England, New York, Oregon, Washington, California, and other States; but in several of them insect pests have made their appearance, and in others occasional damp weather results in mildew. Hops have been successfully grown at various points in Colorado, but the particulars of Mr. Van Buren's Hop garden near Denver, as above given, clearly demonstrate that practical experienced men can develop Hop culture in the neighbourhood of Denver until it becomes quite an important local industry, which will not only supply the breweries of Colorado with all the Hops they need, but finally result in a considerable export business to the great brewery centres of St. Louis, Milwaukee, and other cities. As far as present experience goes there seems no reason why Colorado should not become as famous for Hops as Kent. If you have among your readers practical Hop growers willing or wishful to try a new country they would do well to personally investigate the advantages of Colorado as above demonstrated.—THOMAS TONGE.

## SIXTY YEARS OF HORTICULTURAL PROGRESS.

(1760-1820).

(Continued from page 464, last Vol.)

THERE was a nobleman of the last century who used jocosely to say to his friends that he knew the exact length of an old woman's conscience. One of several, employed in his garden as weeder, came to his lordship one morning, it seems, when he was strolling about his grounds, and said, "My Lord, there is a roll of red tape in one of the garden sheds, may I have some of it?" "Certainly, my good woman," he replied, "take enough in conscience," employing a familiar expression then. Subsequently he was told that the head gardener wanted some of this tape, and as he knew how much had been in the roll, he measured it to see what was left, and found the old woman had taken the greater part, about 10 yards. At that time tape was occasionally to be seen in gardens, being employed for tying up shrubs or as a support for climbers, and the anecdote also reminds us that in the days of George III. a great want of order or method prevailed amongst gardeners with regard to tools and appliances. Sheds existed here and there in gardens of some size, each having a miscellaneous assortment of articles, and anything that was particularly wanted was often difficult to find. Loudon mentions as one of the improvements slowly spreading, that proper tool-rooms were constructed by some where each article was kept in suitable condition for use, in labelled compartments, with drawers for the storage of such things as needed to be kept clean or dry. This author refers also to the circumstance that lodges or apartments for under gardeners were often built amongst hothouses or against a wall or shed. Cooking, eating, reading, and sleeping frequently had to be done in one room, stuffy and hot, or else cold and damp. Many gardeners have their grievances now, no doubt, but they have little reason to envy those who worked in the "good old" times. We should rather like to know whether the "concealed alarm," as they called it, worked well in the gardens or orchards, where it was tried as a precaution against trespassers. This was, of course, before the application of electricity to transmission of sound or motion. Some gentlemen had a system of wires arranged communicating to a room in which the movement of any wire would strike a gong, drop a fulminating bead, or in some other way give notice of an intruder. This singular mode of protecting enclosures seems to have been too expensive for general adoption, and had fallen out of use by the end of last century. Happily obsolete, also, is the mantrap, which was a not uncommon but cruel means of punishing trespassers, and sometimes placed without warning being given. Both kinds—that resembling a rat trap, and the humane form, which did not crush the leg—were, like the spring

guns, formerly regarded as articles quite justifiable, and there are persons still living who can remember seeing them frequently in London market gardens.

A favourite form of trowel in the reign of George III. was in the form of a spatula, the edges being turned up. Its size was larger than that of the garden trowel now mostly used. This was substituted sometimes for the hoe in loosening weeds for removal, and by its aid shrubs or young trees were transplanted. The draw hoe seems to have been generally preferred at that time to the thrust or Dutch hoe, especially that one with blades like a half-circle, which served for drilling, often also made double, the broad piece forming the other half being effective in removing weeds. About 1770 the wheel hoe is said to have been introduced from Holland, where garden walks were kept in order by its means. It was a combination of the draw and thrust hoes, a cumbrous affair, requiring two men to work it, and it did not find favour with English gardeners, nor did the French combination of the hoe and rake, at opposite ends of one handle, intended for dressing borders. Saul's fruit gatherer was also, I believe, the invention of a native of France. A pair of cutters were mounted on the top of a pole, having a basket attached; these had a lever by which they were worked, and which could be shifted to any part of the pole. The pole itself was sometimes made in joints on the fishing-rod principle. Lane, shortly after, brought out his apparatus for the same purpose. His pole had to be lifted up and down with each fruit picked. This was made with forceps at the extremity, which were moved by a trigger and lined with soft leather. The fastidious taste of the upper classes led to the introduction of an implement called the berry gatherer moved by the hand like a pair of scissors, and by which Strawberries or Raspberries could be gathered without any contact with the fingers of the person engaged in the work—a method of picking which would certainly not pay in our time. And an occasional sight in a gentleman's garden was rows of Strawberry plants in pots meant to be brought to the table thus, so that guests might pick the fruit for themselves. One of the notable events marking the early years of George the Third's reign was the spread of nurseries on the southern or Surrey side of the metropolis, where formerly there had been but few, and distant from each other. Many of their proprietors were intelligent men skilled in floriculture, willing and able to impart information to others. There was Rutter of Wandsworth, and his friend Carter of Battersea (the latter an ancestor of men well-known in the present reign) who brought out between them, in 1767, a book somewhat oddly called "Modern Eden," and intended to give particulars on all points connected with the production of flowers, fruit, and vegetables. Then there was Michelson, no author, but a great conversationist, who reclaimed some waste land at Kennington, now familiar as the Oval, and cultivated it many years, living to become a centenarian. One of his men, Denyer, afterwards started an important nursery at Brixton. Walworth was an attraction to visitors because Maddock's and Griffin's establishments were rich in bulbs. This Maddock took pen in hand, and at a later period published a "Florist's Directory," illustrated, descriptive of flowers, and methods of culture. Under Curtis and Milliken, who succeeded him, the Walworth nursery became even more renowned. Chandler of Vauxhall was not an author, but he subsequently did more than any other Georgian gardener to make the Camellia popular, and produced himself a number of varieties. At Camberwell, not far distant, was the celebrated Arboretum of Buchanan, to which people sent from long distances to obtain specimens of exotic trees and shrubs.

To us, at this advanced date of the nineteenth century, it seems a thing scarcely supposable that a volume of poetry should have sufficient power over the public mind to alter the taste in matters of garden arrangement, yet such was, so we are assured, the effect of William Mason's "English Garden," the first book of which came out in 1772. (He is to be distinguished from George Mason, also an eighteenth century man, who wrote about 1768 an essay upon design in gardening, though he was not himself one specially qualified to discourse upon this topic). A death blow was given to the mechanical and monotonous style of laying out gardens and parks, which had made Brown and his compeers famous in their day, and the principle of introducing as much variety as your space allows, and that of following Nature, without imitating her too closely, were gradually recognised, and have ever since then been more or less put into practice. With the poetical work of Mason we must couple Wheatley's "Observations on Modern Gardening" as another book of high importance, published one year earlier. It was soon very highly commended by continental gardeners, having been translated into French. Sir W. Chambers and others had already called attention to the Oriental styles of gardening and their defects, insisting on the advantages of art judiciously employed in planning and arranging, while artificiality is avoided. There would have been much communication between English and

continental gardeners upon this and other interesting subjects had it not been for the unsettled state of France on the verge of revolution.—J. R. S. C.

#### CYPRIPEDIUM ALFRED.

HYBRID CYPRIPEDIUMS are now numerous, but that of which a flower is represented in fig. 23 is distinct and attractive, though not one of the most showy. It is a hybrid from *C. laevigatum* and *C. venustum*, the flowers neat and remarkable for the colouring, the streaks and spots being clearly defined. The ovate dorsal sepal is white, veined with green, the lower sepals similar. The petals are broad and twisted, spotted and tipped with reddish brown, and edged with dark hairs, the lip yellowish green. It was shown by Drewett O. Drewett, Esq., Riding-mill-on-Tyne (gardener, Mr. H. A. Keeling) at the Royal Horticultural Society's meeting on August 26th, 1890, when an award of merit was

FIG. 23.—HYBRID CYPRIPEDIUM ALFRED.

granted for it. At the same meeting Mr. Drewett also had two other hybrid Cypripediums, one named Constance, from *C. Curtisii* and *C. Stonei*, the other Alice, from *C. Spicerianum* and *C. Stonei*.

#### A RUN INTO SOUTH WALES.

THE Cardiff Conference and Show last week afforded an opportunity for a run through a very pleasant district of England into one of the busiest parts of South Wales; a glimpse of agreeable scenery, an inspection of a fine garden, and the privilege of adding a few more to a wide circle of horticultural friends and acquaintances, constituting full compensation for the fatigue of a hurried railway journey. Some of my co-workers in the British Fruit Growers' Association had wisely taken advantage of their chance to travel Cardiff way the previous night; but this I was unable to do, and therefore an early start on Wednesday morning was necessitated, especially as I had decided to make

#### A CALL BY THE WAY.

Reading was the first stage, and here I found I could spend an hour without any material loss at the other end of the journey, so a scamper through Messrs. Sutton & Sons' nurseries and trial grounds was indulged in as a preliminary. Every season, almost every month, has its special horticultural attractions at Reading. Just now the Gloxinias present a magnificent display, several large houses being filled with vigorous young plants, bearing richly coloured, varied, and delicately tinted flowers in surprising profusion, with well-developed pot-concealing foliage. So much prolonged attention has been paid to the improvement of the Reading strain of Gloxinias that it is difficult to see what remains to be accomplished. The flowers are large, bold, well formed, of great substance, borne erect upon stout stalks, which enable their

floral beauties to be readily seen. In some the colour is solid from margin to centre, in others a clear white margin throws up the colour still more boldly, while delicately dotted or netted varieties are also seen in due proportion, the last-named constituting a very distinct and elegant strain. Perhaps the finest of all is a pure white variety named *Her Majesty*, which has already secured several certificates, and is in all respects unique. Then the *Achimenes*, the *Gesneras*, the *Tuberous Begonias*, the healthy *Cyclamens* advancing for another season's display, and many other attractions in succession receive hurried attention.

Out of doors, both in the nurseries and trial grounds, are breadths of all the most useful annuals and hardy plants raised from seed, some beds of seedling *Carnations* and *Picotees* being remarkable for the large percentage of well-formed double varieties of excellent colours, and the profusion of flowers, plants about eighteen months old bearing hundreds of bright and fragrant blooms invaluable for cutting purposes. The trials of *Asters* will afford much interest in a week or two, as also will the *Tomatoes*, of which large numbers are being tested side by side. Half a day could have been advantageously spent in the admirable *Suttonian* establishment, but an hour had to suffice, and by the kindly assistance of Mr. Leonard Sutton the station was reached in good time for the Cardiff train, and I arrived at my destination in a little over four hours' run, via Stroud, Gloucester, Chepstow, and Newport.

#### THE CONFERENCE.

The *Sophia Gardens* is a capital place for a horticultural exhibition, its dense fresh lawns and abundant trees adapting it admirably for such a purpose, and most generously is the local Society treated in having so fine a site placed at their disposal. Fortunately the weather favoured the gathering, and visitors assembled in considerable numbers. The dozen or so tents devoted to the Show were soon filled with competitors' friends and the general public, the spacious tent devoted to the Conference being also crowded when the proceedings commenced. With much kind consideration the Marquess of Bute had consented to preside, and his presence undoubtedly contributed materially to the success of the meeting. Mr. Gordon gave a short address on the past and present condition of fruit culture in the United Kingdom, and in doing so directed attention to the enormous influence for good that had been exercised by the British Fruit Growers' Association since its foundation in 1888. As proved by the Agricultural Returns the area under orchards had since that year increased so rapidly that the total acreage of land devoted to fruit at the end of last year exceeded that of 1888 by over 12,000 acres. He did not, however, attach so much importance to the increase in the acreage as to the improvements that had been effected both in the selection of sites and varieties and in the preparation of the land, because it was only by adopting the best possible methods that fruit culture could be made profitable. This point the Association had from the first kept to the front, and had at all times carefully avoided the extravagant estimates that had been given by some speakers. The Association endeavours to enforce the view that fruit culture would, if properly carried on, give a good return for the outlay both in planting and management. The means by which it is seeking to disseminate trustworthy information was briefly described, and it was pointed out that in addition to holding conferences, arrangements had been made for giving lectures at meetings of horticultural and other societies, the staff of lecturers comprising about thirty of the most eminent fruit growers in the United Kingdom. A plan had also been prepared by which it is hoped that fruit culture will occupy a prominent position in the schemes of technical education now being carried out under the direction of the various County Councils. In conclusion, it was pointed out that many districts in South Wales were highly favourable to the production of hardy fruits, and although in the gardens of Cardiff Castle hardy fruits were grown in a manner that was not surpassed in the United Kingdom, good orchards were practically unknown in the vale of Glamorgan.

Then came worthy Mr. Pettigrew with the practical remarks upon fruit culture in South Wales which have already been read with interest by thousands of cultivators. Probably, however, the reader was afforded more gratification by the close attention with which the Chairman followed this narration of successful experience, and the applause in which he also heartily joined. It was a subject upon which Mr. Pettigrew could speak with the greatest authority, and the proofs of all he said concerning fruit culture were within a few hundred yards of the Conference tent, almost in the midst of a busy city.

Mr. Baillie's address on fruit growing as an industry was an eloquent dissertation upon the pecuniary and social advantages arising from judiciously extended fruit culture, and it is needless to say that it was admirably delivered. It was suggestive and

clear, just what was desired and expected from him. It was unfortunate that the time did not permit of extended discussion, for it was evident that much of a useful character could have been communicated by some of those present, and this is exactly what is required. It is only by a comparison of experiences and opinions that the best way can be found, and in every district there are special obstacles as well as special facilities that demand careful consideration before embarking extensively upon fruit tree planting.

#### THE SHOW.

A word or two must now be devoted to the Show itself, which far exceeded the expectations of most visitors, and it was gratifying to learn that the exhibits exceeded those of last year by nearly 100 per cent. It is customary at provincial and metropolitan horticultural shows to crowd all the exhibits into two or three tents, placed as near together as possible, and the visitors are often kept in the tents until a complete circuit has been made. A different order of things prevails at Cardiff, and it has much in its favour. About a dozen tents were employed, each one being devoted to special classes or exhibits. The tents were also placed some distance apart, the visitors were not crowded into so small a space, and were thus enabled to inspect the Show with much more comfort than is the rule at popular gatherings of this kind.

The quality of the exhibits throughout was very satisfactory, plants, flowers, fruit, and vegetables being all well represented. Fruit was good, the Grapes especially so, and excellent bunches were shown by Mr. G. Gill, gardener to W. M. Franklin, Esq., St. Helens (six varieties); Mr. Silk (Muscat of Alexandria, Gros Maroc, and Golden Queen); Mr. A. Pettigrew (Foster's Seedling), and Mr. J. Aye, Clifton (Black Hamburg). In the Melon classes Mr. Pettigrew was victorious, as he also was with Apples and Pears; Mr. Muir, Margam Park Gardens, being the best exhibitor of Peaches (Barrington).

In the plant classes groups were not very well shown, but specimens were fine, Mr. J. Lockyer, gardener to J. C. Hanbury, Esq., Pontypool, having twelve grand plants in flower, defeating Mr. J. Cypher of Cheltenham, who, however, had the best fine-foliaged plants and Orchids. Pelargoniums, Fuchsias, and other softwooded plants were well shown, as were also cut flowers and table decorations, which occupied several tents, and formed a very interesting portion of the display. Amongst the vegetables Mr. Muir exhibited well, and took the first place for a collection of nine kinds with excellent samples in his best style. The non-competing exhibits also occupied considerable space. Messrs. B. S. Williams & Son, Upper Holloway, had a fine group of stove and greenhouse plants. Messrs. Clibran & Son had a capital group of hardy flowers, with fine examples of their new *Tropæolums* Mrs. Clibran (bright yellow) and Gem (very dark maroon). Mr. Pettigrew had forty varieties of Apples and thirty varieties of Pears; Mr. J. Watkins, Hereford, had fifty dishes of Gooseberries and Apples; Mr. Ralph Crossling, Penarth, had a group of plants; Messrs. Dobbie & Co, Rothesay, a collection of Marigolds and Violas; and Messrs. Perkins & Son, Coventry, showed several handsome bouquets. This is only a brief review of a really creditable Exhibition, and it only remains to be said that the Chairman (Mr. Lewis), the Vice-Chairman (Mr. Pettigrew), the Secretaries (Messrs. Blackmore and Gillett), with several members of the Committee assisted materially in promoting the success of the Show, while they certainly contributed to the pleasure of the members of the British Fruit Growers' Association who were enabled to be present at the Show and meeting.

#### CARDIFF CASTLE GARDENS.

The members of the Association are busy men, and the majority hurried away to other duties immediately after the conclusion of the Conference. A few, however, remained, and on the following day had the pleasure of inspecting the gardens at Cardiff Castle, a treat which would alone have repaid the trouble of so long a journey. Able writers have made readers of this Journal familiar with the great establishment over which Mr. Pettigrew presides, and it is unnecessary to enter upon a description; but it must be said that not one word too much has been written concerning the examples of cultural skill there found. I was prepared for something exceptional in the fruit trees, but I did not expect to see such marvellously healthy specimens of Apples and Pears, loaded with fine fruits from the tips of their branches to within a few inches of the ground. Trees eighteen or twenty years old 20 to 30 feet high, and forming avenues as regular and perfect in form as if cast in one mould, cannot be seen every day; but there they are, an all-convincing proof of what can be accomplished in hardy fruit culture even in a town garden. They have been planted under Mr. Pettigrew's superintendence, he has watched them grow into bearing and profit, and the tons of fruit they have produced have afforded an

ample return for the labour and expense they have required. But it is not only hardy fruits that are grown well at Cardiff Castle, Melons under glass are equally surprising in their way, the crops of fruits obtained from individual plants far exceeding the conventional numbers. A dozen or more fine specimens on one plant are frequently secured. Grapes, too, are admirably grown, and with Peaches and miscellaneous useful plants fill numerous houses, good order and the best culture prevailing throughout. It is in fact a grand school for young gardeners.

#### THE CASTLE COCH VINEYARDS.

A delightful drive of some five miles to the Castle Coch Vineyard concluded my horticultural experiences of Cardiff, and with a few words respecting it I must close these notes. The weather was warm, and we could appreciate the wisdom of the choice made when the elevated slope was reached, above which stands Castle Coch itself, looking across a beautiful panorama, with the Bristol Channel gleaming in the distance. It was like a sub-tropical climate, the soil was quite perceptibly warm, and a few weeks clear weather will effect a great change in the abundant Grapes which are now developing. The Vines are planted in rows 3 feet apart, are cut back annually, and the shoots are tied to stout stakes in the continental fashion. The Vines have fine well developed leathery deep green foliage, and evidently have a soil that suits them, for the growth is stout and strong. The yield of Grapes and the quality of the fruit necessarily vary according to the season, but that excellent wine is produced I had the opportunity of testing. Many varieties have been tried, but a large proportion of the ten thousand Vines now consist of one variety, Gamai Noir, with small black berries, which is grown in the French wine districts, but is not cultivated in gardens here. This vineyard is extremely interesting, and though it may be regarded as an experiment conducted under favourable circumstances yet there are no doubt many similar sites where equal success could be achieved.

Reluctantly several kindly invitations had to be declined, including one from Mr. Muir at Margam, and with an invigorating little sea trip from Cardiff to Weston-super-Mare our homeward journey was commenced in preparation for a longer trip in other lands.—LEWIS CASTLE.

**EVENTS OF THE WEEK.**—The Fruit, Floral, and Orchid Committees of the Royal Horticultural Society will meet at the Drill Hall, James Street, Victoria Street, S.W., on Tuesday, August 25th, when there will be an exhibition of Gladioli, Orchids, Fruit, &c., and a lecture at 3 P.M. by the Rev. H. H. D'Ombraim, M.A., on "Gladioli." The Newcastle-on-Tyne Autumn Show will take place on August 26th, 27th, and 28th. On Monday and Thursday next, August 24th and 27th, Messrs. Protheroe & Morris will hold sales of bulbs at Cheapside. A sale of Orchids from Mr. F. Sander will also take place in the same rooms on August 21st.

— **MR. D. T. FISH.**—We are informed on good authority that Mr. D. T. Fish, who has been gardener at Hardwicke House, Bury St. Edmunds, for upwards of thirty years, will relinquish his charge during the ensuing autumn. T. M. Gibson Cullum, Esq., is the present owner of Hardwicke, and Mr. Fish is a member of the Town Council of Bury St. Edmunds, the only instance, so far as we know, of a gardener in service being elected to a position of that nature. He is a brother of the late Mr. Robert Fish, who was for some years a shining light on the staff of the *Journal of Horticulture*. Mr. D. T. Fish will not, we understand, seek another situation as a private gardener.

— **THE WEATHER IN THE METROPOLITAN DISTRICT** has been somewhat finer for the greater part of the past week, and this has been general in the northern and western counties, where harvesting is proceeding rapidly. Rain has, however, fallen heavily on several days, and clear sunny weather would help fruit and other crops greatly.

— **GARDENING APPOINTMENT.**—Mr. Eldon Quantrell, late foreman at Porters Park, Shenley, has been appointed head gardener to Mrs. Holt, Waratah, Chislehurst.

— **SHREWSBURY SHOW.**—The Exhibition which opened at Shrewsbury on Wednesday is larger than ever. The entries numbered 2500, from cottagers 1500. The schedule comprised 189 classes. Good and in several cases generous prizes were provided, the aggregate amount in group class being no less than £62. The conditions were a group of miscellaneous plants, in or out of bloom, arranged in a space of 300 square feet. In this class the prizes are won by Mr. Peter Blair, Trentham Gardens; Mr. A. Webb, gardener to J. H. Sutton, Esq., Newark; Mr. Currey, gardener to Col. Pepper, Salisbury; and Mr. Roberts, gardener to C. H. Wright, Esq., Oswestry, in the order named. For sixteen stove and greenhouse plants, not less than four in flower, the prizes of £20, £15, and £10 are won by Mr. Finch, gardener to J. Marriott, Esq., Coventry, and Mr. J. Cypher of Cheltenham, who are equal firsts, Mr. Currey being third. In the cut flower section the principal class is for a collection of Dahlias, a silver medal and £5 as the first prize being awarded to Messrs. Jones and Sons, Shrewsbury. A silver medal and a similar money prize for a collection of Gladioli are also secured by Messrs. Kelway & Sons, Langport. With a collection of fruit (twelve dishes) Mr. J. H. Goodacre, Elvaston Castle Gardens, Derby, wins the £10 first prize, followed by Mr. R. Dawes, The Gardens, Temple Newsam, Leeds, and Mr. Bailey, gardener to W. Martin, Esq., Ledbury. The first prize for six bunches of Grapes (£10) is secured by Mr. T. Bannerman, gardener to Lord Bagot, Blithfield, Rugeley; the other prizewinners being Mr. J. Barber, gardener to W. Raynes, Esq., Rockferry, and Mr. W. Iggulden, Marston Gardens, Frome. The Show is a grand one all round.

— **THE CONFERENCE OF THE BRITISH FRUIT GROWERS' ASSOCIATION AT CARDIFF** on August 12th was held in conjunction with the local horticultural society's exhibition in the Sophia Gardens. A large tent was devoted to the Conference, which was largely attended, the Marquess of Bute presiding, and being supported by the Rev. G. A. Jones, Alderman Lewis (Deputy Mayor), Mr. T. F. Rivers, Mr. E. J. Baillie, F.L.S., of Chester, Mr. Blackmore (Secretary of the Cardiff Horticultural Society), Mr. G. Gordon, and Mr. Lewis Castle (Hon. Sec.). After a few words from the Chairman, Mr. Gordon gave a review of the work of the Association and the extension of fruit culture. Mr. A. Pettigrew then read an excellent paper on "Hardy Fruits for South Wales," and by Mr. E. J. Baillie with an address on "Fruit Culture as an Industry." Some discussion followed, in which several prominent local horticulturists took part, including Mr. W. J. Grant, and the business of a very successful meeting concluded with a hearty vote of thanks to the Marquess of Bute for presiding, proposed by Mr. Rivers and seconded by Alderman Lewis.

— **MR. C. M. MAJOR** of Croydon sends us an example of a **CURIOUS FREAK IN AN OPUNTIA**. The ovary of a previous flower has produced two other flowers near its apex, the ovaries of which are also developing. Instances of a similar character are occasionally seen in members of this family where leaves are absent, both flower and growth buds springing from the fascicles of spines all over the plant.

— **SAXIFRAGA MUSCOIDES PURPUREA** is excellent for the rockery. The growth is compact, the flowers are freely produced, and last so long that it deserves a place in the smallest collection of rockery plants. The flowers when first open are a bright rose, which pale considerably with age. The best time to increase the stock is after flowering, by division, planting in sandy soil, in a partly shaded situation it succeeds better than in the full sun.—M.

— **AT** the ordinary monthly meeting of the **BRIGHTON AND SUSSEX NEW HORTICULTURAL AND MUTUAL IMPROVEMENT SOCIETY**, held at the Imperial Hotel, on Thursday evening the 13th inst., twelve new members were proposed and admitted. The Sub-Committee appointed at a previous meeting submitted a schedule for a spring show next year, which was approved, and the dates fixed for the 5th and 6th April. Mr. J. Cheal then delivered a most interesting lecture on Conifers, referring to their history, the period of their introduction to this country, their value as timber trees or for the embellishment of our pleasure grounds, their comparative hardiness in this country, and other valuable information. A large number of specimens—sprays of many of the trees referred to—were exhibited in the room, and by the aid of two large maps the speaker succeeded in interesting his hearers for over an hour. Mr. Balchin, who presided, in moving a vote of thanks to Mr. Cheal, congratulated the members of the society on having amongst themselves one capable of handling a subject with such ability.

— MESSRS. FISHER & SHARPE, 172, Queen Victoria Street, London, E.C., send us some excellent samples of BAMBOOS FOR STAKING PURPOSES in all sizes, from 18 inches to 7 feet long, and proportionate thickness. They are adapted for supporting plants of all kinds, both in pots and in the open borders. They are very durable, light, yet strong, and have a good appearance.

— NICOTIANA AFFINIS.—Surely the truth is that this is simply a hardy annual. Years ago I raised a few plants from seed, and planted them out in light soil on a warm border. Since then, though I have never sown or planted any more, I have never been without them; they come up, evidently self-sown seedlings, here, there and everywhere. There is nothing perennial about them.—L. G., *Chester*.

— HARDINESS OF NICOTIANA AFFINIS AND TUBEROUS BEGONIAS.—Your correspondent, "W. I." in your impression of August 6th, states that the above Nicotiana withstood the winters of 1890 and 1891. It has lived through several winters at this place, as also have some Begonias. Their tubers are somewhat similar to Potatoes, which often pass through the winter unhurt. I believe all the Begonias would survive our winters if they are on well-drained beds and covered with cinder ashes. The Salvia patens will survive some winters, but the last one was too much for it.—J. PERKINS, *Thornham Hall*.

— A PROLIFIC CURRANT TREE.—I showed a Red Currant tree at Patching, Sussex. The tree measured 5 feet 6 inches through, 3 feet 6 inches high. Weight of Currants gathered from it, 17½ lbs. I think this a very good crop, and should like to hear your opinion of it.—H. BOWMAN. [We shall be glad to hear from correspondents who may happen to have weighed their crops how our correspondent's yield compares with their own. We have gathered a greater weight from bushes, both of Black and Red Currants.]

— MUSHROOM SPAWN IN OLD BEDS.—"A. W." writes:—"May I invite the experience of your readers on the following matter?—In clearing away some Mushroom beds I have found some spawn, which seems to me to be in splendid condition. I am about making up some more beds. Shall I be safe in using it for them with a chance of a good crop? I have cut many fine Mushrooms. The largest was 11 inches over, and weighed 1 lb. 9 ozs.; the next 1 lb. 5 ozs., 1 lb. 3 ozs., and many 1 lb. My beds have been down nine months, and I still get a few Mushrooms."—A. WYATT.

— FRUIT CROPS IN BEDFORDSHIRE.—Apples on old trees are half a crop, but on younger trees they are better, but still very small. Pears are fairly good, but very small. Most varieties of Plums are plentiful. Peaches on unprotected walls good average crop, the trees clean and healthy. The same remark applies to most fruit trees. Gooseberries, Raspberries, and Currants are good average crops; also Strawberries, but the early varieties suffered a good deal from the late frosts, and also from the very damp weather during the fruiting season. Walnuts are mostly good.—G. R. ALLIS, *Old Warden Park*.

— MODES OF CHRYSANTHEMUM CULTURE.—I was much obliged to Mr. Jameson for his kindly criticism of my paper. In answer to his query as to where free sandy loam is to be obtained near Hull, I can only reply that, when visiting a brother of mine a few years since, at that time resident near Brough, I was shown a very fine sample, and given to understand it was obtained in the neighbourhood, from the banks of the Humber. From this fact, and that of the Humber being a tidal river, I had formed the opinion that such was not difficult to obtain in the neighbourhood of Hull. If it is an error I thank Mr. Jameson for drawing attention to it. I fully agree with him that the question of benefit derived by the plants from salt at the roots is one deserving investigation and carefully conducted experiments.—W. K. W.

— THE WEATHER LAST MONTH.—July was changeable and unsettled, with many showers and thunder on the 6th, 7th, 8th, and 17th, but not one entire bright day all through the month; very bad weather for haymaking, and not much of it was carried at the end of the month. The wind was in a westerly direction twenty-seven days. Barometer, highest 30.38 on the 14th at noon; lowest 29.59 on the 30th at 9 A.M. Rain fell on sixteen days, the greatest daily fall being 0.56 on the 8th. Total for the month, 2.60 inches. Highest shade temperature was 80° on the 17th, lowest 41° on the 13th and 28th; lowest on the grass, 37° on the 28th. Mean maximum temperature, 67.87°; mean minimum, 49.93°. Mean temperature of the month, 58.91°. The garden spring ran 20 gallons per minute on the 31st.—W. H. DIVERS, *Ketton Hall Gardens, Stamford*.

— EARLY APPLES.—Mr. G. Bunyard sends us samples of the following early Apples for comparison:—Mr. Gladstone, rich crimson, angular, 2½ inches wide and high, flesh white, tender, juicy, excellent. Early Red Juneating (Margaret), more uniform in shape than the preceding, but not so highly coloured; and though sweet and tender, not on the whole quite so good. Tetofsky, yellow, slightly angular, 2 inches high and 2½ inches wide, flesh greenish white, firm, sweet, juicy, and pleasantly flavoured. Cardinal, also known as Peter the Great; fruits uniform, 2¾ inches wide, 2½ inches high, yellowish green on the shaded, flushed with crimson on the sun side, flesh firm, and fruits therefore heavy. An early cooking Apple of good promise, the tree being a healthy grower and free bearer.

— DAISIES ON LAWNS.—After using various means for years in trying to get rid of the Daisies on our lawn, including grubbing them up at much expense with the little tool provided for the purpose, I gave up the hope of ever exterminating them; but to encourage a better growth of herbage I made a thin sowing of White Clover, and over that, in early spring, a top-dressing of ground bones. To my surprise not a single Daisy has appeared this year, and the lawn is beautiful. I mentioned the fact to a friend of mine, and was amused to learn that, like myself, he had pursued the same course with like results. I think this experience is deserving of publication, and trust you will be of the same opinion.—A. Z.

— ASTER HARBINGER.—This is, I believe, one of Messrs. Sutton's introductions, and is, I should imagine, quite correctly named. It is only recently I have been privileged to make the acquaintance of the variety growing in a neighbour's garden, and to those by whom white Asters are required as early as possible in the summer the variety under notice should commend itself. The seeds in this instance were sown on March 30th in a frame with only a slight bottom heat from a partially spent hotbed. The seedlings grew sturdily, assisted as they were by cool surroundings, and were finally planted in a well manured and prepared border towards the end of May. There they grew vigorously after they were once established, and the first blooms were ready for cutting by the first week in July. The habit of the plants is extremely free and branching, every bloom being supported by a rather long stem, which is an advantage for cutting purposes. The flowers are a pure white and reflexed, like the Chrysanthemum flowered, but are larger. Considering how late Asters as a rule are this year, it must be readily understood how valuable Harbinger is for decorative work in a cut state or even in pots.—W. S.

— ERYNGIUM GIGANTEUM AND TELEKIA SPECIOSISSIMA.—The Eryngium named is one of the most striking plants in the herbaceous border at the present time. Its steel blue cone-like flowers show most conspicuously, and form a distinct contrast to such plants as Gaillardias, Campanulas, and Chrysanthemum segetum. It gives very little trouble in the way of propagating, for it seeds freely, and if the seedlings are taken care of they will grow into flowering plants by the second season. This Eryngium being of a biennial nature it is necessary to have young plants continually coming on to take the place of those which bloom, as all these die as soon as they have finished flowering. Another beautiful plant which is just now at its best is Telekia speciosissima, its bright golden flowers, which are borne on stout flower stalks and carried up well above its handsome foliage, make it a fine plant for large borders or the shrubbery border. The florets remind one of threads of golden silk. This plant also makes a fine object for planting in clumps on the grass in the pleasure ground.—T. A.

— LITERARY PIRACY.—The death of a great man in America, Mr. James Russell Lowell, whose writings made him a citizen of the world, has brought forth the reproduction of the following lines of his in condemnation of literary piracy:—

"In vain we call old notions fudge,  
And bend our conscience to our dealing;  
The Ten Commandments will not budge,  
And stealing will continue stealing."

It used to be customary to make some slight acknowledgment of the source from which information was extracted, and is yet in many quarters, but new ways have become established in these latter days, and Mr. Lowell's rebuke is timely. We commend it to the notice of a Birmingham paper, which is supplied with information almost weekly, dished up in various curious ways from our columns by some ingenious compiler. We cannot think the editor of the paper in question is aware of the practice of his subordinate, and it is not conceivable that the proprietors could approve of the method of obtaining news if it were brought before them.

— **HOOPER & CO. (LIMITED).**—The winding-up order against this Company was made upon a creditor's petition, presented on May 25th, 1891. The Company was registered on Dec. 9th, 1886, for the purpose of taking over the business of Messrs. Hooper & Co., seed and horticultural merchants, carried on for nearly fifty years at Covent Garden and elsewhere. The nominal capital of the Company is £100,000, divided into 10,000 shares, of which 4500 were offered for public subscription. The total number of shares allotted is 2556, including 1500 issued to the vendors as fully paid, and 692 so issued to the proprietor of the Maida Vale Nurseries, which were purchased by the Company in 1887 for the amount thus represented. The number of shares applied for at the date of the first allotment (Feb. 23rd, 1887, appears to have been 264. The purchase price agreed upon for the assets of the business was £23,640, of which £15,000 was paid in shares, £2000 in mortgage debentures, and £6640 in cash. The insolvency is attributed to the expenses having exceeded the profits, and to loss by the purchase of stock at the Maida Vale Nurseries. The unsecured liabilities as regards creditors are returned at £10,686, and the assets are estimated at the same amount, the liabilities towards contributories being £24,112.

— **GLAZED FLOWER POTS.**—"J.," on page 136, has said much in favour of these, but from what I have seen of them I must confess that I do not like them so well as the ordinary flower pot, even if the latter does get a little discoloured at times. The glazed pots look more artificial than ordinary pots. We want a pot that looks as natural and unobtrusive as possible. By far the best ware that I have seen for the purpose is made in Nottingham. It is rustic and rough in appearance, coloured green, black and gold in an irregular manner, and looks very ornamental even when empty. When filled with plants the colours harmonise well with the foliage when the spectator is near to the plant, and at a short distance the whole thing is almost inconspicuous. For dinner tables and other purposes connected with indoor decoration there is nothing to compete with these at present; but whether plants will grow in them for any length of time, and whether they can be produced cheaply enough to take the place of ordinary flower pots for everyday use, remains to be proved. As they have only recently come under my notice I cannot express any opinion on these points at present.—W. H. D.

— **SWEET PEAS.**—At the recent Liverpool Show a charming stand of named varieties of Sweet Peas was exhibited by Mr. Henry Eckford. It is the first time Mr. Eckford has paid the Liverpool people a visit, but it is to be hoped it will not be the last, for the exhibit was greatly enjoyed. The varieties which seemed to stand out most conspicuously were Apple Blossom, the standards bright pinkish rose, wings blush; Countess of Radnor; pale mauve standards, wings pale lilac; Primrose, beautiful pale primrose yellow; Orange Prince, bright orange pink suffused with scarlet; Stanley, very dark purple, the flowers having a metallic hue; Mrs. Sankey, pure white, of fine form. There were also varieties of great merit and of the most delicate hues. In a conversation I had with Mr. Eckford he stated great care is required to keep the varieties true to name and the limited quantity of seed some of them produced. He went on to state that with the choicer varieties the best way to succeed with them was to sow them in small pots from the middle to the end of January or a little later, according to situation, and then transplant. By doing so failures would be very few and the step greatly in advance of sowing them outside in drills.—R. P. R.

— **SWEET PEAS FOR CUTTING.**—Few hardy annuals are more generally admired when used in a cut state than these delightful flowers. New classes of plants and flowers are each year brought to the front and remain the rage for a limited time and then sink into oblivion. But however many flowers there may be of various descriptions to cut from, a daily supply of Sweet Peas for filling glasses is always welcomed. A great variety of colour may be obtained from a few packets of mixed seeds, and many effective combinations may be worked out with them. Although the great value of Sweet Peas is well known and fully appreciated, in many cases sufficient attention is not given to their culture to secure the best results, especially in cases where the soil is naturally light and poor. In such instances the rows should be mulched with well decayed manure as soon as the plants have grown to the height of 18 inches or 2 feet, and should the weather prove dry a thorough soaking with water can be given once or twice during the season. The little extra labour thus given is amply repaid by a continuous supply of extra large flowers. I know nothing more effective for arranging with them than pieces of *Dactylis glomerata variegata*. This hardy and easily grown Grass is so useful for a variety of purposes as to deserve a special note on some future occasion.—D. W. C.

— **COREOPSIS.**—These are charming flowers for the garden border, giving a supply of their pretty and varied-coloured blooms from early summer until cut down by frost in autumn. The variety *C. tinctoria* seems to be the most commonly cultivated among the annuals; but there are others more beautiful even than this obtainable from a mixed packet of seeds. There are no seeds cheaper than *Coreopsis*, or *Calliopsis* as they are sometimes called, and certainly no plants give a more continued or brighter display in the borders, or provide more useful flowers for cutting. Although they associate well with other cut flowers in large vase arrangements they, to my mind, have a more pleasing effect when arranged lightly in small vases alone, or rather with only an accompaniment of greenery, preferably small sprays of the common *Asparagus*. Their culture is of the simplest character possible. Sown outdoors in April they bloom in August if they are put in where they are intended to flower. A portion of the seeds, if sown in a box or frame similar to *Asters*, to be afterwards pricked out singly, or in patches of three or four plants, will, if kept under glass protection until the middle of May, commence flowering a few weeks sooner than the outdoor-sown stock, and thus a good succession is ensured. I have given some prominence to mixed packets on the score of economy; but growers preferring to have each variety under name can do so without incurring a large outlay; but for ordinary cutting purposes a mixed packet will furnish ample material for small gardens at any rate. The height of the stems and weight of the flower heads demand some support, or they are liable to be broken by wind and heavy rains.—J. H.

### THE FLOWER TRADE IN PARIS.

[Notes of a Conference held at the Hall of the Association Française pour l'Avancement des Sciences, by MR. H. L. DE VILMORIN.]

(Continued from page 90.)

As will have been seen by previous notes the Parisian flower markets are never idle. In spite of their number and good organisation we are however, compelled to go to the places where they are held in order to profit by them, and many persons who are great flower lovers have not sufficient leisure to do that. It is to these customers that the street merchants apply, selling flowers, vegetables, or fruits of the season. It may be easily understood that the majority of the authorised porters who devote themselves to that laborious but simple trade prefer to offer things that are easily consumed rather than flowers which are an article of luxury or pleasure. But among the poorer classes themselves the agreeable is often placed on the same footing as the useful, and if the "four season" merchant (*marchand des quatre saisons*) has his cart loaded with fruits and flowers, the latter are not always the last to be sold.

Every morning, before daybreak, the small carts are seen in long files all round the central market and the adjoining streets. Watching the sales the street vendors use their small capital with great caution, seeking a bargain before everything, but seldom departing from their usual kind of goods, when the whole army hastily disperses, 4000 carts parading Paris, and 2000 wandering into the suburbs. At no time of the year is there a dearth of supplies, and if on certain days they cease to hawk their modest assortments, it is because the temperature is too severe in the streets, and not on account of the goods being deficient in the central market.

From November to March the environs of Paris furnish irregularly winter flowers, such as Christmas Roses, perpetual Violets, Wallflowers, and winter Heliotropes; but it is, on the contrary, the time of the year when the South of France sends in great profusion the Paper White, Bicolor, and Yellow Narcissus, Roman Hyacinths, and mixed Anemones. It is the season of the yellow Acacia (*Mimosa* of the Parisians), early Tulips, white *Allium neapolitanum*, and for Mignonette, Ten-week Stocks, and Marguerites (*Chrysanthemum frutescens*). Even the wild flowers then yield their tribute, the Lilac Heath (*Erica mediterranea*) reaches us in January from the vicinity of Ciotat and Ollioules; in March the white Heath (*Erica arborea*) comes from Cannes and Esterel.

As soon as plant life awakens in March the woods which surround Paris supply Anemones, and the single yellow Narcissus pseudo-Narcissus, which with Primulas partake the name of "Coucou." They are brought in March from the Bois de Vincennes, or the forest of Sénart, in globular bouquets surmounted by a tuft of green leaves. Then come the Parisian Hyacinths, single and double, the Narcissus odorus, Narcissus poeticus, called "Jeannettes," the Lily of the Valley, usually sold in a still green budded state, so afraid are the collectors to be distanced by their competitors, the *Stellaria* with their light flowers, and the *Arabis alpina*. The season soon becomes warmer; the open-air Lilac appears, followed by Pompon Roses, Pinks, first Pæonies, Syringas, Snowball, Laburnum, Sweet Williams, Cornflowers, and Fritillarias.

*Lilium candidum* is the first harbinger of the summer; it is followed by Moss Roses, bundles of Grasses intermixed with large Marguerites, of *Lychnis Flos-cuculi*, *Salvia pratensis*, and Buttercups. In full

summer it is the turn of the Ten-week and other Stocks of all colours, Asters, double Picotees, Larkspurs, and Lupins, Sweet Peas, and the Gladiolus, which, with the Dahlias, prolong the flowering period until frosts set in, and combining with the Chrysanthemums, which become more abundant, remain almost alone to keep company with the first Wallflowers and first Violets. It is by no means easy to value, even in an approximate way, the business of the street merchants, but one thing of which we may be certain is that the traffic is reduced by at least one-half during the spells of cold weather.

Between the street vendors and the florists having a shop come the occupants of the kiosks and barracks established in several points of Paris, and particularly around the churches. Being on an average better provided than the street hawkers, and selling pot plants, which the latter do not, these kiosk-keepers nevertheless run after common and cheap goods. White Stocks, Tree Marguerites, Richardia æthiopica, Deutzias, and white Dahlias are the favourite flowers. The business is most brisk during the "*mois de Marie*" (May) and near the great festivals. Those which in Paris give the greatest impetus to the flower traffic are, proceeding in order of date, St. Josephus, 19th March; St. John, 24th June; St. Peter and St. Paul, 29th June; St. Vincent, 19th July; St. Ann, 26th July; Assumption, 15th August; St. Louis, 25th August; St. Augustin, 28th August; St. Charles, 4th November. When the festivals do not correspond with the authorised market days exceptional markets are held on their eve at the "*Quai aux Fleurs*." We must also mention here the merchants established near the cemeteries, and which are most numerous towards All Saints' day.—EUG. SCHAETTEL.

(To be continued.)

### HORTICULTURE AMONG THE ANCIENTS.

In the search for records of work in far past times I have found much of interest to me, and it may possibly be of interest to others. To go no further back, the Chinese, Japanese, Chaldeans, Egyptians, and Phœnicians held husbandry in high esteem, but a great deal relating to the two former is mythological, though they early practised the art of stirring the soil, economising manures, and applying them in the form best calculated to nourish and bring the crop to maturity, and displayed unwearied industry in eradicating weeds, yet it is a mistake to set them down as adepts at husbandry. They were slavish followers of routine, absolutely refusing to profit by the advanced views of contemporaries in other countries. The rich alluvial plains of China may account for their wishing nothing better than the rudest implements. The historic horticulture of China is alleged to date 2000 or 3000 years before Christ, but the Chow dynasty was founded by Woo-wang, about 1100 B.C., and of their gardening little was known until recent years beyond fable. The Japanese have made rapid strides in "latter times."

Babylon was famous for its hanging gardens, and amongst the most ancient of the earth, having attained to a certain degree of scientific cultivation 2000 B.C. Of Nineveh, founded 2347 B.C., absolutely nothing is known of its gardening. The Greeks took up the arts of the Assyrians on their decadence. The Egyptians early grew Beans, Leeks, Garlic, Onions, and Cucumbers. When Abraham entered the Delta from Canaan, about 1600 to 1700 B.C., they had long enjoyed the advantage of a settled government, and become great in pyramids, dating 2500—2000 B.C., if not in gardening, for which it does not appear they were at any time famous, therefore we must concede the Egyptians to agriculturists. Diodorus Siculus, who wrote in the time of Julius Cæsar and Augustus, states that they were acquainted with the importance of a rotation of crops, their adaptation to soils, and tethered cattle on green Clover, feeding them on hay during the inundations of the Nile.

Phœnicia was renowned for its fertile soil and producing fruit—Almonds, Apricots, Bananas, Citrons, Figs, Grapes, Olives, Peaches, Pomegranates, and Sugar-cane, with "ordinary fruit" (whatever that may have been). Carthage was founded between 800 and 900 B.C., but some place it as early as 1200 B.C. The Carthaginians were foremost in agriculture of their times. Mago, one of their greatest generals, wrote twenty-eight books on farming, which Columella states were translated into Latin by express decree of the Roman Senate. Columella lived about the middle of the first century, wrote twelve books on practical agriculture, one on gardening in verse ("*De Re Rustica*"), and another book on the cultivation of trees. He was born at Cadiz, in Spain, therefore had his tuition from the Phœnicians or second-hand from the Carthaginian Mago. What the Phœnicians left behind in Cornwall in lieu of tin is not known, but they could hardly fail to have an effect in their intercourse with our island inhabitants and its gardening of a beneficial character.

Damascus, supposed to be the most ancient city in the world, was in all times famed for its gardens, and now the plain on which it stands is covered with the most "beautiful gardens and orchards, irrigated by the limpid waters of the Barrada, forming a waving grove of more than fifty miles in circuit, rich in the most luxuriant foliage and the finest fruits, including Oranges, Lemons, Citrons, Pomegranates, Mulberries, Figs, Plums, Walnuts, Pears, Apples, &c." Its soil is of remarkable fertility. Syria early became part of the Assyrian empire, passed to the Persians under Cyrus, and the Greeks under Alexander, the gardening of which we shall presently note.

Abraham was no gardener, nor were the Israelites in any sense horticulturists, for their life was nomadic up to the going down into Egypt, from which people they derived the art of gardening, hence their hankering after its Cucumbers. After possession of Canaan their

delight seems to have been in fields and vineyards, none of their cities being famous for gardens. Jerusalem, if identical with Salem, must have existed 2000 B.C., but it is not known by its own name until 1500 B.C. Its strata are limestone, thin of soil, therefore, not suited for horticulture, yet the Olive thrives well, and there were ornamental if not useful gardens in the time of Solomon, but these appear to have been an Egyptian innovation, made to delight Pharaoh's daughters. Indeed, Solomon's writings are confined to the ornamental aspect of gardening, and this seems to have been the extent of Israelitic horticulture. The Hebrews were a pastoral nation—shepherds, herdsmen, lovers of milk and honey, corn and wine, hence the frequent reference in the Scriptures to vineyards.

Passing to the Greeks we find the greatest of epic poets—Homer, 1184-684 (a difference of 500 years) B.C., in vivid and picturesque descriptions singing the praises of the palace gardens of Alcæon and those of the cottage of Laertes. Homer is supposed to have been a native of some place on the seaboard of Asia Minor; his gardening, therefore, would combine that of the Chaldean, Egyptian, and Phœnician, hence the truth and wisdom—the living picture of Nature so unique in Homer and in Shakespeare.

Hesiod, a native of Cyme, Æolia, a province of Asia Minor, settled when a boy in Asera, a village of Bœotia, at the foot of Mount Helicon, but spent the latter part of his life at Soeris. Herodotus calls him the contemporary of Homer, living 400 years before himself, about 900 B.C.; but Hesiod is supposed to have lived about 735 B.C. He and his brother Perses resided with their father at Asera, engaged in cultivating the soil and tending cattle. After the death of their parent the estate was divided, but Hesiod was deprived of half his share by his avaricious and prodigal brother, aided by unjust judges. Nevertheless, Hesiod carefully husbanded what remained to him, and seems to have been a successful cultivator of the soil and economist. Perses wasted his estate by neglect and indolence; labour-starved land did not pay in Hesiod's time. Hesiod wrote a poem entitled "*Works and Days*," so denominated because husbandry requires exact observances of times and seasons. He mentions a plough consisting of three parts, the share-beam, draught-pole, and plough-tail; also a cart with low wheels, and ten spans (7 feet 6 inches) in width; a rake, sickle, and ox goad. The ground received three ploughings—one in autumn, another in spring, and a third before sowing the seed. Manures were applied and ploughed in.

Lessons of wisdom appear to have been taught by the seven wise men of Greece—Periander, Pittacus, Thales, Solon, Bias, Chilo, and Cleobulus, the title acquired by mature experience, practical skill in business, and the arts. The poetie, by the spirit of inquiry, passes into the scientific period, presents us with Herodotus, father of history, the recorder of facts. He was born at Halicarnassus, in Caria, 484 B.C. Egypt early engaged his attention, from which he collected a mass of information. Babylon, still flourishing, was visited, and he states himself that he resided at Tyre. Thus the richest stores of knowledge was gathered from Egyptian, Chaldean, and Phœnician sources, for Herodotus not only described the places seen in his travels, but investigated the productions of the soil.

Socrates (469-399 B.C.) must be named for giving Greek philosophy a practical direction, and one of his scholars, Xenophon, born at Athens about 445 B.C., wrote on agriculture. Plato, another disciple of Socrates, was born at Athens or in the island of Ægina, probably on 27th May, 430 or 427 B.C., and about 389 or 388 began to teach in the gymnasium of the Academy and in his own gardens at Colonus, the inner circle of his disciples assembling at simple meals in his garden. He died 347 B.C., and by his will his garden remained the property of his school.

Aristotle was born in 384 B.C., at Stagira, a seaport of Chalcidice, a southern province of Macedonia. His father, Nicomachus, was physician to Amyntas II., king of Macedonia; but the family was not Macedonian, for Aristotle claimed to be descended from Æsculapius; therefore of the race of Asclepiadæ, whose hereditary profession was that of physicians. Aristotle established his school in the Lyceum, a gymnasium attached to the temple of Apollo Lyceus at Athens, and his lectures were delivered in the wooded walks of the Lyceum. Pleasure gardens or recreation grounds were an institution of Greece.

Theophrastus, a disciple of Plato and Aristotle, was born early in the fourth century, B.C., at Eresus, in the island of Lesbos. Two thousand students attended his lectures, kings and princes solicited his friendship, Cassandre, sovereign of Macedon, and Ptolemy Lagos, king of Egypt, treating him handsomely. Two entire works of his on botany are preserved to us, and he mentions six different kinds of manures, and adds that a mixture of soil produces the same effects as manures. Clay, he observes, should be mixed with sand, and sand with clay. He died in 287 B.C., some accounts giving his age at eighty-five, others 106 or 107 years.

Epicurus, the founder of the Epicurean system, was born in the island of Samos, 342 B.C. In 306 B.C. the philosophical school of Epicurus was established, he having purchased a garden in a favourable situation, where he spent the remainder of his life in simplicity and temperance, dying, aged seventy-two, 270 B.C. Thus the Greeks combined learning, art, and science with gardening. They were not to the "manner born," but they had a poor soil to deal with, and derived their ideas of cultivation from the Chaldeans, Egyptians, and Phœnicians.

In passing to the Romans we must observe that Greek colonies had been formed in the Roman peninsula, and the ancient Romans had the advantage of their and Carthaginian experience.

Cato, the Censor, was born 234 B.C., at Tusculum, cultivated a

small estate, inherited from his father, in the territory of the Sabines, and at seventeen was taken from his farm to repel Hannibal's invasion of Italy, and after the war returned to his estate, practising husbandry and oratory in the neighbouring towns. His work, "*De Re Rustica*," shows him to have been an industrious and judicious husbandman, and, though statesman, orator, and general, his highest honour is his voluminous work on agriculture. He mentions two kinds of plough, one for heavy and the other for light soils.

Varro, born 116 B.C., wrote a treatise upon agriculture, "*De Re Rustica*," in three books, and among other implements, mentions a plough with two mould boards, which was used to "ridge" with. He died at Rome in 28 B.C. Cicero, a native of Arpenum, was born in the

in the Valley of Ustica, about fifteen miles from Tivoli, and a cottage at Tiber, and another at Rome, so that he was a gardener and farmer, combining the ornamental with the useful. He died 17th November, 8 B.C.

Lucullus, the conqueror of Mithridates, had a splendid villa and magnificent gardens in the north of the city (Rome) on Mount Pincius, called *Collis Hortorum*, which held first rank, and he first transplanted the Cherry tree to Rome from Cerasus, in Pontus. He is stated to have died before 56 B.C. The Pincian Hill is still laid out in walks and gardens, a much frequented spot, and occupying high ground east of the Piazza del Popolo, commands extensive views of modern Rome.

Pliny, author of "*Historia Naturalis*," was a native of Verona or

FIG. 24.—EARLY RIVERS NECTARINE. (See page 149.)

year 106 B.C., his father living in retirement devoted to literary pursuits. He had country seats, and was the intimate friend of Varro.

Virgil, born 15th October, 70 B.C., at Andes, a little village near Mantua, appears to have been inducted into the routine of a small estate which his father possessed and cultivated. Virgil seems to have inherited this farm, for at thirty years of age he went to Rome to seek the restoration of his estate, taken possession of by the soldiers of Octavius and Antony, and was presented to Augustus. That, however, is questioned, but his "*Georgics*" (poem on agriculture), written at the suggestion of Mæcenas, and completed in 31 B.C., after seven years' labour, prove his acquaintance with the cultivation of the soil. He advises me to "bring down the waters of a river upon the seed corn, and when the field is parched, and the plants dying, convey it from the brow of a hill in channels." This is, perhaps, the first mention of irrigation in Europe.

Horace, born December 8th, 65 B.C., had a husbandman father, who purchased the farm where the poet was born, but his paternal estate was confiscated. Mæcenas stood his friend and patron, and had the favour of Augustus Caesar. Horace owned the Sabine Estate, situated

Como, born 23 A.D., and travelled in Germany and Spain. Among other things he mentions a plough with one mould-board, others with a coulter. Fallowing was believed in by the Romans, and manure was collected from many sources, pigeon's dung was most prized, then night soil, mixed with street scrapings, and urine, and esteemed of the greatest value for Vines and Olive trees. Lime was used by the Romans as a manure for fruit trees. Indeed, their cultivation was scientific, and in general such as would meet the approbation of to-day cultivators, and this they made important—namely, the thorough tillage of the soil. Pliny affords an example of what the Romans, with their great advantages, might have done for the extension of human knowledge. He was procurator of the Emperor Nero in Spain, significant of some of the sources of his information, which, according to his own account, were compiled from upwards of 2000 volumes, making extracts from all the books he read, and at his death left his nephew (Pliny the Younger) 160 volumes of these notes. He perished in the eruption of Mount Vesuvius, which overwhelmed Pompeii and Herculaneum 24th August, 79. It may be instructive to note that the Pompeian houses mostly belonged to the wealthy middle class, and had an open court in the centre enclosed by

columns, the middle of which was laid out as a garden, and beyond this lay the private garden, also surrounded by columns. Pliny's "Natural History" was published about 77. On intimate terms with Vespasian, his knowledge may be said to embrace that of the world known at that period.

Columella's book on gardens, already alluded to, contains the most correct information on Roman horticulture of the first century A.D. Martial, born at Bilbilis in Celtiberia, 43 A.D., went to Rome when young, where he continued to reside during the reigns of Nero, Galba, and Domitian, the latter making his circumstances easy, showing the importance the Roman emperors attached to horticulture and agriculture. But though Martial treated of Roman horticulture, he was a native of Spain, and the first civilised nation who made a descent on the peninsula and founded settlements were the Phœnicians. The first inhabitants in historic times appear to have been Iberians, extending beyond the Pyrenæes into Gaul as far as the Rhone, and to these afterwards were joined certain tribes of Celts, who succeeded in making a settlement for themselves, and in process of time the two races amalgamated into one, and were named Celtiberians, of which Martial was a representative. Columella also was of the same stock, and Pliny, as already stated, was Procurator of Spain, and it is significant that these are the most important, except the learned Varro of the Roman writers on husbandry; in fact Columella makes no secret of the fact that Roman arts in tilling the soil was derived from the Carthaginians, and their invasion of Spain took place about 238 B.C. Spanish national literature, however, does not begin until the twelfth century, therefore we must accept the conclusion that Rome attracted all the famous of its time, and stood foremost in knowledge and experience in the horticultural art—gleaned it, no doubt, from other countries. Just as Herodotus, who explored all countries between Egypt and the Straits of Gibraltar, brought knowledge of Carthaginian soil and its tillage to the Greeks to appear in Hesiod, so the Roman Senate, by its edict to translate all Carthaginian works into Latin, brought tillage of the soil to the Romans, and preserved to us in the writings of Columella. Carthage dates 878 B.C., was founded by the Phœnicians, and, according to tradition, Dido, fleeing from Tyre, came to this country, whose inhabitants agreed to give her as much land as could be compassed by an ox-hide. Dido cut the hide into small thongs, with which she enclosed a large piece of land. Thus Carthage bears a close resemblance in her rise to our colonies. The immediate wants of the city must be provided for by the cultivation of the surrounding territory. So it was at Carthage, so it is with all emigrants—they must live, and they cannot subsist without tilling the ground.

Rome ceased to rely on its own soil, deriving supplies from savage Britain, and with neglect of cultivation Roman soil products declined. It got into few hands, became labour-starved. The Empire marked the climax of its prosperity and the beginning of its downfall, but in its hey-day Rome was famous for its gardens. Its population in the reign of Augustus 1,300,000, in that of Trajan 2,000,000.

The open spaces in ancient Rome were numerous, and set apart for various purposes. What concerns our subject is the *campi*, open places covered with grass, which served for popular assemblies, public processions, for the exercise of the youth in arms, and for the burning of the dead bodies. Except for the latter, and by substituting play for arms, the Roman *campi* correspond to our parks; but *aræ* applied to open spaces generally, and put to no particular use, as squares in front of palaces and temples. *Campus Martius* was outside the city, the seven-hilled of Servius Tullius, the upper bend of the Tiber enclosing a large alluvial flat, and the most celebrated, the *Campus Esquilinus* being on the east of the town, and converted by Mæcenas, in great part, into pleasure grounds attached to his palace.

The most magnificent gardens were those of Lucullus, already mentioned; Julius Cæsar had splendid gardens, also Mæcenas and Heliogabalus. Campania, a province of ancient Italy, on account of its natural curiosities, including Vesuvius, the Phlegrean fields, the Lake of Avernus, and the fertility of its soil, was a favourite resort of the ancient Romans. There they built grand country houses and had splendid gardens, with Vines forming a canopy overhead, and everything beautiful, delightful, and fruitful borne by its fertile soil. "There," exclaims Goethe, "it is worth while to till the ground." That is the recorded verdict in all time, whether wealthy citizens have resort to it for health and recreation, or poor emigrants for a living. Our emigrant progeny in the United States and most every colony settled from this country "till the ground" so effectively that its products are placed in our markets at prices starving out the home grower; more, the small holder of land in France, Belgium, &c., places butter, eggs, and fruit at the command of consumers on more acceptable terms than the large, labour-starved holdings of this country. These need the emigrant—the "tiller of the ground." That is where Rome failed. She founded no colonies—no United States, no Australia—secured none in tilling the soil and reaping the reward of their labour.—G. ABBEY.

(To be continued.)

## FAVOURITE FLOWER BEDS.

It unfortunately happens that the majority of bedding plants which produce showy flowers lack perfume, without which they cannot be really perfect, and the charms of any flower garden are greatly enhanced if, while the eye feasts on the glowing colours

around, the delightful fragrance of scented flowers mingles with the air. This can be accomplished to a certain extent by having small beds at intervals filled with scented flowers; but I think there is plenty of room for improving upon that plan, by planting more mixed beds, in which sweet-scented and showy flowers are judiciously combined. Two large beds planted on that principle in the flower garden here are much admired and appreciated. They were sown with Mignonette in May, and at bedding-out time the seedlings were a couple of inches high. Thinking so large a mass without any bright colour near to enliven it would rather spoil the effect of the flower garden as a whole, we planted good examples of Henry Jacoby Pelargonium at intervals of 20 inches among the Mignonette, and as the young seedlings increased in size a few were removed so as to give the "Geraniums" plenty of room, and any shoots that showed signs of growing very strongly were stopped. As soon as the Mignonette began flowering, a number of sweet-scented Mignonette spikes were obtained for filling glasses. These were removed from places where they were becoming crowded, and from around the Pelargoniums. All points considered these beds are quite a success, and I would advise others to give them a trial next year. It would be interesting if several readers of the *Journal* would describe what they consider favourite flower beds.—D. W. C.

## A GIGANTIC VEGETABLE AND FLOWER SHOW.

THE Show held at the Crystal Palace last Saturday in connection with the annual Co-operative Festival was not only of extraordinary magnitude, but of remarkable excellence. The tables were not quite so crowded as they were last year, but the products were decidedly better; indeed, taking into account the extent and quality of the exhibits it is questionable if such a show has ever been seen. It is also difficult to imagine any other building than the Crystal Palace capable of affording accommodation for such a display and the enormous throng of visitors who assembled on the occasion. A length of 2400 feet of tabling was provided for the exhibits, the entries numbering upwards of 4500.

The exhibits from the gardens and allotments of working people numbered over 3000, those of members of the Agricultural and Horticultural Association about 1000; the rest were honey and miscellaneous exhibits. The Show afforded evidence of the great variety of vegetables cultivated by cottagers. Although Potatoes headed the list in the industrial classes with 243 exhibits (many of them collections), other vegetables were adequately represented, as may be seen by the following summary:—Beans, 231 entries; Carrots, 126; Peas, 118; Onions, 102; Beetroot, 97; garden Turnips, 85; Lettuces, 81; Vegetable Marrows, 76; Shallots, 61; Cucumbers, 54; Celery, 49; Parsnips, 39; Cabbages, 36; Tomatoes, 33; Cauliflowers, 21; Radishes, 20; and Leeks, 6. There were besides thirty-eight collections of vegetables shown by cottagers. In flowers the exhibits by cottagers numbered 1358, and their fruit exhibits 240. Roses headed the list in flowers, Apples and Gooseberries in fruit.

It would be impossible to speak too highly of the produce in the various classes. Vegetables of all kinds were apparently as good as they could be, while all the flowers usually seen in gardens were represented, and there was a creditable display of fruit. Some hundreds of prizes were awarded, and the fourteen experienced Judges found it no easy task to complete their work in the prescribed time. It was not quite finished at the time for opening the Show, as the exhibits could not be ready at the time for commencing. The crowd broke through the barriers, but Mr. O. E. Greening was equal to the occasion. He promptly made Mr. D. T. Fish Chairman, and asked him to address the multitude. He mounted the chair and spoke with his usual fluency, concluding by asking Mr. J. Wright to open the Show, and he in turn kept the attention of the huge audience till his colleagues brought the judging to a close. Mr. Greening, Mr. Broomhall, Mr. Head, and all who shared in the organisation and arrangement, as well as the cultivators, are to be congratulated on the great success that was undoubtedly achieved.

## STRAWBERRIES IN 1891.

THE severe frost of Whit-Sunday cut all the king flowers of the earlier sorts, so that we only began picking on 24th, as against the 13th June in 1890, and finished August 5th, so that for earliness we cannot make decisive notes, while as a natural consequence the early fruit came smaller than usual. John Ruskin proves precocious, but it lacks flavour, and is only fit for a few early berries in the forcing house, while owing to the want of bright warm days and, still more, warm nights, all kinds have wanted flavour. Those which have withstood the weather best and proved of average merit are

Vicomtesse Hericart de Thury, Goliath, Victoria, Eleanor, La Grosse Sucrée, Aromatic; while British Queen, Dr. Hogg, Lucas, and Countess have been extra fine in size and flavour; Elton Pine, Filbert Pine, Kimberley, Aberdeen Favourite were, with Waterloo, better than for some years.

King of Earlies, President, James Veitch, Noble, Jubilee, and Napier suffered from the want of finer weather and rotted off, those with dwarf

foliage naturally doing best in a watery summer. Among less known varieties Georges Lusuir, Unser Fritz, the new Albert, and Commander were very good. Laxton's Latest of All is a fine large fruit of the highest flavour, and Competitor is a very promising kind, but Laxton's (this year's) White Knight is a very distinct and remarkable berry, which in a drier season will, we believe, be of first class flavour. No others in our large collection from which we are selecting the finest for adoption have proved of marked excellence, but two or three years' trials are necessary to establish the reputation of any variety of Strawberry.—GEORGE BUNYARD & CO., Maidstone.

### SEASONABLE WORK IN PLEASURE GROUNDS.

WHERE pleasure grounds are extensive the work of pruning shrubs and trees is an item of great importance, and should not be confined to one season of the year only, but should be continually going on as the necessity for the operation arises and the opportunity for carrying it out occurs. Unfortunately in many instances pruning becomes necessary to a far greater extent than is desirable, on account of too close planting. In the case of shrubs which are only employed as an undergrowth, and which are destined to be cut clean away as the permanent trees develop themselves, close planting is sometimes desirable. It is a mistake to plant trees intended to be permanent too close together, for the obvious reason that the difficulty cannot afterwards be overcome satisfactorily by removing some of the trees, because those left are not in the exact positions in which they are required, unless in the first place those intended to be permanent are planted with that object in view, and for the sake of immediate effect, the spaces between them planted with supernumerary trees, which will in the course of a few years prove useful for removing to other parts of the grounds. At the present time of the year an opportunity occurs in most gardens of giving shrubs and trees special attention, not only in the way of pruning, but also by marking those that require transplanting in the autumn, and by determining other alterations necessary. When evergreen and deciduous trees are intermixed (as they should be for the sake of effect) it can be more accurately determined what alterations are necessary while the foliage is still upon the deciduous trees. Any that require cutting back severely can then be left till the early spring months, while the work of pruning those which only require a little cutting into shape and shortening can be done now as well as at any season of the year. As the experience of the last year or two shows how unwise it is to leave so large an amount of work for the winter months, with the result that planting cannot be performed at the most suitable times, and failure is often the sequel.

The operation of pruning and clipping should first be performed upon hedges of Yew and Box, as when clipped at the present time they make just enough sturdy growth to look well throughout the winter; and during the spring months, when everything is fresh and green around, the young growth on the hedges is in keeping with surrounding scenes. The same remarks apply to Box edgings, the clipping of which cannot be performed at a better season, and wherever blank spaces occur good bushy pieces of Box may be inserted with a certainty of their taking root if the soil is pressed firmly around them and they are kept watered for a time. Rhododendrons of the ponticum type when planted near the edges of walks or at the back of mixed borders quickly cover their allotted space, and begin to encroach upon walks and borders. The best way to treat these is to cut away a few of the most straggling shoots, drive a few stakes and pegs into the ground, and tie some of the strongest shoots back to them, and the smaller shoots can be tied loosely to the main branches. By these means they may be kept within proper limits for several years without cutting away many of the flowering shoots. Laurel and Yew bushes that require annual pruning to keep them within bounds should now have the strongest shoots cut back to two or three buds at the base, while the weaker shoots can be left uncut, always taking care to prune in such a way as to leave as few cuts as possible visible, and by taking out a few large branches here and there shrubs of this description may always be kept within proper limits without pruning them back in the formal mop-headed style in which we often see them.

The general overhauling of shrubberies which should take place at this time of the year often reveals young trees (which give promise of making fine specimens) threatened with being permanently crippled by surrounding shrubs unless prompt action is taken. In my opinion it is a suicidal policy to pass over such cases to be dealt with in the winter when the evil is daily becoming worse. Every effort should be made to cut away shrubs at once so that the young trees, whose welfare is the greatest consideration, may have the benefit of light and sun to prepare them for the winter by solidifying and ripening their growth. Any young trees that are not thriving in a satisfactory way, apparently by reason of the poorness of the soil in which they are growing, should have a few inches of the surface soil removed and be top-dressed with fresh soil to which an equal quantity of well decayed manure and a good sprinkling of burnt refuse has been added. If this is done within the next few weeks the rains of autumn and winter will wash the enriching properties of the top-dressing down to the roots, so that the trees may receive the fullest benefit from it. It left till the spring the little rain we usually get during the summer months is kept from the soil by the overhanging branches; the trees cannot, therefore, derive the fullest amount of benefit from the top-dressing.—H. DUNKIN.

### LARGE AND SMALL ROSE GROWERS.

ANOTHER season of exhibiting has passed and nothing has been done by the Committee of the N.R.S. to relieve the grievance still existing—viz., to allot to each grower of Roses the *bonâ fide* class, or classes, in which he ought to compete according to his capabilities.

All the arguments of "J. B." and myself in the previous numbers of your Journal that were brought to prove how utterly unfair the framing of the schedule is, as it now stands, have been of no avail.

Is it not positively clear that growers in the upper divisions can compete in the lower ones if they choose?

Have they not done so? will they not do it again to suit their purpose when circumstances arise? Has there not been a case in point this year at Hereford, where a gentleman, who, I believe, has been accustomed to show in the upper division, entered in the class for twenty-four varieties? On arrival at the Show, I suppose, he found the competition too keen for him, so he re-entered in the class of twelve. By some means it became known to the exhibitors in that class, and had it not been for their vigilance in entering a protest against such tactics, no doubt someone would have been deprived of winning a prize; but, thanks to the prompt action of the Committee (in this case), his designs were frustrated, according to Rule II. members not being allowed to enter in more than one class.

I ask, Is it right that this sort of thing should be allowed any longer to exist? Is it fair to the small grower, who pays his contribution the same as the larger one? This being the case, why should he not have the same consideration from the Committee? Fair play is the jewel I will continue to ask for; it is all the small growers want, and it is only just that they should have it.—AN EXHIBITOR.

["J. B." desires the address of our correspondent, but it will only be furnished when sent for that purpose with a special request that it be forwarded.]

### A FINE WEEPING ROSE.

WE have received from Mr. Ismay Fisher of Sturton, near Brigg, Lincolnshire, a photograph of a remarkably fine weeping standard Rose. We thought of engraving it, but find that by reducing it to the size of our page its multitude of small blooms could not be adequately represented. The Rose was budded on a Briar twelve years ago. Its height is 9 feet 3 inches, and the branches arch over and reach the ground. The diameter of the Rose a foot above the ground is 14 feet, circumference 44 feet. The circumference of the stem at the ground is 12 inches, 5 feet from the ground 9½ inches. The tree is a fleecy mass of flowers and a beautiful object on the lawn on which it stands. A comparison of the flowers and foliage with other climbing or weeping Roses in Mr. William Paul's collection at Waltham Cross determines the Rose to be the Ayrshire variety Ruga. Mr. Fisher is a great admirer of Roses, and grows them well. He canter off with first prizes at local shows, and his name is among the prizewinners at one at least of the Shows of the National Rose Society. He can do more than grow Roses, he can make "farming pay," a much more notable achievement, and we congratulate him on his success in growing both food and flowers.

### THE NATIONAL CARNATION AND PICOTEE SOCIETY. NORTHERN DIVISION, MANCHESTER.

THE annual Exhibition of this division of the Society was held in the Botanic Gardens, Manchester, on Saturday, the 15th inst., and there was a large attendance of growers. Amongst those from Lancashire and Yorkshire were Messrs. Lord, Whitham, Geggie, Samuel Barlow, Shaw, Edwards, and others. The midland exhibitors were Messrs. Herbert (Thomson & Co.), Sydenham, A. W. Jones, A. R. Brown, J. P. Sharp, and W. Bacon, Derby; and the more southern exhibitors were Messrs. Joseph Lakin and George Chaundy from Oxford, and Mr. Charles Turner, Slough. The Exhibition was decidedly in advance of last year, and the blooms generally were of fine quality.

In the class for twelve Carnations, dissimilar.—First, Mr. T. Lord, Todmorden, with a very fine Master Fred, Sarah Payne, Gordon Lewis, J. D. Hextall, Master Stanley, Wm. Skirving, Sybil, Robert Houlgrave, Richard Beeley, Admiral Curzon, Mayor of Nottingham, and Henry Cannell. Second, Messrs. Thomson & Co. with a capital stand of Master Fred, Duke d'Aumale, very fine indeed; Sarah Payne, Robert Thomson, Thalia, C. H. Herbert, Rifleman, Alismond, Matador, Florence Nightingale, Robert Houlgrave, and a crimson bizarre sport from Tim Bobbin, very fine. Third, Mr. H. Geggie, a very good stand consisting chiefly of seedlings. Fourth, Mr. Joseph Lakin.

Twelve Picotees, dissimilar.—First, Messrs. Thomson & Co., with a stand of large well-built refined flowers, consisting of John Smith, Becky Sharp, Gertrude, Little Phil, Zerlina, Thomas William, Mrs. Sharp, Favourite, Campanini, very fine; seedling, Mrs. Payne and Brunette. Second, Mr. T. Lord, with rather small but very refined blooms of Zerlina, Favourite, Clara Penson, Mrs. Sharp, Campinini, Alice, Thomas

William, Muriel, Robert Scott, Mrs. Flowdy, Ann Lord, and John Smith. Third, Mr. Joseph Lakin.

In the class for twelve Carnations, nine at least dissimilar.—First, Mr. George Chaundy, Oxford, with seedlings chiefly. Second, Mr. J. Whitham, Hebden Bridge, with Master Fred, twelve blooms; Robert Houlgrave, Gordon Lewis, Captain Holford, Oscar Witford, Biddy Malone, Joseph Lakin, Sybil, Robert Houlgrave, Joseph Lakin, and Admiral Curzon. Third, Mr. A. R. Brown, Birmingham. Fourth, Mr. Samuel Barlow.

In the class for twelve Picotees, nine at least dissimilar.—First, Mr. A. R. Brown, with Becky Sharp, Lady Holmesdale, two fine blooms; Clara Penson, Constance Heron, Campanini, Brunette, two blooms; Norman Carr, Favourite, Thomas William, and Mrs. Rudd. Second, Mr. G. Chaundy, with two blooms of Imogen, two seedlings, Norman Carr, Royal Visit, Thomas William, two blooms; Annie, Dora Goodman, Zerlina, and Mrs. Bower. Third, Mr. J. Whitham. Fourth, Mr. E. Shaw. Fifth, Mr. W. Bacon, Derby. In the class for six Carnations, dissimilar, there were several exhibits, but we failed to get notes of the winners.

With six Picotees, dissimilar, there was a strong competition. First, Mr. A. W. Jones with a very excellent stand of Brunette, Mr. Payne, Muriel, Thomas William, Edith Dombain, and Zerlina. Second, Mr. J. Edwards, Blackley, with Mrs. Edwards, Daisy, Clara Penson, Thomas William, Seedling, and Mr. Lord, a fine lot of blooms. Third, Mr. J. Blackley. Fourth, Mr. J. P. Sharp. Fifth, Mr. J. Beswick. In the class for twelve selfs, not more than two flowers of any one variety.—First, Mr. G. Chaundy with Germania and seedlings. Second, Mr. Robert Sydenham with Germania, Theodora, Dodwell's 197, Mrs. Ford, Chaundy's 134, Sportsman, Annie Lakin, Mrs. Reynolds Hole, Mrs. Vernon Harcourt, Hebe, Claudine, and Seedling. Third, Mr. J. Edwards. Fourth, Mr. A. R. Brown. For six Selfs.—First, Mr. A. W. Jones. Second, Messrs. Thomson & Co.

For twelve Carnations, florists' varieties and selfs excluded.—First, Messrs. Thomson & Co., with a stand of superb Fancy varieties with A. W. Jones, two blooms; Schleiben, a very fine seedling, yellow ground; Dodwell's 167, Esmarch, Stadthail, a grand variety; Terra Cotta, Dodwell's 166, Von Helonhaltz, Agnes Chambers, and Lady Edwards. Second, Mr. G. Chaundy with Dodwell's 167, 184, 185, 202, 192, Ada, Queen of Hearts, and five seedlings. Third, Mr. S. Barlow. Six Fancy Carnations.—First, Mr. A. W. Jones with Alfred Gray, two blooms; A. W. Jones, Dodwell's 191, Terra Cotta, and Ellis's Maud, very fine. Second, Mr. J. Lakin, Oxford, with Janira, two blooms, very fine; Lilian, two blooms, a lovely yellow ground with bright carmine marking, very fine; Stadthail, and a seedling. Third, Mr. S. Barlow. Fourth, Mr. A. R. Brown.

**SINGLE BLOOM CARNATIONS.**—*Scarlet Bizarres.*—First and fifth, Mr. Lord with Robert Houlgrave, and second with Admiral Curzon. Third, Messrs. Thomson & Co. with Robert Houlgrave. Fourth, Mr. R. Sydenham with Robert Lord.

*Crimson Bizarres.*—First, Mr. Lord with J. D. Hextall. Second, Mr. Whitham with Master Fred. Third, Mr. Lord with Master Fred. Fourth, Mr. Whitham with Joseph Lakin. Fifth, Mr. Sydenham with Master Fred.

*Pink and Purple Bizarres.*—First, Mr. Lord with Wm. Skirving, and second with Harrison Weir. Third, Mr. J. Edwards with E. S. Dodwell. Fourth, Mr. Sydenham with Thos. Anstiss. Fifth, Mr. Chaundy with Rifleman.

*Scarlet Flakes.*—First, J. W. Lord with Sportsman. Second, Mr. Geggie with Seedling. Third, Mr. Sydenham with Sportsman. Fourth, Mr. J. Cliff with the same. Fifth, Messrs. Thomson & Co. with Alismond.

*Rose Flakes.*—First and third, Messrs. Thomson & Co., with Robert Thomson. Second and fifth, Mr. J. P. Sharpe, with Thalia. Fourth, Mr. J. Whitham, with Crista Galli.

*Purple Flakes.*—First, Mr. G. Chaundy, with Young Mcynell. Second, with Seedling; and fifth, with Oscar Wilford. Third, Messrs. Thomson and Co., with Florence Nightingale. Fourth, Mr. J. Whitham, with Gordon Lewis.

**SINGLE BLOOM PICOTEES.**—*Heavy Red Edge.*—First, Messrs. Thomson & Co., with Isabella Lakin. Second, Mr. A. W. Jones, with John Smith. Third, Mr. E. Shaw, with Lord Valentia. Fourth, Mr. J. Whitham, with Brunette. Fifth, Mr. A. R. Brown, with Mary Anstiss.

*Light Red Edge.*—First, second, fourth and fifth, Mr. A. W. Jones, with Thomas William. Third, Mr. Lord, with the same.

*Heavy Purple Edge.*—First and third, Mr. Lord, with Zerlina. Second, Mr. A. W. Jones, with the same; fourth and fifth also, with Muriel.

*Light Purple Edge.*—First, Mr. Lord, with Clara Penson; and second with Sylvia. Third, Mr. A. W. Jones, with Baroness Burdett Coutts. Fourth, Mr. A. Brown, with Clara Penson. Fifth, Mr. J. P. Sharp, with a seedling.

*Heavy Rose, Salmon or Scarlet Edge.*—First and second, Mr. A. W. Jones, with Lady Louisa, also third with Mrs. Payne. Fourth, Messrs. Thomson & Co., with Campanini; and fifth, with Little Phil.

*Light Rose, Salmon, or Scarlet Edge.*—First, Mr. A. W. Jones, with Mrs. Payne. Second, Messrs. Thomson & Co., with Favourite. Third, fourth, and fifth, Mr. A. W. Jones, with Favourite.

The premier Carnation in the Exhibition was Master Fred from Mr. T. Lord, and the premier Picotee Mrs. Payne from Mr. A. W. Jones.

Certificates were awarded to Mr. Charles Turner for Fancy Picotees Countess of Jersey, Romulus, Victory, Mrs. Henwood, Mr. Walford; Selfs Salamander, King of Scarlets; Carnation Lady Mary Currie, R.F.; Picotee Mrs. Harford, heavy rose edge. Messrs. Thomson & Co.'s yellow ground bizarre Picotee A. W. Jones, a very fine variety, intense in the

brightness of colour; Blushing Bride, a superb blush white self; Robert Thomson, a fine rose flake. Mr. J. P. Sharp, Picotee Edith, light purple edge, very fine; Heroine, a heavy rose edge.

The luncheon was well attended, Mr. Samuel Barlow presiding.

## HORTICULTURAL SHOWS.

### TAUNTON DEANE.

THE promoters and friends of this long-established and admirably managed Society were exceedingly fortunate in this "snatchy" season, which has been so fatal to outdoor engagements, to have secured a beautiful day for their annual Exhibition, and it need hardly be said that it again showed the earnestness with which horticulture is pursued in the West, and the extent of its popularity was to be seen in the vast amount of spectators who thronged the tents and Show ground, while the streets were so filled that it was a matter of difficulty to steer one's way through them. Certainly these western counties put to shame the cold and flabby way in which horticultural shows are carried out nearer the metropolis. It is here the day of the year, trains bringing in crowds of visitors from all parts; the neighbouring counties, not all perhaps attracted by the love of horticulture, but all determined to "make a day of it," and when to this it is added that a first-rate cricket match between Surrey and Somerset and an Electric Exhibition were going on at the same time, it will be acknowledged, I think, that these good folks in the west country can stand a good deal of fatigue in the way of pleasure.

It can hardly be said, however, that in many points the plants and flowers were equal to those of former years. The season was against many things, and the changes of fashion were responsible for others. Thus, although Mr. Cypher of Cheltenham was there, as usual, with his magnificent stove and greenhouse plants, Ferns, and Orchids, there was a great falling off in the other exhibitors. Mr. Cleave was no longer there to run him hard, and other exhibitors who in former years used to help to fill up the nurserymen's class were no longer there, and there was a great gap between the first and second collections. In class 1, for twelve stove and greenhouse plants (open), Mr. Cypher easily took first prize with *Ixora regina*, *Ixora Fraseri*, *Ixora Williamsi*, *Clerodendron Balfourianum*, *Kalosanthes coccinea*, *Statice profusa*, *Bougainvillea glabra*, *Allamanda nobilis*, *Allamanda grandiflora*, *Erica Irbyana*, *Erica Fosteriana*, and *Stephanotis floribunda*, a grand plant, splendidly grown and flowered. Mr. W. Boule of Exeter was second; and Mr. Mould, nurseryman, Pewsey, third. In class 2, for six stove and greenhouse plants, Mr. Cypher was again first with *Allamanda nobilis*, *Ixora Fraseri*, *I. Williamsi*, *Erica Fosteriana*, *E. obbata profusa*. In class 3, for eight fine-foliaged and variegated plants, he was also first with fine plants of *Croton angustifolius*, *Croton Newmani*, *Croton Sunset*, *Cycas revoluta*, *Kentia Fosteriana*, *Kentia australis*, *Cordyline indivisa*, and *Latania borbonica*. He also took the first prize in new ornamental plants with *Pteris tremula Smithiana*, and for new plants in flower with *Cypripedium vexillarium superbum*. In the class for four Orchids he took also first prize with *Epidendrum prismatocarpum*, *Cattleya Gaskelliana*, *Cattleya Sanderiana*, and *Oncidium macranthum*. It is, of course, about the worst time for Orchid growers, but these were excellent specimens. *Pelargoniums* (Zonal) are always a feature of the Taunton Show. Rarely does one see plants so thoroughly well flowered as here, and those exhibited by Mr. Colthurst and others fully sustained this character. Unfortunately no names were attached to the plants, so that I am unable to say what the kinds were. There were some excellent plants of *Begonias*, both single and double; one from Mrs. W. Herbert Fowler of Claremont, Taunton, was placed first. They were well grown, fine varieties, and full of flower. Amongst them were *Wonder* (a seedling of first-rate character), *Guardsman*, *Geo. Bryanson*, *Mrs. French*, and *Eximia*. Mr. H. Godding was a good second.

There was a considerable falling off in *Fuchsias*, the fine well flowered plants that used to be seen here being absent. There were several very effective groups of plants arranged for effect, that shown by Colonel Pepper being deservedly placed first. Amongst the cut flowers in this open division there were some admirable *Roses* shown by Messrs. Perkins & Sons of Coventry. They were *Her Majesty*, *Henry Wm. Eaton* (Perkins) a flower I have never seen before, very pretty, of the *Alfred Colomb* class of flower; *Captain Christy*, *Devienne Lamy*, *Viscountess Folkestone*, *Annie Wood*, *Emily Hausburg*, *Beauty of Waltham*, *Marie Baumann*, *Louis Van Houtte*, *Duc de Rohan*, *Elie Morel*, *Etienne Levet*, *Merveille de Lyon*, *Duke of Wellington*, *Ulrich Brunner*, *Duke of Edinburgh*, *M. Susanne Radocanachi*, *Charles Darwin*, *Madame Eugene Verdier*, *Alfred Colomb*, *Charles Lefebvre*, very dark, almost approaching *Sir Rowland Hill*; *Comtesse de Camando*, *Duchesse de Morny*, *Dr. Andry*, *François Louvat*, *Marie Rady*, *Comte de Raimbaud*, *Exposition de Brie*, *Niphetos*, *Harrison Weir*, *Earl of Dufferin*, *Duke of Connaught*, a fine bloom; *The Bride*, *A. K. Williams*, and *Marie Finger*. Mr. S. P. Budd of Bath was second with some excellent flowers. In the class for twenty-four trebles Messrs. Perkins were again first with excellent blooms of *Alfred Colomb*, *François Louvat*, *Magna Charta*, *A. K. Williams*, *M. Susanne Rodocanachi*, *The Bride*, *Devienne Lamy*, *Pride of Waltham*, *Horace Vernet*, *Earl of Dufferin*, *Grace Darling*, *Duke of Wellington*, *Merveille de Lyon*, *Marie Finger*, *Duke of Edinburgh*, *La France*, *E. Y. Teas*, *Annie Wood*, *Viscountess Folkestone*, *Madame E. Verdier*, *Annie Wood*, *Lady Sheffield*, *Lady Helen Stuart*, and *Duchess of Bedford*.

In this tent Mr. Kelway had, as usual, a stand of his very beautiful *Gladioli* which attracted much attention. They consisted mainly of his

own seedlings, and were close and compact in the spike; two of them received certificates in those staged for competition. Mr. W. Herbert Fowler had a beautiful stand of twenty-four, and considering the backwardness of the season, it was quite wonderful to see so good a stand set up. The varieties were, it need hardly be said, good, consisting of such kinds as Shakespeare, Cherub, Adolphe Brongniart, Mr. Fowler, Pollux, &c. The standard which Mr. Fowler has attained is a very high one, and his flowers will bear comparison with any that I have seen exhibited anywhere, although they were not quite equal to those of last year. He exhibited, however, in the amateur division a beautiful stand of six which were very superior varieties of Cherub, Delila, Adolphe Brongniart, Satin Rose, Pollux, and Distinction.

Mr. Budd exhibited two boxes of Roses in excellent condition, so fine were they that they were awarded a medal for examples of excellency of cultivation; especially good was the box of Teas. His twenty-four varieties were Mrs. John Laing, A. K. Williams, Charles Lefebvre, La France, Lady Helen Stuart, Alfred Colomb, Alfred Dumesnil, Le Havre, Catherine Mermet, Charles Darwin, The Bride, Duke of Wellington, Fisher Holmes, Merveille de Lyon, &c. His Teas were Souvenir d'Elise, Edith Giffard, Caroline Kuster, Madame Lombard, Francisca Kruger, The Bride, and Amazone. Of some of these, as permitted by the schedule, two were staged; the veteran Mr. Thomas Hobbs of Bristol also showed, and was especially strong in Dahlias, in which he has for many years held a conspicuous place. Messrs. Kelway, besides their stand of Gladioli, exhibited a collection of cut blooms, Gaillardias and Delphiniums; Messrs. Veitch & Son of Exeter a fine group of miscellaneous plants. The cut blooms of Begonias exhibited by Mr. Fowler were very fine, noticeable amongst them was Cannell's Rosebud, perhaps the most perfect double Begonia yet raised, and well deserving its name.

It would be, of course, impossible to give anything like a full statement of every department of this very extensive Show, and even in the plant and flower department we can only notice the most striking points. The table decorations were not so abundant as in some years, but that exhibited by Mr. Cypher was in the best style.

I have been compelled to pass by many things that deserved more minute description, but hope that I have been enabled to show that in the ancient county town of Taunton so well, so honourably, and so sadly known in our history, there is no decline in the taste for horticulture, and no want of hearty support; and I could not help thinking if such support is given at this Show and to the Chrysanthemum, why should not there be an equally hearty support given to the Rose, and why should we not hope to see ere long a Rose show at Taunton as well as at Bath?—D., Deal.

Fruit and vegetables were shown exceedingly well, and in great numbers, or enough to fill two large tents, the competition in every instance being most keen. The best collection of ten dishes of the former was staged by Mr. W. Iggulden, gardener to the Earl of Cork, Marston House, Frome, for a generally excellent lot of fruit, Madresfield Court and Foster's Seedling Grapes, Sea Eagle Peaches, Golden Gem Melon, and Oullins Golden Plum being most noteworthy. Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., Hill House, Langport, was a good second, and Mr. Crossman, gardener to J. Brutton, Esq., Yeovil, third. The last named was first for four dishes, Dymond Peach in this collection being especially good. Mr. Iggulden followed closely, the third prize in this strongly filled class being won by Mr. B. Marks, gardener to Sir John Shelley, Bart., Crediton.

The best Black Hamburgh Grapes were shown by Mr. C. Warden, Clarendon Park, Salisbury, these being of medium size both in bunch and berry, and beautifully finished. Mr. Iggulden was second, and Mr. G. Bridge, gardener to the Rev. Spekes-Mules, third. The class for any other black variety of Grape was also very well filled, Mr. Daffurn being first with fine Madresfield Court, Mr. Iggulden second with neat well-coloured bunches of the same variety, and Mr. Lloyd was third with Gros Colman, remarkably good. Muscats were not up to their usual excellence, and with these Mr. W. Connelly, gardener J. R. C. Talbot, Esq., Lyme Regis, was well first, and Mr. J. Lloyd second. Nor were the any other white varieties so good as often seen at Taunton. Mr. C. Warden was well first with Buckland Sweetwater, and Mr. Crossman, gardener to Earl Poulett, second with the same variety.

Melons were largely shown, but were only of moderate quality. Mr. A. Turner was first, and Mr. J. Lloyd second. Several good dishes of Peaches were shown, Mr. Crossman being first for a grand dish of Dymond, the second prize going to Mr. Iggulden for Sea Eagle. Mr. F. W. Newton was first and Mr. Iggulden second for Apricots, the first prize lot, however, being badly bruised. A very fine dish of Pine Apple gave Mr. Crossman the lead in the Nectarine class, Mr. Daffurn being second. Several other fruit classes were provided, and in most instances brought together excellent produce. Vegetables, as before stated, were very numerous, and the quality excellent. Mr. Henry Moore was the most successful with collections, Messrs. Ricks, Manley, and Kettlewell also showing well.

#### WILTS.—AUGUST 12TH.

THE annual Exhibition by this Society of plants, cut flowers, fruit, and vegetables took place on the 12th inst. in the Bishop's Palace Grounds, Salisbury, and was one of the best ever held by the Society. The weather was beautifully fine, and a large number of visitors attended the Show. The opportunity of inspecting the well-kept grounds and gardens of the Palace proved an additional attraction. Mr. W. H. Williams (Hon. Sec.) is to be congratulated upon the success of the Show.

**Plants.**—There was a good show of these. A new exhibitor at Salisbury, Mr. Finch, gardener to James Marriott, Esq., Coventry, obtained the first prize in the class for twelve stove and greenhouse plants (distinct), six foliage and six flowering, staging grand plants of, amongst others, Kentia Fosteriana, Cycas circinalis, Latania borbonica, Ixora Williamsi of great size, and covered with large trusses of bright scarlet flowers, Erica jasminiflora alba, and Erica Irbyana. Mr. James Cypher, Cheltenham, was a good second, and Mr. Thomas Wilkins, gardener to Lady Theodora Guest, Inwood House, Henstridge, was third. Four collections were staged. In the class for nine stove and greenhouse plants, four in bloom and five foliage, the first prize was secured by Mr. J. Currey, gardener to Col. Pepper, Milford Hall, Salisbury, his plants including a well-flowered Erica Macnabiana. Mr. W. Peel, gardener to Miss Todd, Shirley, Southampton, was an excellent second. Mr. Wilkins was first for six exotic Ferns, staging large plants, in fine condition, of Gymnogramma Laucheana gigantea, Adiantum cuneatum, Microlepia hirta cristata, Davallia Mooreana, D. polyantha, and Adiantum farleyense. Mr. W. Peel was a good second.

**Groups.**—These formed quite a feature of the Show, no less than twenty-one being arranged. In the two most important classes the arrangements were, generally speaking, in the same light and effective style, plants of various kinds being placed in a groundwork of Maidenhair Fern, fringed with Panicum variegatum and Isolepis gracilis, and in some cases the dwarf variegated Caladium argyrites was used by itself, producing a good effect. The Earl of Radnor's prize for a group covering a semicircle of 12 feet in diameter was won by Mr. Wilkins, four other competitors also having capital arrangements. In the first group a fine spike of Oacidium incurvum showed to great advantage in the centre, in which were also conspicuous well-flowered plants of Cattleya Gaskelliana and Dendrobium formosum. Mr. Curry was second, and Mr. Wills, Shirley, Southampton, was third. Eight good groups were arranged for Messrs. Keynes, Williams & Co.'s prize, the space to be covered being a semicircle of 10 feet in diameter. Mr. Wilkins, Mr. Peel, and Mr. Curry were first, second, and third respectively.

**Fruit.**—This made a good display, and was shown in fine condition. Mr. H. W. Ward, gardener to the Earl of Radnor, Longford Castle, Salisbury, secured premier honours in the class for a collection of eight kinds, staging good bunches of Muscat of Alexandria and Alnwick Seedling Grapes, Queen Pine, Sea Eagle Peaches, Elruge Nectarines, Moor Park Apricot, Lockinge Hero Melon, and Brown Turkey Figs. Mr. Inglefield, gardener to Sir John Kelk, Bart., Tedworth House, Marlborough, was a good second, his dishes including extra fine Black Hamburgh and Muscat Grapes, and Walburton Admirable Peaches. Mr. Ward had the best Pine Apple, and Mr. Budd, gardener to F. G. Dalgety, Esq., Lockerby Hall, Romsay, obtained the second prize, both staging bright fruits of the Queen variety. Grapes.—Out of seven good stands of three bunches of Muscat of Alexandria Mr. Inglefield took the lead with handsome, well coloured bunches, being followed by Mr. Wilson, gardener to Ashley Dodd, Esq., Stockton House, Codford, and Mr. Budd. In the corresponding class for Black Hamburghs Mr. Inglefield was again to the front in a similar competition, being closely followed by Mr. C. Warden, Clarendon Park Gardens, Salisbury, both showing medium-sized bunches of good shape and perfect finish. Mr. Holloway, Down Grange, Basingstoke, was a good third. In the class for any other black Grape, Mr. Warden was first, staging medium-sized bunches of Madresfield Court in fine condition as regards shape and finish. Mr. McFarlane, gardener to W. Baring, Esq., Norman Court, Salisbury, was second with fine bunches of Gros Maroc, Mr. Wilson being a good third with the same variety.

In the class for any other white Grape than Muscat, Mr. Browning, gardener to the Rev. Sir Talbot H. Baker, Bart., had the best stand out of five, being closely followed by Mr. Warden, both staging good bunches of bright-berried Buckland Sweetwater. Mr. Holloway had the best flavoured Melon out of twelve staged, a Lockinge Hero. Messrs. Inglefield and McFarlane showed the best Peaches, staging grand fruits of Walburton Admirable and Barrington, while Messrs. Budd and Ward obtained first and second honours for Nectarines. The first prize for three dishes of dessert Apples was taken by Mr. F. Smith, gardener to the Lord B shop of Salisbury, with clean, even fruits of Beauty of Bath, Irish Peach, and Worcester Pearmain, Mr. Browning staging the best three dishes of culinary Apples—Alexander, Frogmore Prolific, and Lane's Prince Albert—and Mr. Smith being a good second in the same class. The same exhibitors occupied the same positions for four dishes of Pears.

**Vegetables.**—Two good collections of twelve kinds were staged by Mr. Inglefield and Mr. Wilkins, who took the prizes in the order in which their names appear. The first prize collection contained grand examples of Reading Perfection Tomato, Sutton's Satisfaction Potato, Duke of Albany Pea, Ailsa Craig Onion, New Intermediate Carrot, Sutton's Al Runner Bean, Veitch's Autumn Giant Cauliflower, Artichokes, Sutton's Prizetaker Leeks, Wright's Giant Celery, Pragnell's Exhibition Beet, and Cucumbers, the whole being tastefully set up in curled Parsley.

The two medals offered for cultural skill were awarded to Mr. Ward for his collection of fruit, and to Mr. Finch for his grand dozen of foliage and flowering stove and greenhouse plants.

**Cut Flowers.**—Mr. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, was a good first, his best blooms being Earl of Dufferin, Viscountess Folkestone, Captain Christy, Madame J. Laing, Alfred Colomb, and Comtesse de Nadaillac. In the class for twelve blooms, distinct varieties, Mr. T. G. Shenton, The Glen, Golden Common, Winchester, was first, his best blooms being The Bride, Countess of

Oxford, Alfred Colomb, and Catherine Mermet. Mr. W. Browning was second, and Mr. Fred. Smith was a good third. Mr. W. Goodall, gardener to Alfred Morrison, Esq., Fonthill House, Tisbury, had the best six bunches of Cactus Dahlia, and Mr. West, gardener to J. R. Wigram, Esq., Northlands, Salisbury, had the second best. Mr. R. Goodall, gardener to A. Newall, Esq., Wishford House, Salisbury, was to the front with twelve show Dahlias, staging large blooms of great depth, being very even and fresh, Mr. F. Marlow and Mr. West being second and third in that order. With eighteen bunches of cut flowers Mr. J. Budd was first and Mr. W. Goodall second. Mr. G. Inglefield was a good first in the class for twelve bunches; Mr. W. Browning and Mr. Brown, gardener to Hon. Percy Wyndham, Clouds, Salisbury, were second and third in that order. Mr. Budd and Mr. Inglefield's stands contained good blooms of *Cattleya crispa*, *Stephanotis*, and white *Lapageria*.

**Ladies' Classes.**—These are always well filled at this Show, and the exhibits of the highest order. Miss Agnes Flight was first for a dressed flower vase, a very elegant arrangement, first for six buttonholes, and first for two ladies' shoulder sprays; Miss Lovibond, Miss Marryatt, Miss E. Burt, Miss B. Lywood (Stockbridge), and Mrs. W. F. Trask (Winchester).

**Open Classes.**—For dressed flower vase for dinner-table Mr. Cypher was first with a good arrangement of choice flowers; Mr. Ladhams, Shirley, was second; and Miss Agnes Flight third. For two bouquets, one bride's and one ballroom, first Miss C. A. Mathews, Salisbury, with good arrangements; Tuberoses, white *Lapagerias*, and other suitable flowers were employed with good effect, these being fringed and judiciously intermixed with sprays of Maidenhair Fern. Mr. B. Ladhams was a good second, and Miss Lovibond a good third. Mr. B. Ladhams was first for six gems of buttonholes, Miss C. A. Mathews being a creditable second.

**Non-competitive Exhibits.**—Messrs. Keynes, Williams, & Co. made a fine show of Dahlias, Gladioli, and Roses. Two arches, about 7 feet high and 18 inches wide, crossing each other and covered with moss, in which Roses in great variety were thickly inserted, being garnished with their own foliage, proved a very attractive feature of the Show, and this artistic arrangement of the celebrated Castle Street firm being placed in the centre of one of the large tents was greatly admired. A good show of cut flowers of herbaceous plants in great variety was made by the well-known Exeter firm of Messrs. Robert Veitch & Son, which, tastefully set up, made a telling display, and was much admired, as also were exhibits of similar description by Mr. Ladhams of Shirley. The stands of cut blooms of Tuberoses-rooted Begonias of great size and variety, both double and single, which were staged in the most effective manner by Mr. Davis of Yeovil, commanded much attention from visitors during the day. Mr. Warden also staged six handsome and well-netted Melons of the Conqueror of Europe type. Among Messrs. Keynes' exhibits was a stand of new Cactus Dahlias of bright and attractive colours, seven of which were awarded first-class certificates, including the following:—St. Catherine, Keynerith, Dr. Masters, Baron Schröder, Lady Pembroke, Mrs. Arthur Newall, and the Countess of Radnor.

#### SHEFFIELD FLORAL SOCIETY.

THE ninth annual Show of this successful Society was held on Thursday last, August 13th, in the spacious grounds at The Farm, the Sheffield residence of the Duke of Norfolk. The Society comprises the whole of the tenants occupying land on the various and extensive allotment plots belonging to His Grace in the suburbs of Sheffield. The schedule of prizes was a good one, containing numerous open classes in addition to those reserved for members of the Society, and brought forth a fine competition, well filling an exceedingly large tent 103 feet long by 39 feet wide. The Show was formally opened to the public by the Duke of Norfolk, who was supported by Lord E. Talbot, Sir H. E. Watson, Sir W. C. Leng, the Mayor of Sheffield (Alderman Clegg), and a large and influential company of Sheffield's leading men, the majority of whom afterwards lunched with the Committee and Judges in a large tent specially fitted for the occasion.

The exhibits in many classes were this year decidedly superior to those of previous seasons. Especially was this the case with the open class groups arranged for effect, and in the various classes for specimen plants, open. The style of grouping has greatly improved at this Show as compared with a few years ago, the first and second prize groups especially being so good, both in quality of material and tasteful arrangement, as to apparently leave scarcely any room for further improvement. The first prize was won by Mr. E. Pidsley, gardener to Mrs. H. Wilson; the second by Mr. W. Collier, gardener to Mr. Jno. Eaton. Specimen stove and greenhouse plants were very fine, especially those shown by Mr. Pidsley.

In the numerous classes for vegetables and outdoor garden flowers the quality was not quite up to former years, this falling off being especially noticeable in the Society classes, and is attributable to the remarkably late season, which has been especially felt by the allotment holders of Sheffield. In the open classes the exhibits of cut flowers and of vegetables were of a high order of merit. Messrs. Fisher, Son, and Sibray, Handsworth Nurseries, and Mr. Seagrave, Gleadless Nurseries, contributed groups of plants not for competition, which deservedly received much attention and admiration. At a small tent adjoining the large one a brisk trade appeared to be done in the sale of plants and cut flowers, the proceeds to be devoted to the support of a cot in the Children's Hospital, the plants and flowers having been given for the purpose by members of the Society. The arrangements were excellent, and everything being staged by the time fixed, and the tents cleared for the Judges, so that their work was completed with little

difficulty and in good order before the official time for declaring the Show open. Much of this is due to the tact and energy of the Secretary, Mr. W. Swift, who is well supported by a good working Committee.

#### DUNMORE EAST SHOW.

THIS picturesque marine village, on the edge of the Atlantic, is always an animated sight on each recurring Lady Day (15th August) a holiday in Ireland. It owes much to Mrs. Malcomson, of the palatial residence Villa Marina; Lord James Butler, the Hon. M. Bunbury, and other gentlemen who have residences adjoining the handsome small park provided for the people by the munificence of the Malcomson family. In this park the Show is usually held in a large marquee, and this year the weather joined with all other agencies in making it a success. We missed the Hon. Dudley Fortescue's (gardener, Mr. J. A. Calthorpe) splendid collections of exotic and greenhouse plants and Ferns, Tree Ferns, Caladiums, and plants of ornamental foliage, that in former years made the Show a credit to his fine marine residence at Summer-ville, and had an educational gardening effect each season. This was in some measure compensated for by a really creditable exhibition from Mr. David Saunders (Saunders & Son) Friar's Walk Nurseries, Cork, a flower Show in themselves, and sent evidently at much expense and inconvenience, and also by many fine stove and greenhouse, &c., exhibits from Mr. G. D. Goff, Glenville, near Waterford. Messrs. Saunders staged blooms of twenty-four and forty-eight of double and single Zonals, chiefly the productions of M. Lemoine and other French growers, but having some of Cannell's recent introductions very fine. The same is true of double and single Begonias, that, for outdoor work, have cut out the Zonals this moist season. Among double Begonias particularly good were M. Leroque, M. Cuvellier, M. Commesse, *Candidissima plena*, *Oreste*, *Madame Alfieri*, M. de Werle, M. Paul Figue, Agnes Sorrel, and Blanche Duval.

For the time of the year the Roses were surprisingly good, especially our Irish raised ones that we are so proud of as coming from Messrs. Dickson, Newtownards, and that you had an opportunity of seeing so frequently in England this year. To individually notice the Dahlias would be to repeat the list of winning varieties that have appeared in this Journal frequently. There was a buzz of interest around the stands all day. Among the chief prizewinners, which I must take collectively owing to the limits of space, were the already mentioned Mrs. Malcomson, who had products from her gardens at Villa Marina and Kallinakill; Mrs. Gough Glenville, Waterford; Sir Robert Peel, Ballyglene; Lady Carew, Woodstown; Lord James Butler; Mrs. Jacob, Newtown; Rev. M. Gilmour, rector; Robert Dobbins, Esq., Ballinakill House; Mrs. Alcock; Henry Morris, Belle Lake; Miss Hassard, who had first prize for table decorations. The fruit and vegetables were, as generally occurs, here particularly good. Villa Marina was as usual profuse in its hospitality, among the rest to the press, officers of the Society (Rev. J. D. Ford, Secretary), and the Judge.—W. J. MURPHY, *Clonmel*.

#### FRUIT FORCING.

**PEACHES AND NECTARINES.**—*Earliest Forced Trees.*—The leaves will soon be off (but there must not be any attempt to forcibly remove them, keeping them clean until the last), then loosen the trees from the trellis, cleanse the house, seeing to the needful repairs, painting the woodwork and trellis. Remove the mulching and loose surface soil, giving fresh loam with a twentieth part of steamed bonemeal and wood ashes in equal proportions added, affording a moderate watering if the soil be dry. Whatever pruning is necessary should be done as soon as the house is put in order, but if the trees have been properly attended to very little work will be required for the knife. Dress the trees with an insecticide. It is well to wash the whole of the trees with a soapy solution, say 4 ozs. softsoap to a gallon of water, adding a pint of strained tobacco juice, and if there be any scale a small wineglassful of spirits of turpentine, keeping it well mixed by frequent stirring. In applying insecticides, take care to reach every part, and use the brush in such a manner as not to disturb the buds. Trees cleaned and neatly secured to the trellis look far better than those left untrimmed until the latest period before starting.

*Planting or Lifting Trees for Early Forcing.*—Where new houses have to be planted and fruit is wanted at an early period the trees should be planted as soon as the growth is perfected, the wood and foliage ripe, and the buds plumped. The most suitable trees are those that have been trained three or four years to walls, and have been lifted annually or biennially. Those intended for moving to be started early ought now, if there is any tendency to a late growth or any doubt as to the maturity of the wood and buds, to have the soil taken out as deeply as the roots one-third the distance from the stem that the trees extend, and the trench should remain open a fortnight or three weeks, when it may be refilled; but do not allow the trees to suffer from insufficient supplies of water whilst the trench is open. All that is necessary, however, is sufficient to prevent flagging. This will effectually check the growth and insure its ripening, whilst it will materially assist lifting

with a mass of fibrous roots. Plant the trees for early forcing by the end of September, and lifting early forced trees should be commenced as soon as the leaves give indications of falling. It will not matter about a few sappy laterals, their softness will tend to the production of roots. Soil should be in readiness, so that work of this kind can be performed with the utmost promptness and despatch. Clean drainage, too, in different sizes must be provided and placed convenient. The soil may consist of any good loam, preferably rather strong and calcareous, nothing being better than the top 3 or 4 inches of an old pasture overlying limestone or chalk, and if intermingled with flints all the more desirable. Such will grow Peaches to perfection without any admixture. Any deficiency of calcareous matter may be overcome by an addition of chalk to sandy soil, and of lime rubbish to heavy soil. If light add a sixth of clayey marl dried, pounded, or finely divided; if too heavy add road scrapings. New borders must have efficient drainage, the bottom of the border being concreted if the strata beneath be unfavourable, or better laid with bricks on flat run with cement, the border being enclosed with walls so as to confine the roots, but the border must have 3-inch drains with proper fall and outlet, the bottom of the border, whether concrete or cement, falling to the drains. A border one-third the width of the trellis will be sufficient in the first instance, and need not at any time exceed the width of the trellis. Place rubble over the drains 1 foot thick, the roughest at the bottom and finest at the top, having 3 inches thickness of rather fine material as an upper layer, and if this consist of old mortar rubbish free of pieces of wood the drainage will keep sound indefinitely; 24 inches depth of soil is ample. The compost should be put together when rather dry and somewhat firm; in fact, it cannot be made too firm when the soil is light. The best varieties for very early forcing are Alexander, Early Albert, and Early Rivers. The finest of all Peaches for forcing is Stirling Castle; Hale's Early, Crimson Galande, and Royal George are superb. Of Nectarines Lord Napier and Dryden.

**Late Houses.**—With the fruit taking its last swelling liberal supplies of water are required until the ripening is well advanced, when moderate supplies will be sufficient; enough, however, must be given to maintain the foliage in a healthy state. Trees that are making gross wood, and have a tendency to late growth, can be marked for lifting, an infallible remedy for indifferent setting and uncertainty of stoning. Any young trees that do not ripen the wood well should be curtailed at the roots by taking out a trench so as to detach the roots about one-third the distance from the stem the trees cover on the trellis, doing it about the end of September or as early in October as the fruit is gathered.

**MELONS.**—*The Latest Plants.*—Preserve the leading shoot until it reaches two-thirds across the trellis, then pinch out its point, rubbing off the laterals up to the trellis, and then every alternate one on opposite sides of the primary. Maintain a temperature of 65° to 70° at night, 70° to 75° by day, 80° to 85° with sun heat, closing early so as to run up to 90° or 95°. Stopping the laterals should not be practised unless the plants are weak, and they do not show fruit at the second or third joint. Weakly plants should have the first shows of fruit removed, relying on sub-laterals. Early ventilation with plenty of light are the essentials of a thoroughly solidified growth.

**Plants in Pits and Frames.**—The last plants in these are swelling their fruits freely. Earth the roots if necessary, but late plants on dung-heated beds do not require much soil. Close early, affording the needful supplies of water at that time, keeping laterals well in hand, not allowing them to interfere in any way with the principal leaves. If the weather be dull afford good linings and admit a little air, as nothing is so fatal to quality in the fruit as a close atmosphere. Practise sprinkling only on fine afternoons. If black aphides attack the plants fumigate them on two or three consecutive evenings moderately. Examine frequently for canker, and promptly apply quicklime to the affected parts. Gradually withhold water at the roots and moisture in the atmosphere from plants ripening fruit, and if a little extra heat is afforded by means of linings so as to admit of a free circulation of air the quality of the fruit will be enhanced considerably.

**CUCUMBERS.**—Encourage the plants for autumn fruiting to make a strong sturdy growth by adding fresh soil from time to time, affording plenty but not overmuch water at the roots, with a moist genial condition of the atmosphere by syringing at closing time, and damping available surfaces occasionally. Sufficient fire heat must be employed to prevent the temperature falling below 65° at night, and to maintain it at 70° to 75° by day. Old plants should have exhausted growths cut out, and others where likely to be crowded thinned, so as to admit light and air, securing solidified growth and a succession of bearing wood. The syringe should be regularly employed about 3 P.M., and if mildew appear dust with flowers of sulphur in the evening whilst the foliage is damp, maintaining a somewhat freely ventilated atmosphere. In bad cases ammoniacal carbonate of copper solution may be used, 1½ oz. precipitate carbonate of copper being dissolved in a pint of liquid ammonia, and a fluid ounce of the solution added to each gallon of water, the plants being well sprayed with the solution, or if syringed it must be through a fine rose and disposed as much as possible in a fine mist. The preparation of sulphate of copper with lime, known as "antiblight," is equally effectual, and being in powder is handily applied with bellows, the "Malbec" being specially suited for applying powders to the under side of the leaves of infested plants. Black aphides are sometimes troublesome at this time of year. Those and all aphides succumb to repeated fumigations with tobacco paper, taking care to have the foliage dry, to deliver the smoke cool, and not give an over-

dose. We find it best to fumigate in the evening and repeat the dose early the following morning. If seed is wanted any knobby ended ones should be left. They come freely enough on old plants, if not impregnation will have the desired effect.

Houses that are to afford a supply of fruit at Christmas should be cleared, removing every particle of old soil, and thoroughly cleansing, repairing, or painting the house before it is wanted. Pot the plants as they require it, keeping well up to the light, and place a small stick to each, grow the plants without stopping, rubbing off side shoots as they appear to the height of the trellis. Plants in frames that have been in bearing some time will be restored to vigour by a good thinning out of the old growths and the addition of a little fresh loam, giving a moderate watering, and a sprinkling overhead on bright afternoons, closing at about 3 P.M. With linings and protection of mats over the lights Cucumbers will be produced for a lengthened period.

#### PLANT HOUSES.

**Crotons.**—Where small plants are required in large numbers for decoration during the autumn and winter in from 2 to 4-inch pots very few plants surpass Crotons, either for beauty or lasting properties. To have them in good condition they must be highly coloured or their effectiveness is lost. Well coloured side branches should be taken off at once and rooted in the pots in which they are to be used. Cuttings of a suitable nature should be plentiful on plants from which the heads were taken and rooted some time ago. We invariably find the smallest cuttings with three or four well developed leaves very useful in thumb pots. It is useless to insert cuttings that are not fairly well coloured, for they will not improve after the end of September. As soon as these small plants are rooted gradually expose them to full light and sunshine close to the glass, and if the weather prove bright for a few weeks the colour of their foliage will be highly developed. The Crotons intended for autumn and winter decoration should by now be placed in their largest pots—in fact, only the best rooted should remain to be potted, and these must be attended to at once. All our plants are well established, and will soon have grown as large as they are desired, while the beautiful markings of a few of the young leaves near the top only need developing. Where the plants have been grown close to the glass they should be examined for fear red spider has attacked the young leaves. This pest, if in existence, will quickly spoil the appearance of the plants. The quickest and easiest means of destroying the pest is to dip the plants in a solution of softsoap and water, 1 oz. of the former to a gallon of the latter, to which should be added a handful of sulphur. This may be left on the plants two or three days, and then thoroughly washed off with clean water, and the syringe used twice or three times daily.

**Panicleum variegatum.**—A good stock of this useful decorative plant should now be prepared by inserting cuttings thickly in 2 and 3-inch pots. After insertion a good watering should be given and the pots stood in the propagating frame and shaded until they are rooted. Grow the plants afterwards under moist, shady, warm conditions until they are well furnished, when slightly cooler treatment may be given them.

**Tradescantias.**—Large numbers of the variegated forms should be prepared by inserting about five cuttings in each 2-inch pot. These will root freely enough on a high shelf or any other position in heat if shaded for a few days from the sun. A few boxes may also be filled so that the plants can be lifted out for various purposes when vases and baskets have to be made up with a variety of small plants.

**Fittonias.**—These are highly ornamental in appearance when dotted amongst small Ferns and other suitable plants near the edge of large baskets or vases that have to be regularly furnished. The plants required first should be rooted singly in 2-inch pots, and quantities of others in boxes and pans for lifting out when required during the winter. If they can be used in small pots two or three weeks is ample to establish them, and they can be potted from the boxes in batches as required.

**Bertolonias.**—This is a good time to root a number of these as well as Sonerilas. Young plants pass the winter with greater certainty than those that have been growing luxuriantly the whole of the summer. The established plants need not be destroyed for this purpose, for cuttings near the base of the former will be found, and young growing shoots from amongst the latter should be selected without destroying the appearance of those now doing duty in the stove. These cuttings should be inserted in light sandy soil and kept close, moist, and shaded until thoroughly established; in fact they will winter better in the propagating house than the stove, where more airy conditions will presently be maintained.

#### SEASONABLE HINTS.

##### TAKING HONEY.

IN all districts the light-coloured honey harvest is practically at an end, and no time should be lost in taking the same from the supers, whether we are working for comb honey in sections or for extracted honey. If we delay our sample will be spoilt by having the darker honey mixed with it, and any additional weight we might

obtain would reduce the price of the whole, so that we should be no better off; and if a dull time follows with cold nights it is more than likely that any unsealed honey would be carried down into the body of the hive. In the body of the hive a good deal of comb space is now empty, the brood having hatched out, and I would strongly recommend that any honey collected after this time should be left in the hive to make up the stores for the bees to winter upon.

#### EXTRACTING FROM THE BROOD COMBS.

This is a plan that is most prejudicial to the well-being of a colony, and is never thought of by modern bee-keepers. We ought to be satisfied with the honey we are able to take from the supers, interfering with the frames in the body of the hive as little as possible. Extracting the last pound of honey and then feeding with syrup is a waste of our time, and an unnecessary wear and tear to the bees. It is often the cause of spring dwindling, the old bees being worn out before others are hatched to fill their places by the additional labour entailed by artificial feeding. My experience teaches me that those colonies of bees having sufficient food stored in the natural way will winter best and be ready to take advantage of the early pollen and any honey flow from fruit blossoms or other sources, giving us more than compound interest in good honey, for that left them in the fall of the year of an inferior kind.

#### SUPER CLEARERS.

The want of some ready way of getting bees from supers has long been felt, and many attempts have been made to invent something for the purpose. The first of these inventions was that of Mr. Aston in 1873, advertised as a bee and drone trap. There is also a description of one on page 56 of "Bee-keeping for the Many." Mr. Cheshire in 1874 obtained a prize at the Crystal Palace for a pin trap. Nothing of real practical value was invented until last year, when two or three came before the public, and each has its advocates. "The Cone Super Clearer" is the simplest, is most useful, and facilitates the removal of supers with the least possible disturbance to the bees. A cone made of zinc is fixed in the gable of the hive at both ends close under the projecting roof; holes are bored the size of the large end of the cone, in which they are fixed, the small end projecting, so that when the roof cover (which must fit accurately) is in its place the only light comes through the cones. We proceed as follows:—Raise the cover, blow a little smoke into and under the super, which take off and set on one side for a moment, whilst putting the quilts carefully on the frames of the hive, making all secure below. The super is then put back on the hive, communication having been cut off. The super covers, quilts, being taken off, the roof is closed at once, the bees make for the light coming through the cones and escape, having no means of communicating with the hive. Another form is that of an adapting board, having several small cones fixed on it, and having a fillet on the under side gives a space for the bees to get over the frames and out of the cones. If this super is lifted on to a board it may be taken away and put in a suitable place, and left for the bees to get out by degrees. In this way a quantity of honey may be taken in a short time.—JOHN M. HOOKER.

#### PUNIC BEES.

In the *Journal of Horticulture* for July 23rd, "A Lanarkshire Bee-keeper," who has two or three imported queens, says if the smallness of these bees is not against them everything else is in their favour. He has written to me asking if, in my opinion, their smallness is any detriment, and as I have been too busy to reply, and there may be many others wishing to know, I think I cannot do better than write an article for all the world to read.

Long before I saw or heard of a Punic bee I was satisfied that small bees would gather more honey than large ones, or rather they "should" do, according to all scientific laws. If honey could be collected from filled casks then large bees would have the advantage; but it is not so gathered. A bee has to visit many flowers before it fills its sac with honey, and in its expended energy of going from flower to flower a certain amount of honey is consumed to supply this expended energy. Now, no matter what it is you are dealing with, whether a bee, horse, steam engine, or

anything else that gives out force—i.e., performs work, the greater the work done the greater will be the consumption of fuel, whether in the form of coal, grass, corn, or honey, and as a large bee would require more force to move it there would consequently be less honey in its sac than a small one, although both visited as many flowers side by side in a given time—that is, assuming that each bee was of equal strength according to its size. But there is another natural law to consider—viz., that the ratio of strength compared with the bulk increases as the size of the animal decreases; thus: if an elephant were as strong as a flea in comparison to its weight it could about jump over the moon. The point may also be considered from the following standpoint:—1000 Punic bees are about equal in weight to 700 Carniolians. Now if each bee of the two kinds visited the same number of flowers per day, and took the same quantity of honey from each, the 700 Carniolians would consume just the same quantity of honey that the Punics would, and yet the latter would have the gathering of 300 bees extra without any deduction for food, because, bear in mind, it is not numbers that consume, but "weight" when the food is expended in energy or work. The above is simply a scientific deduction, assuming that all bees are of equal strength in relation to their size.

But as I have pointed out, we must look for greater relative strength as size diminishes; and to show that Punic bees are very much stronger, I will relate the following that came under my observation a few days ago. I found a stock of Carniolians with a quantity of sealed drone brood, and not wishing it to hatch I removed the cappings, decapitating the drones, and gave the comb to a small stock of Punic bees to clear out and replace with pure Punic drones if they would. Any other bees would have simply dragged them out of the hive, because too heavy to fly away with; but these little puny-looking Punic bees actually flew away with the Carniolian drones quite as readily as British bees would have flown away with a dead Punic worker bee. What was the cause of this enormous strength? Was it because the bee had less weight to carry in its own body, or because it was actually stronger? I believe the latter is the true theory. Hence we have a bee with less weight to carry in its own body, and with more strength to carry it, and herein lies the explanation of the fact that pure Punic bees are better than hybrids, as hybrids are all larger, and have therefore more weight to carry.

I have also been asked if they swarm as much as Carniolians? to which I can answer both yes and no. When Punics resolve to swarm they make tremendous preparations, constructing hundreds of queen cells. The stock may be of enormous strength, and working in full blast, with no sign of a swarm. All other bees cease work for three days before, and Carniolians six or eight days; then all of a sudden off comes the prime swarm with the old queen, which with me has invariably dropped on the floor in front of the hive, where she will be seen stroking herself. If the bee-keeper is sharp he will catch and cage her, and hang her with the swarm when it shows signs of settling, when he can hive it any time; if on an old stand by simply removing the queen. This first swarm is never very large, the second swarm being generally as large or larger, which may come off the day after the first. They will go on swarming day after day, and each swarm will quickly settle down to work. Thus it will be seen they are liable to throw off as many swarms as Carniolians. But there is this difference between them: Carniolians will swarm without leaving a queen cell behind, Punics never do this. Carniolians will remain idle for three to eight days before swarming, Punics not three minutes. Carniolians will swarm in bad weather and leave not a drop of honey behind, Punics never do this. If the weather is bad they will not swarm at all, and will destroy all queen cells, although they preserve them until the young queens begin piping. Strictly speaking they are less inclined to swarm in this country of any bee, at the same time they may throw five or six swarms in one week. I have also described them as "non-stinging." One person wrote me to send him a queen if I would guarantee them not to sting. I could not give this guarantee absolutely, because they can and will sting when provoked to it, also if treated roughly when they are getting ready to swarm. What I say is this, they are tamer than Carniolians; and practically, that is with ordinary management, non-stinging.

I have received some very flattering reports of what they have done as hybrids. All know how "A Lanarkshire Bee-keeper" praises them, how last year the weakest nuclei built up and beat his best stocks by 9 lbs., and how they have stored three times as much honey in one day of any other bees. Mr. William Stokes, Balnastraid, Carr Bridge, Invernesshire, a well-known Scotch bee-keeper, says, if he can get half a dozen more queens like the one he had last year he will consider himself a lucky man, as the one has left all his others fifty stocks, a long way in the rear. Mr. R. Robinson, Exchange Arcade, Hawick, another well-known

Scotch bee-keeper, though a native of Yorkshire, had a queen very late last year, and this is what he says, dated July 9th, 1891:—"I considered the queen I got from you a useless little thing, and thought of killing it; however, I put it into a three-frame nuclei, and let it fight its own way, live or die. At the back end I found the queen had done more than well, so I gave her three more frames of comb and covered up for winter. To my surprise this March I found it as good a stock as any I had out of forty. I have taken fourteen 1-lb. sections from it—the best from one hive about here. I have Carniolians, Italians, blacks, and hybrids of all kinds." I can give many more such as this, but I must not omit one from the south that beats all in the way of testimonials. I sent Mr. Thomas Ford, Keynsham, near Bristol, four virgin Punics last year. He wrote about July 25th as follows:—"I received the four Punic queens safely, and introduced them into nucleus hives. On examination yesterday I find two of the queens have commenced laying, but in the other two hives there is not a bee or any honey left. Will the two nucleus hives build up into two stocks in time for winter?" On May 21st, 1891, he writes from Warbrough Green, Warbrough, Oxfordshire:—"The four Punic queens I had from you last summer have given me good satisfaction; they have built up into four very strong stocks, and I put supers on each of them last Thursday. They are on ten frames each, which I consider very good." So it seems from this that two queens without a bee or honey built up into two ten frame stocks, which, considering the late spring, is better than the average of stocks in good condition. Of course he wanted more of such queens, and no wonder. Who would not?

It is now well known that I first received these bees safely in 1886; the attempt in 1885 proved a failure, only one worker bee landing alive. As soon as I was satisfied of their superior qualities I tried to get more, but could not, up to the end of August last year. I have had very many difficulties to consider and overcome. The first arrangement with my agent was to send boxes for fifty stocks from here, and have as many stocks sent direct; but when we began to inquire how many times they would be handled, and by how many porters, each speaking a different language, and none perhaps understanding bees, it seemed to be very improbable that I should receive any alive. So fresh arrangements had to be made, which consisted in getting the stocks up to the nearest post office, and then sending the queens forward by mail, the stocks of bees being then of no further value. Fifty stocks were obtained from the natives, and as many queens sent on to me, more than thirty of the first reaching me in fine order. I was so pleased with the condition of one lot that I sent it forward to America, after being here four days, just as it came, and it arrived safely without a dead bee. After thirty had come safely, eight came with two dead queens, then three dead out of four, there being eight which arrived dead in all. There was also a loss of two before introduction, and five have failed to lay, including one sent to America. In addition to these losses there are large numbers that do not come up to my standard, more than half, of what a breeding queen should be, and which I should not think of either selling or breeding from. There are, to make up for all these losses, some really splendid specimens, which alone are worth the trouble and expense, for breeding purposes. I am charging £5 5s. for them in this country for what I have to spare, and I must say that I consider them cheap at the price. Do not think, Mr. Editor, I am putting this off for an advertisement, it is to prevent folk writing me for a queen on the expectation of getting one for 5s. I do not care to sell any at all until their extraordinary qualities are recognised, still when I can oblige anyone I like to do so.

If I could depend on only getting the very best queens without any loss, possibly, when things were in good working order, they could be had for a comparatively low price, but I have no hopes of this for some time. Besides, when the demand springs up, which it is sure to do, the prices will have to be high to keep the demand and supply balanced. I am afraid that I could not count on more than 100 queens any season; besides, if this number passed through the post office they would be noticed and stopped, and without the post we could not get them safely, as the time occupied in transit would mean certain death. Some of our American friends seem to be trying to draw the "red herring" across these bees. Mr. Root, in "Gleanings in Bee Culture" for June 1st (page 484), says:—"It is admitted they are bad propolisers." This individual prides himself on speaking the truth. What I said—and no one else has mentioned their propolisising propensities—was, "They fill cracks or chinks with an enormous quantity of propolis, and if natural supplies fail nothing 'sticky' comes amiss, but with it they keep their combs clean, and thus make anything do for hives—even baskets." It will be noted that no admission is made of being "bad propolisers." If they daubed propolis over their beautiful white clean combs then they would be bad propolisers, but when they put the substance in its right place only I insist that they are good

propolisers. Since I wrote that I have learned that the natives keep them in rude wickerwork hives, and the bees have to fill all the little holes in their hive sides, which may have developed the propolisising instinct.

Another writer in the American "Bee Journal" for June 11th, page 766, signing himself "Veritas," says, "The Punic bee originated during the second Punic war, and was a cross between the African pissmire [ant] and the Roman mosquito." Well, if he is "Veritas" he must know, because he verifies all things; and if he knows so much cannot he cross the Punic bee with some of the numerous American insects, and so produce the veritable *Apis americana*? He has plenty of subjects over there to "operate" on.

Mr. D. A. Jones, Editor of the Canadian "Bee Journal," publishes the hope that bee-keepers will let some other fellow try them first. Is this so that he can get the start, or is he afraid Punics will get all the honey and leave none for his bees? Depend on it this will be the result where tried, for such is the six seasons' experience of—A HALLAMSHIRE BEE-KEEPER.

#### TRADE CATALOGUES RECEIVED.

 William Bull, 536, King's Road, Chelsea.—*Catalogue of Tuberous Plants and Bulbs.*

\* \* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Gardener's Dismissal (B.).**—If a gardener is paid weekly wages he cannot claim a month's notice from his employer.

**Tomatoes (D. Arkell).**—The stamped envelope you enclosed was posted the day it was received, and we trust it reached you, though the address appeared incomplete.

**Seedling Tropæolum (E. F. G. G.).**—It is a rather uncommon colour, but we have seen similar varieties before. It would not be so useful for bedding purposes as a good scarlet or pure yellow.

**Seedling Tuberous Begonias (J. S.).**—The variety is a good one. The flower sent is of capital form, and the colour is pleasing. By all means preserve it if all the other flowers are equal to that sent.

**Peach Fruit Hard (R. P.).**—The fruit is very heavy and beautiful to look at, but is very firm and stringy, with little juice. We do not know of anything likely to cause the tree to produce tender, melting, juicy fruit. It certainly is not worth growing, and the sooner it is removed and another useful variety planted in its place the better.

**Tomatoes (A. D. S. K.).**—Certainly we should save seed from those plants which are so superior to the others, assuming that the crop on them is satisfactory. Some varieties of Potatoes resist fungoid attacks much better than others, and it is prudent to grow them when they are in other respects good; and the same remarks apply to Tomatoes.

**Slug Worms on Pear Trees (G. E. B.).**—The leaves sent are seriously injured with the larvæ of one of the sawflies (*Selandria*), which deposit eggs early in summer, the "worms" subsequently appearing, and eventually they form cocoons, and passing the winter a few inches below the surface of the soil. Dusting with lime freshly slaked from lumps

will destroy the slug worms, and the earth should be removed from round the stems of the trees to an extent of 2 feet in winter, giving a good dressing of lime, and covering with soil obtained more distant from the trees.

**Changeable Clematises** (*Old Subscriber*).—The specimens you sent are interesting as demonstrating a fact that is not recognised by all—namely, that all flowers are modifications of leaves. The coloured parts of Clematises, usually called flowers, are not even petals, but sepals, the normal colour of which is green, but these change in texture and colour into floral appendages. In your specimens the change is seen in operation, half, more or less, of the sepals being in the green leaf form, the other portions in the coloured or floral form. These changes are more liable to occur in dull wet seasons than in hot dry summers.

**Propagating Tuberous Begonias** (*T. E. B.*).—An easy method of striking cuttings of these plants was described on page 145 last week, but this has reference to the luxuriant growths of plants in beds, not growths hard and exhausted by flowering, and which have no buds in the axils of the leaves. For increasing choice varieties by cuttings these should be taken when the growths are long enough and before any flower buds are visible, and placed in a warm pit for striking. When the growths are an inch or so high the tubers may be divided if desired, dressing the cut parts with pounded charcoal. Plants may be increased by any of those methods. If there are no buds in the axils of the leaves near the base of the cuttings the tubers are apt to “go blind.” Subject to the presence of those buds, stout healthy growths, and few or no flowers, cuttings may be inserted at the present time.

**Peaches Decaying** (*M. S. P.*).—The decay is caused by a fungus, *Glaeosporium læticolor*. It is by no means rare, but is rather too common, and becomes more so because means are not taken to prevent its spread, the affected fruits being left about and thrown anywhere but into the only safe place—a fire that will consume them speedily. The fact does not seem to be grasped that fungi are propagated by spores like other plants; but it is important that this should be known, and all affected fruits consigned, without loss of time, to the flames. That is a certain means of localising the disease, and, taken in time, an effective agent in preventing its recurrence. The disease affects Apricots, Peaches, Nectarines, Figs, and even Grapes. It usually attacks the finest fruits in consequence of their cuticles being extremely thin owing to their distension by the high swelling. Thus highly swelled fruits are the most readily pierced by the germinal tubes, as seen in Peaches of the Early York, Bellegarde, and Violette Hâtive varieties, in Brown Turkey Figs and Muscat of Alexandria Grapes. The only preventive is free ventilation in all the stages of growth, with available mineral elements in the soil, so that the epidermal tissues will be strengthened and hardened and made fungus proof, along with a free circulation of warm, rather dry air during the ripening process. The disease is most prevalent in heavy soils and damp locations, but it will prevail anywhere and everywhere where the conditions favouring its development are present along with the spores. Destroy all affected fruits with as little loss of time as possible.

**Yellow Thrips Infesting Grapes** (*W. J.*).—The pest infesting the Grapes is no doubt the *Heliothrips ochraceus* of Curtis, which pierces the footstalks of the bunches and sucks out the juices of the berries, causing them to have a rusty and very disagreeable appearance. It is narrow and linear, of a bright deep ochreous colour, eyes black, horns six jointed and brown at the tips, three ocelli in its crown, body hairy, tip pointed and bristled, wings shorter than the body in the male, and fringed, feet dusky and bladdered. At the tip of the body a globule of blackish fluid may be seen, and this is frequently deposited, forming innumerable spots of glutinous matter, which disfigure the fruit attacked. There is no better remedy than fumigation with safe tobacco paper. It is best done on two consecutive evenings, or in the evening and early the following morning, then follow in two or three days, and again in another week, when the pest will be subdued; but the fumigations must be effectual—that is, the house filled with smoke each time. Its prevalence is no doubt due to infection from some quarter. It is easily conveyed by persons with insects on their clothes, such as young men having care of plant houses and having to attend to the ventilation of vineries; besides, the insects have wings. The pests hibernate, and may seek and find resting quarters before it is safe to adopt measures for their destruction, but the chief thing is to destroy them as they hatch from the eggs, and this persisted in will soon effect a clearance. Thorough cleanliness and winter dressings must not be neglected, and a moist genial condition of the atmosphere acts prejudicially upon the insects, but it cannot always be accorded. The essential condition of its extirpation is to prevent its passing the winter by destroying it when active. Efficient and consecutive fumigations at not more distant intervals than a week effect that desirable object.

**Linaria vulgaris var. Peloria** (*J. R. S.*).—The accompanying illustration (fig. 25) will convey a better idea to you than a written description alone. It is an example of a peculiar phenomenon that is occasionally observed in flowers, and is termed Peloria. This consists in the transformation, or, according to some botanists, the reversion, of what are usually irregular corollas to a regular form. For example, in the Linarias and Antirrhinums the corollas, as is well known, have commonly a two-lipped form, to which the term “personate” is applied, the chief difference between the two being that the corollas of the Linarias are furnished with a spur at the base and those of the Antirrhinum are without this appendage. In the case of the variety Peloria, however, this two-lipped form quite disappears, the upper part assuming

a conical shape with the extremity five-cleft and sharply revolute, the base being furnished with five spreading spurs, giving the flowers a totally different appearance. The species itself is an attractive plant, but this variety is superior to it, as the flowers are produced so abundantly that they form a dense spike 6 to 9 inches or more in length, and of an extremely pleasing yellow colour. As a garden plant it is much appreciated both on account of its peculiarity and its beauty, and as it is readily increased by its roots a stock can soon be obtained. Occasionally fine specimens may be seen at exhibitions where classes are provided for hardy plants, and they form some of the most effective for such collections. Though not very common, this Linaria has been long known both to cultivators and botanists, and in the sixth fasciculus of

FIG. 25.—LINARIA VULGARIS VAR. PELORIA.

Curtis's “Flora Londinensis” are given some interesting particulars concerning the history of the plant, as follows:—“The earliest account that we find of the Peloria is in the first volume of the ‘Amœnitates Academicæ’ of Linnæus, published in 1749. It there forms a distinct thesis or dissertation written by Daniel Rudberg, who enters minutely into the history of the plant, describes it fully, and illustrates it by an engraving. The plant appears to have been first discovered in the year 1742 growing in a province of Sweden about seven miles from Upsal by a botanical student named Zioberg, who gathered a specimen of it and placed it in his herbarium as a plant he had not met before.” Professor Celsius observed this specimen, and called the attention of Linnæus to it, who secured plants for the Botanic Gardens at Upsal. Linnæus, it is said, at first considered it a new genus, but further examination proved that it was only a variety of *Linaria vulgaris*, or *Antirrhinum Linaria* as it was then termed. Plants of the variety Peloria have been found wild in several parts of Great Britain, but it is very rare.

IT is sometimes difficult to tell the truth on a matter without being suspected of exaggeration, but in this case it is impossible to exaggerate, and only facts will be narrated, plain, incontrovertible, sober facts. It is beyond all question that on a fine day, or nearly so, early in the present month miles of fruit plantations were traversed and millions of flowers seen and admired. Either one or the other of these would suffice as affording material for a page of the *Journal of Horticulture*, but as they were seen together, so to say, they must be referred to together at the risk of each detracting from the force of the other; though both undoubtedly, and in association, show in a remarkable manner the outcome of industrial enterprise and great business aptitude in creating wealth to the advantage of a community. The pioneers in the work of changing the character of a district in and from which hundreds of families obtain the means of subsistence in the place of tens, or even of fives, a few short years ago, ought to be the chief beneficiaries, and it is gratifying to observe that they appear to enjoy a goodly amount of prosperity, with the pleasant addition of the respect of the surrounding population.

A good deal is heard from time to time of over-population, of the people not having room to live in the old country, and of the desirability, therefore, of the formation of relief colonies in other lands. Unfortunately it is too true that there are congested districts not capable perhaps of material industrial development, but there are many more of an entirely different character, which only need capital, enterprise, and labour to increase their productiveness and value tenfold, and afford means of livelihood to ten times more families than the few that now struggle for existence. Given what may be termed favourable concrete conditions, fertile soil, fair elemental influences, and direct links, in the form of railways, with the great centres of population, and there is good hope that industrial colonies as happy and prosperous may be founded in the Old World as in the New. The "resources of civilisation" as applied to soil cultivation are not yet exhausted at home, and the best and most has not yet been done in meeting the wants of the nation by the nation, with something to spare for other nations in the form of fruit, plants, and flowers which make the millions who enjoy them the happier by their possession.

What has already been accomplished in some localities in the direction indicated demonstrates, if anything can demonstrate, the possibility of greater achievements in others. That vast tracts of land have depreciated in value during recent years is a deplorable fact, but it is not less true that there have been more exceptions to the deterioration than is generally supposed; and it is well known by many workers that the rental of hundreds of acres of land devoted to purposes of cultivation has been substantially increased. It may appear a bold statement to make, but it is true, that through a change of culture alone, from poverty stricken herbage and weedy corn fields to the production of fruit and flowers, the value of much land has not been doubled or trebled merely as represented by increased rental; but instances could be narrated in which the rise has been tenfold in about half a generation. Naturally it will be thought, if not said, that such results must be entirely exceptional. There is not the least desire to suggest that they are otherwise. Let it be admitted that the cases are distinctly and absolutely exceptional, and what then? Simply that they

exist, and do not they carry with them much significance? No evidence is said to be so cogent as that founded on accomplished facts, and that the facts alluded to are as stated those who pay and those who receive the rents know full well. Nor is it suggested that similar results are attainable everywhere, for they are not. Landowners differ, tenants differ, and soil differs; but when all are good together the standard of productiveness is bound to be raised very considerably.

But where has the progress in question been made? Where can the miles of fruit plantations and millions of flowers be seen? In the neighbourhood of Swanley in Kent. The object of a visit to this district was to verify a statement that nearly 500 tons of Strawberries had been sent from Swanley Station in July, and nearly 80 tons in one day; also to try and gain admittance to Mr. Wood's jam factory and see what was going on there. Both desires were accomplished. The one that was thought to be the most difficult in the easiest possible manner—seeing the great fruit-preserving establishment. Quite unexpectedly the first person met with at the station was Mr. Cannell. "Ah, good morning, my friend; good morning, very pleased to see you. Come along" (just as if he thought I had gone to see him alone). "Yes," was the response, "with pleasure, if you can just get me into the factory there, as I am on a fruit prospecting expedition." "All right," was the rejoinder. "I see—you just do what I tell you, and you shall see something—fruit growing, fruit picking, and fruit boiling; miles of trees, and the most beautiful country in the world. Been abroad have you? Yes; well there is nothing like it abroad—come along, and if you are satisfied with the fruit you shall see some flowers." I feared when I met the floral pioneer of Swanley he would if he could keep me all day among the flowers, as he is such an enthusiast. It is due to him to say he did not attempt anything of the kind. He spent far more time in showing the fruit of others than the flowers of his own. He is no doubt proud of his work as he ought to be, but he is not less proud of the work of others, and of what has been done in the district in which he dwells. He found Swanley with a roadside inn, a few scattered cottages, with no industries, no population worth naming, because there was small demand for labour on the farms when under grass or agricultural tillage; but a change ensued, he established himself there, let the world know it in a proper and profitable business way, and Swanley, which hitherto was unheard of beyond a local radius, became a familiar name throughout the civilised world. His energy and enterprise had a stimulating effect on others, the favourable nature of the soil for fruit culture was recognised, and facilities for distribution perceived. Farmers who grew some fruit extended their operations until hundreds of acres were devoted to Strawberries and Raspberries, mainly in the place of Potatoes, Wheat, and weeds. In the meantime his own business increased. His increasing number of workpeople required homes. He commenced building. The labour demand grew with the extension of fruit culture, and others found it both necessary and advantageous to erect houses for the workers in turn, and the work still goes on. What with glass and cottages, half of the tract of land, about half a mile long, originally obtained by Mr. Cannell will soon be roofed over, and the cottages are still, row after row, creeping down the hill, and will soon be in touch with his own residence at the foot. The whole ground at least down to the forty or fifty ranges of glass in the valley seems destined to be eaten up, and perhaps the glass will go in turn, who knows? Mr. Cannell appears to be alive to the coming change, and hence his acquisition at Eynsford. On his 300 acres there he has not only "somewhere to go," but has in great part gone, for he has built himself a much larger house there than the one he built at Swanley.

The increase of population, tenements, wealth is almost wholly due to flowers and fruit. Wealth! Yes; Mr. Cannell's ground, previously let for less than a pound an acre, could not now be

had for a ten-pound rental; and the once practically worthless poverty-stricken acres secured on long lease by Mr. Ladds have increased in the same remarkable manner by his enterprise and extraordinary business capacity. He, too, is building all around. Then there is Mr. Wood—a man who, by persevering endeavour on sound lines, has made himself a great position; while Mr. Vinson, a little further afield, who has been longer engaged in growing fruit, and kept abreast of the times in production, is one of the wealthy and worthy inhabitants of the district. It is not, however, the wealth acquired by the few that is the most gratifying feature, but the means of livelihood afforded to an army of workers where formerly a few settlers or stragglers gained fitful subsistence. The great problem of the day is to find work for workers who are willing to labour, and this, obviously, cannot be done when their work is not remunerative. The problem appears to be solved in the district in question, and in no other way could it be solved so well—namely, by capital wisely invested, and operations prudently conducted by able and intelligent men. If the thousands of wage-earners who work on the land had each been planted on a little patch, not even a remote approach to the present productiveness of the whole could possibly have been realised. A combination of the three essentials—capital, skill, and labour—was requisite for achieving such great results. It is well, indeed most desirable from several points of view, that men who can work small plots advantageously should have them as adjuncts to their wages, but these earnings must be the sheet-anchor of the vast majority, and are provided by fruit and flowers in the fertile neighbourhood under notice to thousands who could not otherwise enjoy them. We read of the wonders wrought by labour in the western wilds of America. Numbers of thrifty and lazy men are tempted there; a few to succeed after strenuous endeavour, but most to starve. Knowing a little—not from newspapers—of the state of things in the “far West,” I suspect it would be difficult to find in those “virgin lands” instances of half the money being earned by and paid to workers on and from a given area, that is produced by the renovated soil and methods of cropping and working adopted on the fertile slopes in the salubrious district of Kent contiguous to what may not be inappropriately termed the flower and fruit station of Swanley Junction.

But the fruit factory. We are a long time in reaching it, though it is close at hand. After all, I was fortunate in meeting with Mr. Cannell, for we walked straight into it as if he were a proprietor and I a purchaser of a few hundreds of tons of jam and bottled fruits for exporting to those parts of the world where similarly preserved fruits cannot be grown so well and prepared so cheaply. We have soil as fertile, or which can easily be made so, as any in the world for the growth of these fruits; we have a more temperate climate, just what they need, than prevails either in Central Europe, or in Asia, Africa, America, or Australasia; we have the best of sugar at the lowest price in the world, and therefore, practically speaking, we have the world at our feet as a market for distribution. The fruits in question are the most certain of all to afford crops to the cultivator. One kind may be scarce this year, and another the next; but a general failure is unknown, and if any particular crop is scarce the grower has compensation in higher prices. For instance, this year a hundred tons of Raspberries were wanted by a firm at £50 a ton, and could not be obtained; next year they may be plentiful at half the price. One year a Gooseberry grower sells his produce of a heavy crop of 30 or 40 tons at £10 a ton; another year, with a light crop, he obtains more than twice the price, and scarcely knows which he prefers, but is well satisfied with the average. Plum trees are sometimes almost broken down with fruit, and quantities are not worth sending to market; but with jam factories handy the crops in a year of plenty can be preserved, and a supply insured for a year of scarcity which is apt to follow. Mr. Wood has three preserving establishments—two in Kent and one in London, the last named erected at a cost of upwards of

£60,000. The trade in which he engages must be a gigantic one, and his last costly erection proves his faith in the future.

Work in the Swanley factory was going on briskly. Three thousand pounds' worth of white lump sugar was piled up in bags and bins. Preparing fruit and boiling was going on. All appears to be done by steam except “stalking and nosing” Gooseberries, which is done by the nimble fingers of women and girls, but seeing that Black Currants can be dressed by machinery and left whole when desired, the large being separated from the small at the same time, perhaps machinery will master the Gooseberries by-and-by. It can nearly do everything. In Mr. H. R. Williams' gigantic wine cellar in London bottling is not only done by machinery, but a machine prepares the corks and throws out the bad ones; and I have seen a machine of Mr. C. M. Major's husking coffee and refusing to let any light or bad berries pass the barrier into the collecting sacks. It is much the same with Mr. Wood's Currant dressing machine; it rubs off their noses on rapidly moving wire trays down which they go dancing, the large into one receptacle, the small into another, in the same way that Potatoes are sorted by machines on large farms. But all fruit is not preserved whole at Swanley. There is a large section of the consuming public who will not be “imposed on” by such fruit, but want “real jam,” fortunately, perhaps, for the makers, who willingly pulp it for them. Currants were passed down a hopper into a wire-woven cylinder, inside which brushes revolved, pressing against the wires, the pulp being squeezed from the fruit, and the stalks turned out as clean as if washed. This jam is what a certain class of customers like, others like some whole fruit with it, and others, again, prefer all whole fruit. All can be accommodated; but this must be said, in whatever manner prepared nothing but good sound wholesome fruit was seen in the factory, and that there is not a doubt that every jar is genuine.

The boiling is done by steam in twenty or thirty coppers, each holding two or three bushels of fruit. They are double-cased for affording space for the steam, which is turned on by a tap. Boiling commences in a minute, and is fast or slow as desired, being controlled by the tap, with the same certainty as a jet of gas is lowered or raised. All works smoothly and briskly, and everything is as clean as a new pin. Old methods cannot be compared with the new in preparing and preserving fruit, and it is only by such factories and machinery as Mr. Wood's that the wants of the world can be met.

But all the fruit grown about Swauley is not preserved there—for instance, Strawberries. Apart from those sent by road to London the station master's books show that during the month of July 472 tons 3 cwt. were sent direct to northern towns and 133 tons 4 cwt. to London, the most sent in one day being 78 tons; 65 tons to the north and 13 tons to London, or a total of 605 tons in 97,000 baskets of 14 lbs., or 1,358,000 lbs. of Strawberries from one station in one month. For comprehending the manner in which these are grown and gathered, readers who are interested in the subject are directed to page 181. They will there see a photographic representation of a busy scene, and acknowledge that fruit growing affords work for workers on the land.

I thought all could be said in a page of this Journal in connection with the fruit and flowers seen during a flying visit to the fields of their production, but the twin subject has proved too great, and must be resumed another day.—J. WRIGHT.

## VIOLAS IN THE SOUTH.

MR. WILLIAM DEAN wrote interestingly on these flowers in your issue of August 6th. Violas seem to be coming rapidly into favour in the south. This is no doubt in a great measure due to the fact that they are so very accommodating, and adapt themselves to our hot summers better than do fancy Pansies. I am just back from a journey in Scotland, and have seen some large collections of Violas. I have no hesitation in saying that Violas can be grown quite as well in the south as in the north. Regarding growing

Violas round London, there is a charming collection in the R.H.S. Gardens at Chiswick, sent for trial by Messrs. Dobbie & Co. of Rothesay, N.B. They have done splendidly, and are still the brightest feature in the gardens. I was informed by several trade growers in the north that the unexpected demand for Violas this spring has completely cleared out their stocks.

I often hear people grumbling about the great number of Violas they lose in a hot summer. I think the principal cause is late planting in the spring. Autumn and early spring is the proper time to plant, as Violas are perfectly hardy, but some varieties grow better than others through the summer, those that are shy to seed remaining the longest in bloom. I noticed at Kew Gardens that Ardwell Gem (yellow) and True Blue grew best. They are shy seeders; in fact, I doubt very much if any of the Ardwell Gem class seed at all, comprising as it does Ardwell Gem, Goldfinch, and the sport from Goldfinch, Duchess of Fife. This is the most charming Viola in commerce, and has been in great demand this year, one firm alone having sold 4000 plants of it. Violas that are dwarf and tufted in habit succeed best in the south, as they afford a natural shade to their own roots. Sports in Violas are of frequent occurrence. At Chiswick a variety called Delicata, sent out in 1890, has sported completely in every plant into a fine striped variety, somewhat after the style of York and Lancaster but much prettier. Again Columbine has sported into York and Lancaster, not a single flower retaining its true character.

Regarding Mr. Dean's notes on new 1891 varieties, I think Beauty, Cottage Maid, and Wonder are the best of the set. Hartree is attractive, but no improvement on either Columbine or Lucy Ashton, both of which it resembles. Mrs. Neil is a great acquisition, and next to Duchess of Fife is the finest Viola sent out during recent years. It was introduced, if my memory serves me right, by Messrs. Dickson & Son, Edinburgh, in 1890. I slightly differ with Mr. Dean regarding Sunrise. No doubt it is a large flower and rich in colour, but its flowers have such short footstalks that for sprays and glasses it is almost useless, and even on the plants it does not show well. A much better flower, after the same style, but without the above defect, is Princess Beatrice. Mr. Dean is quite correct in his notes on all the others. Self Violas having neither markings nor rays are being eagerly sought after, and are very charming. The best rayless selfs are in whites, Lady Polworth and Countess of Hopetoun. Dean's Bridesmaid is a rayless flower of a peculiar shade of subdued yellow. The best yellows are Queen of Spring, Golden Gem, and Golden Circle; all are very charming. It has been my good fortune to have seen a number of the new varieties to be sent out in 1892, and I can assure lovers of Violas that they will not be disappointed in the 1892 set, as several of them are quite novel and charming.—*VIOLA*.

### THE FINEST VINE IN BRITAIN.

ON visiting the other day, as I have been accustomed to do occasionally for years past, the gardens at Speddoch, my attention was called by the gardener to a paragraph in your issue of August 6th, headed "The Finest Vine in Britain." On reading it I was somewhat surprised to find that the writer of the article claimed this title for the Manresa Vine, and he gave the grounds on which the claim is based, mentioning at the same time the well known Vine at Kinnell House as the only possible competitor.

I am not sure that the Manresa Vine will be permitted to carry off the coveted honour so easily. The Speddoch Vine, while making no boast of its size, lays claim to qualities which are of far more value than the mere power of occupying a large space under glass. Speddoch is a quaint old mansion nine miles from Dumfries, and within half a dozen miles of the moorland solitude where Carlyle wrote "Sartor Resartus." The principal house measures only 60 feet by 20, but within that limited area grows what one of our highest authorities in matters of gardening has declared to be "the most wonderful Vine in Britain." It is of the Black Ham-burgh variety, with one rod grafted on it of the Buckland Sweetwater. It bears more than 500 bunches, averaging over 2 lbs. each; and this year, as for several years past, the total yield will be considerably over 1000 lbs. Thus, on a Vine hardly more than a fourth the size of the Manresa Vine a larger and finer crop is grown. Therefore, if judgment is to be based not on mere magnitude, but on the quantity and quality of the fruit produced, the Speddoch Vine must rank a long way ahead of the Manresa Vine.

Mr. A. Smith, who has had charge of the gardens and houses at Speddoch for over twenty years, will be glad to show this fine Vine to anyone interested; but to be seen at its best it should be visited within the next ten days, as cutting will be in full progress after that period. It may be mentioned

that there are other three houses at Speddoch containing smaller Vines, which yield proportionately as heavy a crop as "the finest Vine in Britain."—KARMI.

### NOTES ON PLANTS.

*VERATRUM NIGRUM* commands attention in the herbaceous border by the peculiarity of the colour of its blossoms, which may be described as purplish black; it is the nearest approach to black of any flower I know. Under good cultivation the flower spikes run up from 3 to 4 feet high. The leaves are a somewhat pale green in colour, broad and bold in appearance. Altogether this *Veratrum* is one of the most interesting plants in the list of hardy perennials. It does not increase rapidly; some time is needed to obtain strong plants, but when once established they annually flower well without any trouble. Our plant is growing in a nook of the rockery where it has a deep root run in holding soil, and it has had nothing done to it since it was planted five years since. Division of the roots is the most ready way of securing a stock of plants.

*Sedum pulchellum* is one of the late flowered varieties of this large family, and is extremely useful for covering parts of the rockery which happen to be somewhat overhung with trees, which this variety does not seem to mind in the least. It is close growing, not more than 2 inches high, except the flower heads, which extend 4 or 6 inches; the colour is rosy lilac. As to propagation it is perhaps the easiest of all *Sedums* to manage.

Amongst hardy *Statice* *S. latifolia* is now in its beauty on the rockery. The pale blue or lavender coloured flowers are so freely produced every year as to render it a safe plant to cultivate. It does not appear to mind if the weather is severely cold in winter or broiling hot in the summer. This *Statice* is easily grown from seed sown in the spring in a cold frame.

*Montbretia Pottsi* is this year flowering very well indeed, even more so than last year, in spite of the hard winter which has so seriously affected *M. crocosmaeflora*. We had last year several strong clumps of the latter, but they are now but weak both in the growth and flowers, indeed long after the usual time for the growth to show above the surface I thought they were dead, but a little later a few weakly growths appeared. It will require at least another season before the clumps are as good as they were last year. *M. Pottsi* does not seem to have suffered from the frost or adverse weather of any kind, for now the clumps are beautifully in flower and from 3 to 4 feet across, indeed I think the leaves are more luxuriant than I have seen them before. The brick red of the funnel-shaped flowers, which hang downwards almost hiding the internal yellow of the perianth, is quite an uncommon colour in the border. Some persons say that to get these *Montbretias* to flower really well the roots should be taken up occasionally and divided, but my experience leads me to think the reverse; certainly it is not applicable to *M. Pottsi*.

*Telekia cordifolia*, or as some prefer to call it *Bupthalmum*, is a grand plant to grow where boldness of character is appreciated, but in the ordinary herbaceous border of a limited extent it is too large to have justice done to it thoroughly. Where this shows to the best advantage is when growing on the grass, so that it may have an all-round effect. The bold foliage has a distinctly tropical appearance. The Ox-eye Daisy-like flowers resemble very much the blooms of some of the *Anemone* Japanese *Chrysanthemums*, the florets being narrow and slightly twisted, falling away from a bright yellow disc. Propagation is easily effected by dividing the roots in the autumn or spring, according to the soil in which it has to grow. If of a light character the autumn is the best, but if the reverse the spring affords the best chance of success, as growth at once takes place after removal in early April.

For continuity of flowering, easy growth, and requiring little aid in maintaining an orderly appearance in the borders, I know of no plant to excel *Bupthalmum salicifolium*. It commences unfolding its bright yellow Ox-eye Daisy-like flowers early in July and continues without intermission until the end of September, sometimes longer. There appear to be two varieties of the type; one, the most generally seen, growing not more than 2 feet high, with a somewhat spreading habit, forming a dense bush, while the other grows always fully 1 foot higher and more erect. If anything the flowers are a trifle smaller on the tall growing plant, but both are exactly of one colour. Propagation is most easily effected by cuttings of side shoots which have not flowered taken off early in September, inserted in sandy soil in a cold frame, remaining there until the following May, when they will be bushy little specimens, and if planted then where they are intended to flower they will produce abundance of blossoms the following year. It is wise to strike a few cuttings every year; a stock of neat, compact flowering plants are then always on hand. The old roots when they get too

large can easily be disposed of, the younger ones taking up less space in the border.

No plant in our rather large collection has given more pleasure than the old crimson Clove has this year. With us it succeeds well the first year from layers. In some gardens I have seen quite old plants produce abundance of blooms, but here it will not last more than a couple of years; indeed the second year it does not do nearly so well as the first. Why I know not, unless it be that the soil is too cold and wet during the winter. I notice every spring that the plants show signs of decay and eventually die in patches. We grow a bed of it about 12 feet square, half of which are young plants, the remainder a year old. Directly the flowers are past we layer the oldest, replant that part, and allow the other half to remain.

Besides their value as pot plants, *Campanula pyramidalis* and its variety *alba* are well worthy of a conspicuous position in the herbaceous border. At the present time these Chimney Bell-flowers are making a great show at the back of the border, especially where they are in contrast with large double scarlet Poppies. The plants will last a number of years, but it is not wise to allow them to do so, because they are so easily raised from seed sown out of doors in May. Some will flower the following year, all the second; if left more than three years the flower stems appear at some distance from each other, which renders neat staking more difficult. Pieces of the root will throw up strong growths and make stocky plants in a short time, treating them similarly to Seakale. No border is complete without a few roots of this type of a large family. If the trouble is taken to remove the first crop of seed pods other flowers will push forth later.

Herbaceous Phloxes are great favourites with most persons, and rightly so where a continuance of flowers is required and an extended variety of colour. One of the showiest of these now in flower is *Max Kolb*, which may not be one of the best sorts from a florist's point of view, but as a decorative plant of extremely taking colour this variety deserves cultivating. The growth is strong, the flower heads large, and no doubt with attention in confining the spikes to a limited number much larger bloom heads might be secured, but that is not my object. I grow it merely from a decorative point of view. The colour is deep rose in the centre, the outer part of the petals a pleasing shade of salmon.

I have noticed a curious circumstance in connection with many plants of *Ceanothus divaricatus* which were badly injured by the frost of the late winter, so much so that all the small branches were killed back to the main stem, on south walls as well as upon northern aspects. These small branches were cut off in April early. Hundreds of vigorous shoots pushed from the main stem, giving promise of a free summer's growth; but now most of them have turned quite yellow, and seem to be dying, which will be a lamentable occurrence where they cover large spaces, as in my case. Can anyone account for this?

Perennial Sunflowers are desirable hardy plants to grow—in fact, are indispensable where a representative collection is required. All grow erect—a point in their favour, as they are much more easily kept tidy than those which have a tendency to spread. One stout stake at the back of the plant, to which the stems should be loosely secured, is all the support needed. In my opinion *Helianthus maximus* is the best of the group. The well-formed single flowers are very showy and stately, in a growing state especially. This variety under good cultivation will grow 8 feet high. *H. communis* fl.-pl. is the oldest of the type; a full flower of a pleasing shade of yellow, height 5 feet. *H. communis* *Soleil d'Or* is pale orange yellow, very full and double, not quite so tall as the parent type.

*Clematis Jackmanni* is one of the most useful summer flowering climbers we have. Not only does it flourish admirably on a southern aspect, but it will give a greater abundance of flowers when growing at the base and covering a north wall than any other plant at this time of the year. Many persons have a difficulty in procuring plants that will succeed on a northern aspect other than those which are valuable for their foliage only. Many fail to grow it well by neglecting to prune it hard down in the spring; February is the best time for this, leaving but one or two eyes from the base. In this way the after growth is strong, and cannot fail to flower freely; it is only when the growth is weak that few flowers are produced. No plant that I know pays a better return for good treatment in the way of supplying it liberally with water and liquid manure than does this climber. Growing at the base of a south wall, for instance, during a spell of dry weather, the wall naturally absorbs much of the moisture from the soil to the detriment of the *Clematis*; it is then that artificial waterings are a boon. If this *Clematis* is allowed to entwine its growth with something else on the same wall the trouble of constantly nailing or tying it to the wall is dispensed with, and a prettier effect is secured when the long trailing shoots covered with the deep purple blossoms are allowed to hang downwards. We have it growing along with a

*Cratægus Pyracantha* and an *Aristolochia Siphon*, and right well does it succeed in the company of these two plants. For verandahs, porches, or pillars by garden entrances it is unequalled for giving a fine display of richly coloured blossoms.—E. M.

#### DENDROBIUM LEUCOLOPHOTUM.

THE English edition of the "Lindenia" for August (part vii.) contains excellent illustrations of *Mormodes Rolfeanum*, *Lælia grandis* var. *tenebrosa*, *Cattleya bicolor*, and the white flowered *Dendrobium* named above. Concerning this the following history is given by Mr. R. A. Rolfe:—"Dendrobium leucolophotum was originally described by Reichenbach, in 1882, from specimens sent by Curtis from some part of the Malayan Archipelago to Messrs. James Veitch & Sons of Chelsea during the previous year. The precise locality is said to be unknown. Prof. Reichenbach speaks of it as follows:—'Very near *D. barbatulum*, Lindl., but with a much stronger pseudo-bulb, a lax inflorescence exceeding a foot in length and much larger flowers of a fine white colour, apparently with yellowish buds. The acute chin is small, and the sepals ligulate acute, and far larger than the sepals. Lip trifid as in *D. cuspidatum*, Wall., with triangular side laciniae rounded outside, and a linear ligulate acute long anterior lacinia. All the nerves of the superior half are covered with minute lobed lamellæ, just as in *D. barbatulum*, whose conspicuous middle callus is absolutely unrepresented.'

"The species appears to be extremely rare, but there is a raceme in the Kew Herbarium, received from Signor Comendatore H. J. Ross of Florence, Italy. And now it has been re-introduced, a raceme and the complete drawing of the plant having been forwarded by Messrs. Linden, L'Horticulture Internationale, Parc Leopold, Brussels, with the information that it came from Northern Queensland. It is quite identical with the plant mentioned above. As the precise locality of the original plant is unknown it seems quite possible that it may have come from the far east, and if so, the two localities are not so far apart as they may at first appear to be. It should also be remembered that *D. Phalænopsis* occurs in Queensland, New Guinea, and Timor-laut, and *D. leucolophotum* may occur over an equally wide area. We know so little of the distribution of Orchids in this interesting region.

"Although the plant has been very well compared with *D. barbatulum*, there are some decided affinities with *D. Phalænopsis*. The long scapes and the gibbous projection underneath the spur, as well as the general shape of the flowers, are all characteristic of this group.

"The application of the specific name is somewhat difficult to understand, and its author does not explain it. From his description it would appear to be in allusion to the minute white hairs upon the disc of the lip, which may be called the crest. It has been suggested as derived from *leucos*, white, and *lophos*,\* a tuft of long hairs, 'as the mane of a horse,' and 'evidently intended to refer to the long one-sided racemes of white flowers,' but I am inclined to think that *lophos* here means a 'crest.' In any case, the name is a somewhat fanciful one. As regards cultivation it will be found to succeed under the same treatment as is given to *D. Phalænopsis*, *D. bigibbum*, and *D. superbiens*, with or near some of which I suspect it grows in its native habitat."

#### SOME SELECT ALPINES.

##### LYCHNIS LAGASCÆ.

I SHOULD unhesitatingly place this charming species in any and every selection of choice alpine, for I know none to surpass it in the beauty and profusion of its flowers, and few that are more easily cultivated or more readily increased. To the amateur or beginner in the cultivation of alpine I would always recommend this one, for with even ordinary care success is all but certain, and when a full measure of it is attained its brilliant rose-coloured blossoms are sure to tempt the cultivator to try what he can do with others. Of really easily grown and free flowering alpine, such indeed as we may justly pronounce decorative, there are numbers, and it is these that I would recommend the majority to make a

\* More correctly from the adjective *lophotos*, "tufted" or "crested."—[Ed.]

start with, especially if they would secure some of the brightest gems in the spring flora, that in a year or so would cover a space a foot or perhaps 2 feet across.

Like most members of its family this produces seed freely, consequently it is of the greatest value to the beginner, as by obtaining a packet of seeds a score or two of plants are almost a certainty, and a good show of flowers quickly follows when the seedlings appear. The seeds are glossy black, and may be sown early in autumn or as soon as ripe, which is generally about the end of June; while for a late spring display winter sown seeds are perhaps the best, for then the seeds germinate with the lengthening of the days, and if duly attended to the plants will flower the same spring. Cover the seeds lightly with finely sifted sandy loam, and, having watered them thoroughly, place in a cool spot till the seedlings appear. It is a point worth noting that the seedlings should be pricked off early, not allowing them to be crowded, and thereby become weakly, placing half a dozen in a 4-inch pot for the present; these to be thinned to half the number should all survive. If plants from a dozen or more of such pots can be pricked off so much the better, and when growth has fairly commenced remove the point of each to induce them to branch. On any favourable day these, if properly hardened by exposure, may be transplanted to the rockery in sunny spots where a deep root run of sandy loam is available; and if some well decayed manure be added this brilliant alpine will grow rapidly. When seen overhanging a rude bit of rock nothing can surpass this. It is also charming when inserted in the crevices of roughly built walls or the nearly perpendicular chinks of rockwork or on old ruins. To establish it thus is quite an easy matter, and may be done by seeds or seedlings, first boring out the mortar with a piece of pointed iron, then apply some soil, and in this latter insert the seeds or the young plants. The simplest way to obtain success with seeds is to mix them with a little soil and make all moist, when they may be readily rubbed into the places prepared for them.

#### SILENE ALPESTRIS

is another of those easily grown plants which all must admire, for it possesses every merit which can render any alpine popular. In the perfect sheet of bloom which in late spring and early summer is produced on established plants this is probably unique, and the shining leaves are hidden. The blossoms are of a pure and glossy whiteness, beautifully notched, and are 6 inches above its dense compact tuft of leaves. It is by no means particular as to soil, thriving well in any ordinary garden soil made fairly rich, spreading freely and quickly into handsome tufts, but prefers deep fairly moist soil, and should not be placed on the dry rockery. Beyond this we have no alpine more easily grown; indeed, on the level ground in quite heavy soil I have had this lovely plant a yard across in the greatest luxuriance, and even growing quite as freely as an *Aubrietia*. I have heard of its failing occasionally, but the instances are rare, and always due to improper positions. The whole of the Mossy Saxifrages on the level ground or in moist spots will soon become rampant, while on the dry rockwork they are frequently seen dwarfed and stunted in growth. Still in both cases the soil may be precisely the same; therefore soil in such a case plays quite a secondary part, and it is so with this Alpine Catchfly, which on level ground grows and flowers with the greatest freedom. Seeds are freely produced, and it may be increased by this means or by division. Freedom at the root it must always receive to allow full development to the growths that are abundantly produced. Its flowering period is from the middle of May to about the same time in July, varying of course with the season as with the locality. A native of the European Alps, and one of the best of this family.—J. H. E.

#### LINDELUFIA SPECTABILIS.

ALTHOUGH comparatively little known in gardens generally this beautiful Boragewort has been grown in a few collections for many years, and must be placed amongst the neglected favourites of past days. Messrs. Paul & Son of Cheshunt recently exhibited some specimens at one of the Royal Horticultural Society's meetings, when the illustration (fig. 26) was prepared as a means of calling special attention to the plant.

If search is made for the name given above it will not be readily found, but it appears in Walper's "*Annales Botanices Systematicæ*" for 1858 (page 539), where *Omphalodes longiflora* and *Cynoglossum longiflorum* are given as synonyms. Under the latter name an illustration appeared in the "*Botanical Register*" for 1840, where Lindley gave the following particulars:—

"Of this fine species of Hounds-tongue the characteristic marks are derived in part from the great length of the tube of the corolla, and in

part from the elongation of the processes which rise up from the mouth of the corolla, and alternate with the stamens. They are as long as the projecting filaments, curved inwards and emarginate at the apex, and hollow, which latter circumstance renders it probable that they are mere folds of the corolla and not abortive stamens. According to Brown the species with projecting stamens are to be excluded from the genus, and if so this plant is not a *Cynoglossum*. But the fruit is that of the latter genus, not of *Anchusa*, to which I presume the species must otherwise be referred. This is a very pretty hardy perennial, growing about 1½ foot high if planted in any good garden soil, and flowering freely from the end of May to the beginning of August. It is increased by seeds or divisions of the roots; but by seeds is the best way, as they are produced abundantly. However, the plants so raised will not flower before the second season after sowing. It was raised from seed received from the

FIG. 26.—LINDELUFIA SPECTABILIS.

Honourable East India Company, through Dr. Royle, in May, 1839, and collected in Cashmere. It stood out last winter in the open border without any protection."

The flowers are of a variable metallic blue tint, the centres pink, and the tube pale blue.

#### THE CULTIVATION OF THE GRAPE VINE.

[Read before the Sheffield Floral and Horticultural Society, by Mr. H. TRANTER, gardener to Sir F. T. Mappin, Bart., M.P., Thornbury, Sheffield.]

GRAPES are always greatly appreciated and stand first among dessert fruits. For general purposes there is no better way of propagating Vines than by eyes. These must be selected from well ripened wood. I cut the wood right across, about half an inch on each side of the eye, as I find they strike sooner, and they callus more quickly in sand than in loam. They may be placed in bottom heat, but after they are struck they should be shifted into larger pots, and have no bottom heat except the temperature of the house they are grown in. It is far better to have firm than large half-ripened growth. The Vines must not be crowded in dark houses, direct light and sun being essential. January is a good time for inserting the eyes in a bottom heat of about 90° and as near the glass as possible, with an atmospheric temperature of 55° at night, rising to 70° by day, keeping them moderately moist. When the plants have a few leaves on them take them out of the plunging material; and though they will not make such rapid growth as if left in, it will be firmer and safer. They must be kept growing and not checked. If the Vines are for planting out 8-inch pots are sufficiently large; if for fruiting in the following season the size should not be less than 8 nor more than 14 inches. When potted they should be for a few days shaded from the sun. In March the temperature

and general treatment as to ventilating should be the same as I will recommend for the first year they are planted in the border. I advise stopping them when they are about 6 feet high, and the laterals should be stopped to one joint. These will break again, and should be stopped so as to leave another joint. The Vines growing in the full blaze of the sun will soon become brown and show signs of ripening, and then the whole of the lateral branches may be cut off, care being taken not to injure the leaves that come from the main stem, as these have to support the buds that will produce the fruit next year.

When the leaves are acquiring an autumnal tint, or showing any sign of being fairly ripened, about September they may be removed outside against a wall, left there until the approach of frost, and then be removed to a house where they can be kept cool. The roots should never be allowed to get dry during the season of rest, nor should they have too much water.

It is of great importance to prepare a good border, one that will last a good number of years. The top 4 or 5 inches should be taken off an old pasture with not too much grass on it, 1 bushel of bones, and 1 of bonemeal to every four loads of soil; add plenty of lime rubbish and oystershells and some horse droppings or cowdung. Many make the borders too rich; it is a great mistake because you can always give manure as a top-dressing.

Mix the quantities together, and the same compost will do for pot Vines. A border about 3 feet deep is quite enough, and the bottom of the border should be concreted, and plenty of drainage used. Some situations are suitable without it, but as a rule the Vines like plenty of drainage. One foot of rubble is not too much, and then over that place a layer of turf with the grass side downwards, filling in with the compost.

The border being in readiness, the Vines may be planted at any time during spring, say about April or May, and about 4 feet apart, spreading the roots out their full length, not leaving them in a ball, and cover them about 6 inches deep, as it is bad practice to plant too deep. Care must be taken that the Vines do not sustain a check, as the progress of the Vine depends a great deal on this. When planted a little water should be given to settle the soil about the roots. It is a general practice when the Vines begin growing to rub off all the eyes from the shoots but one or two in case of accident.

Do not prune the Vines at planting time, but allow them to break, and then rub the buds off to the part where you want the young canes to start from. The best practice is to let as many canes grow as you can the first year, as this will give abundance of roots, and the more roots the more vigour in the Vines the next season. Allow the house to get full of foliage without crowding, so that they will have plenty of sun. As the shoots appear they should be carefully trained to the trellis 18 inches from the glass. If the spur method is to be adopted then only one shoot should be encouraged after the first season's growth, and it should be allowed to reach the top of the house without stopping. Admit air in sufficient quantities according to the weather, so that the shoots do not become drawn and weakly—say a temperature about 65°, rising to 70°. As the plants advance in growth give liberal supplies of water, syringing twice a day in fine bright weather to induce vigorous growth, also to keep red spider in check and the foliage clean.

By the middle of September the wood will be getting ripe; if not, fire heat must be given, so that the temperature may stand at about 70° to 75° till all the shoots assume a brown colour. As the wood begins to ripen both air and water must be gradually reduced, until the latter is entirely dispensed with. The second year is a good time to prove the varieties with one bunch each, but not to overcrop, as it is a bad plan to overcrop young Vines. For the future the canes should be shortened each year, leaving 3 or 4 feet of new wood till the length of the house is reached, leaving spurs from 2 to 3 feet apart. The leading shoots I always allow to remain, and grow to the top of the house and down the back wall before stopping. The side shoots I usually stop at two or three leaves beyond the bunch, the sub-laterals at the first leaf, and if there is plenty of room two or three more, and then we insure healthy root action, which is necessary for the proper finishing of the fruits.

When the house is full of foliage stop every lateral as soon as it shows. By that time the Vines will be in bloom, and will require a dry temperature, rising 75° to 80° by day, or even 90° to 95°, with plenty of sun and air. This is particularly necessary with Muscats. The Vines should be gently tapped to disperse the pollen, as they set better. After the berries are set commence thinning as soon as possible, and to do this will require practice. Do not handle the berries or prick them with the point of the scissors, or you will spoil the appearance of the bunches. At the same time clear all dead flowers out of the bunches, or the water from syringing will stain the berries. After the fruits begin to colour syringing must cease. Some gardeners never syringe after the fruit is set, but I am obliged to do so to prevent the increase of red spider. Have plenty of moisture in the house, and admit plenty of air when a temperature can be maintained of 80° to 85° by day and 70° by night.

Soakings of tepid liquid manure, not too strong, every two or three weeks from the time they are set till they begin colouring, are advisable for established Vines. I have also used sulphate of ammonia with good results two or three times a year. Never water the borders with liquid manure without opening the ventilators, as the steam rising from liquid manure is liable to cause rust.

VINE ENEMIES.—Vines are liable to both diseases and insects, and

in both cases prevention is better than cure. Mildew is a very destructive disease if neglected. Painting the pipes with freshly slaked lime and sulphur soon destroys it. The best preventive is a well-drained border and a sweet healthy atmosphere.

Shanking is a disease which often causes disappointment at the finish, as it attacks the stalks of the berries, eventually causing them to fall. In some cases it is caused by the roots being in an uncongenial or wet subsoil. A good preventive is a concreted bottom to the border, well ripening the wood and inducing healthy roots, thus preventing rank growth. The fruits on rank growth are very liable to shank. Rust is scarcely a disease, though a disfigurement. It is generally caused by overheating the pipes or by sulphur left on them from the previous year, cold draughts when the berries are setting, and watering with liquid manure without ventilation. Warts occasionally occur on the under side of the leaves, and some cultivators contend that they do no harm, but the leaves "cup" and are arrested in their growth. They are caused by the atmosphere being overcharged with moisture, and by insufficient ventilation.

Some Grapes are more subject to scalding than others. It occurs at stoning time. Early ventilation and a cool atmosphere are the best preventives I know. Red spider is one of the worst enemies of the Vine, and if neglected soon spreads over the house, destroying the foliage and weakening the Vines. A dry atmosphere encourages it. In guarding against it, practise cleanliness, and painting the pipes with sulphur and milk, or sponge the leaves with softsoap water. Mealy bug and thrips are often introduced into vineries through growing plants in them, and if once they gain a footing they are difficult to get rid of until the foliage of the Vines falls. The best remedy is to paint and scrub the Vines when they are pruned, and brush them with methylated spirits of wine. This will destroy the mealy bug.

The best varieties to grow are Black Hamburgh, Muscat of Alexandria, Madresfield Court, Lady Downe's, Alicante, Gros Maroc. The best for amateurs are Black Hamburgh and Foster's Seedling.

### SELF-FERTILISING FLOWERS.

A LONG list of flowers which cannot use their own pollen has been placed on record, as well as of plants that depend on insect or outside agencies for the use of their own pollen. There are also flowers which, capable of using their own pollen in a late state of anthesis, are so constructed, as regards the relative maturity of stamens or pistils, that they may be fertilised by foreign pollen before being able to use their own. The records of all these make important material for philosophical strictures. The author of this paper has performed his own share in this work.

It is a continual thought with him, however, that the facts which bear on self-fertilisation deserve equal prominence. It is a line in which there seem to be few workers. The following additions to others already recorded are offered, not because cases of absolute self-fertilisation are unfrequent, but because the study of these particular instances developed other facts of interest in the study of plant life as well worth recording as the mere fact that they are self-fertilisers.

SYMPLOCARPUS FÆTIDUS.—So much has been said of the relations between insects and flowers—even a structure so peculiarly arranged as the Skunk Cabbage, *Symplocarpus fœtidus*, being claimed as an illustration of some close relation—that I devoted a half-day of the 22nd of February to a thorough examination of plants growing in the woods and swamps within a short distance of my residence in Germantown. I gained some facts in addition to those recorded in the chapter on this plant in my "Flowers and Ferns of the United States," vol. i., series I, page 57 et seq., 1878. It was there shown that the sexual character of the plant is variable, and that the hermaphrodite condition, as distinguishing the genus and its allies from their monœcious relatives, was a very slender line. A difference was noted in the relative maturity of stamens and pistils. Sometimes the stamens matured before the pistils, or technically, the flowers would be proterandrous, at others the pistil matures days before the stamens, when the flowers are proterogynous. At that time I thought, as the result of the examination of a few flowers each season, that this difference was caused by the peculiarities of the season. The result of the examination of many flowers on the afternoon mentioned shows an almost equal number of both forms. Both thus existing at the same time and under the same conditions of temperature, the circumstances being in fact exactly the same, shows the difference to be of an innate character, and tending towards an unisexuality. Indeed, so far as one may be justified by analogy in similar cases, and in the absence of an actual test by marking the plants and waiting for results, we may risk saying of the species that it is dioecious. If this be not the case, it is certainly tending towards dioecism. In the one case the pistil pushes through the perianth, extending a full line beyond, and is capped by its beautiful head of stellate hair. No sign of the stamens is visible, though the pistil has evidently been protruded for several days, as it has lost the little globule of moisture that envelops it on its first appearance. In the other case, the swelling anthers part the perianth segments, and exhibit the apex of the pistil nestling among the anthers. Finally the apex of the pistil, in company with one stamen, is protruded barely beyond where the pistil remains, but the stamen continues until the whole of the comparatively large anther extends beyond the

perianth. The other three stamens follow the next day. Certainly on one plant are flowers on which all the stamens are in advance of the pistils, and are very vigorous, while on other plants the pistil is in advance and comparatively strong, differences which in other species are associated with fertility or infertility, or, as we say, render the plants practically dioecious.

These conclusions are reached in face of the fact that they render the problem of fertilisation still more difficult of solution. Although the dry pollen would indicate an anemophilous species, the manner in which the spathe is coiled around the spadix must render it next to impossible for the wind to be a material agent in carrying pollen to separate plants. As for insects, though I have seen a few flies on exceptionally warm spring days among the flowers, and other observers have noted similar insect visitors, these visits can be far from as general as we must demand before we can assign them any important part in a system of cross-fertilisation. On the whole of the afternoon of February 22nd, though they were the special object of the afternoon's search, the thermometer indicating 52° Fahr., no winged insect of any kind was seen. I cannot think that either insects or the wind have any material agency in fertilising these flowers. As, however, I know that some plants in the vicinity of the examination bear an abundance of seed the probability is that some individuals have flowers in which perfect hermaphroditism prevails, and that these are self-fertilising.

The great variation in the colour and form of the spathes and spadices of this plant has been often noticed. It is worthy of remark, however, that through all the changes, the striped and splashed character of the tints remains. The spathe may be either almost wholly yellowish-green, or purple, there will generally be striae of one or the other colour spashed over the surface. In one case a flower was found with a double spathe, as is occasionally seen in the common garden Calla, *Richardia africana*. The explanation given in the latter case is that the flower stem is but a consolidated mass of leafstalks, in which the blades of all but the white spathe have been suppressed. There is no reason, therefore, why these suppressed blades should not occasionally appear. The case of *Symplocarpus* shows the inflorescence to be also formed by the consolidation of several leaves, of which a second blade has been advanced though usually suppressed. This is the first case that I have heard of, but there is no reason why they should not be oftener found if looked for.

It may not be out of place to repeat what I have already noted in the chapter above cited, that the flowers are odourless, the foetid smell being given off only when the leaf or stem is broken. These facts were again confirmed on this occasion, showing the speculations that have been offered concerning the "carion like odour" of the flowers as an attraction to carion flies, to be, like many similar speculations, figments of overwrought enthusiasm.

**PORTULACA PILOSA, L.**—This is everywhere classed as an annual except by De Candolle ("Prodromus" 3, p. 354) where it is classed as either annual or biennial. Among a collection of dried specimens brought by my wife from Punto Gorda, Florida, in the winter of 1887, I found a specimen with life and planted it in a flower pot, where it has continued to grow and flower annually. Now four years old, it seems likely to live for an indefinite period. Its flowers open only, according to all authors before me, under bright sunshine, and then merely for a very brief period. De Candolle says it opens only between 10 and 12, Bon, however, (Ed. of Miller, vol. iii, p. 74), notes that this is only true of days when the sun is out. Englemann ("Plantæ Lindheimerianæ," p. 155) observes that in bright sunshine it opens from 9 to 11 or 12, and at the same time notes that the neighbouring *P. Gilliesi*, *Hook.*, originally from Chili, common in cultivation, opens from 8 or 9, to 2 or 3 P.M. in sunshine. My plant has never been set in bright sunshine, and thus the flowers which are produced abundantly and seed freely, have never opened. They must of course, be arranged for self-pollination, or they could not seed so perfectly. Opening only in bright sunshine in their country, and no one flower opening twice, a large number of those growing in their natural places must of necessity also be close-fertilised.

The inquiry which these facts suggest is whether the chance for cross-fertilisation could have been much of an object in nature in the arrangement for the opening of the flowers. It is a well-known fact, that of the immense number of seeds produced by any one plant of any kind, but a very small number escape the chapter of accidents and reproduce a plant. If cross-fertilisation were so desirable, it would seem that the flowers should have a better chance for effecting it than the brief period of daily opening, and limited, at this, to the few moments bright sunshine affords. As the facts stand, the greater proportion of seeds in this species are the product of close and not cross fertilisation.

To this fact we have to add that the expanding flowers do not seem to my mind to favour cross-pollination. The seed is most probably from close-fertilisation in the expanded as well as in those which seed without expanding. I placed on record, ("Gardener's and Landsteward's Journal," 1845), that the stamens of *Portulaca grandiflora*—a mere form probably of *P. Gilliesi*—were irritable, and in 1878 (Proceedings of Ac. Nat. Sciences, 1878, p. 332) that the stamens of the common Purslane, are irritable also. Close observations have frequently been made on these flowers, because of irritability of a precisely similar character in *Opuntia* and other Cactaceæ. But in none of these observations has there been any suggestion of design or adaptation to cross-pollination by insect or other agency.

The leading object of this paper is not however, to show the relation

which the behaviour of these flowers bears to speculations on cross-fertilisation, but to point out in how many particulars the character of some Portulacaceæ resembles some Cactaceæ. A large number of the latter open only for a single day, and for a few hours, under sunshine, during that day. In my experience a large number never expand their petals, and the sexual organs are well protected from wind and from insects, but seed just as well. The bulk of the seeds certainly, if not the whole probably, are the result of close-pollination. Again we have the resemblance in the irritable stamens, in the succulence, and many other characters. It is fair to assume that both families have had a close derivation, and if we would search for the object of Nature in so limiting the duration and period of opening and yet with a resulting productiveness, we should probably have to look back in the past to some necessity common to both families, and which does not exist at the present time.

**CUPHEA ZIMPANI.**—Observing that with scarcely an exception the flowers of the annual species of *Cuphea* were fertile, I was led to look for the evidence of self-fertility in *C. Zimpiani* in bloom in my garden, and found that it was so arranged that the reception of any pollen but its own was evidently impossible. An examination of the flower soon after the expansion of the limb would lead to the inference that it was arranged for cross-pollination. The two bearded stamens are abundantly polliniferous, while it is evident by the thick bearded mass below that the communication between stamen and pistil is completely cut off. Between the two large upper petals, however, the calyx forms a sort of sheath, down which an insect in search of honey, and not gifted with the tube-splitting habits of the humble bee, would no doubt thrust its proboscis. It would be natural to suppose an insect thus examining a flower would carry pollen to the next. But an examination of this sheath will show that the stigma cannot be reached in this way. That and the four other anthers remain coiled away in a nest of downy hair, which is at once the cradle and the grave of both. A more perfect adaptation for self-fertilisation is seldom seen.

**DAPHNE CNEORUM.**—Though I have seen this under cultivation for half a century, I have never known it to produce a seed. The flowers seem well arranged for self-pollination. The mouth of the tube is effectually closed by four anthers abundantly polliniferous, and the next day the second series of four below, also burst their sacs. The exposure of pollen is simultaneous with the expansion of the limb, and it seems next to impossible that foreign pollen should reach the stigma. The short style and stigma at the base of the tube seem perfect, but I have never been able to detect any pollen on the stigma. It is highly gelatinous and does not separate readily from the anther-cell. It looks as if it might be necessary for an insect to carry the pollen to the stigma, aiding in self-pollination as in *Yucca* and other plants. The tube is too long for the honey bee, and the humble bee slits the tube even before the flower opens, thus wholly avoiding contact with the stamens. It may be that in its native places self-pollination is aided by long-tongued lepidoptera, but this suggestion places the plant at a disadvantage in the "struggle for life" as it cannot travel as a self-fertiliser does.

"He that fights, and runs away,  
May live to fight another day,"

does not apply to a plant, which cannot run.

**LOPEZIA CORONATA.**—That *Lopezia coronata*, *Andrews*, a Mexican Onagraceæ common in cultivation, is a self-fertiliser, I am confident from the fact that every flower is fertile, and this is equally as true of plants growing in greenhouses where insects and currents of air are wholly excluded, as when growing in the open air. But I have been baffled in endeavouring to ascertain how the flower's own pollen, or the pollen of a neighbouring flower, which, as is well shown by Mr. Darwin, is practically the same thing, reaches the stigma. To one who had not been assured of self-fertilisation from the actual facts, the flowers would seem as perfectly arranged for cross-pollination as it is possible to be. In the early stages of the bud, before anthesis, the large single anther is introrse. It is sheathed by the blade of the petaloid stamen, and its own filament sheaths the style. At anthesis the connective twists, and the anther turns its back on the style. The anther cells burst at once, and some of the pollen undoubtedly falls on the apex of the style. The stamen soon recurves, until the face of the anther rests upon one of the sepals. At this time, however, the first day of opening, the apex can scarcely be called a stigma, for it is not till the second day that the globular, capitate, and capillate head, properly deserving of the name of stigma, is developed. Looking at the relative positions of stamen and stigma at this period, and when the latter might be regarded as in receptive condition, one might readily conclude it impossible that the flower could be individually self-pollinated. The next day the fading sepals and petals coil upwards and enfold the style and stigma. Whether the pollen which falls on the immature apex of the style at anthesis remains there till the stigma matures, or whether the pollen which has been scattered over the petals and sepals is brought up when the fading petals incurve, may well be a question. Possibly, as before noted, it falls from the flower above.

Certainly pollination is not effected by insect agency, and the chief point of this chapter is to show how error may creep in by mere speculations on the arrangement of the parts. Here is a case where one might well believe the arrangements were nicely adapted to pollination by insect agency, when in fact the plant in some way not clear, but certainly, is self-fertile.—THOMAS MEEHAN (in *Proceedings of Academy of Natural Sciences, Philadelphia*).

**EVENTS OF THE WEEK.**—The Oxfordshire Horticultural Society's Exhibition takes place on the 27th. Sandy (Beds) and Falkirk are fixed for the 28th. Bath Exhibition is to be held on September 2nd and 3rd. On August 28th Messrs. Protheroe & Morris will offer a consignment of *Cattleya aurea* for sale by auction.

— **NEWCASTLE SHOW.**—From a telegram to hand late on Wednesday, we learn that Newcastle Show, which was fixed for the 26th, 27th, and 28th insts., has had to be abandoned in consequence of the gale. Great damage has been done.

— **THE WEATHER.**—Showers have fallen daily of late, though there have been alternate periods of sun, but since Thursday and Friday last the rain does not appear to have been so heavy in the neighbourhood of London as in many other districts. A settled term of clear bright weather is urgently required to impart good colour and high flavour to fruit. Tuesday night was stormy, Wednesday fine.

— **TECHNICAL EDUCATION.**—Among the subjects included in the technical education scheme of the Surrey County Council "Horticulture" has a place, and Mr. J. Wright, of the *Journal of Horticulture*, has been invited to undertake the duties of lecturer on useful gardening generally, including the cultivation of fruit, in various districts.

— **A ROYAL APPOINTMENT.**—After nearly twenty years of assiduous and successful work in his extensive and important charge, Mr. Thomas Jones has resigned his position of head gardener to Her Majesty the Queen at Windsor and Frogmore. Mr. Owen Thomas the accomplished gardener to the Duke of Devonshire at Chatsworth, has had the honour of being chosen as Mr. Jones' successor, and he will enter on his duties on 1st October. By the ability he has displayed, and his diligence and devotedness in the discharge of his duties, Mr. Jones has well won the rest he seeks, and which all who know him must hope he will long enjoy; while Mr. Thomas will take with him the best wishes of the gardeners of Britain and a host of friends for his success in gaining the highest position in which a gardener can exercise his calling in the kingdom. We have not the slightest doubt he possesses the requisite qualifications for the charge, and we are convinced he will prove a worthy successor to a worthy man.

— **YORKSHIRE HORTICULTURAL SOCIETIES—A GOOD IDEA.**—We are pleased to hear that a movement is on foot to hold a great gala under the auspices of the whole of the Yorkshire Horticultural Societies next year in one of the largest and best private establishments within easy reach of the chief towns, the proceeds to be devoted to the Garden Charities. We understand that this subject has been before the Committee of the Wakefield Paxton Society, who highly approve of the proposed scheme, but as yet the matter is undeveloped. We cannot but think that the project will commend itself to other societies in Yorkshire. The Association of Gardeners is in itself good, and if by co-operation they can enjoy a day of pleasurable instruction and at the same time afford some assistance to those who so urgently need it, an example will be set that is in every way most worthy to be followed by gardeners and amateurs in various parts of the kingdom. We shall hope to hear that the proposal meets with unanimous approval, and that there will be a combined effort to make the scheme a great success.

— **DEATH OF MR. SAMUEL BRADLEY.**—We regret to hear of the death of this diligent worker and estimable man, which occurred on the 13th inst., at Halam, Notts. Many growers and consumers of Strawberries have cause to respect the memory of Mr. Bradley, for he was the raiser of Sir Joseph Paxton, Dr. Hogg, Amateur, and several other varieties, the first-named being more extensively cultivated than any other, while the second often succeeds where British Queen fails, and ranks among the best flavoured. Amateur is also a favourite in some gardens, but the two former are the best memorials of the raiser. He also raised a very useful Apple of the Codlin type, Bradley's Seedling, somewhat resembling Domino. Mr. Bradley was very unostentatious, and spent the latter years of his life surrounded with his fruit trees, which he loved so well. He was about seventy-two years of age.

— **WEIGHTS OF NECTARINES.**—I enclose the weights and circumferences of six Downton Nectarines, grown in a small house, which is used also for plants. I believe I should have had them finer but for a little mishap in the spring, through having some Arum Lilies in the house. The six fruits weighed together 2 lbs. 7½ ozs.; separately 7, 6½, 6½, 7½, 6½, and 5½ ozs. respectively. The circumference of the largest was 9½ inches, the others about 9¼ inches, with the exception of the lightest fruit. There were five dozen fruits on the tree. I should like the opinions of Nectarine growers on the fruits and crop.—J. G.

— **WE regret to announce the death of Mr. J. F. MESTON**, well known as a prominent figure connected with horticulture, which took place at Brighton on the 19th inst. at the age of 64. Mr. Meston was during the greater part of his life engaged in landscape gardening, in association with Mr. Nesfield and Mr. Marnock, and his special department was that of contracting for the execution of planting and ground-work. He was intimately associated with all movements tending to the advancement of horticultural matters, and especially of the Gardeners' Royal Benevolent Institution. Mr. Meston will be greatly missed by a wide circle of friends.

— **BRITISH FRUIT GROWERS' ASSOCIATION.**—At the Conference to be held by the above Association in the Crystal Palace on September 4th, at 4 P.M., the subjects for discussion will be "Pruning," and "Gathering, Packing, and Storing Fruits," to be introduced by practical addresses. At the Edinburgh Conference to be held in conjunction with the International Show on the second day—namely, September 10th, at 3 P.M., the programme will include an address on "The Present Condition of Fruit Culture," "Fruit Culture for Profit in Scotland," "Strawberries for Market," "Gathering, Packing, and Storing Fruits," and several other important subjects. Further particulars can be had on application to the Hon. Secretary, Mr. Lewis Castle, Hotham House, Merton, Surrey.

— **POISONING BY LABURNUM SEEDS.**—A correspondent sends us the following cutting from a newspaper which he does not name:—"At Birmingham last week seven children were taken to Queen's Hospital suffering from the effects of having eaten seeds taken from the pods of a Laburnum tree. They each showed symptoms of poisoning, and emetics had to be administered. Two of them were so ill that they had to be detained. The children had been playing in the churchyard at St. James's Church, Edgbaston, and had picked the pods from a Laburnum tree and eaten them, not knowing that they were injurious."

— **THE POTATO DISEASE.**—The Potato crops in Cambridgeshire, Lincolnshire, Northamptonshire, and Huntingdonshire are said to be attacked with disease in consequence of the continued moisture of the land. The crops are everywhere exhaling the stench which demonstrates the presence of the disease, while the leaves are covered with the fatal black spot. These counties form one of the principal Potato growing districts in the country. For the past two years the breadth of Potatoes planted has been less than it formerly was, and the presence of the disease is therefore of serious importance.

— **BIRMINGHAM GARDENERS' ASSOCIATION.**—At a special meeting, on the 19th inst., Mr. C. H. Herbert, of the Sparkhill Nurseries, read a paper on the Carnation and Picotee, giving details of cultivation, propagation, and his results in hybridising. Mr. Herbert saved seed from Benary's superb yellow Germania, and not one of the seedlings at all resemble the parent except in good growth, for amongst them are various forms of florists' Picotees, a distinct bizarre fancy Carnation, and a very large yellow ground fancy Picotee. He also exhibited several varieties, including the new varieties he raised, also Benary's new sorts. Mr. Robert Sydenham also exhibited some very fine blooms, and a good discussion followed.

— **THE ESSEX COUNTY COUNCIL** has appointed an Organising Joint Committee, consisting of six members of their own body and six members of the Essex Field Club, to form a centre for supplying lecturers and teachers (with apparatus and materials), conducting examinations, and affording help and guidance to local bodies, in connection with the recent grants towards technical instruction. A grant of £900 has been made for these purposes. The members of the Committee are: (representing the County Council) Mr. E. N. Buxton, Mr. E. A. Fitch, Mr. J. H. Burrows, Mr. S. W. Squier, Mr. F. West, and Mr. W. B. Whittingham; (for the Essex Field Club) Prof. Boulger, Mr. F. Chancellor, Prof. R. Meldola, F.R.S., Sir Henry E. Roscoe, M.P., F.R.S., Mr. F. W. Rudler, and Mr. J. C. Shenstone. The Organising Secretary to the Committee is Mr. W. Cole, 35, New Broad Street, E.C.—(Nature.)

— **ANTWERP EXHIBITION.**—A temporary Horticultural Exhibition will be held in connection with the International Exhibition at Antwerp from the 13th to the 20th of September, consisting mainly of plants from North America, the tropical Andes, Brazil, Mexico, Northern and Central Africa, Cape of Good Hope, China, Japan, British and Dutch Indies, Central Asia, Central and Mediterranean Europe, Belgium, Australia, and Oceania. Entries are to be sent to Le Président du Comité Exécutif de l'Exposition Internationale d'Anvers, à Liège, lez-Anvers, Belgique, by the 5th of September.

— **WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.**—On Wednesday, the 19th inst., a large number of the members of this Society paid a visit to the Royal Horticultural Society's gardens, Chiswick, when by special arrangement they were enabled to inspect the varieties of Tomatoes on trial, the vineries, and other houses, also the various plants and crops on trial in the grounds. The Royal Gardens, Kew, were also visited, and the afternoon well spent in the houses, museums, and grounds. After a very interesting and instructive day the members returned well pleased with the visit to these places of interest.

— **GLOBE FLOWERS (TROLLIUS)** are useful in the herbaceous borders. *T. europæus major*, which is said to be an improvement on the old form, and *T. japonicus plenus* (Fortunei), orange scarlet, give colours which are scarce at any time in the border. The foliage of the Trollius is interesting in itself, while the growth and freedom in flowering are all that could be desired.—M.

— **HOLLYHOCKS.**—Messrs. Stuart & Mein write:—"We beg to send herewith some blooms of Hollyhocks of which we make a specialty. Our plants are from 8 to 12 feet high, and the blooms enclosed can give you only a slight idea of the beauty of the spikes. We have been more successful with them this season than we have been for twenty-five years, and an old grower, when amongst them the other day, said he hadn't seen such Hollyhocks since he was a boy, so the future looks brighter." The varieties sent were as follows:—Grace Darling, rose; Oetoroon, rich crimson; Cygnet, pure white; Mrs. Maynard, pale yellow; Pride of Layton, rosy salmon; Favourite, soft pink. All the flowers were of excellent form and substance.

— **THE WAKEFIELD PAXTON SOCIETY.**—With the object of promoting a taste for domestic floriculture, a "Window Garden Exhibition" is annually held under the auspices of this Society. The Show of last week appears to have been a great success, and was attended by 5000 or 6000 people. Commenting on it the "Wakefield Express" says:—"The Paxton Society keeps up its high reputation as an educational agency in a centre whose traditions are somewhat out of harmony with the objects of the organisation. In these days of 'free education' the Society may claim the honourable distinction of having always acted upon that principle. Their exhibitions have been open gratuitously to the public at large, as a rule they have relied upon themselves rather than on the public for funds, and it is literally true to say that the educational and refining influences which they have called into action are to-day permeating the homes and moulding the dispositions of families in hundreds of the more humble homes in the city and its suburbs. It is an honourable record, and deserves to be held up every year as an incentive to others to go and do likewise, according to the measure of their ability and opportunities." To those observations we say hear, hear.

— **HEAVY RAINS NEAR LONDON.**—The heavy rain which set in over the southern counties of England last Thursday continued steadily throughout the ensuing night, and by 8 A.M. on Friday some very large amounts had been measured. In the London district the quantity varied from 1.1 inch at Westminster to 1.3 inch at Wandsworth Common, and 1.4 inch at Clapham and Brixton. The meteorological correspondent of the "Daily News" says the amount of rainfall in London was the heaviest recorded on any one day for more than a year past, the most recent instance of so large a fall being that of the 17th of July, 1890, when as much as 1.8 inch was measured as the result of a tremendous thunderstorm which visited this part of the country. From an examination of the London records for many years it would appear that a daily rainfall of over an inch occurs on an average scarcely more often than once in twelve months. During the past twenty years there have been just twenty-four such occasions, the number per annum varying from four in 1879 and three in 1878 and 1886 to none at all in 1872, 1874, 1877, 1882, 1883, 1884, 1887, and 1889. In eight years of the past twenty, in fact, there was no instance of so heavy a rainfall as that which visited the metropolis on the days named.

— **TOP-HEATING.**—I wonder more hothouses and pits are not heated from the top as well as the ordinary way. I have a 2-inch socket pipe running along the purline and along the point towards the eaves, inside of course. All persons know that hot water rises to its highest part first, consequently these pipes become hot first, and we have a stratum of the hottest air along the glass, and consequently there is no condensation. As this stratum of air is first heated it acts as a kind of cushion; the air subsequently heated rises to this, and is then deflected and falls like dew on the plants instead of condensing on the glass and creating a drip. I have used this mode of heating in Orchid houses, vineries, plant houses, and pits now some four or five years, and the houses were put up by Messrs. Foster & Pearson of Beeston. My gardeners like the mode of heating much, and say that no other form of heating is so perfect. They never have anything damp off; in fact, take just the number of cuttings they want, and never think of any loss from the cause just named. Melons, Cucumbers, Tomatoes, grow wonderfully well and bear correspondingly. We have been picking Tomatoes since March, and Cucumbers also. The Vines (early) have borne well, but the late ones have only small crops.—J.

— **NEWCASTLE AND TYNESIDE HORTICULTURAL MUTUAL IMPROVEMENT ASSOCIATION.**—On Friday last the inaugural meeting of this Association was held in the Lecture Room of the Literary and Philosophical Society, Newcastle. There was a large attendance. The following officers were elected:—Mr. Norman C. Cookson, President; Mr. Thos. Bell (Ex-Mayor) and Mr. Wm. Angus, Vice-Presidents; Chairman of meetings, Mr. Bernard Cowan; Vice-Chairmen, Messrs. P. H. Irvine and A. Heslop; Treasurer, Mr. R. Moffitt; J. Hood, Jun., Secretary. Gardeners' Committee, Messrs. Pringle, Russell, Spalding, and Adamson; under gardeners, Messrs. Elliot, Robertson, Kennedy, and Bell; amateurs, Messrs. Jackson, Scott, Harwood, and Nicholson. After the election of officers under the presidency of Wm. Angus, Esq., Mr. Bernard Cowan of South Shields gave the inaugural address. He dwelt upon the advantages of a Society like theirs, where mutual intercourse with each other was useful, both for imparting information and forming friendships, he mentioned that young gardeners might gain a great deal of knowledge by attending the meetings, and particularly urged on them the necessity of constant study to keep pace with the times. He hoped as many amateurs as possible would join, and pointed to the necessity of a Society for imparting knowledge that might be useful, as the County Council were affording easy facilities for obtaining land for garden purposes. The speaker addressed them over forty minutes, when the Chairman and he both received a vote of thanks.

— **LONDON PARK SUPERINTENDENTS.**—Some changes are taking place in the superintendence of the London public parks, and this, with the opening of a new enclosure, has created two vacancies for superintendents. After twenty-two years of service at Finsbury Park death has ended the career of Mr. Cochrane. He discharged his duties with credit to himself and advantage to the public, and the park had become famous for general high keeping and the special excellence of Chrysanthemums. The vacant post has been filled by the appointment of Mr. Melville, who has done good work at Dulwich Park, and deserves his promotion. The position he vacates has been offered to and accepted by Mr. J. W. Moorman, now at Brockwell Park, and who so ably superintended the laying out of Myatt's Fields, a small park at Camberwell. By his appointment the excellent collection of alpine and herbaceous plants got together at Dulwich Park by Mr. Melville will fall into good hands, and there can be no doubt that this beautiful South London enclosure will increase yearly in interest to the flower lover and attractiveness to the public. Mr. Moorman's post at Brockwell Park, together with the superintendence of Waterlow Park, Highgate, will be filled by fresh appointments, applications for which are now being invited by the London County Council. The salary at Brockwell Park, which is at Herne Hill in the south-eastern district, will be £100 a year, rising to £125; and that at Waterlow Park £80, rising to £105, a residence free of rates and taxes and supplied with gas and water being included in each case. Brockwell Park is possessed of great natural beauty, and it is hoped and expected that the Council will retain its present character. There is no flower gardening. Waterlow Park is, we understand, beautifully laid out, and will give plenty of scope for taste and skill on the part of the person appointed. Forms of application may be obtained from Mr. H. De la Hooke, Clerk of the Council, Spring Gardens, London, S.W., and must be sent in by September 13 h.

## LARGE AND SMALL GROWERS.

IN reply to "An Exhibitor," who says "Another season has passed and nothing has been done by the Committee of the N.R.S. to relieve a grievance still existing," I feel rather like the Irish defendant in a certain case who was sued for damages on the ground that he returned a lent kettle with a hole in it. He pleaded, if I recollect right, first that he returned it in a sound state; secondly, that he received it with a hole in it; thirdly, that he never had it all.

In the same way, if Irish myself, I would plead first that if nothing has been done it is because "An Exhibitor" and his friends took no steps to bring the matter before the N.R.S. in the proper manner; secondly, that the N.R.S. have done something by adding at least one class and two medals in the direction desired; and, thirdly, that no such just grievance existed or still exists.

In my humble opinion "if the arguments of 'J. B.' and 'An Exhibitor' have been of no avail" it is because they have been refuted.

I do not know what constitutes "growers in the upper divisions."

In the case at Hereford, as cited by "An Exhibitor," no case whatever is made out against the schedule or the management. On the contrary, as he himself admits, justice was done. Considering the nature of the cards supplied to exhibitors I do not see how there could be an infringement of regulation 2 without detection.

"Fair play is the only jewel" large "growers ask for;" but that in a backward season small growers should as usual be able to compete with those of their own standing while large growers are not allowed to exhibit at all does not seem fair play to—W. R. RAILLEM.

## BRIGHTON CHRYSANTHEMUM AND NEW HORTICULTURAL SOCIETIES' ANNUAL OUTING.

THE Brighton gardeners and their friends had their second annual outing on Thursday, the 18th inst., Redhill being their destination. The party started from Brighton a little before 8 o'clock, and were joined by others at the various stations. Arrangements had been made for an inspection of four of the best gentlemen's gardens in the neighbourhood of Redhill and Reigate. A start was at once made for Gatton Park, the seat of G. Colman, Esq. This is a beautiful old place standing on an eminence some two miles from Redhill. It is surrounded by a beautifully wooded park of considerable extent, the rich green of the pastures and the huge proportions of the Oaks and Elms giving good evidence of a fertile soil. Under the guidance of Mr. Ormiston, the able gardener and his assistants, the party at once commenced a tour round the garden and the extensive ranges of houses. Those first entered were a new range of span-roofed plant houses well stocked with clean healthy plants, two of them being occupied with Orchids. Behind these stands a fine range of forcing pits, also span-roofed, used for Cucumbers, Melons, Tomatoes, &c., and in one was a large stock of Primulas, Mignonette, and other autumn and winter blooming plants. We next passed through a range of what in olden times had been Pine pits in three divisions, but now occupied with Vines, at present carrying a crop of good serviceable Grapes. Chrysanthemums were next critically examined. About 300 plants are grown chiefly for large blooms in the orthodox style; they looked well, and promised good results. A move was then made for the front of the mansion, where a splendid view of the country round and beyond Redhill and of the park, the large lake now seen for the first time, together with the beautifully wooded Reigate hills to the right, make a charming picture not easily forgotten. On the lawn to the south of the house are some very large Elms that would compare favourably with any at Windsor or elsewhere. After having a peep into some of the mysterious underground passages, we were admitted into the marble hall. This is a marvel of itself, the floor and the walls being wholly of marble wrought out in beautiful designs. In the recesses are exquisite statuary of the same material, and in the centre is a table of elegant design, in which is concentrated all the brightest coloured marbles to be found. The mansion is now undergoing extensive alterations on the south and west fronts, which, when finished, will doubtless greatly improve those parts.

Our party then wended their way through the Park towards Reigate, feeling that we had seen a place the history of which would be worth reading up. A short halt was made on reaching the top of Reigate Hill, where there is a fine bird's-eye view of the town at our feet, and the view of the country beyond is splendid. All round it is beautifully timbered, with here and there stately mansions rearing their turrets and towers, and far to the south, over the tops of the higher ground in north and mid-Sussex, are dimly seen the rounded outlines of the South Downs. From this vantage ground we had pointed out to us the various places we were about to visit, and although we would fain have lingered over such a scene time would not permit, and the journey down to the valley was soon accomplished. The next halt was made at

## WRAY PARK,

the residence of G. Simpson, Esq. Here we were welcomed by Mr. Hoad, who conducted us through the glass structures and over the

highly kept grounds. In the former a great number of Orchids are well grown, and all departments showed good management. This place is justly celebrated for its extensive carpet bedding. The principal beds and borders are laid out in artistic designs, the groundwork being dwarf neatly kept Box, and the spaces filled in annually. Many hardy plants are used, and the whole enlivened with bright-coloured Alternantheras. In other parts of the grounds were some beds of Begonias, which looked very bright, and hardy herbaceous plants were freely planted in the shrubberies. Mr. Hoad accompanied the party to Reigate, taking a hurried look round the Castle grounds before luncheon at the Grapes Hotel.

## WOODHATCH LODGE.

Mr. Salter, gardener to T. B. Haywood, Esq., who had joined the party at luncheon, now took the lead on the road to that place. On reaching the entrance he pointed out a beautiful specimen of the Maidenhair Tree, *Salisburia adiantifolia*, standing close to the road on the left-hand side. It is at least 40 feet high, of a pyramidal shape, well furnished, and in excellent health. Inside the lodge gates a branch of a very fine weeping Beech has been carried across the drive, forming a peculiar arch with its drooping branches. Beech is quite at home here, there being some fine specimens, and also some grand old Cedars of Lebanon. We passed through several houses of Orchids, admired the elegant Palms and various stove plants, the Begonias in the Peach house, and the crops of fruit on the walls behind them. We must not pass over the Chrysanthemums. They are in strong force, about 1000, the majority being tall plants, and to judge by the "timber," Mr. Salter may expect to have something for the Aquarium when the time comes. We next passed through an orchard some little distance from the garden. The trees are healthy, carrying good crops, and seem to be treated and pruned on a rational principle. There is also a large square of Roses planted in rows of one sort for cutting, more like nursery style than a gentleman's garden. But we must hasten on to our next place, which is situated on much higher ground, and the walk up the hill was not much to the taste of the now rather tired pedestrians. In consequence of this the party was not in very good marching order. On reaching

## HIGH TREES,

the beautifully situated seat of W. B. Waterlow, Esq., Mr. C. Goldsmith, who is well known to most frequenters of Brighton shows, gave them a hearty welcome, and at once led the way round the grounds. The beds of hardy Azaleas and Rhododendrons must be very fine when in bloom. Symmetrical specimens of choice variegated Hollies, Retinospora, and other Conifers meet the eye at every turn, and hardy flowering plants are in plenty wherever there is space for them. On the front terrace are some beautiful carpet beds, but the subtropical beds were more admired, if that were possible.

This is evidently a good place for fruit of all sorts. Mr. Goldsmith takes a great interest in hardy fruit culture, and his success is well known. Lingerer over these matters brought out the query, "But where are the mums?" "Oh, we are coming to them," was the reply. And we did, some 1300 altogether. But Mr. Goldsmith does not believe in "long legs" at all, nearly the whole of his plants having been cut down, and it may safely be said that very few exceeded 2 feet in height, and the buds are now being "taken" as they come. A splendid lot of plants. In the plant and fruit houses everything was on a par with what we had already seen, but I must not omit to mention his Begonias. Two houses especially devoted to them made quite a show of themselves. All were thoroughly satisfied with what they had seen. If these disjointed notes see the light of day I am afraid it will give members who were absent but a very faint idea of the treat they lost. That the members of the societies will take the earliest possible opportunity of passing a hearty vote of thanks to the gentlemen who kindly threw their gardens open for inspection, as they did to Mr. Miller, who presided at the luncheon, and Mr. Longhurst, who organised the trip, is the desire of—ONE OF THE PARTY.

## ROYAL HORTICULTURAL SOCIETY.

THE usual fortnightly Committee meetings were held at the Drill Hall, Westminster, on the 25th inst. The building was not quite so full of exhibits as on some previous occasions, but the display was good, and, what is equally important, well varied in character. Gladioli and Dahlias were, as might have been expected, particularly prominent. Fruit, vegetables, and Orchids were few, and the chief work devolved upon the other Committee.

FRUIT COMMITTEE.—Present: P. Crowley, Esq., in the chair, and Dr. Hogg, with Messrs. G. Bunyard, R. D. Blackmore, J. H. Veitch, J. Cheal, W. Warren, T. J. Saltmarsh, A. Dean, G. Norman, G. Wythes, H. Balderson, W. Bates, A. H. Pearson, and J. Wright.

Mr. A. Bishop, gardener to R. Burrell, Esq., Westley Hall, Bury St. Edmunds, sent a large oval-shaped beautifully netted Melon, decidedly over-ripe. It was possibly very good a day or two ago, but fermentation had commenced, and therefore no opinion could be formed on the merits of the variety. Mr. Wilson, gardener to C. S. Sullivan, Esq., Broome House, Fulham, sent a fine-looking, round, yellow, well netted Melon, but its quality by no means equalled its appearance, and it was passed. Mr. Wythes also sent a Melon of promising appearance, but the quality was the reverse of satisfactory. Possibly the dull weather may have prejudicially influenced the ripening of the Melons exhibited.

Mr. W. H. Bannister, gardener to St. Vincent Ames, Esq., Westbury-

on-Trym, Bristol, sent a good dish of well-coloured Doyenné de Boussoch Pears, for which a vote of thanks was accorded. Mr. W. Roupell, Streatham Hill, sent four excellent dishes of early dessert Apples—Mr. Gladstone, Irish Peach, Red Astrachan, and Devonshire Quarrenden, grown on dwarf trees in his garden within five miles of Charing Cross. They were very good and remarkably well coloured, Mr. Roupell attributing their rich appearance largely to the use of soot in the soil, and he is probably right. Mr. T. Laxton, Bedford, sent a dish of a new dessert Apple named Harvest Queen. The fruits somewhat resemble Irish Peach in character, but were much paler and less richly flavoured than that excellent variety. No award was made. Mr. T. Burton, Bexley Heath, sent four boxes of very fine Peaches, and a vote of thanks was accorded, a medal having previously been recommended for his produce.

Sir Trevor Lawrence, Bart., M.P., sent fruits of *Prunus Pissardi*,

request was made that a dish be sent to Chiswick for comparison with the varieties grown there. It is no doubt an excellent variety. Messrs. Sutton & Sons sent samples of their new climbing Bean Tender and True. The pods were straight, stout, and brittle, somewhat resembling fine examples of Canadian Wonder, but thicker, and they were borne in extraordinary profusion on plants that were sent to show the productiveness of the variety. As this new Bean is being grown at Chiswick it was considered advisable for it to be inspected there with others that would be brought under notice. It was stated in discussion that when Dwarf Kidney Beans, such as Canadian Wonder and others, are grown in Italy and the warm districts of Southern Europe generally that they develop into runners—a circumstance that is by no means generally known in this country.

FLORAL COMMITTEE.—Present: Messrs. W. Marshall (in the chair), B. Wynne, Herbst, R. Dean, C. T. Drury, W. C. Leach, W. Goldring,

FIG. 27.—GATHERING STRAWBERRIES AT SWANLEY. (See page 172)

identical with those of the Myrobalan or Cherry Plum, from which the purple-leaved variety presumably originated either from seed or by sporting (vote of thanks). Dr. Hogg placed on the table fruiting sprays of a Plum almost exactly resembling Cherries, but rounder, glossy red in colour, and deepening to nearly black when fully ripe. They were the growths of the stock on which a double flowering Peach had been worked that he obtained from the Continent many years ago. The variety was new to him and apparently all else at the table, but it was thought it might be a seminal variety of the Myrobalan. Dr. Hogg drew attention to the circumstance that though several varieties of Plum stocks were well known and largely employed by nurserymen little or nothing appeared to be known about their fruits. A vote of thanks was accorded to the Doctor for the specimens and his observations.

Mr. James Foster, 14, Horse Market, Kettering, sent a dish of fine looking white kidney Potatoes named Tit Bits, but no award was made. Mr. W. C. Leach, gardener to the Duke of Northumberland, Albury Park Gardens, Guildford, sent a dish of Sutton's Emperor of Germany Runner Bean. The pods were straight, very fleshy, and brittle, and a

G. Phippen, G. Nicholson, H. Cannell, C. Jefferies, T. Baines, H. H. D'Ombra, W. Bain, C. E. Pearson, W. Ingram, C. Noble, J. Fraser, W. H. Williams, and Jas. Walker. Amongst the plants in the scope of this Committee,

Dahlias were a strong feature. There was quite a large display of them in the various sections. Messrs. Cheal & Sons of Crawley had some beautiful stands of Show, Bouquet, Cactus and single varieties. The latter comprised a number of well-known varieties, together with one or two novelties. T. W. Girdlestone is a remarkably neat and pleasing bloom, not too large; the petals white, margined broadly with crimson. Cleopatra is purplish brown, Duchess of Fife dull orange, and Eclipse rosy magenta. The Cactus and Decorative varieties also embraced several of comparatively recent introduction. Black Prince (new) is a large bold flower, purplish black, and darker than Zulu. Robert Maher, Lady E. Dyke, Henry Patrick, and Marchioness of Butte were all noteworthy. Messrs. Cheal also had a collection of their Tom Thumb Dahlias in pots, and ranging from 9 to 15 inches in height. A vote of thanks was awarded for these, and a silver Banksian medal for the larger collection. Mr. S. Mortimer, Swiss Nursery, Rowledge, Farnham, had some very

fine Show and Fancy Dahlias, as also had Mr. Arthur Rawlings, Romford, comprising several seedlings. The former received a bronze Banksian medal. Messrs. Keynes, Williams & Co., Salisbury, were awarded a silver Banksian medal for a very handsome collection of different classes of Dahlias, comprising several seedlings of the Cactus and Decorative group. Ione is a fine rich magenta-coloured flower, Baron Schröder being of a somewhat similar shade, Kynerith and St. Catherine described below are very beautiful. Messrs. Cannell & Sons of Swanley (bronze Banksian medal) and Mr. Phippen of Reading (silver Flora) also had displays of this popular group. Kentish Sun in the former collection was very brilliant, Eynsford Gem a rich carmine, Pride of Swanley white heavily suffused with rose. One of the most distinct varieties was Robert Cannell, carmine with curiously twisted florets, a very beautiful and striking flower.

Gladioli were splendidly shown by the great Langport specialists, Messrs. Kelway & Sons. They occupied about 70 feet of staging, and embraced some of the finest varieties of these beautiful autumn flowers. A silver-gilt Floral medal was awarded.

Miscellaneous exhibits comprised much that was of interest. Messrs. Kelway had a stand of French and African Marigolds. Mr. W. H. Divers, Ketton Hall Gardens, Stamford, exhibited a beautiful collection of border Carnations, and received a bronze Banksian medal. Six plants of Ketton Rose were shown as lifted from the open border, and the variety is recommended as very hardy and free flowering. Others were shown as cut from plants in the open that had not received any protection or been disbudded. Mr. J. Walker Thame, had a seedling self Carnation named Odorata, a flower that should prove useful. Some of the blooms were almost pure white, and others suffused with delicate rose. The variety has a pronounced Clove scent. Messrs. J. Veitch & Sons had a box of Java Rhododendrons, small-flowered forms of value for pot culture; also a small marbled-leaved Begonia named Marie Louise. Messrs. Cannell & Sons had a small collection of double seedling Begonias. Messrs. Wallace & Co., Colchester, exhibited *Lilium eximium giganteum*, evidently a free flowering form; *L. eximium magnificum*, with still larger flowers; and *L. takesima*. A bronze Banksian medal was awarded to them. Mr. A. Campbell, Lord Street, Southport, exhibited *Scolopendrium vulgare crispum* Campbelli, a very beautiful form. Messrs. Hugh Low and Co., Clapton, received a silver Banksian medal for *Lilium nepalense*, a yellow species with recurved petals, the centre of the flower heavily blotched with purple, and *L. Wallichianum superbum*, pale yellow, very large and fine. Messrs. J. Veitch & Sons showed the handsome white flowered shrub *Eucryphia pinnatifolia*, *Colletia spinosa*, *Retinospora squarrosa*, *R. s. sulphurea*, tinged with pale yellow and quite hardy, *Cupressus arizonica* (hardy) and *C. Lawsoniana versicolor*. Messrs. Dicksons, Limited, Chester, had the new border Carnations Lady Gerard, Mr. C. R. Humbert, and Miss Greenall; and Mr. Swanson, nurseryman, Barton-on-Humber, Hull, also exhibited some seedling Carnations. Messrs. R. Veitch & Son, Exeter, showed single Asters, while Asters and Perennial Sunflowers came from Chiswick. Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, had a small collection of Dahlias, Lilliums, Carnations, and Chrysanthemums. A very interesting collection of Oak foliage, comprising thirty-six varieties, came from Mr. Quartermain, gardener to C. E. Smith, Esq., Silvermere, Cobham. Mr. G. C. Powell received a vote of thanks for hybrid Gladioli.

AWARDS.—The following received first-class certificates:—

*Hypericum Moserianum*.—Large rich yellow flower with a profusion of stamens, and reddish leafstalks; distinct and handsome. Exhibited by Mr. A. Waterer, Knap Hill.

*Cupressus arizonica*.—Dull greyish green foliage, growth slender and graceful, habit bushy and compact. Exhibited by Messrs. J. Veitch and Sons.

The following flowers received awards of merit:—

*Show Dahlia John Walker*.—A large and very handsome bloom; white faintly suffused with lemon. Exhibited by Mr. J. Walker, Thame.

*Show Dahlia Mrs. McIntosh*.—A flower of admirable form, colour old gold. This and the following three came from Mr. Arthur Rawlings.

*Show Dahlia John Rawlings*.—Very large, fine form, pale mauve, distinct colour.

*Show Dahlia Mrs. Lewis Standbridge*.—Good form, clear amber hue.

*Show Dahlia Arthur Ocock*.—A large flower of perfect shape, colour crimson scarlet.

*Single Dahlia T. W. Girdlestone*.—Exhibited by Messrs. Cheal and Son, and described above.

*Single Dahlia Miss Glasscock*.—Florets soft lavender, edge deep mauve; also from Messrs. Cheal & Sons.

*Cactus Dahlia St. Catherine*.—Bright yellow, large bloom, broad pointed florets.

*Cactus Dahlia Baron Schröder*.—Handsome form; colour rich magenta.

*Cactus Dahlia Kynerith*.—Rich red, with a glow of yellow in the centre; good form, with broad pointed florets. The three latter came from Messrs. Keynes, Williams & Co.

*Cactus Dahlia Swanley Cactus*.—Somewhat small flower, orange red. From Messrs. Cannell & Sons.

*Cactus Dahlia Robert Cannell*.—Described above; a perfect Cactus Dahlia. From Messrs. Cannell & Sons.

*Cactus Dahlia Delicata*.—Soft rose, good form. From Mr. T. S. Ware.

*Carnation Mr. C. R. Humbert*.—Scarlet self border variety, very free. From Messrs. Dicksons (Ltd.), Chester.

*Carnation La Neige*.—White self, fringed flower, Clove-scented. From Mr. T. S. Ware.

*Gladiolus Thalia*.—Very large flower, ivory ground, throat suffused with crimson. This and the following two came from Messrs. Kelway.

*Gladiolus James O'Brien*.—Beautiful salmon, large bold flower.

*Gladiolus Bias*.—Salmon red, throat blotched crimson.

PRIZES FOR GLADIOLI.—There was not much competition for the Gladiolus prizes. Mr. W. Herbert Fowler was the only exhibitor both in the class for twelve and eighteen, and was awarded the first prize in each case. His spikes were very fine, and he well deserved his position. The Rev. H. H. D'Ombraim was the only competitor with nine spikes, and was placed first.

ORCHID COMMITTEE.—Present: Messrs. J. Douglas (in the chair), H. M. Pollett, H. Ballantine, E. Hill, M. T. Masters, and J. O'Brien. The duties of this Committee were light, and the business was speedily disposed of. The following were the awards:—

*Zygopetalum grandiflorum*, exhibited by Messrs. Charlesworth and Shuttleworth, received a botanical certificate.

*Cypripedium Lowianum*, exhibited by Mr. J. Douglas, received a cultural commendation.

Awards of merit were made for the following:—

*Lælia elegans blenheimensis*, exhibited by T. Statter, Esq., Manchester. This was remarkable for the large, broad, and richly coloured lip, which is of a deep purplish magenta; sepals and petals rosy mauve.

*Cattleya Behrensiana* (*Lælia elegans* × *Cattleya Loddigesi*) exhibited by Messrs. F. Sander & Co., St. Albans. A charming hybrid; sepals and petals delicate lavender, lip rich magenta crimson.

*Sobralia leucoxantha* from Messrs. Seeger & Tropp. The plant shown was bearing a solitary flower, pure white; lip much fimbriated and recurving, showing the yellow throat.

Votes of thanks were awarded to Mr. Statter for *Lælia elegans Turneri*; to Mr. J. Prewett, Swiss Nursery, Hammersmith, for *Dendrobium Phalaenopsis Statteriana*; to F. Wigan, Esq. (gardener, Mr. W. H. Young), for *Acrides suavisimum*; and to M. S. Cook, Esq. (gardener, Mr. Cullimore), for *Cattleya velutina*.

Rev. H. H. D'Ombraim delivered a practical lecture on Gladioli in the afternoon, Dr. Hogg presiding.

## SHREWSBURY SHOW.

THOSE persons who have not seen the fine old town of Shrewsbury at the time of the annual Horticultural Exhibition can scarcely form an idea of the scene it presents when the people are flocking in to the beautiful Quarry grounds to admire the exhibits and generally to spend a day of recreation and enjoyment. It is the great gala day of the district, and on the 20th inst., the second day of the Show, no less than seventy excursion trains had to be emptied and filled at the station; or as a railway inspector stated the case, "140 trains, in and out; had to be dealt with." The town was decorated in the most profuse manner, the main street being almost canopied with flags, streamers, and emblematical devices in almost every imaginable colour. The crowd was enormous, and Fleet Street, one of London's famous thoroughfares, does not present a more animated appearance on Lord Mayor's day. Even the side streets and out-of-way places are decorated for the occasion. Business appears to be suspended for the time, and hotels are crowded. The Quarry grounds, delightful in character and appropriate for the occasion, occupied as they appeared to be with twenty or thirty large marquees for one purpose or another, and such a company as does not congregate elsewhere at a "flower show," were a sight to see and remember. A splendid feature of these grounds is a magnificent avenue of Limes that skirts the banks of the Severn in its semicircular course, and another cross avenue from the centre of the arc, forming lofty and complete arcades of foliage. The trees were planted 170 years ago, and must be considerably more than 100 feet high. In the centre of the grounds is what presumably has been the real quarry, now a beautiful sunken garden, bright with flowers, and cool, by a miniature lake that meanders through. Then the music is of the best that money can obtain, and various other attractions are provided; but the "Flower Show," as it is called, is the central attraction, and the tents are densely crowded all the time with visitors. It is easy for straight-laced horticulturists to raise objections to auxiliary attractions at shows, but in such places as Shrewsbury the difficulty is not to get people into the tents, but out of them, so that the greatest number may have an opportunity for at least glancing at the plants, flowers, fruit, and vegetables, in which they are evidently deeply interested, and therefore counter attractions are a necessity of the case.

The Shrewsbury Show is a great representative exhibition of garden produce, and taking all departments and the different classes of exhibitors into consideration, it may be safely said the Show of last week has never been surpassed, if equalled. Specimen plants were of the best that could be produced at the season; artistically arranged groups excelled all other competitions of the nature yet presented; flowers were staged in great profusion and variety; fruit was extensively and well shown, but the Grapes, as a rule, not quite finished; and vegetables were remarkable for their numbers and the cultural skill displayed in their production. The cottagers' exhibits were extraordinarily good,

vegetables especially; while fruit was well and flowers admirably staged by the humble toilers. Eighteen Judges were engaged to adjudicate, and there was not one too many for doing their work well in the appointed time.

The finances of the Society are altogether exceptional, the accumulated amount after all expenses were met at the beginning of the year being no less than £3251 5s. 5d. With such a large balance the Committee decided to increase their long prize list. This proved a wise step, and brought together no less than 3150 entries. Their principal increase was for the best arranged group of miscellaneous plants in 300 square feet. As was stated last week, the first prize of £20 was won by the Duke of Sutherland's gardener, Mr. Peter Blair, who certainly ought to be proud of his work, as no doubt the exhibit was one of the best of its kind ever seen at any show. The specimen plants were so fine, and the competition so close, that the Judges, in their efforts to do justice, were driven to award equal first prizes to Messrs. Marriott and Cypher. Specially noticeable among the vegetables were the grand first prize collections of Messrs. T. Wilkins and C. J. Waite; the centres of attraction in the fruit classes being the premier collection of Mr. Goodacre and the Grapes of Mr. Bannerman. In a show of such magnitude only the chief prizewinners and their productions can be briefly enumerated.

**PLANTS.**—Groups of miscellaneous plants.—First, Duke of Sutherland, Trentham. This was a specially well arranged group, the chief plants being Palms, Crotons, Orchids, Tillandsias, Liliiums, Anthuriums, and Caladiums, artistically disposed in a series of mounds and dells. Second, J. H. Sutton, Esq., Newark-on-Trent (gardener, Mr. A. Webb). This group would have been easily first at most shows, but it lacked the refinement and taste displayed in the former. Third, Col. Pepper, Salisbury (gardener, Mr. Currey). Fourth, C. H. Wright, Esq., Oswestry (gardener, Mr. C. Roberts). Fifth, Messrs. Jones & Sons, Shrewsbury.

**Specimen Plants.**—Sixteen stove and greenhouse plants, not less than six in bloom.—As before stated Messrs. James Cypher and Mr. James Marriott, Coventry, were placed equal first. Mr. Cypher's best plants were grand specimens of *Phenocoma prolifera* Barnesi, *Bougainvillea glabra*, *Ixora regina*, and *Croton angustifolius*; Mr. Marriott's most noteworthy examples being *Ixora Duffi*, splendid; *Dipladena floribunda*, and *Ixora Williamsi*. Third, Mr. Currey. Six stove and greenhouse plants, open to Salop only.—First, Mrs. Juson, Monklands, Abbeyforegate (gardener, Mr. J. Farrant) with well grown specimens, *Croton majesticus* and *Ixora Williamsi* being remarkably well shown. Second, H. H. France Hayhurst, Esq., Wellington (gardener, Mr. S. Brimmell). Third, Lord Berwick, Attingham Hall (gardener, Mr. Pearson), with creditable examples. Six exotic Ferns.—First, C. H. Wright, Esq., Oswestry (gardener, Mr. C. Roberts), with good clean fresh specimens. Second, Mr. J. Cypher with larger specimens. Third, Mrs. Juson. Six exotic Ferns, Salop only.—First, Mr. H. H. France Hayhurst. Second, Mr. G. Burr. Third, Mrs. Juson. Six plants in flower.—First, Mr. J. Marriott, his best specimens being *Bougainvillea glabra* and *Ixora Williamsi*. Second, Mr. J. Cypher. Third, Mrs. Juson.

A group of not less than twenty Orchids in flower.—First, Mr. J. Cypher, whose exhibit was of great excellence, the plants being healthy and well flowered. Second, the Duke of Sutherland with a charming assortment. Four Orchids in flower.—First, James Watson, Esq., Berwick Hall (gardener, Mr. A. Grant). Second, Mrs. Juson. Six Palms.—First, Mr. J. Cypher with very fine specimens. Second, the Duke of Sutherland. Third, Mr. Sutton. Six *Dracenas*.—First, H. H. France Hayhurst, Esq. Second, Mrs. Juson. Third, J. H. H. Sutton, Esq. Six *Caladiums*.—First, Mrs. Juson with well grown plants. Messrs. H. H. France Hayhurst, A. Myers, and J. Laing, Cherry Orchard (gardener, Mr. Francis Morris), took the prizes for *Coleus* in the order named. Mr. A. Myers was first for *Fuchsias*, also for double and single *Pelargoniums*.

In the amateurs' classes Mr. H. Owen, Mr. R. Taylor, the Hon. W. H. Herbert, Mr. W. Beacall, Mrs. L. Burd, and Mr. C. H. Smith were the most successful exhibitors. In the class for twelve table plants the Duke of Sutherland was first. Second, Mrs. Juson. Third, Mrs. Watkins (gardener, Mr. J. Birch). For fifty miscellaneous plants Major-General The Hon. W. H. Herbert, Mr. R. Powell, and Mr. G. Burr were successful in the order named; Mrs. Wade, H. Owen, Esq., and G. Burr, Esq., taking the prizes in the corresponding class for twenty-five plants. The competition was good in all those classes, and the exhibits reflected credit on the several cultivators.

**CUT FLOWERS.**—This department of the Exhibition was an improvement on all previous years, and a powerfully attractive feature. In the class for twenty-four Roses Messrs. Perkins & Sons, Coventry, were first with a capital stand, considering the weather and season, excellent blooms in it of Her Majesty, Mrs. John Laing, Susanne Rodocanachi, and Duke of Connaught, attracted attention. Second, Messrs. Dickson, Limited, Chester. Third, Mr. E. Murrell, Shrewsbury. Liberal prizes of £5, £4, and £3 were offered for a collection of Dahlias, all kinds, and Messrs. Jones & Sons, nurserymen, Shrewsbury, had a very good assortment of Cactus, single and Pompons, admirably displayed with a large number of Show Dahlias in the front. Two other smaller collections were staged for the second and third prizes by Messrs. J. Walker and Heath & Sons. In the class for twenty-four Show Dahlias Mr. J. Walker, Thame, Oxon, was first with bright, well finished blooms, Mr. Wm. Shaw, Kidderminster, being second. A certificate was awarded to Mr. Walker for a fine and evidently constant white Dahlia, John Walker.

Prizes of £5, £4, and £3 were offered for a collection of Gladioli open

to nurserymen, but only one collection was staged, a grand one by Messrs. Kelway & Sons, Langport, consisting of 150 spikes, containing some beautiful new varieties. Certificates were awarded to Ellen Terry, white, exquisitely feathered with bright rose; Henry Irving, delicate pale salmon with deeper coloured centre; and Frank Miles, creamy blush with rich carmine stripes, yellow throat. All these are of the finest form, and of good substance. Amongst the collection as extra fine and striking were the following:—Pithys, Viscount Glenworth, Baron Schröder, intense deep scarlet with almost black stripes; Lord Shaftesbury, Satellite, General Cobert, Clarence, Lady Leigh, Lady Maefarlane, Duni, rich deep scarlet; Emperor William, Mrs. Grimwood, Electra, and Lady Carrington. Some good Asters were staged, Mr. J. Walker taking the first prize with well set up bright blooms of *Pæony* flowered.

There was a fine display of cut stove and greenhouse flowers in twelve varieties.—First, Mr. Finch, gardener to Mr. Alderman Marriott, Coventry, with grand masses of choice kinds. Second, Mr. G. Williams, with a very fine stand. Cut flowers of herbaceous plants were admirably represented. In the class for twenty-four, nurserymen only, Mr. Murrell, Shrewsbury, was well ahead with large bunches well arranged, and Messrs. Jones & Sons were an admirable second with a fine display.

Prizes of £5, £3, and £2 were offered for two bouquets, bridal and ball-room. There were five exhibits, and better bouquets are rarely met with at an exhibition. Messrs. Perkins & Sons, Coventry, were first with a pair of artistically made bouquets; Messrs. Jones & Sons, Shrewsbury, a very excellent second; and Messrs. Pope & Sons, Birmingham, third with fine examples, but too massive for ladies' use. Extra prizes of £1 each were awarded to the other two exhibitors, Messrs. Heath and Son and Mr. Chard, as their bouquets were so good.

Epergnes reflected very much credit on those who arranged them. Messrs. Jones & Sons were first; Mr. J. Cypher, Cheltenham, second; Mr. J. R. Chard, Stoke Newington, London, third. Some capital stands of Carnations and Picotees were staged, Messrs. Thomson & Co., Birmingham, being first in each class for twelve, also first for twelve Fancies or Sells. Mr. A. R. Brown, Handsworth, Birmingham, was second in each class for twelve Carnations, fine blooms of Little Phil and Thalia being in this stand; also for twelve Picotees. In Messrs. Thomson's stand of Carnations were very fine blooms of C. H. Herbert, Alisemond, Duc d'Aumale, Robert Houlgrave, and a very promising rose flake seedling. In their first prize stand of twelve Fancy varieties were fine blooms of A. W. Jones, Lilian, and Von Beningen. This firm also received certificates for their superb seedling Fancy Picotee, A. W. Jones, and new crimson bizarre Carnation C. H. Herbert.

Honorary exhibits were numerous. Messrs. Dobbie & Co., Rothesay, staged an extensive collection of Violas, fine Fancy Pansies, well striped French Marigolds, and the most perfect African Marigolds we have seen. Messrs. Henry Cannell & Sons, Swanley, exhibited fine double and single Begonia blooms; many of the doubles had great breadth of petal and were very fine; a collection of Cactus Dahlias, amongst them Mrs. Douglas, Beauty of Arundel, Maid of Kent, and Odin being very noticeable, and a stand of *Gladiolus Marie Lemoine*. Mr. R. B. Davis, Yeovil, staged very fine single and double Begonia blooms, amongst the latter a remarkably fine variety, Mrs. B. R. Davis, as excellent in form as a handsome Camellia, a light flower with a bright, light pink margin, to which a certificate was awarded. Mr. M. Campbell, florist, Blantyre, staged three dozen blooms of his good white Carnation Mrs. Muir, and stands of other Carnations and Picotees; also Fancy Pansies, amongst the latter a very fine variety, Mrs. M. T. Atkinson. Mr. Henry Eckford, Wem, Salop, sent twenty-four bunches of his newest varieties of Sweet Peas, nicely staged in bunches, amongst them the very fine varieties Mrs. Eckford, Ignea, Lemon Queen, Dorothy Tennant, H. M. Stanley, and others. Messrs. Thomson & Co. set up excellent border varieties of Carnations in loosely arranged bunches; Mr. Henry Pattison, Shrewsbury, Fancy Pansies and Violas; Messrs. Clibran & Sons, nurserymen, Altrincham, cut herbaceous blooms, Begonias, &c., including two new dwarf Tropæolums, Clibran's Gem and Mrs. Clibran, to which the certificates were awarded; Messrs. Dicksons, Limited, Chester, some fine Roses, also border Carnations; Messrs. Ryder & Co., Sale, Manchester, Tuberous Begonia blooms; The English Fruit and Rose Company, Hereford, a fine lot of Rose blooms, including a twenty-four box of Mrs. John Laing; Messrs. Hewitt & Co., Solihull, cut herbaceous and Cactus Dahlia blooms; Mr. Innes, florist, Rothesay, Fancy Pansies, including Maggie Lawrence, a fine Archie Buchanan style of flower; and Mr. A. Lister, Rothesay, Fancy Pansies, and a certificate for Mrs. McCorkindale, a fine variety.

**FRUIT.**—The competition was very keen throughout, and only those showing first-rate produce stood a chance of winning a prize. Lord Harrington's first prize collection of twelve dishes, grown by Mr. Goodacre, contained excellent bunches of Foster's Seedling and Gros Guillaume, also fine, but not quite finished, Muscat of Alexandria, and good Black Hamburg Grapes, with a capital Queen Pine and strong dishes of Circassian Cherries, Barrington Peaches, Melon The Countess, Kirk's Plum, Lord Napier Nectarine, Brown Turkey Figs, and Moorpark Apricots. Second, Hon. Mrs. Ingram, Leeds (gardener, Mr. R. Davies), the best dishes being Queen Pine, Black Hamburg Grapes, Sea Eagle Peaches, and Roman Nectarine. Third, W. A. H. Martin, Esq., Ledbury (gardener, Mr. J. Bailey). For nine dishes ditto, open to Salop only, Sir C. H. Rouse Boughton, Bart., Downton Hall (gardener, Mr. H. E. Kennedy), was first with good dishes of Muscat of Alexandria and Black Hamburg Grape, Noblesse Peaches, Eastnor Castle Melon, fine; Frogmore Late Pine Strawberry in excellent condition; Moorpark Apricots, Pineapple Nectarine, Brown Turkey Figs, and Peach Plums. Second

S. K. Mainwaring, Esq., Ellesmere (gardener, Mr. C. Pearse). Third H. T. Hayhurst, Esq.

In the class for six bunches of black Grapes there were six competitors, Mr. Bannerman's Alnwick Seedling, Black Alicante, and Black Hamburgh being very fine indeed; Mr. J. Barker's second prize bunches being larger, but not so well finished. Mr. W. Iggulden exhibited well for the third prize, an extra being awarded to Mr. H. C. H. Wynn. Ten competitors entered in the class for three bunches of Black Hamburghs, Rev. Bulkley Owen, Tedsmere Hall (gardener, Mr. J. Langley), S. K. Mainwaring, Lord Bagot, and Miss Christy (gardener, Mr. C. Griffin) being awarded the prizes in the order named. Three bunches of black, any other variety.—First, Mr. James Thorpe. Second, Mr. J. W. Raynes. Third, Mr. S. K. Mainwaring. Four bunches of white Grapes, two varieties.—R. Pilkington, Esq., was first with Foster's Seedling and Muscat of Alexandria, J. Thorpe, Esq., second, and the Earl of Harrington third. Three bunches of Muscat of Alexandria.—First, R. Pilkington, Esq., with superb bunches, well finished. Second, Mr. Charles Dawes. Third, Earl of Harrington. Three bunches of white, any other variety.—First, Earl of Cork, with well finished bunches of Foster's Seedling. Second, J. T. Harries, Esq., Stone, Staffordshire (gardener, Mr. G. Bates), with the same variety. Third, the Earl of Harrington. In the classes open to Salop only, the Rev. T. B. Owen, S. K. Mainwaring, Esq., and Captain Cunliffe were the successful exhibitors.

Peaches were plentiful and good; the Earl of Cork took first honours with a good dish of Sea Eagle, the same exhibitor being again first for Apricots. The Hon. Mrs. Ingram was the most successful in the Nectarine class with a well-coloured dish of Lord Napier, seventeen lots being staged. The best Plums, purple or red, were staged by Mrs. C. Davies, a good dish of Kirk's; the best yellow Plums by the Earl of Cork. Melons were very numerous, R. C. Naylor, Esq., being first with green-fleshed, and Mrs. Ingram with scarlet-fleshed. The best dish of Cherries were from the gardens of the Right Hon. Hume Dick (gardener, Mr. W. Palmer). In the classes for six dishes of hardy fruits Lady Sutton, Combermere, Mr. C. Davies, and Mr. F. Meares were successful in the order named. Special prizes were awarded to Mr. Sneyd for five dishes of Figs, and to Mr. Davies for five Pines.

**VEGETABLES.**—In the class for twelve dishes Lady Theodore Guest (gardener, Mr. F. Wilkins) won first honours with a grand collection, the dishes being Green Globe Artichokes, Sutton's Autumn Mammoth Cauliflower, Lyon Leek, Deverill's Ailsa Craig Onion, Giant White Celery, Ne Plus Ultra Runner Bean, Sutton's Perfection Tomato, Sutton's Student Parsnip, Duke of Albany Pea, and Sutton's Satisfaction Potatoes; second, Col. the Hon. W. P. Talbot (gardener, Mr. C. J. Waite), both with splendid produce. Third, the Earl of Dudley, Himley Hall (gardener, Mr. Coombes); six competitors. Six varieties, open to Salop only.—First, Capt. Cunliffe, with a good collection, his best dishes being Rousham Park Hero Onion, Carter's Jubilee Runner Bean, and Chancellor Potato. Second, W. R. Mansell, Esq. Third, Mrs. Juson.

Potatoes were in great force. In the class for six dishes the Earl of Dudley was first with superior dishes of Sutton's Satisfaction, Edgemoor Purple, Sutton's Abundance, Sutton's Windsor Castle, Cole's Favourite, and Early White Beauty. Col. Talbot was first for three dishes with Sutton's Seedling, Queen of the Valley, and Pride of Ontario. The classes for single dishes of vegetables were all well filled, the produce being of first-rate quality; the principal winners were Messrs. A. E. Payne, H. H. France Hayhurst; T. J. Lowe, the Right Hon. Hume Dick, Mr. W. E. King King, and the Earl of Dudley.

Messrs. Webb & Sons' special prizes for eight dishes of vegetables, to include two of their own varieties, brought a good competition, Col. Talbot being first with a grand collection, consisting of Mammoth Red Celery, Webbs' Early Mammoth Cauliflower, Cranston's Excelsior Onion (very fine), Webbs' Defiance Intermediate Carrot, Stourbridge Marrow Pea, Webbs' Renown Potato, Jubilee Tomato, and Scarlet Runner Bean. Second, Lady Theodore Guest. Third, The Right Hon. Earl of Dudley. Fourth, Capt. Cunliffe. Fifth, Earl of Latham. For Sutton & Sons' special prizes the classes were all well filled. Melons.—First, Earl of Cork. Second, Mrs. Juson. Cucumbers.—First, Earl of Cork. Second, Right Hon. Hume Dick. Tomatoes.—First, Earl of Dudley. Second, Hon. Mrs. Ingram. Dish of Peas, thirty pods.—First, T. Mears, Esq. Second, Right Hon. Hume Dick. Carrots.—First, Right Hon. Hume Dick. Second, E. W. Darby, Esq. Messrs. Carter and Co. also gave special prizes for their Jubilee Runner Bean, Blenheim Orange Tomato, also for their Blenheim Orange or Holborn Favourite Melons; Lady Guest, J. J. Craven, Esq., and the Earl of Cork being the principal winners. Mr. Robert Sydenham's prizes for vegetables were won by Messrs. R. J. Greator and H. H. France Hayhurst. Special prizes were offered for the heaviest bunch of Grapes by Mr. William Colchester, Ipswich. First, James Thorpe, Esq., with Black Hamburgh, 6 lbs. Second, H. H. France Hayhurst, Esq., 4 lbs. Third, Hon. C. H. Wynn, 3½ lbs.

**COTTAGERS' PRODUCE.**—As before mentioned, this was of a remarkable character. The Right Hon. Lord Harlech (President of the Society) kindly offered special prizes of £5, £3, and £2 for the best collection of eight dishes of vegetables, Cucumbers and Potatoes excluded. This brought together thirty-four exhibitors, the premier honour falling to Mr. Job Peplow, Bicton. Second, Mr. W. Haycock, Oswestry. Third, Mr. J. Beetlestone, St. Michaels Street. It is impossible to speak too highly of the produce in the cottagers' tent, and the prizes offered were well won by the several competitors.

**MEDALS.**—Silver medals were awarded to Messrs. Pritchard & Sons

for a collection of plants and cut flowers; Mr. E. Murrell, for a collection of plants and cut flowers; Messrs. Dobbie & Co., for Violas, Pansies, and Marigolds; Mr. Henry Cannell, Swanley, Kent, for new Cactus Dahlias, double Begonias, and Gladioli. Bronze medals to Messrs. Cutbush & Son, Highgate, London, and Mr. A. Myers for collections of plants and cut flowers.

**CERTIFICATES.**—In addition to those previously mentioned special certificates were awarded to Messrs. Dobbie & Co., Rothesay, for African and French Marigold blooms, also for a collection of Viola blooms; Mr. J. R. Chard, for Arcadian table decorations; Messrs. Lewis & Co., new Orchid, *Miltonia spectabilis alba*; Messrs. H. Cannell & Sons, Swanley, Kent, double Begonia blooms, new Cactus Dahlia, and *Gladiolus Marie Lemoine*; Mr. R. B. Davis, Yeovil, Somerset, double and single Begonia blooms; Mr. Peter Blair and Messrs. Jones & Sons, Shrewsbury, for groups of miscellaneous plants; Mr. H. Eckford, Wem, new varieties of Sweet Peas; Messrs. Thompson & Co., Birmingham, border Carnations and Picotees; Mr. J. H. Pattison, Shrewsbury, Viola and Fancy Pansy blooms; Messrs. Dickson & Sons, cut Rose blooms and border Carnations; Messrs. Ryder & Sons, Manchester, Tuberous Begonia blooms; Mr. H. Cuthbertson, Rothesay, cut herbaceous blooms; Messrs. Hewitt & Co., Birmingham, herbaceous and other cut flowers; the English Fruit and Rose Company, Hereford, collection of Roses; Messrs. Clibran & Sons, Altrincham, herbaceous cut flowers; Mr. Alex. Lister, Rothesay, for Fancy and Show Pansies; Mr. William James, Rothesay, for Fancy Pansies; Messrs. Clibran & Sons, for *Pteris serrulata Clibrani*; Messrs. R. Smith & Co., Worcester, for *Pteris serrulata Smithiana*; and Mr. Cuthbertson, Rothesay, for a new Leek.

The Judges were—Mr. J. Wills, Mr. A. Outram, and Mr. J. Wright, London; Mr. Colc, Althorpe Park, Northampton; Mr. Ranger, Aigburth Nursery, Liverpool; Mr. W. Dean, Sparkhill, Birmingham; Mr. G. T. Miles, Wycombe Abbey; Mr. R. Coleman, Eastnor Castle; Mr. H. Gadd, Lenton, Nottingham; Mr. J. Muir, Margam Park; Mr. H. W. Ward, Longford Castle; Mr. F. H. Pownall, Lenton Hall; Mr. W. Beacall, Shrewsbury; Mr. T. P. Blunt; Mr. T. Selwood, Eaton Hall; Mr. J. Lambert, Powis Castle; Mr. J. Jones, Cloverley; and Mr. P. Blair, Trentham.

**THE ATTENDANCE.**—The Show, as above indicated, was attended by thousands of visitors. On the first day there were present 15,000, and the amount taken at the gates was £315 16s. 2d., as against £311 13s. 9d. in 1890. The receipts from this source alone are greater than those of any Show in the history of the Society. On the second day there were present 45,000 persons. The actual amount taken at the gates was £1413 11s. 4d. To this must be added a sum of about £625, representing the sale of cheap tickets; £400, or thereabouts, for subscriptions; the amount realised by the sale of programmes, and the sums due to the Society by the various contractors, so that the actual receipts cannot fall far short of £3000.

**THE SOCIETY'S GIFTS.**—The Society has made many and valuable gifts to the town, these amounting in the aggregate to £2652. The record of the liberality thus bestowed shows that in 1878 a donation of £100 was made to the Corporation for improvements to the Quarry; in 1879 £233 was paid for erecting the band-stand; in 1881 the beautiful gates at the entrance to the Quarry were erected at a cost of £216 9s. 3d.; in the same year the Society gave a donation to the Salop Infirmary of £105; in 1888 they erected the smaller gates at the entrance at Quarry Place, and provided seats and music stands in the band-stand at a cost of £155 8s.; a donation of £105 was also given that year; in 1886 the handsome lodge at the entrance to the Quarry was built at a cost of £486 6s. 5d.; in 1887 a presentation of £105 for books was made to the Free Library; railings provided at the Quarry entrance (£112 13s. 6d.), and the band-stand enlarged at a cost of £304 12s. 3d., and in 1888 a donation of £300 was given towards the erection of the Shrewsbury Public Baths.

Messrs. Adnitt and Naunton, the courteous and indefatigable Honorary Secretaries, are adepts in the art of conducting large shows and large gatherings. On this occasion all things worked smoothly, and the officials are to be congratulated on the brilliant success achieved.

## BASINGSTOKE SHOW.

AUGUST 20TH.

THIS Show suffered like many others through the drenching wet day on which it was held. It took place in Hackwood Park, a site most suitable for such a gathering, as it affords ample space for promenading amongst the very fine timber trees with which the Park is thickly studded. Oaks and Beeches appear thoroughly at home, judging by the straight, clean stems which they are furnished with. The Exhibition was a thoroughly representative one, vegetables especially standing out boldly; indeed, such a name has this Society gained for kitchen garden exhibits that extra fine produce is expected here every year. Plants showed a slight falling off in number, but the quality was thoroughly representative. Three large tents were required to hold the exhibits, and a smaller one for the ladies' classes of decorative cut flower exhibits. Mr. A. Wallington, Hon. Secretary, and his assistant, Mr. Weeks, laboured hard, as usual, to command success, which they achieved in all respects except the weather.

The most important class for plants was for twelve specimens in or out of bloom. Three competed, the first prize falling to Mr. Bowerman, gardener to C. Hoare, Esq., Hackwood Park. *Clerodendron fallax* and *Allamanda Hendersoni* were especially good, and there were excellent

Palms, Crotons, and a richly coloured specimen of *Alocasia Thibautiana*. Mr. Russell, gardener to the Rev. S. Saville, Audleys, was second; and Mr. T. Holdaway, gardener to Colonel May, Hawkfield, Basingstoke, third. Specimen foliage plants in six varieties were best shown by Mr. T. Weaver, gardener to W. O. Gilchrist, Esq., Oakley Hall, Basingstoke. Mr. Bowerman won with a capitally grown Croton, Queen Victoria, in the class for a specimen foliage plant, Mr. Weaver being second with *Cycas revoluta*. The last named grower easily secured leading honours in the exotic Fern class, staging six very fine plants, *Adiantum concinnum latum* and *A. cardiochlamys* being particularly good. Mr. G. Southcott, gardener to Captain Oldfield, South Warnboro', was second. Mr. Kneller, gardener to W. S. Portal, Esq., Malshanger Park, Basingstoke, took the premier award in the hardy Fern class with healthy well grown specimens; Mr. B. Tripp, gardener to Mrs. Field, Goldings, Basingstoke, being a good second. *Coleus* are seldom seen in better condition than they were on this occasion. The plants were compact yet freely grown, pyramids ranging from 4 to 7 feet high, the majority well coloured. Mr. Southcott secured the first prize; Mr. Russell following. *Fuchsias* were represented by pyramids from 7 to 8 feet high, not too stiffly trained, but profusely flowered. Messrs. Russell and Mr. F. Holloway, gardener to F. W. C. Reade, Esq., Down Grange, securing the awards in the order of their names. Tuberous *Begonias* were more remarkable for the quality of their flowers than for the quantity. In a brisk competition Mr. Norris, gardener to J. Porter, Esq., Kingsclere, was first. Mr. Kneller had the best Zonal *Pelargoniums* in four varieties, and they were freely flowered. Table plants were shown admirably by Mr. Bowerman and Mr. Kneller, who were first and second.

Unfortunately there was but one entry for the special prize of £5 5s., presented for a group of miscellaneous plants arranged in a semicircle not more than 16 feet long. The solitary group came from Mr. Weaver, who well deserved the premier award given, suitable plants lightly arranged insuring his success.

Cut flowers were largely staged in all the classes set apart for them. Roses were bright and fresh, if small. For twenty-four, distinct, Mr. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester was an easy first, the Rev. C. Eddy, Brawley, being second. Mr. Neville again led in the class for twelve blooms, Mr. Norris being second. A neat bloom of *A. K. Williams* secured Mr. Neville honours for the premier bloom in the Show. Stove and greenhouse flowers were best staged by Messrs. Weaver and Norris, and herbaceous varieties by Mr. Kneller. Mr. R. H. Munday, nurseryman, Basingstoke, had the best *Asters*, and the finest *Dahlias* came from Mr. Russell. The following cut-flower classes were open to ladies only. For a stand or vase of flowers and fruit suitable for table decoration, Miss M. Owen, Basingstoke, was the most successful, Mrs. Osman, Ottershaw Park, following closely. Miss N. Owen, Basingstoke, had the most tastefully dressed pair of vases, flowers only. Mrs. Thorne, Basingstoke, was first for a stand of wild flowers, grasses, and berries, with an arrangement which showed considerable taste, Miss Portsmouth, Down Grange, being second. A special feature was made by water bouquets, Mrs. Wadmore, Basingstoke, winning easily, and Miss Milson being second. The last-named had the best shoulder spray, and Mrs. Wadmore the neatest button-hole bouquet.

Fruit was both abundant and good. For six dishes, Pines excluded, Mr. Osman, gardener to L. J. Baker, Esq., Ottershaw Park, had no difficulty in securing the premier position; good *Muscats* of Alexandria Grapes, Barrington Peaches, Bouverie's green-flesh Melon, and Moor Park Apricot were his best dishes. Mr. Best, gardener to — Chute, Esq., The Old Vyne, was second. Classes were provided for Black Hamburg Grapes and any other black variety. Mr. Holloway, with medium sized, compact, and well finished examples was placed first with the former, Mr. Osman being second, and Mr. Best third. In the other class Mr. Holloway repeated his previous success, this time with beautifully finished examples of *Alicante*, Mr. Osman being second with *Madresfield Court*. The latter staged good *Muscats* of Alexandria in the class for that variety, and was awarded first prize. Melons were staged in considerable numbers, the best green flesh being a small one of *The Countess* from Mr. Norris. Mr. Kneller took second place with *Emerald Gem*. The best scarlet flesh variety was *Blenheim Orange* from Mr. Bowerman, Mr. Tripp being second. Peaches were largely and excellently shown. Well coloured fruit of *Violette Hâtive* won the first prize for Mr. Bowerman, and he was successful with good *Lord Napier* Nectarines in the single dish class, Mr. Best with *Elruge*, highly coloured, taking second honours. Apples were well staged. For three dishes of culinary varieties Mr. Neville won with even fruit, Mr. Kneller being second. Mr. Best gained the premier award in the dessert class for three dishes, staging highly coloured fruit. Mr. Bowerman was easily first for Apricots with very fine examples of *Moor Park*. Mr. J. Wasley, gardener to C. Lethbridge, Esq., Sherfield Manor, had the best Cherries, fine *Morellos*, in strong competition.

Vegetables, as previously indicated, are always well shown at Basingstoke, and this year was no exception. Messrs. Sutton & Sons offered prizes for six varieties, which brought out fine produce. Mr. Lye, gardener to W. H. Kingsmill, Esq., Sydmonton, was the most successful. His best dishes were *Anglo-Spanish Onion*, *Mammoth Cauliflowers*, and *Perfection Tomatoes*, and they were very fine. Mr. Kneller was a close second. For the prizes offered for the same number of varieties by Messrs. Webb & Sons these two exhibitors occupied similar positions with equally good produce. Prizes were offered also for single dishes of numerous kinds of vegetables, which were well contested for.

Messrs. Sutton & Sons, Reading, had an attractive stand of cut flowers, mainly annuals, such as fine strains of *Godetias*, *Jacobæas*, *Sweet Sultans*, *Lupins*, *Dianthus*, and *Phlox Drummondii* in great variety. Seedling *Carnations* were also shown well. This firm also exhibited two dozen plants of *Gloxinias* grown from seed sown in February, which carried numerous handsome flowers of brilliant colours.

### IRIS FIMBRIATA.

ALL the Irises possess special attractions for plant admirers, and though many are more showy than the little *Iris fimbriata* yet this has a graceful habit, and is so floriferous that it can be employed with good

FIG. 28.—IRIS FIMBRIATA.

effect in several ways. Like numerous other members of the family its flowers are, however, somewhat fugacious and are not adapted for cutting. The plant is compact in habit and is consequently well suited for culture in pots, and being somewhat tender it is safer in a greenhouse than outside; in fact comparatively few positions suit it except in the warm southern and western counties, where I have occasionally seen it tried, but not with very encouraging results.

For some years I have grown it entirely for greenhouse decoration, and as I have a good stock by forwarding some and retarding others I manage to keep up a fairly long succession of flowers. These are of such a soft pale bluish mauve relieved by orange markings that they appear very distinct arranged with other plants having more brightly coloured flowers. A moderately light loam, ample root space, and plentiful supplies of water during the growth and flowering, are the principal points in its culture and need special attention. —C. M.

## A BLACK COUNTRY SHOW—BILSTON.

BILSTON is said to be in the heart of the "Black Country," where the earth has been turned inside out in coal mining. Travelling from Birmingham onwards to Wolverhampton, anything more desolate, so far as regards vegetation, could not easily be imagined. A large district is practically treeless, and the only tinge of green visible is in the form of struggling grass and Coltsfoot. Millions of tons of *débris* have been dragged out of the earth, and heaped on the surface in huge irregular mounds. It is a dismal scene. As Bilston is approached improvement is manifest, and on entering the town, which is two or three miles from Wolverhampton, it is evident that trees and flowers are cherished by the inhabitants.

With the object of creating a taste for gardening the Bilston Horticultural Society was formed about eleven years ago, and thanks to able and earnest officials the years succeeding have been years of increasing success. Considering the fact that the surface of the ground is represented by a series of hummocks, "pit mounds," and "spoil heaps" it seems little short of marvellous that such splendid produce could be grown in the form of vegetables, and flowers especially, as was seen in the tents. Even for these level ground could not be found in the field, and it was a question of walking uphill and down between the tables and banks of plants.

The exhibits were most commendable throughout the three sections—gardeners, amateurs, and cottagers; but taking all things into consideration the productions of the latter must be accorded the palm. Vegetables and flowers were surprising by their excellence, equalling the average of the great Show at the Crystal Palace the week previous, while the window plants were better. The character of the Show is admirably condensed in the following extract from the *Midland Herald* :—

"The produce was staged in three ten's, the open tent being 200 feet by 40 feet, the cottagers' 100 by 36, and the amateurs' 100 by 40. In each of the open amateurs' and cottagers' classes the competition was remarkably keen, and while there was a larger display of produce in the two first mentioned classes, a leading feature of the Show was the splendid collection of vegetables to be found in the cottagers' section. This was admitted on all hands to be much superior to anything of the kind ever seen at these shows. In this tent, too, were several splendid groups of plants not intended for competition, which had been lent by Sir Alfred Hickman and Messrs. J. Harper, B. Whitehouse, J. Mothershaw, and Harris. The Potatoes were a grand lot—undoubtedly the best shown in the district this season—and Celery, Shallots, Turnips, Peas, Lettuce, Onions, Leeks, Parsnips, and Beans were alike creditable. The cut flowers were capital, Asters, Marigolds, and Pansies especially so, but fruit was only fair. There were several good garden bouquets, and the window plants were very meritorious, well grown, and clean.

"The tent set apart for the open class was filled with a magnificent collection of stove and greenhouse plants, and in some cases the Judges had considerable difficulty in awarding the prizes owing to the general excellence of the exhibitors' displays. The first prize for best arranged group of plants was awarded to Mr. Dyer, gardener to Mrs. Marigold, Edgbaston; and the second was taken by Mr. Horton, gardener to Mr. W. H. Fowler, Sedgley; Mr. J. E. Knight, Wolverhampton, being third; and an extra prize was given to Mr. S. Dean, gardener to Mr. L. Foster, Sedgley. Several fine groups of plants, arranged in half-moon form, were shown, and in this class the first prize was taken by Mr. Kenrick, Edgbaston, Mr. Dyer being second, and Mr. Fewkes, gardener to Mr. T. Clayton, Castle Bromwich, third. Mr. Dyer and Mr. Fewkes were awarded equal first prizes for their six specimen stove or greenhouse plants, and Mr. Dyer carried off premier honours for three stove or greenhouse plants and for three Ferns. Mr. S. Horton of Sedgley well deserved the first prize for six *Coleus* which he showed, and also for a single specimen stove or greenhouse plant. In the class for six dissimilar Ferns Mr. S. Dean of Woodsetton carried off the first prize. Mr. Fewkes was first for *Fuchsias*, and Mr. C. Barlow, Tettenhall Wood, first for *Lilies*.

"The display of cut flowers was of a most attractive character, the principal features being the *Roses*, *Dahlias*, *Asters*, *Picotees*, *Carnations*, and *Pansies*. The prizetakers for *Roses* were Messrs. Perkins & Sons, Coventry, Messrs. Heath & Son, Cheltenham, and Mr. Townsend, Worcester. The amateurs' section was on the whole creditable. The centre of the tent was occupied by several excellent groups and specimen plants, the exhibitors of the former including Messrs. R. Jones, Highfields; S. Fullwood, Bilston; J. Kirkland, Bilston, and Taylor, West Bromwich. The principal features were *Dracænas*, *Crotons*, *Palms*, *Ferns*, *Gloxinias*, and *Liliums*. The specimen plants were very fine. There were also four half-moon groups, one by Mr. W. Knight containing fine *Dracænas*, *Orchids*, *Caladiums*, *Crotons*, &c., and the others by Messrs. Kirkland, Fullwood, and Jones. Mr. G. Knight of Oxford Street, Bilston, showed, not for competition, a collection of stove and greenhouse plants, including shrubs, Ferns, *Ivies*, *Palms*, *Coleuscs*, *Myrtles*, *Mosses*, and *Lilies*.

"The vegetables here were also excellent, Turnips, Lettuce, and Peas being a strong lot, but the Potatoes were not equal to the cottagers'. Fruit was only moderately good, and cut flowers were not a great feature, though French Marigolds were extra good. Table decorations were fair, and collections of vegetables commendable. The bouquets, baskets, &c., of wild flowers were a highly pleasing feature, and reflected creditably on the children, who had tastefully arranged them, and

deserve every encouragement. The Judges were Messrs. W. Dean (Birmingham), Latham (Botanical Gardens, Birmingham), Coombes (gardener to the Earl of Dudley), E. Cooper (gardener to the Right Hon. J. Chamberlain), W. Spinks (Birmingham), and W. Jones (gardener to J. E. Matthews, Esq., Birmingham)."

The luncheon, which followed, was as good as the Show. It was attended by more than a hundred ladies and gentlemen, and the speeches afforded convincing evidence of the earnestness of the desire that exists to see horticulture flourish. Interesting presentations were made on the occasion to Mr. C. J. Morrell, who has been the valued Hon. Secretary for many years, and now retiring. The President, J. L. Gibbons, Esq., J.P., asked Mr. Morrell's acceptance of a beautiful case of dessert cutlery, and Mr. F. Nokes, Chairman, followed with a handsome marble clock and bronze ornaments from the Committee.

Mr. R. J. Rogers has succeeded Mr. Morrell, and intends trying to do as well as he has done, while Mr. Nokes, it is said, is untiring in his efforts on behalf of the Society and garden or "pit mound" cultivators in the district. All the officials who have worked so well must be congratulated on the results of their labours.

A Chrysanthemum and Fruit Society is formed at Bilston, and the Show is to be held on November 17th and 18th. Mr. Alfred Folkes is the Secretary.

## NEPHRODIUMS.

THIS large group contains many species that are of value from a commercial point of view, and several of them have already so proved their usefulness as to be included in the regular trade lists of florists' Ferns. In point of general utility I am inclined to rank the *Nephrodiums* third, placing *Adiantums* first and *Pteris* in variety second, though possibly the correctness of this classing may be disputed in some localities, it being well known that the demands of all markets are not alike. But be this as it may, the fact remains that the *Nephrodiums* are a useful family, being easily reproduced, mostly of rapid growth, and in general not requiring a high temperature or special cultivation in order to secure a satisfactory result. It is scarcely necessary to state that these Ferns are propagated from spores, this fact being patent in most places where any plants of this class are grown, at least so far as the well-known *N. molle* is concerned, this species appearing in the form of self-sown seedlings in the most unexpected places.

Among the best species of this genus is *N. aristatum* var., a bold-looking Fern with dark green leaves, that are marked down the centre of the pinnules with a band of yellowish green. The fronds of this species are of medium size and of good texture, and the plant is sufficiently hardy to frequently survive after all the others in a table fernery have succumbed to the furnace-heated air. *N. aristatum* var. also stands well when cut, but possibly would not pay for this purpose on account of the limited number of fronds produced by each plant.

Another good one is *N. varium*, also known as *Lastrea opaca*, which is of similar outline to the preceding, though having but one colour in the mature fronds, these being very dark green, and having the stems much covered with brown chaffy scales. The young fronds of this species are also very noticeable in colour, being a peculiar shade of light brown, and sometimes tinted with pink. In habit *N. varium* is compact, and makes a useful plant in a 3-inch pot, though it will not grow much during the winter, and if forcing by extra heat is attempted the result is likely to be an attack of thrips.

*N. Richardsi multifidum* is also a handsome variety, and is of more recent introduction than the preceding. It has long bi-pinnate fronds, finely divided and much crested, the colour of which is light green. This form also comes true from spores, and consequently is easily multiplied, the young plants when in 3-inch pots being of a useful size for table ferneries.

Still another very distinct and easily grown species is *N. Sieboldi*, probably better known as *Lastrea Sieboldi*, a strong growing Fern of bold aspect and nearly hardy. The fronds of this species are pinnate, and composed of from five to nine broad pinnules with slightly serrated edges, the stipes and crown of the plant being covered with brown chaffy scales. *N. Sieboldi* should be grown in a moderately cool house in order to keep it in good condition, for when grown too warm it is liable to become infested with thrips.

*N. molle* is too well known to need description, though a useful species for certain purposes; for instance, it is an excellent Fern to plant among rockwork when filling a conservatory, and will produce a good result with very little care. The crested forms of this species are very pretty, and may be used with good effect at times, though too brittle to become generally useful. The most peculiar of these forms is *N. molle corymbiferum*, the fronds of which are upright, quite stiff, and terminated by a large crest. Another of these forms of *N. molle* is *N. m. grandiceps*, in which the fronds retain the outline of the type, while the tip of each pinnule is nicely crested in much the same way as those of *N. Richardsi multifidum*. *N. molle* Langwelli is a comparatively recent form, having been distributed about six years ago, but is, however, of little value commercially.

*N. glabella* is a finely divided species of dwarf habit, and deserves more recognition, the fronds being nearly triangular in outline and from 8 to 12 inches in height. This is also a cool house species, and will flourish under the same treatment as *N. Sieboldi*—that is, with a temperature of 50°.

The short list here presented contains some of the most useful species

included in this comprehensive genus, but does not by any means exhaust it, as under the present classification what formerly comprised several genera have been combined in the single genus *Nephrodium*, thus giving it about 300 species.—W. H. TAPLIN (in *American Florist*).

### FRUIT FORCING.

**PINES.**—*Potting Rooted Suckers.*—Suckers obtained from the summer-fruiting plants will soon be ready for potting. It is well to divide the plants; the strongest should be shifted into their largest pots as soon as ready, employing 10 or 11-inch pots according to the variety, affording them a position near the glass in a light airy house, keeping them gently growing through the winter. The plants so started will be readily excited into fruit next May or June, and will afford a good successional supply of ripe fruit in late summer or early autumn. In other plants suckers from the summer fruiters not large enough to shift into the fruiting pots, winter best in 7 or 8-inch pots, transferring them to larger as soon as ready in spring, which, with suckers of Smooth-leaved Cayenne that were started last March, will afford a successional supply of Pines through the winter months.

*Re-arranging Pine Plants.*—A re-arrangement of the plants should now be made in order to separate the fruiting from the non-fruiting plants, as many of those that were started from suckers of last summer's fruiting plants will have fruit swelling. Those plants not fruiting will have completed their growth, and should have air very liberally for the next six weeks when the temperature exceeds 80°, maintaining the bottom heat steady at 80°, and all plants well established—that is, well rooted, should have a bottom heat of 80° to 85°, but recently potted suckers, or those not having roots well established in the fresh compost, should have a bottom heat of 90°, steadily maintained to insure speedy rooting.

*Fruiting Plants.*—Those swelling off their fruits should have moderate atmospheric moisture, admitting a little air at the top of the house early in the morning, so as to allow of any superfluous moisture escaping before the sun's rays act powerfully or upon the fruit. Any fruit it is desired to retard should be moved to a rather cool or shady house, admitting abundance of air.

**FIGS.**—*Earliest Fig House.*—In the earliest house the trees will now be ripening their wood, and watering may be discontinued, air being given very liberally. If, however, the second crop is not yet ripened moderate moisture in the soil will be necessary, with a free circulation of warm air to insure high quality in the fruit. When the fruit is off take prompt measures to destroy insects.

*Earliest Forced Trees in Pots.*—These may be placed outdoors when the wood is ripe; but they must not be so treated if there is any doubt about this, keeping them under glass with a free circulation of air. These are matters in which the cultivator will need to exercise his judgment. In either case encourage surface roots by dressings of manure, rough loam, and a sprinkling of steamed bonemeal. See that those placed outdoors do not root from the base of the pots. Cut off all roots that have passed into the plunging material, top-dress, after which give a good watering, and they will need no more water than suffices to keep the foliage in health.

*Trees Unsatisfactory.*—Fig trees planted out in houses not unfrequently grow rampantly, and consequently produce thin crops of fruit. In that case root-pruning should be resorted to, and the roots confined to a narrow border of from 3 to 4 feet in width. A trench taken out at this distance from the stem after the fruit is gathered will check the tendency to a late growth, assist in the ripening of the wood, more particularly if the growths are thinly disposed and the points of the shoots, instead of being tied closely in, are allowed to grow up to the glass. If the drainage be defective it will be necessary to lift the trees in the autumn as soon as the leaves commence falling, and replant in fresh soil. Place 9 to 12 inches of drainage, rough at the bottom, at the top, and on this place 3 inches thickness of old mortar rubbish, freed of old laths and other pieces of wood, smashed and sifted with a half-inch sieve, using that remaining in the sieve, the finer particles being mixed with the soil to the extent of one-sixth. Turfy loam, inclined to be strong rather than light, forms a suitable rooting medium, adding to it a sixth part of old mortar rubbish, a tenth of calcined oyster shells, and a bushel of bonemeal or ground coprolites to every cartload or 30 bushels of loam. In replanting ram the compost, well incorporated, thoroughly about the roots, spreading them out evenly well up to the surface, and with soil between each layer so as not to have the roots altogether. This will insure steady progressive growth, short-jointed fruitful wood, a solidified compost duly stored with nutrition securing, with judicious ventilation and management, solidified growth and large heavy fruit. The border may be 2 feet deep. Should the drainage be good it will only be necessary to detach the roots as advised, confine the trees to the narrow border, and remove some of the old soil from amongst the roots, replacing and top-dressing with the compost above stated.

*Late Houses.*—The value of the fruit of trees in cool houses so as to ripen in late August and early September is considerable. The great point is to keep the growths thin and the roots restricted so as to insure a thoroughly solidified growth, short-jointed well ripened wood. If the wood does not ripen freely treat these as advised for "unsatisfactory trees" when the fruit is gathered, and lift when the foliage gives indications of falling. Keep up a free circulation of air, expose the fruit as much as possible to the sun, but if spider be troublesome syringe on a fine morning after a close picking of the fruit, and afford no more water at the roots than is sufficient to keep the foliage in health. Ventilate freely in the early part of the day, and leave a little air on constantly to allow the moisture to escape and prevent its deposition upon the fruit, which may cause it to spot and decay prematurely.

**VINES.**—*Early Forced Vines in Pots.*—These for starting in November must not be allowed to become dust dry at the roots. They will now be at rest, the wood ripe, the laterals cut close home, and the canes shortened to about 6 feet, more or less, according to the situation of the plump eyes. Whilst the cuts are dry dress them with styptic or patent knotting to prevent trouble from bleeding; they should be kept in a cool airy house.

*Earliest Forced House.*—It is not necessary to wait until all the leaves have fallen before pruning matured Vines for early forcing, but the wood must be brown and hard, and the leaves turning yellow. The pruning will cause the Vines to rest quickly and thoroughly. If in good condition they will afford bunches quite large enough when pruned to a couple of buds from the base, but if the Vines are weak from over-cropping or a long course of forcing, the spur shoots may be left a little longer with a view to large bunches. When this method is adopted take shoots from as near the base as possible when growth commences, which should not be allowed to carry fruit, but be stopped at about the sixth leaf, and the laterals at the first leaf, and subsequently as produced. Such shoots are sure to form good buds; the extra foliage will tend to invigorate and support the fruit on the other shoot, which can be cut away in due time in favour of the other for fruiting the following season. This alternative system of fruiting necessitates keeping the shoots further apart for development and exposure to light and air. If the Vines are grown on the extension system it will only be necessary to cut back to plump buds on well ripened wood, being guided by the space at command, for there must not be overcrowding. It is important that the house be thoroughly cleansed and the Vines also. Any weakly Vines, or those in an unsatisfactory state, may be improved by removing the soil down to the roots, and substituting fresh loam with an admixture of steamed bonemeal to the extent of a thirtieth, and if calcareous matter be wanting add a sixth of old mortar rubbish to heavy soil, and chalk to light soil, or in the latter case clayey marl, dried, pounded and incorporated with the soil is preferable. Lift any roots available for the purpose, laying them out upon the fresh compost, and cover them about 3 inches deep. This is best done over the whole extent of border occupied by the roots before the leaves fall. It is a mistake to allow Vines when at rest to become very dry at the roots. Comparative dryness is desirable, yet great injury is caused by allowing the soil to be dust dry. The outside borders should have a covering to protect the roots from the heavy autumn rains, which reduce the temperature considerably. Glass lights are preferable for throwing off heavy rains, while allowing the sun's heat to penetrate the soil. Many, however, are obliged to rest content with a covering of leaves and litter after cold weather sets in, yet there is nothing like inside borders for early forcing, and reason and practice justify the employment of protective material on outside borders wherever available for the exclusion of moisture in undue proportion to the requirements of the Vines and preserving the soil warmth.

*Young Vines.*—Those that have made strong growth and are late in ripening should be assisted with fire heat, maintaining a minimum of 65°, and a maximum of 75° from fire heat, continuing it until the wood is ripe, accompanied with free top and front ventilation. Discourage any further growth by keeping the laterals well in hand, removing them as they appear, but be careful not to cause the principal buds to be forced into growth.

*Late Grapes.*—These are now colouring rapidly, but are a long way from being properly finished, which in almost all cases is due to the lateness of starting. Late Grapes require plenty of time, and all the sun it is possible to insure to them. Keep the laterals well thinned, and thereby admit as much light as possible to insure the finishing of the crop, not by large reductions of foliage at a time, but by frequent pinchings. Maintain a night temperature of 70° to 75°, falling 5° to 10° during the night, increasing to 80° to 85° by day, up to 90° in the afternoon, accompanied with a free circulation of air in the early part of the day, and a moderate amount day and night—always enough to insure a circulation. Make the most of the next month or six weeks in case of Grapes that are late in ripening, for when the days are short ventilation cannot be freely admitted, and unless Grapes have a moderate amount of air moisture when ripening they do not swell freely, but are liable to shrivel, particularly Muscats, and it is not the moisture that causes Grapes to spot and crack, but the confined atmosphere—moisture condensed preventing evaporation from the surface of the fruit. Those Grapes well advanced in ripening may have the atmospheric moisture reduced; those only colouring should have a moderate amount of moisture to assist their swelling, not neglecting to apply water to the roots, but it will hardly be further needed by outside borders, whilst it must be given to inside borders as required.

## THE KITCHEN GARDEN.

**TOMATOES.**—Plants against sunny walls have grown more strongly than desirable this season, and in some places are already diseased, while those in the open are in a still worse plight. Rank growth can be checked considerably by reducing the size of the principal leaves or those on the main stems, but it is a most unwise proceeding to completely denude the lower half of the latter. This premature removal of the leaves greatly checks the swelling of the fruit, and the latter ripen quite as surely, being also less exposed to disease germs, when a moderate amount of foliage is left on the stems. All side shoots formed at this late date ought to be kept cut out, and it will be no advantage to allow the leading growths to extend any farther. Heavy crops, and they are no rarity, would pay well for being protected from the rains, pit and frame lights not otherwise in use answering well for the purpose. Keeping the foliage dry is the best preventive of Potato blight, those plants most exposed to the rains being already affected by this dreaded fungus. Some of the more advanced fruit or any just changing colour might be cut and forwarded in heat or a kitchen without much detriment to the quality, and if there is a great likelihood of the plants being overrun by the disease, nothing but greatly improved weather preventing this, it is advisable to cut the bulk of the more forward fruit and either attempt to ripen it in heat or use it in pickles and pies. Very good preserve can also be made of young green fruit, but as Plums are plentiful there will be less need to thus utilise the Tomatoes.

**WINTER TOMATOES.**—In order to be certain of a heavy crop of fruit to ripen in succession during the winter the sowing ought in most cases to have been made last month, this being particularly necessary where the plants are put out all over a border and trained uprightly. The crops set most surely when the plants are trained thinly over the roofs of well heated forcing houses, and it is quite immaterial whether they are confined to single stems or fewer plants are grown, and these be allowed to spread. This being so there is nothing to prevent the utilisation of strong pot plants that have already given good crops of fruit. These, being either planted out in narrow borders or given a rich top-dressing and made to root out, more soil surrounding or mounded over them, will quickly push out numerous side shoots, the best placed of which should be laid in and the rest cut out. Treated in this manner, well looked after at the root, and not kept in a close atmosphere, they do not grow too rankly, but may be depended upon to set and swell capital crops throughout the autumn, winter, and following spring months. If young plants are grown these also may with advantage have their roots confined for some time in 10-inch or rather larger pots, allowing them to root out subsequently into rather rich soil, maintaining their vigour without impairing their productiveness. The ribbed varieties, notably Large Red and Orangefield, are the heaviest croppers, the newer Conference also cropping admirably, and it is one of the best for winter culture.

**LATE PLANTED BROCCOLI.**—It is quite useless to place out tall plants or those that have stood for several weeks longer than they ought to do in the seed beds in the ordinary manner. Seeing, however, that comparatively young plants frequently survive severe frosts better than much stronger older Broccoli, it is advisable to continue planting them according as Peas, Beans and Potatoes are cleared off the ground. They should be dug in, that is to say, be planted as the ground is dug. Prepare a sloping shallow trench for the first row, a little short manure placed in the bottom not being wasted, and cover the roots and stems up to the leaves with fine soil well pressed down. Similar sloping trenches should be formed while the ground is being dug, till all the space is covered. At this late date the plants may be put out 18 inches apart in rows 2 feet asunder. The tops will soon attain an upright position, and in all probability a late supply of serviceable sized hearts be eventually obtained. This plan answers best where the soil can readily be broken down, lumpy ground not suiting newly put out plants of any kind.

**CELERY.**—It is surprising how little impression heavy rains make upon Celery in trenches, especially after the plants are strongly rooted. No greater mistake can be made than to mould up Celery without first examining the trenches. These being rather deeply probed may disclose the fact that the manure and soil thickly occupied by hungry roots is almost dust dry, and that, too, after a spell of wet weather. Earthed in this state they will most probably remain dry all the season, premature seeding and other evils being the consequence. It is advisable, therefore, in most cases to give the trenches a good soaking of water, or better still, liquid manure, abundance of soot and a sprinkling of salt being the best substitute for the latter. A free use of soot and the salt in moderation are good preventives of slug attacks. The greater portion of the rows ought now to be cleared of weeds, runners, and small lower leaves, and after the before-advised watering has been given have a little soil chopped down into the trenches, this answering the double purpose of benefiting the roots and keeping the tops from opening out too much. The more forward, or any required for use in about a month or six weeks' time, this being quite as soon as it is much in demand, ought now to be finally moulded up. The stalks should be kept well up together, either with the hand or temporary ties, so as to effectually exclude the soil from the hearts. Great care ought to be taken not to pack the soil against the stalks too closely, especially near the top, as this may cause bulging and splitting, while the successional rows should not be moulded up much in advance of the growth of the hearts, or this also may lead to bulging and splitting at the base. The soil surrounding Celery cannot be too light and finely divided.

**AUTUMN SOWN ONIONS.**—Tripolis obtained by sowing seed last

autumn are likely to keep badly this season. They were much damaged by mildew, and to make matters worse rainy weather has caused a second root growth. All that can be done is to thoroughly harvest them in dry vineries, pits, or frames, and then to bunch or "rope" them up and keep them in a cool dry shed in preference to storing them in heaps. Underground Onions, Garlic, and Shallots ought also to be harvested as much as possible under cover, and be stored thinly in a cool dry place. No time should be lost in sowing seed of Onions to stand out through the winter. Tripolis of sorts are usually preferred, but they are no harder than the white Spanish types, and there is no good reason why some of the latter should not be sown with them. The white Tripolis are the mildest in flavour, and form a very good vegetable. Room ought to be found for a row or rows of the quick-bulbing Queen, and the white Naples is fit for use very early in the season. Single rows of any or all that may be selected between late-planted Strawberries, or a good open piece of ground or moderately warm border may be sown with them. Thinly sowing in shallow drills is preferable to sowing broadcast, unless in the latter case the plan of covering the seed with sifted soil is adopted.

## PLANT HOUSES.

**Poinsettias.**—Poinsettias are not growing satisfactorily under cold frame treatment. It will be necessary to encourage them by artificial heat. They should be kept growing steadily, air being admitted freely whenever the weather is warm. When fire heat is used leave a little air on the frame both day and night. Water with care those plants that are compelled to be grown in cold frames, or the roots will perish, and result in the lower leaves turning yellow and eventually falling. Euphorbias, Plumbagos, and other plants of a like nature will do better if they can have gentle heat while the present sunless weather continues.

**Begonias.**—Though practically at a standstill in cold frames no harm will result to plants that are well advanced and already large enough for the purpose for which they are required. Care is needed in not giving too much water or allowing the atmosphere about the plants to become too moist. The foliage is liable to damp, especially large-foliaged forms of the *B. manicata* type. Water in the early part of the day, and maintain a moderately dry atmosphere about the plants. Those in a backward state of growth should be encouraged by gentle heat. Do not grow them too warm or too close. If they are to flower well firm sturdy growth is necessary. Place into 4-inch pots all young plants of *B. nitida alba* and *B. rosea*, also *B. Ingrami* and others that are well rooted. Cuttings of the last may still be rooted; they will be useful in spring if wintered in small pots. The forms of *B. nitida* rooted now will also be useful in the stove in spring. Place into 4-inch pots seedlings of *B. semperflorens* varieties, and transfer smaller plants from the seed pans into small pots. *B. semperflorens carminea* when rooted should be grown in a light position, where it can enjoy a little warmth. When ready for transference into 4-inch pots remove the points of the plants to induce them to throw up from the base. Where stage room cannot be devoted to the stock of Begonias needed for cutting they can be grown well in small baskets suspended from the roof of stoves and intermediate houses. Useful baskets can be formed by placing a plant of *B. semperflorens carminea* in the centre and *B. Ingrami* round the sides of it. They soon become a mass of growth, and then flower profusely. Few flowering plants are more useful than these for furnishing vases for home decoration. Unfortunately they do not travel well, even when the utmost care is taken to pack them.

**Lilium candidum.**—Imported bulbs can now be obtained, and should be potted for early flowering without delay. Large bulbs should be placed singly in 7-inch pots, in a mixture of good loam two parts, the other part being composed of leaf mould and sand, adding one-seventh of decayed manure. Cover the bulbs about an inch below the surface, and stand them outside if a cold frame cannot be devoted to them. For early flowering it is better to place the pots in a cold frame, and cover the surface with cocoa-nut fibre refuse to prevent having to water them too frequently. After flowering bulbs can be lifted from the open borders and potted in the same way. The flowering stem should be cut down directly the plants have flowered, the sooner they are lifted and repotted afterwards the better.

**Lilium Harrisii.**—Imported bulbs can now be had, and as they flower before the old *L. longiflorum* they are worth growing in quantity. The plants are highly appreciated either for grouping or for cutting the flowers. Bulbs potted at once may be had in flower by Easter. Liliums are much subject to attacks of aphides, and it is almost impossible to grow them without. Keeping the plants clean after they once start into growth is the greatest difficulty the grower has to contend against. Large bulbs should be placed into 7-inch pots, those of a smaller size into 5 and 6-inch. Use the compost advised for *L. candidum*, and give the bulbs the same treatment.

**Roman Hyacinths.**—A good number of these should be potted for early flowering. Place five bulbs into each 5-inch pot in a mixture of loam, leaf mould, and sand, with one-seventh of manure added. Be careful that the soil is in an intermediate state for moisture, so that no water is needed before the pots are placed outside and covered with ashes. Successional plants should be potted at intervals of three weeks or a month until the end of October.

**Freesias.**—Pot the main stock of home-grown bulbs thickly together in 3 and 4-inch pots. The bulbs increase rapidly every year, and the small ones should be placed together in pans, they soon make flowering bulbs. After these bulbs are potted place them in a cold frame, and

cover the surface with cocoa-nut fibre refuse until they begin to grow. When once they have fairly started into growth place them on a shelf close to the glass, where they will enjoy abundance of air. If hurried in their early stages they seldom do well. *Freesias* are most useful for cutting, and may be potted in batches at intervals of a month according to the demand.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### AT THE MOORS.

As the Heather this year is in excellent condition I ventured to take some of my hives to it on the 11th, but there, as at home, the weather has been for more than a month very unpropitious. They have had only one dry day since the middle of July, and that was on August 10th, and was one of three only since June that queens could be fertilised. The result is that many of my hives have eggs only instead of what is desirable—the hives full of brood in all stages—so that even with fine weather, and the superior bloom that is on the Heather and other flowers, the yield of honey will not be so great as it might have been.

Although the rainfall has not been excessive, it has been so constant, with its attendant strong winds, that the bees cannot venture out. Had the air been calm, the yield of Clover honey would have been very great, and unless it calms the Heather will come and go as it did without the bees securing any good from it; but with ten days calm fine weather, and it is much needed, the bees would do much good.

Notwithstanding the long unsettled weather, many places are experiencing a scarcity of water. The pastures are, however, everywhere much improved. While writing, the sky has a more promising appearance, and it is to be hoped we shall have finer weather than we have had since February. I am anxious it should improve, to be able to put to the test several things, particularly the

#### PUNIC BEES.

They are showing great anxiety to get to work, and contrary to report, making strong attempts to enter other hives; it may be an exception as it is an exceptional year. At home there were several days on which the Carniolians appeared to work, and carry much from the Limes and aphides secretion, while the Syrian and Punic races remained idle. But I could not determine whether this seeming illeness was a defect or a property. It sometimes happens that bees appear to be working assiduously and with spirit, when they are but easing themselves and are making no weight. Every hive is weighed, and this is the test by which I shall decide, at the end of the honey gathering, which are the best honey gatherers. One variety is much more easily managed than many.

#### USES OF EXCLUDER ZINC.

Although I never experienced any advantage with perforated zinc in supering, it is useful to me in other respects. Mr. William Hogg, Castle Douglas, uses it as mice excluders as some of your readers know, as well as my own plan of driving the bees downwards into an empty hive through it, leaving the queen on its upper surface. Then when I wish to preserve a few young queens for some days, if the queen cells have not been raised in tumblers, I cut them out with a piece of comb adhering, and fit them into them. I then place the tumblers upon the top of the hive with squares of zinc beneath the tumblers and cover all; the bees ascend, and the queens creep out, but cannot get beyond the tumbler each is confined in. The bees feed and defend them till wanted, and no swarming takes place.

Another use I find for it is to prevent the issue or loss of a swarm when not at hand, or unable to attend to it or them. One

day lately seven swarms were issuing at the same time. I immediately closed the entrances of all but one, and lowered the ventilator. The bees of their respective hives returned and clustered beneath the zinc floor, and in a little time, when the doorway was opened the bees returned to the entrance. This is a great advantage, for when stranger bees mix, or several queens, many are killed. When excluder zinc is used for closing the doorway the bees may leave, but the queens, if large, cannot; and when there is but one queen fighting does not take place so readily amongst bees of different swarms.

There is an American device introduced into this country called the swarm, or self-hivers. I do not approve of it. Drones are prevented leaving the hive, and are thereby rendered useless. Moreover, it is never certain whether the queen is an old or a young one; if the latter, she may be prevented mating by the continued use of the hiver, while an old queen forced out of the hive, as it were, might take refuge in the hiver; but a young one is too jealous to allow her rival to remain at peace without a battle royal, or to leave with her due share of her subjects. The way queens pipe I described years ago, but not why. It is natural for young queens to pipe for the purpose of knowing whether any rival is in the hive, and the piping is performed often when there is but one queen.

#### VARIETY IN DRONES.

For many years past there has been much fruitless discussion on the variety of colour in drones of certain variety of bees, but as in many things concerning bees those who took part in them lacked the knowledge of what they talked about, their arguments being on a false basis. I have long preserved the purity of two differently imported strains of Carniolians. Neither of these strains show the slightest yellow marking beyond the rudimentary dark orange tint upon the hairs on the first segment of the abdomen. This instead of being a fault is, I consider, the distinguishing mark of the pure race. The other does not show the slightest yellow in the skin or hair, and is less mild tempered than the first named. Its drones are of a light fawn colour on the under side of the thorax, a little darker on the upper side, and are generally of a more uniform colour (although some specimens differ a little) than the drones of the other variety present.

Taking the progeny of a dozen queens, there is a distinct difference in every one of them. Some of them have the appearance of yellow Ligurian and Cyprian drones, some have a sombre brown colour of various shades, while others are in part and in whole as black as ebony. This variation of colour is not confined to one race but is common to all. Even the latest imported Punics show it. The Egyptian race was of the most uniform colour of any I ever saw.

It would be interesting to know what is the cause of so much variation of colour in drones bred from a preserved pure race. I know "A Hallamshire Bee-keeper" has a theory, but without mentioning it, I may say that I have witnessed a queen depositing eggs for drones, and when they crept out of the cell they possessed the variations as mentioned above.

I have been prompted to write the foregoing through a query from a correspondent as to the markings of Carniolians crossed with the native brown or black bee. He elicited an answer to a similar query through a contemporary to the effect that, owing to the similarity of the two varieties, it was difficult to distinguish the pure from the crossed Carniolian. The answer is absurd, and I should not be surprised to learn that the answerer never saw a pure black bee, as, before he kept bees, the country was overrun with the Ligurian bee. As those who are able to throw light on the above mysteries are few, if this should meet the eye of Dr. G. Walker, may I be permitted to ask that gentleman to give his opinion for the gratification of many besides—A LANARKSHIRE BEE-KEEPER?

## TRADE CATALOGUES RECEIVED.

Messrs. W. Clibran & Son, 10 and 12, Market Street, Manchester.—*Catalogue of Bulbs.*

Messrs. E. H. Krelage & Son, 17, 19, 21, 23, 25, and 27, Kleinen Houtweg, Haarlem, Holland.—*Catalogue of Bulbs.*

Fisher, Son, & Sibray, Handsworth Nurseries, near Sheffield.—*Catalogue of Bulbs and Roots.*

Dicksons, Chester.—*Catalogue of Bulbs and Flower Roots.*

Messrs. J. Laing & Sons, Forest Hill, London, S.E.—*Catalogue of Bulbs.*

\* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Everlastings** (S. E.).—The question is doubtful, and the flowers may or may not be admitted by the judges.

**Apricots Cracking** (Lankhills).—The cracking of the fruit is caused by a combination—wet weather and the attacks of a fungus. All decaying fruits should be burned.

**Dressing for Apple Scale** (X. Y. Z.).—Some American terms differ from English. We suspect all that is meant by the words referred to is carbonate of soda in the form of lumps, and you may use ordinary washing soda for the mixture.

**Insects on Begonias** (J. W. R.).—There are a few of the insects referred to on page 147 on the Begonia leaves you have sent, also some white thrips. We should burn all the worst of the leaves, and apply a mixture of softsoap and sulphur to the others with a sponge.

**Small Grapes** (F. C.).—The numerous small Grapes on the bunch you have sent are the result of imperfect fertilisation. They contain no seeds the same as are found in the large berries. The house was probably too cold and damp during the flowering period for the ripening and dispersion of pollen. If by a "cold" house you mean that there is no provision for heating it, such misfortunes cannot always be averted.

**French and German Asters** (C. R. W.).—For purposes of exhibition all the Asters with flat florets, whether they reflex or incurve, may be regarded as French varieties, and those with tubular florets as German Asters. The blooms of these resemble round balls with an outer row of guard petals, and are as dissimilar from the others as an Anemone-flowered Chrysanthemum is from a reflexed or incurved bloom.

**Market Gardening** (Mr. L.).—Persons who understand their business both in cropping and selling the produce derive a fair return for their investments. If they did not do so they could not pay so much higher rents than are obtainable for land under agricultural tillage. Rich deep soil and proximity to a railway station are the chief points to be considered in choosing a site. Much practical training is needed for nursery gardening.

**Sewage** (R. A. C.).—Without any doubt the best method of dealing with the sewage will be to use it in the kitchen garden, conveying it there by the best methods that can be devised on the spot. Almost every case of this kind differs, and measures must be adopted the most applicable to each. Sulphate of iron is an excellent deodoriser, a preparation of 3 or 4 per cent. or less to the bulk of sewage destroying offensive smells and not impairing the manurial value of the contents of tanks.

**Pears Cracking** (G. W.).—The cracking is due to a fungus, *Fusicladium pyrinum*, the typical form of which is found on Apples—namely, *Cladosporium dentriticum*, but it is aggravated by a wet season. Nothing will now effect the restoration of fruit, but the spores may be prevented spreading by spraying the fruit and tree with ammoniacal carbonate of copper solution. Particulars for its preparation and application in the case of trees affected with the disease are given in the *Journal of Horticulture* of June 25th, 1891, pages 504 and 505.

**Drain Choked by the Roots of Trees** (C. P.).—The only effectual remedy would be to take out the present 4-inch ordinary drain tiles and put down others with close joints. Four-inch sanitary glazed

pipes with the joints properly made in cement would endure indefinitely. Gas lime placed on the pipes is obnoxious to roots only for a time, and when the lime passes into the gypsum state it aids rather than hinders the roots entering the pipes. The sanitary pipes would, of course, not drain the plantation. If drains are wanted for that purpose rubble drains might be made, but open drains are much the best for plantations.

**Gladioli Unsatisfactory** (A Many-years Subscriber).—The plants going off suddenly is a most perplexing disease, and unfortunately rather common. It is more prevalent in named than in seedling varieties, but there is considerable difference in constitutional vigour of the same variety as affected by soil preparation. The soil in your case has probably been too rich, and the liquid manure too powerful. We should keep the corms for stock, as varieties become acclimatised, and often do well after a year or two spent in recuperation. The corms splitting up had the number of breaks in embryo, otherwise they would not have appeared in the resultant growths. If the corms are diseased burn them.

**Ammoniacal Gas Liquor for Destroying Weeds on Gravel Walks** (G. J. B.).—Gas liquor varies considerably in strength. If there are few weeds and the ground be dry it may be diluted with two parts water; if many weeds but not strong add an equal proportion of water; if the weeds are numerous and strong use the gas water neat. It will certainly kill the present weeds, cause an intolerable smell, and by enriching the gravel and soil make future weeds grow faster and stronger than they have ever done before. The advertised weed killers are infinitely better and inexpensive, while the gas liquor properly diluted can be employed for stimulating the growth of useful crops. Try some differing in strength on grass.

**Tomatoes Diseased** (R. W.).—The fruits are attacked by the fungus *Cladosporium lycopersici*, or Tomato scab. All the worst affected should be removed and burnt, but the spores will fly about, and alighting on the plants or fruit will germinate and reproduce the fungus. The plants, therefore, and house should be sprayed with the following mixture. Dissolve 1½ oz. precipitated carbonate of copper in a pint of liquid ammonia (26°), of this one fluid ounce to a gallon of soft water. Spray the plants thoroughly in every part, repeat in twelve to fifteen days, then in twenty-one days, but it is useless to attempt anything beyond the spread of the disease at this advanced period of the season. The fruits already infested, like the examples sent, are beyond restoration.

**Roses for Forcing** (North Cotswold).—In selecting Roses for forcing under glass much depends upon the time you wish to commence forcing operations. You will find Niphotos, The Bride, Madame Lambard, Rubens, Safrano, and Isabella Sprunt good and free-flowering varieties. The last two produce charming buds, not fine blooms, but they are useful on account of their freedom and early flowering nature. No others force so well early in the season. If you require one for the roof William Allen Richardson flowers freely and bears forcing well; the flowers individually are small, but they last a long time in a cut state, and are highly appreciated on account of their colour. It would be difficult to name a red Azalea with all the good properties of Deutsche Perle. You might do worse than grow Duc de Nassau, semi-double, dark rosy carmine. Bernhard Andreas is brighter in colour, but does not grow so freely as the one named above.

**Plum Trees Dying** (J. B.).—Plum trees are not attacked by canker as it prevails in Apple and Pear trees; but an analogous disease known as gum infests Plum trees and causes the destruction of many, especially in cold localities and where the soil is deficient in calcareous matter. It is caused by a fungus, *Coryneum Beijerinckii*, and is largely on the increase, because trees are propagated from infested stock. The roots of infested trees are generally healthy, but the gum disease prevents the ascent of the sap, causes early and free bearing, and a sudden collapse of the trees often when laden with fruit. Unsuitable stocks are also a cause of Plum trees dying after a few years' growth, but yours collapse from one to five years after planting. Young Plum trees often fail through attacks of borers, but this case seems to be due to gum as the trees "die off in all stages always in summer," simply because the fungus has destroyed the tissues, and the sap cannot ascend.

**Training Cordon Gooseberry Trees** (South Devon).—In raising the trees from cuttings it is desirable to shorten them so as to insure a strong growth from the upper bud, therefore remove all the buds except the uppermost two or three, the cutting being shortened to about 10 inches, and inserted 3 or 4 inches in the soil. When the buds break select the strongest growth for training up to form the cordon, and the other shoots may be pinched off at the third leaf so as to form spurs; but it is desirable to have the plants with short clean stems to facilitate cultural operations. In subsequent years the leading shoot should be cut back to about 13 inches, to insure its pushing side growths throughout its length, selecting the strongest in spring for continuing the main branch, pinching the others to form spurs at the third leaf and to one subsequently, cutting them back in winter to about an inch of their base. In pinching, the small basal leaves must not be counted. Well managed cordon Gooseberries bear abundantly.

**Young Canes on Permanent Vines** (F. J.).—The two shoots thrown out from the main stem 12 to 14 inches from the ground, and allowed to grow at will, can only assist the Vines by the manufacture of roots, and thus aid in the storing of nutrition, and being cut away or shortened considerably at the winter pruning the other parts will

## THE POTATO DISEASE AND REMEDIES.

FROM various parts of the country we hear that Potatoes are smitten with the destructive murrain, and it is feared that many crops of tubers are practically destroyed. The prolonged wet is the initial cause of the outbreak, and it would probably have occurred sooner if the temperature had been higher. The month just closed was the coldest August that has been experienced for twenty years; and close observation in the past has shown that the destruction of the Potato crops was the most rapid and complete if a high temperature prevailed when the soil and the air were continuously wet, approaching saturation. It has been noticed in the great Potato growing districts, when the disease was so virulent many years ago, and crops left in the ground as not worth digging, that some of the tubers grew in the autumn, and that the growths from these remained free from the fungoid visitant, though water was standing between the rows. This immunity was presumably due to the low temperature that prevailed at the time, and it is certainly a fact that rows of young Potato growths springing from the ridges in October have remained without a speck of disease on them till they were killed by frost, while within the ground were thousands of decaying tubers—a veritable mass of corruption. It has also been observed that when the plants have been first attacked in summer that the progress of the disease was slow when the temperature fell, and quick when it increased. This probably gave rise to the supposition by some persons that it was caused by electricity, as it spread, like the scourge it is, when thunder prevailed, the weather close and warm, and the ground and plants were reeking with moisture. It may reasonably be supposed therefore that the growth of the fungus has been to some extent held in check this year by the low temperature that prevailed during the wet month of August. However, the murrain is prevalent now, and if wet and warmth prevail will spread with great rapidity. Probably nothing can save many crops but a term of distinctly dry weather which is urgently needed.

Some varieties of Potatoes are less liable to fall victims than others to the attacking foe, because of their inherent vigour, and the firmness of the stems and leaves. Many raisers of Potatoes have done incalculable service in the production and distribution of varieties far more disease-resisting in their nature than the "good old sorts" of a former time; also cultivators have become more alive than formerly to the necessity for careful seed and land preparation, as well as to the applicability of manures appropriate to the crop and the soil, while the advantage of wider planting has been to a large extent realised. The establishment of fungoid growths in plants is to an appreciable degree a question of epidermal resistance. The spores no doubt fall on stout and thin leaves alike, but the young and tender stems and leaves of Vines, Roses, Apples, and Potatoes are the first to be infested with parasitical growths.

That the texture of the growth of Potatoes is influenced by the soil is apparent. Those grown in land that is much too destitute of mineral matter, as in fens and drained bogs, produce leaves much softer and more vulnerable to the enemy than do the plants which are better fortified with mineral constituents; and therefore we first hear of the disease outbreak where the soil is little more

than a mass of black, wet humus. Also the more the plants are crowded, and air consequently excluded from the leaves, the weaker these must be and the sooner taken possession of by the devastating "host." It would be well if all growers of Potatoes would, as some of them do, think of these things, and thus do all that is in their power to produce full, clean crops, or in other words make the best of the good varieties that are provided to resist the disease.

During the present season experiments are being made on farms and in gardens with different supposed antidotes to mildew on Potatoes and other crops. Preparations of sulphate of copper and quicklime, *bouillie bordelaise*, also of sulphate of iron and quicklime, are applied in solution. In some carefully conducted experiments by a scientific and practical farmer we are informed that the latter, though keeping the Potato disease at bay for a time, eventually became ineffective; but up to the present time the former dressing has proved efficacious. Preparations of sulphate of copper and quicklime are also prepared in the form of fine powder, and applied with a puff or bellows. We have only had an opportunity of inspecting some experiments that have been carried out with one of these anti-blights—Messrs. Tait and Buchanan's, as supplied by Mr. Peter Barr, and the results up to the present time are highly satisfactory and encouraging.

A few days ago a letter came from an old friend of the Journal and veteran Potato raiser, Mr. Robert Fenn, in which he said, "The disease is smiting me hip and thigh, but with more powder I shall conquer. Come and see; it will be worth your while." The invitation was accepted and Mr. Fenn's work inspected. Exactly opposite the entrance to one of his fields were three rows of Potatoes in full growth, and only in about one plant could evidence of disease be seen; but stretching along each side of these three rows all the tops were blackened. Digging up several roots the tubers were found sound in the three rows mentioned, diseased in the others. The variety was the same, Eliza Fenn, and the cultivation throughout identical, except that the three green rows had been several times dressed with the powder, while the others had not. The contrast was most striking, and the benefits of the powder conclusive. He can secure a good sound crop of Potatoes at any time from the dressed rows, but seems to enjoy the fight with the enemy, and disposed to allow the combat to continue till the mastery is completely proved one way or the other.

Passing alongside of a long stretch of decaying leaves and stems another green oasis was arrived at—eight rows of Fiftyfold which had been dressed, and the plants generally clean and healthy; only a few specks of the fungus were on them, but the undressed rows were blackened. Digging amongst the dressed rows good crops of sound tubers were turned out, and one diseased tuber from a plant that had a few blackened leaves; but from the undressed rows in some instances half the tubers were tainted, and several quite rotten. These trials were in the field. A blacksmith's garden was visited where the soil is black and deep. The powder had been applied to a plot of Sutton's Satisfaction and Windsor Castle. The leaves were fresh, and every root lifted gave a splendid crop of clean beautifully shaped tubers.

Mr. Fenn's garden containing new and favourite older varieties was next examined. The soil here is richer than in the field, and the Potatoes had grown luxuriantly. "There!" exclaimed the veteran, "you can find nothing like this in the neighbourhood; and if the sight is not worth coming from London to see, I don't know what is. Look at my Woodstock Kidney there; one of the best quality Potatoes, but worst 'diseasers' known; but where is the disease now?" There was absolutely not a speck, but the stems were creeping along the ground and the leaves of the richest healthiest green. Rector of Woodstock, which is notorious for taking the disease, was also free. Fenn's New Bountiful yielded an enormous crop, and every tuber sound. Precisely the same remarks apply to Dora, a new pebble-shaped red variety, and to

Damson, also to Cottage Farm, every tuber of which was white and clean. The white tubers of Sir Charles Douglas (a heavy crop) were quite free from the suspicion of a taint. Mr. Fenn says this Potato will keep sound two years, and is the pollen parent employed in some of Messrs. Sutton's "Maglia crosses," which are being looked forward to with much interest. Sir Charles was raised by applying pollen of the American Snowflake, which had been sought for nine years, to one of his seedlings. International was also free. Mr. Fenn says when he raised this variety he sent it with others to a friend to try, with an injunction not to part with it, as the quality was not good enough; but it was "parted with," and Mr. McKinley obtained a certificate for it at a provincial show, and it eventually became a favourite with many exhibitors and cottagers. That is in brief the history of the International.

From one part of Mr. Fenn's garden some rows of Early Border were dug in July, and Ringleader planted on their sites. The plants are now a foot high, and their tender growths free from any trace of the disease. They had been several times powdered, but two self-planted roots of other varieties that came up close to them and not dressed were seriously stricken, as were all the rows of whatever variety that had not been dressed in the enclosure.

This is a simple narrative of facts as they were found last Monday, and not one of the four inspectors can say the record is inaccurate. Mr. Fenn is not only confident that the powder has saved the crops to which it was applied, but is firm in the belief that it has also acted as a fertiliser in his soil; as evidence of this he points to the early variety Ringleader not withering so soon as usual where the powder was used.

In a little unheated lean-to house he has a Vine and Tomatoes. For ten years the Vine has been worthless, eaten up with mildew; this year not a speck can be found on leaves or fruit, nor on the Tomatoes. The powder has had the same good effect on Roses, outdoor Vines, Apple trees, and indeed to whatever it was applied. Use it, he says, in good time and perseveringly, and it will keep mildew off everything, and insects too; but he glories chiefly in having conquered his old enemy on his precious Potatoes.

### FAVOURITE FLOWER BEDS.

I do not think the idea of "D. W. C." at all a bad one that readers should note in the Journal beds which have special features about them for the guidance of others. The old fashioned beds of Pelargoniums with the usual Lobelia edgings will no doubt give place to other designs of a more mixed kind in private gardens. Where the same people see the same style of arrangement, it may be many times in a day, the eye wearies of the constant repetition of colour and form. Beside in seasons like the present "Geraniums" are the reverse of cheering, giving little else but dead leaves and fading flowers.

Beds of mixed plants, whether of the flowering or foliage type, in separate order or in combination are destined to play an important part in the summer arrangements of flower beds. I consider that all beds which are situated on grass ought to have raised edges, no matter whether they be wholly of one kind, or each one raised with separate plants. There is no comparison between flower beds which have the edges raised about 4 inches above the grass and those which have not. If anyone doubts this let him try the effect either by planting one or two, or by observing those which are so raised. If the edging of the beds is to be confined to one colour let it be *Herniaria glabra*. It is surprising what a contrast there is between this plant and the grass, even though both are green. Besides the *Herniaria* affords so many opportunities of contrasting the plants in the beds with the surroundings.

But I am digressing from the heading of the article. A favourite bed here is one which has for its groundwork a mass of Harrison's Musk; the whiffs obtainable from this, first on one side of the bed and then on the other, according to the way in which the wind is blowing, are very pleasing. The bed is about 12 feet long, oval in form, and 6 feet wide; the edge is raised and planted with *Herniaria glabra*. Next to this is a thickly planted row of *Festuca glauca*, which contrasts delightfully with the green edging and the yellow and green of the Musk. Four Castor Oil

Plants, *Ricinus cambodgensis*, a dwarf-growing variety with dark green leaves, are planted at intervals of 3 feet apart from the centre, and dotted over the bed at spaces of 1 to 2 feet are plants of *Eulalia japonica*, *Zea gracillima*, and *Heliotrope Swanley Giant*, the dark purple of the latter contrasting well with the yellow undergrowth and silver and green of the *Eulalia* and Maize. For originality of design and perfume this bed is generally admired.

Another mixture which deserves notice is in an oblong bed 15 feet long by 5 feet wide. In the centre line are Fuchsias *Charming* and *Elegans*, both purple in colour, of excellent habit, and free flowering. Space is allowed between them to avoid crowding. The surface of the bed is carpeted with blue *Marguerites* (*Agathæa*), which are pegged down. Rising from these are Tuberous Begonias, seedlings of the current year, mainly pink and white varieties, with here and there a taller plant of *Begonia Vesuvius*, an occasional yellow *Marguerite*, and *Grevillea robusta*, the latter giving character to the bed. The edging is raised and planted with *Herniaria glabra*. Between the Fuchsias a slender plant of variegated *Ageratum* is growing, the silvery leaves of which contrast pleasingly with the dark purple of the flowers.

Alongside of the latter bed is another like it in size and shape, containing a mass of *Lobelia cardinalis* in rows just wide enough to prevent the leaves of one plant touching those of its neighbour. As the flower spikes exceed 3 feet in height the effect of such a mass of colour can easily be imagined, especially when in contrast with such a pleasing green cushion-like base as *Sedum Lydium* provides. The edge of the bed is raised with *Antennaria tomentosa*.

In another bed 14 feet long and 8 feet wide Tuberous Begonias are planted at such a distance that they do not quite touch each other. The colours are mixed judiciously, which gives more variety than would a mass of any one colour. At intervals of about 2 feet single stemmed plants of *Abutilon Thompsoni* are growing, the large golden mottled leaves contrasting well with the bright colours below, and relieving also the evenness of the bed generally. As the soil is carpeted with *Sedum glaucum* the effect of the rich crimson and deep scarlet of some of the Begonias is enhanced. The edge is raised and planted with *Echeveria secunda glauca* intermixed with *Veronica repens*. A narrow band of the latter also divides the glaucous *Sedum* from the *Echeveria* of the same tint. Either at a reasonable distance or on close inspection this bed has many admirers.

A circle 4 feet in diameter has growing in the centre a good plant of *Dracæna indivisa*, under which is a thick carpet of *Coleus Verschaffelti*, banded with a raised edging of *Mesembryanthemum cordifolium variegatum*. The effect of the three colours is charming, I never saw *Coleus* with a better shade on them than at present.

An oval-shaped bed 12 feet long has in the middle three strong roots of the double *Helianthus Soleil d'Or*, nearly 3 feet apart and 5 feet high. The centre of the bed is planted thinly with *Begonia Vesuvius*, and the ground underneath carpeted with the blush white *Begonia Princess Beatrice*, dwarf and floriferous. The edging is a raised one of *Sedum azoideum*; hanging over this and planted just within is a full row of *Linaria reticulata aurea*, which imparts colour, freedom, and variety to the bed.

Perhaps the most showy bed in the garden is one wholly planted with double Zinnias, except a narrow edging of *Viola Ardwel* Gem, which serves the twofold purpose of giving a colour which is not obtainable among the Zinnias, a soft yellow, and of hiding the stems. The plants were laid in a sloping direction, which made the pegging down much easier and produces a more uniform height. The edge of the bed, which is 24 feet long and 12 feet wide, in places, is raised and planted with *Echeveria secunda glauca*, *Veronica repens* being planted amongst the *Echeveria* as a setting to the glaucous-tinted succulent.—E. M.

### WATERY VEGETABLES.

VEGETABLES are always largely composed of water, but with so much rainfall and no sunshine worthy of the name they must be far more watery than usual. Apparently this does not materially affect their quality; in fact, as far as this is concerned, vegetables are better when grown with the aid of abundance of water than they are when too little of it falls to their share. What we are most concerned about, then, is the effect of so much water in their composition on their keeping properties. That coarse over-grown samples of various roots, notably Onions, Carrots, Parsnips, Turnips, and Beet, rarely, if ever, keep so well as do medium sized to small samples, cannot be denied, nor are they desired from a cook's point of view; but to all appearances they are in the ascendant

this season. Much the same remarks apply to various other winter vegetables, notably Brussels Sprouts, Broccoli, Savoys, Chou de Burghley, and Celery, all of which are growing far too rankly to please experienced gardeners. With the ground in such a wet and cold state, there being little likelihood of its getting any warmer this year, frosts may reasonably be expected both early and severe, and it is not unlikely that the vegetable crops may be cut even more severely than they were last winter.

It is to be hoped, however, that the majority have profited by the experience of the past, every effort having been made to grow more of the hardier or most reliable kinds of vegetables, steps also having been taken to prepare the less hardy kinds for severe weather. We have always grown a moderately large breadth of Seakale, but this year I have put out three times more than ever before, and the variety, Lily White, being very superior to the old form, the probability is that not a root too many will be prepared, either for forcing or cutting from where grown. Jerusalem Artichokes, Salsafy, Scorzonera, early raised breadths of Turnip Chirk Castle Black Stone, and young Carrots are among the most reliable winter vegetables, and abundance of these ought always to be grown. If somewhat scarce, then what there is of them should be taken good care of till other less hardy vegetables are less plentiful. There would be fewer failures with Celery if this was heavily banked up with soil before severe weather sets in, not more than half of the leaves, or even less, protruding after the final moulding is given. If the stalks are badly frosted decay soon spreads to the hearts, but when only the leaves are crippled the keeping qualities of the Celery are not greatly impaired. The Turnip-rooted Celery ought also to be taken good care of, roots well moulded over keeping well, and form by no means a despicable vegetable. Let Brussels Sprouts have abundance of room—even if this necessitates drawing a considerable number of plants—and they will then solidify considerably, producing closer sprouts, and prove hardier in consequence. Crowding is even more fatal to Broccoli. Much-drawn plants are certain to lose their lower leaves early, and the exposed stems, being the most vital part of the plants, collapse after only a moderately severe frost. After the experience of the last winter more gardeners than formerly will be disposed to lift and store the greater portion of their breadths of Veitch's Protecting Broccoli before severe frosts set in, and thereby be certain of a good mid-winter supply of medium-sized, well-blanching hearts. It will also be in accordance with the same idea to lift and bed in a considerable number of plants of later varieties where they can be heavily protected with mats, bracken, or dry litter whenever severe frosts are imminent.

As it happens there is yet plenty of time to think of these various protective measures, but there are a few other matters that will admit of no delay. For instance, it is scarcely possible to overrate the value of a good supply of Mushrooms during the winter, these constituting a dish hard to surpass on either the breakfast or dining table, cooks also putting them to other good uses. As a rule Mushroom houses proper are far too limited in size, but they are almost indispensable during severe winters. Mushrooms can be and frequently are grown in a variety of places other than the orthodox house, but in hard weather little dependance can be placed on any beds not given the benefit of a little fire heat. Instead, therefore, of filling the houses at this early date or any time before October, with beds that will most probably be exhausted before cold weather sets in, the wiser plan is to form the early beds in various makeshift positions, including open sheds, disused cellars, stables, and such like, forming the principal winter beds in the heated Mushroom house. Ridge-shaped, open air beds, properly managed, are remarkably productive, and these ought always to supplement those formed under cover of any kind. Where failures with these ridge-shaped beds occur they are often traceable to either the use of too raw or too fine materials. Not thoroughly well prepared by repeated fermentation and turnings, such a solid mass of manure is certain to heat too strongly, this perhaps both destroying the spawn and quite unfitting the material for the growth of Mushrooms. It must also be borne in mind that a considerable amount of somewhat short straw or fully one-third of the bulk of the heap should be kept with the horse manure, or it will not hold together or answer well in other respects. Wright's "Mushrooms for the Million" ought to be in the hands of all would-be successful growers.

Tomatoes, again, are of the greatest value, either as a vegetable or salad, during a hard winter, and with such a prospect before us of the early collapse of various watery vegetables, the attempt to keep up a supply of Tomatoes during the winter ought to be made on a larger scale, it may be, than usual. Instead of closely stopping all the plants in Peach houses and cases, vineries, and other places, where they are treated as supernumerary crops, let some of the leading growths extend and set clusters of fruit, and these will most probably ripen, or can be ripened during the winter.

Plants in various other heated houses and pits, now nearly cleared of their crops, may easily be induced to start afresh into active growth. Removing some of the old soil, watering with liquid manure, and then giving a top-dressing of good loamy compost, also keeping the structures somewhat closer and warmer than heretofore, quickly have the desired effect. A moderate number of young shoots being reserved on the old stems these will flower and set good clusters of fruit long before the winter sets in, and the maintenance of a somewhat dry but not strong heat during the winter will insure all ripening in due course. If there are no old roof or other plants to renovate, nor no young ones that can be put out in ridges of soil or potted, then lift some of the healthiest of those growing against dry warm walls. They will move without experiencing much check, and the fruit already set on them ripen well.—W. IGGULDEN.

## FRUITERS AT CRAWLEY.

ON Saturday last several members of the Court of the Worshipful Company of Fruiterers visited the nurseries of Messrs. J. Cheal & Sons. They travelled in a saloon carriage from London Bridge, Sir James Whitehead, Bart., Master of the Company, meeting them at Three Bridges Station from Eastbourne. Crawley Station is the nearest to the nurseries (a little more than a mile), but Three Bridges and Horley have better quick train accommodation—that is to say, are "stopping stations" for several of the London and Brighton expresses. The distance from these stations to the nurseries is about three miles, and a drive on a fine day along the Surrey and Sussex roads and lanes is very delightful. Amongst the company were G. J. Brocklesby, Esq., Upper Warden; H. Martin, Esq., Renter Warden; and Past Masters G. Cutt, W. N. Froy, and H. R. Williams, Esqs. A. H. Smee, Esq., and other gentlemen were present, also some ladies. All were greatly interested by an inspection of the fruit and Dahlias for which the nurseries are famed, and more than satisfied with the pleasant reception accorded them by Messrs. J. & A. Cheal. They had also much pleasure in meeting Mr. Cheal, sen., a gentleman ninety-two years old. He has had to battle against a serious attack of the influenza epidemic, which has conquered so many, but his sound constitution shook off the enemy, and the nonagenarian is now active, vivacious, and well.

Twenty years ago the site of the chief nursery was unbroken common, the land so heavy and wet that local farmers considered it worthless, and would have left it to its fate. Not so the Messrs. Cheal. They believed that by drainage, cultivation, and tall sheltering hedges they could do something with it. They have done a great deal, not for themselves alone, but for the district. Previous to their possession of the land it afforded practically no employment to men who live by their labour, but now the 65 acres afford regular work for sixty-five persons. The staple of the land is sound—a "holding" clayey loam, and when ameliorated soil of that character is highly productive. In the Lowfield Nurseries some parts are heavier than others but none light, and by adapting the crops to the soil all appear to thrive exceedingly well. Conifers, Rhododendrons, various kinds of ornamental trees and shrubs, Roses, Dahlias, hardy and herbaceous plants thrive quite as well as the fruit trees, and these are as clean, healthy, and productive as anyone could wish for trees to be.

Naturally the "Fruiterers" first desired to see the fruit. Passing under a tunnel of Pears, the trees planted close to the side of the walk and trained over as single cordons, a liveryman observed that it was the best method of turning paths to account he had seen, and thought many gardens might be improved in appearance and productiveness by similar canopies of fruit. "Hedges" of Apples and Pears were also greatly admired, the former trained diagonally across each other, forming a sort of diamond fruit fence, the trees sustaining each other, and the Pears trained obliquely to wires stretched from post to post 7 or 8 feet high. The trees were laden with fruit, and it is not conceivable that an equal weight could be obtained from the space occupied so inexpensively in any other way except trained in the same manner to a boarded fence with a southern aspect. The Pears on such a fence were bearing fine fruit in the greatest profusion, and it was thought by more than one visitor that the value of this one crop was equal to the cost of the boarding. "Is it the soil or the climate, Mr. Cheal, that does so much for you?" asked the Master. "The soil, Sir James," was the reply, "is what we have made it out of the clay, by working and top-dressing, and as for the climate we have been deluged with rain—yesterday the paths were full of water." "Yet," was the rejoinder, "some newspapers tell us that fruit cannot be grown in this country; it is here, however, and we must be allowed to believe what we see." There were certainly plenty of Pears to be seen, indeed no room for more on the trees or the

fence. The proprietors of this nursery believe in cordons, and all available board space or wall space is occupied with them, and they have taught numbers of visitors to believe in them too.

Passing onwards, large trees as well as small ones are found in the collection—trees trained as well as untrained, productive bushes as well as heavily laden orchard standards. Among the latter several trees of the Sussex cottager's Apple, The Forge, were, as they are every year, bright with clusters of orange-red fruits, the glow of colour being produced by the numerous crimson streaks on a yellow ground. This Apple, as is correctly stated in Dr. Hogg's "Fruit Manual," "originated at the Forge Farm, near one of the old forges in Sussex, near Crawley," and it is described as "the cottager's Apple *par excellence* in that part of Sussex which is conterminous to Surrey and Kent." That is so, for trees are seen in gardens on both sides of the border lines of those counties. It is said they bear "regardless of weather," and if one should be found with few or no Apples it is because of the heavy exhausting crop of the previous year. It may be expected that the Forge Apple would bear in other districts as well, but only in strong fertile soil would the fruit be large enough to be useful. It is essentially an Apple for home use, and too small to grow for sale. Few surpass it when cooked, and in October and November the fruit makes a bright dish for the table. The flesh is tender, juicy, sweet, and agreeably perfumed.

Standard trees of Devonshire Quarrenden, King of the Pippins, Keswick Codlin, Betty Geeson, Dutch Mignonne, and several other Apples, also of The Czar, Victoria, and Early Transparent Gage Plums were heavily laden, but many of the fruits of the latter cracking through excessive wet, not bursting through the pressure of sap, but splitting by the transmission of moisture through the cuticle. It is, however, on the three or four-year-old bush trees on Paradise stocks that the finest Apples are to be seen. There must be a bushel of saleable fruit on some of the Stirling Castle trees from 4 to 5 feet high. Duchess of Oldenburg was bearing its beautifully streaked fruits abundantly, good alike for cooking and eating. Lord Grosvenor was laden with very large fruits, and has quite superseded Lord Suffield at Crawley as well as in many other districts. Professor is a favourite Apple of the Codlin type with Messrs. Cheal; fruit large, conical, of the richest golden yellow of all, the tree hardy, with a free sturdy character of growth. Lane's Prince Albert attracted attention by the full crops of handsome fruit, as also did The Queen, the fruits striped similar to those of Duchess of Oldenburg, but larger. Bismarck was large and highly coloured, and Worcester Pearmain all aglow with its rich red fruits. Yorkshire Beauty was producing yellow red-flushed Apples in abundance; and there were beautiful examples of Lady Sudeley, full crops of Cox's Orange Pippin, and fine clusters of the symmetrical Hormead Pearmain. Besides those mentioned Messrs. Cheal have planted in an orchard for bearing standards on Crab stocks, Newton Wonder, Blenheim Pippin, slow in bearing, but they can afford to wait; Ecklinville, Golden Noble, New Hawthornden, Potts' Seedling, Warner's King, and Winter Queening, which they find well adapted for their clay soil. Of the early summer Apples Mr. Gladstone is the first in and the first over, the richly coloured fruits being excellent when "caught just right," but soon turn mealy, and the Red Juneating and Astrachan last a little longer.

Some of the city visitors were much interested in the process of budding, which was going on briskly over 40,000 stocks. One of the ladies was fain to try her hand in the operation, which she performed remarkably well. The tree is marked, and will some day bear fruit—presumably in her garden at Putney Heath. Standard Peach and Nectarine trees in pots, bearing and ripening good crops in a sheltered position, were lingered over admiringly, the trees not having been placed under glass for protecting their blossoms.

Apples are not grown under glass, but Pears are in a most satisfactory manner. The structure is a steep, light, span-roofed one unheated, the Pears planted about 15 inches apart, and trained up the roof as cordons. They are bearing full crops of fine fruit, and suggest that such houses would be both interesting and useful in gardens where certain crops of the finest Pears are coveted. An inspection of the double cased, double windowed, and double doored fruit room was inspected, in which Apples kept perfectly last winter without the aid of artificial heat, though the frost outside was prolonged and intense, the thermometer registering down to zero.

After the fruit came the Dahlias. The "Tom Thumbs" were proving all that has been said about them. They are dwarf, sturdy, and floriferous, only a few varieties exceeding a foot in height. The demand for them has exceeded the supply, and they have probably a bright future before them, and will brighten many gardens. The flowers are single. The general stock of single Dahlias is very extensive. Among the most distinct and beautiful

of this and last year's varieties raised in the nursery and certificated at Westminster are T. W. Girdlestone, Miss Glasscock, Eclipse, Gulielma, Northern Star, Duchess of Albany, and Victoria. Two of Mr. Ware's varieties, Miss Ramsbottom and W. C. Harvey, were also greatly admired. Cactus Dahlias are in strong force, and they have to be, so great is the request for them. Two of the finest are Duke of Clarence, rich glossy maroon crimson; and Beauty of Arundel, a rich crimson purplish tipped sport from Juarez. Black Prince, Mrs. J. Douglas, Asia, and Panthea have also a host of admirers. Of show and bouquet varieties the collection is large, but there is no space left for a selection of the varieties, and all the best from here and elsewhere will soon be on view at the Crystal Palace. The close and lofty sheltering hedges of Hornbeam and Thorn 9 or 10 feet high, and neatly clipped, which intersect the nurseries, have proved invaluable in sheltering both the Dahlias and fruit trees from the boisterous gales that have lately swept over the district.

After the luncheon, which was provided in a large marquee on the lawn, Sir James Whitehead expressed, on behalf of the company, the pleasure that had been experienced and the instruction gained by the visit to the extensive, well furnished, and admirably kept grounds; also thanked Messrs. Cheal for their courtesy and unstinted hospitality. The brothers responded in appropriate terms, most of the visitors then departing, a few, however, lingering behind for a second look round.—A. FRUITERER.

### PREPARING FOR FRUIT TREE PLANTING.

IN the preparation of ground and other work connected with the planting of fruit trees much may be done at the present time. There are so many small items in connection with fruit culture demanding attention that it is not always wise to leave everything to be done when days are short and atmospheric conditions not by no means so favourable. Where a large collection of hardy fruit is grown there must of necessity be always something to renovate, also to remove and make room for something more worthy. A good plan is to take a look round the trees, and jot down the names of any which require root-pruning, removal, &c., for it is not prudent to trust to the memory alone to carry one through. The gardener's duties are so multitudinous that it is easy to forget something, so that notes are invaluable. As regards varieties it is needless to traverse the same ground over again, for time after time the advice given in these columns is, "To plant only good varieties which are known to succeed in each district, and which will amply repay for the trouble." Then add style of training, and order early from a good firm; nothing is gained by buying the rubbish so often seen at some auction sale rooms, for the trees in many instances are not worth the trouble of planting. Besides, early orders ensure the most prompt attention, and naturally the best trees are forwarded.

If new plantations are to be made the ground ought to be drained thoroughly, trenched, and if at all poor have plenty of decayed manure incorporated with it, and all made in good working order for the reception of the trees at the proper season. Where old trees are taken up and young ones have to be substituted the ground should be well broken up and all old roots picked out. As much of the old soil as can be conveniently removed should be, and fresh added with the compost in which the trees are to be planted. Good fruit growers will have much of the compost ready, but where it is not so the sooner the work is accomplished the better. Cuttings of hedges which have been clipped and useless wood out of the shrubberies are charred. Old hotbeds are wheeled out and plenty of manure provided, and what loam we can spare, with lime rubbish, or if this is not available some slaked lime, the whole being turned over several times, form the chief elements with which our trees are annually dressed at the roots. This if mixed now will be in the right order when required a few weeks hence. In districts where the soil is good this compost may not be required for newly planted trees, but here (near Liverpool), where we have in many instances a cold clayey subsoil and the ground throughout of a rather cold nature, we find it the one thing needful. Good stout stakes for the newly planted trees ought also to be prepared, and labels of some approved pattern, so as to be in readiness when the work commences.

The advantage of making possible provision now for planting when the time comes cannot be sufficiently estimated by those who delay all such matters to the last. On the one hand those who are prepared can choose fine days and get through a large amount of planting, whilst on the other the work is delayed by having to look for and prepare all kinds of things; the trees, if the weather is unfavourable, being planted in a way neither favourable to their growth nor creditable to those who have charge of them.—R. P. R.

LYCASTE COSTATA.

A PECULIAR Orchid in its floral colouring is *Lycaste costata*, of which a drawing is reproduced in fig. 29. The sepals and petals are greenish, the lip white or yellow tinted. It was received from the Cordilleras over thirty years ago by Mr. R. Hanbury, and is still found in collections of Orchidic curiosities. A plant was shown at one of the Royal Horticultural Society's meetings this year, when it attracted attention even amongst many brightly coloured and handsome Orchids.

#### ORCHID NOMENCLATURE AT KEW.

"THE Royal Kew Gardens Bulletin of Miscellaneous Information" for August contains some interesting information with regard to Orchid nomenclature, and the authorities deem it desirable to state the position of Kew with regard to this matter. In no other country are pains and money so lavishly expended on the cultivation of the plants of this family as in England. In no other country are so many species to be found in a living state as in our private collections. And a large capital is invested in the commerce by which these collections are supplied. It is the business of botanical science to furnish such plants with names under which they can be recognised, and with technical descriptions, by means of which the names can be fixed and the plants identified. For this purpose it is necessary that a standard of nomenclature should be maintained by some competent authority. During the middle of the present century this function was performed by the well-known botanist, Dr. Lindley. After his death, his admirable private herbarium of Orchids, amounting to 3000 sheets, was purchased in 1865 by the Government for Kew.

In 1863 Dr. H. G. Reichenbach was appointed Professor and Director of the Botanical Gardens at Hamburg, and from that time made the study of Orchids the scientific business of his life. He was speedily recognised as occupying the place of Lindley, and cultivators of Orchids in all countries were in the habit of sending their specimens to Hamburg for identification and determination. Meanwhile, Kew had continued to amass what is, on the whole, probably the largest comprehensive herbarium of these plants. It was Professor Reichenbach's custom to spend in most years a few weeks at Kew, and he had the opportunity of examining and, in some cases, of describing the new accessions. He was, however, in the habit of describing the novelties sent him by correspondents from English collections in the pages of a contemporary, and of these, for the most part, no other record exists at Kew. Thus in the genus *Dendrobium* about 160 species are represented in the Kew herbarium by names above, and in *Epidendrum* as many as 200.

The defect of Professor Reichenbach's method was that he never brought the scattered work of his life to anything like a comprehensive review. To a certain extent he had the clue to it himself, but when oppressed with failing health in the latter years of his life, he seems to have become in some degree overwhelmed with the enormous amount of material which he had accumulated, and it is now ascertained that he often described the same species more than once under independent names.

There is the further difficulty that he was not a felicitous expert in the art of describing plants, and from his bare descriptions alone it is often all but impossible to identify the species which he had in view.

This difficulty would not have been considerable if after his death in 1889 he had, as it was confidently expected he would do, left his herbarium to some public institution where it would be open to the inspection of those who took up his work. For reasons on which it is easy to speculate, but for which it is difficult to account, he bequeathed his collection to the Imperial Hof Museum at Vienna, on the condition that they should be sealed up for twenty-five years. This singular provision undoubtedly placed the "Orchid world" in a rather cruel position. Reichenbach was no longer available to give them names; and his herbarium was not accessible to ascertain what he had done in the past. To this no one having an unnamed Orchid in his hands possessed very much in the way of a clue. Nevertheless something had to be done, and amateurs of Orchids turned to Kew for help. It seemed a proper part of the functions of the national botanical establishment to render all the assistance in its power as regards the solution of purely botanical problems. Kew was not, as will have been seen, on the whole, badly equipped for the task. In the first place it possessed Lindley's collections, the classical starting point of systematic

orchidology. Next, Mr. Bentham had devoted two years at Kew to the elaboration of the family for "Bentham and Hooker's Genera Plantarum." This was published in 1883. Bentham thoroughly sorted the copious material at Kew into genera, which he defined on a clear basis.

Reichenbach's works upon various collections preserved at Kew, which he described and published, is of course available here. Moreover, Sir Joseph Hooker, during 1888-90 thoroughly worked out the Orchids of India, amounting to about 1300 species (in 113 genera) for the fifth volume of his "Flora of British India." Not to speak of other countries, the collection of South African Orchids is pronounced by Mr. Bolus, F.L.S., their most recent monographer, to be the most complete in existence. The Kew collection of living Orchids now amounts to 1400 species, the nomenclature of which is all carefully determined; the most recent enumeration of the number of existing species is that of Sir Joseph Hooker, who puts them at 5000.

FIG. 29.—LYCASTE COSTATA.

On the whole Kew probably stands in a better position to serve as a standard of Orchid nomenclature than any other botanical establishment. The only real difficulty in its way is how to deal with Reichenbach's indeterminate descriptions and nomenclature. Various correspondents have, however, rendered very useful assistance in filling up this gap by the communication of specimens from living plants which Reichenbach had named. Much more might be done in this direction, and in time it can hardly be doubted that the vast proportion of Reichenbach's types might be recovered. There is, however, always the risk that when an unnamed Orchid cannot be run down in the Kew Herbarium it may not really be undescribed, but may be lurking somewhere with a name in Reichenbach's collections. This, however, is a problem which, for the next quarter of a century, cannot be solved. For practical purposes it has, therefore, been decided to assume that such an Orchid is new, and to describe it with an appropriate name. This task has been entrusted to Mr. Rolfe, one of the assistants in the Kew Herbarium; and as the work will be done in official time, the descriptions will be published from time to time in the "Kew Bulletin."

It must be the aim of every botanist to avoid the multiplication of names and the piling up of synonyms. But the world

cannot wait on posterity, and someone, a quarter of a century hence, may have the patience to disinter from Reichenbach's herbarium, if it is thought worth while, any names which have the prescription of priority. If even so astute and experienced a botanist as Sir Joseph Hooker found himself unable to penetrate the mystery which surrounds many of Reichenbach's names and descriptions, it seems scarcely worth while attempting to rescue them from the oblivion into which for the present they must fall.

### MARGUERITES ALL THE YEAR ROUND.

IF I were asked to name which I considered the most useful of all plants grown in pots for decorative purposes I should unhesitatingly say *Chrysanthemum frutescens*; and although I am prepared to hear that many will not agree with me, I think I can show that the white Marguerite has at least great claims to that distinction when all its good qualities are fairly considered. Because it happens to be a somewhat common and easily grown plant its merits are frequently overlooked. Doubtless it reached the height of its popularity a few years ago when the æsthetic craze was at its height. The ever-changing fashion in flowers brings many plants to the front in turn which have slumbered in obscurity, and after the rage is over they gradually settle down to the position to which their merits entitle them.

Marguerites have now won for themselves a prominent position with all who have much experience in decorative work. Although comparatively easily grown they are not as a rule cultivated so well as they should be. Market growers find that there is an enormous demand for them at good prices. Not long ago an old friend who is growing a quantity for market, wrote to ask my opinion as to the best way to manage the plants in order to produce good flowering examples during the spring months, as he knew I took great interest in them, and had at various times grown them largely in a great variety of ways, and in sizes ranging from useful decorative plants in 4, 5, and 6-inch pots up to gigantic specimens 6 feet in diameter.

Propagation is easily performed at any time of the year, and should be constantly going on, as in this way an unbroken succession of flowers may be kept up throughout the year; and these charming plants are useful alike for supplying cut flowers and for decorative purposes. A good batch of cuttings should be put in at the present time, which will supply flowering plants in pots from 4 to 6 inches in diameter during April and May next. We dibble the cuttings into boxes and place them in close frames or handlights at all times, and by preventing the leaves from flagging by shading and sprinkling we find they root very quickly, and grow freely. Good leaf soil and loam in equal proportions with sand added form our favourite compost for cuttings, but where sweet and good leaf soil cannot be obtained substitute peat or cocoa-nut fibre refuse. In addition to the cuttings that are put in now, another batch should be inserted at the end of October, and another in January, a regular succession being put in every month from that time onward throughout the spring and summer months. Spring-struck cuttings make plants quite large enough for bedding purposes. Our own, which were struck at that season, are now a mass of flowers. Plants rooted in June are now well set with flower buds at the point of every shoot. These will give a good supply of flowers in October and November, and others just potted off will succeed them. In selecting cuttings choose short jointed, sturdy shoots, as although any part of the stem will grow these make the best plants.

As soon as the plants begin to grow take out the point of each, and when young shoots begin to appear place them in 3 and 4-inch pots. We flower a limited number in the latter size, and as from the first stopping they generally produce three or four shoots they are not again stopped, but any odd flowers which appear are removed till the shoots become strong, then they flower profusely. Those which are transferred to 5-inch pots are stopped once more, while those which go into 6 or 7-inch ones receive an additional stopping or two, according to their strength and the number of shoots they have. A cut-back plant is much more productive for anything large than the last-named size. At each potting the soil should be rammed thoroughly firm to produce sturdy roots, and to store as much food as possible into a small space. Like all other *Chrysanthemums* the Marguerite is a gross feeder, and is also very partial to soot. After trying many composts we find the following gives the best results:—Two parts loam, one leaf soil, one fresh horse droppings, and a 6-inch pot of soot added to each barrowful.

In order to produce large plants the largest of them when they have done flowering in May should be cut back to two or three eyes. As soon as they begin to grow again knock them out of the pots, remove part of the old ball, cut the roots with a sharp knife; see that they are thoroughly moist, and plant in moderately rich

soil in an open position out of doors, where, if they they are well attended to in watering should the weather be dry, they will quickly grow into fine heads. About the second week of September put them into suitable size pots, and place them under a north wall, or in some other shady position, and syringe once or twice a day if bright weather prevails. As soon as danger from frost threatens place the plants under glass. A vinery cleared of fruit or an ordinary greenhouse will be suitable. Should bright weather follow they will still require to be syringed in the middle of the day.

As soon as an opportunity presents itself after the plants are housed they should be tied out, as that is the time to lay the foundation of a fine plant. Commence by placing a wire under the rim of the pot, and with strong green thread bring the lower branches down so that they rest on the rim of the pot, or as near to that point as possible without running any risk of breaking the shoots. After the lower part of the plant has been dealt with fasten many of the other shoots to neat stakes, so as to have them evenly distributed over the whole surface, the centre of the plant being full and rounded, and each shoot standing quite clear of its neighbours. Stakes will not be required for every shoot, but if they are arranged at regular intervals the shoots in the spaces between can be kept in position by being fastened to the tying material carried from stick to stick. As this tying goes on all strong shoots should be stopped, and by the end of October the shoots which are the strongest then will require stopping, and any flower buds that are showing should be removed. From that time till Christmas remove any odd flower buds which appear. After then let both flowers and shoots remain, and by the middle of May they should be a mass of fresh white starry flowers, which will assuredly receive a full share of admiration.

If very large plants are wanted quickly the shoots may be left from 5 to 9 inches in length at the next pruning, and if any blank spaces occur even longer to get the plant into good form. Where there is no particular desire to secure large specimens quickly prune to three or four eyes, plant out, and treat as above described. Plants that have been used for summer bedding may also be lifted and grown for pot specimens. If room can be spared it is a capital plan to lift a good number of plants from the beds before the frost has injured them, as these supply a quantity of flowers during the autumn months, and if they are then cut back they supply fine cuttings in the spring, after which the old plants can be thrown away.

The only insects that are really destructive to Marguerites are the larvæ of the Celery fly (*Tephritis onopordinis*), and these often work sad havoc amongst them. I believe the only real remedy is to pick off all the leaves infested as soon as the attack is noticed and burn them. This plan should be followed up as long as any trace of the pest is visible. The plants should also be syringed with water in which quassia chips have been steeped. This renders the leaves bitter and distasteful to the fly, which first bores the leaves and then lays the eggs. When plants become very badly infested before remedial measures are taken it is better to burn them and start with a clean stock. It is generally supposed that when these insects abound in any district any Marguerites growing near are bound to become a prey to their destructive attacks. With this I do not agree, as I have frequently noticed that it is the conditions under which plants are often grown which predispose them to such attacks. Surround them with conditions congenial to their requirements, give them liberal treatment, and there need be no dread of the pest which sometimes proves so destructive. A dry atmosphere, or continued dryness at the root, will quickly bring the plants into such a debilitated state as to render them unable to resist the attacks of the leaf borer. I have seen fine healthy plants lifted in September, which were not given the requisite amount of shade and syringing, badly attacked a week after they were lifted. Other plants which were carried safely through that period by good attention sometimes fall a prey to the attacks of the same enemy shortly after they are housed, the great change from the cool dewy nights and the shady position they occupied in the open air to the dry atmosphere of a vinery during bright days, such as often follow frosty nights in October, undoubtedly bringing about, in my opinion, such an undesirable result. Prevention could have been effected by thoroughly syringing the plants during the middle of the day, and in some cases shading as well. These are all useful lessons learnt by observation.

Marguerites, being gross feeders, require plenty of water and a regular system of feeding when the pots are crammed with roots, indeed they require far more water at the roots than the show types of *Chrysanthemums*, and quite as much feeding. Soot water given two or three times weekly keeps the foliage good in colour. Weak manure water made from the drainings of stables should be given once a day if the plants require watering so often, and an occasional dressing of the artificial manures regularly advertised

is of great benefit. All plants growing in pots in the open air should be syringed once a day in bright weather, and when the flowers begin to unfold should have the protection of glass.

*Chrysanthemum frutescens* (white) and *Etoile d'Or* (yellow) are the best varieties to grow.—H. DUNKIN.

### RAGLEY.

THE British as a nation may well be proud of the many palatial residences that are scattered throughout the kingdom, surrounded as they are in many instances by extensive and beautiful gardens. They stir up within our minds admiration for the beautiful in both Nature and Art, and by reason of their splendour tell of the greatness and prosperity of the past, in times when these massive piles were built, and the grounds around them laid out with so much taste and judgment. Ragley, the fine Warwickshire seat of the Marquis of Hertford, fully answers to the above description. It is situated about fifteen miles from Warwick and one mile from the quaint old town of Alcester, which was evidently built at a time when architectural adornments were not indulged in for ordinary dwelling houses; and even now those remnants of the past, thatched and mossy roofs, still remain in the outskirts of the town, while the overhanging gables of the other houses and the crooked walls show that strength and substance in their building received more attention than the production of perpendicular walls.

A pleasant drive through the park, which is chiefly remarkable for its good roads and extensive and well wooded scenery, brings us to the front of the mansion, which lies open to the park, and being on high ground commands a fine view. No part of the flower garden or pleasure grounds are visible from this point, as they are shut off on each side by a long belt of trees and shrubs. The park being very extensive affords ample room for the fine herd of deer to roam in freedom, and they add a distinct feature to surrounding scenes. A large lake at the bottom of the grounds is frequently taken advantage of for holding aquatic sports.

### THE PLEASURE GROUNDS.

On entering these a delightful scene presents itself. Winding walks bordered with grass verges sweep round in graceful curves in many directions. The one which we instinctively pursued led to a charming rosery with a raised Rose temple in the centre, over which the long shoots of climbing Roses were wreathed with deep red flowers. The variety was one of those old semi-double Roses which few seem to know the name of, but all admire when seen in the perfection in which it is here growing. Among the Rose beds the most striking was a mass of that general favourite *La France*. Pegged down shoots were carrying a wreath of fine flowers, and although I am no advocate for the pegging down system for Roses generally, yet in this instance it undoubtedly answered well. A very effective boundary to this rosery is formed by a low hedge of *Cupressus Lawsoniana pendula* and *erecta viridis* intermixed. A long winding walk leads from this rosery to the flower garden, and a charming walk it is, abounding at each step with arboreal beauty. Trees and shrubs of the choicest kinds have been planted extensively, and at the present time are in such vigorous health and so well proportioned in outline as to make one wish they would never grow larger, and so render unnecessary the removal of many of them. This is contemplated, and must be done to allow those left room for development. *Picea Pinsapo*, *P. glauca*, and *P. Nordmanniana* are represented by many fine healthy trees from 20 to 30 feet in height, with every branch perfect quite to the ground; and *Picea nobilis* not quite so large bearing fine cones. As we follow the windings of the walk we come upon stretches of velvety turf, skirted by irregular bands of shrubs, and many fine specimens of the numerous varieties of *Cupressus* till a bright glow of scarlet in the distance arrests attention.

### THE FLOWER GARDEN.

We find that the bright colour noticed on the approach is produced by the flowers of Donald Beaton *Pelargonium*. Old plants are trained to stakes in the form of a pyramid, and form grand objects, especially when seen from the top of the long flight of steps up which we ascend to the heart of the flower garden. A massive square built mansion stands in front, of what style of architecture I know not, but is indeed a stately pile, and two other flights of steps have to be ascended to reach it, so that it is easy to imagine that a fine view is obtained of the flower garden and grounds below it. Nor does the beauty of the scene end here, as the finely wooded portions of the park, the planting of which has been the work of years, have all been carried out with the object of producing a grand view from the terrace around the mansion, and it only requires to be seen to know that the object is accomplished. Below are the large masses of well defined colours in the flower beds, then on a still lower level a long open stretch of park with trees dotted about in picturesque irregularity. Then as the ground slopes gradually upwards a thin and irregular belt of trees begins, which become thick and massive as they extend far away in the horizon. Through the centre of this mass of trees the broad green sward extends upwards as far as the eye can reach, and being shaded on either side by the leafy canopy above, it forms a delightful retreat, which seems to impress the on-looker with a sense of quiet repose.

To describe the flower garden in detail is a task by no means easy; but I will attempt to give a faint idea of the grandeur of the scene—grand, because everything is on so large a scale: imposing, because distinct colours are produced in large masses; and it seems well nigh

impossible to have the beds too bright in colour on account of the large number of green trees around. Standing on the terrace already mentioned the two ends of the flower garden immediately in front are in the form of half circles; the one nearest the mansion is formed by a sloping bank of grass. At the base of this a level strip of lawn extends to a broad gravel walk which runs round the whole garden. At the base of the bank round the centre arc four large Portugal Laurels, trimmed into the form of half globes finely proportioned and perfect in shape. From this point a straight walk leads to a fine specimen of *Cupressus Lawsoniana*, surrounded by a large mass of *Gladioli* in the centre of the garden, then a broad band of Marshal McMahon Golden Bicolor *Pelargonium*, an edging of Mrs. Perry, and a narrow verge of lawn. The walk then continues its course to the lower end of the garden, where the half circular form is defined by a well-kept Yew hedge, which is of more than usual interest on account of being marked with bands of the Golden Yew at about every 12 feet, which have a novel and pleasing appearance. Around the central bed already described and divided from it by the gravel walk and grass verge is an imposing group of sub-tropical beds. The beds are filled with Cannas, *Ricinus*, *Wigandias*, and *Nicotianas*, edged with triangles of Beet, Marigolds, and variegated leaved *Pelargoniums*. Around these beds on each side of the central walk large fan-shaped beds, which have the same radius, are cut in the grass, and beyond these a band of long curved beds are arranged, the outline of them corresponding with the arc of the outer edge of the fan-shaped beds. Many of these beds are planted with a groundwork of *Cerastium tomentosum*, with a circle or centre the same form as the bed, filled in with *Pelargoniums*, *Begonias*, or *Calceolarias*. The effect is very good indeed, and is also a good way of economising bedding plants, a matter of some importance, where, as in this case, 100,000 are required for bedding purposes.

Other noteworthy beds were planted as follows:—*Pelargonium* Mrs. Perry, edged with Tom Thumb *Ageratum*; Madame Crousse, with *Alyssum variegatum*; and Henry Jacoby, edged with Manglesi. On the terrace which overlooks the larger portion of the garden some capital beds are cut in two grass panels. The central one is filled with *Coleus Verschaffelti*, edged with Lady Plymouth *Pelargonium*. This has quite a unique appearance. Several attractive carpet beds are also worked out. One deserving special attention is a double coronet, marked out with *Alternanthera* on a groundwork of *Sedum*. The wall that forms the boundary to this terrace has a border in front of it effectively planted in the following way. Back row next the wall *Perilla nankinensis*, next a half circle of *Iresine Lindenii* at some distance from it, the space being filled in with Master Christine *Pelargonium*. In front of the arc formed with *Iresine* is a groundwork of *Mesembryanthemum* filled in with *Alternanthera magnifica*, edged with blue *Lobelia*. The wall is clothed with *Clematis Jackmanni* and variegated Honeysuckle. This was one of the most telling pieces of bedding in the whole garden.

### THE KITCHEN GARDEN AND GLASS STRUCTURES.

These are situated half a mile from the mansion, on much lower ground. The greater part of the garden is enclosed within substantially built walls, and massive iron gates erected at the entrance give it a most imposing appearance. Large breadths of all kinds of vegetables such as are in constant demand for the supply of an extensive establishment were noticeable, but so much time was taken up in thoroughly examining the flower and pleasure gardens as to leave little at our disposal for the inspection of the kitchen garden, which is about six acres in extent, including those portions set apart for hardy fruits. The glass structures are numerous, but scattered. This is likely to be remedied to a great extent in the near future by erecting another range which will connect the principal portions of them. A cool Peach house 100 feet in length was first entered. The trees are trained one-third of the distance up the roof, the back wall being also covered. This gives a large amount of space for the production of fruit. All the trees were carrying heavy crops, Barrington Peach and Violette Hâtive Nectarine being great favourites. We next entered the principal range of fruit and plant houses. The vineries are four in number, and as there is a large demand for Grapes the Vines are heavily cropped. I should not like to conjecture the weight of fruit per running foot the Vines were carrying, but it was certainly considerably above what is generally regarded as a full crop, and the Vines will require high feeding to carry them through. This, however, they are receiving, judging by the heavy dressing of manure on the borders. The varieties in the earliest house are Black Hamburg, Buckland Sweetwater, and Madresfield Court. The other houses are filled with Muscats, Gros Colman, Lady Downe's, Alicante, and Barbarossa (Gros Guillaume). There are also two Peach houses in this range, one being cleared of fruits, the other having a fine crop of Barrington just ripening.

The roof of the greenhouse is covered with *Plumbago capensis*, a fine plant of Maréchal Niel Rose, and *Lapageria*. The side stages were occupied with *Pelargoniums*, *Begonias*, *Fuchsias*, and other plants, with Palms in the central bed, all good for decorative purposes. In one stove two grand plants of *Adiantum farleyense* show that the cultivation of this beautiful Fern is understood at Ragley. Gardenias and Cucumbers were growing in another house both in the best of condition. Among a mixed collection of Orchids, *Calanthes* and that fine old plant *Phaius grandifolius* were in fine condition. Several other pit-like houses of the type which were in vogue when wood was cheap and glass dear are still in use, and are found convenient for wintering bedding plants, and for growing Ferns, Azaleas, and Melons in.

Ragley is a fine example of the home of an English nobleman, and the Marquis and Marchioness of Hertford are fortunate in securing the services of so good a gardener as Mr. A. D. Christie, who is doing excellent work there, and who fully appreciates the encouragement given him by his noble employers.—H. D.

**EVENTS OF THE WEEK.**—The following Shows are fixed for the ensuing week :—September 2nd and 3rd (Thursday), Bath ; 3rd, Dundee and Thame ; 4th and 5th, Hardy Fruit Show and Exhibition of the National Dahlia Society at the Crystal Palace ; 8th, Royal Horticultural Society, Drill Hall, Westminster, with lecture on hardy water and bog plants by Mr. Geo. Paul ; 9th and 10th, show of early Chrysanthemums at the Royal Aquarium, Westminster ; 9th, 10th, and 11th, Fruit Show of the Royal Caledonian Society at Edinburgh. Auction sales take place at Protheroe & Morris' Rooms, Cheapside, London ; also at Bloomfield House, Fareham, Hants, and Beechfield, Doncaster. For particulars see advertisements.

**THE WEATHER.**—Showers more or less heavy have fallen almost every day since our last issue in the Metropolitan district, but the passing storms have been much less violent than are reported from various parts of the country.

— **THE NEW HEAD GARDENER AT CHATSWORTH.**—Mr. Wm. Chester, for upwards of thirty years foreman of the large conservatory at Chatsworth, has been appointed successor to Mr. Owen Thomas, who, as already announced, takes charge of the Royal Gardens at Windsor. Mr. Chester is to be warmly congratulated on a promotion which gives him one of the most important gardening posts in the kingdom, and he has well proved his capacity by a long term of service.

— **ANOTHER SHOW CALAMITY.**—The thirty-sixth autumn Show of the Gateshead Horticultural Society, which was to have been opened on Tuesday, 1st inst., could not be held in its entirety in consequence of a violent gale which blew down the tents. The cut flowers, fruit, and vegetables were conveyed to the Pavilion, and what might have been a good Show was entirely spoilt. Great sympathy was expressed by everyone for the Secretary and Committee who have laboured so hard to make the Show a success. The gale lasted the whole of the day.

— **DEATH OF MRS. KNIGHT.**—We regret to learn that Mrs. Knight, wife of the accomplished British gardener to His Majesty the King of the Belgians, died last week at Laeken in the fifty-fourth year of her age. Those who had the pleasure of knowing the late Mrs. Knight, her goodness of heart, her genuine unaffected hospitality, will be able to realise the loss to Mr. Knight and his family, and will accord him and them their heartfelt sympathy.

— **A YOUNG GARDENER'S DIFFICULTY AND REQUIREMENTS.**—I shall be grateful if any of your readers can advise me through the medium of the Journal in the following circumstances. I am a young gardener twenty-seven years of age, working under glass. The changes of temperature to which I am subjected, especially in winter, cause me to have severe colds which have a continued weakening effect on my chest. I have a strong desire to go abroad to one of the colonies, and being active and energetic with a life experience in gardening, I might be able, in a more genial climate, to follow my occupation with health and profit. I am anxious to know what place would be likely to suit me. Any information will be thankfully received.—J. H.

— **VIOLA ARDWELL GEM.**—This variety has, in spite of the adverse weather, flowered abundantly. In the colour of this Viola, soft yellow, there is a very pleasing shade, admired by all who see it, in a mass especially. To succeed well with Violas in summer they should be planted much earlier than is customary. Where the beds are filled with spring flowers the best thing to do is to see that the Violas are put out of the cutting frame at the end of March into a compost largely made up of leaf soil, so that when the beds are ready the plants can be transferred in such a manner that no check to growth is received. Plants prepared in this way give much better results than those which are allowed to remain thickly together in the cutting frame until finally planted in their flowering quarters.—SOUTHERNER.

— **ECKFORD'S SWEET PEAS.**—I can corroborate what "R. P. R." says about Eckford's Sweet Peas. There are, I think, much better sorts on the way than those he names, but the whole of them must in a year or two be indispensable.—B.

— **GARDENING APPOINTMENTS.**—Mr. T. Patterson, late foreman, East Thorpe, Reading, informs us that he is now gardener to H. M. Pollett, Esq., Fernside, Bickley, Kent. Mr. George Reason has succeeded Mr. J. Dale as gardener at Brancepeth Castle, Durham.

— **PRESTON AND FULWOOD HORTICULTURAL SOCIETY.**—On Saturday evening next, September 5th, the thirty-ninth monthly meeting of the above Society, Mr. Alfred Waters, The Gardens, Hopwood Hall, Middleton, will read a paper on "The Use and Abuse of Watering and Syringing."

— **THOMSON'S BLUSHING BRIDE CARNATION.**—Mr. William Dean sends us blooms of this new self Carnation. He says, "The plant is a good grower with stout footstalks, has a capital pod, and when known will be a popular market variety." We have only to add that the petals are broad and smooth, and the blush-white blooms clove-scented.

— **MR. DAVID T. FISH.**—We hear that Mr. Fish, Hardwicke, Bury St. Edmunds, whose approaching retirement from private gardening we announced about a fortnight since, is about to engage in the jury work of flower shows, landscape gardening, literature, and probably popular lecturing on horticultural and other subjects, and all his friends will wish him success in his new and wider sphere.

— **CAMPANULA PULLA.**—On the rockery at the present time there is no more interesting or showy plant than Campanula pulla. The violaceous blue of the small bell-like flowers, which are terminal, give a shade most difficult to compare. The plants grow in neat tufts about 4 to 6 inches high. In soil of a light character it succeeds the best, a heavy retentive one not being favourable to its growth.—E.

— **ERYNGIUM AMETHYSTINUM.**—Almost all plants, especially hardy ones which bear blue flowers, are sought after no matter at what period of the year they may blossom, and there is little wonder, therefore, that the amethyst blue of this plant is appreciated during July and August. The growth is of a compact character, easily supported, in fact almost self-supporting. For cutting it is valuable, the flowers lasting fresh a long time in water. A large number of plants can soon be raised by seed or division of the roots.—S.

— **WEATHER AT LIVERPOOL.**—The weather here still keeps of the most unsatisfactory character, the damage done by the storm of the 25th ult. being in many places considerable. Bushels of Apples were blown down, as well as Pears and other fruit, and Chrysanthemums met with a large number of mishaps. Such a severe storm as this is a rarity in the month of August. To day is the last day of the month and the rain has been incessant. Potatoes are badly diseased and harvest prospects look extremely gloomy. With what pleasure we should hail a warm and sunny September.—R. P. R.

— **THE WEATHER DURING AUGUST, 1891.**—During the past month we have experienced very dull stormy weather, and on the whole have had very little sunshine. Strong winds from the S.W. have been very prevalent, and blown a quantity of fruit off standard trees, whilst the bush, pyramid, and espalier form of trees are unhurt. Rain fell on twenty-four days. Maximum in any twenty-four hours, 1.13 inch, on the 21st ; minimum 0.01, on the 16th ; total for the month 3.70, against 2.64 in 1890. In spite of the dull season I gathered good fruits of Early Louise Peach outdoor on a south wall on the 4th inst. They were very useful, as they took the place in the dessert dishes of the late Strawberries. This Peach comes in with me about the same time as Early Beatrice, and produces much larger fruit.—E. WALLIS, *The Gardens, Hamels Park, Buntingford, Herts.*

— **THE WEATHER IN HAMPSHIRE.**—The weather has been very showery of late, and bad for harvest operations. On the 21st inst. we registered 1.88. As showing the equality of the downfall in two places two miles distant, 1.85 was registered at Bishop's Waltham, which is considerably lower than the situation of Swanmore Park. On the 23rd, from a thunderstorm, half an inch fell in twenty minutes, bringing the total rainfall for the present month up to 3.98, which is considerable for the first three weeks in August. It is a curious coincidence that last year on the 17th of the month we registered 1.85. In the low lying gardens, especially in stiff soil, Potatoes are very badly diseased.

Instances occur where it is difficult to find a sound tuber. A few can be found, but not many. Tomatoes as an outside crop are about ruined by the disease, although a short time since they promised remarkably well.—E. MOLYNEUX, *Swanmore Park*.

— WASPS.—“We have many wasps now,” writes Mr. F. Geeson, Cowdray Park Gardens, Midhurst. “Our mode of taking the nests is to pour a little gasoline into the hole, and stop it up till the wasps are stupefied. We take all nests found within a mile, and also, last May, paid for destroying 1667 queens at 1d. each, £6 18s. 11d.” Several wasps were sent, including young queens, but it does not follow that the whole of these, if not caught, would pass the winter and found future colonies. It is most desirable, however, to prevent the possibility.

— CACTUS AND DECORATIVE DAHLIAS.—New forms of this popular section continue to be introduced, and great as have been the improvements previously made the latest additions will mark a still further step in advance. There has been some tendency to deviate from the true Cactus form, but we are brought back to it by the varieties honoured at the Drill Hall last week. Of these one of the most noteworthy was Robert Cannell, and Swanley Cactus, though less strikingly distinct, is of the correct type. In Kynerith, too, we have a marked advance, the form being good, and the greenish shade which has disfigured so many of the earlier varieties thoroughly worked out.

— BOCCONIA CORDATA.—This is an extremely elegant hardy herbaceous plant not often met with, but it is really a stately and beautiful object, thoroughly adapted for planting on lawns where bold objects are desirable, in positions similar to those in which the various kinds of Pampas Grasses are grown with marked effect. The bold and finely cut leaves of this Bocconia are produced on long tapering stems, crowned with panicles of small buff coloured flowers. The panicles being light and well proportioned appear at a distance like “feathery plumes,” and are highly prized for associating with Asparagus, Gladiolus, and Phloxes in tall trumpet-shaped glasses, and for growing at intervals in the back row of herbaceous borders.—H. DUNKIN.

— TOWN SEWAGE.—The disposal of town sewage and waste has long been the most troublesome question local bodies have had to answer. They have dealt with the matter in different ways, in which they have been assisted or harassed, as the case may be, by various suggestions and criticisms. Mr. E. R. Shapland now comes to the rescue. He advocates in a small pamphlet, published by S. Edgecumbe-Rogers, at Dorset House, Salisbury Square, Fleet Street, London, the disposal of garbage, refuse and sewage, by conveying it in trucks or barges to some selected spot and burying it in large trenches, from which, after a natural process of decomposition, it could be dug and sold as manure. In another part of the pamphlet we are told that 70,000 tons of London sewage sludge are thrown into the sea every month. If to this we add at least an equal weight of dust refuse we have 140,000 tons to be disposed of. Can Mr. Shapland have thought what it means to collect, load, unload, and trench in 4500 tons of such material every day? The problem is not to be solved thus. There are far greater possibilities in an extension of the Kingston system, where the Native Guano Company evolve a cheap, safe, and useful manure out of town sewage without endangering the public health.

— STRAWBERRIES.—A small manual by W. H. Harrison, M.A., Shrewsbury, on “How to Grow, Protect, Gather, and Eat Strawberries,” has been sent to us by the publishers, Messrs. Simpkin, Marshall & Co. The author is an enthusiast, and we have no doubt whatever that he grows well the fruit he loves. His teaching, he tells us, is for amateurs, and not for professional gardeners. It contains many sensible hints—some good grain, but mixed with a large amount of chaff; or, in other words, though readable, is tautological, and as the author himself suggests, egotistical. He cannot have had much experience with gardeners, as he tells us he allows his Strawberry beds to become crowded with runners when he has not time to cut them away, because he has “never found a man sufficiently educated in Strawberry culture to entrust with the task—not one with sufficient judgment to know which of the runners should be taken and which should be left.” This, he goes on to say, may seem “very egotistical,” and that is just what gardeners will think it is, as will those experienced amateurs who know how thoroughly competent many of their professional friends are in growing, gathering, showing, and winning prizes for fruits weighing from 1½ oz. to 2 ozs. each. There really are men who know how to cut off Strawberry runners, though our author has “not had the good fortune to meet with them.” It seems a pity he has not succeeded in

training one during his experience of thirty years. The work is weakened by a number of words and sentences in italics. Yet it may be useful to discriminating amateurs.

— THE SQUIRE AND THE SCHOOLMASTER.—A squire down in Essex, Mr. W. Mellis of Stewardstone, has, it is said, caused to be numbered all the fruit trees in the parish, and he keeps these numbers in a register at the Hall, with the proper name of the variety appended to each. The schoolmaster, Mr. Spink, has drawn up a graduated scheme for teaching fruit culture as a specific subject to his scholars. This has been sanctioned by the Education Department of the Government. The children will first be taught the botany of the Apple blossom and fruit, followed by the difference between seedling and parent, planting, mulching, summer and winter pruning, thinning the fruit, insect pests, packing and storing the fruit. This will constitute the first stage. The second stage deals with the food of fruit trees, manures, course of sap, and the third the art of propagation.

— NICOTIANA AFFINIS.—“L. G., *Chester*,” writes very positively in reference to the duration of *Nicotiana affinis*, p. 156. He is quite mistaken in affirming that it is a hardy annual, for the growth above ground is exceedingly tender, and any seedlings appearing in the autumn would most assuredly be killed to the ground line by the first nip of frost. Other self-sown plants would come up in the spring, as Balsams and Portulacas do, in which case it would be termed a tender annual. However the plant may conduct itself in Cheshire, I have long since regarded it here (near Bristol), as a hardy perennial. Only last spring I dug up a clump of old roots that had started into growth in order to transplant some elsewhere. No artificial protection had been given during the late severe winter, and I am not sure that it is not as hardy as Bindweed, but there is nothing of the “hardy annual” about it, in this country at least.—T. S., *Henbury Hill*.

— THE LONDON PLANE TREES have begun to shed their bark this year somewhat earlier than usual, says a daily paper. The circumstance is the more curious, as though we have had some hot days, there has been plenty of air and a good deal of rain. Generally speaking, the trees seem in excellent condition. Where there is a failure the authorities should make a note now, and renew at the proper time. The trees seem to grow better in the heart of the city than in its outskirts. Those along the Thames Embankment are peculiarly flourishing. In Trafalgar Square they have dwindled a little. The tree in the north-east corner seems dying, and another near it on the east side wants a little looking to. Of course the source of delicacy is not city smoke, but sewer gas. In front of the National Gallery well clipped Bay trees, growing in roomy tubs—the gift of the Metropolitan Gardens Association—give a little grateful colour where it is most needed. The success is so great—the green looks so well next the grey stone—that it is curious the experiment is not pushed a little further. The yard between the railing and the façade of the building might easily be sodded over. London is greener than most large cities, but there is still room for much improvement.

— HEUCHERA SANGUINEA.—A little tuft of this “Alum Root,” which was risked to all the rigours of the late winter, is now in full bloom. This fact, taken with the notes of other cultivators in various parts of the north-east, proves that this excellent plant is, beyond all doubt, hardy as far north as Boston at least. Few plants of recent introduction have attracted such widespread attention, and the number of those as well worthy of cultivation is still smaller. It was introduced from Mexico about ten years ago, and the exertions of propagators were rewarded by rapid distribution in Europe. The demand for the plant is still strong across the ocean, and it now finds a ready sale in this country. The uncertainty as to its hardiness was the principal cause of the neglect which it has hitherto suffered from American growers of hardy plants, but it is likely to receive ample attention in future. The plant forms a close mass of pale green lobed leaves, the entire cluster of foliage being about 8 or 9 inches high. The erect, loose panicles of bright salmon-red flowers attain a height of from 18 to 24 inches, and are produced in large quantity. When in bloom, in established masses, the plant is a never-failing source of gratification. There are, at the present time, many more striking hardy plants in bloom, but certainly none more pleasing. This *Heuchera* thrives best in a light and moderately rich soil. The best situation is one where the roots will be moderately dry in winter, and which affords moisture and partial shade in summer. Propagate by dividing the plants early in the season before growth commences.—(*American Garden and Forest*.)

— AN EXHIBITION OF INSECTS.—While the weather is doing its worst to hurt the seasonable fruits of the earth, the insects are not to be left in quiet enjoyment of their share of the booty. The Paris correspondent of a daily contemporary says that a French Society, that of Agriculture and Insectology, has set on foot a remarkable little exhibition in a corner of the Tuileries grounds with a view of spreading a knowledge of insect pests and the best methods of destroying them. One is struck with the neatness of the exhibits and the co-operative character of the display. Every member of the Society in the Departments was notified that contributions were wanting, and in a short time was informed what were the insects which by their rarity, obscurity, or general importance were most needed. The Government helped with a bonus—small, it is true, but better than nothing—of £120. The Committee in Paris selected from the numberless cases that arrived the best conditioned samples and arranged them under glass in a manner illustrating the stages of their development and the nature of their ravages. One sees the phylloxera burrowing among the roots of the Vine, and the saw-fly and Turnip grub at their destructive work. Useful insects are exhibited side by side, and lectures are given on the exhibits three or four times a week.

### ENGLISH ARBORICULTURAL ASSOCIATION.

THE annual excursion of the members of this Association took place last week at Hexham. Hexham is historically known as the "Heart of All England," a title which the Tynedale inhabitants are all very proud of. It has been the theatre of many stirring events, narrated with much that is interesting by many historical writers, including Surtcees, Hutchison, and others. To all who are now members (the number exceeding 200) a visit to the birthplace of the English Arboricultural Association was naturally attractive.

The organisation commenced in a very humble way at the suggestion of a well-known forester, Mr. Clark of Blenkinsopp Castle, who thought that England should not be behind Scotland in the enthusiasm and earnestness to adopt every means of obtaining information and increasing the desire to induce landed proprietors and others to clothe the hillsides, swamps, morasses, and barren plots of ground with trees to improve the landscape, modify the climate, increase the quantity of genial showers, and ultimately add considerably to the coffers of the landlords of this country. In no previous excursion has the Society seen and had larger experience of what was naturally most unproductive land. In the neighbourhood of Hexham there is some excellent land, well adapted for grazing and productive in every kind of cereal; but there is always, further removed from the Tyne, much very barren and hilly land which has been taken every advantage of for the production of timber. The local council exhibited good taste in bringing the members to Hexham for still further enhancing their knowledge of arboriculture.

The members arrived at Hexham at about 11 A.M., when they first inspected the extensive nurseries of Messrs. Wm. Fell & Co., Wentworth. This firm is well known as one of the largest growers of forest trees in the country. Millions of seedling trees were inspected, the nurseries, by their high altitude, being especially adapted for the raising of forest trees. Larch, Spruce, and Scotch Fir trees predominate, the seed being principally procured from Scotland. This firm is well known in the trade as very large growers of the Whinham Industry Gooseberry; over 125,000 of this useful variety were inspected. But this does not include the firm's stock, as the sales last year exceeded 275,000. Mr. Joseph Robson's nursery was also visited, and gave the members much satisfaction. It is pleasantly situated, and has in recent years been much developed by the present proprietor, who inherited it from his father. A new entrance has been made, and the nursery is noted for its healthy specimens of Coniferae, Alpines, and fruit trees.

After the inspection the party sat down to an excellent luncheon, provided by Messrs. Wm. Fell & Co., in the packing shed in the nursery grounds, after which the members entered carriages and drove to Dilston Castle. This place is a connecting link in the history of Northumberland. It was formerly the seat of the unfortunate Earl of Derwentwater, a nobleman who was loved by everyone in Tynedale; but his adherence to the House of Stuart lost him his life. He was beheaded in 1715, and his estates confiscated. They reverted to the care of the Commissioners of the Greenwich Hospital, and have latterly been sold to W. B. Beaumont, Esq., for £275,000. There was a curious tradition of folk lore believed by the people in reference to the Earl's execution, that the northern lights, or aurora borealis, were never seen till that night. The Castle is beautifully situated, and from it can be seen one of the finest views in Tynedale. The woods are very extensive. Larch and Spruce Fir are principally grown, and there are many fine trees. Many acres of Larch were inspected. The trees had never had any disease. Thinning had been done prudently, removing a few trees at a time frequently. Some of these trees were 20 inches quarter girth, and contained 250 cubic feet of timber, which made them worth from £7 to £10 per tree. Mr. J. Balden, sen., the manager, is proud of them, and justly so.

The party next drove to Stagsham Close House, the seat of Mrs. Straker. Mr. Keag, the head gardener, was guide. A fine avenue of Lime trees was inspected and gave much pleasure; the extensive

gardens, Peach houses and hothouses were also inspected, and the plants found in a good state of cultivation. A call was made at Sandhoe, the former residence of Sir Rowland Stanley Errington, Bart. The grounds are very extensive, and under good cultivation. Mr. Stokes, the head gardener, offered every facility for inspecting them. Some very fine bedding was seen on the lawn; on a sloping terrace large scalloped beds were just filled with *Ageratum* and *Tropæolums* margined with white and blue *Lobelia*. These from a distance had a most excellent effect, while Yew trees cut in all sorts of fantastic designs give the appearance of a French garden at once.

A fine Yew on the lawn is 28 feet in quarter girth, also Larch 70 feet; Copper-coloured Beech, *Abies nobilis*, *Wellingtonias*, *Araucarias*, *Larches* self-sown, and a Silver Fir over 115 feet were admired.

At Beaufront Castle, the seat of Mr. H. F. Swan, some splendid Silver Firs are 28 feet quarter girth, Larch 22 feet in girth, and over 100 feet in height. The girths of the principal trees were taken by the visitors. Mr. Oliver, the gardener, kindly piloted the party along with Mr. Loan, forester. In the grounds there are many fine ornamental trees, including *Platanus occidentalis*, *Liriodendron tulipifera*, *Taxodium sempervirens*, scarlet, yellow, and common Chestnuts, yellow-berried Hollies, and some fine *Pinus nobilis*. From the castle a view of Hexham Abbey has been gained by cutting through the extensive plantation; the sun was just setting and enhanced this beautiful peep view of the ancient town.

After dinner at the Royal Hotel, Hexham, the annual meeting of the Association was held. County Councillor John M. Ridley, Esq., Warwick Hall, was appointed President for the year. Mr. Forbes, Masham, was awarded the silver medal for the best essay, "The Best Method of Successfully Combining the Duties of Foresters and Game-keepers in their Separate Departments." For the essays for next year Mr. J. R. Brown suggested that the best and quickest method of producing a fox and game covert was to keep and preserve game in their various coverts. Mr. B. Cowan suggested that the best way to bring the Society before the landed proprietors of this country was to secure their co-operation and support. Council, Secretaries, Auditors, &c., were all re-elected.

The next morning the party drove to Duke's House, the seat of Mrs. Backhouse, when some very fine Coniferae were inspected, including *Thuja gigantea*, 18 feet high; *Picea grandis*, 50 feet; *P. nobilis*, 45 feet; *P. lasiocarpa*, 25 feet; *Libocedrus decurrens*, a beautiful Spanish Chestnut in full bloom; *Pinus Cembra*, *Abies Albertiana*, and *Wellingtonia gigantea*, 20½ inches girth. This fine place is situated 464·8 feet above the sea. *Abies Hookeri*, 18 feet high, was very fine, a perfect specimen for symmetry and beauty. Many of these very fine trees had been recently transplanted from the woods by a machine invented by the late owner. There is in addition a grand tree of *Pinus Jeffreyi*, also very rare in these parts.

From here the party proceeded to Dipton Wood, or Cosbridge Fell, containing 1500 acres, which belongs to the Duke of Northumberland and Mr. Beaumont. The land for agricultural use would not be worth more than 2s. 6d. per acre. The trees are principally Scotch Fir grown on a sandy peaty soil, which lies on a substratum of sandstone. These plantations were most interesting. Mr. Coxon, head forester to the Duke of Northumberland, was present, and gave a lucid account to the members of the profits realised from these woods. They were planted about eighty to a hundred years ago, and over £10,000 worth of wood has been used for estate purposes. The woods yield a profit of about £1 an acre annually, besides providing a great amount of labour in the district, beautifying these bleak hill sides, and adding to the health of the district. It was admitted that these woods were amongst the best the Society has visited. Mr. Beaumont's East Dipton estate was next visited, where some very fine Larch admired. From here the party drove to Healy, where lunch was provided by the local members of the Council. Isaac Baty, Esq., was in the chair. After Mr. B. Cowan had proposed a vote of thanks to the Council, which was acknowledged by the Chairman, the woods were inspected under Mr. Jewitt's guidance. In 1816 this wild moorland was bought by a Mr. Ormston for £22,000, including 10,000 acres of land, contiguous to which was a wild common, and when it was divided Mr. Ormston planted his share of 640 acres with Spruce and Scotch Fir. He lived to see the trees cut down, and realised the handsome sum of £56,000 net, after all labour was paid, from land not worth 2s. 6d. per acre. All the woods were planted before any wood was cut. In 1832 the receipts were £20 12s.; 1840, £300 18s. 9d.; 1850, £644 9s.; 1860, £2062 14s. 4d.; 1870, £4070, 12s. 10d., and up to the present £56,000 has been derived from them. This experience if brought before the landed proprietors of the country ought to induce them to plant and to encourage the arboricultural societies as much as possible, more particularly as the timber supplies from Norway are diminishing.

At Whiristracores, the seat of H. Silvertop, Esq., an avenue of *Wellingtonia gigantea* has a bold and massive effect, and close to is one of the first specimens sent out by the Royal Horticultural Society. Mr. Marr, the present gardener's father, struck nine cuttings thirty years ago from this tree, which are now grand specimens. The grouping of Coniferae has been carried out here effectively. *Cupressus Lawsoniana*, fine specimens, had a telling effect on the landscape; also *Libocedrus decurrens*, *Abies Alcockiana*, rich glaucous colour; and some specimens of *Picea Smithiana* and *nobilis*, the latter, the finest in the country, planted about eighty years ago, and now 81 feet high.

This trip will long be remembered by the members as affording a great amount of pleasure and enhanced knowledge of the commercial advantage of planting timber on the thousands of acres of waste land

in this country. It would be well if the Government would afford facilities to the County Council to acquire waste lands, borrow money, and plant them, which would eventually bring a good revenue to the country and afford employment to thousands of men. — BERNARD COWAN.

### CRINUMS.

[In reply to a correspondent ("J.") who asks for information respecting the species of Crinums, we give the following notes by Sir Charles Strickland, Bart., read at a meeting of the Royal Horticultural Society last year, and reproduced in vol. xiii. of the Society's Journal. Illustrations of two distinct types are

and in the form of the flowers. The first has columnar, leafy bulbs like a Leek, evergreen leaves, for the most part erect and spreading, and perfectly even, symmetrical, star-shaped flowers on the top of straight, upright tubes, and with upright, spreading, usually straight stamens. This group includes Mr. Baker's subgenera of *Stenaster* and *Platyaster*, between which I cannot see any sufficiently marked line of distinction. A large part of this group comes from Asia, Australia, and the South Sea Islands, especially those with very narrow petals. A few very beautiful forms with wider petals come from tropical America. The other group is the same as Mr. Baker's sub-genus *Codonocrinum*. These are very different in character from the first group. They have round bulbs like an Onion, many of them are deciduous, and others

FIG. 30.—CRINUM PURPURASCENS.

given in figs. 30 and 31, namely, *Crinum purpurascens* and *C. Kirki*.]

In the remarks that I am going to make upon the plants of the genus *Crinum* with which I am acquainted I do not intend to deal in any way with the naming of them. Many of those that I know have had two or more different names given to them, and a large number of the names that I know have been applied to two or more different plants. All that I propose to do is to try and arrange in some kind of order those plants which I have had in cultivation; but as this includes only a part of those described by Mr. Baker and others, it must be understood that a fuller acquaintance with all the recorded species might materially alter this arrangement. I divide the genus into two large groups, which are very distinct from one another both in their habit of growth

which are not quite deciduous grow in a similar manner to the deciduous ones. The tube of the flowers is curved, and the flowers are nodding, bell shaped, and more or less ringent, and with broad petals. The stamens are curved, often lying close together. There appear to be a few species which are more or less intermediate between the two great groups. There are only two or three of these which I have any acquaintance with, but I think that most of the species which I have not seen, which are figured, may be arranged in one of the two groups.

Of the plants with very narrow petals, I have examples bought under various names, e.g., *asiaticum*, *latifolium*, *pedunculatum*, *procerum*, *pedunculatum* from Lord Howe's Island, species from South Sea Islands, species from Japan, *sumatranum*, *bracteatum*, &c., all of them large plants with thick, columnar, leafy bulbs,

large, upright, spreading leaves, and with heads of rather insignificant flowers with purple style and stamens, and all equally with short peduncles, which vary in length in the same head of flowers. Some of these are very near to one another, the plants especially being undistinguishable. The plant from Japan differs from the rest in having very short, broad leaves, and short, blunt petals. The plant I have under the name of *procerum* is figured in the *Botanical Magazine*, 2231, as *C. declinatum*; it is a very tall plant with broad, wavy leaves and very small flowers. *C. sumatranum* (*Bot. Reg.*, 1049) has longer and wider (not upright) petals, and is easily known by the dull, darkish green of its broad, stiff leaves. *C. bracteatum* (*Bot. Reg.*, 179) is a similar plant with leaves of a brighter green and more shining; a short scape and large head of flowers, with much broader, more upright, pure white petals. In *C. amabile* the bulb becomes conical and less leafy, resembling rather more a tall bulb than a column of leaves. So also in *C. erubescens* the column approaches a short conical bulb. In form and habit, and in being stoloniferous, this approaches *C. americanum*, and like that species comes from tropical America. It is easily known by its very dark green foliage, and the scape being mottled like Snakewood. I have three or four varieties of *C. americanum* under various names—*americanum*, *Carolinianum*, *pratense* from Florida, and *Careyanum*, the last being a large form and *Carolinianum* a somewhat smaller one, all equally beautiful. A plant from the seashore, Jamaica, resembles these, but with a very long coloured tube and buds, which are upright before expanding. In this respect it rather resembles the small plant from Fernando Po, *C. purpurascens* (fig. 30), which has flower-tubes longer than the scape. These are the principal of the star-shaped *Crinums* with which I am acquainted.

There are two very distinct species which are intermediate in habit and form of flowers between the star-shaped and campanulate *Crinums* which I have in cultivation. One named *Crassipes* by Mr. Baker, from a plant of mine, has a thick, conical bulb, very thick, broad, upright leaves, ending in a long point, a short scape, and a few upright flowers, not opening wide, and slightly ringent. It differs much both in habit and form of flowers from any of the species which are described and figured. Unfortunately I cannot say whence it comes. I bought it many years ago at Henderson's, where it was growing in a very cold house, and I grow it with the deciduous *Crinums* from the Cape, which are nearly hardy. Then *C. pratense* has a distinct bulb, round at the base, with a tapering neck, very long, narrow-pointed deeply channelled leaves, growing straight upright, and a head of few upright flowers, more campanulate than star shaped, on a short scape. Some of the Australian *Crinums* seem to be allied to this, as far as I can judge from figures.

Of the second great group with round bulbs and campanulate flowers, *C. giganteum* and its allies approach most nearly in habit to the former group. They have evergreen lanceolate leaves. In *C. giganteum* and the plant sold by Mr. Bull as *C. nobile*, which appears to be a highly coloured variety of *giganteum*, the leaves are spreading immediately above the bulb, very wavy, and the plant altogether hardly distinguishable from that of *C. zeylanicum*, figured in the *Botanical Magazine*, 2466, as *C. Careyanum*; but there is another form of *C. giganteum*, with upright, petiolate leaves, with a stout midrib and thin blades, varying very much in width. *C. podophyllum* has the appearance of a starved variety of this form.

Allied to these in habit comes the finest of the whole genus, well known as *C. Moorei*, figured and described also under the name of *C. Macowani*. It is quite distinct from all others in having a long, narrow neck above its large round bulb, crowned with thin, broad, lanceolate leaves, with a thick midrib, springing not in a line with the neck, but at a very obtuse angle. It has very large campanulate flowers, with broad petals, varying from pink to nearly white. The Glasnevin plant (*Botanical Magazine*, 6113) has the flowers darker pink than I have ever seen them, arising possibly from being grown out of doors.

We now come to the deciduous *Crinums* and those allied to them. These make three or four fresh leaves every year, which last for three years, dying down more or less completely in the winter, so that the three or four middle leaves are the middle part of last year's leaves, and the three or four bottom leaves are the base of the leaves of the year before. They all have campanulate nodding flowers, with the ends of the petals more or less rolled back, and with a more or less bright red stripe down the middle of each petal. I believe that all of these very beautiful plants are African. From *C. Kirki* (fig. 31) of Zanzibar to *C. longifolium* at the Cape, and *C. yuccæflorum* of the West Coast, a series of intermediate forms are found. One rather extreme form is Mr. Baker's *C. pauciflorum*, with two flowers with very long tubes, which I have from Lake Nyassa. I have two or three forms from the

Upper Zambesi, varying in the colour and width of the leaves and the length of the tube; and as the interior of Africa becomes better known, no doubt we shall obtain from thence a great variety of forms of this beautiful plant, which may be called varieties of one species, or a dozen or more different species, according to the fancy of the botanist who describes and names them. They all have nodding campanulate flowers, with the ends of the petals more or less rolled back, and with a more or less distinct purplish red stripe along the middle of each petal. Towards the West Coast of Africa are some forms with somewhat narrower petals, less rolled back, and with a very bright stripe. *C. scabrum*, from Brazil, and a plant that seems to be common in Jamaica, resemble these closely. I suppose that they have been brought from Africa by slave ships.

In the largest of the deciduous *Crinums* that I have—coming I believe from Natal or thereabouts—the bulb is 5 or 6 inches in diameter, the leaves 4 or 5 inches wide in the second year, more in the third year; a large head of nearly white, bell-shaped, nodding flowers, with the tips of the petals rolled back. I have had it under the name of *campanulatum*, which well describes it; and as the plant generally known as *campanulatum* is figured in the *Botanical Magazine*, 2352, as *C. aquaticum*, which describes it far better than *C. campanulatum* does, it might perhaps be as well to keep this name for the large kind. Another similar large bulb has shorter flowers, with much more colour. Mr. Baker thought the flower the same as that of *C. Forbesi*, but it is not the same as the plant at Kew of that name.

Another extreme form of the deciduous *Crinums* is *C. campanulatum* or *aquaticum*, a swamp plant, with cylindrical, very deeply channelled leaves, and flowers very like those of the flowering Rush (*Butomus umbellatus*). I will now only notice two interesting species with which I am only very imperfectly acquainted—*C. brachynema*, with small, beautiful, creamy white flowers, with round petals and very short stamens. The flowers are symmetrical, and it comes from India, so I suppose that its affinities are with the columnar, star-shaped group, although it has a round bulb; and *C. Balfouri*, which has a round bulb and flaccid, shining, strap-shaped leaves, so that no doubt its relations are African; but it has pure white flowers, and seems to differ rather widely from them.

#### LINARIA RETICULATA AUREO-PURPUREA.

THIS pretty annual Toad Flax is a useful addition to the flower garden where variety of colouring is an object. Well grown plants commence flowering directly they are put out at the end of May, and continue until quite the end of the summer. Like all annuals this plant loves the sun, but it has the advantage over others that it will flower fairly well without so much of it as some require to succeed at all. From one packet of seed as many as half a dozen colours or shades of colour can be had. It grows from 1 foot to 15 inches high. It may be grown in patches in the herbaceous border, in thick lines, or it answers well as an edging if pegged down once early in the season, afterwards being allowed to grow at will. We have it in this way as a margin to a Begonia bed, and it looks very attractive hanging loosely down over a raised edging on to the grass. The bright scarlet of *Vesuvius Begonia* adds to the appearance of the *Linaria*. It is admired by all who see it. As it seeds so freely it is a good plan to save seed annually from all the shades of colour. Some sow it where it is to bloom, but a better effect is produced by sowing the seed in sandy soil in a cold frame about the middle of March, afterwards pricking out the seedlings in a temporary sod-pit, where they grow strongly, and throw up numerous sucker-like shoots from the base which flower very freely in advance of those which are sown in the open. The inside-raised plants bloom so much earlier than those sown out of doors that any little trouble expended is a gain in the success of the plants afterwards. When intended for a row in front of any other bedding plant it is wise to support each with a small stake, which can be neatly hidden in the centre, tying the branches loosely to it. Heavy rains are liable to beat down the plants, as the number of flowers is somewhat heavy for the slender stems.—E. M.

#### THE VAPOURER MOTH.

IN the note to "C. C. E." last week on this moth there are some points which do not agree with my experience. It certainly feeds on almost everything, and is most difficult to get rid of when once established. I watched this caterpillar and its changes as a boy. Its beauty charmed me, and when a few years ago I found a few on a *Louise Bonne* Pear at the back of my house I allowed them to stay where they were. I bitterly repented this, as the following season they nearly ruined the tree, and were on many of the Rose trees as well. I cannot say I am without them now.

One way in which I largely reduced the numbers was to brush up the leaves of the tree with a long stick several times a day. This was generally followed by several falling to the ground, and as it was paving under the tree they were easily seen and destroyed. They fall very

lightly from the tree, more like a feather than a grub; this, I think, is owing to the quantity of hair on them. Then the following winter, when the leaves were off, I had every shred carefully overhauled, also every projection on the walls—both favourite places for the cocoons. The eggs have a red spot on the upper surface and a red ring round it. They seem to be invariably laid on the cocoon, and fortunately are not often more than two hundred in number. I have not noticed that the same batch hatches out many days apart. I burn all the eggs I can find, and it is a capital imitation of distant fire firing, as they pop continuously. The larger caterpillars, with the four whitish tufts on the

moult. If I see a dark reddish moth flying about a tree in the daytime I should suspect the presence of a female, and look carefully about for her.—Y. B. A. Z.

#### VIOLAS AND BEDDING PANSIES.

VIOLAS have certainly had an innings this season, and have scored largely as outdoor decorative plants. They began to make our gardens gay in April, some earlier, and they have continued in full bloom ever since, the long spell of wet weather affecting them very little.

FIG. 31.—CRINUM KIRKI.

back, are females; the smaller, with yellow tufts, males. The chrysalids I have seen, and I have opened dozens of cocoons, are invariably a polished black. The male moth is a day flier, often called round London the cockney, and I have seen it flying in the City itself, hence this nickname. When at rest the white spot on each upper wing is very visible, and its well feathered front legs are stretched out on each side of its head. This latter—the head I mean—is furnished with a pair of beautifully fringed black antennæ. Its flight is very erratic. The female is a fat dull greyish brown, much the colour of the cocoon, and easily escapes notice. It rarely moves from the cocoon. The caterpillar is preyed on by a small long black ichneumon, and the cocoon of this is mottled black and white. I have never found more than one in each caterpillar, and it causes the death of the caterpillar before its third

In the Journal of last week a correspondent speaks of their success near London, and I can speak in terms of high praise of their well doing in a comparatively smoky town garden, surrounded by buildings, large factories, and workshops in a large midland manufacturing centre. All through the season from planting out time they have been in flower, latterly in very full bloom, the white kinds used being Countess of Hopetoun, Marchioness of Tweedale, and Mrs. Gray, very fragrant and profuse blooming. The yellows are Ardwell Gem, pale yellow; Bullion, a very free-blooming deep yellow; and a variety named Yellow Boy, with a stronger Pansy habit, and an immense bloom of good constitution, early to bloom and continuous, being now a mass of flowers. Two excellent town garden blues are to be found in True Blue, which has more blue colour in it than any other, and Holyrood, a rich violet purple

bedding Pansy of good constitution and very free blooming. Other kinds which do well in this town garden are Skylark, white with cerulean blue border; Countess of Kintore, The Mearns, Lady Amory, and Mrs. Pearce, a very free blooming light coloured variety which stands bad weather well. These are all standard useful cheap varieties for growing anywhere, in town gardens especially.

Violas and bedding Pansies can be easily propagated now by cuttings or taking off rooted side shoots and planting either firmly in a shady place. I say "firmly" because they are so likely to be thrown out or drawn under by worms if not firm in the soil. Planting out can be done in October or November, when the plants are strong and well established for standing the winter. Where autumn planting can be done I strongly recommend it for securing an early bloom in the spring and the plants going ahead.

For bedding purposes, free-flowering kinds which are both early and continuous are wanted such as I have named. Still there are many other beautiful varieties which well deserve culture, and a collection of the best kinds yield as much pleasure as any other kind of plant. A very fine white variety which is but little known has this season come under my notice, Countess of Wharnccliffe, sent out from Wharnccliffe Hall Gardens some three or four years since. It is snow white, free from markings, of compact habit, and very floriferous. In William Neil we have a distinct gain in its lovely pale rose tint and excellent habit. Lady Amory is very beautiful, rich plum violet with light top petals and excellent form; and Duchess of Fife, Beauty, Bridesmaid (Dean's), Cottage Maid, Bessie Clark, Mr. Charles Turner, Queen of Scots, Dean's Golden Gem, Mrs. Grant, and Master of Arts are all valuable acquisitions.—WM. DEAN, *Sparkhill, Birmingham*.

### DOGWOODS AND VIBURNUMS IN THE ARNOLD ARBORETUM.

AMONG exotic Cornels, as at present represented in the Arboretum, there are only two which possess ornamental qualities of a different character from those found in our native species, and which will repay cultivation in this country. There are some East Asian species which are not introduced, and a few others only imperfectly known, so that there is a chance that the number of good garden Cornels may still be enlarged.

The two foreign species which can well be added to our shrubberies are the White-fruited Dogwood, *Cornus alba*, and the so-called Male Dogwood or Cornelian Cherry, *C. Mas*. The first is a spreading shrub which, in good soil, grows to the height of 6 or 10 feet, and produces slender, recurved branches covered with bright red bark. In habit and in the general appearance of the foliage and flowers, and in the colour of the fruit, it bears a strong resemblance to our native red-stemmed Dogwood (*C. sericea*), and the only advantage it possesses over that species is in the brighter colour of its branches in winter. In this particular it is far superior to the American plant, and should replace it where the attempt is made to produce a bright effect in the shrubbery during the winter months. There is a variety of this plant occasionally met with in nurseries under the name of *C. sibirica*, which has deeper and brighter branches than any other plant which is hardy; and this, rather than the more common form, should be planted. Of the origin of this variety not very much is known; it may have been brought from Siberia or it may have appeared in some European nursery. The earliest mention of it is to be found in the catalogue for the year 1836 of the Loddiges, fifty years ago famous London nurserymen who maintained a large and very rich arboretum in connection with their business.

*C. alba* is widely distributed, and very common in Siberia and through Northern Asia, and is perfectly hardy. It is, like all the Cornels of this class, easily raised from seed or from cuttings made in the summer. It grows as rapidly as any of the native species, and can be mingled with them without danger of offending the most sensitive taste or shocking the susceptibilities of those critical designers of natural landscape who sometimes find the most beautiful garden plant out of place in the picture of sylvan beauty and quietness they would create, unless from harmony of outline and of character acquired by natural selection and long association it happens to accord with its surroundings.

The Cornelian Cherry is a small tree, reaching sometimes the height of 20 feet, with slender, rigid branches forming a head of rather formal outline. It is one of the plants which cover themselves with flowers in early spring, before any of its leaves appear. The flowers are small and bright yellow; they are arranged, however, in compact, many-flowered clusters, and these, being scattered along the whole length of the branches, give to the plant, in the early days of April, a very striking and beautiful appearance. It is the first of the shrubs with showy flowers to blossom, the flowers appearing almost a week earlier than those of the native Benzoin bush, which the Cornelian Cherry resembles in general appearance at that period—that is, the two plants cover themselves with yellow flowers before any of their leaves unfold. The Cornel is, however, a more showy plant; it grows to a larger size and the flowers are of a brighter yellow. There is not much to say, however, of this Dogwood, once its flowers are fallen. The fruit, which is half an inch long, or rather more, is elliptical and bright red, and, individually, is as handsome as a Cherry or a small Plum. But it is not produced in very great abundance, and the leaves so completely hide it that, practically, it makes no show at all, and there is nothing striking or remarkable about the foliage. One passes the plant without noticing it much, except in early spring, and its appearance leaves no lasting impression

on the mind. But this, after all, is perhaps a merit, for plants without striking individuality are sometimes the most valuable, as they are available for many purposes and combinations where more distinct subjects might prove disturbing elements in a composition. The Cornelian Cherry is, therefore, a good plant to use in a garden or a shrubbery where a bright show of flowers would be agreeable in the very earliest days of spring, and where, for the rest of the season a mass of pleasant objectionable foliage would not destroy any of those natural and restful conditions of scenery a good garden should be made to afford.

*C. Mas* is a native of central and southern Europe, and is one of the hardiest and most satisfactory of the trees of that continent which have been introduced into America. The wood has in all ages been celebrated for its strength, hardness, and density, and it is from this peculiarity that the Cornels obtain their name of *Cornus*, derived from the Latin word meaning a horn. The origin of the English name of Dogwood is not so apparent. John Parkinson, who wrote voluminously and learnedly about plants two hundred years ago, says that the name came from the fact that the fruit of the English species (*C. sanguinea*) was so bad that it was not fit to give to the dogs. In his time the English Cornel had been called Houndsberry Tree also, and Hound's Tree and Dogberry Tree, so, for some reason or other, its canine affinities seem to have been firmly settled in the popular mind.

The fruit of *C. Mas* is at least more valuable than that of the other species, although it appears to have been one of the coarse fruits which Circe threw with acorns and Beech mast to the companions of Ulysses after their transformation. When it is thoroughly ripe the flavour is sweet and not entirely disagreeable, and in Germany and other European countries it is used in making preserves, robs and liquors. It is not probable that it will ever find much favour in this country, or that the Dogwood will be planted for its wood, which by the ancients was much esteemed for the shafts of javelins, and in later days for the cogs of wheels and butchers' skewers.

There is a variety in gardens with light-coloured fruit, and others with brightly variegated leaves. These last, however, are feeble and ugly plants of no merit whatever, except in the eyes of those persons who delight in vegetable monstrosities and like to see a garden filled with "freaks" and converted into a vegetable dimc museum, useful enough, perhaps, to physiologists, but abhorrent to the lover of the beautiful.

Among the native shrubs which are not well known to gardeners there is a southern species of *Viburnum* which deserves a place in the garden. This is *Viburnum molle*, a plant which is widely scattered through the Southern States, and which just reaches New England on the Massachusetts islands of Nantucket and Naushon. In habit and in general appearance, in the shape of the leaves, in the flowers and in the fruit it bears a strong likeness to the Arrow-wood (*V. dentatum*). It is not a handsomer or in any way a better plant than that familiar species, and its value lies in the fact that it flowers two weeks or more later than the other *Viburnums*. It serves, therefore, to prolong the flowering period of one of the most useful and beautiful of the groups of hardy shrubs, and Mr. Dawson is preparing to get together a large supply of young plants, with a view of introducing them on a considerable scale in some parts of the Arboretum.

A word about *V. dilatatum* will not, perhaps, be out of order here. The plants have passed safely another winter, and have flowered more profusely than ever before. There can be little doubt that this is a perfectly hardy plant, and that it has the capacity of adapting itself to new surroundings. It will only be planted by people who desire to make their gardens beautiful in the late autumn and early winter; in habit and in foliage it is not better, and indeed not so good as *V. dentatum* or the species which has just been mentioned. The flowers, although abundant enough, are much smaller, and they fall almost as soon as they open; and this Japanese species has really little to recommend it as a flowering plant. But the fruit is splendid, brilliant, abundant, and long-hanging. There is no shrub of recent introduction that equals it in the beauty of its fruit, and there is hardly one among the innumerable varieties found in this collection which surpasses it. This certainly is one of the plants which need to be known only to become one of the most popular.—(*American Garden and Forest*.)

### THE NEWCASTLE HORTICULTURAL SHOW.

#### A CALAMITY.

INSTEAD of publishing in our present issue a report of what we hoped would be a successful show at Newcastle-on-Tyne, we have with much regret to record a calamity. Of this we had telegraphic information just in time for insertion in our last issue. As there stated, the Show was to have been held on August 26th, 27th, and 28th, when a display of unusual magnitude and excellence was anticipated, but a raging storm swept away the tents. The only consolatory thought that arises in connection with the great misfortune is that the storm did not come on Thursday instead of early on Wednesday morning, as if it had the results, serious as they were, would have been still more lamentable.

Not only our northern but our southern readers—indeed, horticulturists everywhere—will join us in a strong expression of sympathy with the Newcastle Committee in their trying ordeal, also in the expression of a hope that the old Society, which has

done so much to foster the higher and extended cultivation of plants, flowers, fruits, and vegetables, will be enabled by wealthy and public-spirited citizens to rise, phoenix-like, from its ashes, and continue to exert its good influence in future years. The following report of the gale and destruction is taken from the *Newcastle Chronicle*:—

"This morning (Wednesday, 26th August) the tents in the Leazes Park, in which the annual Exhibition of the Newcastle Flower Show was to have been opened, were blown to the ground during the gale of wind which prevailed during the early hours of the day. A meeting of the Council was subsequently held, and after some discussion it was decided to abandon the autumn Show for this year. This will doubtless be a great disappointment to the many thousands who annually visit this Show, which has been increasing in popularity year by year. The Committee had no option but to decide as they have done. A visitor to the Park this morning at ten o'clock would have failed to find the huge marquees which, it was hoped, would by that time be covering the beautiful flowers and plants usually forwarded to the Show from all parts of the northern district. At that time, on the immediate spot on which the Show usually stands, only a number of pegs of wood driven into the ground, broken and whole tent poles, pieces of canvas rolled up, and broken ropes and electric wires were to be seen. The Exhibition ground this year was prepared on a different plan from that of previous years. It was of quadrangular shape, and the Committee anticipated that they would have been able to show the plants, flowers, and fruit to greater advantage than heretofore. All the arrangements were completed—the engine and electric apparatus laid, the fireworks erected below the bandstand, the tents put up, the tables put together, the refreshment tent all ready, and the bands engaged. Many of the large coniferous plants had been placed on the stands last night. The valuable smaller plants and specimens of fruit and flowers are usually placed in position between 9 and 10 o'clock on the morning of the opening day, and thus the tents were not filled with the exhibits when they collapsed. The park keeper, Mr. John Wilson, informs us that a terrific gale blew shortly after five o'clock, and, fearing that damage would be done to the tents, he proceeded to the spot, only to find his fears realised.

"The tents were erected in the usual place at the west end of the park. This spot is the most elevated in the district, and being an open space, is subject to winds from every direction of the compass. The wind blew with great force from the west. This portion of the park is exposed to this wind, particularly as the ground is higher than the house-tops lying to the westward of the park. Mr. Wilson found the tents lying slightly to the east, many of the pegs being torn up, and some of the ropes being snapped. Two policemen and one or two of the park men were doing their utmost to keep the tents from going over altogether, by driving in extra pegs of wood and by placing here and there extra rope supports. The park keeper, fearing that even these efforts would prove of no avail in keeping the marquees up, very wisely gave orders to have all the large plants laid flat on the ground, so that in the event of a collapse of the tents they would sustain little damage. This was accordingly done. Messrs. Jos. Robson & Sons, nurserymen, of Hexham, had their exhibits of coniferous and other plants at the north end of the tents; and Mr. W. J. Watson, of Fenham Nurseries, Newcastle, had a number of valuable exhibits at the west end of the tents. As the last-named gentleman's plants were in the most exposed position, they were attended to first, and were placed as much out of danger as possible. The exhibits of Mr. Robson, and those sent by Messrs. William Fell & Co., nurserymen, of Hexham, were next attended to. The noise made by the flapping of the canvas and the straining of the ropes and poles was something terrific. All that could be done was done to keep everything taut. The efforts of the men, however, proved futile. First one rope gave way, then another. A portion of the canvas broke loose from the ropes, and almost immediately it was torn to ribbons. As soon as the wind got a hold underneath the canvas, the men cleared out from the marquees, as they expected every moment that the whole would come down with a crash. The wind if anything increased in fury, and the ropes continued to snap. The west end portion of the huge erection was the first to give way, the north-west corner shortly followed. Then the whole of the tents swayed backwards and forwards for a little while, and fell in a heap to the ground.

"The fall of the tents naturally exposed the wooden shed covering the engine used to drive the electric apparatus, which was situated in the centre of the quadrangle. The roof became quickly loosened, and was blown off in fragments. A great quantity of the canvas was torn to pieces, and nearly the whole of the ropes and electric light wires were broken. Armstrong's large refreshment tent, erected at the north end of the marquees, stood the strain of the wind pretty well, and damage was prevented to this tent by the canvas being lowered. The whole of the erections were levelled with the ground before half-past seven. Shortly after men were set to work, and the *débris* was cleared away as quickly as possible. Many of the plants were of course damaged through the fall of the poles, and we understand Mr. Watson is the greatest sufferer in this respect. The work of clearing away was carried on under most trying circumstances.

"Some of the members of the Committee naturally anticipated that some damage must have been done to the marquees during the early hours of the morning, and several of them were early on the spot. At 9.30 nearly the whole of the members of the Council of the Society were assembled on the ground, and it was decided to hold a meeting to decide what should be done in regard to the holding of the Show. The

Mayor of Newcastle (Mr. J. Baxter Ellis) presided, and amongst those present were Messrs. E. Wilson, G. Huntley, A. M. Loades, N. Armstrong, W. J. Watson, G. J. Wilson, W. F. Fowkes, P. Hastie, T. G. Winship, George Nesbit, Balfour, Batey, Hepburn, J. B. Garland, and the Secretary, Mr. J. J. Gillespie. A long discussion ensued, and various suggestions were put forward. Ultimately it was resolved that, 'Owing to the tents having been totally destroyed by the gale of this morning, the Show for this year be abandoned.' It was also decided that notices intimating the fact be posted up in the city, and that instructions be forwarded to the various railway stations. The notices to the railway stations, however, would not be in time to stop many excursionists coming to the town, some of whom would be in the city before the Committee had made its decision. Word was at once sent to Mr. J. H. Amers, who was engaged to conduct the Royal Exhibition Band, and the band of the 1st Northumberland Artillery, in their performances of selections of popular music, cancelling the engagements.

"The fireworks erections were also damaged. Messrs. Brock & Co. of London had been engaged to give pyrotechnic displays on each of the three evenings of the Show. The decision of the Committee, and the damage done, practically made the 'scenic' fireworks useless, and they were destroyed before noon behind the park keeper's house at the west entrance to the park. During the whole of the morning the work of clearing was going on. Refreshments were being packed up; ropes, canvas, and woodwork being sorted, and plants being made ready for conveyance from the park. A number of vans and vehicles filled with plants and flowers arrived on the ground during the morning, but were, of course, returned at once to their respective destinations.

"Expressions of sympathy with the energetic Committee will doubtless be general in the present lamentable state of affairs. The Incorporated Botanical and Horticultural Society of Durham, Northumberland, and Newcastle-on-Tyne is conducted only for the public good. In previous years the Society has been extremely unfortunate in respect of the weather, which had been wet, and which naturally affected the attendance at the shows so seriously that the funds were considerably reduced. On two or three occasions there was a deficit, but thanks to the generosity of certain gentlemen, and to the untiring energy displayed by the present Mayor of Newcastle and the members of the Committee of the Society, the deficits were made good, and each year the Show has made a fair bid for financial success. At each show the entries have been numerous, and very considerable expense was incurred to make the exhibitions attractive to all. But the weather has been persistently against the promoters, and the present difficulty must prove very distressing to the members of the Committee. Probably they will meet with the public support they deserve. Mr. J. B. Ellis, at the last annual luncheon, said: 'The Committee had had serious difficulties to overcome, but he had the satisfaction of knowing that it was his privilege to preside over a Committee of gentlemen who were full of energy, pluck, and determination, and who would not know what it was to give in. In spite of the fact that the last autumn (1889) show left them with a serious deficiency of nearly £100, they had the satisfaction of commencing the present Show (1890) with a surplus in hand. He thought the Society deserved the support of all the people of Newcastle, because there was no doubt that it was of an educational and elevating nature, and was accomplishing a great work in which the people were deeply interested.' The words of His Worship aptly described the object of the Society, and the hard work of the Committee in the past. Under the present circumstances the difficulties of the Council must have infinitely increased, and an even greater amount of energy will have to be put forward in the future to give the Society a good position. They will doubtless not appeal in vain.

"Without doubt the autumn Show, which was to have been held, would have been the most successful from a botanical and horticultural point of view ever held by the Society. The various divisions of plants, table decorations, cut flowers, fruit, and window plants had a total of nearly 100 classes, each having an average of about ten exhibitors, showing some thousands of exhibits. Such of the exhibits as arrived on the ground, and were seen by competent judges, were pronounced to be some of the finest forwarded for competition.

"STATEMENT BY THE MAYOR.—His Worship the Mayor of Newcastle (Mr. J. Baxter Ellis), President of the Committee, having been interviewed by one of our representatives, stated that the members of the Committee were completely broken down at this, the greatest calamity that has befallen them. A meeting was convened, presided over by the Mayor. It was found impossible to do anything with respect to the flower Show, and arrivals coming in during the morning were ordered to be returned to the railway station, and forwarded to their owners. The first thought, however, was as to what could be done for the members of the Society and ticket holders, and it was thought there should be a fireworks display and music, but after some consultation, it was found that the gale was still blowing too strong to allow of this, especially as so much damage had been done. This calamity places the Society in a serious state financially, as there are large claims which must be met. The general feeling is that there is nothing for it but to disband the Society. Of course it goes without saying that it will be a source of deep regret to do anything of the kind, but it is asked what can be otherwise done under the circumstances. The Committee, Chairman, and Secretary have fought against calamity after calamity year after year, until at last the greatest has overtaken them, and completely prostrated their efforts. It will be now for the general public to declare whether the assistance so urgently needed to tide over the financial difficulties which have so unexpectedly arisen shall be

forthcoming, and whether the Show and its attractions shall continue in the future."

The disbanding of the Society would be felt as a deplorable loss, not by northern horticulturists alone, but generally, as its exhibitions are regarded as important events by the gardening community. We hope the greater calamity indicated will be averted.

## HORTICULTURAL SHOWS.

CALNE.—AUGUST 18TH.

FINE weather favoured the annual Exhibition of the Calne and District Society, and this being held as usual in the beautiful park at Bowood, the double attraction was the means of bringing together a large number of appreciative visitors. Although there was room for improvement in some of the classes, the Show on the whole was a highly creditable one, nurserymen, professional gardeners, amateurs, and cottagers all contributing to the success.

The best collection of stove and greenhouse plants was shown by Mr. J. F. Mould, Pewsey; Mr. G. Smart, gardener to Mrs. Harris, Calne, being a good second. With six fine-foliaged plants Mr. Smart was well first, his exhibit including a grand specimen of *Davallia Mooreana* and a good *Cycas revoluta*. Mr. Mould was second, and Mr. Perry, gardener to Captain Spicer, Spye Park, third. Mr. Smart was well first for a capital lot of exotic Ferns, and was successful in several other plant classes. The principal prizes for Fuchsias went to Messrs. Cray of Frome, while Mr. Cook, gardener to Major Heneage, Compton Bassett, was first for a well-grown lot of Begonias, and took prizes in several other plant classes. Mr. J. Wilcox, Quemerford, had the best Zonal and other Pelargoniums, Mr. Perry also showing well.

There was a marked improvement in the fruit classes. Mr. Cook was well first for a collection, also having the best Muscat Grapes and the finest Peaches, Nectarines, Plums, and Pears in the various classes provided for these fruits. Mr. Perry took the second prize for a collection, and was also successful in several other classes. With fine well coloured bunches of Gros Maroc Mr. Nelson, the gardener at Bowood, was well first in the class for any variety of black Grape. Other prizewinners with fruit were Messrs. Smart, F. C. Henby, F. E. Redman, W. Powney, and Henry Carter.

Vegetables generally were well shown, Tomatoes being a noteworthy feature. With these the Bromham Fruit Company were well first, showing a very good dish of Ham Green Favourite. Mr. Perry was first for a collection of vegetables, the second prize in this closely contested class going to Mr. Smart.

Messrs. B. S. Williams & Co., Upper Holloway, sent a fine bank of Orchids and various other flowering plants, with Palms, Ferns, and fine-foliaged plants to show them off to advantage. This non-competitive group was highly commended by the Judges.

STREET, SOMERSET.—AUGUST 24TH.

STREET is one of the few towns that can boast of having just held its twentieth annual flower Show, and probably few societies have done more to promote and improve horticulture in its immediate neighbourhood, more especially among cottagers and amateurs. The Show is never a large one, but it is of great excellence, and very creditable to all concerned.

Groups of plants arranged for effect are the principal feature in the display, and in this class Mr. Edwards, gardener to James Clark, Esq., Street, was well first. The arrangement was somewhat formal, but the superior quality of the plants and good finish gave him the premier position. The second prize went to Mr. W. Gale, gardener to H. S. Bailey, Esq., Glastonbury, the centre of the group in this case being faulty, while the third prize was taken by Mr. G. Ford, gardener to F. J. Clarke, Esq., Street, for a light though somewhat dull combination. In the latter group were included two strong plants well in flower of the strikingly beautiful *Lilium auratum virginale*. For two flowering plants Mr. Edwards was easily first, having a well flowered specimen of *Allamanda Hendersoni* and a fairly good *Bougainvillea glabra*.

There was good competition in this class, and also in that provided for two fine-foliaged plants, the gardeners to Mr. A. Colson, H. S. Bailey, Esq., and F. J. Clarke, Esq. also showing well. Tuberous Begonias are always remarkably well shown at Street, professional gardeners, amateurs, and cottagers all cultivating them most successfully. The first prize in the class open to gardeners was taken by Mr. F. Edwards, who had six specimens that would have won a prize anywhere. Miss Ansell was a good second and Mr. Ford third. Remarkably good, also, were the six specimens of Zonal Pelargoniums sent by Mr. Colson, Glastonbury, and which easily won the first prize in a well filled class. Miss Ansell was first for Fuchsias and Mr. Edwards second.

Cut flowers, fruit and vegetables were all shown in goodly numbers, the hardy fruit, notably Apples and Plums, being particularly good in quality. It should be added that Mr. A. D. Porter is the energetic Secretary, and that there are no signs of any waning popularity in respect to the Society. The Grange, kindly lent by Mr. Clark, is very appropriate and convenient for a horticultural meeting, very few societies being more fortunate in this respect.

KINGSWOOD AND WEST GLOUCESTERSHIRE.—AUGUST 26TH.

AFTER the rather long interval of twenty years this Society has been resuscitated and placed on a new footing, but the Committee were most

unfortunate in their selection of a day for holding the Show, the weather being altogether against anything of the kind. A liberal prize list had been prepared, and it was no fault of the Honorary Secretaries, Messrs. F. H. Jullion and J. Stubbs, if a pecuniary failure has to be chronicled. For a first attempt the Show was a highly creditable one, local growers more than holding their own in many of the classes. The first prize of £10, offered for twelve flowering plants, was well won by Mr. Cypher, Cheltenham, who had fresh well-flowered specimens of *Ixora Fraseri*, *I. amabilis*, *I. regina*, *Allamanda nobilis*, *Clerodendron Balfourianum*, *Stephanotis floribunda*, *Phenocoma prolifera* Barnesi, *Erica Austiniana*, *E. tricolor vera*, *E. Marnockiana*, *Statice profusa*, and *Bougainvillea glabra*. Mr. Mould, Pewsey, was second, his best plants being *Erica Eweriana*, *E. Marnockiana*, *Allamanda Hendersoni*, and *Dipladenia amabilis*. Mr. Cypher was also easily first for eight fine-foliaged plants, these including two good Kentias, and Crotons Thompsoni, Newmanni, and Sunset, all beautifully coloured. Mr. A. J. Hancock, gardener to A. W. Summers, Esq., had a collection of healthy plants, the best of which were *Cocos Weddelliana*, *Croton Youngi*, and *Alocasia Lowi*, and was awarded the second prize, the third going to Mr. Mould. In a class for six flowering plants, Mr. W. Rye, gardener to Captain Belfield, was easily first, having large well-flowered specimens of *Allamanda nobilis*, *Stephanotis floribunda*, *Bougainvillea glabra*, *Ixora Williamsi*, *Anthurium Andreanum*, and *A. ferriense*. The same exhibitor was also well to the front with six fine-foliaged plants, these comprising *Kentia Forsteriana*, *Cycas revoluta*, and Crotons majesticus, pictus, and undulatus in good health and colour. In the open class for eight Ferns Mr. Rye was again first, staging grand specimens of *Todea superba*, *T. pellucidum*, *Adiantum concinnum latum*, *A. trapeziforme*, *A. gracillimum*, *A. cardiochloena*, *Davallia Mooreana*, and *Davallia elegans*. Mr. W. Coombes, gardener to J. W. Kingdom, Esq., was second.

There were two classes for six Orchids, Mr. Cypher taking the first prize in that open to nurserymen with beautifully flowered plants of *Oncidium macranthum*, *Cattleya Gaskelliana*, *Dendrochilum filiforme*, *Odontoglossum grande*, *Epidendrum prismatocarpum*, and *Odontoglossum Harryana*. In the other instance Mr. J. Crispin, Bristol, was first, having *Cattleya Gaskelliana*, *Aerides Lobbi*, *Cypripedium longifolium*, *Dendrobium Dearei*, *Cattleya Harrisoni*, and *Cattleya Leopoldi* in good condition. The best Zonal Pelargoniums were staged by Mr. W. Coombes, Mr. A. Garland being second. Tuberous Begonias were well shown by Messrs. W. Clifford and W. Coombes, who were placed first and second respectively. There were also a considerable number of other classes for plants and cut flowers, the competition in most of which was close and good.

Fruit was shown creditably, the entries in some of the classes being very numerous. The best collection of eight dishes was shown by the gardener to Captain J. G. Bayley, who had fairly good Muscat of Alexandria and Black Hamburg Grapes, and Blenheim Orange Melon, Mignonne Peaches, Pine Apple Nectarines, Shipley Apricots, Beurré Giffard Pear, and Orleans Plum in good condition. Mr. G. Garraway, Bath, was second, and Mr. E. Hall third. With three bunches of black Grapes Mr. W. Marsh was first, having very good Alicante, and in a corresponding class for white Grapes Mr. J. Dole was easily first for some of the best bunches of Buckland Sweetwater seen this season. Peaches, Nectarines, Melons, Plums, Apples, and Pears were all well shown, and there was a capital lot of vegetables to be seen. The cottagers made quite an extraordinary display of pot plants, cut flowers, hardy fruit, and vegetables.

## SANDY (BEDS) HORTICULTURAL SOCIETY.

THE twenty-third annual Exhibition of this flourishing midland Society was held at Sandy on Friday last, under somewhat adverse circumstances, as the advent had been extremely unpropitious, the site of the Show having to be changed from its usual place in Sandy Park on account of the death of its late proprietor, and the weather of the preceding days being very hostile to preparations for a great rural gathering, as some twenty tents had to be raised and fitted in the intervals between alternating tornadoes and downpours of rain. However, the perseverance of the Committee and the well known energy of Mr. W. Green, the Secretary, had their reward in a good show in all the departments of horticulture, poultry, birds, rabbits, and dogs, and as the morning opened with a rising barometer and the day proved much more favourable than its predecessors, there was a large and appreciative attendance. The change of site to the cricket field proved probably of an advantage to the visitors, and not nearly so detrimental to the Show as the prophets forebode.

In the plant department Mr. Finch, gardener to J. Marriott, Esq., Coventry, took the leading position in the open class for ten stove and greenhouse plants, his collection being perhaps one of the finest which has ever been got together, all his specimens showing high cultivation, and being equally perfect in flower and training. They consisted of *Bougainvillea glabra*, *Sobralia macrantha*, *Stephanotis floribunda*, *Ixora Prince of Orange*, *Williamsi*, *Duffi*, and *Fraseri*, *Lapageria alba*, and *Ericas Irbyana* and *Marnockiana*. Mr. Rabbitt, gardener to General Pearson, C.B., The Hazells, Sandy, was a creditable second, having a fine *Bougainvillea arborea*, also *Lapageria rosea* and *Allamandas cathartica* and *Hendersoni* in good form. Mr. Redman, gardener to J. H. Goodgames, Esq., Eynesbury, Hunts, was third. Zonal Pelargoniums are usually attractive at this Show, and serve to brighten up the foliage plants. Mr. Redman was first with twelve fine bright and well flowered plants in the open class; and Mr. Rabbitt second. For six foliage plants Mrs. Astell of Woodbury Hall was first and Mr.

Redman second. For six stove and greenhouse Ferns Mr. Rabbitt was first and Mrs. Astell second. For six Zonal Pelargoniums in the amateurs' class Mrs. Astell was first; and for six variegated ditto Mr. Rabbitt won. Six Cockseombs Mr. Cook, gardener to Colonel Stuart, Tempsford Hall. Six Coleus Mr. Redman. Three Lilioms Mr. J. H. Empson, gardener to the Hon. Mrs. Wingfield, Ampthill House.

For a group of plants arranged for effect Mr. Redman was placed first, Mr. Rabbitt being a close second. Cut flowers were largely shown, and the herbaceous classes made a grand display. For twenty-four bunches of herbaceous and bulbous flowers, strictly hardy, in the open class, Messrs. Burrell & Co., Cambridge, were first with large and showy clusters, *Rudbeckia purpurea*, *Bocconia cordata*, *Montbretia Gerbe d'Or* and *crocosmæflora*, *Helianthus multiflorus maximus*, *Echinops ritro*, *Chrysanthemum latifolium*, and *Gladiolus Lemoinei* being conspicuous. Messrs. Laxton Bros., Bedford, were second with somewhat smaller but very neatly set up bunches, including *Plateodon grandiflorum*, *Eryngium planum*, and *Helianthus grandiflorus Soleil d'Or*; Messrs. Paul and Son, Cheshunt, coming third. For twenty-four *Gladioli* (open) Messrs. Burrell & Co.'s stand, consisting mostly of M. Lemoine's brilliant hybrids, took the lead. For forty-eight cut Roses, not less than twenty-four distinct, in the open class Messrs. Paul & Son were placed first with a stand of large and fresh looking blooms, in which Mrs. John Laing, A. K. Williams, Marie Finger, Beauty of Waltham, Her Majesty, J. S. Mill, Marshall P. Wilder, Dr. Hogg, H. Schultheis, Etienne Levet, Marie Rady, Chas. Lefebvre, Paul Neyron, the new Teas Nardy and Ernest Metz, and their own new seedling T. B. Haywood, were the most striking flowers. Messrs. Burch, Peterborough, were second with good flowers of Her Majesty, Fisher Holmes, Catherine Mermet, Chas. Darwin, Merveille de Lyon, Innocente Pirola, Anna Ollivier, Ulrich Brunner, and Earl Dufferin, Messrs. Burrell taking third place with smaller but good blooms. For twenty-four Roses, not less than twelve distinct, in the class from which nurserymen were excepted, E. B. Lindsell, Esq., Hitchin, was first, having in his stand fine blooms of Duchess of Bedford, Mrs. John Laing, Her Majesty, Catherine Mermet, Général Jacqueminot, Amazone, C. Kuster, Victor Verdier, Baroness Rothschild, and Marie Rady. Mr. Geo. Moules, Hitchin, was second.

For twenty-four Show Dahlias in the open class Mr. Geo. Humphries of Chippenham closely contested the premier position with Mr. A. Rawlings of Romford, Mr. Humphries securing first place with grand flowers of Royal Queen, Mr. Glassecock, Queen of the Belgians, Harry Keith, R. T. Rawlings, Thos. Hobbs, Mrs. Gladstone, Nellie Cramond, Burgundy, Vice-President, Crimson King, Mr. Humphries, Ovid, Maud Fellowes, Lustrous, Mrs. Geo. Rawlings, Willie Garratt, Mrs. Kendall, Rosetta, Mrs. D. Saunders, Jas. Stephens, Earl of Ravensworth, Mrs. Dodds, and Geo. Barnes (self); Mr. A. Rawlings being second, and Mr. J. Myers, gardener to the Earl of Sandwich, Hinchinbrook House, third. Mr. Rawlings also received a first-class certificate for his new orange buff seedling Mrs. Lewis Standberg, a welcome addition to this class. For twelve Show Dahlias (nurserymen excepted) Mr. G. Arnold of Leighton Buzzard was to the front; Mr. W. Bourne, Cambridge, second, and Mr. Redman third; whilst for ten Zinnias Mr. A. Burgess of Wimpole Hall Gardens, Cambs, was first, as also for twelve *Truffaut's* and twelve *Chrysanthemum Asters*; Mr. C. Bright, Cambridge, securing first for twelve African, and Mr. E. T. L. Smith, Sandy, for twelve French Marigolds. Pompon Dahlias were tastefully set up by Messrs. Paul & Son, Mr. G. Humphries, and Messrs. Burrell, who were placed in the order named.

The show of fruit was one of the largest and best yet seen at Sandy, the classes for Grapes, Melons, Peaches, Nectarines, and Plums all being well filled. The faulting generally was in the want of finish of most of the Grapes, arising from the continued absence of the sun's rays; but there were notable exceptions in some of the leading stands. For a collection of eight distinct kinds of fruit (Pines excluded) Mr. Jas. Linneus of Walkem Hall Gardens took the lead with good examples of Madresfield Court and Muscat Grapes, Bellegarde Peaches, Golden Queen Melon, Stanwick Nectarines, Moor Park Apriots, Apple Duchess of Gloucester, and Plums; Mr. J. Anning, Welwyn, coming second; Mr. C. Forbes, gardener to E. B. Foster, Esq., Anstey Hall, Cambridge, third; and Mr. R. Carter, gardener to Capt. Duncombe, Waresley Park, Hunts, fourth. For a collection of six varieties Mr. Burgess was first, Mr. Redman second, and Mr. Geo. Cook, gardener to Col. Stuart, Tempsford Hall, Beds, third. For two bunches of Black Hamburg Grapes Mr. W. H. Murfin, Great Staughton, Hunts, was first with medium-sized bunches, the berries very well coloured and fine; Mr. Burgess came second, and Mr. J. A. Baker, St. Ives, third. For two bunches of Black Grapes (Hamburgs excluded) Mr. Empson, gardener to Mrs. Wingfield, Ampthill House, took the first prize and a silver medal offered for excellence of culture for two very beautiful and symmetrical bunches of Madresfield Court, highly finished; G. E. Foster, Esq., Brooklands, Cambridge, being second; and Mr. G. D. White, gardener to Sidney Stanley, Esq., Longstowe Hall, Cambridge, third. For two bunches of Muscat of Alexandria Mr. Anning, Mr. Linneus, and Mr. Forbes were placed in the order named, all showing fine bunches, but slightly wanting in finish. For two bunches of white Grapes (Muscats excluded) Mr. White was first, Mr. G. E. Foster second, and Mr. Empson third, all showing Foster's Seedling in good form and finish. Mr. Linneus was first for six fine Noblesse Peaches, and again for Nectarines and outdoor Figs. For green fleshed Melon Mr. Empson took first place amongst about twenty specimens with Hero of Lockinge, and also for scarlet fleshed with Woolston Scarlet Gem. Mr. Allis, gardener to Major Shuttleworth, Old Warden Park, received high commendation

for two well-finished bunches of Lady Downe's Seedling Grape not for competition. For a collection of dessert Apples Mr. Allis was first, showing a well-kept dish of fruits of 1890 unnamed.

Vegetables, the staple of Sandy, were as usual amply and well represented both in the amateur and market garden divisions. Potatoes were especially fine. For a basket of twelve varieties of vegetables in the gardeners' and amateurs' class Mr. W. Pepper, Welwyn, was first, Mr. H. Ridgewell, Cambridge, a good second, and Mr. F. Faust, Hertford, third. For a basket of six varieties Mr. W. Bourne, Cambridge, came first, Mr. R. Carter second, and Mr. White third. For a collection of Potatoes in the same division Mr. Simkins, Shillington, Beds, was first with splendid examples of Sutton's Seedling, Satisfaction, Best of All, Reading Russet, Chancellor, and The Dean. Mr. W. Bourne was second, and Mr. W. H. Wootton, Thornly, third. For twelve white kidney Potatoes Mr. Simkins was again successful with Satisfaction, and Mr. Wootton second with Snowdrop. For twelve white rounds Mr. Simkins was first with Windsor Castle, for seventeen coloured kidneys with Reading Ruby, and for twelve coloured rounds with The Dean. This lot was altogether probably the finest exhibition of Potatoes as yet got together this season, all the specimens being nearly perfect. For three dishes of Peas, the prizes being offered by Messrs. Chas. Sharpe and Co., Sleaford, for their varieties, Mr. Rabbitt was first with Sharpe's Queen (very fine), Sir F. Millbank, and Triumph. Onions were not in the best condition, being small in size and insufficiently ripened.

In the market gardeners' class Mr. W. Cousins of Cliff-a-Hoo was first for a collection of Potatoes, the specimens being very large and rather coarse. Mr. H. Ridgewell was second with a very even collection. Mr. R. M. Simpson of the Three Counties Asylum, Arlesley, had the best collection of Onions, good for the season. The special prizes offered by Mr. F. Yates, seedsman, Nottingham, were taken by Mr. F. Davison, Sandy, for Cucumbers; Mr. H. Ridgewell for Cauliflowers, and Mr. R. Preece, Sandy, for Carrots. For three new varieties of Potatoes not more than two years in commerce, Mr. Ridgewell was first, showing Laxton's Victorious, very fine kidney; Hughes' Pink Perfection, and Sutton's Windsor Castle. Carrots were very good, and of fine colour, the best coming from Mr. C. Quince of Sandy.

A tent was devoted to table decorations, and here it is hardly possible to criticise, as there is diversity and fashion in taste. The first prize went to Miss Pearson of The Hazells for a very showy table, orange and yellow predominating; but the second prize table, set out by Miss Richardson of Sandy Rectory, and consisting mainly of pink Ivy-leaved Pelargoniums and *Ampelopsis Veitchi*, was softer, and showed much taste.

Messrs. Cutbush & Sons of the Highgate Nurseries, had a beautiful group of ornamental plants not for competition, and deservedly received very high commendation.

#### HARDY FRUIT GARDEN.

**RASPBERRIES.**—As soon as these have finished ripening their fruit the old bearing wood must be cut away close to the ground to give the young wood every advantage possible in the way of sun and air to ripen it for the next season's fruiting. All weak growths of the current year should also be removed at the same time, unless they are required for fresh plantations. If the young wood has been tied up hitherto it should now be left loose for the above reason. All mulching material may be cleared off, also any weeds that may have gained a footing, leaving the crown clean.

**FIGS.**—Take out all weak shoots, and any that are not required for next year's fruiting, cutting them off close to the main branches, and laying in the sturdiest and best placed shoots. Plenty of room must always be left between the young shoots that are secured to walls. Abundance of light and air are essential at all times for Figs in order to ensure good crops, and any shoots that extend beyond the top of the wall should be left entire, as these often give the best fruit and the most also. They grow short-jointed and firm in such positions, and if protected in the winter from the frost will not fail to fruit next season. The second crop of Figs rarely ripens outside in this country, and then only in the warmest places, and during the best seasons. The young wood should, therefore, be laid in full length without any stopping, as next year's crop comes at the points of this season's growth.

**APPLES AND PEARS.**—Fruits of these for show must now have every encouragement in order that they may finish off well. Expose them to all the sun and air possible, fasten them so that they may not get damaged by wind, and protect them from small birds, which often make holes in them a long time before they are ready for gathering. If the weather is dry a copious application of liquid manure occasionally will aid their swelling considerably. The earliest varieties will now be ripening fast, and should be gathered a few at a time and placed in the fruit room to finish, thus prolonging their season as much as possible. The Red and White Juneatings, Astrachan and Early Margaret Apples,

with Doyenné d'Été, Citron des Carmes, Beacon, and Jargonelle Pears are the first that require attention.

**PEACHES.**—Trees of the early varieties from which the crops have been gathered should be carefully looked over in order to remove all superfluous wood, and give the remainder every chance to mature well. If there is any trace of red spider or thrips syringe the trees thoroughly with softsoap at the rate of 2 ozs. to the gallon of water, working the syringe so as to reach the under side of the leaves. The best time for this operation is during the afternoon as soon as the greatest part of the sun heat is over. The solution should not be rinsed off, but allowed to remain on the trees for a day or two without any more syringing.

**PROTECTING FRUIT FROM WASPS AND FLIES.**—Although exceptionally plentiful early in the season wasps have been very scarce lately, but if we have a few days of warm and dry weather they will soon increase. The damage done to all kinds of autumn fruit by these insects is often enormous, and every means must be used to lessen their numbers as soon as they put in an appearance. Their nests may often be found by quietly watching which way they fly towards evening, and carefully following in that direction until the exact spot is reached. Generally speaking, it will be in some dry, stony bank or near the roots of large trees. The place must be marked with a stick, so that it can be easily found at night, when the insects are at home. There are various ways of destroying the nest, one of the simplest and safest being to pour about half a pint of gas tar into the hole and lay a piece of turf on the top of it. This will suffocate the inhabitants, and two days after they should be dug out and the brood destroyed. Another way is to make squibs by mixing two parts of sulphur to one of gunpowder, and wrapping it up in brown paper in a cylindrical form, about half an inch in diameter and 9 inches long. The end of this should then be set fire to and inserted in the hole, and a piece of turf put over it when it gets well started. If a little gunpowder is arranged at the end by itself so as to go off at the finish it will tell when the mixture is burnt out, and drive the smoke home to the nest. A few minutes afterwards the nest may be dug out and the brood destroyed. A teaspoonful of cyanide of potassium placed in the entrances in the daytime destroys all the wasps.

Those that cannot be caught at their homes may be trapped near the trees which they visit. There are several ways of doing this, and of catching flies, &c., at the same time. One of the best plans is to take an ordinary handlight and remove part of one of the panes of glass at the highest point of the cover, fit another handlight closely on the top of this, and be careful to see that there are no holes in it, packing it closely with moss or wadding where it touches the lower glass. The whole arrangement should then be put near to the place where the ripe fruit is, and must be raised a little distance from the ground by means of four bricks or something of the kind so as to give the insects plenty of room to creep under. A few pieces of damaged fruit or a saucer of beer and sugar placed underneath will entice them in. They afterwards fly through the aperture into the upper glass and then perish, as they are unable to find the way back again. Those who have no handlights should hang small-mouthed bottles about the trees, and place a little beer and sugar in them. Some very good glass traps are also made specially for this purpose.

Figs and Grapes should be placed in small muslin bags before they get ripe enough to suffer damage. These will require careful watching in wet weather to see that the fruit does not decay from want of air. Other fruits, such as Peaches, Nectarines, Plums, Gooseberries, and choice Pears, may be protected by fastening hexagon netting or muslin over them, but there must be no holes at the floor or on the sides of the walls where the insects can obtain an entrance, or they will soon do so.

#### FRUIT FORCING.

**CUCUMBERS.**—Shorter days necessitate closing the house earlier, also syringing sooner, so as to have the foliage fairly dry before dusk. Fire heat, in consequence of the cold wet weather, has become necessary to maintain a temperature of 70° to 75° by day and 65° to 70° at night. Keep the growths fairly thin, removing old shoots so as to make room for the young ones, and so provide a succession of bearing parts. Stop the shoots one joint beyond the fruit unless growth is wanted, then allow more extension, but avoid crowding. Encourage root action by a steady bottom heat of 80°, surface dressing with lumpy loam and sweetened horse droppings, and afford liquid manure in a tepid state whenever water is required. Do not allow the fruit to hang after it becomes fit for use, and avoid overcropping.

**Autumn Fruiters.**—Afford every encouragement to these plants, stopping so as to insure an even spread of bearing growths. Remove the first fruits, also the male blossoms and tendrils. No shading will now be necessary. Avoid syringing in the morning, and only use the syringe on fine afternoons, and then early and lightly, keeping the house damped as occasion requires. Admit air in moderation; draughts must be avoided, as they chill and stunt the growths, and if no air is given the foliage becomes very thin and flabby when kept close, moist, and warm. Seek to encourage sturdy thoroughly solidified growth by early and judicious ventilation whilst opportunity offers, but without gentle fire heat this is hardly practicable at this season.

**Winter Fruiters.**—Seed having been sown in August the plants will now be ready to plant out. The house must be a light one, and have means of securing a temperature of 70° to 75° in all weathers, also of maintaining a bottom heat of 80° to 90°. The first consideration is to thoroughly cleanse the house. All soil previously used must be cleared out, and the whole of the interior scalded, if possible, with boiling or

very hot water; the woodwork washed with softsoap, water, and a brush; the glass washed with water only, the walls limewashed, and everything put into proper repair. If rubble is used about and over the pipes for bottom heat see that the material is clean, and if not take it out and clean it by washing. Secure the drainage with a layer of turves, grass side downwards. Put in hillocks or ridges of soil 2 feet wide at the base, 10 to 12 inches deep and 1 foot across at the top. Turfy loam laid up until the grass is killed, chopped up rather roughly, two-thirds, fibrous sandy peat one-third, chopped or torn up, rejecting any woody matter, old mortar rubbish freed of laths and other pieces of wood, the rough broken small, one-sixth, the whole thoroughly incorporated, form a suitable compost. It should be neither wet nor dry, and only made moderately firm. This material is equally suited for plants in pots or boxes, which should be well drained, and only so far filled with soil that when the plants are introduced their seed leaves will be about level with the rim of the pots, earthing the plants as they increase in growth. Very useful fruit can be had from plants in pots or boxes in houses with a stove temperature. A quart of soot, or any of the advertised fertilisers, may be added to every bushel of the loam. Plant when the soil is warmed through, press the soil gently, and secure the plants to stakes reaching to the trellis. Rub off the laterals to that height, and stop the leading shoot at about the second or third wire of the trellis. Shade from bright sun until established. Syringe lightly in the early afternoon, damp in the morning, noon, and afternoon. Keep a day temperature of 70° to 75°, raising 10° to 15° from sun heat, and a night temperature of 70°, falling 5° in the early morning. Plants from seed sown early in August will fruit in late autumn, but they must not be cropped much if they are to give a plentiful supply from Christmas to spring.

**Cucumbers for Christmas.**—For producing these sow early in this month, September. Telegraph is one of the best, but it is much confused with other varieties by cross-breeding, so that a true stock of Rollisson's original variety is not always secured. Cardiff Castle is also an admirable winter fruiting variety. The seed is best sown singly in large 60-pots a little more than half filled with soil, and covered half an inch deep. Keep the plants near the glass, earth them up as they grow, and transfer to 48's when they need a shift, placing a stick to each, to which secure the growth as it advances. Rub off laterals as they show, training with a single shoot. They will be fit to plant during the first fortnight of October.

**Cucumbers in Pits and Frames.**—The growths of these will need to be trained thinly as a safeguard against damp. Watering must be done early and judiciously, as damp and cold soon injuriously affect Cucumbers at this season. A light sprinkling may be given at closing time on fine afternoons, but water will not be much needed after this, or very little of it, the plants obtaining sufficient moisture through the decay of the fermenting beds. The beds must be lined with stable litter, and a little air given at the back to allow of any steam escaping. The temperature should be kept about 65° at night. Employ a covering of mats over the lights on cold nights. With care Cucumbers will be obtained from these structures for many weeks to come.

**MELONS.**—*Perfecting the Crops.*—In order to enhance the flavour of the fruit, maintain a brisk heat by day with sufficient ventilation to insure a circulation of air constantly. Keep water from the house and the soil somewhat dry as soon as the fruit commences ripening, supplying moisture only to prevent flagging. The October fruiting plants are swelling their crops, and must be assisted with weak tepid liquid manure whenever they become dry. Keep the laterals well in hand; also a sharp look out for canker, and rub quicklime into the affected parts, repeating as the parts become moist by exudation or spread of the canker, for it is next to hopeless striving to avert the evil at this late period of the season, except so far as to secure the ripening of the fruits. If there is any fear of cracked fruits, cut the stems about half way through a little below the fruit. It will check the flow of sap. But the chief cause of cracking is a close atmosphere, causing the deposition of moisture on the fruit during the night and in dull weather, especially after a prolonged period of fine bright weather. Ventilate freely, and keep the air moderately dry by a little ventilation constantly, as a preventive of canker and cracking.
